## 1 快速入门
1.1 概述 ........................................... 3  
1.2 准备工作  ........................ .......... 3  
1.2.1 硬件： ..................................... 3  
1.2.2 软件： .................................... 91  
1.3 安装 .......................................... 92  
1.3.1 IDE .......................................... 92  
1.3.2 手动安装 .................................. 92  
1.4 编译第一个工程 .............................. 122  

## 2 API 参考
2.1 API Conventions ................................. 123  
2.1.1 Error handling .............................. 123  
2.1.2 Configuration structures .................... 123  
2.1.3 Private APIs ................................ 124  
2.1.4 Components in example projects ............ 124  
2.1.5 API Stability ................................ 125  
2.2 应用层协议 ................................. 126  
2.2.1 ASIO port ................................ 126  
2.2.2 ESP-Modbus ................................ 126  
2.2.3 ESP-MQTT ................................ 127  
2.2.4 ESP-TLS ................................ 142  
2.2.5 ESP HTTP Client ......................... 157  
2.2.6 ESP Local Control ......................... 172  
2.2.7 ESP Serial Slave Link .................... 181  
2.2.8 ESP x509 Certificate Bundle .......... 198  
2.2.9 HTTP 服务器 ............................ 200  
2.2.10 HTTPS 服务器 ......................... 226  
2.2.11 ICMP Echo ................................ 230  
2.2.12 mDNS 服务 ............................ 234  
2.2.13 Mbed TLS ............................... 235  
2.2.14 IP 网络层协议 ......................... 236  
2.3 蓝牙 API ................................. 237  
2.3.1 BT COMMON ............................. 237  
2.3.2 BT LE ................................. 242  
2.3.3 CLASSIC BT ............................ 365  
2.3.4 Controller & VHCI ...................... 485  
2.3.5 ESP-BLE-MESH ......................... 494  
2.3.6 NimBLE-based host APIs .............. 776  
2.4 Error Codes Reference ................. 778  
2.5 连网 API ................................. 785  
2.5.1 Wi-Fi ................................. 785  
2.5.2 以太网 ................................. 888  
2.5.3 Thread ................................. 920  
2.5.4 IP 网络层协议 ......................... 926
2.5.5 外设 API .......................... 957
2.5.6 应用层协议 .......................... 959
2.6 外设 API .......................... 959
2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver .......................... 959
2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver .......................... 968
2.6.3 Analog to Digital Converter (ADC) Calibration Driver .......................... 976
2.6.4 Clock Tree .......................... 980
2.6.5 Digital To Analog Converter (DAC) .......................... 988
2.6.6 GPIO & RTC GPIO .......................... 1001
2.6.7 通用定时器 .......................... 1020
2.6.8 I2C 驱动程序 .......................... 1034
2.6.9 Inter-IC Sound (I2S) .......................... 1051
2.6.10 LCD .......................... 1086
2.6.11 LED PWM 控制器 .......................... 1099
2.6.12 Motor Control Pulse Width Modulator (MCPWM) .......................... 1116
2.6.13 脉冲计数器 (PCNT) .......................... 1164
2.6.14 Remote Control Transceiver (RMT) .......................... 1178
2.6.15 SD Pull-up Requirements .......................... 1202
2.6.16 SDMMC Host Driver .......................... 1206
2.6.17 SD SPI Host Driver .......................... 1211
2.6.18 SDIO Card Slave Driver .......................... 1217
2.6.19 Sigma-Delta Modulation (SDM) .......................... 1227
2.6.20 SPI Master Driver .......................... 1232
2.6.21 SPI 从机驱动程序 .......................... 1257
2.6.22 ESP32-WROOM-32SE (Secure Element) .......................... 1264
2.6.23 驱动程序 .......................... 1274
2.6.24 Two-Wire Automotive Interface (TWAI) .......................... 1282
2.6.25 Universal Asynchronous Receiver/Transmitter (UART) .......................... 1300
2.7 Project Configuration .......................... 1325
2.7.1 Introduction .......................... 1325
2.7.2 Project Configuration Menu .......................... 1326
2.7.3 Using sdkconfig.defaults .......................... 1326
2.7.4 Kconfig Formatting Rules .......................... 1326
2.7.5 Backward Compatibility of Kconfig Options .......................... 1326
2.7.6 Configuration Options Reference .......................... 1326
2.8 配网 API .......................... 1600
2.8.1 Protocol Communication .......................... 1600
2.8.2 Unified Provisioning .......................... 1615
2.8.3 Wi-Fi Provisioning .......................... 1619
2.9 存储 API .......................... 1639
2.9.1 FAT 文件系统 .......................... 1639
2.9.2 量产程序 .......................... 1646
2.9.3 非易失性存储库 .......................... 1650
2.9.4 NVS 分区生成程序 .......................... 1672
2.9.5 NVS 分区解析程序 .......................... 1676
2.9.6 SD/SDIO/MMC 驱动程序 .......................... 1677
2.9.7 SPI Flash API .......................... 1690
2.9.8 SPIFFS 文件系统 .......................... 1726
2.9.9 虚拟文件系统组件 .......................... 1730
2.9.10 摩损均衡 API .......................... 1745
2.10 System API .......................... 1749
2.10.1 App Image Format .......................... 1749
2.10.2 Application Level Tracing .......................... 1755
2.10.3 Call function with external stack .......................... 1760
2.10.4 Chip Revision .......................... 1761
2.10.5 控制台终端 .......................... 1764
2.10.6 eFuse Manager .......................... 1773
2.10.7 Error Codes and Helper Functions .......................... 1793
### 3 H/W 硬件参考

| 2.10.8  | ESP HTTPS OTA                                      | 1796 |
| 2.10.9  | Event Loop Library                                 | 1802 |
| 2.10.10 | FreeRTOS                                           | 1814 |
| 2.10.11 | FreeRTOS Supplemental Features                    | 1927 |
| 2.10.12 | Heap Memory Allocation                             | 1946 |
| 2.10.13 | Heap Memory Debugging                              | 1960 |
| 2.10.14 | High Resolution Timer (ESP Timer)                  | 1971 |

| 2.10.17 | Interrupt allocation                               | 1984 |
| 2.10.18 | Logging library                                    | 1990 |
| 2.10.19 | 杂项系统 API                                       | 1997 |
| 2.10.20 | 空中升级 (OTA)                                     | 2012 |
| 2.10.21 | Performance Monitor                                | 2023 |
| 2.10.22 | 电源管理                                           | 2026 |
| 2.10.23 | POSIX Threads Support                              | 2032 |
| 2.10.24 | Random Number Generation                           | 2036 |
| 2.10.25 | 睡眠模式                                           | 2038 |
| 2.10.26 | SoC Capabilities                                   | 2050 |
| 2.10.27 | 系统时间                                           | 2059 |
| 2.10.28 | The himem allocation API                           | 2063 |
| 2.10.29 | ULP 协处理器编程                                  | 2066 |
| 2.10.30 | Watchdogs                                          | 2098 |

### 4 API 指南

| 4.1         | 应用层跟踪库                                      | 2107 |
| 4.1.1       | 概述                                              | 2107 |
| 4.1.2       | 运行模式                                           | 2107 |
| 4.1.3       | 配置选项与依赖项                                  | 2108 |
| 4.1.4       | 如何使用此库                                      | 2109 |
| 4.2         | 应用程序的启动流程                                | 2117 |
| 4.2.1       | 一级引导程序                                      | 2117 |
| 4.2.2       | 二级引导程序                                      | 2117 |
| 4.2.3       | 应用程序启动阶段                                  | 2118 |
| 4.3         | BluFi                                              | 2119 |
| 4.3.1       | 概览                                              | 2120 |
| 4.3.2       | BluFi 流程                                         | 2120 |
| 4.3.3       | BluFi 流程图                                       | 2120 |
| 4.3.4       | BluFi 中定义的帧格式                              | 2120 |
| 4.3.5       | ESP32 端的安全实现                                | 2125 |
| 4.3.6       | GATT 相关说明                                      | 2126 |
| 4.4         | 引导加载程序 (Bootloader)                          | 2126 |
| 4.4.1       | 引导加载程序兼容性                                | 2126 |
| 4.4.2       | 日志级别                                           | 2127 |
| 4.4.3       | 恢复出厂设置                                      | 2127 |
| 4.4.4       | 从测试固件启动                                    | 2128 |
| 4.4.5       | 回滚                                              | 2128 |
| 4.4.6       | 看门狗                                            | 2128 |
| 4.4.7       | 引导加载程序大小                                  | 2129 |
| 4.4.8       | 从深度睡眠中快速启动                             | 2129 |
| 4.4.9       | 自定义引导加载程序                                | 2129 |

### 4.5 构建系统

| 4.5.1       | 概述                                              | 2129 |
| 4.5.2       | 使用构建系统                                      | 2130 |
| 4.5.3       | 示例项目                                           | 2132 |
| 4.5.4       | 项目 CMakeLists 文件                              | 2132 |
4.5.5 组件 CMakeLists 文件 ........................................... 2134
4.5.6 组件配置 ....................................................... 2136
4.5.7 遵循器定义 ....................................................... 2136
4.5.8 组件依赖 ....................................................... 2136
4.5.9 覆盖项目部分设置 ................................................ 2140
4.5.10 仅配置组件 ..................................................... 2140
4.5.11 CMake 调试 ..................................................... 2141
4.5.12 组件 CMakeLists 示例 ............................................. 2141
4.5.13 自定义 sdkconfig 的默认值 ..................................... 2145
4.5.14 Flash 参数 ...................................................... 2145
4.5.15 构建 Bootloader ................................................ 2146
4.5.16 编写纯 CMake 组件 ............................................. 2146
4.5.17 组件中使用第三方 CMake 项目 .................................. 2146
4.5.18 组件中使用预建库 .............................................. 2147
4.5.19 在自定义 CMake 项目中使用 ESP-IDF ............................ 2147
4.5.20 ESP-IDF CMake 构建系统 API ................................... 2148
4.5.21 文件编译 & 增量构建 .......................................... 2152
4.5.22 构建系统的元数据 ............................................. 2152
4.5.23 构建系统内部 ................................................. 2153
4.5.24 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统 .... 2154
4.6 Core Dump ............................................................ 2155
4.6.1 Overview .......................................................... 2156
4.6.2 Configurations ..................................................... 2156
4.6.3 Save core dump to flash ........................................... 2157
4.6.4 Print core dump to UART .......................................... 2157
4.6.5 ROM Functions in Backtraces ..................................... 2157
4.6.6 Dumping variables on demand ..................................... 2158
4.6.7 Running idf.py coredump-info and idf.py coredump-debug ..... 2158
4.7 Deep Sleep Wake Stubs ................................................ 2160
4.7.1 Rules for Wake Stubs ................................................ 2160
4.7.2 Implementing A Stub ............................................... 2161
4.7.3 Loading Code Into RTC Memory .................................... 2161
4.7.4 Loading Data Into RTC Memory .................................... 2161
4.7.5 CRC Check For Wake Stubs ......................................... 2162
4.8 错误处理 ............................................................ 2162
4.8.1 概述 ............................................................. 2162
4.8.2 错误码 .......................................................... 2163
4.8.3 错误码到错误消息 ................................................ 2163
4.8.4 ESP_ERROR_CHECK 宏 ............................................. 2163
4.8.5 ESP_ERROR_CHECKWITHOUT_ABORT 宏 ..................... 2164
4.8.6 ESP_RETURN_ON_ERROR 宏 ....................................... 2164
4.8.7 ESP_GOTO_ON_ERROR 宏 ......................................... 2164
4.8.8 ESP_RETURN_ON_FALSE 宏 ....................................... 2164
4.8.9 ESP_GOTO_ON_FALSE 宏 ......................................... 2164
4.8.10 CHECK 宏使用示例 .............................................. 2164
4.8.11 错误处理模式 .................................................. 2165
4.8.12 C++ 异常 ...................................................... 2165
4.9 ESP-BLE-MESH ....................................................... 2166
4.9.1 ESP-BLE-MESH 快速入门 ......................................... 2166
4.9.2 ESP-BLE-MESH 示例 .............................................. 2171
4.9.3 ESP-BLE-MESH 演示视频 ......................................... 2173
4.9.4 ESP-BLE-MESH 常见问题手册 .................................... 2173
4.9.5 相关文档 ....................................................... 2173
4.10 ESP-IDF FreeRTOS (SMP) ........................................... 2200
4.10.1 Overview ......................................................... 2201
4.10.2 Symmetric Multiprocessing ...................................... 2201
4.10.3 Tasks ............................................................ 2202
4.10.4 SMP Scheduler .................................................... 2203
4.10.5 Critical Sections .................................................. 2207
4.10.6 Misc ................................................................. 2208
4.11 ESP-WIFI-MESH ....................................................... 2209
  4.11.1 概述 .............................................................. 2209
  4.11.2 简介 .............................................................. 2209
  4.11.3 ESP-WIFI-MESH 概念 ........................................... 2210
  4.11.4 建立网络 ......................................................... 2215
  4.11.5 管理网络 .......................................................... 2219
  4.11.6 数据传输 .......................................................... 2222
  4.11.7 信道切换 .......................................................... 2224
  4.11.8 性能 .............................................................. 2226
  4.11.9 更多注意事项 .................................................... 2227
4.12 Event Handling ....................................................... 2227
  4.12.1 Wi-Fi, Ethernet, and IP Events .................................. 2227
  4.12.2 Mesh Events ......................................................... 2228
  4.12.3 Bluetooth Events .................................................. 2229
4.13 严重错误 ............................................................. 2229
  4.13.1 概述 .............................................................. 2229
  4.13.2 紧急处理程序 ...................................................... 2230
  4.13.3 寄存器转储与回溯 ............................................... 2230
  4.13.4 GDB Stub ........................................................... 2232
  4.13.5 RTC 看门狗超时 .................................................. 2233
  4.13.6 Guru Meditation 错误 ............................................ 2233
  4.13.7 其他严重错误 .................................................... 2234
4.14 Flash 加密 .......................................................... 2237
  4.14.1 概述 .............................................................. 2237
  4.14.2 相关 eFuses ....................................................... 2237
  4.14.3 Flash 的加密过程 ............................................... 2238
  4.14.4 Flash 加密设置 ................................................... 2239
  4.14.5 可能出现的错误 .................................................. 2244
  4.14.6 ESP32 flash 加密状态 ............................................. 2246
  4.14.7 在加密的 flash 中读写数据 ..................................... 2246
  4.14.8 更新加密的 flash ............................................... 2247
  4.14.9 关闭 flash 加密 .................................................. 2247
  4.14.10 Flash 加密的要点 ............................................... 2247
  4.14.11 Flash 加密的局限性 ............................................ 2248
  4.14.12 Flash 加密与安全启动 .......................................... 2248
  4.14.13 Flash 加密的高级功能 ......................................... 2248
  4.14.14 技术细节 ......................................................... 2250
4.15 Hardware Abstraction ............................................... 2251
  4.15.1 Architecture ....................................................... 2251
  4.15.2 LL (Low Level) Layer ............................................. 2252
  4.15.3 HAL (Hardware Abstraction Layer) ............................. 2253
4.16 High-Level Interrupts ............................................... 2254
  4.16.1 Interrupt Levels ................................................... 2254
  4.16.2 Notes .............................................................. 2255
4.17 JTAG 调试 .......................................................... 2255
  4.17.1 引言 .............................................................. 2255
  4.17.2 工作原理 ......................................................... 2256
  4.17.3 选择 JTAG 适配器 ............................................... 2256
  4.17.4 安装 OpenOCD ..................................................... 2257
  4.17.5 配置 ESP32 目标板 ............................................... 2257
  4.17.6 启动调试器 ....................................................... 2262
  4.17.7 调试范例 ........................................................ 2263
  4.17.8 从源码构建 OpenOCD .......................................... 2263
  4.17.9 注意事项和补充内容 ............................................ 2267
  4.17.10 相关文档 ........................................................ 2272
4.18 链接器脚本生成机制 ............................................... 2297
4.18.1 概述 .................................................. 2297
4.18.2 快速上手 ............................................. 2297
4.18.3 链接器脚本生成机制介绍 ................................ 2300
4.19 lwIP .................................................. 2306
  4.19.1 Supported APIs ...................................... 2306
  4.19.2 BSD Sockets API ...................................... 2306
  4.19.3 Netconn API .......................................... 2310
  4.19.4 lwIP FreeRTOS Task .................................... 2310
  4.19.5 IPv6 Support ........................................... 2311

这里是乐鑫 IoT 开发框架 (esp-idf) 的文档中心。ESP-IDF 是 ESP32、ESP32-S 和 ESP32-C 系列芯片的官方开发框架。

本文档仅包含针对 ESP32 芯片的 ESP-IDF 使用。

| 快速入门 | API 参考 | API 指南 |
Chapter 1

快速入门

本文档旨在指导用户搭建 ESP32 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32 开发板等步骤。

备注：这是 ESP-IDF master 分支（最新版本）的文档，该版本在持续开发中。还有 Stable version 的文档，以及其他版本的文档 ESP-IDF 版本简介 供参考。

1.1 概述

ESP32 SoC 芯片支持以下功能:

- 2.4 GHz Wi-Fi
- 蓝牙
- 高性能 Xtensa® 32 位 LX6 双核处理器
- 超低功耗处理器
- 多种外设

ESP32 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

1.2 准备工作

1.2.1 硬件:

- 一款 ESP32 开发板
- USB 数据线 (A 转 Micro-B)
- 电脑 (Windows、Linux 或 macOS)

备注：目前一些开发板使用的是 USB Type C 接口。请确保使用合适的数据线来连接开发板！

以下是 ESP32 官方开发板，点击链接可了解更多硬件信息。
ESP32-DevKitC V4 入门指南

本指南介绍了如何开始使用 ESP32-DevKitC V4 开发板。

准备工作

- ESP32-DevKitC V4 开发板
- USB A / micro USB B 数据线
- PC（Windows、Linux 或 Mac OS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

概述  ESP32-DevKitC V4 是 乐鑫 一款基于 ESP32 的小型开发板，板上模组的绝大部分管脚均已引出，开发人员可根据实际需求，轻松通过跳线连接多种外围器件，或将开发板插在面包板上使用。

为了更好地满足不同用户需求，ESP32-DevKitC V4 还支持以下不同配置：

- 可选多款 ESP32 模组
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROVER-E
  - ESP32-WROVER-IE
  - ESP32-WROOM-DA

- 可选排针或排母

详情请见 乐鑫产品选型工具。

功能说明  ESP32-DevKitC V4 开发板的主要组件、接口及控制方式见下。

图 1: ESP32-DevKitC V4（板载 ESP32-WROOM-32）
**主要组件**

<table>
<thead>
<tr>
<th>主要组件</th>
<th>基本介绍</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Boot</td>
<td>复位按钮。</td>
</tr>
</tbody>
</table>
| USB-to-UART 桥接器 | 下载按键，按住 Boot 键并保持。同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
| Micro USB 接口  | USB 接口，可用作电路板的供电电源，或连接 PC 和 ESP32-WROOM-32 模组的通信接口。 |
| 5V Power On LED | 开发板通电后（USB 或外部 5 V），该指示灯将亮起。更多信息，请见相关文档中的原理图。 |
| I/O            | 板上模组的绝大部分管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。 |

**电源选项** 开发板可从以下三种供电方式中任选其一：
- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

**警告**：上述供电模式 不可同时连接，否则可能会损坏开发板和/或电源。

**排针** 下表列出了开发板两侧排针（J1 和 J3）的名称和功能，排针名称如图 ESP32-DevKitC V4 （或 ESP32-WROOM-32）中所示。

</tbody>
</table>

1: P: 电源；I: 输入；O: 输出。
2: 管脚 D0、D1、D2、D3、CMD 和 CLK 用于 ESP32 芯片与 SPI flash 间的内部通信，集中分布在开发板两侧靠近 USB 端口的位置。通常而言，这些管脚最好不连，否则可能影响 SPI flash / SPI RAM 的工作。
### 管脚布局

**有关 C15 的提示**

较早版本 ESP32-DevKitC 开发板上的 C15 可能存在以下问题:

1. 管脚 GPIO16 和 GPIO17 仅适用于搭载 ESP32-WROOM 系列和 ESP32-SOLO-1 的开发板，搭载 ESP32-WROVER 系列开发板的管脚 GPIO16 和 GPIO17 保留内部使用。

#### 图 2: ESP32-DevKitC 管脚布局（点击放大）
- 开发板上电后可能进入下载模式；
- 如果用户通过 GPIO0 输出时钟，C15 可能会影响信号。

用户如果认为 C15 可能影响开发板的使用，则可以将 C15 完全移除。C15 在开发板上的具体位置见下图黄色部分。

图 3: C15（黄色）在 ESP32-DevKitC V4 开发板上的位置

应用程序开发  ESP32-DevKitC V4 上电前，请首先确认开发板完好无损。

现在，请前往 快速入门 中的 安装 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

### ESP32-DevKitC V2 入门指南

本指南介绍了如何开始使用 ESP32-DevKitC V2 开发板。

#### 准备工作

- ESP32-DevKitC V2 开发板
- USB A / micro USB B 数据线
- PC（Windows，Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

#### 概述

ESP32-DevKitC V2 是 乐鑫 一款基于 ESP32 的小型开发板，板上板的绝大部分管脚均已引出，开发人员可根据实际需求，轻松通过跳线连接多种外围器件，或将开发板插入面包板上使用。

#### 功能说明

ESP32-DevKitC V2 开发板的主要组件、接口及控制方式见下。

### 电源选项

开发板可从以下三种供电方式中任选其一：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告：上述供电模式不可同时连接，否则可能会损坏开发板和/或电源。

### 应用程序开发

ESP32-DevKitC V2 上电前，请首先确认开发板完好无损。

现在，请前往快速入门 中的 安装 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

### ESP-WROVER-KIT V4.1 入门指南

本指南介绍了如何开始使用 ESP-WROVER-KIT V4.1 开发板及其功能和相关配置。

### 准备工作

- ESP-WROVER-KIT V4.1 开发板
- USB 2.0 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

### 概述

ESP-WROVER-KIT 是乐鑫 一款基于 ESP32 的开发板。

ESP-WROVER-KIT 开发板已集成了如下组件：

- ESP32-WROVER-E 模组
- LCD 屏
- microSD 卡槽

此外，ESP-WROVER-KIT 的独特之处在于集成了两款先进多协议 USB 桥接器（FTDI FT2232HL），允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。
备注：ESP32 的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述 ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 6: ESP-WROVER-KIT 功能框图

功能说明 ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

Chapter 1. 快速入门

ESP32 管脚分配 ESP32 模组的部分管脚或终端已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可用作他用。比如，摄像头/JP4 排针未连接相应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用，比如 GPIO0 和 GPIO2。由于管脚限制，一些外围设备不可同时使用，比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的卡检测信号。如无需使用卡检测功能，开发人员还可以通过移除 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

主要 I/O 连接器 / JP1 JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间 “I/O” 列的介绍。两侧的“共用” 列则介绍了这些管脚在板上的其他用途。

说明:
- NC/XTAL - 32.768 kHz 晶振
- JTAG - JTAG / JP2
- Boot - Boot 按键 / SW2
- 摄像头 - 摄像头 / JP4
- LED - RGB LED
- microSD - microSD Card / J4
- LCD - LCD / U5
- PSRAM - ESP32-WROVER-E 的 PSRAM

32.768 kHz 晶振

<table>
<thead>
<tr>
<th></th>
<th>ESP32 管脚</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

备注：默认情况下，管脚 GPIO32 和 GPIO33 已连接至晶振。因此，为了保证信号的完整性，这两个管脚并未连接至 JP1 I/O 连接器。用户可通过将 R11 或 R23 处的 0 欧电阻移至 R12 或 R24 处，以将 GPIO32 和 GPIO33 的连接从晶振移至 JP1。
### SPI Flash / JP2

<table>
<thead>
<tr>
<th>ESP32 管脚</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CLK / GPIO6</td>
</tr>
<tr>
<td>2</td>

</tr>
<tr>
<td>5</td>
<td>SD3 / GPIO10</td>
</tr>
<tr>
<td>6</td>
<td>CMD / GPIO11</td>
</tr>
</tbody>
</table>

**重要：**模组的 flash 总线已通过 0 欧电阻 R140 ~ R145 连接至排针 JP2。如果需要将 flash 的工作频率控制在 80 MHz，以达到保证总线信号完整性等目的，建议移除 R140 ~ R145 电阻，将模组的 flash 总线与排针 JP2 断开。

**應用程序开发** ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

**初始设置** 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP2 连接器，使能 UART 通信。

<table>
<thead>
<tr>
<th>USB 供电</th>
<th>使能 UART 通信</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="USB 供电" /></td>
<td><img src="image2" alt="使能 UART 通信" /></td>
</tr>
</tbody>
</table>
注意不要连接其他跳线帽。
打开 电源开关，5V Power On LED 应点亮。

正式开始开发 现在，请前往 快速入门 中的 安装 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

您可以在 IDF 组件注册器 中下载板级支持包 (BSP)。

以下链接提供了与 ESP-WROVER-KIT 开发板硬件相关的示例:

ESP-WROVER-KIT V3 入门指南

本指南介绍了如何开始使用 ESP-WROVER-KIT V3 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：H/W 硬件参考。

准备工作

- ESP-WROVER-KIT V3 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往 应用程序开发 章节。

概述 ESP-WROVER-KIT 是 乐鑫 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 microSD 卡槽。

ESP-WROVER-KIT 可选贴以下 ESP32 模组:

- ESP32-WROOM32
- ESP32-WROVER 系列模组

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

备注：该版本 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述 ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。
图 9: ESP-WROVER-KIT 功能框图

功能说明 ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。
下表介绍了开发板的主要组件，顺序如下：
- 从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件
- 然后以同样的顺序介绍了图 2 中的主要组件

说明：
- NC/XTAL - 32.768 kHz Oscillator
- JTAG - JTAG / JP8
- Boot - Boot 按键 / SW2
- 摄像头 - 摄像头 / JP4
- LED - RGB LED
- microSD - microSD Card / J4
- LCD - LCD / U5
- PSRAM - 仅适用于选装 ESP32-WROVER 的情况。

**32.768 kHz 晶振**

<table>

应用程序开发：ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。
初始设置 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 J7 连接器，选择 USB 为开发板供电。
- 使用 J11 连接器，使能 UART 通信。

<table>
<thead>
<tr>
<th>USB 供电</th>
<th>使能 UART 通信</th>
</tr>
</thead>
</table>

注意不要连接其他跳线帽。
打开 电源开关，5V Power On LED 应点亮。

正式开始开发 现在，请前往快速入门 中的安装 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

ESP-WROVER-KIT V2 入门指南
本指南介绍了如何开始使用 ESP-WROVER-KIT V2 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见 H/W 硬件参考。

准备工作
- ESP-WROVER-KIT V2 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows，Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

概述  ESP-WROVER-KIT 是 乐鑫 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 microSD 卡槽。
ESP-WROVER-KIT 可选配以下 ESP32 模组：
- ESP32-WROOM-32
• ESP32-WROVER 系列模组
此外, ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL), 允许开发人员直接通过 USB 接口, 使用 JTAG 对 ESP32 进行调试, 无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。
为了便于使用, 板上模组的绝大部分管脚均已引出至开发板的引脚。

备注: ESP-WROVER-KIT V2 板载 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下, 为了给用户提供可靠的性能, 这两个 GPIO 管脚不引出至开发板引脚。

功能概述 ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 12: ESP-WROVER-KIT 功能框图

功能说明 ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。
下表介绍了开发板的主要组件，顺序如下:
• 从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件
• 然后以同样的顺序介绍了图 2 中的主要组件
图 13: ESP-WROVER-KIT 开发板布局—俯视图
图 14: ESP-WROVER-KIT 开发板布局—仰视图
主要组件 | 基本介绍
---|---
32.768 kHz | 外接 32.768 kHz 振荡器，可提供 Deep-sleep 下使用的低功耗时钟。
ESP32 模组 | 可选配 ESP32-WROOM-32 或 ESP32-WROVER。ESP32-WROVER 模组集合了 ESP32-WROOM-32 的所有功能，且内置 32-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
CTS/RTS | 串口流控信号。管脚默认不连接至电路。为了使能该功能，必须用跳线帽短路掉 JP14 的相应管脚。
UART | 串口。FT2232HL 和 ESP32 的串行 TX/RX 信号已引出至 JP11 的两端。默认情况下，这两路信号由跳线帽连接。如果要跳过 FT2232 使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI | 默认情况下，ESP32 使用 SPI 接口访问内核 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，选配 ESP32-WROVER 模组时，该接口的工作电压为 1.8 V；选配 ESP32-WROOM-32 时，该接口的工作电压为 3.3 V。
JTAG | JTAG 接口，FT2232HL 和 ESP32 的 JTAG 信号已引出至 JP8 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照设置选项的介绍，连接跳线帽。
FT2232 | FT2232 多协议 USB 转串口桥接器。开发者可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 具有 USB-to-uart 和 USB-to-JTAG 功能。

EN | 复位按键。
Boot | 下载按键。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
USB | USB 接口，可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源选择开关 | ESP-WROVER-KIT 开发板可通过 USB 端口或 5 V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节设置选项中有关 JP7 连接器的描述。
电源开关 | 拨向 USB 按键一侧，开发板上电；拨向 USB 按键一侧，开发板掉电。
5V Input | 5 V 电源接口建议仅在开发板自动运行（未连接 PC）时使用，仅用于全负荷工作下的后备电源。
LDO | 5V-to-3.3V 低电压差线型稳压器 NCP1117(1A)，NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 ESP-WROVER-KIT V2 原理图。
摄像头 | 摄像头接口，支持标准 OV7670 摄像头模块。
RGB LED | 红绿蓝发光二极管，可由 PWM（脉冲宽度调制）控制。
I/O | 板上模组的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。
microSD 卡槽 | microSD 卡槽，可扩充存储空间：当 ESP32 进入下载模式时，GPIO2 不可处于高电平。然而，为了使能 microSD 卡功能，需为 GPIO2 增加一个上拉电阻。默认情况下，GPIO2 和上拉电阻 R153 处于断开状态。为了使能 microSD 卡，请按照设置选项章节的要求，连接 JP11 连接器。
LCD 显示屏 | 支持贴装一款 3.2 " SPI (标准四线串行外设接口) LCD 显示器。请见 ESP-WROVER-KIT 开发板布局—俯视图。

设置选项 | 用户可通过 5 组排针，设置开发板功能，其中常见功能见下表：

设置选项    | 功能描述

ESP32-PICO-KIT V4/V4.1 入门指南

本指南介绍了如何开始使用 ESP32-PICO-KIT V4/V4.1 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：H/W 硬件参考。

本指南仅适用于 ESP32-PICO-KIT V4 和 V4.1。ESP32-PICO-KIT V4.1 与 V4 的最大差别在于桥接器。其中 V4 搭载的 CP2102 USB-to-UART 桥接器最高速率为 1 Mbps，V4.1 搭载的 CP2102N 桥接器最高传输速率为 3 Mbps。

准备工作
- ESP32-PICO-KIT 迷你开发板
- USB 2.0 线（A 型转 Micro-B 型）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发章节。
概要  ESP32-PICO-KIT 是一款来自 乐鑫 的迷你开发板。

该开发板的核心是具有完整 Wi-Fi 和蓝牙功能的 ESP32 系列 SiP 模组 ESP32-PICO-D4。与其他 ESP32 系列模组相比，ESP32-PICO-D4 模组已集成以下外围器件:

- 40 MHz 晶体振荡器
- 4 MB flash
- 滤波电容
- 射频匹配网络等

这大大降低了用户额外采购和安装这些元件件的数量和成本，及额外组装测试的复杂度，并增加了可用性。

ESP32-PICO-KIT 集成了 USB 转 UART 桥接电路，允许开发人员直接通过 PC 的 USB 端口进行下载和调试。

为了便于连接，ESP32-PICO-D4 上的所有 IO 信号和系统电源管脚均通过开发板两侧焊盘（每侧 20 个 x 0.1 英寸间隔）引出。为了方便板间线的使用，ESP32-PICO-KIT 开发板每侧的 20 个焊盘中，有 17 个引出至排针，另外 3 个靠近天线的焊盘未引出，可供用户日后焊接使用。

备注:
1. ESP32-PICO-D4 开发板目前有两种版本，分别采用排针与排母。本指南默认以排针版本为例。
2. 每排未引出至排针的 3 个管脚已连接至 ESP32-PICO-D4 SiP 模组的内置 flash 模块。更多信息，请见相关文档 中的模组技术规格书。

功能概要  ESP32-PICO-KIT 开发板的主要组件和连接方式见下。

功能说明  ESP32-PICO-KIT 开发板的主要组件、接口及控制方式见下。ESP32-PICO-KIT 开发板的主要组件描述见下表（从左上角起顺时针顺序）。

电源选项： 开发板可任选一选用以下三种供电方式：
- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告：上述供电模式不可同时连接，否则可能会损坏开发板和/或电源。

管脚说明： 下表介绍了开发板 I/O 管脚的名称和功能，具体布局请见相关文档中的原理图。请参考 ESP32-PICO-KIT 开发板布局（排母版）。

备注:

1. 该管脚已连接至 ESP32-PICO-D4 的内置 flash 管脚。
2. 32.768 kHz 晶振：(a) 输入；(b) 输出。
3. 该管脚已连接至开发板的 USB 桥接器芯片。
4. ESP32-PICO-KIT 内置 SPI flash 的工作电压为 3.3 V。因此，strapping 管脚 MTDI 在复位过程中应保持低电平。如连接该管脚，请确保该管脚在复位中不要保持高电平。

图 17: ESP32-PICO-KIT 管脚布局（点击放大）

管脚布局

应用程序开发

ESP32-PICO-KIT 上电前，请首先确认开发板完好无损。

现在，请前往快速入门中的安装章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

开发板尺寸

ESP32-PICO-KIT 的尺寸为 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4” )。

图 18: ESP32-PICO-KIT 尺寸图—背面（排针版）

有关开发板的物理结构细节，请见下方参考设计。

ESP32-PICO-KIT V3 入门指南
本指南介绍了如何开始使用 ESP32-PICO-KIT V3 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：H/W 硬件参考。

准备工作
- ESP32-PICO-KIT V3 迷你开发板
- USB 2.0 线（A 型转 Micro-B 型）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发章节。

概述  ESP32-PICO-KIT V3 是一款来自 乐鑫 的迷你开发板，其核心是具有完整 Wi-Fi 和蓝牙功能的 ESP32 系列 SiP 模组 ESP32-PICO-D4。

ESP32-PICO-KIT 集成了 USB 转 UART 桥接电路，允许开发人员直接通过 PC 的 USB 端口进行下载和调试。

为了便于连接，ESP32-PICO-D4 上的所有 IO 信号和系统电源管脚均通过开发板两侧焊盘（每侧 20 个 x 0.1 英寸间隔）引出。

功能说明  ESP32-PICO-KIT V3 开发板的主要组件、接口及控制方式见下。

ESP32-PICO-KIT 开发板的主要组件描述见下表。

### ESP32-Ethernet-Kit V1.2 入门指南

本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

**ESP32-Ethernet-Kit** 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

### 准备工作

- **ESP32-Ethernet-Kit V1.2 开发板**
- USB 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

### 概述

ESP32-Ethernet-Kit 是一款来自乐鑫的开发板。

它由以太网模块（A 板）和 PoE 子板（B 板）两部分组成。其中以太网模块（A 板）集成了蓝牙/Wi-Fi 双模 ESP32-WROVER-E 模组和单端口 10/100 Mbps 快速以太网收发器 (PHY) IP101GRI。PoE 子板（B 板）提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器（FT2232H 芯片）。FT2232H 芯片使得开发人员无需额外的 JTAG 适配器，通过 USB 桥接器使用 JTAG 接口便可对 ESP32 直接进行调试。

### 功能概述

ESP32-Ethernet-Kit 开发板的主要组件和连接方式如下。

### 功能说明

有关 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式，请见下方的图片和表格。

</table>

备注：开发板支持固件自动下载模式。若遵循应用程序开发 章节中的步骤并使用了规定软件，则无需对 BOOT 或 EN 按键进行任何操作。

PoE 子板（B板） PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板 (A板) 提供电源。PoE 子板（B板）的主要组件见 功能概述 中的功能框图。

PoE 子板（B板）具有以下特性：

- 支持 IEEE 802.3at 标准
- 电源输出：5V，1.4A

如需使用 PoE 功能，请用以太网电缆将以太网母板 (A板) 上的 RJ45 Port 连接至 PoE 的交换机。以太网母板 (A板) 检测到来自 PoE 子板 (B板) 的 5V 供电后，将从 USB 供电自动切换至 PoE 供电。

</tbody>
</table>

RMII 时钟源选择 RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50 MHz 同步时钟 (即 RMII 时钟)，它既可以由外部提供，也可以由内部的 ESP32 APLL 产生 (不推荐)。

备注：有关 RMII 时钟源选择的更多信息，请参见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图，第 2 页的位置 D2。

PHY 侧提供 RMII 时钟 ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M_CLKO 信号线提供 RMII 时钟。该时钟信号由 PHY 外侧连接的 25 MHz 无源晶振经过倍频产生。详情请参见下图。

请注意，系统上电时 RESET_N 旁的下拉电阻会将 PHY 置于复位状态。ESP32 需要通过 GPIO5 将 RESET_N 拉高才能启动 PHY。只有这样才能保证系统的正常上电，否则 ESP32 会存在一定几率进入下载模式 (当 REF_CLK_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平)。

ESP32 APLL 内部提供的 RMII 时钟 另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

要实现此选项，用户需要在板子上移除或添加一些阻容元器件。有关详细信息，请参见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

GPIO 分配 本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

IP101GRI (PHY) 接口 下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。
图 26: PHY 侧提供 RMII 时钟
图 27: ESP32 APLL 内部提供的 RMII 时钟
### Chapter 1. 快速入门

<table>
<thead>
<tr>
<th>No.</th>

### 备注:

1. 为防止 ESP32 器 GPIO 的上电状态受 PHY 部分时钟输出的影响，PHY 部分的 RESITOR_B，默认为低，以关
   闭 PHY 部分时钟输出。上电后，用户可通过 GPIO5 控制 RESITOR_B 以打开该时钟输出。见 PHY 部分提
   供 RMII 时钟。对于无法通过 RESITOR_B 关闭时钟输出的 PHY，PHY 部分建议使用可在外置禁用/能使
   的有源晶振。分使用 RESITOR_B 类似，默认情况下晶振模块应禁用，并在上电后由 ESP32 开启。有关
   参考数据，请参见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图。
2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-E 模组的管脚，因此无法使
   用。若需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-
   WROOM-32D 或 ESP32-SOLO-1。

### 应用程序开发

ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

### 初始设置

1. 首先，请以大母板（A 板）上的所有开关均拨至 ON 状态，使 功能选择开关 处于默认状态。
2. 为了方便应用程序的下载和调试，不要为开发板输入任何信号。
3. 此时可以连接 PoE 子板（B 板），但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将大母板（A 板）连接至 PC。
5. 将 电源开关 从 GND 拨至 5V0 一侧。此时，5V Power On LED 应点亮。

### 正式开始开发

现在，请前往 快速入门 中的 安装 章节，查看如何设置开发环境，并尝试将示例项目烧录
至您的开发板。

请务必在进入下一步前，确保您已完成上述所有步骤。

Submit Document Feedback
配置与加载以太网示例 在完成开发环境设置和开发板测试后，您可以配置并烧录`ethernet/basic`示例。本示例专门用于测试以太网功能，支持不同PHY，包括ESP32-Ethernet-Kit V1.2（点击放大）开发板使用的IP101GRI。

针对ESP32-Ethernet-Kit V1.1的主要修改

- 更正拨码开关周围GPIO编号丝印。
- C1、C2、C42 和 C43 更改 为20 pF。详细信息见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图。
- 模组ESP32-WROVER-B替换为ESP32-WROVER-E。

ESP32-Ethernet-Kit V1.0 入门指南

本指南介绍了如何使用ESP32-Ethernet-Kit 开发板以及配置相关功能。

ESP32-Ethernet-Kit 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 也同时支持以太网供电 (PoE)。

准备工作

- ESP32-Ethernet-Kit V1.0 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发章节。

概述 ESP32-Ethernet-Kit 是一款来自乐鑫的开发板。

该开发板由以太网母板（A 板）和PoE 子板（B 板）两部分组成。其中以太网母板（A 板）贴蓝牙 / Wi-Fi 双模 ESP32-WROVER-B模组和单端口 10/100 快速以太网收发器 (PHY) IP101GRI。PoE 子板（B 板）提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议USB桥接器（FTDI FT2232H芯片），进而允许开发人员直接通过USB接口，使用JTAG对ESP32进行调试，无需额外的 JTAG适配器。

功能概述 ESP32-Ethernet-Kit 开发板的主要组件和连接方式见下。

功能说明 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式见下。

**PoE 子板（B 板）** PoE 子板通过以太网电缆传输电能 (PoE)，为以太网母板（A 板）提供电源。PoE 子板（B 板）的主要组件见 功能概述 中的功能框图。

---

Espressif Systems 56  Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
PoE 子板（B 板）具有以下特性：

- 支持 IEEE 802.3at
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板（A 板）上的 RJ45 端口连接至 PoE 的交换机。太网母板（A 板）检测到来自 PoE 子板（B 板）的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

图 31: ESP32-Ethernet-Kit - PoE 子板（B 板）布局（点击放大）

<td></td>
</tr>
</tbody>
</table>

用户还可以关闭 DIP DW，将部分 GPIO 用于其他用途。

流控 2 x 2 跳线连接器，可用于 UART 流控功能。
### GPIO 分配

本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

### IP101GRI (PHY) 接口

ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系见下。ESP32-Ethernet-Kit 开发板默认使用媒体独立接口 (RMII)。

<table>
<thead>
<tr>
<th>接口</th>

**备注：**

1. GPIO2 用于使能 PHY 的外部振荡器。
2. GPIO0 用于为 PHY 提供 50 MHz 基准时钟源。为了防止传输线路延迟对时钟相位带来的影响，该时钟信号将首先被反相，而后提供给 PHY。
3. 为防止 PHY 端 GPIO0 的上电状态受到时钟输出的影响，PHY 的外部晶振将在 ESP32 上电后通过 GPIO2 使能。
4. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 SPIRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。

**应用程序开发** ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

**初始设置**

1. 首先，请将 以太网母板（A 板） 上的所有开关均拨至 ON 状态，即使 功能选择开关 处于默认状态。
2. 为了方便应用程序的下载和测试，此时请不要在开发板安装任何跳线帽，也不要为开发板接入任何信号。
3. 此时可以连接 PoE 子板（B 板），但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将 以太网母板（A 板） 连接至 PC。
5. 将 电源开关 从 GND 拨至 5V0 一侧，此时，5V Power On LED 应点亮。

**正式开始开发** 现在，请前往 快速入门 中的 安装 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

如需使用较早 GNU Make 编译系统，则请参考 安装 章节。

请务必在进入下一步前，确保您已完成上述所有步骤。

**配置与加载以太网示例** 在完成开发环境设置和开发板测试后，您可以配置并烧录 ethernet/basic 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.0 开发板 使用的 IP101GRI。

**相关文档**

- ESP32-Ethernet-Kit V1.0 以太网母板（A 板）原理图 (PDF)
- ESP32-Ethernet-Kit V1.0 PoE 子板（B 板）原理图 (PDF)
- 《ESP32 技术规格书》 (PDF)
- 《ESP32-WROVER-B 技术规格书》 (PDF)
- JTAG 调试
- H/W 硬件参考

有关本开发板的更多设计文档，请联系我们的商务部门 sales@espressif.com。

**ESP32-Ethernet-Kit V1.1 入门指南**

本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

ESP32-Ethernet-Kit 是一款以太网转 Wi-Fi 开发板。可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

**准备工作**

- ESP32-Ethernet-Kit V1.1 开发板
- USB 数据线 (A 转 Micro-B)
- PC (Windows, Linux 或 macOS)

您可以跳过介绍部分，直接前往 应用程序开发 章节。
Chapter 1. 快速入门

图 32: ESP32-Ethernet-Kit V1.1
概述 ESP32-Ethernet-Kit 是一款来自 乐鑫 的开发板。

它由 ESP32-WROVER-B 模组和单端口 10/100 Mbps 以太网收发器 (PHY) IP101GRI、PoE 子板（B 板）构成。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器（FTDI FT2232H 芯片）。FTDI FT2232H芯片使得开发人员无需额外的 JTAG 适配器，通过 USB 桥接器使用 JTAG 接口便可对 ESP32 直接进行调试。

功能概述 ESP32-Ethernet-Kit 开发板的主要组件和连接方式如下。

![ESP32-Ethernet-Kit 功能框图](image)

图 33: ESP32-Ethernet-Kit 功能框图（点击放大）

功能说明 有关 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式，请见下方的图片和表格。

以太网母板（A 板） 下表将从图片右上角开始，以顺时针顺序介绍图中的主要组件。
### 图 34: ESP32-Ethernet-Kit - 以太网母板 (A 板) 布局（点击放大）

Submit Document Feedback
PoE 子板（B 板） PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板（A 板）提供电源。PoE 子板（B 板）的主要组件见功能概述 中的功能框图。

PoE 子板（B 板）具有以下特性：
- 支持 IEEE 802.3at 标准
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板（A 板）上的 RJ45 Port 连接至 PoE 的交换机。以太网母板（A 板）检测到来自 PoE 子板（B 板）的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

图 35: ESP32-Ethernet-Kit - PoE 子板（B 板）布局（点击放大）

### 表 4: 表格 2 PoE 子板（B 板）

<table>
<thead>
<tr>
<th>主要组件</th>
<th>基本介绍</th>
</tr>
</thead>
<tbody>
<tr>
<td>A 板连接器</td>
<td>4 个排针（左侧）和排母（右侧），用于将 PoE 子板（B 板）连接至 Ethernet board (A)。左侧的管脚接受来自 PoE 交换机的电源。右侧的管脚为以太网母板（A 板）提供 5 V 电源。</td>
</tr>
<tr>
<td>外部电源终端</td>
<td>PoE 子板（B 板）可选电源 (26.6 ~ 54 V)。</td>
</tr>
</tbody>
</table>

### 设置选项
本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

### 功能选择开关
拨码开关打开时，拨码开关将列出的 GPIO 路由到 FT2232H 以提供 JTAG 功能。拨码开关关闭时，GPIO 可用于其他目的。

<table>
<thead>
<tr>
<th>拨码开关</th>
<th>GPIO 管脚</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

备注：拨码开关旁边开发板的丝印层上的 GPIO 管脚标记的位置是不正确的。请以表格中的顺序为准。

### RMII 时钟源选择
RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50 MHz 同步时钟（即 RMII 时钟），它既可以由外部提供，也可以由内部的 ESP32 APPLL 产生。

备注：有关 RMII 时钟源选择的更多信息，请参见 ESP32-Ethernet-Kit V1.1 以太网母板（A 板）原理图，第 2 页的位置 D2。

### PHY 侧提供 RMII 时钟
ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M_CLKO 信号线提供 RMII 时钟，该时钟信号由 PHY 外侧连接的 25MHz 无源晶振经过倍频产生。详情请参见下图。
图 36: PHY 侧提供 RMII 时钟
请注意，系统上电时 RESET_N 旁的下拉电阻会将 PHY 置于复位状态，ESP32 需要通过 GPIO5 将 RESET_N 拉高才能启动 PHY，只有这样才能保证系统的正常上电；否则 ESP32 会存在一定几率进入下载模式（当 REF_CLK_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平）。

**ESP32 APLL 内部提供的 RMII 时钟** 另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

![ESP32 APLL 内部提供的 RMII 时钟](image)

图 37: ESP32 APLL 内部提供的 RMII 时钟

要实现此选项，用户需要在板子上移除或添加一些阻容元件件。有关详细信息，请参见 ESP32-Ethernet-Kit V1.1 以太网母板（A 板）原理图，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

**GPIO 分配** 本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

**IP101GRI (PHY) 接口** 下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。
<table>
<thead>
<tr>

### 备注:

1. 为防止 ESP32 的 GPIO 的上电状态受 PHY 随时钟输出的影响，PHY 侧 RESET_N 默认为低，以关闭 PHY 随时钟输出。上电后，您可通过 GPIO5 控制 RESET_N 以打开该时钟输出。请参见 phy 侧提供 RMI 时钟。对于无法通过 RESET_N 关闭时钟输出的 PHY，PHY 侧建议使用可在外部禁用/使能的有源晶振。与使用 RESET_N 类似，默认情况下晶振模块应禁用，并在上电后由 ESP32 开启。有关参考设计，请参见 ESP32-Ethernet-Kit V1.1 以太网母板（A 板）原理图。

2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，如 ESP32-WROOM-32D 或 ESP32-SOLO-1。

### 应用程序开发

ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

### 初始设置

1. 首先，请将以太网母板（A 板）上的所有开关均拨至 ON 状态，使 功能选择开关 处于默认状态。
2. 为了方便应用程序的下载和测试，不要为开发板输入任何信号。
3. 此时可以连接 PoE 子板（B 板），但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将以太网母板（A 板）连接至 PC。
5. 将 电源开关 从 GND 拨至 5V0 一侧。此时，5V Power On LED 应点亮。

### 正式开始开发

现在，请前往 快速入门 中的 安装 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

*请务必在进入下一步前，确保您已完成上述所有步骤。*
配置与加载以太网示例  在完成开发环境设置和开发板测试后，您可以配置并烧录 ethernet/basic 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.1 开发板使用的 IP101GRI。

针对 ESP32-Ethernet-Kit V1.0 的主要修改
- 原 GPIO0 反相后时钟供给 PHY 方案改为由 PHY 侧外接无源晶振，提供时钟给 GPIO0。原用于控制有源晶振的 OSC_EN 的 IO2 释放，可用作其他用途。
- 为防止 ESP32 侧 GPIO0 的上电状态受到 PHY 侧时钟输出的影响，PHY 侧 RESET_N 默认为低，关闭 PHY 侧时钟输出。而后再通过 GPIO0 控制 RESET_N 打开该时钟输出。
- 移除 FT2232H 芯片的外部 SPI Flash U6。
- 移除流控的测试排针 J4。
- 移除 nTRST JTAG 信号，相应的 GPIO4 可用作其他用途。
- GPIO15 线上的上拉电阻 R68 移至 JTAG 的 MTDO 侧。
- 为了加强 A 板和 B 板连接间的防呆设计（减少反向插入 B 板的机会），将原先 A 板上的 2 排 4 针排针改为 1 排 4 针排母和 1 排 4 针排针。相应的 4 针排针排和排母排则安装在 B 板上。

ESP32-DevKitS(-R)

本指南介绍了乐鑫专为 ESP32 设计的烧录底板 ESP32-DevKitS(-R)。

ESP32-DevKitS(-R) 包括两款开发板，分别是 ESP32-DevKitS 和 ESP32-DevKitS-R。S 代表弹簧 (spring)，R 代表 WROVER 模组。

本指南包括如下内容：
- 入门指南: 简要介绍了 ESP32-DevKitS(-R) 和硬件、软件设置指南。
- 硬件参考: 详细介绍了 ESP32-DevKitS(-R) 的硬件。
- 相关文档: 列出了相关文档的链接。

Espressif Systems 70 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
**入门指南** 本节介绍了如何快速上手 ESP32-DevKitS(-R)。开始部分介绍了 ESP32-DevKitS(-R)，如何烧录开发板。小节介绍了怎样在 ESP32-DevKitS(-R) 上安装模块，配置及烧录固定。

**概述** ESP32-DevKitS(-R) 是乐鑫专为 ESP32 设计的烧录底板，无需将 ESP32 模组与电源和信号线焊接便可进行烧录。ESP32-DevKitS(-R) 搭载模块后，可作为类似 ESP32-DevKitC 的小型开发板使用。

ESP32-DevKitS 和 ESP32-DevKitS-R 仅在弹簧布局上有所不同，用于适配不同的 ESP32 模块。

- **ESP32-DevKitS:**
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R:**
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

有关上述模块的详细信息，请参考 ESP32 系列模块。

</tbody>
</table>

**如何烧录开发板** 通电前，请确保 ESP32-DevKitS(-R) 完好无损。

**必备硬件**

- 任选一款 ESP32 模组
- USB 2.0 数据线（标准 A 型转 Micro-B 型）
- 电脑（Windows、Linux 或 macOS）

**硬件设置** 请按照下列步骤将模组安装到 ESP32-DevKitS(-R) 烧录底板上：

- 将模组轻放到 ESP32-DevKitS(-R) 烧录底板上。确保模组上方的邮票孔与底板上的引脚弹簧对齐。
- 将模组向下压，听到“咔哒”一声即说明模组已经压入底板。
- 检查所有引脚弹簧是否均已卡进邮票孔中。如发现错位，可使用镊子将引脚弹簧拨入邮票孔中。
软件设置

首选方式 使用 ESP-IDF 开发框架是将二进制文件 (*.bin) 烧录到 ESP32-DevKitS(-R) 的首选方式。请前往快速入门，在安装一节查看如何快速设置开发环境，将应用程序烧录至 ESP32-DevKitS(-R)。

备选方式 Windows 用户也可以使用 Flash 下载工具 烧录二进制文件。请下载该工具，解压并参照 doc 文件夹内的使用指南。

备注:
1. 烧录二进制文件时需将 ESP32 芯片设置成固件下载模式。这一步骤可由烧录工具自动执行，也可按住 Boot 按键并点按 EN 按键手动执行。
2. 烧录完成后，烧录工具默认情况下会重启模组，运行已烧录的程序。

功能框图 ESP32-DevKitS(-R) 的主要组件和连接方式如下图所示。

电源选项 您可从以下三种供电方式中任选其一给 ESP32-DevKitS(-R) 供电：
• Micro USB 端口供电（默认）
• 5V 和 GND 管脚供电
• 3V3 和 GND 管脚供电

建议选择第一种供电方式：Micro USB 端口供电。

ESP32-PICO-KIT-1

概述  ESP32-PICO-KIT-1 是一款基于 ESP32 的乐鑫开发板。

该开发板搭载 ESP32-PICO-V3（SiP，系统级封装）模组。ESP32-PICO-V3 具备完整的 Wi-Fi 和蓝牙功能，与其它 ESP32 系列模组相比，此模组已集成下述外围组件，无需额外安装：

- 40 MHz 晶振
- 4 MB flash
- 滤波电容
- 射频匹配网络

将上述组件封装至 ESP32-PICO-V3，用户无需额外购买，大大降低了安装和测试的成本，同时也增加了产品的可用性。

ESP32-PICO-KIT-1 开发板还集成了 USB-to-UART 桥接电路，方便开发人员直接通过 PC 的 USB 端口直接进行固件烧录和调试。

为方便硬件连接，ESP32-PICO-V3 上的所有 IO 信号和系统电源管脚均引出至开发板两侧焊盘 (18 x 0.1")。上述 18 个焊盘也均引出至排针，可使用杜邦线连接。
图 42: ESP32-DevKitS(-R)（点击放大）

备注：ESP32-PICO-KIT-1 开发板默认采用排针。

ESP32-PICO-KIT-1 为用户提供了基于 ESP32 芯片应用开发的硬件，更加方便用户探索 ESP32 芯片的功能。

本指南包括以下几个章节：

- 快速入门：简要介绍 ESP32-PICO-KIT-1 开发板，以及上手这款开发板所需的软件配置；
- 内含组件和包装方式：介绍零售订单和批量订单所提供的组件及包装方式；
- 硬件参考：提供 ESP32-PICO-KIT-1 开发板硬件详细信息；
- 硬件版本：介绍硬件历史版本（如有），已知问题（如有），并提供链接至历史版本开发板的入门指南（如有）；
- 相关文档：提供相关文档的链接。

快速入门 本节介绍了如何快速上手 ESP32-PICO-KIT-1。首先对 ESP32-PICO-KIT-1 开发板进行了简要介绍，然后在应用开发 小节介绍如何将固件烧录至开发板。

组件描述 ESP32-PICO-KIT-1 开发板的主要组件，接口及控制方式见下图。

从左上角开始，按顺时针顺序，开发板主要组件的描述见下表。
图 43: ESP32-PICO-KIT-1 外观图（点击放大）

应用开发 上电前，请确保 ESP32-PICO-KIT-1 完好无损。

所需硬件
- 1 x ESP32-PICO-KIT-1 开发板
- 1 x USB 2.0 A 转 Micro B 数据线
- 1 x PC，运行 Windows、Linux 或 macOS 系统

软件配置 请前往快速入门，在安装一节查看如何快速配置开发环境，将应用程序烧录至 ESP32-PICO-KIT-1 开发板。

内含组件和包装方式

零售订单 如购买样品，每个 ESP32-PICO-KIT-1 将单独包装。
零售订单，请前往 https://www.espressif.com/en/contact-us/get-samples。
批量订单 如批量购买，ESP32-PICO-KIT-1 开发板将以大纸板箱包装。批量订单请前往 https://www.espressif.com/zh-hans/contact-us/sales-questions。

硬件参考

功能框图 ESP32-PICO-KIT-1 的主要组件和连接方式如下图所示。

图 45: ESP32-PICO-KIT-1 功能框图（点击放大）

供电选项 开发板提供以下三种供电方式，可任意选择一种：

- Micro USB 供电（默认）
- 5V/GND 管脚供电
- 3V3/GND 管脚供电

警告：上述供电方式只能选择一种方式，不能同时选择，否则可能会损坏开发板和/或电源。

管脚描述 组件描述 中所示的开发板两侧 I/O 管脚，其具体名称和功能见下表。管脚名称和编号与相关文档 中原理图保持一致。

ESP32-PICO-DevKitM-2

概述 ESP32-PICO-DevKitM-2 是一款基于 ESP32 的乐鑫开发板。板上搭载 ESP32-PICO-MINI-02(02U) 模组。ESP32-PICO-MINI-02(02U) 模组具备完整的 Wi-Fi 和蓝牙功能。

ESP32-PICO-DevKitM-2 开发板同时集成了 USB-to-UART 桥接电路，方便开发人员直接通过 PC 的 USB 端口直接进行固件烧录和调试。
为方便硬件连接，ESP32-PICO-MINI-02(02U)上的所有 IO 信号和系统电源管脚均引出至开发板两侧焊盘（18 x 0.1”）。上述 18 个焊盘也均引出至排针，可使用杜邦线连接。

备注：ESP32-PICO-DevKitM-2 开发板默认采用排针。

ESP32-PICO-DevKitM-2 为用户提供了基于 ESP32 芯片应用开发的硬件，更加方便用户探索 ESP32 芯片的功能。

图 47: ESP32-PICO-DevKitM-2 外观图（点击放大）

本指南包括以下几个章节：
- 快速入门：简介介绍 ESP32-PICO-DevKitM-2 开发板，以及上手这款开发板所需的软件配置；
- 内容组件和包装方式：介绍零售订单和批量订单所包含的组件及包装方式；
- 软件参考：提供 ESP32-PICO-DevKitM-2 开发板软件详细信息；
- 硬件组件：介绍硬件历史版本（如有）、已知问题（如有），并提供链接至历史版本开发板的入门指南（如有）。
- 相关文档：提供相关文档的链接。

快速入门 本节介绍了如何快速上手 ESP32-PICO-DevKitM-2。首先对 ESP32-PICO-DevKitM-2 开发板进行了简要介绍，然后在应用开发小节介绍如何将固件烧录至开发板。

主要组件 | 描述
--- | ---
ESP32-PICO-MINI-02 | ESP32-PICO-DevKitM-2 开发板的板载模组，搭载 ESP32 SoC 芯片。用户也可选择板载 ESP32-PICO-MINI-02U 的开发板。
LDO | 5V 转 3.3V 低压差稳压器
USB-to-UART | CP2102N：单芯片 USB-to-UART 桥接器，数据传输速率可达 3 Mbps。
Micro-B USB 接口 | USB 接口，可为开发板供电，或连接 PC 进行 USB 通信。
5V Power On LED | 开发板上电后，红色指示灯亮起。更多信息，见相关文档中提供的原理图。
I/O Connector | ESP32-PICO-MINI-02 上的管脚均引出至开发板排针。用户可对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等功能。更多信息，见章节管脚描述。
BOOT 按键 | 下载按键。按下 Boot 键并保持，同时按下 EN 键将进入固件下载模式，通过串口下载固件。
EN 按键 | 复位按键。

应用开发 上电前，请确保 ESP32-PICO-DevKitM-2 完好无损。

所需硬件
- 1 x ESP32-PICO-DevKitM-2 开发板
- 1 x USB 2.0 A 转 Micro B 数据线
- 1 x PC，运行 Windows、Linux 或 macOS 系统

软件配置 请前往快速入门，在安装一节查看如何快速配置开发环境，将应用程序烧录至 ESP32-PICO-DevKitM-2 开发板。

内含组件和包装方式

零售订单 如购买样品，每个 ESP32-PICO-DevKitM-2 将单独包装。
零售订单，请前往 https://www.espressif.com/en/contact-us/get-samples。
批量订单 如批量购买，ESP32-PICO-DevKitM-2 开发板将以大纸板箱包装。
批量订单请前往 https://www.espressif.com/zh-hans/contact-us/sales-questions。

硬件参考

功能框图 ESP32-PICO-DevKitM-2 的主要组件和连接方式如下图所示。

![ESP32-PICO-DevKitM-2 功能框图](image)

图 49: ESP32-PICO-DevKitM-2 功能框图（点击放大）

供电方式 开发板提供以下三种供电方式，可任意选择一种：
- Micro USB 供电（默认）
- 5V/GND 管脚供电
- 3V3/GND 管脚供电

警告: 上述供电方式只能选择一种方式，不能同时选择，否则可能会损坏开发板和/或电源。

管脚描述 组件描述 中所示的开发板两侧 I/O 管脚，其具体名称和功能见下表。管脚名称和编号与相关文档 中原理图保持一致。

备注:

1. 该管脚已连接至板上 USB 伴侣芯片。
2. 32.768 kHz 振幅输入输出管脚:
   (a) 输入管脚;
   (b) 输出管脚;
3. ESP32-PICO-DevKitM-2 内置 SPI flash 的工作电压为 3.3 V。因此，Strapping 管脚 MTDI 在上电复位过程中应拉低。如果连接了该管脚，请确保该管脚在复位中不要拉高。

图 50: ESP32-PICO-DevKitM-2 管脚布局（点击放大）

硬件版本 该开发板为最新硬件，尚未有历史版本。

ESP32-DevKitM-1

本指南将介绍如何使用 ESP32-DevKitM-1，并提供更多关于此开发板的信息。

ESP32-DevKitM-1 是乐鑫推出的一款基于 ESP32-MINI-I(1U) 模组的入门级开发板。板上模组大部分管脚
均已引出至两侧排针，用户可根据实际需求，通过跳线轻松连接多种外围设备，同时也可将开发板插在
面包板上使用。
Chapter 1. 快速入门

本指南包括：
- 快速入门：提供 ESP32-DevKitM-1 的简要概述及必要的硬件和软件信息。
- 硬件参考：提供 ESP32-DevKitM-1 的详细硬件信息。
- 相关文档：提供相关文档的链接。

快速入门 本节介绍如何开始使用 ESP32-DevKitM-1。主要包括三大部分：首先，介绍一些关于 ESP32-DevKitM-1 的基本信息，然后在应用程序开发 章节介绍如何进行硬件初始化，最后介绍如何为 ESP32-DevKitM-1 烧录固件。

概述 ESP32-DevKitM-1 开发板是一款小巧实用的开发板，具备以下特色功能：
- 集成了 ESP32-MINI-1 或 ESP32-MINI-1U 模组
- USB 转串口编程接口同时可为开发板供电
- 设有排针
- 设有重置按钮和固件下载模式激活按钮
- 以及其他组件

内含组件和包装

零售订单 如购买样品，每个 ESP32-DevKitM-1 开发板将以防静电袋或零售商选择的其他方式包装。
零售订单请前往 https://www.espressif.com/zh-hans/company/contact/buy-a-sample。

批量订单 如批量购买，ESP32-DevKitM-1 开发板将以大纸板箱包装。
批量订单请前往 https://www.espressif.com/zh-hans/contact-us/sales-questions。

组件介绍 ESP32-DevKitM-1 开发板的主要组件、接口及控制方式见下图。下文以板载 ESP32-MINI-1 的开发板为例进行说明。
图 51: ESP32-DevKitM-1 - 正面

</table>

**应用程序开发**

ESP32-DevKitM-1 上电前，请首先确认开发板完好无损。

**硬件准备**

- ESP32-DevKitM-1 开发板
- USB A / micro USB B 数据线
- PC（Windows，Linux 或 macOS）

**软件设置**

现在，请前往快速入门中的安装章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。
注意：对于 2021 年 12 月 2 日之前生产的 ESP32-DevKitM-1，其搭载的模组为单核 MCU 模组。请查看 PCN-2021-021 以确定开发板上搭载的模组是否为单核模组。对于搭载单核模组的开发板，烧录应用程序前，需要在 menuconfig 中使能单核模式（CONFIG_FREERTOS_UNICORE）。

硬件参考

图 52: ESP32-DevKitM-1

电源选项 开发板可从以下三种供电方式中任选其一：
- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告：
- 上述供电模式 不可同时连接，否则可能会损坏开发板和/或电源。
- 建议选择第一种供电方式：Micro USB 端口供电。

管脚描述 开发板两侧 I/O 管脚，其具体名称和功能见下表。外设管脚分配请参考《ESP32 技术规格书》。

有关本开发板的更多设计文档，请联系我们的商务部门 sales@espressif.com。

### 1.2.2 软件

如需在 ESP32 上使用 ESP-IDF，请安装以下软件：

- 设置工具链，用于编译 ESP32 代码；
- 编译构建工具——CMake 和 Ninja 编译构建工具，用于编译 ESP32 应用程序；
- 获取 ESP-IDF 软件开发框架。该框架已经基本包含 ESP32 使用的 API（软件库和源代码）和运行工具链的脚本；
Chapter 1. 快速入门

1.3 安装

我们提供以下方法帮助安装所有需要的软件，可根据需要选择其中之一。

1.3.1 IDE

备注：建议您通过自己喜欢的集成开发环境（IDE）安装 ESP-IDF。

- Eclipse Plugin
- VSCode Extension

1.3.2 手动安装

请根据您的操作系统选择对应的手动安装流程。

Windows 平台工具链的标准设置

概述 ESP-IDF 需要安装一些必备工具，才能围绕 ESP32 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过命令提示符进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 Eclipse Plugin 或其他支持 CMake 的图形化工具 IDE。

备注：限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能导致构建失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地域-勾选选项“Beta：使用 Unicode UTF-8 支持全球语言”-点击确定-重启电脑。

ESP-IDF 工具安装器 安装 ESP-IDF 必备工具最简易的方式是下载一个 ESP-IDF 工具安装器。
在线安装与离线安装的区别  在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 Git For Windows 安装器。在线安装程序会将下载的文件存储在缓存目录 `%userprofile%\espressif` 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 Git For Windows 安装器。

安装内容  安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 `%userprofile%\Desktop\esp-idf` 目录下，其中 `%userprofile%` 代表家目录。

启动 ESP-IDF 环境  安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (cmd.exe)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

![ESP-IDF PowerShell Environment](image)

图 54: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

使用命令提示符  在后续步骤中，我们将使用 Windows 的命令提示符进行操作。
图 55: ESP-IDF PowerShell

图 56: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF Command Prompt (cmd.exe)
Chapter 1.

图 57: ESP-IDF 命令提示符窗口
Chapter 1. 快速入门

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 cmd.exe），并运行 export.bat 脚本以设置各环境变量（如 PATH，IDF_PATH 等）。此外，您可还以通过 Windows 命令提示符使用各种已经安装的工具。

注意：本快捷方式仅适用于 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 cmd.exe，并切换至您希望使用的 ESP-IDF 目录，然后运行 export.bat。注意，这种方法要求 PATH 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git” 的错误信息，请使用第一种方法。

### 开始使用 ESP-IDF
目前您已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始您的第一个工程。

本指南将帮助您完成使用 ESP-IDF 的第一步。按照本指南，您将使用 ESP32 创建第一个工程，并构建、烧录和监控设备输出。

**备注：** 如果您还未安装 ESP-IDF，请参照安装中的步骤，获取使用本指南所需的所有软件。

### 开始创建工程
现在，您可以准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 examples 目录下的 get-started/hello_world 工程开始。

**重要：** ESP-IDF 编译系统不支持 ESP-IDF 路径中带有空格。

将 get-started/hello_world 工程复制至您本地的 ~/esp 目录下：

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**备注：** ESP-IDF 的 examples 目录下有一系列示例工程，您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

### 连接设备
现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

在 Windows 操作系统中，串口名称通常以 COM 开头。

有关如何查看串口名称的详细信息，请见与 ESP32 创建串口连接。

**备注：** 请记住串口名，您会在后续步骤中使用。

### 配置工程
请进入 hello_world 目录，设置 ESP32 为目标芯片，然后运行工程配置工具 menuconfig。

**Windows**

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```
打开一个新工程后，应首先使用 `idf.py set-target esp32` 设置“目标”芯片。注意，此操作将
清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。
更多信息，请见 `Select the Target Chip: set-target`。

正确操作上述步骤后，系统将显示以下菜单：

![工程配置菜单图](image)

图 58: 工程配置主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。
`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

<table>
<thead>
<tr>
<th>注意：如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组）或 ESP32-DevKitM-1（板载 ESP32-MINI-1(1U) 模组），请在烧写示例程序前，前往 <code>menuconfig</code> 中使用单核模式 (<code>CONFIG_FREERTOS_UNICORE</code>)。</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>备注：您终端窗口中显示的菜单颜色可能会与上图不同。您可以通过选项 <code>--style</code> 来改变外观。请运行 <code>idf.py menuconfig --help</code> 命令，获取更多信息。</th>
</tr>
</thead>
</table>

如果您使用的是支持的开发板，可以通过板级支持包 (BSP) 来协助您的开发。更多信息，请见其他提示。

编译工程 请使用以下命令，编译烧录工程：

```bash
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```bash
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
  -- Found Git: /usr/bin/git (found version "2.17.0")
  -- Building empty aws_iot component due to configuration
  -- Component names: ...
  -- Component paths: ...
```

(下页继续)
如果一切正常，编译完成后将生成.bin 文件。

**烧录到设备** 请运行以下命令，将刚刚生成的二进制文件烧录至您的 ESP32 开发板：

```
idf.py -p PORT flash
```

请将 PORT 替换为 ESP32 开发板的串口名称。如果 PORT 未经定义，`idf.py` 将尝试使用可用的串口自动连接。

更多有关 `idf.py` 参数的详情，请见 `idf.py`。

备注：勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

若在烧录过程中遇到问题，请前往 **烧录故障排除** 或与 **ESP32 创建串口连接** 获取更多详细信息。

**常规操作** 在烧录过程中，您会看到类似如下的输出日志：

```
...  (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
.../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
 --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
 --build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
 --partition-table.bin
or run 'idf.py -p PORT flash'
```

```
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
--0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin--
--0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting...........
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz
MAC: 24:0a:c4:05:b9:14
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.

Wrote 3072 bytes (103 compressed) at 0x00008000 in 0.0 seconds (effective 5962.8...
-kbit/s)... 
Hash of data verified.
Compressed 26096 bytes to 15408...
Writing at 0x00001000... (100 %)
Wrote 26096 bytes (15408 compressed) at 0x00001000 in 0.4 seconds (effective 546.7...
-kbit/s)... 
Hash of data verified.
Compressed 147104 bytes to 77364...
```
如果一切顺利，烧录完成后，开发板将会复位。应用程序“hello_world”开始运行。
如果您希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 Eclipse Plugin，以及 VSCode Extension。

**监视输出** 您可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 PORT 替换为您的串口名称。

运行该命令后，IDF 监视器 应用程序将启动:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
-world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
est Jun 8 2016 00:22:57
...?
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
... Hello world!
  Restarting in 10 seconds...
  This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB...
  --- Minimum free heap size: 298968 bytes
  Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 Ctrl+t]，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（如下），很有可能是因您的开发板采用了 26 MHz 晶振，而 ESP-IDF，默认支持大多数开发板使用的 40 MHz 晶振。

```
%Xng@y\.!d(89yw)+Hh9n9~ /9@0L566P~Ek06e6ca650jA~zY011(0,1+6) e666(Xng@y!.DR+Zy(09jpih)@+z5Ymvp
```

此时，您可以:

1. 退出监视器。
2. 返回 menuconfig。
3. 进入 Component config -> Hardware Settings -> Main XTAL Config -> Main XTAL frequency 进行配置，将 `CONFIG_XTAL_FREQ_SEL` 设置为 26 MHz。
4. 重新编译和烧录应用程序。
在当前的 ESP-IDF 版本中，ESP32 支持的主晶振频率如下:

- 26 MHz
- 40 MHz

备注：您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，
- 请前往 IDF 监视器，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往 idf.py，查看更多 idf.py 命令和选项。

恭喜，您已完成 ESP32 的入门学习！
现在，您可以尝试一些其他 examples，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32，因为 ESP32 中不包含所需的硬件。
在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32，或者不存在这个表格，那么即表示 ESP32 支持这个示例程序。

其他提示

权限问题 /dev/ttyUSB0 使用某些 Linux 版本向 ESP32 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 Linux Dialout 组。

兼容的 Python 版本 ESP-IDF 支持 Python 3.7 及以上版本，建议升级操作系统到最新版本从而更新 Python，也可选择从 sources 安装最新版 Python，或使用 Python 管理系统如 pyenv 对版本进行升级管理。

上手板级支持包 您可以使用 板级支持包 (BSP)，协助您在开发板上的原型开发。仅需要调用几个函数，便可以完成对特定开发板的初始化。
一般来说，BSP 支持开发板上所有硬件组件。除了管脚定义和初始化功能外，BSP 还附带如传感器、显示器、音频编码器等外部元件的驱动程序。
BSP 通过 IDF 组件管理器 发布，您可以前往 IDF 组件注册器 进行下载。
以下示例演示了如何将 ESP-WROVER-KIT BSP 添加到项目中:

```
idf.py add-dependency esp_wrover_kit
```

更多有关使用 BSP 的示例，请前往 BSP 示例文件夹。

擦除 flash ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash:

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令:

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。
Chapter 1. 快速入门

相關文档：想要自定义安装流程的高阶用户可参照:

- 在 Windows 环境下更新 ESP-SDK 工具
- 与 ESP32 创建串口连接
- Eclipse Plugin
- VSCode Extension
- IDF 监视器

在 Windows 环境下更新 ESP-IDF 工具

使用脚本安装 ESP-IDF 工具：请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行:

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行:

```
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。ESP-IDF 工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为:

```
C:\Users\username\espressif
```

使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量：ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口。您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 ESP-IDF，您可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 export.bat，具体命令如下:

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 export.ps1，具体命令如下:

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

与 ESP32 创建串口连接

可以使用 USB 至 UART 桥，与 ESP32 创建串口连接。

部分开发板中已经安装有 USB 至 UART 桥。如未安装，可使用外部桥。

安装有 USB 至 UART 桥的开发板：在安装有 USB 至 UART 桥的开发板中，PC 和桥之间通过 USB 连接，桥和 ESP32 之间通过 UART 连接。

外部 USB 至 UART 桥：部分开发板使用外部 USB 至 UART 桥。这种情况通常出现在需要控制空间和成本的产品中，例如一些小型开发板或成品。

使用 UART 进行烧录：本节描述如何使用 USB 至 UART 桥在 ESP32 和 PC 之间建立串行连接。板上桥与外部桥均适用。
图 59: 安装有 USB 至 UART 桥的开发板

图 60: 外部 USB 至 UART 桥

连接 ESP32 和 PC 用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 至 UART 桥 (或外部转 UART 适配器) 型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 开发板驱动程序的链接:

- CP210x: CP210x USB 至 UART 桥 VCP 驱动程序
- FTDI: FTDI 虚拟 COM 端口驱动程序

以上驱动仅供参考，请查看开发板用户指南，了解开发板具体使用的 USB 至 UART 桥芯片。一般情况下，当 ESP32 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

对于使用 USB 至 UART 桥下载的设备，您可以运行以下命令，包括定义波特率的可选参数。

```
idf.py -p PORT [-b BAUD] flash
```

如需改变烧录器的波特率，请用需要的波特率代替 BAUD。默认的波特率为 460800。

备注：如果设备不支持自动下载模式，则需要手动进入下载模式。请按住 BOOT 按钮，同时按一下 RESET 按钮。之后，松开 BOOT 按钮。

在 Windows 上查看端口 检查 Windows 设备管理器中的 COM 端口列表，断开 ESP32 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口:
图 61: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥
图 62: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口
在 Linux 和 macOS 上查看端口  查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口。

Linux:
```bash
ls /dev/tty*
```

macOS:
```bash
ls /dev/cu.*
```

备注：对于 macOS 用户：若没有看到串口，请检查是否安装 USB/串口驱动程序。具体应使用的驱动程序，见章节连接 ESP32 和 PC。对于 macOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的加载，具体可打开系统偏好设置 -> 安全和隐私 -> 通用，检查是否有信息显示：“来自开发人员的系统软件…”，其中开发人员的名称为 Silicon Labs 或 FTDI。

在 Linux 中添加用户到 dialout  当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，从而获许读写权限:

```bash
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中:
```bash
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限生效。

确认串口连接  现在，请使用串口终端程序，查看重置 ESP32 后终端上是否有输出，从而验证串口连接是否可用。

ESP32 的控制台波特率默认为 115200。

Windows 和 Linux 操作系统  在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。您也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200（如有需要，请更改为使用芯片的默认波特率），数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

然后，请检查 ESP32 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32 的应用程序，请参考输出示例。

备注：请在验证串口通信正常后，关闭串口终端。如果您让终端一直保持打开的状态，之后上传固件时将无法访问串口。

macOS 操作系统  macOS 提供了屏幕命令，因此您不用安装串口终端程序。

- 参考在 Linux 和 macOS 上查看端口，运行以下命令:
  ```bash
  ls /dev/cu.*
  ```

- 您会看到类似如下输出:
  ```bash
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART7
  ```
图 63: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数
图 64: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数
Chapter 1. 快速入门

- 根据您连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令（如有需要，请将 “115200” 更改为使用芯片的默认波特率）：

```
screen /dev/cu.device_name 115200
```

将 device_name 替换为运行 ls /dev/cu.* 后出现的设备串口号。

- 您需要的正是 屏幕 显示的日志。日志内容取决于加载到 ESP32 的应用程序，请参考 输出示例。请使用 Ctrl-A + \ 键退出 屏幕 会话。

备注：请在验证完串口通信正常后，关闭 屏幕 会话。如果直接关闭终端窗口而没有关闭 屏幕，之后上传固件时将无法访问串口。

输出示例 以下是一个日志示例。如果没看到任何输出，请尝试重启开发板。

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
```

```
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
```

```
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32。

备注：在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 esptool 文档。

如您在安装 ESP32 硬件开发的软件环境时，从 第五步：开始使用 ESP-IDF 吧 跳转到了这里，请从 第五步：开始使用 ESP-IDF 吧 继续阅读。

烧录故障排除

连接失败 如果在运行给定命令时出现如 “连接失败” 这样的错误，造成该错误的原因之一可能是运行 esptool.py 时出现错误。esptool.py 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。可以按照以下步骤进行手动复位，轻松解决该问题。如果问题仍未解决，请参考 esptool 故障排除 获取更多信息。

esptool.py 通过使 USB 至 UART 桥（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32（请参考与 ESP32 创建串口连接 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32 的 GPIO0 和 CHIP_FU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 原理图。

一般来说，使用官方的 ESP-IDF 开发板不会出现问题。但是，esptool.py 在以下情况下不能自动重置硬件：

Espressif Systems 108 Release v5.1-dev-2066-g7869f4e151
Chapter 1. 快速入门

- 您的硬件没有连接到 GPIO0 和 CIHP_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同。
- 不存在这样的串行控制线路。

根据硬件的种类，也可以将您的 ESP32 开发板手动设置为固件下载模式 (复位)。

- 对于乐鑫开发板，您可以参考对应开发板的入门指南或用户指南，例如，可以通过按住 Boot 按钮 (GPIO0) 再按住 EN 按钮 (CHIP_PU) 来手动复位 ESP-IDF 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

IDF 监视器

IDF 监视器是一个串行终端程序，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用 idf.py monitor 可以启用此监视器。

操作快捷键 为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。
<table>
<thead>
<tr>
<th>快捷键</th>
<th>操作</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+J</td>
<td>退出监视器程序</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>菜单退出键</td>
<td>按下如下给出的任意键之一，并按指示操作。</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>将菜单字符发送至远程</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>将 exit 字符发送至远程</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>重置目标设备，进入引导加载程序，通过 RTS 线暂停应用程序</td>
<td>重置目标设备，通过 RTS 线（如已连接）进入引导加载程序，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>通过 RTS 线重置目标设备</td>
<td>重置设备，并通过 RTS 线（如已连接）重新启动应用程序。</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>编译并烧录此项目</td>
<td>暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。</td>
</tr>
<tr>
<td>• Ctrl+A （或 A）</td>
<td>仅编译及烧录应用程序</td>
<td>暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>停止/恢复在屏幕上打印日志输出</td>
<td>激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>停止/恢复向文件写入日志输出</td>
<td>在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）。</td>
</tr>
<tr>
<td>• Ctrl+I （或者 I）</td>
<td>停止/恢复打印时间标记</td>
<td>IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 --timestamp-format 命令行参数来改变。</td>
</tr>
<tr>
<td>• Ctrl+H （或者 H）</td>
<td>显示所有快捷键</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X （或者 X）</td>
<td>退出监视器程序</td>
<td></td>
</tr>
<tr>
<td>Ctrl+C</td>
<td>中断正在运行的应用程序</td>
<td>暂停 IDF 监视器并运行 GDB 项目调试器。这需要开启 ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。</td>
</tr>
</tbody>
</table>

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

### 兼具 IDF 特性

**自动解码地址** ESP-IDF 输出形式为 `0x4_________` 的十六进制代码地址后，IDF 监视器将使用 `addr2line_` 查找该地址在源代码中的位置和对应的函数名。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```
Chapter 1. 快速入门

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

IDF 监视器在后台运行以下命令，解码各地址:

xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

备注: 将环境变量 ESP_MONITOR_DECODE 设置为 0 或者调用 idf_monitor.py 的特定命令行选项
idf_monitor.py --disable-address-decoding 来禁止地址解码。

连接时复位目标芯片，默认情况下，IDF 监视器会在目标芯片连接时通过 DTR 和 RTS 串行线自动复位芯片。要防止 IDF 监视器在连接时自动复位，请在调用 IDF 监视器时加上选项 --no-reset，如 idf_monitor.py --no-reset。

备注：--no-reset 选项在 IDF 监视器连接到特定端口时可以实现同样的效果，如 idf.py monitor --no-reset -p [PORT]。

配置 GDBStub 以启用 GDB GDBStub 支持在运行时进行调试。GDBStub 在目标上运行，并通过串口连接到主机从而接收调试命令。GDBStub 支持读取内存和变量、检查调用栈帧等命令。虽然没有任何 JTAG 调试功能，但由于 GDBStub 完全通过串行端口完成通信，故不需要使用特殊硬件（如 JTAG/USB 桥接器）。

通过将 CONFIG_ESP_SYSTEM_PANIC 设置为 GDBStub on runtime，可以将目标配置为在后台运行 GDBStub。GDBStub 将保持在后台运行，直到通过串行端口发送 Ctrl+C 导致应用程序中断（即停止程序执行），从而让 GDBStub 处理调试命令。

此外，还可以通过设置 CONFIG_ESP_SYSTEM_PANIC 为 GDBStub on panic 来配置 panic 处理程序，使其在发生 crash 事件时运行 GDBStub。当 crash 发生时，GDBStub 将通过串口输出特殊的字符串模式，表示 GDBStub 正在运行。

无论是通过发送 Ctrl+C 还是收到特殊字符组合，IDF 监视器都会自动启动 GDB，从而让用户发送调试命令。GDB 退出后，通过 RTS 串口线复位目标。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

备注：IDF 监视器在后台运行如下命令启用 GDB：

```
```

输出筛选  可以调用 idf.py monitor --print-filter="xyz" 启动 IDF 监视器，其中 --print-filter 是输出筛选的参数，参数默认为空字符串，可打印任何内容。

若需对打印内容设置限制，可指定 <tag>:<log_level> 等选项，其中 <tag> 是标签字符串，<log_level> 是 {N, E, W, I, D, V, *} 集合中的一个字母，指的是日志级别。

例如，PRINT_FILTER="tag1:*" 只匹配并打印 ESP_LOGW("tag1", ...) 所写的输出，或者写在较低日志详细级别输出的，即 ESP_LOGE("tag1", ...)。请勿指定 <log_level> 或使用详细级别默认值 *。

备注：编译时，可以使用主日志在 日志库 中禁用不必要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序筛选不能包含空格、星号 *、冒号 :，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能。即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- * 可用于匹配任何类型标签。但 PRINT_FILTER="*:I tag1:E" 打印关于 tag1 的输出时会报错，这是因为 tag1 规则比 * 规则的优先级高。
• 默认规则（空）等价于 *:V，因为在详细级别或更高级别匹配任意标签即意味匹配所有内容。
• "*:N" 不仅抑制了日志功能的输出，也抑制了 printf 的打印输出。为了避免这一问题，请使用 ":E" 或更高的冗余级别。
• 规则 "tag1:V", "tag1:v", "tag1:" 和 "tag1:*" 同时。
• 规则 "tag1:W tag1:E" 等同于 "tag1:E"，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
• 规则 "tag1:I tag2:W" 仅在 Info 详细度级别或更高级别打印 tag1，在 Warning 详细度级别或更高级别打印 tag2。
• 规则 "tag1:W tag3:N" 本质上等同于一规则，这是因为 tag3:N 指定 tag3 不打印。
• tag3:N 在规则 "tag1:I tag2:W tag3:N *:V" 中更有意义，这是因为如果没有 tag3:N，tag3 信息就可能打印出来了；tag1 和 tag2 错误信息会打印在指定的详细度级别（或更高级别），并默认打印所有内容。

**高级筛选规则示例** 如下日志是在没有设置任何筛选选项的情况下获得的：

```
load:0x40078000, len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]: status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_ →1
I (328) wifi: wifi driver task: 3ffdf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="wifi esp_image:E light_driver:I" 筛选选项捕获的输出如下所示：

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdf84, prio:23, stack:4096, core=0
```

```
load:0x40078000, len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]: status: 1, mode: 2
```

**IDF 监视器已知问题**

**Windows 环境下已知问题**

• 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
• 偶然情况下，idf.py 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
• GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

**Linux 和 macOS 平台工具链的标准设置**

**详细安装步骤** 请根据下方详细步骤，完成安装过程。
设置开发环境 以下是为 ESP32 设置 ESP-IDF 的具体步骤。

- 第一步：安装准备
- 第二步：获取 ESP-IDF
- 第三步：设置工具
- 第四步：设置环境变量
- 第五步：开始使用 ESP-IDF 吧

第一步：安装准备 为了在 ESP32 中使用 ESP-IDF，需要根据操作系统安装一些软件包。以下安装指南可协助您安装 Linux 和 macOS 的系统上所有需要的软件包。

Linux 用户 编译 ESP-IDF 需要以下软件包，请根据使用的 Linux 发行版本，选择合适的安装命令。

- Ubuntu 和 Debian:
  ```bash
  sudo apt-get install git wget flex bison gperf python3 python3-venv python3-configure ninja-build ccache libffi-dev libssl1-dev dfu-util libusb-1.0-0-dev
  ```

- CentOS 7 & 8:
  ```bash
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 python3-venv python3-configure ninja-build ccache dfu-util libusb-1.0-0-dev
  ```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:
  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja-configure ccache dfu-util libusb
  ```

备注：
- 使用 ESP-IDF 需要 CMake 3.16 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装“cmake”）。
- 如果上述列表中没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。

macOS 用户 ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 CMake 和 Ninja 编译工具：
  - 若有 HomeBrew，您可以运行:
    ```bash
    brew install cmake ninja dfu-util
    ```
  - 若有 MacPorts，您可以运行:
    ```bash
    sudo port install cmake ninja dfu-util
    ```
  - 若以上均不适用，请访问 CMake 和 Ninja 主页，查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 ccache 以获得更快的编译速度。如有 HomeBrew，可通过 MacPorts 上的 brew install ccache 或 sudo port install ccache 完成安装。

备注：如您在上述任何步骤中遇到以下错误:

```bash
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), missing xcrun at /Library/Developer/CommandLineTools/usr/bin/xcrun
```

则必须安装 XCode 命令行工具，可运行 xcode-select --install 命令进行安装。
Apple M1 用户  如果您使用的是 Apple M1 系列且看到如下错误提示:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```

或者:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

您需要运行如下命令来安装 Apple Rosetta 2:

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

安装 Python 3  Catalina 10.15 发布说明 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本:

```
python --version
```

如果输出结果是 Python 2.7.17，则代表您的默认解析器是 Python 2.7。这时您需要运行以下命令检查电脑上是否已经安装过 Python 3:

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3:

- 使用 HomeBrew 进行安装的方法如下:
  ```
  brew install python3
  ```

- 使用 MacPorts 进行安装的方法如下:
  ```
  sudo port install python38
  ```

第二步：获取 ESP-IDF  在围绕 ESP32 构建应用程序之前，请先获取乐鑫提供的软件库文件 ESP-IDF 仓库。

获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 git clone 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

打开终端，运行以下命令:

```
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 ~/esp/esp-idf。

请前往 ESP-IDF 版本简介，查看 ESP-IDF 不同版本的具体适用场景。

第三步：设置工具  除了 ESP-IDF 本身，您还需要为支持 ESP32 的项目安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

```
cd ~/esp/esp-idf
./install.sh esp32
```

或使用 Fish shell:
上述命令仅为 ESP32 安装所需工具。如果需要为多个目标芯片开发项目，则可以一次性指定多个目标，如下所示:

```
cd ~/esp/esp-idf
./install.fish esp32
```

或使用 Fish shell:

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

如果需要一次性为所有支持的目标芯片安装工具，可以运行如下命令:

```
cd ~/esp/esp-idf
./install.sh all
```

或使用 Fish shell:

```
cd ~/esp/esp-idf
./install.fish all
```

**备注：** 对于 macOS 用户，如您在上述任何步骤中遇到以下错误:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable...
```

可运行您电脑 Python 文件夹中的 Install Certificates.command 安装证书。了解更多信息，请参考 安装 ESP-IDF 工具时出现的下载错误。

**下载工具备份方案** ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，可以设置一个环境变量，从而优先选择 Espressif 的下载服务器进行 Github 资源下载。

**备注：** 该设置只影响从 Github 发布版本中下载的单个工具，它并不会改变访问任何 Git 仓库的 URL。

要在安装工具时优先选择 Espressif 下载服务器，请在运行 install.sh 时使用以下命令:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**自定义工具安装路径** 本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 系统中的 $HOME/.espressif 目录。您可以选择将工具安装到其他目录中，但请在运行安装脚本前，重新设置环境变量 IDF_TOOLS_PATH。注意，请确保您的用户账号已经具备了读写该路径的权限。

如果修改了 IDF_TOOLS_PATH 变量，请确保该变量在每次执行安装脚本 (install.bat, install.psl 或 install.sh) 和导出脚本 (export.bat, export.psl 或 export.sh) 均保持一致。

**第四步：设置环境变量** 此时，您刚刚安装的工具尚未添加至 PATH 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量。这可以通过 ESP-IDF 提供的另一个脚本进行设置。

请在需要运行 ESP-IDF 的终端窗口运行以下命令:

```
Espressif Systems 116 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
```
对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
. $HOME/esp/esp-idf/export.fish
```

注意，命令开始的 “.” 与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 export.sh 创建一个别名，具体步骤如下：

1. 复制并粘贴以下内容到 shell 配置文件中（.profile、.bashrc、.zprofile 等）
   ```
   alias get_idf=' . $HOME/esp/esp-idf/export.sh'
   ```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 esp-idf 环境。

不建议直接将 export.sh 添加到 shell 的配置文件。这样做会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的会话）。这违背了使用虚拟环境的目的，还可能影响其他软件的使用。

**第五步：开始使用 ESP-IDF** 现在您已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始您的第一个工程。

本指南将帮助您完成使用 ESP-IDF 的第一步。按照本指南，您将使用 ESP32 创建第一个工程，并构建、烧录和监控设备输出。

**备注：** 如果您还未安装 ESP-IDF，请参照安装 中的步骤，获取使用本指南所需的所有软件。

**开始创建工程** 现在，您可以准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 examples 目录下的 get-started/hello_world 工程开始。

**重要：** ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

将 get-started/hello_world 工程复制至您本地的 ~/esp 目录下：

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**备注：** ESP-IDF 的 examples 目录下有一系列示例工程，您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

**连接设备** 现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Linux 操作系统**：以 /dev/tty 开头
- **macOS 操作系统**：以 /dev/cu. 开头

有关如何查看串口名称的详细信息，请见与 ESP32 创建串口连接。

**备注：** 请记住串口号，您会在后续步骤中使用。
配置工程 请进入 hello_world 目录，设置 ESP32 为目标芯片，然后运行工程配置工具 menuconfig。

```
(cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig)
```

打开一个新工程后，应首先使用 idf.py set-target esp32 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见 Select the Target Chip: set-target。

正确操作上述步骤后，系统将显示以下菜单:

![工程配置菜单](image)

图 65: 工程配置—主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。hello_world 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 menuconfig 进行项目配置这一步骤。

注意： 如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组）或 ESP32-DevKitM-1（板载 ESP32-MINI-1(1U) 模组），请在烧写示例程序前，前往 menuconfig 中使能单核模式（CON-FIG_FREERTOS_UNICORE）。

备注： 您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 --style 来改变外观。请运行 idf.py menuconfig --help 命令，获取更多信息。

如果您使用的是支持的开发板，可以通过板级支持包 (BSP) 来协助您的开发。更多信息，请见其他提示。

编译工程 请使用以下命令，编译烧录工程:

```
(idf.py build)
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"
```

(下页继续)
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:

```
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
```

or run 'idf.py -p PORT flash'

如果一切正常，编译完成后将生成.bin 文件。

**烧录到设备** 请运行以下命令，将刚刚生成的二进制文件烧录至您的 ESP32 开发板:

```
idf.py -p PORT flash
```

请将 PORT 替换为 ESP32 开发板的串口名称。如果 PORT 未定义，idf.py 将尝试使用可用的串口自动连接。

更多有关 idf.py 参数的详情，请见 idf.py。

**备注:** 勾选 flash 选项将自动编译并烧录工程，因此无需再运行 idf.py build。

若在烧录过程中遇到问题，请前往烧录故障排除 或与 ESP32 创建串口连接 获取更多详细信息。

**常规操作** 在烧录过程中，您会看到类似如下的输出日志:

```
...
esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB
--0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin
--0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting........_
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz
MAC: 24:0a:c4:05:b9:14
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.
Configuring flash size...
Compressed 3072 bytes to 103...
Writing at 0x00008000... (100 %)
Wrote 3072 bytes (103 compressed) at 0x00008000 in 0.0 seconds (effective 5962.8
kbit/s)...
Hash of data verified.
```
如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。
如果您希望使用Eclipse或是VS Code IDE，而非idf.py，请参考Eclipse Plugin，以及VSCode Extension。

监视输出 您可以使用idf.py -p PORT monitor命令，监视“hello_world”工程的运行情况。注意，不要忘记将PORT替换为您的串口名称。

运行该命令后，IDF监视器应用程序将启动:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+I | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
Hello world!
... Restarting in 10 seconds...
... Restarting in 9 seconds...
Minimum free heap size: 298968 bytes
```

您可使用快捷键Ctrl+], 退出IDF监视器。
如果IDF监视器在烧录后很快就发生错误，或读取信息全是乱码（如下），很有可能是因为您的开发板采用了26 MHz 晶振，而ESP-IDF默认支持大多数开发板使用的40 MHz 晶振。
此时，您可以：

1. 退出监视器。
2. 返回 menuconfig。
3. 进入 Component config -> Hardware Settings -> Main XTAL Config -> Main XTAL frequency 进行配置，将 CONFIG_XTAL_FREQ_SEL 设置为 26 MHz。
4. 重新编译和烧录应用程序。

在当前的 ESP-IDF 版本中，ESP32 支持的主晶振频率如下：

- 26 MHz
- 40 MHz

备注：您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```bash
idf.py -p PORT flash monitor
```

此外，

- 请前往 IDF 监视器，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往 idf.py，查看更多 idf.py 命令和选项。

恭喜，您已完成 ESP32 的入门学习！现在，您可以尝试一些其他 examples，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32，因为 ESP32 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32，或者不存在这个表格，那么即表示 ESP32 支持这个示例程序。

其他提示

权限问题 /dev/ttyUSB0 使用某些 Linux 版本向 ESP32 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 Linux Dialout 组。

兼容的 Python 版本 ESP-IDF 支持 Python 3.7 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 sources 安装最新版 Python，或使用 Python 管理系统如 pyenv 对版本进行升级管理。

上手板级支持包 您可以使用 板级支持包 (BSP)，协助您在开发板上的原型开发。仅需要调用几个函数，便可以完成对特定开发板的初始化。

一般来说，BSP 支持开发板上所有硬件组件。除了管脚定义和初始化功能外，BSP 还附带如传感器、显示器、音频编解码器等外部元件的驱动程序。

BSP 通过 IDF 组件管理器 发布，您可以前往 IDF 组件注册器 进行下载。

以下示例演示了如何将 ESP-WROVER-KIT BSP 添加到项目中：

```bash
idf.py add-deperendency esp_wrover_kit
```

更多有关使用 BSP 的示例，请前往 BSP 示例文件夹。

擦除 flash ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：
idf.py -p PORT erase-flash

若存在需要擦除的 OTA 数据，请运行以下命令:

idf.py -p PORT erase-otadata

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

**建议：更新 ESP-IDF** 乐鑫会不时推出新版本的 ESP-IDF，修复 bug 或提供新的功能。请注意，EESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，用户可将项目升级到最新的 ESP-IDF 版本。更多关于支持期限的信息，请参考 ESP-IDF 版本。

因此，您在使用时，也应注意到更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，然后按照 第二步：获取 ESP-IDF 中的指示，重新完成克隆。

另一种方法是仅更新变更的部分。具体方式，请前往 更新 ESP-IDF 章节查看。具体更新步骤会根据您使用的 ESP-IDF 版本有所不同。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考 第三步：设置工具。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考 第四步：设置环境变量。

- Eclipse Plugin
- VSCode Extension
- IDF 监视器

### 1.4 编译第一个工程

如果您已经在 ESP-IDF 且没有使用集成开发环境 (IDE)，请在命令提示行中按照在 Windows 中开始创建工程 或在 Linux 和 macOS 中开始创建工程 编译第一个工程。
Chapter 2

API 参考

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the build system guide.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with esp_err_t type. See Error Handling section for more information about error handling approaches. Error Code Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

重要：Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:
Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on
the stack.

The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way
of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially
supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applica-
tions. Such header files often contain private or esp_private in their name or path. Certain components, such as hal
only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code
duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.
This includes components located in common_components directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via EXTRA_COMPONENT_DIRS build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

2.1.5 API Stability

ESP-IDF uses Semantic Versioning as explained in the versions page.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the deprecated attribute) and header files (using a preprocessor #warning). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system renaming mechanism ensures that the original Kconfig option names can still be used by the application in sdkconfig file, CMake files and source code.

Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See Configuration structures for tips that help ensure compatibility.
- Replacing an extern function with a static inline one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- Private APIs.
- Components in example projects.
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
• Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
• Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
• Location of Kconfig options in menuconfig.
• Location and names of example projects.

2.2 应用层协议

2.2.1 ASIO port

Asio is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component ASIO has been moved from ESP-IDF since version v5.0 to a separate repository:

• ASIO component on GitHub

Hosted Documentation

The documentation can be found on the link below:

• ASIO documentation (English)

2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component freemodbus has been moved from ESP-IDF since version v5.0 to a separate repository:

• ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found on the link below:

• ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

• protocols/modbus/serial/mb_slave
• protocols/modbus/serial/mb_master
• protocols/modbus/tcp/mb_tcp_slave
• protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.
Protocol References

2.2.3 ESP-MQTT

概述

ESP-MQTT 是 MQTT 协议客户端的实现。MQTT 是一种基于发布/订阅模式的轻量级消息传输协议。

特性

- 支持基于 TCP 的 MQTT，基于 Mbed TLS 的 SSL、基于 WebSocket 的 MQTT 以及基于 WebSocket Secure 的 MQTT
- 通过 URI 简化配置流程
- 多个实例（一个应用程序中有多个客户端）
- 支持订阅、发布、认证、遗嘱消息，保持连接心跳机制以及 3 个服务质量 (QoS) 级别（组成全功能客户端）

应用示例

- protocols/mqtt/tcp: 基于 TCP 的 MQTT，默认端口 1883
- protocols/mqtt/tls: 基于 TLS 的 MQTT，默认端口 8883
- protocols/mqtt/tls_d: 基于 TLS 的 MQTT，使用数字签名外设进行身份验证，默认端口 8883
- protocols/mqtt/tls_mutual_auth: 基于 TLS 的 MQTT，使用证书进行身份验证，默认端口 8883
- protocols/mqtt/tls_psk: 基于 TLS 的 MQTT，使用预共享密钥进行身份验证，默认端口 8883
- protocols/mqtt/ws: 基于 WebSocket 的 MQTT，默认端口 80
- protocols/mqtt/wss: 基于 WebSocket Secure 的 MQTT，默认端口 443

配置

通过设置 esp_mqtt_client_config_t 结构体中的字段来进行配置。配置结构体包含以下子结构体，用于配置客户端的多种操作。

- broker - 允许设置地址和安全验证。
- credentials - 用于身份验证的客户端凭据。
- session - MQTT 会话相关配置。
- network - 网络相关配置。
- task - 允许配置 FreeRTOS 任务。
- buffer - 输入输出的缓冲区大小。

下文将详细介绍不同配置。

服务器

地址 通过 broker.address 结构体的 uri 字段或者 hostname, transport 以及 port 的组合，可以设置服务器地址。您也可以选择设置 path，该字段对 WebSocket 连接而言非常有用。

使用 uri 字段的格式为 scheme://hostname:port/path。

- 当前支持 mqtts, mqtt, ws 和 wss 协议
- 基于 TCP 的 MQTT 示例:
  - mqtts://mqtt.eclipseprojects.io: 基于 TCP 的 MQTT，默认端口 1883
  - mqtt://mqtt.eclipseprojects.io:1884: 基于 TCP 的 MQTT，端口 1884
为了验证服务器身份，对于使用 TLS 的安全连接，必须设置 `broker` 的 `verification` 结构体，服务器证书可设置为 PEM 或 DER 格式。如果选择 DER 格式，必须设置等长 `_len` 字段，否则应在 `certificate` 字段传入一个非空字符串的 PEM 格式字符串。

- 从服务器获取证书，例如：
  ```bash
  openssl s_client -connect mqtt.eclipseprojects.io:8883
  ```
- 检查示例应用程序：`examples/mqtt_ssl`
- 配置：

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .broker = {
    .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
  },
};
```
### 遗留消息 (LWT)
通过设置 `esp_mqtt_client_config_t.session.last_will` 结构体的以下字段，MQTT 会在一个客户端意外断开连接时通过遗留消息通知其他客户端。

- **topic**: 指向 LWT 消息主题的指针
- **msg**: 指向 LWT 消息的指针
- **msg_len**: LWT 消息的长度。msg 不可以为空字符结尾时需要该字段
- **qos**: LWT 消息的品质
- **retain**: 指定 LWT 消息的保留标识

### 在项目配置菜单中设置 MQTT
通过 `idf.py menuconfig`，可以在 Component config > ESP-MQTT Configuration 中找到 MQTT 设置。

相关设置如下:

- `CONFIG_MQTT_PROTOCOL_311`: 启用 MQTT 协议 3.1.1 版本
- `CONFIG_MQTT_TRANSPORT_SSL` 和 `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: 启用特定 MQTT 传输层，例如 SSL, WEBSOCKET 和 WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: 禁用 mqtt_outbox 默认实现，因此可以提供特定实现

### 事件

MQTT 客户端可能会发布以下事件:

- `MQTT_EVENT_BEFORE_CONNECT`: 客户端已初始化并即将开始连接至服务器。
- `MQTT_EVENT_CONNECTED`: 客户端已成功连接至服务器。客户端已准备好收发数据。
- `MQTT_EVENT_DISCONNECTED`: 由于无法读取或写入数据，例如因为服务器无法使用，客户端已终止连接。
- `MQTT_EVENT_SUBSCRIBED`: 服务器已确认客户端的订阅请求。事件数据将包含订阅消息的的消息 ID。
- `MQTT_EVENT_UNSUBSCRIBED`: 服务器已确认客户端的退订请求。事件数据将包含退订消息的消息 ID。
- `MQTT_EVENT_PUBLISHED`: 服务器已确认客户端的发布消息。消息将仅针对 QoS 级别 1 和 2 发布，因为级别 0 不会进行确认。事件数据将包含发布消息的消息 ID。
- `MQTT_EVENT_DATA`: 客户端已收到发布消息。事件数据包含：消息 ID, 发布消息所属主题名称, 收到的数据及其长度。对于超出内部缓冲区的数据，将发布多个 MQTT_EVENT_DATA，并更新事件数据的 current_data_offset 和 total_data_len 以跟踪碎片化消息。
- `MQTT_EVENT_ERROR`: 客户端遇到错误。使用事件数据 error_handle 中的 `esp_mqtt_error_type_t`，可以进一步判断错误类型。错误类型决定 error_handle 结构体的哪些部分会被填充。

### API 参考

#### Header File

- components/mqtt/esp-mqtt/include/mqtt_client.h

#### Functions

**esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)**

创建 MQTT 客户端 handle 基于配置。

参数 config - MQTT 配置结构体

返回 mqtt_client_handle 如果成功创建，NULL on error

**esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)**

设置 MQTT 连接 URI。此 API 通常用于覆盖在 esp_mqtt_client_init 中配置的 URI。

参数

- client - MQTT 客户端 handle
- uri -

**esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)**

Starts MQTT client with already created client handle.

- **参数**: client - MQTT client handle
- **返回**: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

**esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)**

This api is typically used to force reconnection upon a specific event.

- **参数**: client - MQTT client handle
- **返回**: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)**

This api is typically used to force disconnection from the broker.

- **参数**: client - MQTT client handle
- **返回**: ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

**esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)**

Stops MQTT client tasks.

- **Notes**: Cannot be called from the MQTT event handler

**int esp_mqtt_client_subscribe (esp_mqtt_client_handle_t client, const char* topic, int qos)**

Subscribe the client to defined topic with defined qos.

- **Notes**: Cannot be called from the MQTT event handler

- **参数**: client - MQTT client handle, topic - defined topic, qos - defines quality of service
- **返回**: message_id of the subscribe message on success -1 on failure

**int esp_mqtt_client_unsubscribe (esp_mqtt_client_handle_t client, const char* topic)**

Unsubscribe the client from defined topic.

- **Notes**: Cannot be called from the MQTT event handler

- **参数**: client - MQTT client handle, topic - defined topic
- **返回**: message_id of the subscribe message on success -1 on failure
int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details.

参数
- client - MQTT client handle
- topic - topic string
- data - payload string (set to NULL, sending empty payload message)
- len - data length, if set to 0, length is calculated from payload string
- qos - QoS of publish message
- retain - retain flag

返回 message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

参数
- client - MQTT client handle
- topic - topic string
- data - payload string (set to NULL, sending empty payload message)
- len - data length, if set to 0, length is calculated from payload string
- qos - QoS of publish message
- retain - retain flag
- store - if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

返回 message_id if queued successfully, -1 otherwise

esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)

Destroys the client handle.

Notes:
- Cannot be called from the MQTT event handler

参数 client - MQTT client handle

返回 ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

参数
- client - MQTT client handle
- config - MQTT configuration structure

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success
**Register MQTT event.**

```c
esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Registers MQTT event.

- **client** - MQTT client handle
- **event** - event type
- **event_handler** - handler callback
- **event_handler_arg** - handlers context

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization. ESP_OK on success.

```c
int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)
```

Get outbox size.

- **client** - MQTT client handle
- **outbox size** 0 on wrong initialization

**Structures**

```c
struct esp_mqtt_error_codes
```

MQTT error code structure to be passed as a contextual information into ERROR event

**Important:** This structure extends **esp_tls_last_error** error structure and is backward compatible with it (so might be down-casted and treated as **esp_tls_last_error** error, but recommended to update applications if used this way previously).

Use this structure directly checking **error_type** first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

**Public Members**

```c
esp_err_t esp_tls_last_esp_err
```

Last esp_err code reported from esp-tls component

```c
int esp_tls_stack_err
```

Tls specific error code reported from underlying tls stack

```c
int esp_tls_cert_verify_flags
```

Tls flags reported from underlying tls stack during certificate verification

```c
esp_mqtt_error_type_t error_type
```

Error type referring to the source of the error

```c
esp_mqtt_connect_return_code_t connect_return_code
```

Connection refused error code reported from MQTT broker on connection

```c
int esp_transport_sock_errno
```

Erno from the underlying socket
struct `esp_mqtt_event_t`  
`MQTT` event configuration structure

**Public Members**

`esp_mqtt_event_id_t` `event_id`  
`MQTT` event type

`esp_mqtt_client_handle_t` `client`  
`MQTT` client handle for this event

`char *data`  
Data associated with this event

`int data_len`  
Length of the data for this event

`int total_data_len`  
Total length of the data (longer data are supplied with multiple events)

`int current_data_offset`  
Actual offset for the data associated with this event

`char *topic`  
Topic associated with this event

`int topic_len`  
Length of the topic for this event associated with this event

`int msg_id`  
`MQTT` message id of message

`int session_present`  
`MQTT` session_present flag for connection event

`esp_mqtt_error_codes_t *error_handle`  
`esp-mqtt` error handle including esp-tls errors as well as internal `MQTT` errors

`bool retain`  
Retained flag of the message associated with this event

`int qos`  
QoS of the messages associated with this event

`bool dup`  
dup flag of the message associated with this event
exp_mqtt_protocol_ver_t protocol_ver

MQTT protocol version used for connection, defaults to value from menuconfig

struct esp_mqtt_client_config_t

MQTT client configuration structure

• Default values can be set via menuconfig
• All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Public Members

struct esp_mqtt_client_config_t::broker_t broker

Broker address and security verification

struct esp_mqtt_client_config_t::credentials_t credentials

User credentials for broker

struct esp_mqtt_client_config_t::session_t session

MQTT session configuration.

struct esp_mqtt_client_config_t::network_t network

Network configuration

struct esp_mqtt_client_config_t::task_t task

FreeRTOS task configuration.

struct esp_mqtt_client_config_t::buffer_t buffer

Buffer size configuration.

struct broker_t

Broker related configuration

Public Members

struct esp_mqtt_client_config_t::broker_t::address_t address

Broker address configuration

struct esp_mqtt_client_config_t::broker_t::verification_t verification

Security verification of the broker

struct address_t

Broker address

• uri have precedence over other fields
• If uri isn’t set at least hostname, transport and port should.
Public Members

const char *uri
   Complete MQTT broker URI

const char *hostname
   Hostname, to set ipv4 pass it as string

esp_mqtt_transport_t transport
   Selects transport

const char *path
   Path in the URI

uint32_t port
   MQTT server port

struct verification_t
   Broker identity verification
   If fields are not set broker’s identity isn’t verified. It’s recommended to set the options in this struct for security reasons.

Public Members

bool use_global_ca_store
   Use a global ca_store, look esp-tls documentation for details.

esp_err_t (*crt_bundle_attach)(void *conf)
   Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char *certificate
   Certificate data, default is NULL, not required to verify the server.

size_t certificate_len
   Length of the buffer pointed to by certificate.

const struct psk_key_hint *psk_hint_key
   Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool skip_cert_common_name_check
   Skip any validation of server certificate CN field, this reduces the security of TLS and makes the MQTT client susceptible to MITM attacks

const char **alpn_protos
   NULL-terminated list of supported application protocols to be used for ALPN
struct buffer_t
Client buffer size configuration
Client have two buffers for input and output respectively.

Public Members

int size
size of MQTT send/receive buffer

int out_size
size of MQTT output buffer. If not defined, defaults to the size defined by buffer_size

struct credentials_t
Client related credentials for authentication.

Public Members

const char *username
MQTT username

const char *client_id
Set MQTT client identifier. Ignored if set_null_client_id == true If NULL set the default client id.
Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool set_null_client_id
Selects a NULL client id

struct esp_mqtt_client_config_t::credentials_t::authentication_t authentication
Client authentication

struct authentication_t
Client authentication
Fields related to client authentication by broker
For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

Public Members

const char *password
MQTT password

const char *certificate
Certificate for ssl mutual authentication, not required if mutual authentication is not needed.
Must be provided with key.
size_t certificate_len
Length of the buffer pointed to by certificate.

const char *key
Private key for SSL mutual authentication, not required if mutual authentication is not needed.
If it is not NULL, also certificate has to be provided.

size_t key_len
Length of the buffer pointed to by key.

const char *key_password
Client key decryption password, not PEM nor DER, if provided key_password_len must be correctly set.

int key_password_len
Length of the password pointed to by key_password

bool use_secure_element
Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void *ds_data
Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct network_t
Network related configuration

Public Members

int reconnect_timeout_ms
Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

int timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)

bool disable_auto_reconnect
Client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

struct session_t
MQTT Session related configuration

Public Members
struct esp_mqtt_client_config_t::session_t::last_will_t last_will

Last will configuration

bool disable_clean_session

MQTT clean session, default clean_session is true

int keepalive

MQTT keepalive, default is 120 seconds

bool disable_keepalive

Set disable_keepalive=true to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t protocol_ver

MQTT protocol version used for connection.

int message_retransmit_timeout

timeout for retransmitting of failed packet

struct last_will_t

Last Will and Testament message configuration.

Public Members

cost char *topic

LWT (Last Will and Testament) message topic

cost char *msg

LWT message, may be NULL terminated

int msg_len

LWT message length, if msg isn’t NULL terminated must have the correct length

int qos

LWT message QoS

int retain

LWT retained message flag

struct task_t

Client task configuration

Public Members

int priority

MQTT task priority
**int stack_size**

MQTT task stack size

**Macros**

**MQTT_ERROR_TYPE_ESP_TLS**

MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility.

**Type Definitions**

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t

MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

- client - MQTT client handle
- various other data depending on event type

typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t

MQTT connection error codes propagated via ERROR event.

typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t

MQTT connection error codes propagated via ERROR event.

typedef enum esp_mqtt_transport_t esp_mqtt_transport_t

MQTT protocol version used for connection.

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously).

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error.

| error_type | related member variables | note | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_error, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

typedef struct esp_mqtt_event_t esp_mqtt_event_t

MQTT event configuration structure.

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t

 *MQTT* client configuration structure

  - Default values can be set via menuconfi
  - All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

**Enumerations**

enum esp_mqtt_event_id_t

 *MQTT* event types.

 User event handler receives context data in *esp_mqtt_event_t* structure with

  - *client* - *MQTT* client handle
  - various other data depending on event type

*Values*:

enumerator MQTT_EVENT_ANY

enumerator MQTT_EVENT_ERROR

  on error event, additional context: connection return code, error handle from esp_tls (if supported)

enumerator MQTT_EVENT_CONNECTED

  connected event, additional context: session_present flag

enumerator MQTT_EVENT_DISCONNECTED

  disconnected event

enumerator MQTT_EVENT_SUBSCRIBED

  subscribed event, additional context:

    - msg_id message id
    - data pointer to the received data
    - data_len length of the data for this event

'enumerator MQTT_EVENT_UNSUBSCRIBED

  unsubscribed event

enumerator MQTT_EVENT_PUBLISHED

  published event, additional context: msg_id

enumerator MQTT_EVENT_DATA

  data event, additional context:

    - msg_id message id
    - topic pointer to the received topic
    - topic_len length of the topic
    - data pointer to the received data
• data_len length of the data for this event
• current_data_offset offset of the current data for this event
• total_data_len total length of the data received
• retain retain flag of the message
• qos QoS level of the message
• dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**
The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
• This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
• Additional context: msg_id (id of the deleted message).

enum **esp_mqtt_connect_return_code_t**
MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_CONNECTION_ACCEPTED**
Connection accepted

enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**
MQTT connection refused reason: Wrong protocol

enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**
MQTT connection refused reason: ID rejected

enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**
MQTT connection refused reason: Server unavailable

enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**
MQTT connection refused reason: Wrong user

enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**
MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**
MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_ERROR_TYPE_NONE**

enumerator **MQTT_ERROR_TYPE_TCP_TRANSPORT**

enumerator **MQTT_ERROR_TYPE_CONNECTION_REFUSED**
```c
enum esp_mqtt_transport_t
    Values:

    enumerator MQTT_TRANSPORT_UNKNOWN

    enumerator MQTT_TRANSPORT_OVER_TCP
        MQTT over TCP, using scheme: MQTT

    enumerator MQTT_TRANSPORT_OVER_SSL
        MQTT over SSL, using scheme: MQTTS

    enumerator MQTT_TRANSPORT_OVER_WS
        MQTT over Websocket, using scheme:: ws

    enumerator MQTT_TRANSPORT_OVER_WSS
        MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
    MQTT protocol version used for connection
    Values:

    enumerator MQTT_PROTOCOL_UNDEFINED

    enumerator MQTT_PROTOCOL_V_3_1

    enumerator MQTT_PROTOCOL_V_3_1_1

    enumerator MQTT_PROTOCOL_V_5
```

### 2.2.4 ESP-TLS

#### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

#### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: `protocols/https_request`.
Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contains the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

**TLS Server verification**

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf and cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf`: pointer to the buffer which contains the CA cert.
  - `cacert_bytes`: size of the CA certificate in bytes.

- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.

- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle.

- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. **WARNING:** Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

**ESP-TLS Server cert selection hook**

The ESP-TLS component provides an option to set the server cert selection hook when using the mbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc). To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```c
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}
```
esp_tls_cfg_t
cfg = {
    cert_select_cb = cert_section_callback,
};

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

注意事项: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands:
   mkdir components
   cd components
   git clone https://github.com/espressif/esp-wolfssl.git

2) Add wolfssl as an extra component in your project.
   • Download wolfssl with:
     git clone https://github.com/espressif/esp-wolfssl.git
   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```bash
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>
ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedTLS as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.

To enable the secure element support, and use it in your project for TLS connection, you will have to follow below steps

1) Add esp-cryptoauthlib in your project, for details please refer esp-cryptoauthlib with ESP_IDF

2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
```

3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit [ATECC608A chip type]

4) Enable use of ATECC608A in ESP-TLS by providing following config option in esp_tls_cfg_t

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

API Reference

**Header File**

- components/esp-tls/esp_tls.h

**Functions**

- `esp_tls_init` (void)
  
  Create TLS connection.
  
  This function allocates and initializes esp-tls structure handle.

- `esp_tls_conn_http_new` (const char *url, const esp_tls_cfg_t *cfg)
  
  Create a new blocking TLS/SSL connection with a given "HTTP" url.

  **Note**: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

  **参数**
  
  - `url` - [in] url of host.
• **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

返回 pointer to esp_tls_t, or NULL if connection couldn’t be opened.

```c
int esp_tls_conn_new_sync(const char* hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

参数

- `port` – [in] Port number of the host.
- `cfg` – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- `tls` – [in] Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_http_new_sync(const char* url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_sync() API. However this API accepts host’s url.

参数

- `cfg` – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.
- `tls` – [in] Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_new_async(const char* hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

参数

- `port` – [in] Port number of the host.
- `cfg` – [in] TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- `tls` – [in] pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
int esp_tls_conn_http_new_async(const char* url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host’s url.
参数
  • `url` [in] url of host.
  • `cfg` [in] TLS configuration as esp_tls_cfg_t.
  • `tls` [in] pointer to esp-tls as esp-tls handle.

返回
  • -1 If connection establishment fails.
  • 0 If connection establishment is in progress.
  • 1 If connection establishment is successful.

`ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)`
Write from buffer ‘data’ into specified tls connection.

参数
  • `tls` [in] pointer to esp-tls as esp-tls handle.
  • `data` [in] Buffer from which data will be written.
  • `datalen` [in] Length of data buffer.

返回
  • >=0 if write operation was successful, the return value is the number of bytes actually
    written to the TLS/SSL connection.
  • <0 if write operation was not successful, because either an error occurred or an action must
    be taken by the calling process.
  • ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the
    handshake is incomplete and waiting for data to be available for reading. In this case this
    functions needs to be called again when the underlying transport is ready for operation.

`ssize_t esp_tls_conn_read (esp_tls_t *tls, void *data, size_t datalen)`
Read from specified tls connection into the buffer ‘data’.

参数
  • `tls` [in] pointer to esp-tls as esp-tls handle.
  • `data` [in] Buffer to hold read data.
  • `datalen` [in] Length of data buffer.

返回
  • >0 if read operation was successful, the return value is the number of bytes actually read
    from the TLS/SSL connection.
  • 0 if read operation was not successful. The underlying connection was closed.
  • <0 if read operation was not successful, because either an error occurred or an action must
    be taken by the calling process.

`int esp_tls_conn_destroy (esp_tls_t *tls)`
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or
esp_tls_conn_http_new_sync()) and `esp_tls_conn_new_async()` (or esp_tls_conn_http_new_async()) APIs.

参数 `tls` [in] pointer to esp-tls as esp-tls handle.

返回 - 0 on success
  • -1 if socket error or an invalid argument

`ssize_t esp_tls_get_bytes_avail (esp_tls_t *tls)`
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbdtls’ s mbdtls_ssl_get_bytes_avail() API.

参数 `tls` [in] pointer to esp-tls as esp-tls handle.

返回
  • -1 in case of invalid arg
  • bytes available in the application data record read buffer

`esp_err_t esp_tls_get_conn_sockfd (esp_tls_t *tls, int *sockfd)`
Returns the connection socket file descriptor from esp_tls session.

参数
- **tls** - [in] handle to esp_tls context
- **sockfd** - [out] int pointer to sockfd value.

*Return* - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
  - ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

**void** esp_tls_get_ssl_context (esp_tls_t *tls)

Returns the ssl context.
- **tls** - [in] handle to esp_tls context
  - ssl_ctx pointer to ssl context of underlying TLS layer on success
  - NULL in case of error

**esp_err_t** esp_tls_init_global_ca_store (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

*Return* - ESP_OK if creating global CA store was successful.
  - ESP_DS_NO_MEM if an error occurred when allocating the mbedtls resources.

**esp_err_t** esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

- **cacert_pem_buf** - [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** - [in] Length of the buffer.

*Return* - ESP_OK if adding certificates was successful.
  - Other if an error occurred or an action must be taken by the calling process.

**void** esp_tls_free_global_ca_store (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

**esp_err_t** esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

- **h** - [in] esp-tls error handle.
- **esp_tls_code** - [out] last error code returned from mbedtls api (set to zero if none)
  - This pointer could be NULL if caller does not care about esp_tls_code
- **esp_tls_flags** - [out] last certification verification flags (set to zero if none)
  - This pointer could be NULL if caller does not care about esp_tls_code

*Return* - ESP_ERR_INVALID_STATE if invalid parameters
  - ESP_OK (0) if no error occurred
  - specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise
**esp_err_t esp_tls_get_and_clear_error_type** *(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)*

Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

参数
- **h** – [in] esp-tls error handle.
- **err_type** – [in] specific error type
- **error_code** – [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

返回
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

**esp_err_t esp_tls_get_error_handle** *(esp_tls_t *tls, esp_tls_error_handle_t *error_handle)*

Returns the ESP-TLS error_handle.

参数
- **tls** – [in] handle to esp_tls context
- **error_handle** – [out] pointer to the error handle.

返回
- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

mbedtls_x509_crt* esp_tls_get_global_ca_store (void)

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

备注： Modifying the pointer might cause a failure in verifying the certificates.

返回
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

**esp_err_t esp_tls_plain_tcp_connect** *(const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)*

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

参数
- **host** – [in] Hostname of the host.
- **hostlen** – [in] Length of hostname.
- **port** – [in] Port number of the host.
- **cfg** – [in] ESP-TLS configuration as esp_tls_cfg_t.
- **error_handle** – [out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** – [out] Socket descriptor if successfully connected on TCP layer

返回 ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

**Structures**

struct psk_key_hint

ESP-TLS preshared key and hint structure.
### Public Members

- **const uint8_t** *key*
  - key in PSK authentication mode in binary format

- **const size_t** *key_size*
  - length of the key

- **const char** *hint*
  - hint in PSK authentication mode in string format

- **struct tls_keep_alive_cfg**
  - esp-tls client session ticket ctx
  - Keep alive parameters structure

### Public Members

- **bool** *keep_alive_enable*
  - Enable keep-alive timeout

- **int** *keep_alive_idle*
  - Keep-alive idle time (second)

- **int** *keep_alive_interval*
  - Keep-alive interval time (second)

- **int** *keep_alive_count*
  - Keep-alive packet retry send count

- **struct esp_tls_cfg**
  - ESP-TLS configuration parameters.

---

**备注**: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).

- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.

- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

---

### Public Members

- **const char** **alpn_protos**
  - Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = [ “h2” , NULL ];**
where ‘h2’ is the protocol name

c = const unsigned char *cacert_buf
    Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM

c = const unsigned char *cacert_pem_buf
    CA certificate buffer legacy name

unsigned int cacert_bytes
    Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
    Size of Certificate Authority certificate legacy name

c = const unsigned char *clientcert_buf
    Client certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM

c = const unsigned char *clientcert_pem_buf
    Client certificate legacy name

unsigned int clientcert_bytes
    Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
    Size of client certificate legacy name

c = const unsigned char *clientkey_buf
    Client key in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM

c = const unsigned char *clientkey_pem_buf
    Client key legacy name

unsigned int clientkey_bytes
    Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
    Size of client key legacy name

const unsigned char *clientkey_password
    Client key decryption password string

unsigned int clientkey_password_len
    String length of the password pointed to by clientkey_password
bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after TLS session is established.

bool use_secure_element
Enable this option to use secure element or atcc608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool is_plain_tcp
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

Type Definitions

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t
typedef struct psk_key_hint psk_hint_key_t
    ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
    esp-tls client session ticket ctx
    Keep alive parameters structure

typedef struct esp_tls_cfg esp_tls_cfg_t
    ESP-TLS configuration parameters.

Note about format of certificates:

• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t

Enumerations

enum esp_tls_conn_state
    ESP-TLS Connection State.
    Values:
    enumerator ESP_TLS_INIT
    enumerator ESP_TLS_CONNECTING
    enumerator ESP_TLS_HANDSHAKE
    enumerator ESP_TLS_FAIL
    enumerator ESP_TLS_DONE

enum esp_tls_role
    Values:
    enumerator ESP_TLS_CLIENT
    enumerator ESP_TLS_SERVER

Header File

• components/esp-tls/esp_tls_errors.h
Chapter 2. API 参考

Structures

struct **esp_tls_last_error**
Error structure containing relevant errors in case tls error occurred.

**Public Members**

```c
enum esp_err_t last_error
   error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

int esp_tls_error_code
   esp_tls error code from last esp_tls failed api

int esp_tls_flags
   last certification verification flags
```

**Macros**

```c
#define ESP_ERR_ESP_TLS_BASE
   Starting number of ESP-TLS error codes

#define ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
   Error if hostname couldn’t be resolved upon tls connection

#define ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
   Failed to create socket

#define ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
   Unsupported protocol family

#define ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
   Failed to connect to host

#define ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
   failed to set/get socket option

#define ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
   new connection in esp_tls_low_level_conn connection timed out

#define ESP_ERR_ESP_TLS_SE_FAILED

#define ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

#define ESP_ERR_MBEDTLS_CERT_PARTLY_OK
   mbedtls parse certificates was partly successful

#define ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
   mbedtls api returned error
```
ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_own_CERT_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
  mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
  mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
  mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED
  mbedtls api returned failed

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED
  wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED

Chapter 2. API 参考

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED
wolfSSL api returned failed

ESP_TLS_ERR_SSL_WANT_READ
Definition of errors reported from IO API (potentially non-blocking) in case of error:
  • esp_tls_conn_read()
  • esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE

ESP_TLS_ERR_SSL_TIMEOUT

Type Definitions

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t
  Error structure containing relevant errors in case tls error occurred.

Enumerations

denum esp_tls_error_type_t
  Definition of different types/sources of error codes reported from different components
  Values:

  enumerator ESP_TLS_ERR_TYPE_UNKNOWN

  enumerator ESP_TLS_ERR_TYPE_SYSTEM
    System error &#8212; errno

  enumerator ESP_TLS_ERR_TYPE_MBEDTLS
    Error code from mbedTLS library

  enumerator ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS
    Certificate flags defined in mbedTLS

  enumerator ESP_TLS_ERR_TYPE_ESP
    ESP-IDF error type &#8212; esp_err_t

  enumerator ESP_TLS_ERR_TYPE_WOLFSSL
    Error code from wolfSSL library
Chapter 2. API

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS**
Certificate flags defined in wolfSSL

enumerator **ESP_TLS_ERR_TYPE_MAX**
Last err type &#8212; invalid entry

### 2.2.5 ESP HTTP Client

#### Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- **`esp_http_client_init()`**: Creates an `esp_http_client_handle_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- **`esp_http_client_perform()`**: Performs all operations of the `esp_http_client` - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- **`esp_http_client_cleanup()`**: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

#### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

#### Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

#### Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

**Use Secure Element (ATECC608) for TLS**

A secure element (ATECC608) can be also used for the underlying TLS connection in the HTTP client connection. Please refer to Secure Element with ESP-TLS section in the `doc:` ESP-TLS documentation</api-reference/protocols/esp_tls` for more details. The secure element support has to be first enabled in menuconfig through `CONFIG_ESP_TLS_USE_SECURE_ELEMENT`. Then the HTTP client can be configured to use secure element as follows:
```c
esp_http_client_config_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

## HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note:** While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)

## HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the content-length from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

## HTTP Authentication

**ESP HTTP client supports both Basic and Digest Authentication.**

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.

Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.
Examples of Authentication Configuration

- Authentication with URI

```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

API Reference

Header File

- components/esp_http_client/include/esp_http_client.h

Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` *config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

参数 config - [in] The configurations, see `http_client_config_t`

返回

- `esp_http_client_handle_t`
- `NULL` if any errors

`esp_err_t esp_http_client_perform` (esp_http_client_handle_t client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invoke to set options for the following `esp_http_client_perform`.

备注： You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

参数 client - The `esp_http_client` handle
**esp_err_t esp_http_client_set_url** (esp_http_client_handle_t client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

- **client** - [in] The esp_http_client handle
- **url** - [in] The url

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_set_post_field** (esp_http_client_handle_t client, const char *data, int len)

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

- **client** - [in] The esp_http_client handle
- **data** - [in] post data pointer
- **len** - [in] post length

**Return**
- ESP_OK
- ESP_FAIL

**int esp_http_client_get_post_field** (esp_http_client_handle_t client, char **data)

Get current post field information.

- **client** - [in] The esp_http_client handle
- **data** - [out] Point to post data pointer

**Return**
Size of post data

**esp_err_t esp_http_client_set_header** (esp_http_client_handle_t client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

- **client** - [in] The esp_http_client handle
- **key** - [in] The header key
- **value** - [in] The header value

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_get_header** (esp_http_client_handle_t client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

- **client** - [in] The esp_http_client handle
- **key** - [in] The header key
- **value** - [out] The header value

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_get_username** (esp_http_client_handle_t client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

- **client** - [in] The esp_http_client handle
- **key** - [in] The header key
- **value** - [out] The header value

**Return**
- ESP_OK
- ESP_FAIL
### API Reference

**esp_err_t esp_http_client_set_username (esp_http_client_handle_t client, const char* username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

- **Parameters**
  - `client` - [in] The esp_http_client handle
  - `username` - [in] The username value

- **Return**
  - ESP_OK
  - ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_get_password (esp_http_client_handle_t client, char** value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

- **Parameters**
  - `client` - [in] The esp_http_client handle
  - `value` - [out] The password value

- **Return**
  - ESP_OK
  - ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_password (esp_http_client_handle_t client, const char* password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

- **Parameters**
  - `client` - [in] The esp_http_client handle
  - `password` - [in] The password value

- **Return**
  - ESP_OK
  - ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_auth_type (esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)

Set http request auth_type.

- **Parameters**
  - `client` - [in] The esp_http_client handle
  - `auth_type` - [in] The esp_http_client auth type

- **Return**
  - ESP_OK
  - ESP_ERR_INVALID_ARG

**int esp_http_client_get_errno (esp_http_client_handle_t client)

Get HTTP client session errno.

- **Parameters**
  - `client` - [in] The esp_http_client handle

- **Return**
  - (-1) if invalid argument
  - errno

**esp_err_t esp_http_client_set_method (esp_http_client_handle_t client, esp_http_client_method_t method)

Set http request method.
### Chapter 2. API 参考

**参数**
- `client` [in] The esp_http_client handle
- `method` [in] The method

**返回**
- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_timeout_ms (esp_http_client_handle_t client, int timeout_ms)
```
Set http request timeout.

**参数**
- `client` [in] The esp_http_client handle
- `timeout_ms` [in] The timeout value

**返回**
- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char* key)
```
Delete http request header.

**参数**
- `client` [in] The esp_http_client handle
- `key` [in] The key

**返回**
- ESP_OK
- ESP_FAIL

```c
int esp_http_client_open (esp_http_client_handle_t client, int write_len)
```
This function will be open the connection, write all header strings and return.

**参数**
- `client` [in] The esp_http_client handle
- `write_len` [in] HTTP Content length need to write to the server

**返回**
- ESP_OK
- ESP_FAIL

```c
int esp_http_client_write (esp_http_client_handle_t client, const char* buffer, int len)
```
This function will write data to the HTTP connection previously opened by esp_http_client_open()

**参数**
- `client` [in] The esp_http_client handle
- `buffer` The buffer
- `len` [in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

**返回**
- (-1) if any errors
- Length of data written

```c
int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)
```
This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**参数**
- `client` [in] The esp_http_client handle

**返回**
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

```c
bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)
```
Check response data is chunked.
### Chapter 2. API 参考

#### 参数 client - [in] The esp_http_client handle

#### 返回 true or false

```c
int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)
```

Read data from http stream.

---

**备注:** (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

---

#### 参数

- client - [in] The esp_http_client handle
- buffer - The buffer
- len - [in] The length

#### 返回

- (-1) if any errors
- Length of data was read

```c
int esp_http_client_get_status_code (esp_http_client_handle_t client)
```

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**参数**

- client - [in] The esp_http_client handle

**返回** Status code

```c
int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)
```

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**参数**

- client - [in] The esp_http_client handle

**返回**

- (-1) Chunked transfer
- Content-Length value as bytes

**esp_err_t**

```c
esp_http_client_close (esp_http_client_handle_t client)
```

Close http connection, still kept all http request resources.

**参数**

- client - [in] The esp_http_client handle

**返回**

- ESP_OK
- ESP_FAIL

**esp_err_t**

```c
esp_http_client_cleanup (esp_http_client_handle_t client)
```

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

**参数**

- client - [in] The esp_http_client handle

**返回**

- ESP_OK
- ESP_FAIL

**esp_http_client_transport_t**

```c
esp_http_client_get_transport_type (esp_http_client_handle_t client)
```

Get transport type.

**参数**

- client - [in] The esp_http_client handle

**返回**

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL
**esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)**

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

参数 client - [in] The esp_http_client handle

返回
  • ESP_OK
  • ESP_FAIL

**void esp_http_client_add_auth (esp_http_client_handle_t client)**

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

备注：There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

参数 client - [in] The esp_http_client handle

**bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)**

Checks if entire data in the response has been read without any error.

参数 client - [in] The esp_http_client handle

返回
  • true
  • false

**int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)**

Helper API to read larger data chunks. This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

参数
  • client - [in] The esp_http_client handle
  • buffer - The buffer
  • len - [in] The buffer length

返回
  • Length of data was read

**esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)**

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to esp_http_client_read_response in situations where the content of the response may be ignored.

参数
  • client - [in] The esp_http_client handle
  • len - Length of data discarded

返回
  • ESP_OK If successful, len will have discarded length
  • ESP_FAIL If failed to read response
  • ESP_ERR_INVALID_ARG If the client is NULL

**esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)**

Get URL from client.

参数
  • client - [in] The esp_http_client handle
  • url - [inout] The buffer to store URL
  • len - [in] The buffer length

返回
  • ESP_OK
### Chapter 2. API 参考

**esp_err_t**  
`esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)`  
Get Chunk-Length from client.

**参数**
- `client` - [in] The esp_http_client handle
- `len` - [out] Variable to store length

**返回**
- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

**Structures**

`struct esp_http_client_event`

HTTP Client events data.

**Public Members**

`esp_http_client_event_id_t`  
`event_id`

event_id, to know the cause of the event

`esp_http_client_handle_t`  
`client`

esp_http_client_handle_t context

`void *data`

data of the event

`int data_len`

data length of data

`void *user_data`

user_data context, from `esp_http_client_config_t` user_data

`char *header_key`

For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

`char *header_value`

For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

`struct esp_http_client_config_t`

HTTP configuration.

**Public Members**

`const char *url`

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

`const char *host`

Domain or IP as string
int port
    Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
    Using for Http authentication

const char *password
    Using for Http authentication

* esp_http_client_auth_type_t auth_type
    Http authentication type, see esp_http_client_auth_type_t

const char *path
    HTTP Path, if not set, default is /

const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password

const char *user_agent
    The User Agent string to send with HTTP requests

* esp_http_client_method_t method
    HTTP Method
int **timeout_ms**
Network timeout in milliseconds

bool **disable_auto_redirect**
Disable HTTP automatic redirects

int **max_redirection_count**
Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max_authorization_retries**
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

**http_event_handle_cb**
HTTP Event Handle

**esp_http_client_transport_t**
HTTP transport type, see **esp_http_client_transport_t**

int **buffer_size**
HTTP receive buffer size

int **buffer_size_tx**
HTTP transmit buffer size

void * **user_data**
HTTP user_data context

bool **is_async**
Set asynchronous mode, only supported with HTTPS for now

bool **use_global_ca_store**
Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**
Skip any validation of server certificate CN field

const char * **common_name**
Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

**esp_err_t** (*crt_bundle_attach*)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep_alive_enable**
Enable keep-alive timeout
int `keep_alive_idle`
   Keep-alive idle time. Default is 5 (second)

int `keep_alive_interval`
   Keep-alive interval time. Default is 5 (second)

int `keep_alive_count`
   Keep-alive packet retry send count. Default is 3 counts

struct ifreq *`if_name`
   The name of interface for data to go through. Use the default interface without setting

**Macros**

`DEFAULT_HTTP_BUF_SIZE`

`ESP_ERR_HTTP_BASE`
   Starting number of HTTP error codes

`ESP_ERR_HTTP_MAX_REDIRECT`
   The error exceeds the number of HTTP redirects

`ESP_ERR_HTTP_CONNECT`
   Error open the HTTP connection

`ESP_ERR_HTTP_WRITE_DATA`
   Error write HTTP data

`ESP_ERR_HTTP_FETC/Header`
   Error read HTTP header from server

`ESP_ERR_HTTP_INVALID_TRANSPORT`
   There are no transport support for the input scheme

`ESP_ERR_HTTP_CONNECTING`
   HTTP connection hasn’t been established yet

`ESP_ERR_HTTP_EAGAIN`
   Mapping of errno EAGAIN to esp_err_t

`ESP_ERR_HTTP_CONNECTION_CLOSED`
   Read FIN from peer and the connection closed

**Type Definitions**

typedef struct esp_http_client *`esp_http_client_handle_t`

typedef struct `esp_http_client_event *esp_http_client_event_handle_t`
typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

**Enumerations**

enum esp_http_client_event_id_t
    HTTP Client events id.

*Values:*

- **HTTP_EVENT_ERROR**
  This event occurs when there are any errors during execution

- **HTTP_EVENT_ON_CONNECTED**
  Once the HTTP has been connected to the server, no data exchange has been performed

- **HTTP_EVENT_HEADERS_SENT**
  After sending all the headers to the server

- **HTTP_EVENT_HEADER_SENT**
  This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

- **HTTP_EVENT_ON_HEADER**
  Occurs when receiving each header sent from the server

- **HTTP_EVENT_ON_DATA**
  Occurs when receiving data from the server, possibly multiple portions of the packet

- **HTTP_EVENT_ON_FINISH**
  Occurs when finish a HTTP session

- **HTTP_EVENT_DISCONNECTED**
  The connection has been disconnected

- **HTTP_EVENT_REDIRECT**
  Intercepting HTTP redirects to handle them manually

enum esp_http_client_transport_t
    HTTP Client transport.

*Values:*

- **HTTP_TRANSPORT_UNKNOWN**
  Unknown

- **HTTP_TRANSPORT_OVER_TCP**
  Transport over tcp
enumerator HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.

Values:

enumerator HTTP_METHOD_GET
HTTP GET Method

enumerator HTTP_METHOD_POST
HTTP POST Method

enumerator HTTP_METHOD_PUT
HTTP PUT Method

enumerator HTTP_METHOD_PATCH
HTTP PATCH Method

enumerator HTTP_METHOD_DELETE
HTTP DELETE Method

enumerator HTTP_METHOD_HEAD
HTTP HEAD Method

enumerator HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

enumerator HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

enumerator HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method

enumerator HTTP_METHOD_OPTIONS
HTTP OPTIONS Method

enumerator HTTP_METHOD_COPY
HTTP COPY Method

enumerator HTTP_METHOD_MOVE
HTTP MOVE Method

enumerator HTTP_METHOD_LOCK
HTTP LOCK Method

enumerator HTTP_METHOD_UNLOCK
HTTP UNLOCK Method
Chapter 2. API

enumerator HTTP_METHOD_PROPFIND
   HTTP PROPFIND Method

enumerator HTTP_METHOD_PROPPATCH
   HTTP PROPPATCH Method

enumerator HTTP_METHOD_MKCOL
   HTTP MKCOL Method

enumerator HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
   HTTP Authentication type.
   Values:

   enumerator HTTP_AUTH_TYPE_NONE
      No authentication

   enumerator HTTP_AUTH_TYPE_BASIC
      HTTP Basic authentication

   enumerator HTTP_AUTH_TYPE_DIGEST
      HTTP Digest authentication

enum HttpStatus_Code
   Enum for the HTTP status codes.
   Values:

   enumerator HttpStatus_Ok

   enumerator HttpStatus_MultipleChoices

   enumerator HttpStatus_MovedPermanently

   enumerator HttpStatus_Found

   enumerator HttpStatus_SeeOther

   enumerator HttpStatus_TemporaryRedirect

   enumerator HttpStatus_PermanentRedirect

   enumerator HttpStatus_BadRequest

   enumerator HttpStatus_Unauthorized
enumerator HttpStatus_Forbidden

descriptor HttpStatus_NotFound

descriptor HttpStatus_InternalError

2.2.6 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <------------------------
                   * ---------------------------------------> MSB */
                0x21,
                0xd5,
                0x3b,
                0x8d,
                0xbd,
                0x75,
                0x68,
                0x8a,
                0xb4,
                0x42,
                0xe8,
                0x31,
                0x4a,
                0x1e,
                0x98,
                0x3d
            }
        },
        .proto_sec = {
            .version = PROTOCOM_SEC0,
            .custom_handle = NULL,
            .sec_params = NULL
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
    /* Start esp_local_ctrl service */
    ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
};
```

Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
  \_start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_
  \_end");
https_conf.servercert = servercert_start;
```

(continued)
You may set security for transport in ESP local control using following options:

1. `PROTOCOM_SEC2`: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.

2. `PROTOCOM_SEC1`: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.

3. `PROTOCOM_SEC0`: specifies that data will be exchanged as a plain text (no security).

4. `PROTOCOM_SEC_CUSTOM`: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocom_security_t *` in this context.

备注：The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in Protocol Communication for more details.

Creating a property

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics.
of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, const esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
        }
    }
}
```

(下页继续)
Chapter 2. API 参考

/* For keeping it simple, lets only log the incoming data */
ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
    prop_values[i].size, ESP_LOG_INFO);
}
}
return ESP_OK;
}

For complete example see protocols/esp_local_ctrl

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. get_prop_count: This should simply return the total number of properties supported by the service
2. get_prop_values: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. set_prop_values: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call get_prop_count and then get_prop_values, hence form an index to name mapping for all properties. Now when calling set_prop_values for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by esp_local_ctrl are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)

Function for obtaining BLE transport mode.

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)

Function for obtaining HTTPD transport mode.
**esp_err_t esp_local_ctrl_start** (const esp_local_ctrl_config_t *config)

Start local control service.

参数 `config` [in] Pointer to configuration structure

返回
- ESP_OK : Success
- ESP_FAIL : Failure

**esp_err_t esp_local_ctrl_stop** (void)

Stop local control service.

**esp_err_t esp_local_ctrl_add_property** (const esp_local_ctrl_prop_t *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

参数 `prop` [in] Property description structure

返回
- ESP_OK : Success
- ESP_FAIL : Failure

**esp_err_t esp_local_ctrl_remove_property** (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

参数 `name` [in] Name of the property to remove

返回
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

**const esp_local_ctrl_prop_t *esp_local_ctrl_get_property** (const char *name)

Get property description structure by name.

This API may be used to get a property’s context structure `esp_local_ctrl_prop_t` when its name is known

参数 `name` [in] Name of the property to find

返回
- Pointer to property
- NULL if not found

**esp_err_t esp_local_ctrl_set_handler** (const char *ep_name, prootcomm_reg_handler_t handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

备注: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

参数
- `ep_name` -[in] Name of the endpoint
- `handler` -[in] Endpoint handler function
- `user_ctx` -[in] User data

返回
- ESP_OK : Success
- ESP_FAIL : Failure
Unions

union esp_local_ctrl_transport_config_t
    #include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble
    This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd
    This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop
    Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

Public Members

char *name
    Unique name of property

uint32_t type
    Type of property. This may be set to application defined enums

size_t size
    Size of the property value, which:
    • if zero, the property can have values of variable size
    • if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t flags
    Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx
    Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

void (*ctx_free_fn)(void *ctx)
    Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.
struct `esp_local_ctrl_prop_val`  
Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members**

- `void *data`
  Pointer to memory holding property value
- `size_t size`
  Size of property value
- `void (*free_fn)(void *data)`  
  This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct `esp_local_ctrl_handlers`  
Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

- `esp_err_t (*get_prop_values)(size_t props_count, const `esp_local_ctrl_prop_t` props[], `esp_local_ctrl_prop_val_t` prop_values[], void *usr_ctx)`  
  Handler function to be implemented for retrieving current values of properties.

<table>
<thead>
<tr>
<th>Param props_count [in]</th>
<th>Total elements in the props array</th>
</tr>
</thead>
<tbody>
<tr>
<td>Param props [in]</td>
<td>Array of properties, the current values for which have been requested by the client</td>
</tr>
<tr>
<td>Param prop_values [out]</td>
<td>Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument</td>
</tr>
<tr>
<td>Param usr_ctx [in]</td>
<td>This provides value of theusr_ctx field of esp_local_ctrl_handlers_t structure</td>
</tr>
<tr>
<td>Return</td>
<td>Returning different error codes will convey the corresponding protocol level errors to the client:</td>
</tr>
<tr>
<td></td>
<td>• ESP_OK : Success</td>
</tr>
<tr>
<td></td>
<td>• ESP_ERR_INVALID_ARG : InvalidArgument</td>
</tr>
<tr>
<td></td>
<td>• ESP_ERR_INVALID_STATE : InvalidProto</td>
</tr>
<tr>
<td></td>
<td>• All other error codes : InternalError</td>
</tr>
</tbody>
</table>

- `esp_err_t (*set_prop_values)(size_t props_count, const `esp_local_ctrl_prop_t` props[], const `esp_local_ctrl_prop_val_t` prop_values[], void *usr_ctx)`  
  Handler function to be implemented for changing values of properties.

|备注：| If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.
**Param props_count** [in] Total elements in the props array

**Param props** [in] Array of properties, the values for which the client requests to change

**Param prop_values** [in] Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr_ctx** [in] This provides value of the **usr_ctx** field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

```c
struct esp_local_ctrl_proto_sec_cfg
```

Protocom security configs

**Public Members**

```c
esp_local_ctrl_proto_sec_t version
```

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via `proto_sec_custom_handle` below

```c
void *custom_handle
```

Custom security handle if security is set custom via `proto_sec` above This handle must follow `protocomm_security_t` signature

```c
const void *pop
```

Proof of possession to be used for local control. Could be NULL.

```c
const void *sec_params
```

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

```c
struct esp_local_ctrl_config
```

Configuration structure to pass to `esp_local_ctrl_start()`

**Public Members**

```c
const esp_local_ctrl_transport_t *transport
```

Transport layer over which service will be provided
**esp_local_ctrl_transport_config_t** transport_config
Transport layer over which service will be provided

**esp_local_ctrl_proto_sec_cfg_t** proto_sec
Security version and POP

**esp_local_ctrl_handlers_t** handlers
Register handlers for responding to get/set requests on properties

**size_t** max_properties
This limits the number of properties that are available at a time

**Macros**

**ESP_LOCAL_CTRL_TRANSPORT_BLE**

**ESP_LOCAL_CTRL_TRANSPORT_HTTPD**

**Type Definitions**

typedef struct **esp_local_ctrl_prop** esp_local_ctrl_prop_t
Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

typedef struct **esp_local_ctrl_prop_val** esp_local_ctrl_prop_val_t
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct **esp_local_ctrl_handlers** esp_local_ctrl_handlers_t
Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by esp_local_ctrl.t

**protocomm_ble_config esp_local_ctrl_transport_config_ble_t**
Configuration for transport mode BLE.

This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

**httpd_ssl_config esp_local_ctrl_transport_config_httpd_t**
Configuration for transport mode HTTPD.

This is a forward declaration for httpd_ssl_config_t. To use this, application must set CONFIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h

**typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t**
Security types for esp_local_control.
typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t
typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t
typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to esp_local_ctrl_start()

Enumerations
enum esp_local_ctrl_proto_sec
    Security types for esp_local_control.
    Values:
    enumerator PROTOCOM_SEC0
    enumerator PROTOCOM_SEC1
    enumerator PROTOCOM_SEC2
    enumerator PROTOCOM_SEC_CUSTOM

2.2.7 ESP Serial Slave Link

Overview
Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.
After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols
For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave
This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.
The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.
**SDIO Slave Capabilities of Espressif chips**  The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

<table>
<thead>
<tr>
<th>Services</th>
<th>ESP32</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDIO slave</td>
<td>Y</td>
</tr>
<tr>
<td>Tohost intr</td>
<td>8</td>
</tr>
<tr>
<td>Frhost intr</td>
<td>8</td>
</tr>
<tr>
<td>TX DMA</td>
<td>Y</td>
</tr>
<tr>
<td>RX DMA</td>
<td>Y</td>
</tr>
<tr>
<td>Shared registers</td>
<td>56*</td>
</tr>
</tbody>
</table>

- * Not including the interrupt registers

**ESP SDIO Slave Initialization**  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of *SDIO Simplified Specification*). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000  
   CMD5 arg = 0x00FF8000 (according to the response above, poll until ready)  
   **Example**: Arg of R4 after first CMD5 (arg=0x00000000) is 0xxxFFFFF00.  
   Keep sending CMD5 with arg=0x00FFFFF00 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)  
   **Example**: Arg of R6 after CMD3 is 0x0001xxxx.  
   Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)  
    CMD52/53 (Write 0x10=0x00)  
    CMD52/53 (Write 0x11=0x02)  
    CMD52/53 (Read 0x10~0x11, read to check the final value)
11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)  
    CMD52/53 (Write 0x110=0x00)  
    CMD52/53 (Write 0x111=0x02)  
    CMD52/53 (Read 0x110~0x111, read to check the final value)

**ESP SDIO Slave Protocol**  The ESP SDIO Slave protocol is based on the SDIO Specification’s I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see *ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers [PDF]*)
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example `peripherals/sdio`.

The **ESP Serial Slave Link** component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

**Slave register table**
Chapter 2. API

32-bit

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

8-bit

Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

FIFO (sending and receiving) 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[
\text{requested length} = 0x1F800 - \text{address}
\]

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the requested length, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

**Interrupts**

SDIO interrupts are “level sensitive”. For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

**Receiving FIFO**

To write to the slave’s receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044)**. The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** (buffer_size x buffer_num is greater than the data to write, buffer_size is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the requested length should not exceed the length calculated at Step 2, and the FIFO address is related to requested length.

4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

**Sending FIFO** To read the slave’s sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. **Read from the FIFO using CMD53.** Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to requested length.
5. **Update the read length.**

警告：The driver for ESP32 hasn’t been developed yet.

**ESP SPI Slave HD (Half Duplex) Mode Protocol**

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
  
  This phase determines the rest phases of the transactions. See Supported Commands.

- **Address:** 8-bit, master to slave, optional
  
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write/to read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy:** 8-bit, floating, optional
  
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data:** variable length, the direction is also determined by the command.
  
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The direction means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.
Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

**QPI Mode**  The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.
### Segment Transaction Mode
Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

### Terminology
- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the esp_serial_slave_link component.
- **ESSL device**: A virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: A handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  
  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: The slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: A counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: A counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts**: The slave can inform the master about certain events by the interrupt line. (optional)
2. **Frohost Interrupts**: The master can inform the slave about certain events.
3. **Tx FIFO (master to slave)**: The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See *SDIO Slave Capabilities of Expressif chips* and *SPI Slave Capabilities of Expressif chips* for more details.

**Initialization of ESP Serial Slave Link**

**ESP SDIO Slave**  
The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmcc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmcc card (see doc: Document of SDMMC driver <api-reference/storage/sdmmc>) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The card member should be the `sdmmc_card_t` got in step 2, and the recv_buffer_size member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**  
备注： If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts (optional)**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Frhost Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.
RX FIFO

1. Call \texttt{essl\_get\_rx\_data\_size()} to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the \textit{rx\_data\_size} for once, if the current \textit{rx\_data\_size} is shorter than the buffer size the master prepared to receive. And it may poll the \textit{rx\_data\_size} if the \textit{rx\_dat\_size} keeps 0, until timeout.

2. Call \texttt{essl\_get\_packet()} to receive data from the slave.

Reset counters (Optional) Call \texttt{essl\_reset\_cnt()} to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO peripherals/sdio.

Please refer to the specific example README.md for details.

API Reference

Header File

- \texttt{components/driver/test\_apps/components/esp\_serial\_slave\_link/include/esp\_serial\_slave\_link/essl.h}

Functions

\texttt{esp\_err\_t essl\_init (essl\_handle\_t handle, uint32\_t wait\_ms)}

Initialize the slave.

- \texttt{handle} - Handle of an ESSL device.
- \texttt{wait\_ms} - Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer \texttt{init}.

\texttt{esp\_err\_t essl\_wait\_for\_ready (essl\_handle\_t handle, uint32\_t wait\_ms)}

Wait for interrupt of an ESSL slave device.

- \texttt{handle} - Handle of an ESSL device.
- \texttt{wait\_ms} - Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

\texttt{esp\_err\_t essl\_get\_tx\_buffer\_num (essl\_handle\_t handle, uint32\_t *out\_tx\_num, uint32\_t wait\_ms)}

Get buffer num for the host to send data to the slave. The buffers are size of \textit{buffer\_size}.

- \texttt{handle} - Handle of a ESSL device.
- \texttt{out\_tx\_num} - Output of buffer num that host can send data to ESSL slave.
- \texttt{wait\_ms} - Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
• One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_get_rx_data_size(essl_handle_t handle, uint32_t*out_rx_size, uint32_t wait_ms)
```

Get the size, in bytes, of the data that the ESSL slave is ready to send.

参数
- **handle** - Handle of an ESSL device.
- **out_rx_size** - Output of data size to read from slave, in bytes
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode

```c
esp_err_t essl_reset_cnt (essl_handle_t handle)
```

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

参数 **handle** - Handle of an ESSL device.

返回
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode

```c
esp_err_t essl_send_packet (essl_handle_t handle, const void* start, size_t length, uint32_t wait_ms)
```

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is buffer_size (configured during initialization).

参数
- **handle** - Handle of an ESSL device.
- **start** - Start address of the packet to send
- **length** - Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode

```c
esp_err_t essl_get_packet (essl_handle_t handle, void*out_data, size_t size, size_t*out_length, uint32_t wait_ms)
```

Get a packet from ESSL slave.

参数
- **handle** - Handle of an ESSL device.
- **out_data** - [out] Data output address
- **size** - The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- **out_length** - [out] Output of length the data actually received from slave.
- **wait_ms** - Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode

One of the error codes from SDMMC/SPI host controller.
```c
esp_err_t essl_write_reg(essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t* value_o, uint32_t wait_ms)
```

Write general purpose R/W registers (8-bit) of ESSL slave.

<table>
<thead>
<tr>
<th>参数</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle – Handle of an ESSL device.</td>
<td></td>
</tr>
<tr>
<td>addr – Address of register to write. For SDIO, valid address: 0-59. For SPI, see essl_spi.h</td>
<td>sdio 28-31 are reserved, the lower API helps to skip.</td>
</tr>
<tr>
<td>value – Value to write to the register.</td>
<td></td>
</tr>
<tr>
<td>value_o – Output of the returned written value.</td>
<td></td>
</tr>
<tr>
<td>wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.</td>
<td></td>
</tr>
</tbody>
</table>

返回
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_read_reg(essl_handle_t handle, uint8_t add, uint8_t* value_o, uint32_t wait_ms)
```

Read general purpose R/W registers (8-bit) of ESSL slave.

<table>
<thead>
<tr>
<th>参数</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle – Handle of an ESSL device.</td>
<td></td>
</tr>
<tr>
<td>add – Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see essl_spi.h</td>

</tbody>
</table>

返回
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

<table>
<thead>
<tr>
<th>参数</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle – Handle of an ESSL device.</td>
<td></td>
</tr>
<tr>
<td>wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.</td>
<td></td>
</tr>
</tbody>
</table>

返回
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

<table>
<thead>
<tr>
<th>参数</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle – Handle of an ESSL device.</td>

<td>wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.</td>
<td></td>
</tr>
</tbody>
</table>

返回
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

<table>
<thead>
<tr>
<th>参数</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle – Handle of an ESSL device.</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 2. API

• **intr_raw** – Output of the raw interrupt bits. Set to NULL if only masked bits are read.
• **intr_st** – Output of the masked interrupt bits. Set to NULL if only raw bits are read.
• **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

• ESP_OK: Success
• ESP_INVALID_ARG: If both **intr_raw** and **intr_st** are NULL.
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller

**esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)**

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

参数

• **handle** – Handle of an ESSL device.
• **ena_mask** – Mask of the interrupt bits to enable.
• **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

• ESP_OK: Success
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller

**esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t* ena_mask_o, uint32_t wait_ms)**

Get interrupt enable bits of ESSL slave.

参数

• **handle** – Handle of an ESSL device.
• **ena_mask_o** – Output of interrupt bit enable mask.
• **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

• ESP_OK: Success
• One of the error codes from SDMMC host controller

**esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)**

Send interrupts to slave. Each bit of the interrupt will be triggered.

参数

• **handle** – Handle of an ESSL device.
• **intr_mask** – Mask of interrupt bits to send to slave.
• **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

• ESP_OK: Success
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller

Type Definitions

typedef struct essl_dev_t *essl_handle_t

Handle of an ESSL device.

Header File

• components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

Functions

**esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)**

Initialize the ESSL SDIO device and get its handle.

参数
Chapter 2. API 参考

- **out_handle** - Output of the handle.
- **config** - Configuration for the ESSL SDIO device.

**返回**
- **ESP_OK**: on success
- **ESP_ERR_NO_MEM**: memory exhausted.

```c
esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)
```

Deinitialize and free the space used by the ESSL SDIO device.

**参数**
- **handle** - Handle of the ESSL SDIO device to deinit.

**返回**
- **ESP_OK**: on success
- **ESP_ERR_INVALID_ARG**: wrong handle passed

**Structures**

```c
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

**Public Members**

```c
sdmmc_card_t *card
```

The initialized sdmmc card pointer of the slave.

```c
int recv_buffer_size
```

The pre-negotiated recv buffer size used by both the host and the slave.

**Header File**

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

**Functions**

```c
esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)
```

Initialize the ESSL SPI device function list and get its handle.

**参数**
- **out_handle** - [out] Output of the handle
- **init_config** - Configuration for the ESSL SPI device

**返回**
- **ESP_OK**: On success
- **ESP_ERR_NO_MEM**: Memory exhausted
- **ESP_ERR_INVALID_STATE**: SPI driver is not initialized
- **ESP_ERR_INVALID_ARG**: Wrong register ID

```c
esp_err_t essl_spi_deinit_dev (essl_handle_t handle)
```

Deinitialize the ESSL SPI device and free the memory used by the device.

**参数**
- **handle** - Handle of the ESSL SPI device

**返回**
- **ESP_OK**: On success
- **ESP_ERR_INVALID_STATE**: ESSL SPI is not in use

```c
esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)
```

Read from the shared registers.
The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

**Parameters**

- `arg` - Context of the component. (Member `arg` from `essl_handle_t`)
- `addr` - Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- `out_value` - [out] Read buffer for the shared registers.
- `wait_ms` - Time to wait before timeout (reserved for future use, user should set this to 0).

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from `spi_device_transmit`.

```c
esp_err_t essl_spi_get_packet(void *arg, void *out_data, size_t size, uint32_t wait_ms)
```

Get a packet from Slave.

**Parameters**

- `arg` - Context of the component. (Member `arg` from `essl_handle_t`)
- `out_data` - [out] Output data address
- `size` - The size of the output data.
- `wait_ms` - Time to wait before timeout (reserved for future use, user should set this to 0).

**Return**

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

```c
esp_err_t essl_spi_write_reg(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)
```

Write to the shared registers.

**Parameters**

- `arg` - Context of the component. (Member `arg` from `essl_handle_t`)
- `addr` - Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- `value` - Buffer for data to send, should be align to 4.
- `out_value` - [out] Not supported, should be set to NULL.
- `wait_ms` - Time to wait before timeout (reserved for future use, user should set this to 0).

**Return**

- ESP_OK: success

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

```c
esp_err_t essl_spi_write_reg(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)
```
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
• ESP_ERR_NOT_SUPPORTED: Should set out_value to NULL. See note 2.
• or other return value from: \cpp\func\spi_device_transmit.

\textbf{esp_err_t essl_spi_send_packet} (void *arg, const void *data, size_t size, uint32_t wait_ms)
Send a packet to Slave.

### 参数
- \textbf{arg} – Context of the component. (Member \texttt{arg} from \texttt{essl_handle_t})
- \textbf{data} – Address of the data to send
- \textbf{size} – Size of the data to send.
- \textbf{wait_ms} – Time to wait before timeout (reserved for future use, user should set this to 0).

### 返回
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send size bytes of data but Slave did not load enough RX buffer

\textbf{void essl_spi_reset_cnt} (void *arg)
Reset the counter in Master context.

### 备注:
Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized.

### 参数 \textbf{arg} – Context of the component. (Member \texttt{arg} from \texttt{essl_handle_t})

\textbf{esp_err_t essl_spi_rdbuf} (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in ISR way.

### 备注:
The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

### 备注:
\texttt{out_data} should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the \texttt{len} is shorter than a word.

### 参数
- \textbf{spi} – SPI device handle representing the slave
- \textbf{out_data} – [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- \textbf{addr} – Address of the slave shared buffer
- \textbf{len} – Length to read
- \textbf{flags} – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### 返回
- ESP_OK: on success
- or other return value from \cpp\func\spi_device_transmit.

\textbf{esp_err_t essl_spi_rdbuf_polling} (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in polling way.
Chapter 2. API

备注: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

参数
- spi – SPI device handle representing the slave
- out_data – [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- addr – Address of the slave shared buffer
- len – Length to read
- flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回
- ESP_OK: on success
- or other return value from \cpp{func}{spi_device_transmit}.

\cpp{func}{essl_spi_wrbuf}(spi_device_handle_t spi, const uint8_t* data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in ISR way.

备注: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

参数
- spi – SPI device handle representing the slave
- data – Buffer for data to send, strongly suggested to be in the DRAM
- addr – Address of the slave shared buffer
- len – Length to write
- flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回
- ESP_OK: success
- or other return value from \cpp{func}{spi_device_transmit}.

\cpp{func}{essl_spi_wrbuf_polling}(spi_device_handle_t spi, const uint8_t* data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in polling way.

备注: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

参数
- spi – SPI device handle representing the slave
- data – Buffer for data to send, strongly suggested to be in the DRAM
- addr – Address of the slave shared buffer
- len – Length to write
- flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回
- ESP_OK: success
- or other return value from \cpp{func}{spi_device_polling_transmit}.

\cpp{func}{essl_spi_rddma}(spi_device_handle_t spi, uint8_t* out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.
This function combines several \cpp{essl_spi_rddma_seg} and one \cpp{essl_spi_rddma_done} at the end. Used when the slave is working in segment mode.

**Parameters**
- **spi** – SPI device handle representing the slave
- **out_data** – [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** – Total length of data to receive.
- **seg_len** – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Retuns**
- ESP_OK: success
- or other return value from \cpp{spi_device_transmit}.

\cpp{esp_err_t essl_spi_rddma_seg(spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)}
Read one data segment from the slave through its DMA.

**备注:** To read long buffer, call \cpp{essl_spi_rddma} instead.

**Parameters**
- **spi** – SPI device handle representing the slave
- **out_data** – [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **seg_len** – Length of this segment
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from \cpp{spi_device_transmit}.

\cpp{esp_err_t essl_spi_rddma_done(spi_device_handle_t spi, uint32_t flags)}
Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**备注:** This is required only when the slave is working in segment mode.

**Parameters**
- **spi** – SPI device handle representing the slave
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from \cpp{spi_device_transmit}.

\cpp{esp_err_t essl_spi_wrdma(spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)}
Send long buffer in segments to the slave through its DMA.

**备注:** This function combines several \cpp{essl_spi_wrdma_seg} and one \cpp{essl_spi_wrdma_done} at the end. Used when the slave is working in segment mode.
• `spi` – SPI device handle representing the slave
• `data` – Buffer for data to send, strongly suggested to be in the DRAM
• `len` – Total length of data to send.
• `seg_len` – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
• `flags` – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Return
• ESP_OK: success
• or other return value from `cpp:func:spi_device_transmit`.

```c
esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t* data, int seg_len, uint32_t flags)
```
Send one data segment to the slave through its DMA.

**Note:** To send long buffer, call `cpp:func:essl_spi_wrdma` instead.

### Parameter
• `spi` – SPI device handle representing the slave
• `data` – Buffer for data to send, strongly suggested to be in the DRAM
• `seg_len` – Length of this segment
• `flags` – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Return
• ESP_OK: success
• or other return value from `cpp:func:spi_device_transmit`.

```c
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```
Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

**Note:** This is required only when the slave is working in segment mode.

### Parameter
• `spi` – SPI device handle representing the slave
• `flags` – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Return
• ESP_OK: success
• or other return value from `cpp:func:spi_device_transmit`.

### Structures

```c
struct essl_spi_config_t
```
Configuration of ESSL SPI device.

### Public Members

```c
spi_device_handle_t *spi
```
Pointer to SPI device handle.

```c
uint32_t tx_buf_size
```
The pre-negotiated Master TX buffer size used by both the host and the slave.
uint8_t tx_sync_reg
The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8_t rx_sync_reg
The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 Certificate Bundle

Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 11 03:12:05 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE: automatically build and attach the bundle.
- CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE: decide which certificates to include from the complete root list.
- CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process.
Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here. The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla.

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, `cmn_crtAuthorities.csv`, from this list provided by Mozilla.

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in Generating the List of Root Certificates.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: `protocols/https_x509_bundle`.

HTTPS example that uses ESP-TLS and the default bundle: `protocols/https_request`.

HTTPS example that uses mbedTLS and the default bundle: `protocols/https_mbedtls`.

API Reference

Header File

- `components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h`

Functions

```c
esp_err_t esp_crt_bundle_attach(void *conf)
```

Attach and enable use of a bundle for certificate verification.

- `conf` - [in] The config struct for the SSL connection.
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

```c
void esp_crt_bundle_detach(mbedtls_ssl_config *conf)
```

Disable and dealloc the certification bundle.

- `conf` - [in] The config struct for the SSL connection.
- Removes the certificate verification callback and deallocates used resources.
esp_err_t esp_crt_bundle_set (const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

参数

返回
- ESP_OK if adding certificates was successful.
- Other if an error occured or an action must be taken by the calling process.

2.2.9 HTTP 服务器

概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤:

- httpd_start(): 创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用于监听 HTTP 流量 (TCP 类型)，另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 httpd_start() 传递 httpd_config_t 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序。在处理程序中需要发送回 HTTP 响应数据包。
- httpd_stop(): 根据传入的句柄停止服务器，并释放相关的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- httpd_register_uri_handler(): 通过传入 httpd_uri_t 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员: uri 名字，method 类型（比如 HTTPD_GET/HTTPD_POST/HTTPD_PUT 等等），esp_err_t *handler (httpd_req_t *req) 类型的函数指针，指向用户上下文数据的 user_ctx 指针。

应用示例

```c
/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler (httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char[] resp = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST/uri 请求时被调用 */
esp_err_t post_handler (httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓冲区 */
    char content[100];
    httpd_req_recv(req, HTTPD_RECV_REPLACE);
    /* 任意二进制数据（需要类型转换）
    * 对于字符串数据，null 终止符会被省略，
    * content_len 会给出字符串的长度 */
    // 假定这里的内容是字符串
    char content[100];
    // 此处用于处理字符串数据
```
Chapter 2. API

```c
/* 如果内容长度大于缓冲区则截断 */
size_t recv_size = MIN(req->content_len, sizeof(content));

int ret = httpd_req_recv(req, content, recv_size);
if (ret <= 0) { /* 返回 0 表示连接已关闭 */
  /* 检查是否超时 */
  if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
    /* 如果是超时，可以调用 httpd_req_recv() 重试 */
    /* 简单起见，这里我们直接 */
    /* 响应 HTTP 408（请求超时）错误给客户端 */
    httpd_resp_send_408(req);
  }
  /* 如果发生了错误，返回 ESP_FAIL 可以确保 */
  /* 底层套接字被关闭 */
  return ESP_FAIL;
}

/* 发送简单的响应数据包 */
const char[] resp = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
  .uri = "/uri",
  .method = HTTP_GET,
  .handler = get_handler,
  .user_ctx = NULL
};

/* POST/uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
  .uri = "/uri",
  .method = HTTP_POST,
  .handler = post_handler,
  .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
  /* 生成默认的配置参数 */
  httpd_config_t config = HTTPD_DEFAULT_CONFIG();

  /* 置空 esp_http_server 的实例句柄 */
  httpd_handle_t server = NULL;

  /* 启动 httpd server */
  if (httpd_start(&server, &config) == ESP_OK) {
    /* 注册 URI 处理程序 */
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
  }
  /* 如果服务器启动失败，返回的句柄是 NULL */
  return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
```
简单 HTTP 服务器示例 请查看位于 protocols/http_server/simple 的 HTTP 服务器示例，该示例演示了如何处理任意内容长度的数据，读取请求头和 URL 查询参数，设置响应头。

HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定自定义的回调函数，以便在连接/会话被关闭时释放这部分内存资源。

长连接示例

```c
/* 自定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 若上下文中不存在会话，则新建一个 */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*！< 指向上下文数据 */
        req->free_ctx = free_ctx_func;
        /*！< 释放上下文数据的函数 */
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* 响应 */
    .................
    .................

    return ESP_OK;
}
```

详情请参考位于 protocols/http_server/persistent_sockets 的示例代码。

Websocket 服务器

HTTP 服务器组件提供 websocket 支持。可以在 menuconfig 中使用 CONFIG_HTTPD_WS_SUPPORT 选项启用 websocket 功能。有关如何使用 websocket 功能，请参阅 protocols/http_server/ws_echo_server 目录下的示例代码。

API 参考

Header File
• components/esp_http_server/include/esp_http_server.h

**Functions**

```c
esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)
```

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

**Notes:** URI handlers can be registered in real time as long as the server handle is valid.
• **method** [in] HTTP method

返回
• ESP_OK: On successfully deregistering the handler
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

**esp_err_t httpd_unregister_uri (httpd_handle_t handle, const char *uri)**

Unregister all URI handlers with the specified uri string.

参数
• **handle** [in] handle to HTTPD server instance
• **uri** [in] uri string specifying all handlers that need to be deregistered

返回
• ESP_OK: On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_NOT_FOUND: No handler registered with specified uri string

**esp_err_t httpd_sess_set_recv_override (httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)**

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

备注: 此API意应在必要时从上下文中被调用，包括
• an http session API where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

参数
• **hd** [in] HTTPD instance handle
• **sockfd** [in] Session socket FD
• **recv_func** [in] The receive function to be set for this session

返回
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t httpd_sess_set_send_override (httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)**

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

备注: 此API意应在必要时从上下文中被调用，包括
• an http session API where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

参数
• **hd** [in] HTTPD instance handle
• **sockfd** [in] Session socket FD
• **send_func** [in] The send function to be set for this session

返回
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t httpd_sess_set_pending_override (httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)**

参数
• **hd** [in] HTTPD instance handle
• **sockfd** [in] Session socket FD
• **send_func** [in] The send function to be set for this session

返回
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG: Null arguments
Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

备注：This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

参数
• hd  [in] HTTPD instance handle
• sockfd  [in] Session socket FD
• pending_func  [in] The receive function to be set for this session

返回
• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

int httpd_req_to_sockfd (httpd_req_t *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

备注：This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

参数 r  [in] The request whose socket descriptor should be found

返回
• Socket descriptor : The socket descriptor for this request
• -1 : Invalid/NULL request pointer

int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

备注：
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
• Presently Chunked Encoding is not supported

参数
• r  [in] The request being responded to
• buf  [in] Pointer to a buffer that the data will be read into
• buf_len  [in] Length of the buffer

返回
• Bytes : Number of bytes read into the buffer successfully
Chapter 2. API

- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

\[
\text{size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)}
\]

Search for a field in request headers and return the string length of it’s value.

**备注:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**参数**
- \( r \) [in] The request being responded to
- \( field \) [in] The header field to be searched in the request

返回
- Length: If field is found in the request URL
- Zero: Field not found / Invalid request / Null arguments

\[
\text{esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)}
\]

Get the value string of a field from the request headers.

**备注:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

**参数**
- \( r \) [in] The request being responded to
- \( field \) [in] The field to be searched in the header
- \( val \) [out] Pointer to the buffer into which the value will be copied if the field is found
- \( val\_size \) [in] Size of the user buffer “val”

返回
- ESP_OK: Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

\[
\text{size_t httpd_req_get_url_query_len (httpd_req_t *r)}
\]

Get Query string length from the request URL.

**备注:** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

**参数** \( r \) [in] The request being responded to
Chapter 2. API

**esp_err_t** httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)

Get Query string from the request URL.

**备注：**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string.

**参数**

- **r** -[in] The request being responded to
- **buf** -[out] Pointer to the buffer into which the query string will be copied (if found)
- **buf_len** -[in] Length of output buffer

**返回**

- **ESP_OK** : Query is found in the request URL and copied to buffer
- **ESP_ERR_NOT_FOUND** : Query not found
- **ESP_ERR_INVALID_ARG** : Null arguments
- **ESP_ERR_HTTPD_INVALID_REQ** : Invalid HTTP request pointer
- **ESP_ERR_HTTPD_RESULT_TRUNC** : Query string truncated

**esp_err_t** httpd_query_key_value(const char*qry, const char*key, char*val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

**备注：**

- The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

**参数**

- **qry** -[in] Pointer to query string
- **key** -[in] The key to be searched in the query string
- **val** -[out] Pointer to the buffer into which the value will be copied if the key is found
- **val_size** -[in] Size of the user buffer “val”

**返回**

- **ESP_OK** : Key is found in the URL query string and copied to buffer
- **ESP_ERR_NOT_FOUND** : Key not found
- **ESP_ERR_INVALID_ARG** : Null arguments
- **ESP_ERR_HTTPDRESULT_TRUNC** : Value string truncated
**esp_err_t** httpd_req_get_cookie_val (httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

**参数**
- `req` - [in] Pointer to the HTTP request
- `cookie_name` - [in] The cookie name to be searched in the request
- `val` - [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- `val_size` - [inout] Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length in case ESP_ERR_HTTPD_RESULT_TRUNC is returned.

**返回**
- ESP_OK: Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
- ESP_ERR_NO_MEM: Memory allocation failure

**bool** httpd_uri_matchWildcard (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

**Example:**
- * matches everything
- /foo/ matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/? or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

**参数**
- `uri_template` - [in] URI template (pattern)
- `uri_to_match` - [in] URI to be matched
- `match_upto` - [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

**返回**
- true if a match was found

**esp_err_t** httpd_resp_send (httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:
- httpd_resp_set_status() - for setting the HTTP status string,
- httpd_resp_set_type() - for setting the Content Type,
- httpd_resp_set_hdr() - for appending any additional field value entries in the response header

**备注:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
### esp_err_t httpd_resp_send_chunk (httpd_req_t *r, const char *buf, ssize_t buf_len)

This API sends one HTTP chunk.

This API will send the data as an HTTP response to the request. It will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- `httpd_resp_set_status()` - for setting the HTTP status string,
- `httpd_resp_set_type()` - for setting the Content Type,
- `httpd_resp_set_hdr()` - for appending any additional field-value entries in the response header.

**Note:**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string.
static inline esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

**参数**
- `r` – [in] The request being responded to
- `str` – [in] String to be sent as response body (NULL to finish response packet)

**返回**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

**esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)**

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**备注:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**参数**
- `r` – [in] The request being responded to
- `status` – [in] The HTTP status code of this response

**返回**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)**

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**备注:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**参数**
- `r` – [in] The request being responded to
- `type` – [in] The Content Type of the response

**返回**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

## esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

### 备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

### 参数

- `r` –[in] The request being responded to
- `field` –[in] The field name of the HTTP header
- `value` –[in] The value of this HTTP header

### 返回

- ESP_OK : On successfully appending new header
- ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
- ESP_OK : On successfully appending new header

## esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)

For sending out error code in response to HTTP request.

### 备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

### 参数

- `req` –[in] Pointer to the HTTP request for which the response needs to be sent
- `error` –[in] Error type to send
- `msg` –[in] Error message string (pass NULL for default message)

### 返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

## static inline esp_err_t httpd_resp_send_404 (httpd_req_t *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

### 备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
Chapter 2. API 参考

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### 参数 r [in] The request being responded to

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline esp_err_t httpd_resp_send_408(httpd_req_t *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

### 备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### 参数 r [in] The request being responded to

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline esp_err_t httpd_resp_send_500(httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

### 备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### 参数 r [in] The request being responded to

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

int httpd_send(httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,
and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

备注:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of: httpd_resp_send(), httpd_resp_send_chunk()

参数
- r [-in] The request being responded to
- buf [-in] Buffer from where the fully constructed packet is to be read
- buf_len [-in] Length of the buffer

返回
- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int httpd_socket_send (http_handle_t hd, int sockfd, const char* buf, size_t buf_len, int flags)
A low level API to send data on a given socket

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

参数
- hd [-in] server instance
- sockfd [-in] session socket file descriptor
- buf [-in] buffer with bytes to send
- buf_len [-in] data size
- flags [-in] flags for the send() function

返回
- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int httpd_socket_recv (http_handle_t hd, int sockfd, char* buf, size_t buf_len, int flags)
A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.
Chapter 2. API

- **hd** - [in] server instance
- **sockfd** - [in] session socket file descriptor
- **buf** - [in] buffer with bytes to send
- **buf_len** - [in] data size
- **flags** - [in] flags for the send() function

返回
- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**esp_err_t httpd_register_err_handler** (*httpd_handle_t* handle, *httpd_err_code_t* error, *httpd_err_handler_func_t* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd_err_code_t*. See prototype *httpd_err_handler_func_t* above for details.

参数
- **handle** - [in] HTTP server handle
- **error** - [in] Error type
- **handler_fn** - [in] User implemented handler function (Pass NULL to unset any previously set handler)

返回
- **ESP_OK** : handler registered successfully
- **ESP_ERR_INVALID_ARG** : invalid error code or server handle

**esp_err_t httpd_start** (*httpd_handle_t* *handle*, const *httpd_config_t* *config*)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

参数
- **config** - [in] Configuration for new instance of the server
- **handle** - [in] Handle to newly created instance of the server. NULL on error

返回
- **ESP_OK** : Instance created successfully
- **ESP_ERR_INVALID_ARG** : Null argument(s)
**Chapter 2. API 参考**

- **ESP_ERR_HTTPD_ALLOC_MEM**: Failed to allocate memory for instance
- **ESP_ERR_HTTPD_TASK**: Failed to launch server task

### esp_err_t httpd_stop (httpd_handle_t handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**参数 handle [in]** Handle to server returned by httpd_start

**返回**

- **ESP_OK**: Server stopped successfully
- **ESP_ERR_INVALID_ARG**: Handle argument is null

### esp_err_t httpd_queue_work (httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution.

**备注**: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

**参数**

- **handle [in]** Handle to server returned by httpd_start
- **work [in]** Pointer to the function to be executed in the HTTPD’s context
- **arg [in]** Pointer to the arguments that should be passed to this function

**返回**

- **ESP_OK**: On successfully queueing the work
- **ESP_FAIL**: Failure in ctrl socket
- **ESP_ERR_INVALID_ARG**: Null arguments

### void *httpd_sess_get_ctx (httpd_handle_t handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**参数**

- **handle [in]** Handle to server returned by httpd_start
- **sockfd [in]** The socket descriptor for which the context should be extracted.

**返回**

- **void**: Pointer to the context associated with this session
- **NULL**: Empty context / Invalid handle / Invalid socket fd
Chapter 2. API 参考

void httpd_sess_set_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session context by socket descriptor.

参数
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.
• ctx [in] Context object to assign to the session
• free_fn [in] Function that should be called to free the context

void *httpd_sess_get_transport_ctx (httpd_handle_t handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

参见:
httpd_sess_get_ctx()

参数
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.

返回
• void*: Pointer to the transport context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_transport_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session ‘transport’ context by socket descriptor.

参见:
httpd_sess_set_ctx()

参数
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.
• ctx [in] Transport context object to assign to the session
• free_fn [in] Function that should be called to free the transport context

void *httpd_get_global_user_ctx (httpd_handle_t handle)

Get HTTPD global user context (it was set in the server config struct)

参数 handle [in] Handle to server returned by httpd_start
返回 global user context

void *httpd_get_global_transport_ctx (httpd_handle_t handle)

Get HTTPD global transport context (it was set in the server config struct)

参数 handle [in] Handle to server returned by httpd_start
返回 global transport context

esp_err_t httpd_sess_trigger_close (httpd_handle_t handle, int sockfd)

Trigger an httpd session close externally.

备注: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

参数
Chapter 2. API

- **handle** - [in] Handle to server returned by `httpd_start`
- **sockfd** - [in] The socket descriptor of the session to be closed

**返回**
- **ESP_OK**: On successfully initiating closure
- **ESP_FAIL**: Failure to queue work
- **ESP_ERR_NOT_FOUND**: Socket fd not found
- **ESP_ERR_INVALID_ARG**: Null arguments

```c
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**备注**: Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

```c
esp_err_t httpd_get_client_list(httpd_handle_t handle, size_t *fds, int *client_fds)
```

Returns list of current socket descriptors of active sessions.

**备注**: Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in `httpd_config_t` structure.

---

**参数**
- **handle** - [in] Handle to server returned by `httpd_start`
- **sockfd** - [in] The socket descriptor of the session for which LRU counter is to be updated

**返回**
- **ESP_OK**: Socket found and LRU counter updated
- **ESP_ERR_NOT_FOUND**: Socket not found
- **ESP_ERR_INVALID_ARG**: Null arguments

```c
httpd_sess_update_lru_counter(handle, sockfd)
```

Returns list of current socket descriptors of active sessions.

---

**备注**: Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in `httpd_config_t` structure.

---

**参数**
- **handle** - [in] Handle to server returned by `httpd_start`
- **fds** - [inout] In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **client_fds** - [out] Array of client fds

**返回**
- **ESP_OK**: Successfully retrieved session list
- **ESP_ERR_INVALID_ARG**: Wrong arguments or list is longer than provided array

**Structures**

```c
struct httpd_config
```

HTTP Server Configuration Structure.

**备注**: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.
Public Members

unsigned **task_priority**
Priority of FreeRTOS task which runs the server

size_t **stack_size**
The maximum stack size allowed for the server task

BaseType_t **core_id**
The core the HTTP server task will run on

uint16_t **server_port**
TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**
UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_opensockets**
Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16_t **max_uri_handlers**
Maximum allowed uri handlers

uint16_t **max_resp_headers**
Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**
Number of backlog connections

bool **lru_purge_enable**
Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**
Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**
Timeout for send function (in seconds)

void **global_user_ctx**
Global user context.
This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.
When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
If you wish to use a custom function for freeing the global user context, please specify that here.

```
httpd_free_ctx_fn_t **global_user_ctx_free_fn**
Free function for global user context
```
void *global_transport_ctx

Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn

Free function for global transport context

bool enable_so_linger

bool to enable/disable linger

int linger_timeout

linger timeout (in seconds)

bool keep_alive_enable

Enable keep-alive timeout

int keep_alive_idle

Keep-alive idle time. Default is 5 (second)

int keep_alive_interval

Keep-alive interval time. Default is 5 (second)

int keep_alive_count

Keep-alive packet retry send count. Default is 3 counts

httpd_open_func_t open_fn

Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx().

Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.

This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, close(sockfd) should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.
httpd_uri_match_func_t uri_match_fn

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using httpd_register_uri_handler()

Available options are: 1) NULL : Internally do basic matching using strncmp() 2) httpd_uri_match_wildcard() : URI wildcard matcher

Users can implement their own matching functions (See description of the httpd_uri_match_func_t function prototype)

struct httpd_req

HTTP Request Data Structure.

Public Members

httpd_handle_t handle

Handle to server instance

int method

The type of HTTP request, -1 if unsupported method

const char uri[HTTPD_MAX_URI_LEN + 1]

The URI of this request (1 byte extra for null termination)

size_t content_len

Length of the request body

void *aux

Internally used members

void *user_ctx

User context pointer passed during URI registration.

void *sess_ctx

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

httpd_free_ctx_fn_t free_ctx

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.

If you wish to use a custom function for freeing the session context, please specify that here.
bool ignore_sess_ctx_changes
Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri
Structure for URI handler.

Public Members

const char *uri
The URI to handle

httpd_method_t method
Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)
Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void *user_ctx
Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD_SOCK_ERR_FAIL

HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200
HTTP Response 200

HTTPD_204
HTTP Response 204

HTTPD_207
HTTP Response 207
HTTPD_400
HTTP Response 400

HTTPD_404
HTTP Response 404

HTTPD_408
HTTP Response 408

HTTPD_500
HTTP Response 500

HTTPD_TYPE_JSON
HTTP Content type JSON

HTTPD_TYPE_TEXT
HTTP Content type text/HTML

HTTPD_TYPE_OCTET
HTTP Content type octet-stream

ESP_HTTPD_DEF_CTRL_PORT
HTTP Server control socket port

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource
Chapter 2. API

**ESP_ERR_HTTPD_TASK**

Failed to launch server task/thread

**HTTPD_RESP_USE_STRLEN**

**Type Definitions**

typedef struct httpd_req httpd_req_t

HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t

Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level send function.

备注：User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

<table>
<thead>
<tr>
<th>Param</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hd</td>
<td>[in] server instance</td>
</tr>
<tr>
<td>sockfd</td>
<td>[in] session socket file descriptor</td>
</tr>
<tr>
<td>buf</td>
<td>[in] buffer with bytes to send</td>
</tr>
<tr>
<td>buf_len</td>
<td>[in] data size</td>
</tr>
<tr>
<td>flags</td>
<td>[in] flags for the send() function</td>
</tr>
</tbody>
</table>

Return

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level recv function.

备注：User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

<table>
<thead>
<tr>
<th>Param</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hd</td>
<td>[in] server instance</td>
</tr>
<tr>
<td>sockfd</td>
<td>[in] session socket file descriptor</td>
</tr>
<tr>
<td>buf</td>
<td>[in] buffer with bytes to send</td>
</tr>
<tr>
<td>buf_len</td>
<td>[in] data size</td>
</tr>
<tr>
<td>flags</td>
<td>[in] flags for the send() function</td>
</tr>
</tbody>
</table>

Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPD's low-level “get pending bytes” function.

备注: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Return
- Bytes : The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket pending()

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

备注:
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

Param req [in] HTTP request for which the error needs to be handled
Param error [in] Error type
Return
- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)

Param ctx [in] object to free
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param** hd **[in]** server instance

**Param** sockfd **[in]** session socket file descriptor

**Return**
- ESP_OK: On success
- Any value other than ESP_OK will signal the server to close the socket immediately

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)

Function prototype for closing a session.

备注: It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Param** hd **[in]** server instance

**Param** sockfd **[in]** session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

**Param** reference_uri **[in]** URI/template with respect to which the other URI is matched

**Param** uri_to_match **[in]** URI/template being matched to the reference URI/template

**Param** match_upto **[in]** For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

**Return** true on match

typedef struct httpd_config httpd_config_t

HTTP Server Configuration Structure.

备注: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)

Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

**Param** arg **[in]** The arguments for this work function

Enumerations

enum httpd_err_code_t

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

**Values:**

enumerator HTTPD_500_INTERNAL_SERVER_ERROR
2.2.10 HTTPS 服务器

概述

HTTPS 服务器组件建立在 HTTP 服务器组件的基础上。该服务器借助常规 HTTP 服务器中的钩子注册函数，注册 SSL 会话回调处理函数。

HTTP 服务器 组件的所有文档同样适用于用户按照本文档搭建的服务器。

API 说明

下列 HTTP 服务器 的 API 已不适用于 HTTPS 服务器。这些 API 仅限内部使用，用于处理安全会话和维护内部状态。

- “send”, “receive” 和 “pending” 回调注册函数——处理安全套接字
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()

- “transport context”——传输层上下文
  - httpd_sess_get_transport_ctx()：返回会话使用的 SSL
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx()：返回共享的 SSL 上下文
  - httpd_config::global_transport_ctx
  - httpd_config::global_transport_ctx_free_fn
Chapter 2. API 参考

- `httpd_config::open_fn`：用于设置安全套接字

其他 API 均可使用，没有其他限制。

如何使用

请参考示例 `protocols/https_server` 来学习如何搭建安全的服务器。

总体而言，您只需要生成证书，将其嵌入到固件中，并且在初始化结构体中配置好正确的证书地址和长度后，将其传入服务器启动函数。

通过改变初始化配置结构体中的标志 `httpd_ssl_config::transport_mode`，可以选择是否需要 SSL 连接来启动服务器。在测试时或在速度比安全性更重要的可信环境中，您可以使用此功能。

性能

建立起始会议大约需要两秒。在时钟速度较慢或日志记录冗余信息较多的情况下，可能需要花费更多时间。后续通过已打开的安全套接字建立请求的速度会更快，最快只需不到 100 ms。

API 参考

Header File

- components/esp_https_server/include/esp_https_server.h

Functions

```c
esp_err_t httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_config_t *config)
```

Create a SSL capable HTTP server (secure mode may be disabled in config)

参数

- `config` [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- `handle` [out] - storage for the server handle, must be a valid pointer

返回 success

```c
esp_err_t httpd_ssl_stop (httpd_handle_t handle)
```

Stop the server. Blocks until the server is shut down.

参数 `handle` [in]

返回

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

Structures

```c
struct esp_https_server_user_cb_arg
```

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

Public Members

```c
httpd_ssl_user_cb_state_t user_cb_state
```

State of user callback
Esp-TLS connection handle

struct \textit{httpd_ssl_config}
\begin{verbatim}
HTTPS server config struct
Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.
\end{verbatim}

Public Members

\begin{verbatim}
httpd_config_t \textit{httpd}
\begin{verbatim}
Underlying HTTPD server config
Parameters like task stack size and priority can be adjusted here.
\end{verbatim}
\end{verbatim}

const uint8_t* \textit{servercert}
\begin{verbatim}
Server certificate
\end{verbatim}

size_t \textit{servercert_len}
\begin{verbatim}
Server certificate byte length
\end{verbatim}

const uint8_t* \textit{cacert_pem}
\begin{verbatim}
CA certificate ((CA used to sign clients, or client cert itself)
\end{verbatim}

size_t \textit{cacert_len}
\begin{verbatim}
CA certificate byte length
\end{verbatim}

const uint8_t* \textit{prvtkey_pem}
\begin{verbatim}
Private key
\end{verbatim}

size_t \textit{prvtkey_len}
\begin{verbatim}
Private key byte length
\end{verbatim}

\begin{verbatim}
httpd_ssl_transport_mode_t \textit{transport_mode}
\begin{verbatim}
Transport Mode (default secure)
\end{verbatim}
\end{verbatim}

uint16_t \textit{port_secure}
\begin{verbatim}
Port used when transport mode is secure (default 443)
\end{verbatim}

uint16_t \textit{port_insecure}
\begin{verbatim}
Port used when transport mode is insecure (default 80)
\end{verbatim}

bool \textit{session_tickets}
\begin{verbatim}
Enable tls session tickets
\end{verbatim}

bool \textit{use_secure_element}
\begin{verbatim}
Enable secure element for server session
\end{verbatim}

\begin{verbatim}
esp_https_server_user_cb \textit{*user_cb}
\begin{verbatim}
User callback for esp_https_server
\end{verbatim}
\end{verbatim}
void *ssl_userdata
user data to add to the ssl context

esp_tls_handshake_callback cert_select_cb
Certificate selection callback to use

const char **alpn_protos
Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

Macros
HTTPD_SSL_CONFIG_DEFAULT()
Default config struct init
(http_server default config had to be copied for customization)

Notes:
• port is set when starting the server, according to `transport_mode`
• one socket uses ~ 40k BRAM with SSL, we reduce the default socket count to 4
• SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
• Stack size may need adjustments depending on the user application

Type Definitions
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

    Param user_cb Callback data struct
typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations
eenum httpd_ssl_transport_mode_t
Values:

    enumerator HTTPD_SSL_TRANSPORT_SECURE

    enumerator HTTPD_SSL_TRANSPORT_INSECURE
eenum httpd_ssl_user_cb_state_t
Indicates the state at which the user callback is executed, i.e at session creation or session close.
Values:

    enumerator HTTPD_SSL_USER_CB_SESS_CREATE

    enumerator HTTPD_SSL_USER_CB_SESS_CLOSE
2.2.11 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session  To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n", recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &total_time_ms, sizeof(total_time_ms));
    printf("Total transmitted = %d packets in %d ms\n", transmitted, total_time_ms);
}
```
void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop ping session You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File
Chapter 2. API

- components/lwip/include/apps/ping/ping_sock.h

**Functions**

*esp_err_t esp_ping_new_session*(const *esp_ping_config_t* config, const *esp_ping_callbacks_t* cbs, *esp_ping_handle_t* hdl_out)

Create a ping session.

参数
- **config** – ping configuration
- **cbs** – a bunch of callback functions invoked by internal ping task
- **hdl_out** – handle of ping session

返回
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

*esp_err_t esp_ping_delete_session*(esp_ping_handle_t hdl)

Delete a ping session.

参数 **hdl** – handle of ping session

返回
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

*esp_err_t esp_ping_start*(esp_ping_handle_t hdl)

Start the ping session.

参数 **hdl** – handle of ping session

返回
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

*esp_err_t esp_ping_stop*(esp_ping_handle_t hdl)

Stop the ping session.

参数 **hdl** – handle of ping session

返回
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

*esp_err_t esp_ping_get_profile*(esp_ping_handle_t hdl, esp_ping_profile_t profile, void* data, uint32_t size)

Get runtime profile of ping session.

参数
- **hdl** – handle of ping session
- **profile** – type of profile
- **data** – profile data
- **size** – profile data size

返回
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Structures**

struct *esp_ping_callbacks_t*

Type of “ping” callback functions.
Public Members

void *cb_args
arguments for callback functions

void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.

void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
Type of "ping" configuration.

Public Members

uint32_t count
A "ping" session contains count procedures

uint32_t interval_ms
Milliseconds between each ping procedure

uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
Size of the data next to ICMP packet header

int tos
Type of Service, a field specified in the IP header

int ttl
Time to Live, a field specified in the IP header

ip_addr_t target_addr
Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
Stack size of internal ping task

uint32_t task_prio
Priority of internal ping task

uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX
Chapter 2. API

**Macros**

`ESP_PING_DEFAULT_CONFIG`()  
Default ping configuration.

`ESP_PING_COUNT_INFINITE`  
Set ping count to zero will ping target infinitely

**Type Definitions**

typedef void *`esp_ping_handle_t`  
Type of “ping” session handle.

**Enumerations**

enum `esp_ping_profile_t`  
Profile of ping session.

  * `ESP_PING_PROF_SEQNO`  
    Sequence number of a ping procedure
  * `ESP_PING_PROF_TOS`  
    Type of service of a ping procedure
  * `ESP_PING_PROF_TTL`  
    Time to live of a ping procedure
  * `ESP_PING_PROF_REQUEST`  
    Number of request packets sent out
  * `ESP_PING_PROF_REPLY`  
    Number of reply packets received
  * `ESP_PING_PROF_IPADDR`  
    IP address of replied target
  * `ESP_PING_PROF_SIZE`  
    Size of received packet
  * `ESP_PING_PROF_TIMEGAP`  
    Elapsed time between request and reply packet
  * `ESP_PING_PROF_DURATION`  
    Elapsed time of the whole ping session

2.2.12 mDNS 服务

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。
自 v5.0 版本起，ESP-IDF 组件 mDNS 已从 ESP-IDF 中迁出至独立的仓库：
### 2.2.13 Mbed TLS

**Mbed TLS** is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

**Note:** ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the [old Mbed TLS site](https://github.com/espressif/esp-mbedTLS).

**Mbed TLS Support in ESP-IDF**

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF here.

**Note:** Please refer the [ESP-IDF Migration Guide](https://github.com/espressif/esp-idf) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

**Application Examples**

Examples in ESP-IDF use **ESP-TLS** which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples `protocols/https_server/simple` (Simple HTTPS server) and `protocols/https_request` (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example `protocols/https_mbedtls`.

**Alternatives**

**ESP-TLS** acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at [https://github.com/espressif/esp-wolfSSL](https://github.com/espressif/esp-wolfSSL) with the upstream submodule pointer.

Please refer to **ESP-TLS: Underlying SSL/TLS Library Options** docs for more information on this and comparison of Mbed TLS and wolfSSL.
Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration

备注: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

<table>
<thead>
<tr>
<th>Mbed Test</th>
<th>TLS Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL Variable Length</td>
<td><code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code></td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td><code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code></td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic TX/RX Buffer</td>
<td><code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code></td>
<td><code>CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code></td>
</tr>
</tbody>
</table>

备注: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in Minimizing Binary Size docs.

此 API 部分的示例代码存放在 ESP-IDF 示例项目的 protocols 目录下。

2.2.14 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档存放在连网 API 目录下。
2.3 藍牙 API

2.3.1 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_defs.h

Structures

struct esp_bt_uuid_t

UUID type.

Public Members

uint16_t len

UUID length, 16bit, 32bit or 128bit

uint16_t uuid16

16bit UUID

uint32_t uuid32

32bit UUID

uint8_t uuid128[ESP_UUID_LEN_128]

128bit UUID

union esp_bt_uuid_t::[anonymous] uuid

UUID

Macros

ESP_BLUEDROID_STATUS_CHECK (status)

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF

Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN

Minimum advertising interval for undirected and low duty cycle directed advertising
ESP_BLE_PRIM_ADV_INT_MAX
Maximum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_CONN_INT_MIN
relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX
relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX
relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN
relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX
relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_PARAM_UNDEF

ESP_BLE_SCAN_PARAM_UNDEF

ESP_BLE_IS_VALID_PARAM (x, min, max)
Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN
Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.
Chapter 2. API

**ESP_APP_ID_MAX**

Maximum of the application id.

**ESP_BD_ADDR_STR**

**ESP_BD_ADDR_HEX** (addr)

### Type Definitions

typedef uint8_t esp_octet16_t[ESP_BT_OCTET16_LEN]

typedef uint8_t esp_octet8_t[ESP_BT_OCTET8_LEN]

typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]

typedef uint8_t esp_bd_addr_t[ESP_bd_ADDR_LEN]

Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

### Enumerations

enum esp_bt_status_t

Status Return Value.

*Values:*

enumerator ESP_BT_STATUS_SUCCESS

enumerator ESP_BT_STATUS_FAIL

enumerator ESP_BT_STATUS_NOT_READY

enumerator ESP_BT_STATUS_NOMEM

enumerator ESP_BT_STATUS_BUSY

enumerator ESP_BT_STATUS_DONE

enumerator ESP_BT_STATUS_UNSUPPORTED

enumerator ESP_BT_STATUS_PARM_INVALID

enumerator ESP_BT_STATUS_UNHANDLED

enumerator ESP_BT_STATUS_AUTH_FAILURE

enumerator ESP_BT_STATUS_RMT_DEV_DOWN
enumerator ESP_BT_STATUS_AUTH_REJECTED
enumerator ESP_BT_STATUS_INVALID_STATIC_RAND_ADDR
enumerator ESP_BT_STATUS_PENDING
enumerator ESP_BT_STATUS_UNACCEPT_CONN_INTERVAL
enumerator ESP_BT_STATUS_PARAM_OUT_OF_RANGE
enumerator ESP_BT_STATUS_TIMEOUT
enumerator ESP_BT_STATUS_PEER_LE_DATA_LEN_UNSUPPORTED
enumerator ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED
enumerator ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT
enumerator ESP_BT_STATUS_MEMORY_FULL
enumerator ESP_BT_STATUS_EIR_TOO_LARGE

enum esp_bt_dev_type_t
  Bluetooth device type.
  
  Values:
  
  enumerator ESP_BT_DEVICE_TYPE_BREDR
  enumerator ESP_BT_DEVICE_TYPE_BLE
  enumerator ESP_BT_DEVICE_TYPE_DUMO

enum esp_ble_addr_type_t
  BLE device address type.
  
  Values:
  
  enumerator BLE_ADDR_TYPE_PUBLIC
  enumerator BLE_ADDR_TYPE_RANDOM
  enumerator BLE_ADDR_TYPE_RPA_PUBLIC
  enumerator BLE_ADDR_TYPE_RPA_RANDOM
enum esp_ble_wl_addr_type_t
   white list address type

   Values:

   enumerator BLE_WL_ADDR_TYPE_PUBLIC

   enumerator BLE_WL_ADDR_TYPE_RANDOM

### BT MAIN API

### API Reference

### Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h

### Functions

**esp_bluedroid_status_t esp_bluedroid_get_status**(void)
   Get bluetooth stack status.
   返回 Bluetooth stack status

**esp_err_t esp_bluedroid_enable**(void)
   Enable bluetooth, must after esp_bluedroid_init().

   返回
   • ESP_OK : Succeed
   • Other : Failed

**esp_err_t esp_bluedroid_disable**(void)
   Disable bluetooth, must prior to esp_bluedroid_deinit().

   返回
   • ESP_OK : Succeed
   • Other : Failed

**esp_err_t esp_bluedroid_init**(void)
   Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

   返回
   • ESP_OK : Succeed
   • Other : Failed

**esp_err_t esp_bluedroid_deinit**(void)
   Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

   返回
   • ESP_OK : Succeed
   • Other : Failed

### Enumerations

enum esp_bluedroid_status_t
   Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

   Values:
Chapter 2. API

enumerator **ESP_BLUEDROID_STATUS_UNINITIALIZED**
Bluetooth not initialized

counter **ESP_BLUEDROID_STATUS_INITIALIZED**
Bluetooth initialized but not enabled

counter **ESP_BLUEDROID_STATUS_ENABLED**
Bluetooth initialized and enabled

**BT DEVICE APIs**

**Overview** Bluetooth device reference APIs.

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_bt_device.h

**Functions**

*const uint8_t* esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.
Return bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

*esp_err_t* esp_bt_dev_set_device_name (const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.
A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

参数 name - [in]: devicename to be set
返回
- ESP_OK: Succeed
- ESP_ERR_INVALID_ARG: if nameis NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**2.3.2 BT LE**

**GAP API**

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough
Chapter 2. API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

`esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)`

This function is called to occur gap event, such as scan result.

**参数**
- `callback` - [in] callback function

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)`

This function is called to override the BTA default ADV parameters.

**参数**
- `adv_data` - [in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)`

This function is called to set scan parameters.

**参数**
- `scan_params` - [in] Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_start_scanning (uint32_t duration)`

This procedure keep the device scanning the peer device which advertising on the air.

**参数**
- `duration` - [in] Keeping the scanning time, the unit is second.

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_stop_scanning (void)`

This function call to stop the device scanning the peer device which advertising on the air.

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t *adv_params)`

This function is called to start advertising.

**参数**
- `adv_params` - [in] pointer to User defined adv_params data structure.

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_stop_advertising (void)`

This function is called to stop advertising.

**返回**
- ESP_OK: success
- other: failed
**esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)**

Update connection parameters, can only be used when connection is up.

- **params [in]** - connection update parameters
- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)**

This function is to set maximum LE data packet size.

- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)**

This function sets the static Random Address and Non-Resolvable Private Address for the application.

- **rand_addr [in]** - the random address which should be setting
- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_clear_rand_addr (void)**

This function clears the random address for the application.

- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)**

Enable/disable privacy on the local device.

- **privacy_enable [in]** - enable/disable privacy on remote device.
- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)**

set local gap appearance icon

- **icon [in]** - External appearance value, these values are defined by the Bluetooth SIG, please refer to [https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf](https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf)
- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)**

Add or remove device from white list.

- **参数**
  - **add_remove [in]** the value is true if added the ble device to the white list, and false remove to the white list.
  - **remote_bda [in]** the remote device address add/remove from the white list.
  - **wl_addr_type [in]** whitelist address type
- **返回**
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_clear_whitelist (void)**

Clear all white list.

- **返回**
Chapter 2. API

• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gap_get_whitelist_size(uint16_t*length)`

Get the whitelist size in the controller.

参数 `length` - [out] the white list length.

返回
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)`

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

参数
• `bd_addr` - [in] BD address of the peripheral
• `min_conn_int` - [in] minimum preferred connection interval
• `max_conn_int` - [in] maximum preferred connection interval
• `slave_latency` - [in] preferred slave latency
• `supervision_tout` - [in] preferred supervision timeout

返回
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gap_set_device_name(const char*name)`

Set device name to the local device.

参数 `name` - [in] - device name.

返回
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t*addr_type)`

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get the public address.

参数
• `local_used_addr` - [in] - current local used ble address (six bytes)
• `addr_type` - [in] - ble address type

返回 - ESP_OK: success
• other : failed

`uint8_t *esp_ble_resolve_adv_data(uint8_t*adv_data, uint8_t*length)`

This function is called to get ADV data for a specific type.

参数
• `adv_data` - [in] - pointer of ADV data which to be resolved
• `type` - [in] - finding ADV data type
• `length` - [out] - return the length of ADV data not including type

返回 pointer of ADV data

`esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t*raw_data, uint32_t raw_data_len)`

This function is called to set raw advertising data. User need to fill ADV data by self.

参数
• `raw_data` - [in] : raw advertising data
• `raw_data_len` - [in] : raw advertising data length, less than 31 bytes

返回
• ESP_OK: success
• other: failed
**Chapter 2. API 参考**

`esp_err_t esp_ble_gap_config_scan_rsp_data_raw` *(uint8_t *raw_data, uint32_t raw_data_len)*

This function is called to set raw scan response data. User need to fill scan response data by self.

- **raw_data** - [in]: raw scan response data
- **raw_data_len** - [in]: raw scan response data length, less than 31 bytes

**返回**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_read_rssi` *(esp_bd_addr_t remote_addr)*

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

- **remote_addr** - [in]: The remote connection device address.
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device` *(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)*

This function is called to add a device info into the duplicate scan exceptional list.

- **type** - [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- **device_info** - [in] the device information.
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device` *(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)*

This function is called to remove a device info from the duplicate scan exceptional list.

- **type** - [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- **device_info** - [in] the device information.
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list` *(esp_duplicate_scan_exceptional_list_type_t list_type)*

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

- **list_type** - [in] duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_set_security_param` *(esp_ble_sm_param_t param_type, void *value, uint8_t len)*
Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only 'secure connection mode', it is necessary do as follows:

1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.

2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

**参数**

- **param_type** [in]: the type of the param which to be set
- **value** [in]: the param value
- **len** [in]: the length of the param value

**返回**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_security_rsp(esp_bd_addr_t bd_addr, bool accept)**

Grant security request access.

**参数**

- **bd_addr** [in]: BD address of the peer
- **accept** [in]: accept the security request or not

**返回**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_set_encryption(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)**

Set a gap parameter value. Use this function to change the default GAP parameter values.

**参数**

- **bd_addr** [in]: the address of the peer device need to encryption
- **sec_act** [in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**返回**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)**

Reply the key value to the peer device in the legacy connection stage.

**参数**

- **bd_addr** [in]: BD address of the peer
- **accept** [in]: passkey entry successful or declined.
- **passkey** [in]: passkey value, must be a 6 digit number, can be lead by 0.

**返回**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_confirm_reply(esp_bd_addr_t bd_addr, bool accept)**

Reply the confirm value to the peer device in the secure connection stage.

**参数**

- **bd_addr** [in]: BD address of the peer
• accept  - [in] : numbers to compare are the same or different.

返回 - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)
```

Removes a device from the security database list of peer device. It manages unpairing event while connected.

参数 bd_addr - [in] : BD address of the peer device
返回 - ESP_OK : success
• other : failed

```c
int esp_ble_get_bond_device_num (void)
```

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

返回 - >= 0 : bonded devices number.
• ESP_FAIL : failed

```c
esp_err_t esp_ble_get_bond_device_list (int *dev_num, esp_ble_bond_dev_t *dev_list)
```

Get the device from the security database list of peer device. It will return the device bonded information immediately.

参数
• dev_num - [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
• dev_list - [out] an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

返回 - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t*TK, uint8_t len)
```

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

参数
• bd_addr - [in] BD address of the peer device.
• TK - [in] Temporary Key value, the TK value shall be a 128-bit random number
• len - [in] length of temporary key, should always be 128-bit

返回 - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)
```

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_ble_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

参数 remote_device - [in] : BD address of the peer device
返回 - ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)
```

This function is called to read the connection parameters information of the device.

参数
• bd_addr - [in] BD address of the peer device.
• conn_params - [out] the connection parameters information

返回 - ESP_OK : success
• other : failed
esp_err_t esp_gap_ble_set_channels(esp_gap_ble_channels channels)
BLE set channels.
参数 channels [in]: The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.
返回 - ESP_OK : success
  • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  • other : failed

esp_err_t esp_gap_ble_set_authorization(esp_bd_addr_t bd_addr, bool authorize)
This function is called to authorized a link after Authentication(MITM protection)
参数
  • bd_addr –[in] BD address of the peer device.
  • authorize –[out] Authorized the link or not.
返回 - ESP_OK : success
  • other : failed

esp_err_t esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)
This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.
参数 bd_addr –[in]: BD address of the peer device.
返回 - ESP_OK : success
  • other : failed

esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)
This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.
参数
  • tx_phy_mask –[in]: indicates the transmitter PHYs that the Host prefers the Controller to use
  • rx_phy_mask –[in]: indicates the receiver PHYs that the Host prefers the Controller to use
返回 - ESP_OK : success
  • other : failed

esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)
This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.
参数
  • bd_addr –[in]: remote address
  • all_phys_mask –[in]: a bit field that allows the Host to specify
  • tx_phy_mask –[in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
  • rx_phy_mask –[in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
  • phy_options –[in]: a bit field that allows the Host to specify options for PHYs
返回 - ESP_OK : success
  • other : failed

esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)
This function is used by the Host to set the random device address specified by the Random_Address parameter.
**Chapter 2. API 参考**

**参数**
- `instance` - [in]: Used to identify an advertising set
- `rand_addr` - [in]: Random Device Address

**返回**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_ext_adv_set_params (uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)`

This function is used by the Host to set the advertising parameters.

**参数**
- `instance` - [in]: identifies the advertising set whose parameters are being configured.
- `params` - [in]: advertising parameters

**返回**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_config_ext_adv_data_raw (uint8_t instance, uint16_t length, const uint8_t *data)`

This function is used to set the data used in advertising PDUs that have a data field.

**参数**
- `instance` - [in]: identifies the advertising set whose data are being configured.
- `length` - [in]: data length
- `data` - [in]: data information

**返回**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)`

This function is used to provide scan response data used in scanning response PDUs.

**参数**
- `instance` - [in]: identifies the advertising set whose response data are being configured.
- `length` - [in]: response data length
- `scan_rsp_data` - [in]: response data information

**返回**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_ext_adv_start (uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)`

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**参数**
- `num_adv` - [in]: Number of advertising sets to enable or disable
- `ext_adv` - [in]: adv parameters

**返回**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_ext_adv_stop (uint8_t num_adv, const uint8_t *ext_adv_inst)`

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**参数**
- `num_adv` - [in]: Number of advertising sets to enable or disable
- `ext_adv_inst` - [in]: ext adv instance

**返回**
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_ext_adv_set_remove (uint8_t instance)`

This function is used to remove an advertising set from the Controller.

**参数**
- `instance` - [in]: Used to identify an advertising set
Chapter 2. API 参考

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_ext_adv_set_clear(void)`

This function is used to remove all existing advertising sets from the Controller.

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)`

This function is used by the Host to set the parameters for periodic advertising.

参数
  • instance [in] : identifies the advertising set whose periodic advertising parameters are being configured.
  • params [in] : periodic adv parameters

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_config_periodic_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)`

This function is used to set the data used in periodic advertising PDUs.

参数
  • instance [in] : identifies the advertising set whose periodic advertising parameters are being configured.
  • length [in] : the length of periodic data
  • data [in] : periodic data information

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)`

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

参数 instance [in] : Used to identify an advertising set

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)`

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

参数 instance [in] : Used to identify an advertising set

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ext_scan_params_t *params)`

This function is used to set the extended scan parameters to be used on the advertising channels.

参数 params [in] : scan parameters

返回 - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)`

This function is used to enable scanning.

参数
  • duration [in] : Scan duration
  • period [in] : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

返回 - ESP_OK : success
  • other : failed
**esp_err_t esp_ble_gap_stop_ext_scan (void)**

This function is used to disable scanning.

- **ESP_OK**: success
- **other**: failed

**esp_err_t esp_ble_gap_periodic_adv_create_sync (const esp_ble_gap_periodic_adv_sync_params_t *params)**

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

- 参数 **params** - [in]: sync parameters
- 返回 - **ESP_OK**: success
- **other**: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_cancel (void)**

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

- 返回 - **ESP_OK**: success
- **other**: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_terminate (uint16_t sync_handle)**

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

- 参数 **sync_handle** - [in]: identify the periodic advertiser
- 返回 - **ESP_OK**: success
- **other**: failed

**esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)**

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

- 参数
  - **addr_type** - [in]: address type
  - **addr** - [in]: Device Address
  - **sid** - [in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising
- 返回 - **ESP_OK**: success
- **other**: failed

**esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)**

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

- 参数
  - **addr_type** - [in]: address type
  - **addr** - [in]: Device Address
  - **sid** - [in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising
- 返回 - **ESP_OK**: success
- **other**: failed

**esp_err_t esp_ble_gap_periodic_adv_clear_dev (void)**

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

- 返回 - **ESP_OK**: success
- **other**: failed
```c
esp_err_t esp_ble_gap_prefer_ext_connect_params_set(esp_bd_addr_t addr,
        esp_ble_gap_phy_mask_t phy_mask,
        const esp_ble_gap_conn_params_t *phy_1m_conn_params,
        const esp_ble_gap_conn_params_t *phy_2m_conn_params,
        const esp_ble_gap_conn_params_t *phy_coded_conn_params)
```

This function is used to set aux connection parameters.

**Parameters**
- `addr` - [in]: device address
- `phy_mask` - [in]: indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- `phy_1m_conn_params` - [in]: Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- `phy_2m_conn_params` - [in]: Connection parameters for the LE 2M PHY are provided.
- `phy_coded_conn_params` - [in]: Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Return**
- ESP_OK: success
- other: failed

**Unions**

```c

*esp.bt_status_t* **status**  
Indicate adv stop operation success status

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT.
```

**Public Members**

uint8_t **status**  
Indicate adv terminate status

uint8_t **adv_instance**  
extend advertising handle

uint16_t **conn_idx**  
connection index

uint8_t **completed_event**  
the number of completed extend advertising events

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_ADV_TERMINATED_EVT.
```

**Public Members**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT.
```
Public Members

uint16_t **conn_handle**
connection handle

uint8_t **channel_sel_alg**
channel selection algorithm

struct **ble_clear_bond_dev_cmpl_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT.

Public Members

*esp_bt_status_t* **status**
Indicate the clear bond device operations success status

struct **ble_ext_adv_data_set_cmpl_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT.

Public Members

*esp_bt_status_t* **status**
Indicate extend advertising data set status

struct **ble_ext_adv_report_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_REPORT_EVT.

Public Members

*esp_ble_gap_ext_adv_report_t* **params**
extend advertising report parameters

struct **ble_ext_adv_scan_rsp_set_cmpl_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

*esp_bt_status_t* **status**
Indicate extend advertising scan response data set status

struct **ble_ext_adv_set_clear_cmpl_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT.
Public Members

```c
struct ble_ext_adv_set_params_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT.
```

Public Members

```c
struct ble_ext_adv_set_rand_addr_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT.
```

Public Members

```c
struct ble_ext_adv_set_remove_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT.
```

Public Members

struct ble_ext_adv_start_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT.
```

Public Members

```c
struct ble_ext_adv_stop_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT.
```
struct ble_ext_conn_params_set_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate extend connection parameters set status

struct ble_ext_scan_start_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate extend advertising start status

struct ble_ext_scan_stop_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate extend advertising stop status

struct ble_get_bond_dev_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the get bond device operation success status

uint8_t dev_num
Indicate the get number device in the bond list

esp_ble_bond_dev_t *bond_dev
the pointer to the bond device Structure

struct ble_local_privacy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the set local privacy operation success status
struct `ble_period_adv_add_dev_cmpl_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising device list add status

struct `ble_period_adv_clear_dev_cmpl_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising device list clean status

struct `ble_period_adv_create_sync_cmpl_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising create sync status

struct `ble_period_adv_remove_dev_cmpl_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising device list remove status

struct `ble_period_adv_sync_cancel_cmpl_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising sync cancel status

struct `ble_period_adv_sync_terminate_cmpl_param`
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT.
Public Members

`esp_bt_status_t status`
Indicate periodic advertising sync terminate status

struct `ble_periodic_adv_data_set_cmpl_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising data set status

struct `ble_periodic_adv_report_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT.

Public Members

`esp_ble_gap_periodic_adv_report_t params`
periodic advertising report parameters

struct `ble_periodic_adv_set_params_cmpl_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising parameters set status

struct `ble_periodic_adv_start_cmpl_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising start status

struct `ble_periodic_adv_stop_cmpl_param`
#include `<esp_gap_ble_api.h>` ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT.

Public Members

`esp_bt_status_t status`
Indicate periodic advertising stop status
struct ble_periodic_adv_sync_estab_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT.

Public Members

uint8_t status
periodic advertising sync status

uint16_t sync_handle
periodic advertising sync handle

uint8_t sid
periodic advertising sid

esp_ble_addr_type_t adv_addr_type
periodic advertising address type

esp_bd_addr_t adv_addr
periodic advertising address

esp_ble_gap Phy_t adv_phy
periodic advertising phy type

uint16_t period_adv_interval
periodic advertising interval

uint8_t adv_clk_accuracy
periodic advertising clock accuracy

struct ble_periodic_adv_sync_lost_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT.

Public Members

uint16_t sync_handle
sync handle

struct ble_phy_update_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT.

Public Members

esp_bt_status_t status
phy update status
Chapter 2. API

\begin{verbatim}
    esp_bd_addr_t bda
        address

    esp_ble_gap_phy_t tx_phy
        tx phy type

    esp_ble_gap_phy_t rx_phy
        rx phy type

struct ble_pkt_data_length_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT.

Public Members

    esp_bt_status_t status
        Indicate the set pkt data length operation success status

    esp_ble_pkt_data_length_params_t params
        pkt data length value

struct ble_read_phy_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_PHY_COMPLETE_EVT.

Public Members

    esp_bt_status_t status
        read phy complete status

    esp_bd_addr_t bda
        read phy address

    esp_ble_gap_phy_t tx_phy
        tx phy type

    esp_ble_gap_phy_t rx_phy
        rx phy type

struct ble_read_rssi_cmpl_evt_param
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.

Public Members

    esp_bt_status_t status
        Indicate the read adv tx power operation success status
\end{verbatim}
int8_t rssi
The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot be read, the RSSI metric shall be set to 127.

esp_bd_addr_t remote_addr
The remote device address

struct ble_remove_bond_dev_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the remove bond device operation success status

esp_bd_addr_t bd_addr
The device address which has been remove from the bond list

struct ble_scan_param_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT.

Public Members

esp bt status t status
Indicate the set scan param operation success status

struct ble_scan_req_received_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT.

Public Members

uint8_t adv_instance
extend advertising handle

esp_ble_addr_type_t scan_addr_type
scanner address type

esp bd addr t scan addr
scanner address

struct ble_scan_result_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RESULT_EVT.
Public Members

`esp_gap_search_evt_t search_evt`
Search event type

`esp_bd_addr_t bda`
Bluetooth device address which has been searched

`esp_bt_dev_type_t dev_type`
Device type

`esp_ble_addr_type_t ble_addr_type`
Ble device address type

`esp_ble_evt_type_t ble_evt_type`
Ble scan result event type

`int rssi`
Searched device’s RSSI

`uint8_t ble_adv[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]`
Received EIR

`int flag`
Advertising data flag bit

`int num_resps`
Scan result number

`uint8_t adv_data_len`
Adv data length

`uint8_t scan_rsp_len`
Scan response length

`uint32_t num_dis`
The number of discard packets

`struct ble_scan_rsp_data_cmpl_evt_param`

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.
```

Public Members

`esp_bt_status_t status`
Indicate the set scan response data operation success status

`struct ble_scan_rsp_data_raw_cmpl_evt_param`

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.
```
Public Members

`esp_bt_status_t status`
Indicates the set raw advertising data operation success status

```c
#include <esp_gap_ble_api.h>
ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.
```

Public Members

`esp_bt_status_t status`
Indicate scan start operation success status

```c
#include <esp_gap_ble_api.h>
ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.
```

Public Members

`esp_bt_status_t status`
Indicate scan stop operation success status

```c
#include <esp_gap_ble_api.h>
ESP_GAP_BLE_SET_CHANNELS_EVT.
```

Public Members

`esp_bt_status_t stat`
BLE set channel status

```c
#include <esp_gap_ble_api.h>
ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

Public Members

`esp_bt_status_t status`
Indicate extend advertising parameters set status

```c
#include <esp_gap_ble_api.h>
ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.
```

Public Members

`esp_bt_status_t status`
Indicate perf default phy set status
struct `ble_set_perf_phy_cmpl_evt_param`

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate perf phy set status

struct `ble_set_rand_cmpl_evt_param`

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate set static rand address operation success status

struct `ble_update_conn_params_evt_param`

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```

Indicate update connection parameters success status

```c
esp_bd_addr_t bda
```

Bluetooth device address

```c
uint16_t min_int
```

Min connection interval

```c
uint16_t max_int
```

Max connection interval

```c
uint16_t latency
```

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

```c
uint16_t conn_int
```

Current connection interval

```c
uint16_t timeout
```

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct `ble_update_duplicate_exceptional_list_cmpl_evt_param`

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
```
**Public Members**

```c
esp_bt_status_t status
```
Indicate update duplicate scan exceptional list operation success status

```c
uint8_t subcode
```
Define in `esp_bt_duplicate_exceptional_subcode_type_t`

```c
uint16_t length
```
The length of `device_info`

```c
esp_duplicate_info_t device_info
```
Device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

```c
#include <esp_gap_ble_api.h>
```

# ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT

**Public Members**

```c
esp_bt_status_t status
```
Indicate the add or remove whitelist operation success status

```c
estp_ble_wl_operation_t wl_operation
```
The value is `ESP_BLE_WHITELIST_ADD` if add address to whitelist operation success, `ESP_BLE_WHITELIST_REMOVE` if remove address from the whitelist operation success

**Structures**

```c
struct esp_ble_adv_params_t
```
Advertising parameters.

**Public Members**

```c
uint16_t adv_int_min
```
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

```c
uint16_t adv_int_max
```
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

```c
esp_ble_adv_type_t adv_type
```
Advertising type

```c
esp_ble_addr_type_t own_addr_type
```
Owner Bluetooth device address type
**Chapter 2. API**

- `esp_bd_addr_t peer_addr`
  Peer device bluetooth device address

- `esp_ble_addr_type_t peer_addr_type`
  Peer device bluetooth device address type, only support public address type and random address type

- `esp_ble_adv_channel_t channel_map`
  Advertising channel map

- `esp_ble_adv_filter_t adv_filter_policy`
  Advertising filter policy

```c
struct esp_ble_adv_data_t
```
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

**Public Members**

- `bool set_scan_rsp`
  Set this advertising data as scan response or not

- `bool include_name`
  Advertising data include device name or not

- `bool include_txpower`
  Advertising data include TX power

- `int min_interval`
  Advertising data show slave preferred connection min interval. The connection interval in the following manner: `connIntervalMin = Conn_INTERVAL_Min * 1.25 ms` Conn_INTERVAL_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

- `int max_interval`
  Advertising data show slave preferred connection max interval. The connection interval in the following manner: `connIntervalMax = Conn_INTERVAL_Max * 1.25 ms` Conn_INTERVAL_Max range: 0x0006 to 0x0C80 Conn_INTERVAL_Max shall be equal to or greater than the Conn_INTERVAL_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

- `int appearance`
  External appearance of device

- `uint16_t manufacturer_len`
  Manufacturer data length

- `uint8_t* p_manufacturer_data`
  Manufacturer data point

- `uint16_t service_data_len`
  Service data length
```c
uint8_t *p_service_data
    Service data point

uint16_t service_uuid_len
    Service uuid length

uint8_t *p_service_uuid
    Service uuid array point

uint8_t flag
    Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
    Ble scan parameters.

Public Members

esp_ble_scan_type_t scan_type
    Scan type

esp_ble_addr_type_t own_addr_type
    Owner address type

esp_ble_scan_filter_t scan_filter_policy
    Scan filter policy

uint16_t scan_interval
    Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
    Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
    The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
    connection parameters information

Public Members

uint16_t interval
    connection interval
```
uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
Connection update parameters.

Public Members

esp_bd_addr_t bda
Bluetooth device address

uint16_t min_int
Min connection interval

uint16_t max_int
Max connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
BLE pkt date length keys.

Public Members

uint16_t rx_len
pkt rx data length value

uint16_t tx_len
pkt tx data length value

struct esp_ble_penc_keys_t
BLE encryption keys.

Public Members

esp_bt_octet16_t ltk
The long term key
```

``exp_bt_octet8_t rand``

  The random number

``uint16_t ediv``

  The ediv value

``uint8_t sec_level``

  The security level of the security link

``uint8_t key_size``

  The key size(7~16) of the security link

struct `esp_ble_pcsrk_keys_t`

  BLE CSRK keys.

  **Public Members**

``uint32_t counter``

  The counter

``exp.bt_octet16_t csrk``

  The csrk key

``uint8_t sec_level``

  The security level

struct `esp_ble_pid_keys_t`

  BLE pid keys.

  **Public Members**

``exp.bt_octet16_t irk``

  The irk value

``exp_ble_addr_type_t addr_type``

  The address type

``exp_bd_addr_t static_addr``

  The static address

struct `esp_ble_lenc_keys_t`

  BLE Encryption reproduction keys.

  **Public Members**
**Chapter 2. API Reference**

*esp_bt_octet16_t* **ltk**
The long term key

*uint16_t* **div**
The div value

*uint8_t* **key_size**
The key size of the security link

*uint8_t* **sec_level**
The security level of the security link

**struct esp_ble_lcsrk_keys**
BLE SRK keys.

**Public Members**

*uint32_t* **counter**
The counter value

*uint16_t* **div**
The div value

*uint8_t* **sec_level**
The security level of the security link

*esp_bt_octet16_t* **csrk**
The csrk key value

**struct esp_ble_sec_key_notif_t**
Structure associated with ESP_KEY_NOTIF_EVT.

**Public Members**

*esp_bd_addr_t* **bd_addr**
peer address

*uint32_t* **passkey**
the numeric value for comparison. If just_works, do not show this number to UI

**struct esp_ble_sec_req_t**
Structure of the security request.

**Public Members**
exp_bd_addr_t bd_addr
    peer address

struct esp_ble_bond_key_info_t
    struct type of the bond key information value

Public Members

exp_ble_key_mask_t key_mask
    the key mask to indicate which key is present

desp_ble_penc_keys_t penc_key
    received peer encryption key

desp_ble_pcsrk_keys_t pcsrk_key
    received peer device SRK

desp_ble_pid_keys_t pid_key
    peer device ID key

struct esp_ble_bond_dev_t
    struct type of the bond device value

Public Members

exp_bd_addr_t bd_addr
    peer address

desp_ble_bond_key_info_t bond_key
    the bond key information

struct esp_ble_key_t
    union type of the security key value

Public Members

exp_bd_addr_t bd_addr
    peer address

desp_ble_key_type_t key_type
    key type of the security link

desp_ble_key_value_t p_key_value
    the pointer to the key value

struct esp_ble_local_id_keys_t
    structure type of the ble local id keys value
**Public Members**

`esp_bt_octet16_t ir`
the 16 bits of the ir value

`esp_bt_octet16_t irk`
the 16 bits of the ir key value

`esp_bt_octet16_t dhk`
the 16 bits of the dh key value

`struct esp_ble_auth_cmpl_t`
Structure associated with ESP_AUTH_CMPL_EVT.

**Public Members**

`esp_bd_addr_t bd_addr`
BD address peer device.

`bool key_present`
Valid link key value in key element

`esp_link_key key`
Link key associated with peer device.

`uint8_t key_type`
The type of Link Key

`bool success`
TRUE of authentication succeeded, FALSE if failed.

`uint8_t fail_reason`
The HCI reason/error code for when success=FALSE

`esp_ble_addr_type_t addr_type`
Peer device address type

`esp_bt_dev_type_t dev_type`
Device type

`esp_ble_auth_req_t auth_mode`
authentication mode

`struct esp_ble_gap_ext_adv_params_t`
ext adv parameters
Public Members

`esp_ble_ext_adv_type_mask_t type`
- ext adv type

`uint32_t interval_min`
- ext adv minimum interval

`uint32_t interval_max`
- ext adv maximum interval

`esp_ble_adv_channel_t channel_map`
- ext adv channel map

`esp_ble_addr_type_t own_addr_type`
- ext adv own address type

`esp_ble_addr_type_t peer_addr_type`
- ext adv peer address type

`esp_bd_addr_t peer_addr`
- ext adv peer address

`esp_ble_adv_filter_t filter_policy`
- ext adv filter policy

`int8_t tx_power`
- ext adv tx power

`esp_ble_gap_pri_phy_t primary_phy`
- ext adv primary phy

`uint8_t max_skip`
- ext adv maximum skip

`esp_ble_gap_phy_t secondary_phy`
- ext adv secondary phy

`uint8_t sid`
- ext adv sid

`bool scan_req_notif`
- ext adv scan request event notify

`struct esp_ble_ext_scan_cfg_t`
- ext scan config
Public Members

`esp_ble_scan_type_t scan_type`
- ext scan type

`uint16_t scan_interval`
- ext scan interval

`uint16_t scan_window`
- ext scan window

`struct esp_ble_ext_scan_params_t`
- ext scan parameters

Public Members

`esp_ble_addr_type_t own_addr_type`
- ext scan own address type

`esp_ble_scan_filter_t filter_policy`
- ext scan filter policy

`esp_ble_scan_duplicate_t scan_duplicate`
- ext scan duplicate scan

`esp_ble_ext_scan_cfg_mask_t cfg_mask`
- ext scan config mask

`esp_ble_ext_scan_cfg_t uncoded_cfg`
- ext scan uncoded config parameters

`esp_ble_ext_scan_cfg_t coded_cfg`
- ext scan coded config parameters

`struct esp_ble_gap_conn_params_t`
- create extend connection parameters

Public Members

`uint16_t scan_interval`
- init scan interval

`uint16_t scan_window`
- init scan window

`uint16_t interval_min`
- minimum interval
```c
uint16_t interval_max
maximum interval

uint16_t latency
ext scan type

uint16_t supervision_timeout
connection supervision timeout

uint16_t min_ce_len
minimum ce length

uint16_t max_ce_len
maximum ce length

struct esp_ble_gap_ext_adv_t
extend adv enable parameters

Public Members

uint8_t instance
advertising handle

int duration
advertising duration

int max_events
maximum number of extended advertising events

struct esp_ble_gap_periodic_adv_params_t
periodic adv parameters

Public Members

uint16_t interval_min
periodic advertising minimum interval

uint16_t interval_max
periodic advertising maximum interval

uint8_t properties
periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
periodic adv sync parameters
```
Public Members

`esp_ble_gap_sync_t` *filter_policy*
periodic advertising sync filter policy

uint8_t *sid*
periodic advertising sid

`esp_ble_addr_type_t` *addr_type*
periodic advertising address type

`esp_bd_addr_t` *addr*
periodic advertising address

uint16_t *skip*
the maximum number of periodic advertising events that can be skipped

uint16_t *sync_timeout*
synchronization timeout

struct `esp_ble_gap_ext_adv_reprot_t`
extend adv report parameters

Public Members

`esp_ble_gap_adv_type_t` *event_type*
extend advertising type

uint8_t *addr_type*
extend advertising address type

`esp_bd_addr_t` *addr*
extend advertising address

`esp_ble_gap_pri_phy_t` *primary_phy*
extend advertising primary phy

`esp_ble_gap_phy_t` *secondly_phy*
extend advertising secondary phy

uint8_t *sid*
extend advertising sid

uint8_t *tx_power*
extend advertising tx power

int8_t *rssi*
extend advertising rssi
Chapter 2. API

uint16_t `per_adv_interval`
    periodic advertising interval

tuint8_t `dir_addr_type`
    direct address type

`esp_bd_addr_t dir_addr`
    direct address

`esp_ble_gap_ext_adv_data_status_t data_status`
    data type

uint8_t `adv_data_len`
    extend advertising data length

uint8_t `adv_data[251]`
    extend advertising data

struct `esp_ble_gap_periodic_adv_report_t`
    periodic adv report parameters

**Public Members**

uint16_t `sync_handle`
    periodic advertising train handle

uint8_t `tx_power`
    periodic advertising tx power

int8_t `rssi`
    periodic advertising rssi

`esp_ble_gap_ext_adv_data_status_t data_status`
    periodic advertising data type

uint8_t `data_length`
    periodic advertising data length

uint8_t `data[251]`
    periodic advertising data

struct `esp_ble_gap_periodic_adv_sync_estab_t`
    periodic adv sync establish parameters

**Public Members**
uint8_t status
    periodic advertising sync status

tuple16_t sync_handle
    periodic advertising train handle

uint8_t sid
    periodic advertising sid

esp_ble_addr_type_t addr_type
    periodic advertising address type

esp_bd_addr_t adv_addr
    periodic advertising address

esp_ble_gap_phy_t adv_phy
    periodic advertising adv phy type

uint16_t period_adv_interval
    periodic advertising interval

uint8_t adv_clk_accuracy
    periodic advertising clock accuracy

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC
    BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

ESP_BLE_ADV_FLAG_DMT_HOST_SPT

ESP_BLE_ADV_FLAG_NON_LIMIT_DISC

ESP_LE_KEY_NONE
    relate to BTM_LE_KEY_xxx in stack/btm_api.h
    No encryption key

ESP_LE_KEY_PENC
    encryption key, encryption information of peer device

ESP_LE_KEY_PID
    identity key of the peer device
**Chapter 2. API**

- **ESP_LE_KEY_PCSRK**
  peer SRK

- **ESP_LE_KEY_PLK**
  Link key

- **ESP_LE_KEY_LLK**
  peer link key

- **ESP_LE_KEY_LENC**
  master role security information

- **ESP_LE_KEY_LID**
  master device ID key

- **ESP_LE_KEY_LCSRK**
  local CSRK has been delivered to peer

- **ESP_LE_AUTH_NO_BOND**
  relate to BTM_LE_AUTH_xxx in stack/btm_api.h
  0 no bonding

- **ESP_LE_AUTH_BOND**
  1 « 0 device in the bonding with peer

- **ESP_LE_AUTH_REQ_MITM**
  1 « 2 man in the middle attack

- **ESP_LE_AUTH_REQ_BOND_MITM**
  0101 bonding with man in the middle attack

- **ESP_LE_AUTH_REQ_SC_ONLY**
  1 « 3 secure connection

- **ESP_LE_AUTH_REQ_SC_BOND**
  1001 secure connection with bond

- **ESP_LE_AUTH_REQ_SC_MITM**
  1100 secure conn with MITM

- **ESP_LE_AUTH_REQ_SC_MITM_BOND**
  1101 SC with MITM and Bonding

- **ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE**
  authentication disable

- **ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE**
  authentication enable
ESP_BLE_OOB_DISABLE
disbale the out of bond

ESP_BLE_OOB_ENABLE
enable the out of bond

ESP_IO_CAP_OUT
relate to BTM_IO_CAP_xxx in stack/btm_api.h
DisplayOnly

ESP_IO_CAP_IO
DisplayYesNo

ESP_IO_CAP_IN
KeyboardOnly

ESP_IO_CAP_NONE
NoInputNoOutput

ESP_IO_CAP_KBDISP
Keyboard display

ESP_BLE_APPEARANCE_UNKNOWN
relate to BTM_BLE_APPEARANCE_UNKNOWN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PHONE
relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_COMPUTER
relate to BTM_BLE_APPEARANCE_GENERIC_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WATCH
relate to BTM_BLE_APPEARANCE_GENERIC_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_SPORTS_WATCH
relate to BTM_BLE_APPEARANCE_SPORTS_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CLOCK
relate to BTM_BLE_APPEARANCE_GENERIC_CLOCK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_DISPLAY
relate to BTM_BLE_APPEARANCE_GENERIC_DISPLAY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_REMOTE
relate to BTM_BLE_APPEARANCE_GENERIC_REMOTE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_EYEGLASSES
relate to BTM_BLE_APPEARANCE_GENERIC_EYEGLASSES in stack/btm_ble_api.h
Chapter 2. API 参考

ESP_BLE_APPEARANCE_GENERIC_TAG
relate to BTM_BLE_APPEARANCE_GENERIC_TAG in stack/btm_ble_api.h

  relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE
  relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER
  relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP
relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST
relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT
relate to BTM_BLE_APPEARANCE_GENERIC_WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
relate to BTM_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR
relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER
relate to BTM_BLE_APPEARANCE_MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR
relate to BTM_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP
relate to BTM_BLE_APPEARANCE_GENERIC_INSULIN_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PEN
relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY
relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS
relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h
**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD**

Relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV**

Relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

**ESP_GAP_BLE_CHANNELS_LEN**

Channel length

**ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT**

This is the old name, just for backwards compatibility.

**ESP_BLE_ADV_DATA_LEN_MAX**

Advertising data maximum length.

**ESP_BLE_SCAN_RSP_DATA_LEN_MAX**

Scan response data maximum length.

**BLE_BIT (n)**

**ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED**

Non-Connectable and Non-Scannable Undirected advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE**

Connectable advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE**

Scannable advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED**

Directed advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED**

High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY**

Use legacy advertising PDUs

**ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV**

Omit advertiser's address from all PDUs ("anonymous advertising")

**ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR**

Include TxPower in the extended header of the advertising PDU

**ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK**

Reserved for future use. If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV_IND
Chapter 2. API Reference

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND
    ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR
    ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR
    ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN
    ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN

ESP_BLE_GAP_PHY_1M
    Secondary Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M
    Secondary Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED
    Secondary Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY
    No Prefer TX PHY supported by controller

ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY
    No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M
    Primary phy only support 1M and LE coded phy.
    Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED
    Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK
    The Host prefers use the LE1M transmitter or reciever PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK
    The Host prefers use the LE2M transmitter or reciever PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK
    The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF
    The Host has no preferred coding when transmitting on the LE Coded PHY
ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING
The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING
The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK
Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK
Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE
Advertising data.
extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE
extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED
extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO
Advertising SYNC policy.
sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY.PERIODIC_LIST
periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND
Advertising report.
advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT.Scan_IND
advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT.DIRECT_ADV
advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT.Scan_RSP
advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND
advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND
advertising report with legacy direct indication type
Chapter 2. API Reference

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND**

advertising report with legacy scan indication type

**ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND**

advertising report with legacy non-connectable indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND**

advertising report with legacy scan response indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND**

advertising report with legacy advertising with scan response indication type

**EXT_ADV_TX_PWR_NO_PREFERENCE**

Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

**Type Definitions**

typedef uint8_t esp_ble_key_type_t

typedef uint8_t esp_ble_auth_req_t

combination of the above bit pattern

typedef uint8_t esp_ble_io_cap_t

combination of the io capability

typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]

typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]

typedef uint16_t esp_ble_ext_adv_type_mask_t

typedef uint8_t esp_ble_gap_phy_t

typedef uint8_t esp_ble_gap_all_phy_t

typedef uint8_t esp_ble_gap_pri_phy_t

typedef uint8_t esp_ble_gap_phy_mask_t

typedef uint8_t esp_ble_ext_scanCfg_mask_t

typedef uint8_t esp_ble_gap_ext_adv_data_status_t

typedef uint8_t esp_ble_gap_sync_t
typedef uint8_t esp_ble_gap_adv_type_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

- **Param event**: Event type
- **Param param**: Point to callback parameter, currently is union type

**Enumerations**

defined enum esp_gap_ble_cb_event_t

GAP BLE callback event type.

- **Values**:

  - enumerator ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT
    - When advertising data set complete, the event comes
  - enumerator ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
    - When scan response data set complete, the event comes
  - enumerator ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
    - When scan parameters set complete, the event comes
  - enumerator ESP_GAP_BLE_SCAN_RESULT_EVT
    - When one scan result ready, the event comes each time
  - enumerator ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
    - When raw advertising data set complete, the event comes
  - enumerator ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
    - When raw advertising data set complete, the event comes
  - enumerator ESP_GAP_BLE_ADV_START_COMPLETE_EVT
    - When start advertising complete, the event comes
  - enumerator ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
    - When start scan complete, the event comes
  - enumerator ESP_GAP_BLE_AUTH_CMPL_EVT
    - Authentication complete indication.
  - enumerator ESP_GAP_BLE_KEY_EVT
    - BLE key event for peer device keys
  - enumerator ESP_GAP_BLE_SEC_REQ_EVT
    - BLE security request
  - enumerator ESP_GAP_BLE_PASSKEY_NOTIF_EVT
    - passkey notification event
enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**
passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**
OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**
BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**
BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**
Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**
When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**
When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**
When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**
When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**
When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**
When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**
When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**
When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**
When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**
When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**
When add or remove whitelist complete, the event comes
enumerator ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
   When update duplicate exceptional list complete, the event comes.

enumerator ESP_GAP_BLE_SET_CHANNELS_EVT
   When setting BLE channels complete, the event comes.

enumerator ESP_GAP_BLE_READ_PHY_COMPLETE_EVT
   When reading phy complete, this event comes.

enumerator ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT
   When preferred default phy complete, this event comes.

enumerator ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT
   When preferred phy complete, this event comes.

enumerator ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT
   When extended set random address complete, the event comes.

enumerator ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT
   When extended advertising parameter complete, the event comes.

enumerator ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT
   When extended advertising data complete, the event comes.

enumerator ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT
   When extended scan response data complete, the event comes.

enumerator ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT
   When extended advertising start complete, the event comes.

enumerator ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT
   When extended advertising stop complete, the event comes.

enumerator ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT
   When extended advertising set remove complete, the event comes.

enumerator ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT
   When extended advertising set clear complete, the event comes.

enumerator ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT
   When periodic advertising parameter complete, the event comes.

enumerator ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT
   When periodic advertising data complete, the event comes.

enumerator ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT
   When periodic advertising start complete, the event comes.
enumerator ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT
    when periodic advertising stop complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT
    when periodic advertising create sync complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT
    when extended advertising sync cancel complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT
    when extended advertising sync terminate complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT
    when extended advertising add device complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT
    when extended advertising remove device complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT
    when extended advertising clear device, the event comes

enumerator ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT
    when extended scan parameter complete, the event comes

enumerator ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT
    when extended scan start complete, the event comes

enumerator ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT
    when extended scan stop complete, the event comes

enumerator ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT
    when extended prefer connection parameter set complete, the event comes

enumerator ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT
    when ble phy update complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_REPORT_EVT
    when extended advertising report complete, the event comes

enumerator ESP_GAP_BLE_SCAN_TIMEOUT_EVT
    when scan timeout complete, the event comes

enumerator ESP_GAP_BLE_ADV_TERMINATED_EVT
    when advertising terminate data complete, the event comes

enumerator ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT
    when scan req received complete, the event comes
enumerator ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT
when channel select algorithm complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT
when periodic report advertising complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT
when periodic advertising sync lost complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT
when periodic advertising sync establish complete, the event comes

enumerator ESP_GAP_BLE_EVT_MAX
when maximum advertising event complete, the event comes

enum esp_ble_adv_data_type
The type of advertising data(not adv_type)

Values:

enumerator ESP_BLE_AD_TYPE_FLAG

enumerator ESP_BLE_AD_TYPE_16SRV_PART

enumerator ESP_BLE_AD_TYPE_16SRV_CMPL

enumerator ESP_BLE_AD_TYPE_32SRV_PART

enumerator ESP_BLE_AD_TYPE_32SRV_CMPL

enumerator ESP_BLE_AD_TYPE_128SRV_PART

enumerator ESP_BLE_AD_TYPE_128SRV_CMPL

enumerator ESP_BLE_AD_TYPE_NAME_SHORT

enumerator ESP_BLE_AD_TYPE_NAME_CMPL

enumerator ESP_BLE_AD_TYPE_TX_PWR

enumerator ESP_BLE_AD_TYPE_DEV_CLASS

enumerator ESP_BLE_AD_TYPE_SM_TK

enumerator ESP_BLE_AD_TYPE_SM_OOB_FLAG

enumerator ESP_BLE_AD_TYPE_INT_RANGE
enumerator ESP_BLE_AD_TYPE_SOL_SRV_UUID
enumerator ESP_BLE_AD_TYPE_128SOL_SRV_UUID
enumerator ESP_BLE_AD_TYPE_SERVICE_DATA
enumerator ESP_BLE_AD_TYPE_PUBLIC_TARGET
enumerator ESP_BLE_AD_TYPE_RANDOM_TARGET
enumerator ESP_BLE_AD_TYPE_APPEARANCE
enumerator ESP_BLE_AD_TYPE_ADV_INT
enumerator ESP_BLE_AD_TYPE_LE_DEV_ADDR
enumerator ESP_BLE_AD_TYPE_LE_ROLE
enumerator ESP_BLE_AD_TYPE_SPAIR_C256
enumerator ESP_BLE_AD_TYPE_SPAIR_R256
enumerator ESP_BLE_AD_TYPE_32SOL_SRV_UUID
enumerator ESP_BLE_AD_TYPE_32SERVICE_DATA
enumerator ESP_BLE_AD_TYPE_128SERVICE_DATA
enumerator ESP_BLE_AD_TYPE_LE_SECURE_CONFIRM
enumerator ESP_BLE_AD_TYPE_LE_SECURE_RANDOM
enumerator ESP_BLE_AD_TYPE_URI
enumerator ESP_BLE_AD_TYPE_INDOOR_POSITION
enumerator ESP_BLE_AD_TYPE_TRANS_DISC_DATA
enumerator ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE
enumerator ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE
enumerator ESP_BLE_AD_TYPE_MANUFACTURER_SPECIFIC_TYPE
enum esp_ble_adv_type_t
   Advertising mode.
   Values:

   enumerator ADV_TYPE_IND

   enumerator ADV_TYPE_DIRECT_IND_HIGH

   enumerator ADV_TYPE_SCAN_IND

   enumerator ADV_TYPE_NONCONN_IND

   enumerator ADV_TYPE_DIRECT_IND_LOW

enum esp_ble_adv_channel_t
   Advertising channel mask.
   Values:

   enumerator ADV_CHNL_37

   enumerator ADV_CHNL_38

   enumerator ADV_CHNL_39

   enumerator ADV_CHNL_ALL

enum esp_ble_adv_filter_t
   Values:

   enumerator ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY
       Allow both scan and connection requests from anyone.

   enumerator ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
       Allow both scan req from White List devices only and connection req from anyone.

   enumerator ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
       Allow both scan req from anyone and connection req from White List devices only.

   enumerator ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
       Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
   Values:

   enumerator ESP_BLE_SEC_ENCRYPT
Chapter 2. API 参考

relate to BTA_DM_BLE_SEC_ENCRYPT in bta/bta_api.h. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn’t bonded, the stack will use the default authentication request used the esp_ble_gap_set_security_param function set by the user.

enumerator ESP_BLE_SEC_ENCRYPT_NO_MITM
relate to BTA_DM_BLE_SEC_ENCRYPT_NO_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn’t been bonded, the stack will use NO MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enumerator ESP_BLE_SEC_ENCRYPT_MITM
relate to BTA_DM_BLE_SEC_ENCRYPT_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn’t been bonded, the stack will use MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enum esp_ble_sm_param_t

Values:

enumerator ESP_BLE_SM_PASSKEY
Authentication requirements of local device

enumerator ESP_BLE_SM_AUTHEN_REQ_MODE
The IO capability of local device

enumerator ESP_BLE_SM_IOCAP_MODE
Initiator Key Distribution/Generation

enumerator ESP_BLE_SM_SET_INIT_KEY
Responder Key Distribution/Generation

enumerator ESP_BLE_SM_SET_RSP_KEY
Maximum Encryption key size to support

enumerator ESP_BLE_SM_MAX_KEY_SIZE
Minimum Encryption key size requirement from Peer

enumerator ESP_BLE_SM_MIN_KEY_SIZE
Set static Passkey

enumerator ESP_BLE_SM_SET_STATIC_PASSKEY
Reset static Passkey

enumerator ESP_BLE_SM_CLEAR_STATIC_PASSKEY
Accept only specified SMP Authentication requirement
enumerator ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH
   Enable/Disable OOB support

enumerator ESP_BLE_SM_OOB_SUPPORT
   Appl encryption key size

enumerator ESP_BLE_APP_ENC_KEY_SIZE
   authentication max param

enumerator ESP_BLE_SM_MAX_PARAM

enum esp_ble_scan_type_t
   Ble scan type.
   Values:

enumerator BLE_SCAN_TYPE_PASSIVE
   Passive scan

enumerator BLE_SCAN_TYPE_ACTIVE
   Active scan

enum esp_ble_scan_filter_t
   Ble scan filter type.
   Values:

enumerator BLE_SCAN_FILTER_ALLOW_ALL
   Accept all:
      i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator BLE_SCAN_FILTER_ALLOW_ONLY_WLST
   Accept only:
      i. advertisement packets from devices where the advertiser’s address is in the White list.
      ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR
   Accept all:
      i. undirected advertisement packets, and
      ii. directed advertising packets where the initiator address is a resolvable private address, and
      iii. directed advertising packets addressed to this device.

enumerator BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR
   Accept all:
      i. advertisement packets from devices where the advertiser’s address is in the White list, and
      ii. directed advertising packets where the initiator address is a resolvable private address, and
      iii. directed advertising packets addressed to this device.
enum `esp_ble_scan_duplicate_t`

Ble scan duplicate type.

Values:

enumerator `BLE_SCAN_DUPLICATE_DISABLE`
the Link Layer should generate advertising reports to the host for each packet received

enumerator `BLE_SCAN_DUPLICATE_ENABLE`
the Link Layer should filter out duplicate advertising reports to the Host

enumerator `BLE_SCAN_DUPLICATE_MAX`
0x02 –0xFF, Reserved for future use

enum `esp_gap_search_evt_t`

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerator `ESP_GAP_SEARCH_INQ_RES_EVT`
Inquiry result for a peer device.

enumerator `ESP_GAP_SEARCH_INQ_CMPL_EVT`
Inquiry complete.

enumerator `ESP_GAP_SEARCH_DISC_RES_EVT`
Discovery result for a peer device.

enumerator `ESP_GAP_SEARCH_DISC_BLE_RES_EVT`
Discovery result for BLE GATT based service on a peer device.

enumerator `ESP_GAP_SEARCH_DISC_CMPL_EVT`
Discovery complete.

enumerator `ESP_GAP_SEARCH_DI_DISC_CMPL_EVT`
Discovery complete.

enumerator `ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT`
Search cancelled

enumerator `ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT`
The number of pkt discarded by flow control

enum `esp_ble_evt_type_t`

Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator `ESP_BLE_EVT_CONN_ADV`
Connectable undirected advertising (ADV_IND)
enumerator **ESP_BLE_EVT_CONN_DIR_ADV**
  Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**
  Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**
  Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**
  Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

  Values:

  enumerator **ESP_BLE_WHITELIST_REMOVE**
    remove mac from whitelist

 enumerator **ESP_BLE_WHITELIST_ADD**
    add address to whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

  Values:

  enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
    Add device info into duplicate scan exceptional list

  enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
    Remove device info from duplicate scan exceptional list

  enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
    Clean duplicate scan exceptional list

enum **esp_ble_duplicate_exceptional_info_type_t**

  Values:

  enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**
    BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

  enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
    BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

  enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
    BLE mesh beacon AD type, the format is |Len|0x2B|Beacon Type|Beacon Data|

  enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**
    BLE mesh provisioning service uuid, the format is |0x02|0x01|flags|0x03|0x03|0x1827|... |
enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**

BLE mesh adv with proxy service uuid, the format is |0x02|0x01|flags|0x03|0x03|0x1828|… |`

enum esp_duplicate_scan_exceptional_list_type_t

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**

duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

GATT DEFINES

API Reference

Header File

- components/bluetooth/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t

```
#include <esp_gatt_defs.h> GATT remote read request response type.
```

Public Members

```
esp_gatt_value_t attr_value

Gatt attribute structure
```

```
uint16_t handle

Gatt attribute handle
```

Structures

struct esp_gatt_id_t

Gatt id, include uuid and instance id.
Chapter 2. API

**Public Members**

```c

esp_bt_uuid_t uuid
    UUID

uint8_t inst_id
    Instance id

struct esp_gatt_srvc_id_t
    Gatt service id, include id (uuid and instance id) and primary flag.

esp_gatt_id_t id
    Gatt id, include uuid and instance

bool is_primary
    This service is primary or not

struct esp_attr_desc_t
    Attribute description (used to create database)

uint16_t uuid_length
    UUID length

uint8_t *uuid_p
    UUID value

uint16_t perm
    Attribute permission

uint16_t max_length
    Maximum length of the element

uint16_t length
    Current length of the element

uint8_t *value
    Element value array

struct esp_attr_control_t
    attribute auto response flag
```
chapter 2. API

public members

uint8_t auto_rsp

if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t

attribute type added to the gatt server database

public members

esp_attr_control_t attr_control

the attribute control type

esp_attr_desc_t att_desc

the attribute type

struct esp_attr_value_t

set the attribute value type

public members

uint16_t attr_max_len

attribute max value length

uint16_t attr_len

attribute current value length

uint8_t *attr_value

the pointer to attribute value

struct esp_gatts_incl_svc_desc_t

Gatt include service entry element.

public members

uint16_t start_hdl

Gatt start handle value of included service

uint16_t end_hdl

Gatt end handle value of included service

uint16_t uuid

Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t

Gatt include 128 bit service entry element.
**Public Members**

`uint16_t start_hdl`
- Gatt start handle value of included 128 bit service

`uint16_t end_hdl`
- Gatt end handle value of included 128 bit service

```c
struct esp_gatt_value_t
    Gatt attribute value.
```

**Public Members**

`uint8_t value[ESP_GATT_MAX_ATTR_LEN]`
- Gatt attribute value

`uint16_t handle`
- Gatt attribute handle

`uint16_t offset`
- Gatt attribute value offset

`uint16_t len`
- Gatt attribute value length

`uint8_t auth_req`
- Gatt authentication request

```c
struct esp_gatt_conn_params_t
    Connection parameters information.
```

**Public Members**

`uint16_t interval`
- connection interval

`uint16_t latency`
- Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
- Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

```c
struct esp_gattc_multi_t
    read multiple attribute
```
Chapter 2. API

Public Members

uint8_t num_attr
  The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
  The handles list

struct esp_gattc_db_elem_t
data base attribute element

Public Members

esp_gatt_db_attr_type_t type
  The attribute type

uint16_t attribute_handle
  The attribute handle, it’s valid for all of the type

uint16_t start_handle
  The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
  The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t properties
  The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp.bt_uuid_t uuid
  The attribute uuid, it’s valid for all of the type

struct esp_gattc_service_elem_t
  service element

Public Members

bool is_primary
  The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle
  The start handle of the service

uint16_t end_handle
  The end handle of the service
The uuid of the service

**struct esp_gattc_char_elem_t**
characteristic element

**Public Members**

```c
uint16_t char_handle
The characteristic handle
```

```c
esp_gatt_char_prop_t properties
The characteristic properties
```

```c
esp_bt_uuid_t uuid
The characteristic uuid
```

**struct esp_gattc_descr_elem_t**
descriptor element

**Public Members**

```c
uint16_t handle
The characteristic descriptor handle
```

```c
esp_bt_uuid_t uuid
The characteristic descriptor uuid
```

**struct esp_gattc_incl_svc_elem_t**
include service element

**Public Members**

```c
uint16_t handle
The include service current attribute handle
```

```c
uint16_t incl_srvc_s_handle
The start handle of the service which has been included
```

```c
uint16_t incl_srvc_e_handle
The end handle of the service which has been included
```

```c
esp_bt_uuid_t uuid
The include service uuid
```

ESP_GATT_CHAR_PROP_BIT_AUTH
ESP_GATT_CHAR_PROP_BIT_EXT_PROP

ESP_GATT_MAX_ATTR_LEN
GATT maximum attribute length.

ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE
If callback report gattc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t

Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
Attribute write data type from the client.
Values:

enumerator ESP_GATT_PREP_WRITE_CANCEL
Prepare write cancel

enumerator ESP_GATT_PREP_WRITE_EXEC
Prepare write execute

enum esp_gatt_status_t
GATT success code and error codes.
Values:

enumerator ESP_GATT_OK
enumerator ESP_GATT_INVALID_HANDLE
enumerator ESP_GATT_READ_NOT_PERMIT
enumerator ESP_GATT_WRITE_NOT_PERMIT
enumerator ESP_GATT_INVALID_PDU
enumerator ESP_GATT_INSUF_AUTHENTICATION
enumerator ESP_GATT_REQ_NOT_SUPPORTED
enumerator ESP_GATT_INVALID_OFFSET
enumerator ESP_GATT_INSUFAuthorization
enumerator ESP_GATT_PREPARE_Q_FULL
enumerator ESP_GATT_NOT_FOUND
enumerator ESP_GATT_NOT_LONG
enumerator ESP_GATT_INSUF_KEY_SIZE
enumerator ESP_GATT_INVALID_ATTR_LEN
enumerator ESP_GATT_ERR_UNLIKELY
enumerator ESP_GATT_INSUF_ENCRYPTION
enumerator ESP_GATT_UNSUPPORT_GRP_TYPE
enumerator ESP_GATT_INSUF_RESOURCE

enumerator ESP_GATT_CCC_CFG_ERR
enumerator ESP_GATT_PRC_IN_PROGRESS
enumerator ESP_GATT_OUT_OF_RANGE

enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.
    Values:
        enumerator ESP_GATT_CONN_UNKNOWN
            Gatt connection unknown
enumerator ESP_GATT_CONN_L2C_FAILURE
       General L2cap failure

enumerator ESP_GATT_CONN_TIMEOUT
       Connection timeout

enumerator ESP_GATT_CONN_TERMINATE_PEER_USER
       Connection terminate by peer user

enumerator ESP_GATT_CONN_TERMINATE_LOCAL_HOST
       Connection terminated by local host

enumerator ESP_GATT_CONN_FAIL_ESTABLISH
       Connection fail to establish

enumerator ESP_GATT_CONN_LMP_TIMEOUT
       Connection fail for LMP response tout

enumerator ESP_GATT_CONN_CONN_CANCEL
       L2CAP connection cancelled

enumerator ESP_GATT_CONN_NONE
       No connection to cancel

enum esp_gatt_auth_req_t
       Gatt authentication request type.

Values:

enumerator ESP_GATT_AUTH_REQ_NONE

enumerator ESP_GATT_AUTH_REQ_NO_MITM

enumerator ESP_GATT_AUTH_REQ_MITM

enumerator ESP_GATT_AUTH_REQ_SIGNED_NO_MITM

enumerator ESP_GATT_AUTH_REQ_SIGNED_MITM

enum esp_service_source_t

Values:

enumerator ESP_GATT_SERVICE_FROM_REMOTE_DEVICE

enumerator ESP_GATT_SERVICE_FROM_NVS_FLASH

enumerator ESP_GATT_SERVICE_FROM_UNKNOWN
enum **esp_gatt_write_type_t**
Gatt write type.

*Values:*

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**
Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**
Gatt write attribute need remote response

enum **esp_gatt_db_attr_type_t**
the type of attribute element

*Values:*

enumerator **ESP_GATT_DB_PRIMARY_SERVICE**
Gattc primary service attribute type in the cache

enumerator **ESP_GATT_DB_SECONDARY_SERVICE**
Gattc secondary service attribute type in the cache

enumerator **ESP_GATT_DB_CHARACTERISTIC**
Gattc characteristic attribute type in the cache

enumerator **ESP_GATT_DB_DESCRIPTOR**
Gattc characteristic descriptor attribute type in the cache

enumerator **ESP_GATT_DB_INCLUDED_SERVICE**
Gattc include service attribute type in the cache

enumerator **ESP_GATT_DB_ALL**
Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

**GATT SERVER API**

**Application Example**
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

**API Reference**
Header File

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

`esp_err_t esp_ble_gatts_register_callback(esp_gatts_cb_t callback)`

This function is called to register application callbacks with BTA GATTS module.

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_app_register(uint16_t app_id)`

This function is called to register application identifier.

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_app_unregister(esp_gatt_if_t gatts_if)`

unregister with GATT Server.

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_create_service(esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)`

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

- gatts_if [in] GATT server access interface
- service_id [in] service ID.
- num_handle [in] number of handle requested for this service.

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint16_t max_nb_attr, uint8_t srvc_inst_id)`

Create a service attribute tab.

- gatts_attr_db [in] the pointer to the service attr tab
- gatts_if [in] GATT server access interface
- max_nb_attr [in] the number of attribute to be added to the service database.
- srvc_inst_id [in] the instance id of the service

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)`

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTS_ADD_INCL_SVRC_EVT is reported the included service ID.

- service_handle [in] service handle to which this included service is to be added.
include_service_handle [in] the service ID to be included.

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)
```

This function is called to add a characteristic into a service.

**Parameters**

- `service_handle` [in] - service handle to which this included service is to be added.
- `char_uuid` [in] - Characteristic UUID.
- `perm` [in] - Characteristic value declaration attribute permission.
- `property` [in] - Characteristic Properties
- `char_val` [in] - Characteristic value
- `control` [in] - attribute response control byte

**Return**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)
```

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATT.S_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Parameters**

- `service_handle` [in] - service handle to which this characteristic descriptor is to be added.
- `perm` [in] - descriptor access permission.
- `descr_uuid` [in] - descriptor UUID.
- `char_descr_val` [in] - Characteristic descriptor value
- `control` [in] - attribute response control byte

**Return**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_delete_service(uint16_t service_handle)
```

This function is called to delete a service. When this is done, a callback event ESP_GATT.S_DELETE_EVT is report with the status.

**Parameters**

- `service_handle` [in] - service handle to be deleted.

**Return**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_start_service(uint16_t service_handle)
```

This function is called to start a service.

**Parameters**

- `service_handle` [in] - the service handle to be started.

**Return**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gatts_stop_service(uint16_t service_handle)
```

This function is called to stop a service.

**Parameters**

- `service_handle` [in] - service to be toppled.

**Return**

- ESP_OK: success
- other: failed
esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t* value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

参数
- gatts_if - [in] GATT server access interface
- conn_id - [in] - connection id to indicate.
- attr_handle - [in] - attribute handle to indicate.
- value_len - [in] - indicate value length.
- value - [in] - value to indicate.
- need_confirm - [in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

返回
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)

This function is called to send a response to a request.

参数
- gatts_if - [in] GATT server access interface
- trans_id - [in] - transfer id
- status - [in] - response status
- rsp - [in] - response data.

返回
- ESP_OK : success
- other : failed

esp_err_t esp_ble_gatts_set_attr_value (uint16_t attr_handle, uint16_t length, const uint8_t* value)

This function is called to set the attribute value by the application.

参数
- attr_handle - [in] the attribute handle which to be set
- length - [in] the value length
- value - [in] the pointer to the attribute value

返回
- ESP_OK : success
- other : failed

esp_gatt_status_t esp_ble_gatts_get_attr_value (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

参数
- attr_handle - [in] Attribute handle.
- length - [out] pointer to the attribute value length
- value - [out] Pointer to attribute value payload, the value cannot be modified by user

返回
- ESP_GATT_OK : success
- other : failed

esp_err_t esp_ble_gatts_open (esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

参数
- gatts_if - [in] GATT server access interface
- remote_bda - [in] remote device bluetooth device address.
- is_direct - [in] direct connection or background auto connection
Chapter 2. API 参考

返回
• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)
```

Close a connection a remote device.

参数
• gatts_if - [in] GATT server access interface
• conn_id - [in] connection ID to be closed.

返回
• ESP_OK : success
• other : failed

```c
esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)
```

Send service change indication.

参数
• gatts_if - [in] GATT server access interface
• remote_bda - [in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

返回
• ESP_OK : success
• other : failed

Unions

union esp_ble_gatts_cb_param_t

```c
#include <esp_gatts_api.h> Gatt server callback parameters union.
```

Public Members

struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg

Gatt server callback param of ESP_GATTS_REG_EVT

struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read

Gatt server callback param of ESP_GATTS_READ_EVT

struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write

Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write

Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu

Gatt server callback param of ESP_GATTS_MTU_EVT

struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf

Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create

Gatt server callback param of ESP_GATTS_CREATE_EVT
struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

uint16_t handle
    The attribute handle

uint16_t offset
    Offset of the value, if the value is too long

bool need_rsp
    The write operation need to do response
bool is_prep
    This write operation is prepare write

uint16_t len
    The write attribute value length

uint8_t *value
    The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL
    Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC
    Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
    GATT Server callback function type.

    Param event : Event type
    Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile
    Param param : Point to callback parameter, currently is union type

Enumerations

enum esp_gatts_cb_event_t
    GATT Server callback function events.

    Values:

    enumerator ESP_GATTS_REG_EVT
        When register application id, the event comes

    enumerator ESP_GATTS_READ_EVT
        When gatt client request read operation, the event comes

    enumerator ESP_GATTS_WRITE_EVT
        When gatt client request write operation, the event comes

    enumerator ESP_GATTS_EXEC_WRITE_EVT
        When gatt client request execute write, the event comes

    enumerator ESP_GATTS_MTU_EVT
        When set mtu complete, the event comes

    enumerator ESP_GATTS_CONF_EVT
        When receive confirm, the event comes
enumerator **ESP_GATTS_UNREG_EVT**
   When unregister application id, the event comes

enumerator **ESP_GATTS_CREATE_EVT**
   When create service complete, the event comes

enumerator **ESP_GATTS_ADD_INCL_SRVC_EVT**
   When add included service complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_EVT**
   When add characteristic complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_DESCR_EVT**
   When add descriptor complete, the event comes

enumerator **ESP_GATTS_DELETE_EVT**
   When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**
   When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**
   When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**
   When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**
   When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**
   When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**
   When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**
   When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**
   When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**
   When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**
   When gatt send response complete, the event comes
enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**  
When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**  
When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**  
When gatt send service change indication complete, the event comes

**GATT CLIENT API**

**Application Example**  
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough

- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough

- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h

**Functions**

- **esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)**  
  This function is called to register application callbacks with GATTC module.
  
  参数 **callback** - [in]: pointer to the application callback function.
  
  返回
  - ESP_OK: success
  - other: failed

- **esp_err_t esp_ble_gattc_app_register (uint16_t app_id)**  
  This function is called to register application callbacks with GATTC module.
  
  参数 **app_id** - [in]: Application Identify (UUID), for different application
  
  返回
  - ESP_OK: success
  - other: failed

- **esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)**  
  This function is called to unregister an application from GATTC module.
  
  参数 **gattc_if** - [in]: Gatt client access interface.
  
  返回
  - ESP_OK: success
  - other: failed
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)

Open a direct connection or add a background auto connection.

参数
- remote_bda [in] remote device bluetooth device address.
- remote_addr_type [in] remote device bluetooth device the address type.
- is_direct [in] direct connection or background auto connection(by now, background auto connection is not supported).

返回
- ESP_OK: success
- other: failed

esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)

esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

参数
- conn_id [in] connection ID to be closed.

返回
- ESP_OK: success
- other: failed

esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

参数
- conn_id [in] connection ID.

返回
- ESP_OK: success
- other: failed

esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

参数
- conn_id [in] connection ID.
- filter_uuid [in] a UUID of the service application is interested in. If Null, discover for all services.

返回
- ESP_OK: success
- other: failed

esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid, esp_gattc_service_elem_t *result, uint16_t *count)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.
参数
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
• `svc_uuid` - [in] the pointer to the service uuid.
• `result` - [out] The pointer to the service which has been found in the gattc cache.
• `count` - [inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• `offset` - [in] Offset of the service position to get.

返回
• ESP_OK: success
• other: failed

```
esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle,
esp_gattc_char_elem_t *result, uint16_t *count, uint16_t
offset)
```

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

参数
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
• `start_handle` - [in] the attribute start handle.
• `end_handle` - [in] the attribute end handle.
• `result` - [out] The pointer to the characteristic in the service.
• `count` - [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• `offset` - [in] Offset of the characteristic position to get.

返回
• ESP_OK: success
• other: failed

```
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t
offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

参数
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
• `char_handle` - [in] the given characteristic handle
• `result` - [out] The pointer to the descriptor in the characteristic.
• `count` - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
• `offset` - [in] Offset of the descriptor position to get.

返回
• ESP_OK: success
• other: failed

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle, esp_bt_uuid_t
char_uuid, esp_gattc_char_elem_t *result,
uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

参数
• `gattc_if` - [in] Gatt client access interface.
• `conn_id` - [in] connection ID which identify the server.
Chapter 2. API

- **start_handle**  [in]  the attribute start handle
- **end_handle**  [in]  the attribute end handle
- **char_uuid**  [in]  the characteristic uuid
- **result**  [out]  The pointer to the characteristic in the service.
- **count**  [inout]  input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

返回
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_btUuid_t char_uuid, esp_btUuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

参数
- **gattc_if**  [in]  Gatt client access interface.
- **conn_id**  [in]  connection ID which identify the server.
- **start_handle**  [in]  the attribute start handle
- **end_handle**  [in]  the attribute end handle
- **char_uuid**  [in]  the characteristic uuid.
- **descr_uuid**  [in]  the descriptor uuid.
- **result**  [out]  The pointer to the descriptor in the given characteristic.
- **count**  [inout]  input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

返回
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_btUuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

参数
- **gattc_if**  [in]  Gatt client access interface.
- **conn_id**  [in]  connection ID which identify the server.
- **char_handle**  [in]  the characteristic handle.
- **descr_uuid**  [in]  the descriptor uuid.
- **result**  [out]  The pointer to the descriptor in the given characteristic.
- **count**  [inout]  input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

返回
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_btUuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

参数
• gattc_if [in] Gatt client access interface.
• conn_id [in] connection ID which identify the server.
• start_handle [in] the attribute start handle
• end_handle [in] the attribute end handle
• incl_uuid [in] the include service uuid
• result [out] The pointer to the include service in the given service.
• count [inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

返回
• ESP_OK: success
• other: failed

ESP_OK 出现：success
其他：failed

esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)

Find the attribute count with the given service or characteristic in the gattc cache.

参数
• gattc_if [in] Gatt client access interface.
• conn_id [in] connection ID which identify the server.
• type [in] the attribute type.
• start_handle [in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
• end_handle [in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
• char_handle [in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
• count [out] output the number of attribute has been found in the gattc cache with the given attribute type.

返回
• ESP_OK: success
• other: failed

ESP_OK 出现：success
其他：failed

esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

参数
• gattc_if [in] Gatt client access interface.
• start_handle [in] the attribute start handle
• end_handle [in] the attribute end handle
• conn_id [in] connection ID which identify the server.
• db [in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
• count [in] number of elements in database.

返回
• ESP_OK: success
• other: failed

ESP_OK 出现：success
其他：failed

esp_err_t esp_ble_gattc_read_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)

This function is called to read a service’s characteristics of the given characteristic handle.

参数
• gattc_if [in] Gatt client access interface.
• conn_id [in]: connection ID.
• handle [in]: characteristic handle to read.
**Chapter 2. API**

- **auth_req** - [in]: authenticate request type
  - ESP_OK: success
  - other: failed

**Esp_err_t esp_ble_gattc_read_by_type** (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)

This function is called to read a service’s characteristics of the given characteristic UUID.

**参数**
- gattc_if - [in]: Gatt client access interface.
- conn_id - [in]: connection ID.
- start_handle - [in]: the attribute start handle.
- end_handle - [in]: the attribute end handle
- uuid - [in]: The UUID of attribute which will be read.
- auth_req - [in]: authenticate request type

**返回**
- ESP_OK: success
- other: failed

**Esp_err_t esp_ble_gattc_read_multiple** (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)

This function is called to read multiple characteristic or characteristic descriptors.

**参数**
- gattc_if - [in]: Gatt client access interface.
- conn_id - [in]: connection ID.
- read_multi - [in]: pointer to the read multiple parameter.
- auth_req - [in]: authenticate request type

**返回**
- ESP_OK: success
- other: failed

**Esp_err_t esp_ble_gattc_read_char_descr** (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)

This function is called to read a characteristics descriptor.

**参数**
- gattc_if - [in]: Gatt client access interface.
- conn_id - [in]: connection ID.
- handle - [in]: descriptor handle to read.
- auth_req - [in]: authenticate request type

**返回**
- ESP_OK: success
- other: failed

**Esp_err_t esp_ble_gattc_write_char** (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)

This function is called to write characteristic value.

**参数**
- gattc_if - [in]: Gatt client access interface.
- conn_id - [in]: connection ID.
- handle - [in]: characteristic handle to write.
- value_len - [in]: length of the value to be written.
- value - [in]: the value to be written.
- write_type - [in]: the type of attribute write operation.
- auth_req - [in]: authentication request.

**返回**
• ESP_OK: success
• other: failed

```c
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

参数
- conn_id - [in] : connection ID
- handle - [in] : descriptor handle to write.
- value_len - [in] length of the value to be written.
- value - [in] : the value to be written.
- write_type - [in] : the type of attribute write operation.

返回
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

参数
- conn_id - [in] : connection ID.
- handle - [in] : characteristic handle to prepare write.
- offset - [in] : offset of the write value.
- value_len - [in] length of the value to be written.
- value - [in] : the value to be written.

返回
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

参数
- conn_id - [in] : connection ID.
- handle - [in] : characteristic descriptor handle to prepare write.
- offset - [in] : offset of the write value.
- value_len - [in] length of the value to be written.
- value - [in] : the value to be written.

返回
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

参数
- conn_id - [in] : connection ID.
API

- **is_execute** - [in] execute or cancel.
  - ESP_OK: success
  - other: failed

`esp_err_t esp_ble_gattc_register_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)`

This function is called to register for notification of a service.

- **server_bda** - [in]: target GATT server.
- **handle** - [in]: GATT characteristic handle.

- **ESP_OK**: registration succeeds
- **other**: failed

`esp_err_t esp_ble_gattc_unregister_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)`

This function is called to de-register for notification of a service.

- **server_bda** - [in]: target GATT server.
- **handle** - [in]: GATT characteristic handle.

- **ESP_OK**: unregistration succeeds
- **other**: failed

`esp_err_t esp_ble_gattc_cache_refresh (esp_bd_addr_t remote_bda)`

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

- **remote_bda** - [in] remote device BD address.

- **ESP_OK**: success
- **other**: failed

`esp_err_t esp_ble_gattc_cache_assoc (esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)`

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database that has stored in the local cache. The source address mains that device want to share the database to the associated address device.

- **src_addr** - [in] the source address which provide the attribute table.
- **assoc_addr** - [in] the associated device address which went to share the attribute table with the source address.
- **is_assoc** - [in] true add the associated device address, false remove the associated device address.

- **ESP_OK**: success
- **other**: failed

`esp_err_t esp_ble_gattc_cache_get_addr_list (esp_gatt_if_t gattc_if)`

Get the address list which has store the attribute table in the gattc cache. There will callback
ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

返回
• ESP_OK: success
• other: failed

esp_err_t esp_ble_gattc_cache_clean (esp_bd_addr_t remote_bda)
Clean the service cache of this device in the gattc stack.

参数 remote_bda [in] remote device BD address.

返回
• ESP_OK: success
• other: failed

Unions

union esp_ble_gattc_cb_param_t

#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members

struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param reg
Gatt client callback param of ESP_GATTC_REG_EVT

struct esp_ble_gattc_cb_param_t::gattc_open_evt_param open
Gatt client callback param of ESP_GATTC_OPEN_EVT

struct esp_ble_gattc_cb_param_t::gattc_close_evt_param close
Gatt client callback param of ESP_GATTC_CLOSE_EVT

struct esp_ble_gattc_cb_param_t::gattc_cfg_mtu_evt_param cfg_mtu
Gatt client callback param of ESP_GATTC_CFG_MTU_EVT

struct esp_ble_gattc_cb_param_t::gattc_search_cmpl_evt_param search_cmpl
Gatt client callback param of ESP_GATTC_SEARCH_CMPL_EVT

struct esp_ble_gattc_cb_param_t::gattc_search_res_evt_param search_res
Gatt client callback param of ESP_GATTC_SEARCH_RES_EVT

struct esp_ble_gattc_cb_param_t::gattc_read_char_evt_param read
Gatt client callback param of ESP_GATTC_READ_CHAR_EVT

struct esp_ble_gattc_cb_param_t::gattc_write_evt_param write
Gatt client callback param of ESP_GATTC_WRITE_DESCR_EVT

struct esp_ble_gattc_cb_param_t::gattc_exec_cmpl_evt_param exec_cmpl
Gatt client callback param of ESP_GATTC_EXEC_EVT

struct esp_ble_gattc_cb_param_t::gattc_notify_evt_param notify
Gatt client callback param of ESP_GATTC_NOTIFY_EVT
struct esp_ble_gattc_cb_param_t::gattc_srvc_chg_evt_param srvc_chg
    Gatt client callback param of ESP_GATTC_SRVC_CHG_EVT

struct esp_ble_gattc_cb_param_t::gattc_congest_evt_param congest
    Gatt client callback param of ESP_GATTC_CONGEST_EVT

struct esp_ble_gattc_cb_param_t::gattc_reg_for_notify_evt_param reg_for_notify
    Gatt client callback param of ESP_GATTC_REG_FOR_NOTIFY_EVT

struct esp_ble_gattc_cb_param_t::gattc_unreg_for_notify_evt_param unreg_for_notify
    Gatt client callback param of ESP_GATTC_UNREG_FOR_NOTIFY_EVT

struct esp_ble_gattc_cb_param_t::gattc_connect_evt_param connect
    Gatt client callback param of ESP_GATTC_CONNECT_EVT

struct esp_ble_gattc_cb_param_t::gattc_disconnect_evt_param disconnect
    Gatt client callback param of ESP_GATTC_DISCONNECT_EVT

struct esp_ble_gattc_cb_param_t::gattc_set_assoc_addr_cmp_evt_param set_assoc_cmp
    Gatt client callback param of ESP_GATTC_SET_ASSOC_EVT

struct esp_ble_gattc_cb_param_t::gattc_get_addr_list_evt_param get_addr_list
    Gatt client callback param of ESP_GATTC_GET_ADDR_LIST_EVT

struct esp_ble_gattc_cb_param_t::gattc_queue_full_evt_param queue_full
    Gatt client callback param of ESP_GATTC_QUEUE_FULL_EVT

struct esp_ble_gattc_cb_param_t::gattc_dis_srvc_cmpl_evt_param dis_srvc_cmpl
    Gatt client callback param of ESP_GATTC_DIS_SRVC_CMPL_EVT

struct gattc_cfg_mtu_evt_param
    #include <esp_gattc_api.h> ESP_GATTC_CFG_MTU_EVT.

**Public Members**

### Chapter 2. API Reference

#### esp_gatt_status_t status
- Operation status

#### struct gattc_svc_chg_evt_param
- #include <esp_gattc_api.h> ESP_GATTC_SRVC_CHG_EVT.

**Public Members**

- esp_bd_addr_t remote_bda
  - Remote bluetooth device address

#### struct gattc_unreg_for_notify_evt_param
- #include <esp_gattc_api.h> ESP_GATTC_UNREG_FOR_NOTIFY_EVT.

**Public Members**

- esp_gatt_status_t status
  - Operation status

- uint16_t handle
  - The characteristic or descriptor handle

#### struct gattc_write_evt_param
- #include <esp_gattc_api.h> ESP_GATTC_WRITE_CHAR_EVT, ESP_GATTC_PREP_WRITE_EVT, ESP_GATTC_WRITE_DESCR_EVT.

**Public Members**

- esp_gatt_status_t status
  - Operation status

- uint16_t conn_id
  - Connection id

- uint16_t handle
  - The characteristic or descriptor handle

- uint16_t offset
  - The prepare write offset, this value is valid only when prepare write

#### Type Definitions

typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

  GATT Client callback function type.

  **Param event** : Event type
**Param gattc_if** : GATT client access interface, normally different gattc_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

### Enumerations

```c
enum esp_gattc_cb_event_t
{
    GATTClientcallbackfunctionevents.

    Values:

    enumerator ESP_GATTC_REG_EVT
        When GATT client is registered, the event comes

    enumerator ESP_GATTC_UNREG_EVT
        When GATT client is unregistered, the event comes

    enumerator ESP_GATTC_OPEN_EVT
        When GATT virtual connection is set up, the event comes

    enumerator ESP_GATTC_READ_CHAR_EVT
        When GATT characteristic is read, the event comes

    enumerator ESP_GATTC_WRITE_CHAR_EVT
        When GATT characteristic write operation completes, the event comes

    enumerator ESP_GATTC_CLOSE_EVT
        When GATT virtual connection is closed, the event comes

    enumerator ESP_GATTC_SEARCH_CMPL_EVT
        When GATT service discovery is completed, the event comes

    enumerator ESP_GATTC_SEARCH_RES_EVT
        When GATT service discovery result is got, the event comes

    enumerator ESP_GATTC_READ_DESCR_EVT
        When GATT characteristic descriptor read completes, the event comes

    enumerator ESP_GATTC_WRITE_DESCR_EVT
        When GATT characteristic descriptor write completes, the event comes

    enumerator ESP_GATTC_NOTIFY_EVT
        When GATT notification or indication arrives, the event comes

    enumerator ESP_GATTC_PREP_WRITE_EVT
        When GATT prepare-write operation completes, the event comes

    enumerator ESP_GATTC_EXEC_EVT
        When write execution completes, the event comes
```
enumerator **ESP_GATTC_ACL_EVT**
When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**
When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHG_EVT**
When "service changed" occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**
When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**
When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**
When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**
When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**
When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**
When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**
When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**
When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**
When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**
When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**
When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**
When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**
When Batch scan parameters are set, the event comes
Chapter 2. API

**enumerator** ESP_GATTC_BTH_SCAN_DIS_EVT
When Batch scan is disabled, the event comes

**enumerator** ESP_GATTC_SCAN_FLT_CFG_EVT
When Scan filter configuration completes, the event comes

**enumerator** ESP_GATTC_SCAN_FLT_PARAM_EVT
When Scan filter parameters are set, the event comes

**enumerator** ESP_GATTC_SCAN_FLT_STATUS_EVT
When Scan filter status is reported, the event comes

**enumerator** ESP_GATTC_ADV_VSC_EVT
When advertising vendor spec content event is reported, the event comes

**enumerator** ESP_GATTC_REG_FOR_NOTIFY_EVT
When register for notification of a service completes, the event comes

**enumerator** ESP_GATTC_UNREG_FOR_NOTIFY_EVT
When unregister for notification of a service completes, the event comes

**enumerator** ESP_GATTC_CONNECT_EVT
When the ble physical connection is set up, the event comes

**enumerator** ESP_GATTC_DISCONNECT_EVT
When the ble physical connection disconnected, the event comes

**enumerator** ESP_GATTC_READ_MULTIPLE_EVT
When the ble characteristic or descriptor multiple complete, the event comes

**enumerator** ESP_GATTC_QUEUE_FULL_EVT
When the gattc command queue full, the event comes

**enumerator** ESP_GATTC_SET_ASSOC_EVT
When the ble gattc set the associated address complete, the event comes

**enumerator** ESP_GATTC_GET_ADDR_LIST_EVT
When the ble get gattc address list in cache finish, the event comes

**enumerator** ESP_GATTC_DIS_SRVC_CMPL_EVT
When the ble discover service complete, the event comes

### BLUFI API

**Overview**  
BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the  “Key Exchange/Negotiation” procedure.
**Application Example** Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

**API Reference**

**Header File**

- components/bt/common/api/include/api/esp_blufi_api.h

**Functions**

```c
#include <api/esp_blufi_api.h>

#define BLUFI_API_API_VERSION_MAJOR 0
#define BLUFI_API_API Version_MINOR 1
#define BLUFI_API_API Version_PATCH 0

// ESP_OK success, other failed

/// 
/// This function is called to receive blufi callback event.
///
/// @param callbacks [in] callback functions
/// @param ESP_OK - success, other - failed

**ESPIF**

### Chapter 2. API Reference

#### Macros

**ESP BLUFI BD ADDR LEN**

Bluetooth address length.

#### Type Definitions

**typedef uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_BD_ADDR_LEN]**

Bluetooth device address.

**typedef void(*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)**

BLUFI event callback function type.

- **Param event**: Event type
- **Param param**: Point to callback parameter, currently is union type

**typedef void(*esp_blufi_negotiate_data_handler_t)(uint8_t* data, int len, uint8_t** output_data, int *output_len, bool *need_free)**

BLUFI negotiate data handler.

- **Param data**: Data from phone
- **Param len**: Length of data from phone
- **Param output_data**: Data want to send to phone
- **Param output_len**: Length of data want to send to phone
- **Param need_free**: Output reporting if memory needs to be freed or not

**typedef int(*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t* crypt_data, int crypt_len)**

BLUFI encrypt the data after negotiate a share key.

- **Param iv8**: Initial vector(8bit), normally, blufi core will input packet sequence number
- **Param crypt_data**: Plain text and encrypted data, the encrypt function must support autothonous encrypt
- **Param crypt_len**: Length of plain text
- **Return**: Nonnegative number is encrypted length, if error, return negative number;

**typedef int(*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t* crypt_data, int crypt_len)**

BLUFI decrypt the data after negotiate a share key.

- **Param iv8**: Initial vector(8bit), normally, blufi core will input packet sequence number
- **Param crypt_data**: Encrypted data and plain text, the encrypt function must support autothonous decrypt
- **Param crypt_len**: Length of encrypted text
- **Return**: Nonnegative number is decrypted length, if error, return negative number;

**typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t* data, int len)**

BLUFI checksum.

- **Param iv8**: Initial vector(8bit), normally, blufi core will input packet sequence number
- **Param data**: Data need to checksum
- **Param len**: Length of data

enumerator ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
enumerator ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

enum esp_blufi_sta_conn_state_t
    BLUFI config status.
    Values:
    enumerator ESP_BLUFI_STA_CONN_SUCCESS
    enumerator ESP_BLUFI_STA_CONN_FAIL
    enumerator ESP_BLUFI_STA_CONNECTING
    enumerator ESP_BLUFI_STA_NO_IP

enum esp_blufi_init_state_t
    BLUFI init status.
    Values:
    enumerator ESP_BLUFI_INIT_OK
    enumerator ESP_BLUFI_INIT_FAILED

enum esp_blufi_deinit_state_t
    BLUFI deinit status.
    Values:
    enumerator ESP_BLUFI_DEINIT_OK
    enumerator ESP_BLUFI_DEINIT_FAILED

enum esp_blufi_error_state_t
    Values:
    enumerator ESP_BLUFI_SEQUENCE_ERROR
    enumerator ESP_BLUFI_CHECKSUM_ERROR
2.3.3 CLASSIC BT

CLASSIC BLUETOOTH GAP API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

static inline uint32_t esp_bt_gap_get_cod_srvc(uint32_t cod)
get major service field of COD
参数 cod - [in] Class of Device
返回 major service bits

static inline uint32_t esp_bt_gap_get_cod_major_dev(uint32_t cod)
get major device field of COD
参数 cod - [in] Class of Device
返回 major device bits

static inline uint32_t esp_bt_gap_get_cod_minor_dev(uint32_t cod)
get minor service field of COD
参数 cod - [in] Class of Device
返回 minor service bits

static inline uint32_t esp_bt_gap_get_cod_format_type(uint32_t cod)
get format type of COD
参数 cod - [in] Class of Device
返回 format type
static inline bool esp_bt_gap_is_valid_cod(uint32_t cod)
    decide the integrity of COD
参数 cod[in] Class of Device
返回
• true if cod is valid
• false otherwise

esp_err_t esp_bt_gap_register_callback(esp_bt_gap_cb_t callback)
register callback function. This function should be called after esp_bluedroid_enable() completes successfully
返回
• ESP_OK: Succeed
• ESP_FAIL: others

esp_err_t esp_bt_gap_set_scan_mode(esp_bt_connection_mode_t c_mode, esp_bt_discovery_mode_t d_mode)
Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.
参数
• c_mode[in]: one of the enums of esp_bt_connection_mode_t
• d_mode[in]: one of the enums of esp_bt_discovery_mode_t
返回
• ESP_OK: Succeed
• ESP_ERR_INVALID_ARG: if argument invalid
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_bt_gap_start_discovery(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)
This function starts Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT when Inquiry is started or Name Discovery is completed. esp(bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT each time the two types of discovery results are got.
参数
• mode[in]: Inquiry mode
• inq_len[in]: Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process, when this time expires, Inquiry will be halted.
• num_rsps[in]: Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.
返回
• ESP_OK: Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if invalid parameters are provided
• ESP_FAIL: others

esp_err_t esp_bt_gap_cancel_discovery()
Cancel Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp(bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if Inquiry or Name Discovery is cancelled by calling this function.
返回
• ESP_OK: Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
**esp_err_t esp_bt_gap_get_remote_services**(esp_bd_addr_t remote_bda)

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

**esp_err_t esp_bt_gap_get_remote_service_record**(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends.

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

**esp_err_t esp_bt_gap_resolve_eir_data**(uint8_t*eir, esp_bt_eir_type_t type, uint8_t*length)

This function is called to get EIR data for a specific type.

- **eir** - [in] - pointer of raw eir data to be resolved
- **type** - [in] - specific EIR data type
- **length** - [out] - return the length of EIR data excluding fields of length and data type

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_ERR_INVALID_ARG**: if param is invalid
- **ESP_FAIL**: others

**esp_err_t esp_bt_gap_config_eir_data**(esp_bt_eir_data_t *eir_data)

This function is called to config EIR data.

- **eir_data** - [in] - pointer of EIR data content

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_ERR_INVALID_ARG**: if param is invalid
- **ESP_FAIL**: others

**esp_err_t esp_bt_gap_set_cod**(esp_bt_cod_t cod, esp_bt_cod_mode_t mode)

This function is called to set class of device. The structure esp_bt_gapCb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

- **cod** - [in] - class of device
- **mode** - [in] - setting mode

- **ESP_OK**: Succeed
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_ERR_INVALID_ARG**: if param is invalid
- **ESP_FAIL**: others
```c
esp_err_t esp_bt_gap_get_cod(esp_bt_cod_t *cod)
This function is called to get class of device.
参数 cod - [out] - class of device
返回
• ESP_OK : Succeed
• ESP_FAIL : others
```

```c
esp_err_t esp_bt_gap_read_rssi_delta(esp_bd_addr_t remote_addr)
This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.
参数 remote_addr - [in] - remote device address, corresponding to a certain connection handle
返回
• ESP_OK : Succeed
• ESP_FAIL : others
```

```c
esp_err_t esp_bt_gap_remove_bond_device(esp_bd_addr_t bd_addr)
Removes a device from the security database list of peer device.
参数 bd_addr - [in] : BD address of the peer device
返回 - ESP_OK : success
• ESP_FAIL : failed
```

```c
int esp_bt_gap_get_bond_device_num(
Get the device number from the security database list of peer device. It will return the device bonded number immediately.
返回 - >= 0 : bonded devices number
• ESP_FAIL : failed
```

```c
esp_err_t esp_bt_gap_get_bond_device_list(int *dev_num, esp_bd_addr_t *dev_list)
Get the device from the security database list of peer device. It will return the device bonded information immediately.
参数
• dev_num - [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
• dev_list - [out] an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.
返回
• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
```

```c
esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
Set pin type and default pin code for legacy pairing.
参数
• pin_type - [in] Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
• pin_code_len - [in] Length of pin_code
• pin_code - [in] Pin_code
返回 - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed
```
esp_err_t esp_bt_gap_pin_reply (esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

参数
- bd_addr [in] BD address of the peer
- accept [in] Pin_code reply successful or declined.
- pin_code_len [in] Length of pin_code
- pin_code [in] Pin_code

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

esp_err_t esp_bt_gap_set_security_param (esp_bt_sp_param_t param_type, void* value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

参数
- param_type [in]: the type of the param which is to be set
- value [in]: the param value
- len [in]: the length of the param value

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

esp_err_t esp_bt_gap_ssp_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

参数
- bd_addr [in]: BD address of the peer
- accept [in]: passkey entry successful or declined.
- passkey [in]: passkey value, must be a 6 digit number, can be lead by 0.

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

esp_err_t esp_bt_gap_ssp_confirm_reply (esp_bd_addr_t bd_addr, bool accept)

Reply the confirm value to the peer device in the legacy connection stage.

参数
- bd_addr [in]: BD address of the peer device
- accept [in]: numbers to compare are the same or different

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

esp_err_t esp_bt_gap_set_afh_channels (esp_bt_gap_afh_channels channels)

Set the AFH channels.

参数 channels [in]: The n th such field (in the range 0 to 78) contains the value for channel n
: 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved
and shall be set to 0. At least 20 channels shall be marked as unknown.

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

esp_err_t esp_bt_gap_read_remote_name (esp_bd_addr_t remote_bda)

Read the remote device name.

参数 remote_bda [in] The remote device’s address

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed
esp_err_t esp_bt_gap_set_qos (esp_bd_addr_t remote_bda, uint32_t t_poll)

Config Quality of service.

参数
- remote_bda [in] The remote device’s address
- t_poll [in] Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

返回
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Unions

union esp_bt_gap_cb_param_t

#include <esp_gap_bt_api.h> GAP state callback parameters.

Public Members

struct esp_bt_gap_cb_param_t::disc_res_param disc_res
discovery result parameter struct

struct esp_bt_gap_cb_param_t::disc_state_changed_param disc_st_chg
discovery state changed parameter struct

struct esp_bt_gap_cb_param_t::rmt_srvcs_param rmt_srvcs
services of remote device parameter struct

struct esp_bt_gap_cb_param_t::rmt_svc_rec_param rmt_svc_rec
specific service record from remote device parameter struct

struct esp_bt_gap_cb_param_t::read_rssi_delta_param read_rssi_delta
read rssi parameter struct

struct esp_bt_gap_cb_param_t::config_eir_data_param config_eir_data
config EIR data

struct esp_bt_gap_cb_param_t::auth_cmpl_param auth_cmpl
authentication complete parameter struct

struct esp_bt_gap_cb_param_t::pin_req_param pin_req
pin request parameter struct

struct esp_bt_gap_cb_param_t::cfm_req_param cfm_req
confirm request parameter struct

struct esp_bt_gap_cb_param_t::keynotif_param keynotif
passkey notif parameter struct

struct esp_bt_gap_cb_param_t::key_req_param key_req
passkey request parameter struct
struct esp_bt_gap_cb_param_t::set_afh_channels_param set_afh_channels
   set AFH channel parameter struct

struct esp_bt_gap_cb_param_t::read_rmt_name_param read_rmt_name
   read Remote Name parameter struct

struct esp_bt_gap_cb_param_t::mode_chg_param mode_chg
   mode change event parameter struct

struct esp_bt_gap_cb_param_t::bt_remove_bond_dev_cmpl_evt_param remove_bond_dev_cmpl
   Event parameter of ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT

struct esp_bt_gap_cb_param_t::qos_cmpl_param qos_cmpl
   QoS complete parameter struct

struct auth_cmpl_param
   #include <esp_gap_bt_api.h> ESP_BT_GAP_AUTH_CMPL_EVT.

Public Members

   esp_bd_addr_t bda
      remote bluetooth device address

   esp_bt_status_t stat
      authentication complete status

   uint8_t device_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]
      device name

struct bt_remove_bond_dev_cmpl_evt_param
   #include <esp_gap_bt_api.h> ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

   esp_bd_addr_t bda
      remote bluetooth device address

   esp_bt_status_t status
      Indicate the remove bond device operation success status

struct cfm_req_param
   #include <esp_gap_bt_api.h> ESP_BT_GAP_CFM_REQ_EVT.

Public Members
```c
esp_bd_addr_t bda
    remote bluetooth device address

uint32_t num_val
    the numeric value for comparison.
```

```c
struct config_eir_data_param

#include <esp_gap_bt_api.h> ESP_BT_GAP_CONFIG_EIR_DATA_EVT *
```

### Public Members

```c
esp_bt_status_t stat
    config EIR status: ESP_BT_STATUS_SUCCESS: config success
    ESP_BT_STATUS_EIR_TOO_LARGE: the EIR data is more than 240B. The EIR may not
    contain the whole data. others: failed
```

```c
uint8_t eir_type_num
    the number of EIR types in EIR type
```

```c
esp_bt_eir_type_t eir_type[ESP_BT_EIR_TYPE_MAX_NUM]
    EIR types in EIR type
```

```
struct disc_res_param

#include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_RES_EVT.
```

### Public Members

```c
esp_bd_addr_t bda
    remote bluetooth device address
```

```c
int num_prop
    number of properties got
```

```c

```
Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`uint32_t passkey`
the numeric value for passkey entry.

```c
struct key_req_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_KEY_REQ_EVT.
```

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

```c
struct mode_chg_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_MODE_CHG_EVT.
```

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

```c
struct pin_req_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_PIN_REQ_EVT.
```

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

```c
bool min_16_digit
TRUE if the pin returned must be at least 16 digits
```

```c
struct qos_cmpl_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_QOS_CMPL_EVT.
```

Public Members

`esp_bt_status_t stat`
QoS status
\texttt{esp\_bd\_addr\_t \ bda}

remote bluetooth device address

\texttt{uint32\_t \ t\_poll}

poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms.

\textbf{Public Members}

\texttt{esp\_bd\_addr\_t \ bda}

remote bluetooth device address

\texttt{esp\_bt\_status\_t \ stat}

read Remote Name status

\texttt{uint8\_t \ rmt\_name[ESP\_BT\_GAP\_MAX\_BDNAME\_LEN + 1]}

Remote device name

\textbf{struct \texttt{read\_rmt\_name\_param}}

\texttt{#include \textless esp\_gap\_bt\_api.h\textgreater} ESP\_BT\_GAP\_READ\_REMOTE\_NAME\_EVT.

\textbf{Public Members}

\texttt{esp\_bd\_addr\_t \ bda}

remote bluetooth device address

\texttt{esp\_bt\_status\_t \ stat}

read rssi status

\texttt{int8\_t \ rssi\_delta}

rssi delta value range -128 ~ 127. The value zero indicates that the RSSI is inside the Golden Receive Power Range, the Golden Receive Power Range is from ESP\_BT\_GAP\_RSSI\_LOW\_THRLD to ESP\_BT\_GAP\_RSSI\_HIGH\_THRLD

\textbf{struct \texttt{rmt\_srvc\_rec\_param}}

\texttt{#include \textless esp\_gap\_bt\_api.h\textgreater} ESP\_BT\_GAP\_RMT\_SRVC\_REC\_EVT.

\textbf{Public Members}

\texttt{esp\_bd\_addr\_t \ bda}

remote bluetooth device address

\texttt{esp\_bt\_status\_t \ stat}

service search status

```c
struct rmt_srvcs_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVCS_EVT.

Public Members

esp_bd_addr_t bda
    remote bluetooth device address

esp_bt_status_t stat
    service search status

int num_uuids
    number of UUID in uuid_list

esp_bt_uuid_t *uuid_list
    list of service UUIDs of remote device

struct set_afh_channels_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_SET_AFHCHANNELS_EVT.

Public Members

esp_bt_status_t stat
    set AFH channel status

Structures
struct esp_bt_cod_t
    Class of device.

Public Members

uint32_t reserved_2
    undefined

uint32_t minor
    minor class

uint32_t major
    major class

uint32_t service
    service class

uint32_t reserved_8
    undefined
```
struct esp_bt_gap_dev_prop_t
   Bluetooth Device Property Descriptor.

Public Members

   esp_bt_gap_dev_prop_type_t type
      Device property type

   int len
      Device property value length

   void *val
      Device property value

struct esp_bt_eir_data_t
   EIR data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

   bool fec_required
      FEC is required or not, true by default

   bool include_txpower
      EIR data include TX power, false by default

   bool include_uuid
      EIR data include UUID, false by default

   uint8_t flag
      EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

   uint16_t manufacturer_len
      Manufacturer data length, 0 by default

   uint8_t *p_manufacturer_data
      Manufacturer data point

   uint16_t url_len
      URL length, 0 by default

   uint8_t *p_url
      URL point

Macros

ESP_BT_GAP_RSSI_HIGH_THRLD
   RSSI threshold.
   High RSSI threshold
Chapter 2. API

ESP_BT_GAP_RSSI_LOW_THRLD
Low RSSI threshold

ESP_BT_GAP_AFH_CHANNELS_LEN

ESP_BT_GAP_MAX_BDNAME_LEN
Maximum bytes of Bluetooth device name.

ESP_BT_GAP_EIR_DATA_LEN
Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_FLAGS
Extended Inquiry Response data type.
Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID
Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID
Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID
Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID
Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID
Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID
Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME
Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME
Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL
Uniform resource identifier

ESP_BT_EIR_TYPE_MANU_SPECIFIC
Manufacturer specific data
ESP_BT_EIR_TYPE_MAX_NUM
    MAX number of EIR type

ESP_BT_EIR_FLAG_LIMIT_DISC

ESP_BT_EIR_FLAG_GEN_DISC

ESP_BT_EIR_FLAG_BREDR_NOT_SPT

ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT

ESP_BT_EIR_FLAG_DMT_HOST_SPT

ESP_BT_EIR_MAX_LEN

ESP_BT_PIN_CODE_LEN
    Max pin code length

ESP_BT_IO_CAP_OUT

ESP_BT_IO_CAP_IO

ESP_BT_IO_CAP_IN

ESP_BT_IO_CAP_NONE

ESP_BT_PM_MD_ACTIVE
    Active mode

ESP_BT_PM_MD_HOLD
    Hold mode

ESP_BT_PM_MD_SNIFF
    Sniff mode

ESP_BT_PM_MD_PARK
    Park state

ESP_BT_COD_SRVC_BIT_MASK
    Bits of major service class field.
    Major service bit mask

ESP_BT_COD_SRVC_BIT_OFFSET
    Major service bit offset
**ESP_BT_COD_MAJOR_DEV_BIT_MASK**
Bits of major device class field.
Major device bit mask

**ESP_BT_COD_MAJOR_DEV_BIT_OFFSET**
Major device bit offset

**ESP_BT_COD_MINOR_DEV_BIT_MASK**
Bits of minor device class field.
Minor device bit mask

**ESP_BT_COD_MINOR_DEV_BIT_OFFSET**
Minor device bit offset

**ESP_BT_COD_FORMAT_TYPE_BIT_MASK**
Bits of format type.
Format type bit mask

**ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET**
Format type bit offset

**ESP_BT_COD_FORMAT_TYPE_1**
Class of device format type 1.

**ESP_BT_GAP_MIN_INQ_LEN**
Minimum and maximum inquiry length. Minimum inquiry duration, unit is 1.28s

**ESP_BT_GAP_MAX_INQ_LEN**
Maximum inquiry duration, unit is 1.28s

**Type Definitions**

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
Combination of the IO Capability

typedef uint8_t esp_bt_pm_mode_t

typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

Param event : Event type
Param param : Pointer to callback parameter
Enumerations

enum `esp_bt_cod_mode_t`

class of device settings

Values:

enumerator `ESP_BT_SET_COD_MAJOR_MINOR`
overwrite major, minor class

enumerator `ESP_BT_SET_COD_SERVICE_CLASS`
set the bits in the input, the current bit will remain

enumerator `ESP_BT_CLR_COD_SERVICE_CLASS`
clear the bits in the input, others will remain

enumerator `ESP_BT_SET_COD_ALL`
overwrite major, minor, set the bits in service class

enumerator `ESP_BT_INIT_COD`
overwrite major, minor, and service class

enum `esp_bt_connection_mode_t`
Discoverability and Connectability mode.

Values:

enumerator `ESP_BT_NON_CONNECTABLE`
Non-connectable

enumerator `ESP_BT_CONNECTABLE`
Connectable

enum `esp_bt_discovery_mode_t`

Values:

enumerator `ESP_BT_NON_DISCOVERABLE`
Non-discoverable

enumerator `ESP_BT_LIMITED_DISCOVERABLE`
Limited Discoverable

enumerator `ESP_BT_GENERAL_DISCOVERABLE`
General Discoverable

enum `esp_bt_gap_dev_prop_type_t`
Bluetooth Device Property type.

Values:

enumerator `ESP_BT_GAP_DEV_PROP_BDNAME`
Bluetooth device name, value type is `int8_t []`
enumerator ESP_BT_GAP_DEV_PROP_COD
   Class of Device, value type is uint32_t

enumerator ESP_BT_GAP_DEV_PROP_RSSI
   Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

enumerator ESP_BT_GAP_DEV_PROP_EIR
   Extended Inquiry Response, value type is uint8_t[]

enum esp_bt_cod_srvc_t
   Major service class field of Class of Device, multiple bits can be set.
   Values:

   enumerator ESP_BT_COD_SRVC_NONE
      None indicates an invalid value

   enumerator ESP_BT_COD_SRVC_LMTD_DISCOVER
      Limited Discoverable Mode

   enumerator ESP_BT_COD_SRVC_POSITIONING
      Positioning (Location identification)

   enumerator ESP_BT_COD_SRVC_NETWORKING
      Networking, e.g. LAN, Ad hoc

   enumerator ESP_BT_COD_SRVC_RENDERING
      Rendering, e.g. Printing, Speakers

   enumerator ESP_BT_COD_SRVC_CAPTURING
      Capturing, e.g. Scanner, Microphone

   enumerator ESP_BT_COD_SRVC_OBJ_TRANSFER
      Object Transfer, e.g. v-Inbox, v-Folder

   enumerator ESP_BT_COD_SRVC_AUDIO
      Audio, e.g. Speaker, Microphone, Headset service

   enumerator ESP_BT_COD_SRVC_TELEPHONY
      Telephony, e.g. Cordless telephony, Modem, Headset service

   enumerator ESP_BT_COD_SRVC_INFORMATION
      Information, e.g., WEB-server, WAP-server

enum esp_bt_pin_type_t
   Values:

   enumerator ESP_BT_PIN_TYPE_VARIABLE
      Refer to BTM_PIN_TYPE_VARIABLE
enumerator **ESP_BT_PIN_TYPE_FIXED**
   Refer to BTM_PIN_TYPE_FIXED

enum **esp_bt_sp_param_t**
   *Values:*

   enumerator **ESP_BT_SP_IOCAP_MODE**
      Set IO mode

enum **esp_bt_cod_major_dev_t**
   Major device class field of Class of Device.
   *Values:*

   enumerator **ESP_BT_COD_MAJOR_DEV_MISC**
      Miscellaneous

   enumerator **ESP_BT_COD_MAJOR_DEV_COMPUTER**
      Computer

   enumerator **ESP_BT_COD_MAJOR_DEV_PHONE**
      Phone (cellular, cordless, pay phone, modem

   enumerator **ESP_BT_COD_MAJOR_DEV_LAN_NAP**
      LAN, Network Access Point

   enumerator **ESP_BT_COD_MAJOR_DEV_AV**
      Audio/Video (headset, speaker, stereo, video display, VCR

   enumerator **ESP_BT_COD_MAJOR_DEV_PERIPHERAL**
      Peripheral (mouse, joystick, keyboard)

   enumerator **ESP_BT_COD_MAJOR_DEV_IMAGING**
      Imaging (printer, scanner, camera, display

   enumerator **ESP_BT_COD_MAJOR_DEV_WEARABLE**
      Wearable

   enumerator **ESP_BT_COD_MAJOR_DEV_TOY**
      Toy

   enumerator **ESP_BT_COD_MAJOR_DEV_HEALTH**
      Health

   enumerator **ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED**
      Uncategorized: device not specified

enum **esp_bt_gap_discovery_state_t**
   Bluetooth Device Discovery state
   *Values:
enumerator **ESP_BT_GAP_DISCOVERY_STOPPED**
Device discovery stopped

enumerator **ESP_BT_GAP_DISCOVERY_STARTED**
Device discovery started

enum **esp_bt_gap_cb_event_t**
BT GAP callback events.

Values:

enumerator **ESP_BT_GAP_DISC_RES_EVT**
Device discovery result event

enumerator **ESP_BT_GAP_DISC_STATE_CHANGED_EVT**
Discovery state changed event

enumerator **ESP_BT_GAP_RMT_SRVCS_EVT**
Get remote services event

enumerator **ESP_BT_GAP_RMT_SRVC_REC_EVT**
Get remote service record event

enumerator **ESP_BT_GAP_AUTH_CMPL_EVT**
Authentication complete event

enumerator **ESP_BT_GAP_PIN_REQ_EVT**
Legacy Pairing Pin code request

enumerator **ESP_BT_GAP_CFM_REQ_EVT**
Security Simple Pairing User Confirmation request.

enumerator **ESP_BT_GAP_KEY_NOTIF_EVT**
Security Simple Pairing Passkey Notification

enumerator **ESP_BT_GAP_KEY_REQ_EVT**
Security Simple Pairing Passkey request

enumerator **ESP_BT_GAP_READ_RSSI_DELTA_EVT**
Read rssi event

enumerator **ESP_BT_GAP_CONFIG_EIR_DATA_EVT**
Config EIR data event

enumerator **ESP_BT_GAP_SET_AFH_CHANNELS_EVT**
Set AFH channels event

enumerator **ESP_BT_GAP_READ_REMOTE_NAME_EVT**
Read Remote Name event
enumerator ESP_BT_GAP_MODE_CHG_EVT

enumerator ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
    remove bond device complete event

enumerator ESP_BT_GAP_QOS_CMPL_EVT
    QOS complete event

enumerator ESP_BT_GAP_EVT_MAX

eum esp_bt_inq_mode_t
    Inquiry Mode
    Values:

enumerator ESP_BT_INQ_MODE_GENERAL_INQUIRY
    General inquiry mode

enumerator ESP_BT_INQ_MODE_LIMITED_INQUIRY
    Limited inquiry mode

Bluetooth A2DP API

Application Example Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

• This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h

Functions

esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)

Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

参数 callback [in] A2DP event callback function
返回
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

参数 callback [in] A2DP sink data callback function
返回
Chapter 2. API

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```
esp_err_t esp_a2d_sink_init (void)
```

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

返回
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_a2d_sink_deinit (void)
```

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

返回
- ESP_OK: if the deinitialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)
```

Connect to remote bluetooth A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

参数 `remote_bda` [in] remote bluetooth device address

返回
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)
```

Disconnect from the remote A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

参数 `remote_bda` [in] remote bluetooth device address

返回
- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_a2d_sink_set_delay_value (uint16_t delay_value)
```

Set delay reporting value. The delay value of sink is caused by buffering (including protocol stack and application layer), decoding and rendering. The default delay value is 120ms, if the set value is less than 120ms, the setting will fail. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

参数 `delay_value` [in] reporting value is in 1/10 millisecond

返回
- ESP_OK: delay value is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_a2d_sink_get_delay_value (void)
```

Get delay reporting value. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

返回
- ESP_OK: if the request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
esp_err_t esp_a2d_media_ctrl(esp_a2d_media_ctrl_t ctrl)

Media control commands. This API can be used for both A2DP sink and source and must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

参数 ctrl - [in] control commands for A2DP data channel

返回 • ESP_OK: control command is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_a2d_source_init(void)

Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

返回 • ESP_OK: if the initialization request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_a2d_source_deinit(void)

De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

返回 • ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_a2d_source_register_data_callback(esp_a2d_source_data_cb_t callback)

Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

参数 callback - [in] A2DP source data callback function

返回 • ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

esp_err_t esp_a2d_source_connect(esp_bd_addr_t remote_bda)

Connect to remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

参数 remote_bda - [in] remote bluetooth device address

返回 • ESP_OK: connect request is sent to lower layer successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_a2d_source_disconnect(esp_bd_addr_t remote_bda)

Disconnect from the remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

参数 remote_bda - [in] remote bluetooth device address

返回 • ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
Unions

union esp_a2d_cb_param_t
    #include <esp_a2dp_api.h> A2DP state callback parameters.

Public Members

struct esp_a2d_cb_param_t:a2d_conn_stat_param conn_stat
    A2DP connection status

struct esp_a2d_cb_param_t:a2d_audio_stat_param audio_stat
    audio stream playing state

struct esp_a2d_cb_param_t:a2d_audio_cfg_param audio_cfg
    media codec configuration information

struct esp_a2d_cb_param_t:media_ctrl_stat_param media_ctrl_stat
    status in acknowledgement to media control commands

struct esp_a2d_cb_param_t:a2d_prof_stat_param a2d_prof_stat
    status to indicate a2d prof init or deinit

struct esp_a2d_cb_param_t:a2d_psc_cfg_param a2d_psc_cfg_stat
    status to indicate protocol service capabilities configured

struct esp_a2d_cb_param_t:a2d_set_delay_value_param a2d_set_delay_value_stat
    A2DP sink set delay report value status

struct esp_a2d_cb_param_t:a2d_get_delay_param a2d_get_delay_value_stat
    A2DP sink get delay report value status

struct esp_a2d_cb_param_t:a2d_report_delay_stat_param a2d_report_delay_value_stat
    A2DP source received sink report value status

struct a2d_audio_cfg_param
    #include <esp_a2dp_api.h> ESP_A2D_AUDIO_CFG_EVT.

Public Members

esp_bd_addr_t remote_bda
    remote bluetooth device address

esp_a2d_mcc_t mcc
    A2DP media codec capability information

struct a2d_audio_stat_param
    #include <esp_a2dp_api.h> ESP_A2D_AUDIO_STATE_EVT.
Public Members

`esp_a2d_audio_state_t state`
   one of the values from esp_a2d_audio_state_t

`esp_bd_addr_t remote_bda`
   remote bluetooth device address

struct `a2d_conn_stat_param`

Type Definitions

typedef uint8_t esp_a2d_mct_t

typedef uint16_t esp_a2d_psc_t

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
  A2DP profile callback function type.
  Param event : Event type
  Param param : Pointer to callback parameter
Chapter 2. API

typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t* buf, uint32_t len)

A2DP sink data callback function.

**Param buf [in]:** pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data

**Param len [in]:** size(in bytes) in buf

typedef int32_t (*esp_a2d_source_data_cb_t)(uint8_t* buf, int32_t len)

A2DP source data read callback function.

**Param buf [in]:** buffer to be filled with PCM data stream from higher layer

**Param len [in]:** size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

**Return** size of bytes read successfully, if the argument len is -1, this value is ignored.

Enumerations

enum esp_a2d_connection_state_t

Bluetooth A2DP connection states.

*Values:*

enumerator ESP_A2D_CONNECTION_STATE_DISCONNECTED
connection released

enumerator ESP_A2D_CONNECTION_STATE_CONNECTING
connecting remote device

enumerator ESP_A2D_CONNECTION_STATE_CONNECTED
connection established

enumerator ESP_A2D_CONNECTION_STATE_DISCONNECTING
disconnecting remote device

enum esp_a2d_disc_rsn_t

Bluetooth A2DP disconnection reason.

*Values:*

enumerator ESP_A2D_DISC_RSN_NORMAL
Finished disconnection that is initiated by local or remote device

enumerator ESP_A2D_DISC_RSN_ABNORMAL
Abnormal disconnection caused by signal loss

enum esp_a2d_audio_state_t

Bluetooth A2DP datapath states.

*Values:*

enumerator ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND
audio stream datapath suspended by remote device
Chapter 2. API

enumerator ESP_A2D_AUDIO_STATE_STOPPED
    audio stream datapath stopped

enumerator ESP_A2D_AUDIO_STATE_STARTED
    audio stream datapath started

enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.
Values:

enumerator ESP_A2D_MEDIA_CTRL_ACK_SUCCESS
    media control command is acknowledged with success

enumerator ESP_A2D_MEDIA_CTRL_ACK_FAILURE
    media control command is acknowledged with failure

enumerator ESP_A2D_MEDIA_CTRL_ACK_BUSY
    media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.
Values:

enumerator ESP_A2D_MEDIA_CTRL_NONE
    Not for application use, use inside stack only.

enumerator ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
    check whether AVDTP is connected, only used in A2DP source

enumerator ESP_A2D_MEDIA_CTRL_START
    command to set up media transmission channel

enumerator ESP_A2D_MEDIA_CTRL_STOP
    command to stop media transmission

enumerator ESP_A2D_MEDIA_CTRL_SUSPEND
    command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.
Values:

enumerator ESP_A2D_DEINIT_SUCCESS
    A2DP profile deinit successful event

enumerator ESP_A2D_INIT_SUCCESS
    A2DP profile deinit successful event
enum `esp_a2d_set_delay_value_state_t`

  Bluetooth A2DP set delay report value states.

  **Values:**

  - **enumerator** `ESP_A2D_SET_SUCCESS`
    
    A2DP profile set delay report value successful
  
  - **enumerator** `ESP_A2D_SET_INVALID_PARAMS`
    
    A2DP profile set delay report value is invalid parameter

enum `esp_a2d_cb_event_t`

  A2DP callback events.

  **Values:**

  - **enumerator** `ESP_A2D_CONNECTION_STATE_EVT`
    
    connection state changed event
  
  - **enumerator** `ESP_A2D_AUDIO_STATE_EVT`
    
    audio stream transmission state changed event
  
  - **enumerator** `ESP_A2D_AUDIO_CFG_EVT`
    
    audio codec is configured, only used for A2DP SINK
  
  - **enumerator** `ESP_A2D_MEDIA_CTRL_ACK_EVT`
    
    acknowledge event in response to media control commands
  
  - **enumerator** `ESP_A2D_PROF_STATE_EVT`
    
    indicate a2dp init&deinit complete
  
  - **enumerator** `ESP_A2D_SNK_PSC_CFG_EVT`
    
    protocol service capabilities configured, only used for A2DP SINK
  
  - **enumerator** `ESP_A2D_SNK_SET_DELAY_VALUE_EVT`
    
    indicate a2dp sink set delay report value complete, only used for A2DP SINK
  
  - **enumerator** `ESP_A2D_SNK_GET_DELAY_VALUE_EVT`
    
    indicate a2dp sink get delay report value complete, only used for A2DP SINK
  
  - **enumerator** `ESP_A2D_REPORT_SNK_DELAY_VALUE_EVT`
    
    report delay value, only used for A2DP SRC

**BT AVRCP APIs**

**Overview**  Bluetooth AVRCP reference APIs.

**API Reference**
**Header File**

- components/bluetooth/bluedroid/api/include/api/esp_avrc_api.h

**Functions**

`esp_err_t esp_avrc_ct_register_callback(esp_avrc_ct_cb_t callback)`

Register application callbacks to AVRCP module. This function should be called after `esp_bluedroid_enable()` completes successfully.

- 参数 `callback` : AVRCP controller callback function
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
  - ESP_FAIL: others

`esp_err_t esp_avrc_ct_init(void)`

Initialize the Bluetooth AVRCP controller module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

- 返回
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
  - ESP_FAIL: others

`esp_err_t esp_avrc_ct_deinit(void)`

De-initialize AVRCP controller module. This function should be called after after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

- 返回
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
  - ESP_FAIL: others

`esp_err_t esp_avrc_ct_send_set_player_value_cmd(uint8_t tl, uint8_t attr_id, uint8_t value_id)`

Send player application settings command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRC connection is established.

- 参数
  - `tl` : transaction label, 0 to 15, consecutive commands should use different values
  - `attr_id` : player application setting attribute IDs from one of `esp_avrc_ps_attr_ids_t`
  - `value_id` : attribute value defined for the specific player application setting attribute

- 返回
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
  - ESP_FAIL: others

`esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd(uint8_t tl)`

Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRC connection is established.

- 参数 `tl` : transaction label, 0 to 15, consecutive commands should use different values

- 返回
  - ESP_OK: success
  - ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
  - ESP_FAIL: others
**esp_err_t esp_avrc_ct_send_register_notification_cmd** (uint8_t tl, uint8_t event_id, uint32_t event_parameter)

Send register notification command to AVRCP target. This function should be called after
ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- tl [in]: transaction label, 0 to 15, consecutive commands should use different values.
- event_id [in]: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
- event_parameter [in]: playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd** (uint8_t tl, uint8_t volume)

Send set absolute volume command to AVRCP target. This function should be called after
ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- tl [in]: transaction label, 0 to 15, consecutive commands should use different values
- volume [in]: volume, 0 to 0x7f, means 0% to 100%

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_metadata_cmd** (uint8_t tl, uint8_t attr_mask)

Send metadata command to AVRCP target. This function should be called after
ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- tl [in]: transaction label, 0 to 15, consecutive commands should use different values.
- attr_mask [in]: mask of attributes, e.g. ESP_AVRC_md_ATTR_ID_TITLE | ESP_AVRC_md_ATTR_ID_ARTIST.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_passthrough_cmd** (uint8_t tl, uint8_t key_code, uint8_t key_state)

Send passthrough command to AVRCP target. This function should be called after
ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- tl [in]: transaction label, 0 to 15, consecutive commands should use different values.
- key_code [in]: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
- key_state [in]: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
**esp_err_t esp_avrc_tg_register_callback** *(esp_avrc_tg_cb_t callback)*

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

参数 **callback** [in] AVRCP target callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_tg_init** *(void)*

Initialize the bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRCP should be initialized before A2DP.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_tg_deinit** *(void)*

De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCTG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

**esp_err_t esp_avrc_tg_get_psth_cmd_filter** *(esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)*

Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

**esp_err_t esp_avrc_tg_set_psth_cmd_filter** *(esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)*

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

返回
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled
• ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
• ESP_ERR_NOT_SUPPORTED: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes commands that are not allowed

bool esp_avrc_psth_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

参数
• op [in] operation requested on the bit mask field
• psth [in] pointer to passthrough command bit mask structure
• cmd [in] passthrough command code

返回 For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

esp_err_t esp_avrc_tg_get_rn_evt_cap (esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init().

For capability type ESP_AVRC_RN_CAP_ALLOWED_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using esp_avrc_tg_set_rn_evt_cap().

返回
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled or AVRC TG is not initialized
• ESP_ERR_INVALID_ARG: if cap is invalid or evt_set is NULL
• ESP_FAIL: otherwise

esp_err_t esp_avrc_tg_set_rn_evt_cap (const esp_avrc_rn_evt_cap_mask_t *evt_set)

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in evt_set and must be a subset of allowed event IDs with current implementation. This function should be called after esp_avrc_tg_init().

返回
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled
• ESP_ERR_INVALID_ARG: if evt_set is NULL

bool esp_avrc_rn_evt_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)

Operate on the type esp_avrc_rn_evt_cap_mask_t with regard to a specific event.

For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

参数
• op [in] operation requested on the bit mask field
• events [in] pointer to event notification capability bit mask structure
• event_id [in] notification event code
For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false.

```c
esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp,
                                    esp_avrc_rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using esp_avrc_tg_set_rn_evt_cap(), in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init().

### Parameters
- `event_id` - [in] notification event ID that remote AVRCP CT registers
- `rsp` - [in] notification response code
- `param` - [in] parameters included in the specific notification

### Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

### Unions

```c
union esp_avrc_rn_param_t
```

```
#include <esp_avrc_api.h>
```

AVRCP notification parameters.

#### Public Members

- `uint8_t volume`
  - response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127

- `esp_avrc_playback_stat_t playback`
  - response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE

- `uint8_t elm_id[8]`
  - response data for ESP_AVRC_RN_TRACK_CHANGE

- `uint32_t play_pos`
  - response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond

- `esp_avrc_batt_stat_t batt`
  - response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE

### Unions

```c
union esp_avrc_ct_cb_param_t
```

```
#include <esp_avrc_api.h>
```

AVRC controller callback parameters.

#### Public Members

   point to the id and value of player application attribute
Chapter 2. API Reference

Structures

struct esp_avrc_psth_bit_mask_t
   AVRC passthrough command bit mask.

Public Members

uint16_t bits[8]
   bit mask representation of PASSTHROUGH commands

struct esp_avrc_rn_evt_cap_mask_t
   AVRC target notification event capability bit mask.

Public Members

uint16_t bits
   bit mask representation of PASSTHROUGH commands

struct esp_avrc_set_app_value_param_t
   AVRCP set app value parameters.

Public Members

uint8_t attr_id
   player application attribute id

uint8_t attr_val
   player application attribute value

Macros

ESP_AVRC_TRANS_LABEL_MAX
   max transaction label

Type Definitions

typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
   AVRCP controller callback function type.
   Param event : Event type
   Param param : Pointer to callback parameter union

typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
   AVRCP target callback function type.
   Param event : Event type
   Param param : Pointer to callback parameter union
Enumerations

**enum esp_avrc_features_t**

AVRC feature bit mask.

*Values:*

- enumerator **ESP_AVRC_FEAT_RCTG**
  - remote control target

- enumerator **ESP_AVRC_FEAT_RCCT**
  - remote control controller

- enumerator **ESP_AVRC_FEAT_VENDOR**
  - remote control vendor dependent commands

- enumerator **ESP_AVRC_FEAT_BROWSE**
  - use browsing channel

- enumerator **ESP_AVRC_FEAT_META_DATA**
  - remote control metadata transfer command/response

- enumerator **ESP_AVRC_FEAT_ADV_CTRL**
  - remote control advanced control command/response

**enum esp_avrc_feature_flag_t**

AVRC supported features flag retrieved in SDP record.

*Values:*

- enumerator **ESP_AVRC_FEAT_FLAG_CAT1**
  - category 1

- enumerator **ESP_AVRC_FEAT_FLAG_CAT2**
  - category 2

- enumerator **ESP_AVRC_FEAT_FLAG_CAT3**
  - category 3

- enumerator **ESP_AVRC_FEAT_FLAG_CAT4**
  - category 4

- enumerator **ESP_AVRC_FEAT_FLAG_BROWSING**
  - browsing

- enumerator **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE_PROP**

data type esp_avrc_psth_filter_t
AVRC passthrough command filter.
Values:

enumerator ESP_AVRC_PSTH_FILTER_ALLOWED_CMD
all of the PASSTHROUGH commands that can possibly be used, immutable
enumerator ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD
PASSTHROUGH commands selectively supported according to the current configuration
enumerator ESP_AVRC_PSTH_FILTER_SUPPORT_MAX

data type esp_avrc_bit_mask_op_t
Values:
enumerator `ESP_AVRC_BIT_MASK_OP_TEST`
   operation code to test a specific bit

enumerator `ESP_AVRC_BIT_MASK_OP_SET`
   operation code to set a specific bit

enumerator `ESP_AVRC_BIT_MASK_OP_CLEAR`
   operation code to clear a specific bit

enum `esp_avrc_pt_cmd_state_t`
AVRC passthrough command state.
   Values:
   
enumerator `ESP_AVRC_PT_CMD_STATE_PRESSED`
   key pressed

enumerator `ESP_AVRC_PT_CMD_STATE_RELEASED`
   key released

enum `esp_avrc_ct_cb_event_t`
AVRC Controller callback events.
   Values:
   
enumerator `ESP_AVRC_CT_CONNECTION_STATE_EVT`
   connection state changed event

enumerator `ESP_AVRC_CT_PASSTHROUGH_RSP_EVT`
   passthrough response event

enumerator `ESP_AVRC_CT_METADATA_RSP_EVT`
   metadata response event

enumerator `ESP_AVRC_CT_PLAY_STATUS_RSP_EVT`
   play status response event

enumerator `ESP_AVRC_CT_CHANGE_NOTIFY_EVT`
   notification event

enumerator `ESP_AVRC_CT_REMOTE_FEATURES_EVT`
   feature of remote device indication event

enumerator `ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT`
   supported notification events capability of peer device

enumerator `ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT`
   set absolute volume response event
enum esp_avrc_tg_cb_event_t
AVRC Target callback events.

Values:

- enumerator ESP_AVRC_TG_CONNECTION_STATE_EVT
  connection state changed event

- enumerator ESP_AVRC_TG_REMOTE_FEATURES_EVT
  feature of remote device indication event

- enumerator ESP_AVRC_TG_PASSTHROUGH_CMD_EVT
  passthrough command event

- enumerator ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT
  set absolute volume command from remote device

- enumerator ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT
  register notification event

- enumerator ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT
  set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.

Values:

- enumerator ESP_AVRC_MD_ATTR_TITLE
  title of the playing track

- enumerator ESP_AVRC_MD_ATTR_ARTIST
  track artist

- enumerator ESP_AVRC_MD_ATTR_ALBUM
  album name

- enumerator ESP_AVRC_MD_ATTR_TRACK_NUM
  track position on the album

- enumerator ESP_AVRC_MD_ATTR_NUM_TRACKS
  number of tracks on the album

- enumerator ESP_AVRC_MD_ATTR_GENRE
  track genre

- enumerator ESP_AVRC_MD_ATTR_PLAYING_TIME
  total album playing time in milliseconds
enum esp_avrc_rn_event_ids_t
AVRC event notification ids.

Values:

enumerator ESP_AVRC_RN_PLAY_STATUS_CHANGE
   track status change, eg. from playing to paused

enumerator ESP_AVRC_RN_TRACK_CHANGE
   new track is loaded

enumerator ESP_AVRC_RN_TRACK_REACHED_END
   current track reached end

enumerator ESP_AVRC_RN_TRACK_REACHED_START
   current track reached start position

enumerator ESP_AVRC_RN_PLAY_POS_CHANGED
   track playing position changed

enumerator ESP_AVRC_RN_BATTERY_STATUS_CHANGE
   battery status changed

enumerator ESP_AVRC_RN_SYSTEM_STATUS_CHANGE
   system status changed

enumerator ESP_AVRC_RN_APP_SETTING_CHANGE
   application settings changed

enumerator ESP_AVRC_RN_NOW_PLAYING_CHANGE
   now playing content changed

enumerator ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE
   available players changed

enumerator ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE
   the addressed player changed

enumerator ESP_AVRC_RN_UIDS_CHANGE
   UIDs changed

enumerator ESP_AVRC_RN_VOLUME_CHANGE
   volume changed locally on TG

enumerator ESP_AVRC_RN_MAX_EVT
enumerator **ESP_AVRC_RN_CAP_ALLOWED_EVT**
all of the notification events that can possibly be supported, immutable

enumerator **ESP_AVRC_RN_CAP_SUPPORTED_EVT**
note that notification events selectively supported according to the current configuration

enumerator **ESP_AVRC_RN_CAP_MAX**

enum **esp_avrc_rn_rsp_t**
AVRC notification response type.

*Values:*

enumerator **ESP_AVRC_RN_RSP_INTERIM**
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

enumerator **ESP_AVRC_RN_RSP_CHANGED**
final response to RegisterNotification command

enum **esp_avrc_ps_attr_ids_t**
AVRC player setting ids.

*Values:*

enumerator **ESP_AVRC_PS_EQUALIZER**
equalizer, on or off

enumerator **ESP_AVRC_PS_REPEAT_MODE**
repeat mode

enumerator **ESP_AVRC_PS_SHUFFLE_MODE**
shuffle mode

enumerator **ESP_AVRC_PS_SCAN_MODE**
scan mode on or off

enumerator **ESP_AVRC_PS_MAX_ATTR**

enum **esp_avrc_ps_eq_value_ids_t**
AVRC equalizer modes.

*Values:*

enumerator **ESP_AVRC_PS_EQUALIZER_OFF**
equalizer OFF

enumerator **ESP_AVRC_PS_EQUALIZER_ON**
equalizer ON
enum `esp_avrc_ps_rpt_value_ids_t`
  AVRC repeat modes.
  Values:

  enumerator `ESP_AVRC_PS_REPEAT_OFF`
  repeat mode off

  enumerator `ESP_AVRC_PS_REPEAT_SINGLE`
  single track repeat

  enumerator `ESP_AVRC_PS_REPEAT_GROUP`
  group repeat

enum `esp_avrc_ps_shf_value_ids_t`
  AVRC shuffle modes.
  Values:

  enumerator `ESP_AVRC_PS_SHUFFLE_OFF`

  enumerator `ESP_AVRC_PS_SHUFFLE_ALL`

  enumerator `ESP_AVRC_PS_SHUFFLE_GROUP`

enum `esp_avrc_ps_scn_value_ids_t`
  AVRC scan modes.
  Values:

  enumerator `ESP_AVRC_PS_SCAN_OFF`
  scan off

  enumerator `ESP_AVRC_PS_SCAN_ALL`
  all tracks scan

  enumerator `ESP_AVRC_PS_SCAN_GROUP`
  group scan

enum `esp_avrc_rsp_t`
  AVCTP response codes.
  Values:

  enumerator `ESP_AVRC_RSP_NOT_IMPL`
  not implemented

  enumerator `ESP_AVRC_RSP_ACCEPT`
  accept
enumerator ESP_AVRC_RSP_REJECT
    reject
enumerator ESP_AVRC_RSP_IN_TRANS
    in transition
enumerator ESP_AVRC_RSP_IMPL_STBL
    implemented/stable
enumerator ESP_AVRC_RSP_CHANGED
    changed
enumerator ESP_AVRC_RSP_INTERIM
    interim

enum esp_avrc_batt_stat_t
    AVRCP battery status.
    Values:
    enumerator ESP_AVRC_BATT_NORMAL
        normal state
    enumerator ESP_AVRC_BATT_WARNING
        unable to operate soon
    enumerator ESP_AVRC_BATT_CRITICAL
        cannot operate any more
    enumerator ESP_AVRC_BATT_EXTERNAL
        plugged to external power supply
    enumerator ESP_AVRC_BATT_FULL_CHARGE
        when completely charged from external power supply

enum esp_avrc_playback_stat_t
    AVRCP current status of playback.
    Values:
    enumerator ESP_AVRC_PLAYBACK_STOPPED
        stopped
    enumerator ESP_AVRC_PLAYBACK_PLAYING
        playing
    enumerator ESP_AVRC_PLAYBACK_PAUSED
        paused
enumerator **ESP_AVRC_PLAYBACK_FWD_SEEK**
   forward seek

enumerator **ESP_AVRC_PLAYBACK_REV_SEEK**
   reverse seek

enumerator **ESP_AVRC_PLAYBACK_ERROR**
   error

**SPP API**

**Application Example**  Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

**API Reference**

**Header File**

- components/bluetooth/bluedroid/api/include/api/esp_spp_api.h

**Functions**

```c
esp_err_t esp_spp_register_callback(esp_spp_cb_t callback)
```

This function is called to init callbacks with SPP module.

- **callback** [in] pointer to the init callback function.
  - ESP_OK: success
  - other: failed

```c
esp_err_t esp_spp_init(esp_spp_mode_t mode)
```

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

- **mode** [in] Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.
  - ESP_OK: success
  - other: failed

```c
esp_err_t esp_spp_enhanced_init(const esp_spp_cfg_t *cfg)
```

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

- **cfg** [in] SPP configuration.
  - ESP_OK: success
  - other: failed

---

Espressif Systems 415  Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
**esp_err_t esp_spp_deinit** (void)

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init()/esp_spp_enhanced_init() completes successfully.

- **ESP_OK**: success
- **other**: failed

**esp_err_t esp_spp_start_discovery** (esp_bd_addr_t bd_addr)

This function is called to perform service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

参数 **bd_addr** - [in] Remote device bluetooth device address.

- **ESP_OK**: success
- **other**: failed

**esp_err_t esp_spp_connect** (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

参数  
- **role** - [in] Master or slave.
- **remote_scn** - [in] Remote device bluetooth device SCN.
- **peer_bd_addr** - [in] Remote device bluetooth device address.

返回  
- **ESP_OK**: success
- **other**: failed

**esp_err_t esp_spp_disconnect** (uint32_t handle)

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

参数 **handle** - [in] The connection handle.

返回  
- **ESP_OK**: success
- **other**: failed

**esp_err_t esp_spp_start_srv** (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

参数  
- **role** - [in] Master or slave.
Chapter 2. API 参考

- **local_scn** - [in] The specific channel you want to get. If channel is 0, means get any channel.
- **name** - [in] Server’s name.

返回
- ESP_OK: success
- other: failed

```c
 esp_err_t esp_spp_stop_srv (void)
```

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

返回
- ESP_OK: success
- other: failed

```c
 esp_err_t esp_spp_stop_srv_scn (uint8_t scn)
```

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

参数
- **scn** - [in] Server channel number.

返回
- ESP_OK: success
- other: failed

```c
 esp_err_t esp_spp_write (uint32_t handle, int len, uint8_t *p_data)
```

This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter ‘cong’ is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter ‘cong’ is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter ‘cong’ equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

参数
- **handle** - [in] The connection handle.
- **len** - [in] The length of the data written.

返回
- ESP_OK: success
- other: failed

```c
 esp_err_t esp_spp_vfs_register (void)
```

This function is used to register VFS. For now, SPP only supports write, read and close.

返回
- ESP_OK: success
- other: failed

Unions

```c
 union esp_spp_cb_param_t
```

SPP callback parameters union.

Public Members
struct esp_spp_cb_param_t::spp_init_evt_param init
    SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
    SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
    SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
    SPP callback param of ESP_SPP_OPEN_EVT

Structures

struct esp_spp_cfg_t
   SPP configuration parameters.

  Public Members

  esp_spp_mode_t mode
     Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.
```
bool enable_l2cap_ertm
   Enable/disable Logical Link Control and Adaptation Layer Protocol enhanced retransmission mode.

uint16_t tx_buffer_size
   Tx buffer size for a new SPP channel. A smaller setting can save memory, but may incur a decrease in throughput. Only for ESP_SPP_MODE_VFS mode.

**Macros**

**ESP_SPP_MAX_MTU**
   SPP max MTU

**ESP_SPP_MAX_SCN**
   SPP max SCN

**ESP_SPP_MIN_TX_BUFFER_SIZE**
   SPP min tx buffer

**ESP_SPP_MAX_TX_BUFFER_SIZE**
   SPP max tx buffer size

**BT_SPP_DEFAULT_CONFIG ()**
   SPP default configuration.

**ESP_SPP_SEC_NONE**
   No security. relate to BTA_SEC_NONE in bta/bta_api.h

**ESP_SPP_SEC_AUTHORIZE**
   Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

**ESP_SPP_SEC_AUTHENTICATE**
   Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

**ESP_SPP_SEC_ENCRYPT**
   Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

**ESP_SPP_SEC_MODE4_LEVEL4**
   Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

**ESP_SPP_SEC_MITM**
   Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

**ESP_SPP_SEC_IN_16_DIGITS**
   Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

**Type Definitions**

typedef uint16_t esp_spp_sec_t
typedef void (*esp_spp_cb_t)(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

**Param event**  Event type  
**Param param**  Point to callback parameter, currently is union type

### Enumerations

**enum esp_spp_status_t**

Values:

- enum \_ESP\_SPP\_SUCCESS  Successful operation.
  - enum \_ESP\_SPP\_FAILURE  Generic failure.
  - enum \_ESP\_SPP\_BUSY  Temporarily can not handle this request.
  - enum \_ESP\_SPP\_NO\_DATA  No data
  - enum \_ESP\_SPP\_NO\_RESOURCE  No more resource
  - enum \_ESP\_SPP\_NEED\_INIT  SPP module shall init first
    - enum \_ESP\_SPP\_NEED\_DEINIT  SPP module shall deinit first
  - enum \_ESP\_SPP\_NO\_CONNECTION  Connection may have been closed
  - enum \_ESP\_SPP\_NO\_SERVER  No SPP server

**enum esp_spp_role_t**

Values:

- enum \_ESP\_SPP\_ROLE\_MASTER  Role: master
  - enum \_ESP\_SPP\_ROLE\_SLAVE  Role: slave

**enum esp_spp_mode_t**

Values:
enumerator `ESP_SPP_MODE_CB`
    When data is coming, a callback will come with data

enumerator `ESP_SPP_MODE_VFS`
    Use VFS to write/read data

e num `esp_spp_cb_event_t`
    SPP callback function events.
    Values:

    enumerator `ESP_SPP_INIT_EVT`
        When SPP is initialized, the event comes

    enumerator `ESP_SPP_UNINIT_EVT`
        When SPP is deinitialized, the event comes

    enumerator `ESP_SPP_DISCOVERY_COMP_EVT`
        When SDP discovery complete, the event comes

    enumerator `ESP_SPP_OPEN_EVT`
        When SPP Client connection open, the event comes

    enumerator `ESP_SPP_CLOSE_EVT`
        When SPP connection closed, the event comes

    enumerator `ESP_SPP_START_EVT`
        When SPP server started, the event comes

    enumerator `ESP_SPP_CL_INIT_EVT`
        When SPP client initiated a connection, the event comes

    enumerator `ESP_SPP_DATA_IND_EVT`
        When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

    enumerator `ESP_SPP_CONG_EVT`
        When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

    enumerator `ESP_SPP_WRITE_EVT`
        When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

    enumerator `ESP_SPP_SRV_OPEN_EVT`
        When SPP Server connection open, the event comes

    enumerator `ESP_SPP_SRV_STOP_EVT`
        When SPP server stopped, the event comes

**HFP DEFINES**

**API Reference**
Header File

- components/bt/host/bluedroid/api/include/api/esphf_defs.h

Enumerations

enum esp_hf_in_band_ring_state_t
  in-band ring tone state
  Values:

  enumerator ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED

  enumerator ESP_HF_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_vr_state_t
  voice recognition state
  Values:

  enumerator ESP_HF_VR_STATE_DISABLED
    voice recognition disabled

  enumerator ESP_HF_VR_STATE_ENABLED
    voice recognition enabled

enum esp_hf_volume_control_target_t
  Bluetooth HFP audio volume control target.
  Values:

  enumerator ESP_HF_VOLUME_CONTROL_TARGET_SPK
    speaker

  enumerator ESP_HF_VOLUME_CONTROL_TARGET_MIC
    microphone

enum esp_hf_audio_state_t
  Bluetooth HFP audio connection status.
  Values:

  enumerator ESP_HF_AUDIO_STATE_DISCONNECTED
    audio connection released

  enumerator ESP_HF_AUDIO_STATE_CONNECTING
    audio connection has been initiated

  enumerator ESP_HF_AUDIO_STATE_CONNECTED
    audio connection is established

  enumerator ESP_HF_AUDIO_STATE_CONNECTED_MSBC
    mSBC audio connection is established
enum `esp_hf_volume_type_t`

Values:

enumerator `ESP_HF_VOLUME_TYPE_SPK`

enumerator `ESP_HF_VOLUME_TYPE_MIC`

enum `esp_hf_network_state_t`

+CIND network service availability status

Values:

enumerator `ESP_HF_NETWORK_STATE_NOT_AVAILABLE`

enumerator `ESP_HF_NETWORK_STATE_AVAILABLE`

enum `esp_hf_service_type_t`

+CIEV Service type

Values:

enumerator `ESP_HF_SERVICE_TYPE_HOME`

enumerator `ESP_HF_SERVICE_TYPE_ROAMING`

enum `esp_hf_call_status_t`

+CIND call status indicator values

Values:

enumerator `ESP_HF_CALL_STATUS_NO_CALLS`

no call in progress

enumerator `ESP_HF_CALL_STATUS_CALL_IN_PROGRESS`

call is present (active or held)

enum `esp_hf_call_setup_status_t`

+CIND call setup status indicator values

Values:

enumerator `ESP_HF_CALL_SETUP_STATUS_IDLE`

no call setup in progress

enumerator `ESP_HF_CALL_SETUP_STATUS_INCOMING`

incoming call setup in progress

enumerator `ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING`

outgoing call setup in dialing state
enumerator **ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING**

outgoing call setup in alerting state

**enum esp_hf_roaming_status_t**

+CIND roaming status indicator values

*Values:*

enumerator **ESP_HF_ROAMING_STATUS_INACTIVE**

roaming is not active

enumerator **ESP_HF_ROAMING_STATUS_ACTIVE**

a roaming is active

**enum esp_hf_call_held_status_t**

+CIND call held indicator values

*Values:*

enumerator **ESP_HF_CALL_HELD_STATUS_NONE**

no calls held

enumerator **ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE**

both active and held call

enumerator **ESP_HF_CALL_HELD_STATUS_HELD**

call on hold, no active call

**enum esp_hf_current_call_status_t**

+CLCC status of the call

*Values:*

enumerator **ESP_HF_CURRENT_CALL_STATUS_ACTIVE**

active

enumerator **ESP_HF_CURRENT_CALL_STATUS_HELD**

held

enumerator **ESP_HF_CURRENT_CALL_STATUS_DIALING**

dialing (outgoing calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_ALERTING**

alerting (outgoing calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_INCOMING**

incoming (incoming calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_WAITING**

waiting (incoming calls only)
enumerator `ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD`
call held by response and hold

enum `esp_hf_current_call_direction_t`
+CLCC direction of the call

Values:

enumerator `ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING`
outgoing

enumerator `ESP_HF_CURRENT_CALL_DIRECTION_INCOMING`
incoming

enum `esp_hf_current_call_mpty_type_t`
+CLCC multi-party call flag

Values:

enumerator `ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE`
not a member of a multi-party call

enumerator `ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI`
member of a multi-party call

enum `esp_hf_current_call_mode_t`
+CLCC call mode

Values:

enumerator `ESP_HF_CURRENT_CALL_MODE_VOICE`

enumerator `ESP_HF_CURRENT_CALL_MODE_DATA`

enumerator `ESP_HF_CURRENT_CALL_MODE_FAX`

enum `esp_hf_call_addr_type_t`
+CLCC address type

Values:

enumerator `ESP_HF_CALL_ADDR_TYPE_UNKNOWN`
unknown address type

enumerator `ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL`
international address

enum `esp_hf_subscriber_service_type_t`
+CNUM service type of the phone number

Values:
Chapter 2. API

enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN**
unknown

enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE**
voice service

enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX**
fax service

enum **esp_hf_btrh_status_t**
+BTRH response and hold result code

Values:

enumerator **ESP_HF_BTRH_STATUS_HELD**
incoming call is put on hold in AG

enumerator **ESP_HF_BTRH_STATUS_ACCEPTED**
held incoming call is accepted in AG

enumerator **ESP_HF_BTRH_STATUS_REJECTED**
held incoming call is rejected in AG

enum **esp_hf_btrh_cmd_t**
AT+BTRH response and hold action code.

Values:

enumerator **ESP_HF_BTRH_CMD_HOLD**
put the incoming call on hold

enumerator **ESP_HF_BTRH_CMD_ACCEPT**
accept a held incoming call

enumerator **ESP_HF_BTRH_CMD_REJECT**
reject a held incoming call

enum **esp_hf_nrec_t**
Values:

enumerator **ESP_HF_NREC_STOP**

enumerator **ESP_HF_NREC_START**

enum **esp_hf_call_waiting_status_t**
+CCWA response status

Values:

enumerator **ESP_HF_CALL_WAITING_INACTIVE**
enumerator **ESP_HF_CALL_WAITING_ACTIVE**

eNum **esp_hf_wbs_config_t**

Values:

enumerator **ESP_HF_WBS_NONE**

enumerator **ESP_HF_WBS_NO**

enumerator **ESP_HF_WBS_YES**

eNum **esp_hf_connection_state_t**

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

enumerator **ESP_HF_CONNECTION_STATE_DISCONNECTED**

RFCOMM data link channel released

enumerator **ESP_HF_CONNECTION_STATE_CONNECTING**

connecting remote device on the RFCOMM data link

enumerator **ESP_HF_CONNECTION_STATE_CONNECTED**

RFCOMM connection established

enumerator **ESP_HF_CONNECTION_STATE_SLC_CONNECTED**

service level connection established

enumerator **ESP_HF_CONNECTION_STATE_DISCONNECTING**

disconnecting with remote device on the RFCOMM data link

eNum **esp_hf_chld_type_t**

AT+CHLD command values.

Values:

enumerator **ESP_HF_CHLD_TYPE_REL**

<0>, Terminate all held or set UDUB ( "busy”) to a waiting call

enumerator **ESP_HF_CHLD_TYPE_REL_ACC**

<1>, Terminate all active calls and accepts a waiting/held call

enumerator **ESP_HF_CHLD_TYPE_HOLD_ACC**

<2>, Hold all active calls and accepts a waiting/held call

enumerator **ESP_HF_CHLD_TYPE_MERGE**

<3>, Add all held calls to a conference

enumerator **ESP_HF_CHLD_TYPE_MERGE_DETACH**

<4>, connect the two calls and disconnects the subscriber from both calls
enumerator **ESP_HF_CHLD_TYPE_REL_X**

<1x>, releases specified calls only

enumerator **ESP_HF_CHLD_TYPE_PRIV_X**

<2x>, request private consultation mode with specified call

**enum esp_hf_at_response_code_t**

*Values:*

enumerator **ESP_HF_AT_RESPONSE_CODE_OK**

acknowledges execution of a command line

enumerator **ESP_HF_AT_RESPONSE_CODE_ERR**

command not accepted

enumerator **ESP_HF_AT_RESPONSE_CODE_NO_CARRIER**

connection terminated

enumerator **ESP_HF_AT_RESPONSE_CODE_BUSY**

busy signal detected

enumerator **ESP_HF_AT_RESPONSE_CODE_NO_ANSWER**

connection completion timeout

enumerator **ESP_HF_AT_RESPONSE_CODE_DELAYED**

delayed

enumerator **ESP_HF_AT_RESPONSE_CODE_BLACKLISTED**

blacklisted

enumerator **ESP_HF_AT_RESPONSE_CODE_CME**

CME error

**enum esp_hf_at_response_t**

*Values:*

enumerator **ESP_HF_AT_RESPONSE_ERROR**

enumerator **ESP_HF_AT_RESPONSE_OK**

**enum esp_hf_cme_err_t**

Extended Audio Gateway Error Result Code Response.

*Values:*

enumerator **ESP_HF_CME_AG_FAILURE**

ag failure
enumerator ESP_HF_CME_NO_CONNECTION_TO_PHONE
   no connection to phone
enumerator ESP_HF_CME_OPERATION_NOT_ALLOWED
   operation not allowed
enumerator ESP_HF_CME_OPERATION_NOT_SUPPORTED
   operation not supported
enumerator ESP_HF_CME_PH_SIM_PIN_REQUIRED
   PH-SIM PIN Required
enumerator ESP_HF_CME_SIM_NOT_INSERTED
   SIM not inserted
enumerator ESP_HF_CME_SIM_PIN_REQUIRED
   SIM PIN required
enumerator ESP_HF_CME_SIM_PUK_REQUIRED
   SIM PUK required
enumerator ESP_HF_CME_SIM_FAILURE
   SIM failure
enumerator ESP_HF_CME_SIM_BUSY
   SIM busy
enumerator ESP_HF_CME_INCORRECT_PASSWORD
   incorrect password
enumerator ESP_HF_CME_SIM_PIN2_REQUIRED
   SIM PIN2 required
enumerator ESP_HF_CME_SIM_PUK2_REQUIRED
   SIM PUK2 required
enumerator ESP_HF_CME_MEMORY_FULL
   memory full
enumerator ESP_HF_CME_INVALID_INDEX
   invalid index
enumerator ESP_HF_CME_MEMORY_FAILURE
   memory failure
enumerator ESP_HF_CME_TEXT_STRING_TOO_LONG
   test string too long
enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING**
invalid characters in text string

enumerator **ESP_HF_CME_DIAL_STRING_TOO_LONG**
dial string too long

enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING**
invalid characters in dial string

enumerator **ESP_HF_CME_NO_NETWORK_SERVICE**
no network service

enumerator **ESP_HF_CME_NETWORK_TIMEOUT**
network timeout

enumerator **ESP_HF_CME_NETWORK_NOT_ALLOWED**
network not allowed &quot;emergency calls only&quot;

**HFP CLIENT API**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h

**Functions**

```c
esp_err_t esp_hf_client_register_callback(esp_hf_client_cb_t callback)
```

Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

参数 callback [in] HFP client event callback function

返回

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
esp_err_t esp_hf_client_init(void)
```

Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

返回

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_deinit(void)
```

De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

返回

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
### esp_err_t esp_hf_client_connect (esp_bd_addr_t remote_bda)

Establish a Service Level Connection to remote bluetooth HFP audio gateway(AG) device. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

- **remote_bda** [in] remote bluetooth device address
- **ESP_OK:** connect request is sent to lower layer
- **ESP_INVALID_STATE:** if bluetooth stack is not yet enabled
- **ESP_FAIL:** others

### esp_err_t esp_hf_client_disconnect (esp_bd_addr_t remote_bda)

Disconnect from the remote HFP audio gateway. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

- **remote_bda** [in] remote bluetooth device address
- **ESP_OK:** disconnect request is sent to lower layer
- **ESP_INVALID_STATE:** if bluetooth stack is not yet enabled
- **ESP_FAIL:** others

### esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

- **remote_bda** [in] remote bluetooth device address
- **ESP_OK:** disconnect request is sent to lower layer
- **ESP_INVALID_STATE:** if bluetooth stack is not yet enabled
- **ESP_FAIL:** others

### esp_err_t esp_hf_client_disconnect_audio (esp_bd_addr_t remote_bda)

Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

- **remote_bda** [in] remote bluetooth device address
- **ESP_OK:** disconnect request is sent to lower layer
- **ESP_INVALID_STATE:** if bluetooth stack is not yet enabled
- **ESP_FAIL:** others

### esp_err_t esp_hf_client_start_voice_recognition (void)

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

- **ESP_OK:** disconnect request is sent to lower layer
- **ESP_INVALID_STATE:** if bluetooth stack is not yet enabled
- **ESP_FAIL:** others

### esp_err_t esp_hf_client_stop_voice_recognition (void)

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

- **ESP_OK:** disconnect request is sent to lower layer
- **ESP_INVALID_STATE:** if bluetooth stack is not yet enabled
- **ESP_FAIL:** others

### esp_err_t esp_hf_client_volume_update (esp_hf_volume_control_target_t type, int volume)

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

- **type**
- **volume**
Chapter 2. API

- **type** [in] volume control target, speaker or microphone
- **volume** [in] gain of the speaker of microphone, ranges 0 to 15

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_dial (const char *number)
```

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

参数 **number** [in] number string of the call. If NULL, the last number is called (aka re-dial)

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_dial_memory (int location)
```

Place a call with number specified by location(speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

参数 **location** [in] location of the number in the memory

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_chld_cmd (esp_hf_chld_type_t chld, int idx)
```

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

参数
- **chld** [in] AT+CHLD call hold and multiparty handling AT command.
- **idx** [in] used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)
```

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

参数 **btrh** [in] response and hold action to send

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_answer_call (void)
```

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_reject_call (void)
```

Reject an incoming call(send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.
Section 2. API Reference

**esp_err_t esp_hf_client_query_current_calls (void)**
Query list of current calls in AG (send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

**esp_err_t esp_hf_client_query_current_operator_name (void)**
Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

**esp_err_t esp_hf_client_retrieve_subscriber_info (void)**
Get subscriber information number from AG (send AT+CNUM command). As a precondition to use this API, Service Level Connection shall exist with AG.

**esp_err_t esp_hf_client_send_dtmf (char code)**
Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

**esp_err_t esp_hf_client_send_xapl (char* information, uint32_t features)**
Send command to enable Vendor specific feature to indicate battery level and docker status. This is Apple-specific commands, but used by most device, including Android and Windows.

**esp_err_t esp_hf_client_send_iphoneaccev (uint32_t bat_level, bool docked)**
Send Battery level and docker status Enable this feature using XAPL command first. This is Apple-specific commands, but used by most device, including Android and Windows.
Chapter 2. API

- **bat_level** - [in] Battery Level: value between 0 and 9
- **docked** - [in] Dock State: false = undocked, true = docked

返回
- ESP_OK: battery level is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_request_last_voice_tag_number (void)
```

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_send_nrec (void)
```

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv,
                                               esp_hf_client_outgoing_data_cb_t send)
```

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

参数
- **recv** - [in] HFP client incoming data callback function
- **send** - [in] HFP client outgoing data callback function

返回
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

```c
void esp_hf_client_outgoing_data_ready (void)
```

Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

```c
void esp_hf_client_pcm_resample_deinit (void)
```

Deinitialize the down sampling converter.

```c
void esp_hf_client_pcm_resample (uint32_t src_sps, uint32_t bits, uint32_t channels)
```

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

参数
- **src_sps** - [in] original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- **bits** - [in] number of bits per pcm sample (16)
- **channels** - [in] number of channels (i.e. mono(1), stereo(2)…)

```c
esp_err_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)
```

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

参数
- **src** - [in] pointer to the buffer where the original sampling PCM are stored
Chapter 2. API

- **in_bytes** - [in] length of the input PCM sample buffer in byte
- **dst** - [in] pointer to the buffer which is to be used to store the converted PCM samples
  
  number of samples converted

**Type Definitions**

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)

HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

**Param buf** [in]: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

**Param len** [in]: size (in bytes) in buf

typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Param buf** [in]: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

**Param len** [in]: size (in bytes) in buf

**Return** length of data successfully read

typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)

HFP client callback function type.

**Param event**: Event type

**Param param**: Pointer to callback parameter

**Enumerations**

enum esp_hf_client_connection_state_t

Bluetooth HFP RFCOMM connection and service level connection status.

**Values**:

enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED

RFCOMM data link channel released

enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING

connecting remote device on the RFCOMM data link

enumerator ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED

RFCOMM connection established

enumerator ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED

service level connection established

enumerator ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING

disconnecting with remote device on the RFCOMM dat link

enum esp_hf_client_audio_state_t

Bluetooth HFP audio connection status.

**Values**:
Chapter 2. API Reference

**enumerator** `ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED`
audio connection released

**enumerator** `ESP_HF_CLIENT_AUDIO_STATE_CONNECTING`
audio connection has been initiated

**enumerator** `ESP_HF_CLIENT_AUDIO_STATE_CONNECTED`
audio connection is established

**enumerator** `ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC`
mSBC audio connection is established

**enum** `esp_hf_client_in_band_ring_state_t`
in-band ring tone state

*Values:*

**enumerator** `ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED`

**enumerator** `ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED`

**enum** `esp_hf_client_cb_event_t`
HF CLIENT callback events.

*Values:*

**enumerator** `ESP_HF_CLIENT_CONNECTION_STATE_EVT`
connection state changed event

**enumerator** `ESP_HF_CLIENT_AUDIO_STATE_EVT`
audio connection state change event

**enumerator** `ESP_HF_CLIENT_BVRA_EVT`
voice recognition state change event

**enumerator** `ESP_HF_CLIENT_CIND_CALL_EVT`
call indication

**enumerator** `ESP_HF_CLIENT_CIND_CALL_SETUP_EVT`
call setup indication

**enumerator** `ESP_HF_CLIENT_CIND_CALL_HELD_EVT`
call held indication

**enumerator** `ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT`
network service availability indication

**enumerator** `ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT`
signal strength indication
enumerator **ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT**  
roaming status indication

enumerator **ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT**  
battery level indication

enumerator **ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT**  
current operator information

enumerator **ESP_HF_CLIENT_BTRH_EVT**  
call response and hold event

enumerator **ESP_HF_CLIENT_CLIP_EVT**  
Calling Line Identification notification

enumerator **ESP_HF_CLIENT_CCWA_EVT**  
call waiting notification

enumerator **ESP_HF_CLIENT_CLCC_EVT**  
list of current calls notification

enumerator **ESP_HF_CLIENT_VOLUME_CONTROL_EVT**  
audio volume control command from AG, provided by +VGM or +VGS message

enumerator **ESP_HF_CLIENT_AT_RESPONSE_EVT**  
AT command response event

enumerator **ESP_HF_CLIENT_CNUM_EVT**  
subscriber information response from AG

enumerator **ESP_HF_CLIENT_BSIR_EVT**  
setting of in-band ring tone

enumerator **ESP_HF_CLIENT_BINP_EVT**  
requested number of last voice tag from AG

enumerator **ESP_HF_CLIENT_RING_IND_EVT**  
ring indication event

### HFP AG API

### API Reference

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_hf_ag_api.h
### Functions

**esp_err_t esp_hf_ag_register_callback(esp_hf_cb_t callback)**

Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

参数 `callback` - [in] HFP AG event callback function

返回

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**esp_err_t esp_hf_ag_init (void)**

Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

返回

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_deinit (void)**

De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

返回

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_slc_connect (esp_bd_addr_t remote_bda)**

To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after esp_hf_ag_init() and before esp_hf_ag_deinit().

参数 `remote_bda` - [in] remote bluetooth HFP client device address

返回

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_slc_disconnect (esp_bd_addr_t remote_bda)**

Disconnect from the remote HFP client. This function must be called after esp_hf_ag_init() and before esp_hf_ag_deinit().

参数 `remote_bda` - [in] remote bluetooth device address

返回

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_audio_connect (esp_bd_addr_t remote_bda)**

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数 `remote_bda` - [in] remote bluetooth device address

返回

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_audio_disconnect (esp_bd_addr_t remote_bda)**

Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数 `remote_bda` - [in] remote bluetooth device address
### Chapter 2. API 参考

**esp_err_t esp_hf_ag_vra_control(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)**

Response of Volume Recognition Command (AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**参数**
- `remote_bda` [in] the device address of voice recognition initiator
- `value` [in] 0 - voice recognition disabled, 1 - voice recognition enabled

**返回**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_volume_control(esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)**

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**参数**
- `remote_bda` [in] remote Bluetooth device address
- `type` [in] volume control target, speaker or microphone
- `volume` [in] gain of the speaker or microphone, ranges 0 to 15

**返回**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_unknown_at_send(esp_bd_addr_t remote_addr, char *unat)**

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**参数**
- `remote_addr` [in] remote Bluetooth device address
- `unat` [in] User AT command response to HF Client. It will response “ERROR” by default if unat is NULL.

**返回**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_cmee_send(esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)**

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**参数**
- `remote_bda` [in] remote Bluetooth device address
- `response_code` [in] AT command response code
- `error_code` [in] CME error code

**返回**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_devices_status_indchange(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)**
Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数
- remote_addr - [in] remote bluetooth device address
- call_state - [in] call state
- call_setup_state - [in] call setup state
- ntk_state - [in] network service state
- signal - [in] signal strength from 0 to 5

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cind_response(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal, esp_hf_roaming_status_t roam, int batt_lev, esp_hf_call_held_status_t call_held_status)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数
- remote_addr - [in] remote bluetooth device address
- call_state - [in] call state
- call_setup_state - [in] call setup state
- ntk_state - [in] network service state
- signal - [in] signal strength from 0 to 5
- roam - [in] roam state
- batt_lev - [in] battery level from 0 to 5
- call_held_status - [in] call held status

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_cops_response(esp_bd_addr_t remote_addr, char *name)
```

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数
- remote_addr - [in] remote bluetooth device address
- name - [in] current operator name

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_hf_ag_clcc_response(esp_bd_addr_t remote_addr, int index, esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state, esp_hf_current_call_mode_t mode, esp_hf_current_call_empty_type_t mpty, char *number, esp_hf_call_addr_type_t type)
```

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数
- remote_addr - [in] remote bluetooth device address
- index - [in] the index of current call
- dir - [in] call direction (incoming/outgoing)
- current_call_state - [in] current call state
Chapter 2. API

**esp_err_t esp_hf_ag_cnum_response (esp_bd_addr_t remote_addr, char* number, esp hf subscriber service type_t type)**

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** - [in] remote bluetooth device address
- **number** - [in] registration number
- **type** - [in] service type (unknown/voice/fax)

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_bsir (esp_bd_addr_t remote_addr, esp hf in band ring state_t state)**

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** - [in] remote bluetooth device address
- **state** - [in] in-band ring tone state

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_answer_call (esp_bd_addr_t remote_addr, int num_active, int num_held, esp hf call status_t call state, esp hf call setup status_t call setup state, char* number, esp hf call addr type_t call addr type)**

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Parameters**
- **remote_addr** - [in] remote bluetooth device address
- **num_active** - [in] the number of active call
- **num_held** - [in] the number of held call
- **call_state** - [in] call state
- **call_setup_state** - [in] call setup state
- **number** - [in] number of the incoming call
- **call_addr_type** - [in] call address type

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_reject_call (esp_bd_addr_t remote_addr, int num_active, int num_held, esp hf call status_t call state, esp hf call setup status_t call setup state, char* number, esp hf call addr type_t call addr_type)**

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.
Chapter 2. API 参考

参数
- remote_addr [in] remote bluetooth device address
- num_active [in] the number of active call
- num_held [in] the number of held call
- call_state [in] call state
- call_setup_state [in] call setup state
- number [in] number of the incoming call
- call_addr_type [in] call address type

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_out_call**

```c
esp_hf_ag_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                    esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                    char *number, esp_hf_call_addr_type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数
- remote_addr [in] remote bluetooth device address
- num_active [in] the number of active call
- num_held [in] the number of held call
- call_state [in] call state
- call_setup_state [in] call setup state
- number [in] number of the outgoing call
- call_addr_type [in] call address type

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_end_call**

```c
esp_hf_ag_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                   esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                   char *number, esp_hf_call_addr_type_t call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数
- remote_addr [in] remote bluetooth device address
- num_active [in] the number of active call
- num_held [in] the number of held call
- call_state [in] call state
- call_setup_state [in] call setup state
- number [in] number of the call
- call_addr_type [in] call address type

返回
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_ag_register_data_callback**

```c
esp_hf_ag_register_data_callback(esp_hf_incoming_data_cb_t recv,
                                 esp_hf_outgoing_data_cb_t send)
```

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

参数
- recv [in] HFP client incoming data callback function
- send [in] HFP client outgoing data callback function

返回
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer
Chapter 2. API 参考

void **esp_hf_ag_outgoing_data_ready** (void)

Trigger the lower-layertofetch and send audio data.

This function is only used in the case that Voice Over HCI is enabled.

As a precondition to use this API, Service Level Connection shall exist with HFP client.

After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data

Unions

### Type Definitions

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)

AG incoming data callback function, the callback is useful in case of Voice Over HCI.

- **Param buf [in]**: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- **Param len [in]**: size (in bytes) in buf

typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

- **Param buf [in]**: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- **Param len [in]**: size (in bytes) in buf
- **Return** length of data successfully read
typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)

HF AG callback function type.

**Param event**: Event type
**Param param**: Pointer to callback parameter

**Enumerations**

enum esp_hf_cb_event_t
HF callback events.

*Values:*

enumerator ESP_HF_CONNECTION_STATE_EVT
Connection state changed event

enumerator ESP_HF_AUDIO_STATE_EVT
Audio connection state change event

enumerator ESP_HF_BVRA_RESPONSE_EVT
Voice recognition state change event

enumerator ESP_HF_VOLUME_CONTROL_EVT
Audio volume control command from HF Client, provided by +VGM or +VGS message

enumerator ESP_HF_UNAT_RESPONSE_EVT
Unknown AT cmd Response

enumerator ESP_HF_IND_UPDATE_EVT
Indicator Update Event

enumerator ESP_HF_CIND_RESPONSE_EVT
Call And Device Indicator Response

enumerator ESP_HF_COPS_RESPONSE_EVT
Current operator information

enumerator ESP_HF_CLCC_RESPONSE_EVT
List of current calls notification

enumerator ESP_HF_CNUM_RESPONSE_EVT
Subscriber information response from HF Client

enumerator ESP_HF_VTS_RESPONSE_EVT
Enable or not DTMF

enumerator ESP_HF_NREC_RESPONSE_EVT
Enable or not NREC

enumerator ESP_HF_ATA_RESPONSE_EVT
Answer an Incoming Call
enumerator **ESP_HF_CHUP_RESPONSE_EVT**
  Reject an Incoming Call

enumerator **ESP_HF_DIAL_EVT**
  Origin an outgoing call with specific number or the dial the last number

enumerator **ESP_HF_WBS_RESPONSE_EVT**
  Codec Status

enumerator **ESP_HF_BCS_RESPONSE_EVT**
  Final Codec Choice

**Bluetooth HID Device API**

**Overview**
A Bluetooth HID device is a device providing the service of human or other data input and output to and from a Bluetooth HID Host. Users can use the Bluetooth HID Device APIs to make devices like keyboards, mice, joysticks and so on.

**Application Example**
Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is an example of Bluetooth HID mouse device. The device running this example can be discovered and connected by a Bluetooth HID Host device such as a PC, and the pointer will move left and right after HID connection is established - bluetooth/bluedroid/classic_bt/bt_hid_mouse_device

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_hidd_api.h

**Functions**

`esp_err_t esp_bt_hid_device_register_callback (esp_hd_cb_t callback)`
This function is called to init callbacks with HID device module.

参数 `callback` - [in] pointer to the init callback function.

返回
- ESP_OK: success
- other: failed

`esp_err_t esp_bt_hid_device_init (void)`
This function initializes HIDD. This function should be called after esp_bluedroid_enable and esp_bluedroid_init success, and should be called after esp_bt_hid_device_register_callback. When the operation is complete the callback function will be called with ESP_HIDD_INIT_EVT.

返回
- ESP_OK: success
- other: failed

`esp_err_t esp_bt_hid_device_deinit (void)`
This function de-initializes HIDD interface. This function should be called after esp_bluedroid_enable() and esp_bluedroid_init() success, and should be called after esp_bt_hid_device_init(). When the operation is complete the callback function will be called with ESP_HIDD_DEINIT_EVT.

返回 - ESP_OK: success
### Chapter 2. API 参考

- other: failed

```c
esp_err_t esp_bt_hid_device_register_app(esp_hid_app_param_t *app_param,
                                         esp_hid_qos_param_t *in_qos,
                                         esp_hid_qos_param_t *out_qos)
```

Registers HIDD parameters with SDP and sets l2cap Quality of Service. This function should be called after `esp_bluedroid_enable` and `esp_bluedroid_init` success, and must be done after `esp_bt_hid_device_init`. When the operation is complete the callback function will be called with `ESP_HIDD_REGISTER_APP_EVT`.

**参数**
- `app_param` - [in] HIDD parameters
- `in_qos` - [in] incoming QoS parameters
- `out_qos` - [in] outgoing QoS parameters

**返回**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_unregister_app(void)
```

Removes HIDD parameters from SDP and resets l2cap Quality of Service. This function should be called after `esp_bluedroid_enable` and `esp_bluedroid_init` success, and should be called after `esp_bt_hid_device_init`. When the operation is complete the callback function will be called with `ESP_HIDD_UNREGISTER_APP_EVT`.

**返回**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_connect(esp_bd_addr_t bd_addr)
```

This function connects HIDD interface to connected bluetooth device, if not done already. When the operation is complete the callback function will be called with `ESP_HIDD_OPEN_EVT`.

**参数**
- `bd_addr` - [in] Remote host bluetooth device address.

**返回**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_disconnect(void)
```

This function disconnects HIDD interface. When the operation is complete the callback function will be called with `ESP_HIDD_CLOSE_EVT`.

**返回**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_send_report(esp_hid_report_type_t type, uint8_t tid, uint16_t len,
                                         uint8_t *data)
```

Send HIDD report. When the operation is complete the callback function will be called with `ESP_HIDD_SEND_REPORT_EVT`.

**参数**
- `type` - [in] type of report
- `id` - [in] report id as defined by descriptor
- `len` - [in] length of report
- `data` - [in] report data

**返回**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_hid_device_report_error(esp_hid_handshake_error_t error)
```

Sends HIDD handshake with error info for invalid set_report. When the operation is complete the callback function will be called with `ESP_HIDD_REPORT_ERR_EVT`.

**参数**
- `error` - [in] type of error

**返回**
- ESP_OK: success
- other: failed
esp_err_t esp_bt_hid_device_virtual_cable_unplug (void)
    Unplug virtual cable of HIDD. When the operation is complete the callback function will be called with ESP_HIDD_VC_UNPLUG_EVT.
    - ESP_OK: success
    - other: failed

Unions
union esp_hidd_cb_param_t
    #include <esp_hidd_api.h> HID device callback parameters union.

Public Members

struct esp_hidd_cb_param_t::hidd_init_evt_param init
    HIDD callback param of ESP_HIDD_INIT_EVT

HID device subclass
```

```c
uint8_t *desc_list
HID descriptor list
```

```c
int desc_list_len
size in bytes of HID descriptor list
```

struct esp_hidd_qos_param_t

HIDD Quality of Service parameters negotiated over L2CAP.

Public Members
**Chapter 2. API 参考**

```
uint8_t service_type
    the level of service, 0 indicates no traffic

uint32_t token_rate
    token rate in bytes per second, 0 indicates “don’t care”

uint32_t token_bucket_size
    limit on the burstness of the application data

uint32_t peak_bandwidth
    bytes per second, value 0 indicates “don’t care”

uint32_t access_latency
    maximum acceptable delay in microseconds

uint32_t delay_variation
    the difference in microseconds between the max and min delay
```

**Macros**

- **ESP_HID_CLASS_UNKNOWN**
  subclass of hid device
  unknown HID device subclass

Type Definitions

typedef void (*esp_hd_cb_t)(esp_hidd_cb_event_t event, esp_hidd_cb_param_t *param)

HID device callback function type.

- **Param event**: Event type
- **Param param**: Point to callback parameter, currently is union type

Enumerations

enum esp_hidd_handshake_error_t

HIDD handshake result code.

- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_SUCCESS**: successful
- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_NOT_READY**: not ready, device is too busy to accept data
- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_REP_ID**: invalid report ID
- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNSUPPORTED_REQ**: device does not support the request
- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_PARAM**: parameter value is out of range or inappropriate
- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNKNOWN**: device could not identify the error condition
- **enumerator ESP_HID_PAR_HANDSHAKE_RSP_ERR_FATAL**: restart is essential to resume functionality

enum esp_hidd_report_type_t

HIDD report types.

- **enumerator ESP_HID_REPORT_TYPE_OTHER**: unknown report type
- **enumerator ESP_HID_REPORT_TYPE_INPUT**: input report
- **enumerator ESP_HID_REPORT_TYPE_OUTPUT**: output report
- **enumerator ESP_HID_REPORT_TYPE_FEATURE**: feature report
enumerator ESP_HIDD_REPORT_TYPE_INTRDATA
    special value for reports to be sent on interrupt channel, INPUT is assumed

enum esp_hidd_connection_state_t
    HIDD connection state.
    Values:

    enumerator ESP_HIDD_CONN_STATE_CONNECTED
        HID connection established

    enumerator ESP_HIDD_CONN_STATE_CONNECTING
        connection to remote Bluetooth device

    enumerator ESP_HIDD_CONN_STATE_DISCONNECTED
        connection released

    enumerator ESP_HIDD_CONN_STATE_DISCONNECTING
        disconnecting to remote Bluetooth device

    enumerator ESP_HIDD_CONN_STATE_UNKNOWN
        unknown connection state

enum esp_hidd_protocol_mode_t
    HID device protocol modes.
    Values:

    enumerator ESP_HIDD_REPORT_MODE
        Report Protocol Mode

    enumerator ESP_HIDD_BOOT_MODE
        Boot Protocol Mode

    enumerator ESP_HIDD_UNSUPPORTED_MODE
        unsupported

enum esp_hidd_boot_report_id_t
    HID Boot Protocol report IDs.
    Values:

    enumerator ESP_HIDD_BOOT_REPORT_ID_KEYBOARD
        report ID of Boot Protocol keyboard report

    enumerator ESP_HIDD_BOOT_REPORT_ID_MOUSE
        report ID of Boot Protocol mouse report

enum [anonymous]
    HID Boot Protocol report size including report ID.
    Values:
Chapter 2. API 參考

enumerator **ESP_HIDD_BOOT_REPORT_SIZE_KEYBOARD**
report size of Boot Protocol keyboard report

enumerator **ESP_HIDD_BOOT_REPORT_SIZE_MOUSE**
report size of Boot Protocol mouse report

eNUM **esp_hidd_cb_event_t**
HID device callback function events.
Values:

enumerator **ESP_HIDD_INIT_EVT**
When HID device is initialized, the event comes

enumerator **ESP_HIDD_DEINIT_EVT**
When HID device is deinitialized, the event comes

enumerator **ESP_HIDD_REGISTER_APP_EVT**
When HID device application registered, the event comes

enumerator **ESP_HIDD_UNREGISTER_APP_EVT**
When HID device application unregistered, the event comes

enumerator **ESP_HIDD_OPEN_EVT**
When HID device connection to host opened, the event comes

enumerator **ESP_HIDD_CLOSE_EVT**
When HID device connection to host closed, the event comes

enumerator **ESP_HIDD_SEND_REPORT_EVT**
When HID device send report to lower layer, the event comes

enumerator **ESP_HIDD_REPORT_ERR_EVT**
When HID device report handshake error to lower layer, the event comes

enumerator **ESP_HIDD_GET_REPORT_EVT**
When HID device receives GET_REPORT request from host, the event comes

enumerator **ESP_HIDD_SET_REPORT_EVT**
When HID device receives SET_REPORT request from host, the event comes

enumerator **ESP_HIDD_SET_PROTOCOL_EVT**
When HID device receives SET_PROTOCOL request from host, the event comes

enumerator **ESP_HIDD_INTR_DATA_EVT**
When HID device receives DATA from host on intr, the event comes

enumerator **ESP_HIDD_VC_UNPLUG_EVT**
When HID device initiates Virtual Cable Unplug, the event comes
enumerator **ESP_HIDD_API_ERR_EVT**

When HID device has API error, the event comes

enum **esp_hidd_status_t**

Values:

enumerator **ESP_HIDD_SUCCESS**

enumerator **ESP_HIDD_ERROR**

general ESP HD error

enumerator **ESP_HIDD_NO_RES**

out of system resources

enumerator **ESP_HIDD_BUSY**

Temporarily can not handle this request.

enumerator **ESP_HIDD_NO_DATA**

No data.

enumerator **ESP_HIDD_NEED_INIT**

HIDD module shall init first

enumerator **ESP_HIDD_NEED_DEINIT**

HIDD module shall deinit first

enumerator **ESP_HIDD_NEED_REG**

HIDD module shall register first

enumerator **ESP_HIDD_NEED_DEREG**

HIDD module shall deregister first

enumerator **ESP_HIDD_NO_CONNECTION**

connection may have been closed

### Classic Bluetooth L2CAP API

**Application Example** Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

• This is a BT_L2CAP demo. This demo can connect, send and receive L2CAP data bluetooth/bluedroid/classic_bt/bt_l2cap_client, bluetooth/bluedroid/classic_bt/bt_l2cap_server

**API Reference**

**Header File**

• components/bt/host/bluedroid/api/include/api/esp_l2cap_bt_api.h
Chapter 2. API 参考

Functions

**esp_err_t esp bt l2cap_register_callback (esp bt l2cap cb f callback)**

This function is called to init callbacks with L2CAP module.

- 参数 callback - [in] pointer to the init callback function.
- 返回 • ESP_OK: success
  • other: failed

**esp_err_t esp bt l2cap_init (void)**

This function is called to init L2CAP module. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

- 返回 • ESP_OK: success
  • other: failed

**esp_err_t esp bt l2cap_deinit (void)**

This function is called to uninit l2cap module. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_BT_L2CAP_UNINIT_EVT. This function should be called after esp bt l2cap_init() completes successfully.

- 返回 • ESP_OK: success
  • other: failed

**esp_err_t esp bt l2cap_connect (esp bt l2cap cntl flags t cntl_flag, uint16_t remote_psm, esp bd addr t peer_bd_addr)**

This function makes an L2CAP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_BT_L2CAP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp bt l2cap_init() successful and before esp bt l2cap_deinit().

- 参数 • cntl_flag - [in] Lower 16-bit security settings mask.
  • remote_psm - [in] Remote device bluetooth Profile PSM.
  • peer_bd_addr - [in] Remote device bluetooth device address.
- 返回 • ESP_OK: success
  • other: failed

**esp_err_t esp bt l2cap_start_srv (esp bt l2cap cntl flags t cntl_flag, uint16_t local_psm)**

This function create a L2CAP server and starts listening for an L2CAP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_BT_L2CAP_START_EVT. When the connection is established, the callback is called with ESP_BT_L2CAP_OPEN_EVT. This function must be called after esp bt l2cap_init() successful and before esp bt l2cap_deinit().

- 参数 • cntl_flag - [in] Lower 16-bit security settings mask.
  • local_psm - [in] Dynamic PSM.
- 返回 • ESP_OK: success
  • other: failed

**esp_err_t esp bt l2cap_stop_all_srv (void)**

This function stops all L2CAP servers. The operation will close all active L2CAP connection first, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of
ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_stop_srv(uint16_t local_psm)
```
This function stops a specific L2CAP server. The operation will close all active L2CAP connection first on the specific L2CAP server, then the callback function will be called with ESP_BT_L2CAP_CLOSE_EVT, and the number of ESP_BT_L2CAP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_BT_L2CAP_SRV_STOP_EVT. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_register(void)
```
This function is used to register VFS. Only supports write, read and close. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_l2cap_vfs_unregister(void)
```
This function is used to unregister VFS. This function must be called after esp_bt_l2cap_init() successful and before esp_bt_l2cap_deinit().

- ESP_OK: success
- other: failed

**Unions**

- a. ESP_BT_L2CAP_SEC_NONE
- b. ESP_BT_L2CAP_SEC_AUTHENTICATE
- c. (ESP_BT_L2CAP_SEC_ENCRYPT|ESP_BT_L2CAP_SEC_AUTHENTICATE) No security

```c
ESP_BT_L2CAP_SEC_AUTHORIZE
```
Authorization required

```c
ESP_BT_L2CAP_SEC_AUTHENTICATE
```
Authentication required

```c
ESP_BT_L2CAP_SEC_ENCRYPT
```
Encryption required

Type Definitions

```c
typedef uint32_t esp_bt_l2cap_ctrl_flags_t

typedef void(* esp_bt_l2cap_cb_t)(esp_bt_l2cap_ctrl_event_t event, esp_bt_l2cap_cb_param_t *param)
```
L2CAP callback function type.

- **Param event** Event type
- **Param param** Point to callback parameter, currently is union type

Enumerations

```c
enum esp_bt_l2cap_status_t
```
L2CAP operation success and failure codes.

**Values**:

- enumerator ESP_BT_L2CAP_SUCCESS
  Successful operation.

- enumerator ESP_BT_L2CAP_FAILURE
  Generic failure.

- enumerator ESP_BT_L2CAP_BUSY
  Temporarily can not handle this request.

- enumerator ESP_BT_L2CAP_NO_RESOURCE
  No more resource
enumerator **ESP_BT_L2CAP_NEED_INIT**
L2CAP module shall init first

enumerator **ESP_BT_L2CAP_NEED_DEINIT**
L2CAP module shall deinit first

enumerator **ESP_BT_L2CAP_NO_CONNECTION**
Connection may have been closed

enumerator **ESP_BT_L2CAP_NO_SERVER**
No server

enum **esp_bt_l2cap_cb_event_t**
L2CAP callback function events.

*Values:*

enumerator **ESP_BT_L2CAP_INIT_EVT**
When L2CAP is initialized, the event comes

enumerator **ESP_BT_L2CAP_UNINIT_EVT**
When L2CAP is deinitialized, the event comes

enumerator **ESP_BT_L2CAP_OPEN_EVT**
When L2CAP Client connection open, the event comes

enumerator **ESP_BT_L2CAP_CLOSE_EVT**
When L2CAP connection closed, the event comes

enumerator **ESP_BT_L2CAP_START_EVT**
When L2CAP server started, the event comes

enumerator **ESP_BT_L2CAP_CL_INIT_EVT**
When L2CAP client initiated a connection, the event comes

enumerator **ESP_BT_L2CAP_SRV_STOP_EVT**
When L2CAP server stopped, the event comes

**BT SDP APIs**

**Overview**  Bluetooth SDP reference APIs.

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_sdp_api.h
Functions

`esp_err_t esp_sdp_register_callback (esp_sdp_cb_t callback)`
This function is called to init callbacks with SDP module.

参数 `callback` [in] pointer to the init callback function.

返回
  • ESP_OK: success
  • other: failed

`esp_err_t esp_sdp_init (void)`
This function is called to init SDP module. When the operation is completed, the callback function will be called with ESP_SDP_INIT_EVT. This function should be called after `esp_bluedroid_enable()` completes successfully.

返回
  • ESP_OK: success
  • other: failed

`esp_err_t esp_sdp_deinit (void)`
This function is called to de-initialize SDP module. The operation will remove all SDP records, then the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT, and the number of ESP_SDP_REMOVE_RECORD_COMP_EVT is equal to the number of SDP records. When the operation is completed, the callback function will be called with ESP_SDP_DEINIT_EVT. This function should be called after `esp_sdp_init()` completes successfully.

返回
  • ESP_OK: success
  • other: failed

`esp_err_t esp_sdp_search_record (esp_bd_addr_t bd_addr, esp_bt_uuid_t uuid)`
This function is called to perform service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SDP_SEARCH_COMP_EVT. This function must be called after `esp_sdp_init()` successful and before `esp_sdp_deinit()`.

参数
  • `bd_addr` [in] Remote device bluetooth device address.
  • `uuid` [in] Service UUID of the remote device.

返回
  • ESP_OK: success
  • other: failed

`esp_err_t esp_sdp_create_record (esp_bluetooth_sdp_record_t *record)`
This function is called to create SDP records. When the operation is completed, the callback function will be called with ESP_SDP_CREATE_RECORD_COMP_EVT. This function must be called after `esp_sdp_init()` successful and before `esp_sdp_deinit()`.

参数 `record` [in] The SDP record to create.

返回
  • ESP_OK: success
  • other: failed

`esp_err_t esp_sdp_remove_record (int record_handle)`
This function is called to remove a SDP record. When the operation is completed, the callback function will be called with ESP_SDP_REMOVE_RECORD_COMP_EVT. This function must be called after `esp_sdp_init()` successful and before `esp_sdp_deinit()`.

参数 `record_handle` [in] The SDP record handle.

返回
  • ESP_OK: success
  • other: failed

      SDP module shall deinit first
    enumerator ESP_SDP_NO_CREATE_RECORD
      No record created

enum esp_sdp_cb_event_t
  SDP callback function events.
  Values:
    enumerator ESP_SDP_INIT_EVT
      When SDP is initialized, the event comes
    enumerator ESP_SDP_DEINIT_EVT
      When SDP is deinitialized, the event comes
    enumerator ESP_SDP_SEARCH_COMP_EVT
      When SDP search complete, the event comes
    enumerator ESP_SDP_CREATE_RECORD_COMP_EVT
      When create SDP records complete, the event comes
### 2.3.4 Controller && VHCI

#### Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - `bluetooth/hci/controller_vhci_ble_adv`.

#### API Reference

**Header File**

- `components/bt/include/esp32/include/esp_bt.h`

**Functions**

```c
esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)
```

Set BLE TX power Connection Tx power should only be set after connection created.

**参数**

- `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc
• `power_level` - Power level(index) corresponding to absolute value(dbm)

```
esp_power_level_t esp_ble_tx_power_get (esp_power_type_t power_type)
```

Get BLE TX power Connection Tx power should only be get after connection created.

参数 `power_type` - The type of which tx power, could set Advertising/Connection/Default and etc

返回 `>= 0` - Power level, `< 0` - Invalid

```
esp_err_t esp_bredr_tx_power_set (esp_power_type_t power_type, esp_power_level_t min_power_level, esp_power_level_t max_power_level)
```

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

参数

• `min_power_level` - The minimum power level
• `max_power_level` - The maximum power level

返回 `ESP_OK` - success, other - failed

```
esp_err_t esp_bredr_tx_power_get (esp_power_type_t power_type, esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

参数

• `min_power_level` - The minimum power level
• `max_power_level` - The maximum power level

返回 `ESP_OK` - success, other - failed

```
esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)
```

Set default SCO datapath Should be called after controller is enabled, and before (e)SCO link is established.

参数 `data_path` - SCO data path

返回 `ESP_OK` - success, other - failed

```
esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)
```

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

参数 `cfg` - Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

返回 `ESP_OK` - success, other - failed

```
esp_err_t esp_bt_controller_deinit (void)
```

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

返回 `ESP_OK` - success, other - failed

```
esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)
```

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

参数 `mode` - the mode(BLE/BT/BTDI) to enable. For compatible of API, retain this argument.

This mode must be equal as the mode in “cfg” of `esp_bt_controller_init()`. 
## Chapter 2. API 参考

### esp_err_t esp_bt_controller_disable (void)
Disable BT controller.

### esp_bt_controller_status_t esp_bt_controller_get_status (void)
Get BT controller is initialised/de-initialised/enabled/disabled.

### bool esp_vhci_host_check_send_available (void)
esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

### void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

#### 参数
- **data** - the packet point
- **len** – the packet length

### esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)
esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

#### 参数
- **callback** - esp_vhci_host_callback type variable

### esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)
esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function.

#### 参数
- **mode** - the mode want to release memory

### esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)
esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode
This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

备注： In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

### esp_err_t esp_bt_sleep_enable(void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable().

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and "ORIG mode" is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function "esp_bt_controller_wakeup_request".

返回
- ESP_OK: success
- other: failed

### esp_err_t esp_bt_sleep_disable (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable().

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep.

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

返回
- ESP_OK: success
- other: failed
**esp_err_t esp_ble_scan_duplicated_list_flush (void)**  
Manually clear scan duplicate list.  
Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

*备注：* This function name is incorrectly spelled, it will be fixed in release 5.x version.

- **返回**  
  - ESP_OK: success  
  - other: failed

**void esp_wifi_bt_power_domain_on (void)**  
bt Wi-Fi power domain power on

**void esp_wifi_bt_power_domain_off (void)**  
bt Wi-Fi power domain power off

**Structures**

- **struct esp_bt_controller_config_t**  
Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

- **uint16_t controller_task_stack_size**  
  Bluetooth controller task stack size

- **uint8_t controller_task_prio**  
  Bluetooth controller task priority

- **uint8_t hci_uart_no**  
  If use UART1/2 as HCI IO interface, indicate UART number

- **uint32_t hci_uart_baudrate**  
  If use UART1/2 as HCI IO interface, indicate UART baudrate

- **uint8_t scan_duplicate_mode**  
  scan duplicate mode

- **uint8_t scan_duplicate_type**  
  scan duplicate type

- **uint16_t normal_adv_size**  
  Normal adv size for scan duplicate

- **uint16_t mesh_adv_size**  
  Mesh adv size for scan duplicate
uint16_t send_adv_reserved_size
Controller minimum memory value

uint32_t controller_debug_flag
Controller debug log flag

uint8_t mode
Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
BLE maximum connection numbers

uint8_t bt_max_acl_conn
BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
SCO data path, i.e. HCI or PCM module

bool auto_latency
BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
BLE low power crystal accuracy index

uint8_t pcm_role
PCM role (master & slave)

uint8_t pcm_polar
PCM polar trig (falling clk edge & rising clk edge)

bool hli
Using high level interrupt or not

uint32_t magic
Magic number

struct esp_vhci_host_callback

`esp_vhci_host_callback` used for vhci call host function to notify what host need to do

**Public Members**
void (*notify_host_send_available)(void)
    callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
    callback used to notify that the controller has a packet to send to the host

**Macros**

`ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL`  
`BT_CONTROLLER_INIT_CONFIG_DEFAULT()`

**Type Definitions**

typedef struct `esp_vhci_host_callback` `esp_vhci_host_callback_t`  

`esp_vhci_host_callback` used for vhci call host function to notify what host need to do

**Enumerations**

enum `esp_bt_mode_t`  
    Bluetooth mode for controller enable/disable.  
    Values:

    enumerator `ESP_BT_MODE_IDLE`  
        Bluetooth is not running

    enumerator `ESP_BT_MODE_BLE`  
        Run BLE mode

    enumerator `ESP_BT_MODE_CLASSIC_BT`  
        Run Classic BT mode

    enumerator `ESP_BT_MODE_BTDM`  
        Run dual mode

enum [anonymous]  
    BLE sleep clock accuracy(SCA), values for ble_sca field in `esp_bt_controller_config_t`, currently only `ESP_BLE_SCA_500PPM` and `ESP_BLE_SCA_250PPM` are supported.  
    Values:

    enumerator `ESP_BLE_SCA_500PPM`  
        BLE SCA at 500ppm

    enumerator `ESP_BLE_SCA_250PPM`  
        BLE SCA at 250ppm

    enumerator `ESP_BLE_SCA_150PPM`  
        BLE SCA at 150ppm
enum `ESP_BLE_SCA_100PPM`
BLE SCA at 100ppm

enum `ESP_BLE_SCA_75PPM`
BLE SCA at 75ppm

enum `ESP_BLE_SCA_50PPM`
BLE SCA at 50ppm

enum `ESP_BLE_SCA_30PPM`
BLE SCA at 30ppm

enum `ESP_BLE_SCA_20PPM`
BLE SCA at 20ppm

def enum `esp_bt_controller_status_t`
Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

enum `ESP_BT_CONTROLLER_STATUS_IDLE`

enum `ESP_BT_CONTROLLER_STATUS_INITED`

enum `ESP_BT_CONTROLLER_STATUS_ENABLED`

enum `ESP_BT_CONTROLLER_STATUS_NUM`

enum `esp_ble_power_type_t`
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected.

ESP_BLE_PWR_TYPE_DEFAULT : if each connection’s TX power is not set, it will use this default value.

if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enum `ESP_BLE_PWR_TYPE_CONN_HDL0`
For connection handle 0

enum `ESP_BLE_PWR_TYPE_CONN_HDL1`
For connection handle 1

enum `ESP_BLE_PWR_TYPE_CONN_HDL2`
For connection handle 2

enum `ESP_BLE_PWR_TYPE_CONN_HDL3`
For connection handle 3
enumerator \texttt{ESP_BLE_PWR_TYPE_CONN_HDL4} \\
For connection handle 4

enumerator \texttt{ESP_BLE_PWR_TYPE_CONN_HDL5} \\
For connection handle 5

enumerator \texttt{ESP_BLE_PWR_TYPE_CONN_HDL6} \\
For connection handle 6

enumerator \texttt{ESP_BLE_PWR_TYPE_CONN_HDL7} \\
For connection handle 7

enumerator \texttt{ESP_BLE_PWR_TYPE_CONN_HDL8} \\
For connection handle 8

enumerator \texttt{ESP_BLE_PWR_TYPE_ADV} \\
For advertising

enumerator \texttt{ESP_BLE_PWR_TYPE_SCAN} \\
For scan

enumerator \texttt{ESP_BLE_PWR_TYPE_DEFAULT} \\
For default, if not set other, it will use default value

enumerator \texttt{ESP_BLE_PWR_TYPE_NUM} \\
TYPE numbers

\texttt{enum esp_power_level_t} \\
Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

\texttt{Values:}

enumerator \texttt{ESP_PWR_LVL_N12} \\
Corresponding to -12dbm

enumerator \texttt{ESP_PWR_LVL_N9} \\
Corresponding to -9dbm

enumerator \texttt{ESP_PWR_LVL_N6} \\
Corresponding to -6dbm

enumerator \texttt{ESP_PWR_LVL_N3} \\
Corresponding to -3dbm

enumerator \texttt{ESP_PWR_LVL_N0} \\
Corresponding to 0dbm

enumerator \texttt{ESP_PWR_LVL_P3} \\
Corresponding to +3dbm
Chapter 2. API 參考

enumerator ESP_PWR_LVL_P6
Corresponding to +6dbm

enumerator ESP_PWR_LVL_P9
Corresponding to +9dbm

enumerator ESP_PWR_LVL_N14
Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator ESP_PWR_LVL_N11
Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator ESP_PWR_LVL_N8
Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator ESP_PWR_LVL_N5
Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator ESP_PWR_LVL_N2
Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator ESP_PWR_LVL_P1
Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator ESP_PWR_LVL_P4
Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator ESP_PWR_LVL_P7
Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t
Bluetooth audio data transport path.

Values:

enumerator ESP_SCO_DATA_PATH_HCI
data over HCI transport

enumerator ESP_SCO_DATA_PATH_PCM
data over PCM interface

2.3.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an un provisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.
Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section `ESP-BLE-MESH 快速入门`. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section `ESP-BLE-MESH 架构`.

Application Examples and Demos

Please refer to Sections `ESP-BLE-MESH 示例` and `ESP-BLE-MESH 演示视频`.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- `ESP-BLE-MESH Definitions`
- `ESP-BLE-MESH Core API Reference`
- `ESP-BLE-MESH Models API Reference`

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- `components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h`

Unions

union `esp_ble_mesh_prov_cb_param_t`

```c
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param prov_register_comp
    Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_unprov_dev_name_comp_param
    node_set_unprov_dev_name_comp
    Event parameter of ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_enable_comp_param
    node_prov_enable_comp
    Event parameter of ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param
node_prov_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param
node_prov_link_open
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param
node_prov_link_close
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param
node_prov_output_num
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_str_evt_param
node_prov_output_str
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_evt_param
node_prov_input
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_complete_evt_param
node_prov_complete
Event parameter of ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_reset_param
node_prov_reset
Event parameter of ESP_BLE_MESH_NODE_PROV_RESET_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_oob_pub_key_comp_param
node_prov_set_oob_pub_key_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_number_comp_param
node_prov_input_numComp
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_string_comp_param
node_prov_input_str_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_identity_enable_comp_param
node_proxy_identity_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_enable_comp_param
node_proxy_gatt_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_disable_comp_param
node_proxy_gatt_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_net_key_comp_param
node_add_net_key_comp
  Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_app_key_comp_param
node_add_app_key_comp
  Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_bind_local_mod_app_comp_param
node_bind_app_key_to_model_comp
  Event parameter of ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_recv_unprov_adv_pkt_param
provisioner_recv_unprov_adv_pkt
  Event parameter of ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_enable_comp_param
provisioner_prov_enable_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_disable_comp_param
provisioner_prov_disable_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_open_evt_param
provisioner_prov_link_open
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisionerProv_read_oob_pub_key_evt_param
provisioner_prov_read_oob_pub_key
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_evt_param
provisioner_prov_input
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_output_evt_param
provisioner_prov_output
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_link_close_evt_param
provisioner_prov_link_close
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_complete
provisioner_prov_complete
  Event parameter of ESP_BLE_MESH_PROVISIONER_PROV COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_unprov_dev_comp_param
provisioner_add_unprov_dev_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_dev_with_addr_comp_param
provisioner_prov_dev_with_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_dev_comp_param
provisioner_delete_dev_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_uuid_match_comp_param
provisioner_set_dev_uuid_match_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_dev_data_info_comp_param
provisioner_set_dev_data_info_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_DEV_DATA_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_static_oob_val_comp_param
provisioner_set_static_oob_val_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_primary_elem_addr_comp_param
provisioner_set_primary_elem_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param
provisioner_prov_read_oob_pub_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param
provisioner_prov_input_num_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param
provisioner_prov_input_str_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param
provisioner_set_node_name_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param
provisioner_add_app_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param
provisioner_update_app_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param
provisioner_bind_app_key_to_model_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT.

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT.

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT.

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT.

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT.

int err_code
This indicates the result of enabling/disabling to receive heartbeat messages by the Provisioner.
This indicates the result of setting the heartbeat filter type by the Provisioner.
This indicates the result of setting the heartbeat filter address by the Provisioner.
This indicates the result of directly erasing settings by the Provisioner.
This indicates the result of opening settings with index by the Provisioner.
This indicates the result of opening settings with user id by the Provisioner.
This indicates the result of closing settings with index by the Provisioner.
This indicates the result of closing settings with user id by the Provisioner.
This indicates the result of deleting settings with index by the Provisioner.
This indicates the result of deleting settings with user id by the Provisioner.

bool enable
This indicates enabling or disabling receiving heartbeat messages.

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.

uint8_t type
This is the type of the filter used for receiving heartbeat messages.

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
definition
This is the event parameter for ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
uint8_t \textbf{op}
Operation (add, remove, clean)

uint16_t \textbf{hb_src}
Heartbeat source address

uint16_t \textbf{hb_dst}
Heartbeat destination address

\textbf{struct esp_ble_mesh_prov_cb_param_t::{[anonymous]}}
\textbf{provisioner_set_heartbeat_filter_info_comp}
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t \textbf{init_ttl}
Heartbeat InitTTL

uint8_t \textbf{rx_ttl}
Heartbeat RxTTL

uint8_t \textbf{hops}
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t \textbf{feature}
Bit field of currently active features of the node

int8_t \textbf{rssi}
RSSI of the heartbeat message

\textbf{struct esp_ble_mesh_prov_cb_param_t::{[anonymous]}} \textbf{provisioner_recv_heartbeat}
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

\textbf{struct esp_ble_mesh_prov_cb_param_t::{[anonymous]}} \textbf{provisioner_direct_erase_settings_comp}
ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT

uint8_t \textbf{index}
Index of Provisioner settings

\textbf{struct esp_ble_mesh_prov_cb_param_t::{[anonymous]}} \textbf{provisioner_open_settings_with_index_comp}
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

\textbf{char \texttt{uid}[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]}
Provisioner settings user id
Chapter 2. API

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_open_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_info_comp_param
set_fast_prov_info_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_action_comp_param
set_fast_prov_action_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_heartbeat_msg_recv_param
heartbeat_msg_recv
Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_enable_comp_param
lpn_enable_comp
Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_disable_comp_param
lpn_disable_comp
Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_poll_comp_param
lpn_poll_comp
Event parameter of ESP_BLE_MESH_LPN POLL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_establish_param
lpn_friendship_establish
Event parameter of ESP_BLE_MESH_LPN FRIENDSHIP_ESTABLISH_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_terminate_param
lpn_friendship_terminate
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_establish_param
frnd_friendship_establish
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param
frnd_friendship_terminate
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_adv_pkt_param
proxy_client_recv_adv_pkt
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connected_param
proxy_client_connected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnected_param
proxy_client_disconnected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_recv_filter_status_param
proxy_client_recv_filter_status
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_connect_comp_param
proxy_client_connect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_disconnect_comp_param
proxy_client_disconnect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_set_filter_type_comp_param
proxy_client_set_filter_type_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_add_filter_addr_comp_param
proxy_client_add_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_remove_filter_addr_comp_param
proxy_client_remove_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_server_connected_param
proxy_server_connected
Event parameter of ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_server_disconnected_param

proxy_server_disconnected
Event parameter of ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_model_sub_group_addr_comp_param

model_sub_group_addr_comp
Event parameters of ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_model_unsub_group_addr_comp_param

model_unsub_group_addr_comp
Event parameters of ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_deinit_mesh_comp_param

deinit_mesh_comp
Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT

#include <esp_ble_mesh_defs.h>
ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.

Public Members

int err_code
Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side

Values:

tenumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

tenumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received
enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**
Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**
Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**
Friend feature disabled or corresponding NetKey is deleted

**Public Members**

```
uint16_t lpn_addr
    Low Power Node unicast address
```

```
enum esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]
reason
    This enum value is the reason of friendship termination on the friend node side Friendship terminated
```

```
struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
```

**Public Members**

```
uint8_t hops
    Heartbeat hops (InitTTL - RxTTL + 1)
```

```
uint16_t feature
    Bit field of currently active features of the node
```

```
struct ble_mesh_input_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_EVT.
```

**Public Members**

```
    esp_ble_mesh_input_action_t action
    Action of Input OOB Authentication
```

```
uint8_t size
    Size of Input OOB Authentication
```

```
struct ble_mesh_input_number_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT.
```
Chapter 2. API

Public Members

```c
int err_code
```
Indicate the result of inputting number

```c
struct ble_mesh_input_string_comp_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT.
```

Public Members

```c
int err_code
```
Indicate the result of inputting string

Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode

Opcode of the previously sent message

esp_ble_mesh_model_t *model

Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx

Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode

Opcode of the unsolicited received message

esp_ble_mesh_model_t *model

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx

Pointer to the context of the message

uint16_t length

Length of the received message

uint8_t *msg

Value of the received message

struct ble_mesh_model_operation_evt_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.
Public Members

uint32_t opcode
    Opcode of the received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the received message

uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message

struct ble_mesh_model_publish_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
    Indicate the result of publishing a message

esp_ble_mesh_model_t *model
    Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
    Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
    Indicate the result of sending a message

uint32_t opcode
    Opcode of the message
```c
#include<esp_ble_mesh_defs.h>
```

# ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

## Public Members

- **err_code**
  - `int`  
  - Indicate the result of updating server model state

- **model**
  - `esp_ble_mesh_model_t *`  
  - Pointer to the server model which state value is updated

- **type**
  - `esp_ble_mesh_server_state_type_t`  
  - Type of the updated server state

## Structures

- **esp_ble_mesh_deinit_param_t**
  - BLE Mesh deinit parameters

  - **erase_flash**
    - `bool`  
    - Indicate if erasing flash when deinit mesh stack

- **esp_ble_mesh_elem_t**
  - Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in `mesh_access.h`

  - **element_addr**
    - uint16_t  
    - Element Address, assigned during provisioning.

  - **location**
    - const uint16_t  
    - Location Descriptor (GATT Bluetooth Namespace Descriptors)

  - **sig_model_count**
    - const uint8_t  
    - SIG Model count

  - **vnd_model_count**
    - const uint8_t  
    - Vendor Model count

---

*Espresif Systems* 526  
Release v5.1-dev-2066-g7869f4e151  
Submit Document Feedback
**struct esp_ble_mesh_model_pub_t**

Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the model to which the context belongs. Initialized by the stack.

- `uint16_t publish_addr`
  Publish Address.

- `uint16_t app_idx`
  Publish AppKey Index.

- `uint16_t cred`
  Friendship Credentials Flag.

- `uint16_t send_rel`
  Force reliable sending (segment acks)

- `uint8_t ttl`
  Publish Time to Live.

- `uint8_t retransmit`
  Retransmit Count & Interval Steps.

- `uint8_t period`
  Publish Period.

- `uint8_t period_div`
  Divisor for the Period.

- `uint8_t fast_period`
  Use FastPeriodDivisor

- `uint8_t count`
  Retransmissions left.

- `uint32_t period_start`
  Start of the current period.
struct net_buf_simple *msg
   Publication buffer, containing the publication message.
   This will get correctly created when the publication context has been defined using the
   ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
   ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

   esp_ble_mesh_cb_t update
   Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
   Publish Period Timer. Initialized by the stack.

uint8_t dev_role
   Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
   Abstraction that describes a model operation context. This structure is associated with struct
   bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
   Message opcode

const size_t min_len
   Message minimum length

   esp_ble_mesh_cb_t param_cb
   Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
   Abstraction that describes a model callback structure. This structure is associated with struct
   bt_mesh_model_cb in mesh_access.h.

Public Members

   esp_ble_mesh_cb_t init_cb
   Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
   Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in
   mesh_access.h

Public Members
const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous] Model ID

union element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

tuint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Messages sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h
Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.

uint16_t recv_dst
Destination address of a received message. Not used for sending.

int8_t recv_rssi
RSSI of received packet. Not used for sending.

uint8_t recv_ttl
Received TTL value. Not used for sending.

uint8_t send_rel
Force sending reliably by using segment acknowledgement

uint8_t send_ttl
TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
Model corresponding to the message, no need to be initialized before sending message

bool srv_send
Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t cid
16-bit SIG-assigned company identifier

uint16_t pid
16-bit vendor-assigned product identifier
Chapter 2. API 参考

uint16_t vid
   16-bit vendor-assigned product version identifier

size_t element_count
   Element count

esp_ble_mesh_elem_t *elements
   A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
   Information of the device which is going to be added for provisioning.

   Public Members

   esp_ble_mesh_bd_addr_t addr
      Device address

   esp_ble_mesh_addr_type_t addr_type
      Device address type

   uint8_t uuid[16]
      Device UUID

   uint16_t oob_info
      Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

   esp_ble_mesh_prov_bearer_t bearer
      Provisioning Bearer

struct esp_ble_mesh_device_delete_t
   Information of the device which is going to be deleted.

   Public Members

   esp_ble_mesh_bd_addr_t addr
      Device address

   esp_ble_mesh_addr_type_t addr_type
      Device address type

   uint8_t uuid[16]
      Device UUID

   uint8_t flag
      BIT0: device address; BIT1: device UUID
struct `esp_ble_mesh_prov_data_info_t`
Information of the provisioner which is going to be updated.

**Public Members**

`uint16_t net_idx`
NetKey Index

`uint8_t flags`
Flags

`uint32_t iv_index`
IV Index

`uint8_t flag`
BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct `esp_ble_mesh_node_t`
Information of the provisioned node

**Public Members**

`esp_ble_mesh_bd_addr_t addr`
Node device address

`esp_ble_mesh_addr_type_t addr_type`
Node device address type

`uint8_t dev_uuid[16]`
Device UUID

`uint16_t oob_info`
Node OOB information

`uint16_t unicast_addr`
Node unicast address

`uint8_t element_num`
Node element number

`uint16_t net_idx`
Node NetKey Index

`uint8_t flags`
Node key refresh flag and iv update flag
uint32_t iv_index
   Node IV Index

uint8_t dev_key[16]
   Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
   Node name

uint16_t comp_length
   Length of Composition Data

uint8_t *comp_data
   Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
   Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
   Minimum unicast address used for fast provisioning

uint16_t unicast_max
   Maximum unicast address used for fast provisioning

uint16_t net_idx
   Netkey index used for fast provisioning

uint8_t flags
   Flags used for fast provisioning

uint32_t iv_index
   IV Index used for fast provisioning

uint8_t offset
   Offset of the UUID to be compared

uint8_t match_len
   Length of the UUID to be compared

uint8_t match_val[16]
   Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
   Context of Provisioner heartbeat filter information to be set
Public Members

uint16_t hb_src
Heartbeat source address (unicast address)

uint16_t hb_dst
Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

int op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
Pointer to the internal data of client model

uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.
Chapter 2. API 参考

Public Members

*esp_ble_mesh_opcode_t* **opcode**
Message opcode

*esp_ble_mesh_model_t *model*
Pointer to the client model structure

*esp_ble_mesh_msg_ctx_t ctx*
The context used to send message

int32_t **msg_timeout**
Timeout value (ms) to get response to the sent message. Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t **msg_role**
Role of the device - Node/Provisioner

struct *esp_ble_mesh_state_transition_t*
Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp_ble_mesh_state_transition_t* sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool **just_started**
Indicate if the state transition has just started

uint8_t **trans_time**
State transition time

uint8_t **remain_time**
Remaining time of state transition

uint8_t **delay**
Delay before starting state transition

uint32_t **quo_tt**
Duration of each divided transition step

Submit Document Feedback
**uint32_t counter**  
Number of steps which the transition duration is divided

**uint32_t total_duration**  
State transition total duration

**int64_t start_timestamp**  
Time when the state transition is started

**struct k_delayed_work timer**  
Timer used for state transition

**struct esp_ble_mesh_last_msg_info_t**  
Parameters of the server model received last same set message.

**Public Members**

**uint8_t tid**  
Transaction number of the last message

**uint16_t src**  
Source address of the last message

**uint16_t dst**  
Destination address of the last message

**int64_t timestamp**  
Time when the last message is received

**struct esp_ble_mesh_server_rsp_ctrl_t**  
Parameters of the Server Model response control

**Public Members**

**uint8_t get_auto_rsp**  
BLE Mesh Server Response Option.

i. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
ii. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
iii. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
iv. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
v. If `status_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
vi. If `status_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages
**uint8_t set_auto_rsp**
Response control for Client Set messages

**uint8_t status_auto_rsp**
Response control for Server Status messages

**Macros**

**ESP_BLE_MESH_SDU_MAX_LEN**
The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

**ESP_BLE_MESH_MIC_SHORT**
Length of a long Mesh MIC.

**ESP_BLE_MESH_MIC_LONG**
The maximum length of a BLE Mesh provisioned node name

**ESP_BLE_MESH_NODE_NAME_MAX_LEN**
The maximum length of a BLE Mesh unprovisioned device name

**ESP_BLE_MESH_DEVICE_NAME_MAX_LEN**
The maximum length of settings user id

**ESP_BLE_MESH_SETTINGS_UID_SIZE**
Invalid settings index

**ESP_BLE_MESH_INVALID_SETTINGS_IDX**
Define the BLE Mesh octet 16 bytes size

**ESP_BLE_MESH_OCTET16_LEN**

**ESP_BLE_MESH_OCTET8_LEN**

**ESP_BLE_MESH_CID_NVAL**
Special TTL value to request using configured default TTL

**ESP_BLE_MESH_TTL_DEFAULT**
Maximum allowed TTL value

**ESP_BLE_MESH_TTL_MAX**

**ESP_BLE_MESH_ADDR_UNASSIGNED**

**ESP_BLE_MESH_ADDR_ALL_NODES**

**ESP_BLE_MESH_ADDR_PROXIES**
ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_KEY_DEV

ESP_BLE_MESH_KEY_PRIMARY

ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED

Supported features

ESP_BLE_MESH_FEATURE_RELAY

ESP_BLE_MESH_FEATURE_PROXY

ESP_BLE_MESH_FEATURE_FRIEND

ESP_BLE_MESH_FEATURE_LOW_POWER

ESP_BLE_MESH_FEATURE_ALL_SUPPORTED

ESP_BLE_MESH_ADDR_IS_UNICAST (addr)

ESP_BLE_MESH_ADDR_IS_GROUP (addr)

ESP_BLE_MESH_ADDR_IS_VIRTUAL (addr)

ESP_BLE_MESH_ADDR_IS_RFU (addr)

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT (count, int_ms)

Encode transmission count & interval steps.

备注：For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

参数
- count – Number of retransmissions (first transmission is excluded).
- int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

返回 BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)

Decode transmit count from a transmit value.

参数
- transmit – Encoded transmit count & interval value.

返回 Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)

Decode transmit interval from a transmit value.

参数
- transmit – Encoded transmit count & interval value.

返回 Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)

Encode Publish Retransmit count & interval steps.

参数
- count – Number of retransmissions (first transmission is excluded).
- int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.
BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

参数

- transmit – Encoded Publish Retransmit count & interval value.

返回

Retransmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

参数

- transmit – Encoded Publish Retransmit count & interval value.

返回

Transmission interval in milliseconds.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**

Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd.mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro **ESP_BLE_MESH_MODEL_NONE** can be given instead.

备注: This macro is associated with BLE_MESH_ELEM in mesh_access.h

参数

- _loc – Location Descriptor.
- _mods – Array of SIG models.
- _vnd.mods – Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

**BT_OCTET32_LEN**
BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)

Define a model publication context.

参数

• _name – Variable name given to the context.
• _msg_len – Length of the publication message.
• _role – Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)

Define a model operation context.

参数

• _opcode – Message opcode.
• _min_len – Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

**Type Definitions**

typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]

Define the BLE Mesh octet 8 bytes size

typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]

Invalid Company ID

typedef uint32_t esp_ble_mesh_cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16

typedef uint32_t UINT32

typedef uint64_t UINT64
typedef \texttt{UINT8} BT\_OCTET32[BT\_OCTET32\_LEN]

typedef uint8\_t BD\_ADDR[BD\_ADDR\_LEN]

typedef uint8\_t esp\_ble\_mesh\_bd\_addr\_t[BD\_ADDR\_LEN]

typedef uint8\_t esp\_ble\_mesh\_addr\_type\_t

BLE device address type.

typedef struct esp\_ble\_mesh\_model esp\_ble\_mesh\_model\_t

typedef uint8\_t esp\_ble\_mesh\_dev\_add\_flag\_t

typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_client\_get\_t

esp\_ble\_mesh\_opcode\_config\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_get\_state function.

typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_client\_set\_t

esp\_ble\_mesh\_opcode\_config\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_set\_state function.

typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_status\_t

esp\_ble\_mesh\_opcode\_config\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_get\_state. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8\_t esp\_ble\_mesh\_cfg\_status\_t

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32\_t esp\_ble\_mesh\_opcode\_health\_client\_get\_t

esp\_ble\_mesh\_opcode\_health\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_get\_state function.

typedef uint32\_t esp\_ble\_mesh\_opcode\_health\_client\_set\_t

esp\_ble\_mesh\_opcode\_health\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_set\_state function.

typedef uint32\_t esp\_ble\_mesh\_health\_model\_status\_t

esp\_ble\_mesh\_health\_model\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32\_t esp\_ble\_mesh\_generic\_message\_opcode\_t

esp\_ble\_mesh\_generic\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_generic\_client\_get\_state & esp\_ble\_mesh\_generic\_client\_set\_state. Generic OnOff Message Opcode
typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum esp_ble_mesh_cb_type_t

Values:

enumerator ESP_BLE_MESH_TYPE_PROV_CB
enumerator ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB

enumerator PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t

Values:

enumerator ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
Set the unprovisioned device name completion event

enumerator ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
Enable node provisioning functionality completion event

enumerator ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
Disable node provisioning functionality completion event

enumerator ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
Establish a BLE Mesh link event

enumerator ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
Close a BLE Mesh link event

enumerator ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
Generate Node input OOB public key event

enumerator ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
Generate Node Output Number event

enumerator ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

enumerator ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

enumerator ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

enumerator ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

enumerator ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

enumerator ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

enumerator ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event
enumerator **ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT**
Enable BLE Mesh Proxy Identity advertising completion event

denumerator **ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT**
Enable BLE Mesh GATT Proxy Service completion event

denumerator **ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT**
Disable BLE Mesh GATT Proxy Service completion event

denumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT**
Node add NetKey locally completion event

denumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**
Node add AppKey locally completion event

denumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Node bind AppKey to model locally completion event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**
Provisioner enable provisioning functionality completion event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**
Provisioner disable provisioning functionality completion event

denumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT.EVT**
Provisioner receives unprovisioned device beacon event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**
Provisioner read unprovisioned device OOB public key event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**
Provisioner input value for provisioning procedure event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**
Provisioner output value for provisioning procedure event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**
Provisioner establish a BLE Mesh link event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**
Provisioner close a BLE Mesh link event

denumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**
Provisioner provisioning done event

denumerator **ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event
Chapter 2. API

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT`
Provisioner delete node with uuid completion event

denumerator `ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT`
Provisioner delete node with unicast address completion event

denumerator `ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT`
Provisioner start to receive heartbeat message completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT`
Provisioner set the heartbeat filter type completion event

enumerator `ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT`
Provisioner set the heartbeat filter information completion event

enumerator `ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT`
Provisioner receive heartbeat message event

enumerator `ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT`
Provisioner directly erase settings completion event

enumerator `ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT`
Provisioner open settings with index completion event

enumerator `ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT`
Provisioner open settings with userid completion event

enumerator `ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT`
Provisioner close settings with index completion event

enumerator `ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT`
Provisioner close settings with userid completion event

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT`
Provisioner delete settings with index completion event

enumerator `ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT`
Provisioner delete settings with userid completion event

enumerator `ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT`
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

enumerator `ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT`
Set fast provisioning action completion event

enumerator `ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT`
Receive Heartbeat message event
enumerator ESP_BLE_MESH_LPACIÓN_ENABLE_COMP_EVT
   Enable Low Power Node completion event

enumerator ESP_BLE_MESH_LPÓN_DISABLE_COMP_EVT
   Disable Low Power Node completion event

enumerator ESP_BLE_MESH_LPÓN_POLL_COMP_EVT
   Low Power Node send Friend Poll completion event

enumerator ESP_BLE_MESH_LPÓN_FRIENDSHIP_ESTABLISH_EVT
   Low Power Node establishes friendship event

enumerator ESP_BLE_MESH_LPÓN_FRIENDSHIP_TERMINATE_EVT
   Low Power Node terminates friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
   Friend Node establishes friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
   Friend Node terminates friendship event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
   Proxy Client receives Network ID advertising packet event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
   Proxy Client establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
   Proxy Client terminates connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
   Proxy Client receives Proxy Filter Status event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
   Proxy Client connect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
   Proxy Client disconnect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
   Proxy Client set filter type completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
   Proxy Client add filter address completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
   Proxy Client remove filter address completion event
enumerator ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT
Proxy Server establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT
Proxy Server terminates connection successfully event

enumerator ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

enumerator ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

enumerator ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

enumerator ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation
Values:

enumerator ESP_BLE_MESH_SERVER_TRANS_TIMER_START

enumerator ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states
Values:

enumerator ESP_BLE_MESH_GENERIC_ONOFF_STATE

enumerator ESP_BLE_MESH_GENERIC_LEVEL_STATE

enumerator ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE

enumerator ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE

enumerator ESP_BLE_MESH_LIGHT_LIGHTESTHNESS_ACTUAL_STATE

enumerator ESP_BLE_MESH_LIGHT_LIGHTESTHNESS_LINEAR_STATE

enumerator ESP_BLE_MESH_LIGHT_CTL_LIGHTESTHNESS_STATE

enumerator ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_STATE

denumerator ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE

denumerator ESP_BLE_MESH_LIGHT_HSL_HUE_STATE

denumerator ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE

denumerator ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE

denumerator ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE

denumerator ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

denumerator ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

denumerator ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

denumerator ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event

denumerator ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

denumerator ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

denumerator ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

denumerator ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

denumerator ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

• ESP-BLE-MESH Stack Initialization
Chapter 2. API 参考

- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

```c
esp_err_t esp_ble_mesh_init(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

- **prov** - [in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** - [in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

备注: After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

```c
esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)
```

De-initialize BLE Mesh module.

备注: This function shall be invoked after esp_ble_mesh_client_model_deinit().

- **param** - [in] Pointer to the structure of BLE Mesh deinit parameters.

Reading of Local Data Information

Header File
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

Functions

```c
int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)
```

Get the model publish period, the unit is ms.

```c
uint16_t esp_ble_mesh_get_primary_element_address(void)
```

Get the address of the primary element.

备注: Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.
uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)

检查模型是否已订阅到给定的组地址。注意：例如，一旦收到状态消息，且目标地址是一个组地址，模型便使用此 API 来检查它是否成功订阅到给定的组地址。

参数
- model [in] 模型指针。
- group_addr [in] 组地址。

返回 指向模型的订阅列表中成功订阅组地址的指针，或者在失败时指向 NULL，这意味着模型尚未订阅到给定的组地址。注意：通过返回的组地址指针，您可以将组地址重置为 0x0000 以取消订阅模型。

esp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)

通过元素地址找到 BLE 网络元素指针。

参数 element_addr [in] 元素地址。

返回 成功时指向元素的指针，否则返回 NULL。

uint8_t esp_ble_mesh_get_element_count (void)

获取已注册的元素数量。

返回 元素数量。

esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)

根据给定的元素、公司 ID 和 Vendor Model ID 查找 Vendor 特定模型。

参数
- element [in] 属于模型的元素。
- company_id [in] 由 Bluetooth SIG 分配的 16 位公司标识符。
- model_id [in] 由厂商分配的 16 位模型标识符。

返回 成功时指向 Vendor Model 的指针，否则返回 NULL，指示 Vendor Model 未找到。

esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)

根据给定的元素和 Model ID 查找 SIG 模型。

参数
- element [in] 属于模型的元素。
- model_id [in] SIG 模型标识符。

返回 成功时指向 SIG Model 的指针，否则返回 NULL，指示 SIG Model 未找到。

const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)

获取已注册的 Composition 数据。

返回 成功时指向 Composition 数据的指针，否则返回 NULL，指示 Composition 数据未初始化。

esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

本地节点或 Provisioner 订阅组地址。

参数
- element_addr [in] 属于模型的元素的单播地址。

备注：此函数在节点未被配置或 Provisioner 启动之前不应被调用。
• `company_id` [in] A 16-bit company identifier.
• `group_addr` [in] The group address to be subscribed.

Annotation: This function shall not be invoked before node is provisioned or Provisioner is enabled.

```c
esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
```

A local model of node or Provisioner unsubscribes a group address.

```
const uint8_t* esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)
```

This function is called by Node to get the local NetKey.

```
const uint8_t* esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)
```

This function is called by Node to get the local AppKey.

```
esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Node to add a local NetKey.

Annotation: This function can only be called after the device is provisioned.

```
esp_err_t esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is called by Node to add a local AppKey.

Annotation: The net_idx must be an existing one. This function can only be called after the device is provisioned.
**esp_err_t** esp_ble_mesh_node_bind_app_key_to_local_model (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

**备注:** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**参数**
- **element_addr** - [in] Node local element address
- **company_id** - [in] Node local company id
- **model_id** - [in] Node local model id
- **app_idx** - [in] Node local appkey index

返回 ESP_OK on success or error code otherwise.

### Low Power Operation (Updating)

**Header File**
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_lpn_enable (void)
```

Enable BLE Mesh device LPN functionality.

**备注:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_disable (bool force)
```

Disable BLE Mesh device LPN functionality.

**参数**
- **force** - [in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_poll (void)
```

LPN tries to poll messages from the Friend Node.

**备注:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

返回 ESP_OK on success or error code otherwise.

**Send/Publish Messages, add Local AppKey, etc.**
Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

`esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)`

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**备注:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**参数**
- callback - [in] Pointer to the callback function.
- 返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)`

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**备注:** This API is only used to set the opcode of the message.

**参数**
- data - [in] Pointer to the message data.
- 返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)`

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

**参数**
- model - [in] BLE Mesh Client model to which the message belongs.
- 返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)`

De-initialize the user-defined client model.

**备注:** This function shall be invoked before esp_ble_mesh_deinit() is called.

**参数**
- model - [in] Pointer of the Client model.
- 返回 ESP_OK on success or error code otherwise.
### Chapter 2. API 参考

**esp_err_t esp_ble_mesh_server_model_send_msg**

```c
esp_err_t esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t *model,
                                           esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, 
                                           uint16_t length, uint8_t *data)
```

Send server model messages (such as server model status messages).

**参数**
- `model` - [in] BLE Mesh Server Model to which the message belongs.
- `ctx` - [in] Message context, includes keys, TTL, etc.
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of Access Payload (exclude the message opcode) to be sent.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_send_msg**

```c
esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
                                            esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, 
                                            uint16_t length, uint8_t *data, int32_t msg_timeout, 
                                            bool need_rsp, esp_ble_mesh_dev_role_t device_role)
```

Send client model messages (such as model get, set, etc).

**参数**
- `model` - [in] BLE Mesh Client Model to which the message belongs.
- `ctx` - [in] Message context, includes keys, TTL, etc.
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `msg_timeout` - [in] Time to get response to the message (in milliseconds).
- `need_rsp` - [in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- `device_role` - [in] Role of the device (Node/Provisioner) that sends the message.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_publish**

```c
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**备注：** Before calling this function, the user needs to ensure that the model publication message (`esp_ble_mesh_model_pub_t::msg`) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**参数**
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `device_role` - [in] Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_server_model_update_state**

```c
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, 
                                                esp_ble_mesh_server_state_type_t type, 
                                                esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.
Chapter 2. API 参考

### esp_err_t esp_ble_mesh_node_local_reset (void)
Reset the provisioning procedure of the local BLE Mesh node.

**备注:** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**参数**
- **index** - [in] Index of the node in the node queue.
- **name** - [in] Name (end by ‘\0’) to be set for the node.

**返回** ESP_OK on success or error code otherwise.

### esp_ble_mesh_provisioner_set_node_name (uint16_t index, const char *name)
This function is called to set the node (provisioned device) name.

**备注:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**参数**
- **index** - [in] Index of the node in the node queue.
- **name** - [in] Name (end by ‘\0’) to be set for the node.

**返回** ESP_OK on success or error code otherwise.

### esp_ble_mesh_provisioner_get_node_name (uint16_t index)
This function is called to get the node (provisioned device) name.

**备注:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**参数**
- **index** - [in] Index of the node in the node queue.

**返回** Node name on success, or NULL on failure.

### esp_ble_mesh_provisioner_get_node_index (const char *name)
This function is called to get the node (provisioned device) index.

**参数**
- **name** - [in] Name of the node (end by ‘\0’).

**返回** Node index on success, or an invalid value (0xFFFF) on failure.

### esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)
This function is called to store the Composition Data of the node.

**参数**
- **unicast_addr** - [in] Element address of the node
- **data** - [in] Pointer of Composition Data
- **length** - [in] Length of Composition Data

**返回** ESP_OK on success or error code otherwise.
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

参数 uuid - [in] Device UUID of the node
返回 Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

参数 unicast_addr - [in] Unicast address of the node
返回 Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name (const char *name)

This function is called to get the provisioned node information with the node name.

参数 name - [in] Name of the node (end by \0).
返回 Pointer of the node info struct or NULL on failure.

uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)

This function is called by Provisioner to get provisioned node count.

返回 Number of the provisioned nodes.

const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry (void)

This function is called by Provisioner to get the entry of the node table.

备注: After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node) is NULL. For example: “

const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { …… } ”

返回 Pointer to the start of the node table.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

参数 uuid - [in] Device UUID of the node
返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr (uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

参数 unicast_addr - [in] Unicast address of the node
返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

备注: app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

参数
- app_key - [in] The app key to be set for the local BLE Mesh stack.
### Chapter 2. API 參考

- **app_idx** - [in] The app key index.
  
  返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_update_local_app_key**

(const uint8_t app_key[16],
uint16_t net_idx, uint16_t app_idx)

This function is used to update a local AppKey for Provisioner.

参数

- **app_key** - [in] Value of the AppKey.
- **net_idx** - [in] Corresponding NetKey Index.
- **app_idx** - [in] The AppKey Index

返回 ESP_OK on success or error code otherwise.

**esp_ble_mesh_provisioner_get_local_app_key**

(const uint8_t* esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

参数

- **net_idx** - [in] Network key index.
- **app_idx** - [in] Application key index.

返回 App key on success, or NULL on failure.

**esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model**

(const uint16_t element_addr,
uint16_t app_idx,
uint16_t model_id,
uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

备注：company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

参数

- **element_addr** - [in] Provisioner local element address
- **app_idx** - [in] Provisioner local appkey index
- **model_id** - [in] Provisioner local model id
- **company_id** - [in] Provisioner local company id

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_add_local_net_key**

(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

备注: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

参数

- **net_key** - [in] The network key to be added to the Provisioner local BLE Mesh stack.
- **net_idx** - [in] The network key index.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_update_local_net_key**

(const uint8_t net_key[16],
uint16_t net_idx)

This function is called by Provisioner to update a local network key.

参数

- **net_key** - [in] Value of the NetKey.
Chapter 2. API 参考

- **net_idx** - [in] The NetKey Index.
  返回 ESP_OK on success or error code otherwise.

```c
const uint8_t* esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

- 返回 Network key on success, or NULL on failure.

```c
esp_err_t esp_ble_mesh_provisioner_recv_heartbeat (bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

备注： If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

- 参数 **enable** - [in] Enable or disable receiving heartbeat messages.
- 返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type (uint8_t type)
```

This function is called by Provisioner to set the heartbeat filter type.

备注： 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

- 参数 **type** - [in] Heartbeat filter type (acceptlist or rejectlist).
- 返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info (uint8_t op, esp_ble_mesh_heartbeat_filter_info_t* info)
```

This function is called by Provisioner to add or remove a heartbeat filter entry.

a. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • The filter entry with the same SRC or DST will be removed.

备注： 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   • If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   • If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

- 参数
  - **op** - [in] Add or REMOVE
Chapter 2. API

• info - [in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

备注: This function can be invoked when the mesh stack is not initialized or has been de-initialized.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

备注: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

参数 index - [in] Settings index.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

备注: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

参数 uid - [in] Settings userid.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

备注: 1. Before closing the nvs namespace, it must be open.

a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ... ...

参数

• index - [in] Settings index.

• erase - [in] Indicate if erasing mesh information.

返回 ESP_OK on success or error code otherwise.
esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid(const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

备注: 1. Before closing the nvs namespace, it must be open.
   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
   b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
   c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ...

参数
   * **uid** – [in] Settings user id.
   * **erase** – [in] Indicate if erasing mesh information.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

备注: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

参数 **index** – [in] Settings index.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid(const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

备注: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

参数 **uid** – [in] Settings user id.

返回 ESP_OK on success or error code otherwise.

const char *esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)

This function is called by Provisioner to get settings user id.

参数 **index** – [in] Settings index.

返回 Setting user id on success or NULL on failure.

uint8_t esp_ble_mesh_provisioner_get_settings_index(const char *uid)

This function is called by Provisioner to get settings index.

参数 **uid** – [in] Settings user id.

返回 Settings index.

uint8_t esp_ble_mesh_provisioner_get_free_settings_count(void)

This function is called by Provisioner to get the number of free settings user id.

返回 Number of free settings user id.
const uint8_t *esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)
This function is called to get fast provisioning application key.

参数

返回 Application key on success, or NULL on failure.

Type Definitions
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,
    esp_ble_mesh_model_cb_param_t *param)
: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File
- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions
esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)
Register BLE Mesh provisioning callback.

参数 callback [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

bool esp_ble_mesh_node_is_provisioned (void)
Check if a device has been provisioned.

返回 TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)
Enable specific provisioning bearers to get the device ready for provisioning.

esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)
Disable specific provisioning bearers to make a device inaccessible for provisioning.

参数 bearers  Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32],
    uint8_t private_key[32])
Unprovisioned device set own oob public key & private key pair.

备注: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.
**Chapter 2. API Reference**

**esp_err_t esp_ble_mesh_node_input_number** (uint32_t number)

Provide provisioning input OOB number.

**参数** number - [in] Number input by device.

**备注:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**esp_err_t esp_ble_mesh_node_input_string** (const char* string)

Provide provisioning input OOB string.

**参数** string - [in] String input by device.

**备注:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**esp_err_t esp_ble_mesh_set_unprovisioned_device_name** (const char* name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**参数** name - [in] Unprovisioned device name

**备注:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key** (uint8_t link_idx, uint8_t pub_key_x[32],
uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device’s OOB public key.

**备注:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**参数**
- link_idx - [in] The provisioning link index
- pub_key_x - [in] Unprovisioned device’s Public Key X
- pub_key_y - [in] Unprovisioned device’s Public Key Y

**备注:**
This is intended to be called after the esp_ble_mesh_prov_t prov_input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**

- **string** [in] String input by Provisioner.
- **link_idx** [in] The provisioning link index.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov_input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Parameters**

- **number** [in] Number input by Provisioner.
- **link_idx** [in] The provisioning link index.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)
```

Enable one or more provisioning bearers.

**Note:** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Parameters**

- **bearers** [in] Bit-wise OR of provisioning bearers.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)
```

Disable one or more provisioning bearers.

**Note:** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Parameters**

- **bearers** [in] Bit-wise OR of provisioning bearers.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev (esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov_dev queue.

**Note:** 1. Currently address type only supports public address and static random address.

a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add
the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.

- In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

- Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.

- If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

- If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

- If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

- Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG cannot be enabled at the same time.

**参数**

- add_dev – [in] Pointer to a struct containing the device information
- flags – [in] Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

**返回**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(
    const uint8_t uuid[16],
    esp_ble_mesh_bd_addr_t addr,
    esp_ble_mesh_addr_type_t addr_type,
    esp_ble_mesh_prov_bearer_t bearer,
    uint16_t oob_info,
    uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**备注**

1. Currently address type only supports public address and static random address.

a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.

b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

c. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

**参数**

- uuid – [in] Device UUID of the unprovisioned device
Chapter 2. API

- **addr** - [in] Device address of the unprovisioned device
- **addr_type** - [in] Device address type of the unprovisioned device
- **bearer** - [in] Provisioning bearer going to be used by Provisioner
- **oob_info** - [in] OOB info of the unprovisioned device
- **unicast_addr** - [in] Unicast address going to be allocated for the unprovisioned device

备注: Zero on success or (negative) error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

参数 **del_dev** - [in] Pointer to a struct containing the device information.

备注: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t*match_val,uint8_t match_len,uint8_t offset,bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

参数
- **match_val** - [in] Value to be compared with the part of the device UUID.
- **match_len** - [in] Length of the compared match value.
- **offset** - [in] Offset of the device UUID to be compared (based on zero).
- **prov_after_match** - [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

备注: ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

参数 **prov_data_info** - [in] Pointer to a struct containing net_idx or flags or iv_index.

备注: ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t*value,uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

备注: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

备注: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

参数
- **value** - [in] Pointer to the static oob value.
- **length** - [in] Length of the static oob value.
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)

This function is called by Provisioner to set own Primary element address.

- **Parameters**
  - `addr` [in] Unicast address of the Primary element of Provisioner.
  - Return ESP_OK on success or error code otherwise.

**Note:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct `esp_ble_mesh_prov_t` will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Type Definitions**

typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
                              esp_ble_mesh_prov_cb_param_t *param)

: event, event code of provisioning events; param, parameters of provisioning events

typedef void (*esp_ble_mesh_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr,
                                    const esp_ble_mesh_addr_type_t addr_type,
                                    const uint8_t adv_type,
                                    const uint8_t *dev_uuid,
                                    esp_ble_mesh_prov_bearer_t bearer)

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

- **Parameters**
  - `addr` [in] Pointer to the unprovisioned device address.
  - `addr_type` [in] Unprovisioned device address type.
  - `adv_type` [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).
  - `dev_uuid` [in] Unprovisioned device UUID pointer.
  - `oob_info` [in] OOB information of the unprovisioned device.
  - `bearer` [in] Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h
Functions

```c
esp_err_t esp_ble_mesh_proxy_identity_enable(void)
```

Enable advertising with Node Identity.

备注：此API要求GATT Proxy支持被启用。一旦调用，每个子网开始使用Node Identity广告60秒，60秒后网络ID将被广告。在正常情况下，BLE Mesh Proxy Node Identity和Network ID广告将自动由BLE Mesh堆栈在设备被配置后启用。

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable(void)
```

Enable BLE Mesh GATT Proxy Service.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable(void)
```

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect(esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)
```

Proxy Client creates a connection with the Proxy Server.

参数
- `addr` - [in] Device address of the Proxy Server.
- `addr_type` - [in] Device address type (public or static random).
- `net_idx` - [in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)
```

Proxy Client terminates a connection with the Proxy Server.

参数 `conn_handle` - [in] Proxy connection handle.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_set_filter_type(uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)
```

Proxy Client sets the filter type of the Proxy Server.

参数
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `filter_type` - [in] whitelist or blacklist.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)
```

Proxy Client adds address to the Proxy Server filter list.

参数
- `conn_handle` - [in] Proxy connection handle.
- `net_idx` - [in] Corresponding NetKey Index.
- `addr` - [in] Pointer to the filter address.
- `addr_num` - [in] Number of the filter address.

返回 ESP_OK on success or error code otherwise.
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

参数
  • conn_handle [in] Proxy connection handle.
  • net_idx [in] Corresponding NetKey Index.
  • addr [in] Pointer to the filter address.
  • addr_num [in] Number of the filter address.

返回 ESP_OK on success or error code otherwise.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
  • Configuration Client/Server Models
  • Health Client/Server Models
  • Generic Client/Server Models
  • Sensor Client/Server Models
  • Time and Scenes Client/Server Models
  • Lighting Client/Server Models

备注：Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

  • components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)

Register BLE Mesh Config Client Model callback.

参数 callback [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)

Register BLE Mesh Config Server Model callback.

参数 callback [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

备注：If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h
参数
- `params` [in] Pointer to BLE Mesh common client parameters.
- `set_state` [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

包括 `esp_ble_mesh_cfg_client_get_state_t`

```
union esp_ble_mesh_cfg_client_get_state_t

  Relay Mode state
**uint8_t relay_retransmit**
Relay Retransmit state

**uint8_t beacon**
Secure Network Beacon state

**uint8_t gatt_proxy**
GATT Proxy state

**uint8_t friend_state**
Friend state

**uint8_t default_ttl**
Default TTL

**struct k_delayed_work timer**
Heartbeat Publication timer

**uint16_t dst**
Destination address for Heartbeat messages

**uint16_t count**
Number of Heartbeat messages to be sent
Number of Heartbeat messages received

**uint8_t period**
Period for sending Heartbeat messages

**uint8_t ttl**
TTL to be used when sending Heartbeat messages

**uint16_t feature**
Bit field indicating features that trigger Heartbeat messages when changed

**uint16_t net_idx**
NetKey Index used by Heartbeat Publication

**struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub**
Heartbeat Publication

**int64_t expiry**
Timestamp when Heartbeat subscription period is expired

**uint16_t src**
Source address for Heartbeat messages

**uint8_t min_hops**
Minimum hops when receiving Heartbeat messages
uint8_t \texttt{max\_hops}  
Maximum hops when receiving Heartbeat messages

### Public Members

#### uint16_t model_id

The model id

#### uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

#### struct esp_ble_mesh_cfg_kr_phase_get_t

Parameters of Config Key Refresh Phase Get.

##### Public Members

#### uint16_t net_idx

The network key index

#### struct esp_ble_mesh_cfg_lpn_polltimeout_get_t

Parameters of Config Low Power Node PollTimeout Get.

##### Public Members

#### uint16_t lpn_addr

The unicast address of the Low Power node

#### struct esp_ble_mesh_cfg_beacon_set_t

Parameters of Config Beacon Set.

##### Public Members

#### uint8_t beacon

New Secure Network Beacon state

#### struct esp_ble_mesh_cfg_default_ttl_set_t

Parameters of Config Default TTL Set.

##### Public Members

#### uint8_t ttl

The default TTL state value

#### struct esp_ble_mesh_cfg_friend_set_t

Parameters of Config Friend Set.

##### Public Members

#### uint8_t friend_state

The friend state value
struct `esp_ble_mesh_cfg_gatt_proxy_set_t`  
Parameters of Config GATT Proxy Set.

**Public Members**

- `uint8_t gatt_proxy`  
The GATT Proxy state value

struct `esp_ble_mesh_cfg_relay_set_t`  
Parameters of Config Relay Set.

**Public Members**

- `uint8_t relay`  
The relay value
- `uint8_t relay_retransmit`  
The relay retransmit value

struct `esp_ble_mesh_cfg_net_key_add_t`  
Parameters of Config NetKey Add.

**Public Members**

- `uint16_t net_idx`  
The network key index
- `uint8_t net_key[16]`  
The network key value

struct `esp_ble_mesh_cfg_app_key_add_t`  
Parameters of Config AppKey Add.

**Public Members**

- `uint16_t net_idx`  
The network key index
- `uint16_t app_idx`  
The app key index
- `uint8_t app_key[16]`  
The app key value

struct `esp_ble_mesh_cfg_model_app_bind_t`  
Parameters of Config Model App Bind.
Public Members

`uint16_t element_addr`
The element address

`uint16_t model_app_idx`
Index of the app key to bind with the model

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

```
struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.
```

Public Members

`uint16_t element_addr`
The element address

`uint16_t publish_addr`
Value of the publish address

`uint16_t publish_app_idx`
Index of the application key

`bool cred_flag`
Value of the Friendship Credential Flag

`uint8_t publish_ttl`
Default TTL value for the publishing messages

`uint8_t publish_period`
Period for periodic status publishing

`uint8_t publish_retransmit`
Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

```
struct esp_ble_mesh_cfg_model_sub_add_t
Parameters of Config Model Subscription Add.
```
### Public Members

**uint16_t element_addr**
The element address

**uint16_t sub_addr**
The address to be added to the Subscription List

**uint16_t model_id**
The model id

**uint16_t company_id**
The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete.
```

### Public Members

**uint16_t element_addr**
The element address

**uint16_t sub_addr**
The address to be removed from the Subscription List

**uint16_t model_id**
The model id

**uint16_t company_id**
The company id, if not a vendor model, shall set to 0xFFFF

```c
struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.
```

### Public Members

**uint16_t element_addr**
The element address

**uint16_t sub_addr**
The address to be added to the Subscription List

**uint16_t model_id**
The model id

**uint16_t company_id**
The company id, if not a vendor model, shall set to 0xFFFF
struct `esp_ble_mesh_cfg_model_sub_va_add_t`
Parameters of Config Model Subscription Virtual Address Add.

**Public Members**

- `uint16_t element_addr`
  The element address
- `uint8_t label_uuid[16]`
  The Label UUID of the virtual address to be added to the Subscription List
- `uint16_t model_id`
  The model id
- `uint16_t company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_va_delete_t`
Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

- `uint16_t element_addr`
  The element address
- `uint8_t label_uuid[16]`
  The Label UUID of the virtual address to be removed from the Subscription List
- `uint16_t model_id`
  The model id
- `uint16_t company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

struct `esp_ble_mesh_cfg_model_sub_va_overwrite_t`
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

- `uint16_t element_addr`
  The element address
- `uint8_t label_uuid[16]`
  The Label UUID of the virtual address to be added to the Subscription List
uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_va_set_t**
Parameters of Config Model Publication Virtual Address Set.

**Public Members**

uint16_t **element_addr**
The element address

uint8_t **label_uuid[16]**
Value of the Label UUID publish address

uint16_t **publish_app_idx**
Index of the application key

bool **cred_flag**
Value of the Friendship Credential Flag

uint8_t **publish_ttl**
Default TTL value for the publishing messages

uint8_t **publish_period**
Period for periodic status publishing

uint8_t **publish_retransmit**
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_all_t**
Parameters of Config Model Subscription Delete All.

**Public Members**

uint16_t **element_addr**
The element address
uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
Parameters of Config NetKey Update.

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
Parameters of Config NetKey Delete.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_app_key_update_t
Parameters of Config AppKey Update.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
Parameters of Config AppKey Delete.

Public Members

uint16_t net_idx
The network key index
Chapter 2. API

```c
uint16_t app_idx
    The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
    Parameters of Config Node Identity Set.
    
Public Members

uint16_t net_idx
    The network key index

uint8_t identity
    New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
    Parameters of Config Model App Unbind.
    
Public Members

uint16_t element_addr
    The element address

uint16_t model_app_idx
    Index of the app key to bind with the model

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t
    Parameters of Config Key Refresh Phase Set.
    
Public Members

uint16_t net_idx
    The network key index

uint8_t transition
    New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_net_transmit_set_t
    Parameters of Config Network Transmit Set.
```
Public Members

uint8_t `net_transmit`
Network Transmit State

struct `esp_ble_mesh_cfg_heartbeat_pub_set_t`
Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t `dst`
Destination address for Heartbeat messages

uint8_t `count`
Number of Heartbeat messages to be sent

uint8_t `period`
Period for sending Heartbeat messages

uint8_t `ttl`
TTL to be used when sending Heartbeat messages

uint16_t `feature`
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t `net_idx`
NetKey Index

struct `esp_ble_mesh_cfg_heartbeat_sub_set_t`
Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t `src`
Source address for Heartbeat messages

uint16_t `dst`
Destination address for Heartbeat messages

uint8_t `period`
Period for receiving Heartbeat messages

struct `esp_ble_mesh_cfg_beacon_status_cb_t`
Parameter of Config Beacon Status
Public Members

uint8_t beacon
Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
Parameters of Config Composition Data Status

Public Members

uint8_t page
Page number of the Composition Data

struct net_buf_simple *composition_data
Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status
Public Members

`uint8_t status`
Status Code for the request message

`uint16_t element_addr`
Address of the element

`uint16_t publish_addr`
Value of the publish address

`uint16_t app_idx`
Index of the application key

`bool cred_flag`
Value of the Friendship Credential Flag

`uint8_t ttl`
Default TTL value for the outgoing messages

`uint8_t period`
Period for periodic status publishing

`uint8_t transmit`
Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

`struct esp_ble_mesh_cfg_model_sub_status_cb_t`
Parameters of Config Model Subscription Status

Public Members

`uint8_t status`
Status Code for the request message

`uint16_t element_addr`
Address of the element

`uint16_t sub_addr`
Value of the address

`uint16_t company_id`
Company ID
Chapter 2. API 参考

```c
uint16_t model_id
    Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
    Parameters of Config NetKey Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
    Parameters of Config AppKey Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

    uint16_t app_idx
        Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
    Parameters of Config Model App Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t element_addr
        Address of the element

    uint16_t app_idx
        Index of the application key

    uint16_t company_id
        Company ID
```
**uint16_t model_id**

Model ID

**struct esp_ble_mesh_cfg_friend_status_cb_t**

Parameter of Config Friend Status

**Public Members**

**uint8_t friend_state**

Friend state value

**Struct esp_ble_mesh_cfg_hb_pub_status_cb_t**

Parameters of Config Heartbeat Publication Status

**Public Members**

**uint8_t status**

Status Code for the request message

**uint16_t dst**

Destination address for Heartbeat messages

**uint8_t count**

Number of Heartbeat messages remaining to be sent

**uint8_t period**

Period for sending Heartbeat messages

**uint8_t ttl**

TTL to be used when sending Heartbeat messages

**uint16_t features**

Features that trigger Heartbeat messages when changed

**uint16_t net_idx**

Index of the NetKey

**struct esp_ble_mesh_cfg_hb_sub_status_cb_t**

Parameters of Config Heartbeat Subscription Status

**Public Members**

**uint8_t status**

Status Code for the request message
**Chapter 2. API Reference**

**uint16_t src**
Source address for Heartbeat messages

**uint16_t dst**
Destination address for Heartbeat messages

**uint8_t period**
Remaining Period for processing Heartbeat messages

**uint8_t count**
Number of Heartbeat messages received

**uint8_t min_hops**
Minimum hops when receiving Heartbeat messages

**uint8_t max_hops**
Maximum hops when receiving Heartbeat messages

**struct esp_ble_mesh_cfg_net_trans_status_cb_t**
Parameters of Config Network Transmit Status

**Public Members**

**uint8_t net_trans_count**
Number of transmissions for each Network PDU originating from the node

**uint8_t net_trans_step**
Maximum hops when receiving Heartbeat messages

**struct esp_ble_mesh_cfg_model_sub_list_cb_t**
Parameters of Config SIG/Vendor Subscription List

**Public Members**

**uint8_t status**
Status Code for the request message

**uint16_t element_addr**
Address of the element

**uint16_t company_id**
Company ID

**uint16_t model_id**
Model ID
struct net_buf_simple *\texttt{sub_addr}
A block of all addresses from the Subscription List

struct \texttt{esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t}
Parameter of Config NetKey List

\textbf{Public Members}

struct net_buf_simple *\texttt{net\_idx}
A list of NetKey Indexes known to the node

struct \texttt{esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t}
Parameters of Config AppKey List

\textbf{Public Members}

uint8_t \texttt{status}
Status Code for the request message

uint16_t \texttt{net\_idx}
NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *\texttt{app\_idx}
A list of AppKey indexes that are bound to the NetKey identified by NetKeyId

struct \texttt{esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t}
Parameters of Config Node Identity Status

\textbf{Public Members}

uint8_t \texttt{status}
Status Code for the request message

uint16_t \texttt{net\_idx}
Index of the NetKey

uint8_t \texttt{identity}
Node Identity state

struct \texttt{esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t}
Parameters of Config SIG/Vendor Model App List

\textbf{Public Members}

uint8_t \texttt{status}
Status Code for the request message
uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct net_buf_simple *app_idx
    All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
    Parameters of Config Key Refresh Phase Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

    uint8_t phase
        Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
    Parameters of Config Low Power Node PollTimeout Status

    Public Members

    uint16_t lpn_addr
        The unicast address of the Low Power node

    int32_t poll_timeout
        The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
    Configuration Client Model callback parameters

    Public Members

    int error_code
        Appropriate error code
**esp_ble_mesh_client_common_param_t** *params

The client common parameters

**esp_ble_mesh_cfg_client_common_cb_param_t** status_cb

The config status message callback values

**struct esp_ble_mesh_state_change_cfg_mod_pub_set_t**

Configuration Server model related context.

**Public Members**

uint16_t **element_addr**

Element Address

uint16_t **pub_addr**

Publish Address

uint16_t **app_idx**

AppKey Index

bool **cred_flag**

Friendship Credential Flag

uint8_t **pub_ttl**

Publish TTL

uint8_t **pub_period**

Publish Period

uint8_t **pub_retransmit**

Publish Retransmit

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

**struct esp_ble_mesh_state_change_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add

**Public Members**

uint16_t **element_addr**

Element Address
Chapter 2. API Reference

.uint16_t sub_addr
    Subscription Address

.uint16_t company_id
    Company ID

.uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
    Parameters of Config NetKey Add

Public Members

.uint16_t net_idx
    NetKey Index

.uint8_t net_key[16]
    NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
    Parameters of Config NetKey Update

Public Members

.uint16_t net_idx
    NetKey Index
Chapter 2. API 参考

```c
uint8_t net_key[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add

Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update

Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t net_idx
NetKey Index
```
Chapter 2. API

\[
\text{uint16_t } \text{app_idx} \\
\quad \text{AppKey Index}
\]

struct \texttt{esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_bind\_t}

Parameters of Config Model App Bind

**Public Members**

\[
\text{uint16_t } \text{element_addr} \\
\quad \text{Element Address}
\]

\[
\text{uint16_t } \text{app_idx} \\

\]

\[
\text{uint16_t } \text{model_id} \\
\quad \text{Model ID}
\]

struct \texttt{esp\_ble\_mesh\_state\_change\_cfg\_kr\_phase\_set\_t}

Parameters of Config Key Refresh Phase Set

**Public Members**

\[
\text{uint16_t } \text{net_idx} \\
\quad \text{NetKey Index}
\]
**uint8_t kr_phase**
New Key Refresh Phase Transition

**struct esp_ble_mesh_cfg_server_cb_param_t**
Configuration Server model callback parameters

**Public Members**

```
esp_ble_mesh_model_t *model
```
Pointer to the server model structure

```
esp_ble_mesh_msg_ctx_t ctx
```
Context of the received message

```
esp_ble_mesh_cfg_server_cb_value_t value
```
Value of the received configuration messages

**Macros**

```
ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
```
Define a new Config Server Model.

- **参数**
  - `svr_data` - Pointer to a unique Config Server Model user_data.
- **返回**
  - New Config Server Model instance.

```
ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
```
Define a new Config Client Model.

- **参数**
  - `cli_data` - Pointer to a unique struct esp_ble_mesh_client_t.
- **返回**
  - New Config Client Model instance.

**Type Definitions**

```typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```
Configuration Server Model context

```typedef void(*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
esp_ble_mesh_cfg_client_cb_param_t *param)
```
Bluetooth Mesh Config Client and Server Model functions.

- **Configuration Client Model callback function type**

```
Param event Event type
Param param Pointer to callback parameter
```
typedef void (*esp_ble_mesh_cfg_server_cb_t)(
    esp_ble_mesh_cfg_server_cb_event_t event,
    esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

- **Param event** Event type
- **Param param** Pointer to callback parameter

### Enumerations

**enum esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

**Values:**

- enumerator **ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT**
- enumerator **ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT**
- enumerator **ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT**
- enumerator **ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT**
- enumerator **ESP_BLE_MESH_CFG_CLIENT_EVT_MAX**

**enum esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

**Values:**

- enumerator **ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT**
- enumerator **ESP_BLE_MESH_CFG_SERVER_EVT_MAX**

### Health Client/Server Models

#### Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

#### Functions

**esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t callback)**

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

- 参数 **callback** [in] Pointer to the callback function.
- 返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t callback)**

Register BLE Mesh Health Server Model callback.

- 参数 **callback** [in] Pointer to the callback function.
- 返回 ESP_OK on success or error code otherwise.
API

**esp_err_t esp_ble_mesh_health_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)**

This function is called to get the Health Server states using the Health Client Model get messages.

**备注:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

参数

- **params** - [in] Pointer to BLE Mesh common client parameters.
- **get_state** - [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)**

This function is called to set the Health Server states using the Health Client Model set messages.

**备注:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

参数

- **params** - [in] Pointer to BLE Mesh common client parameters.
- **set_state** - [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)**

This function is called by the Health Server Model to update the context of its Health Current status.

参数 **element** - [in] The element to which the Health Server Model belongs.

返回 ESP_OK on success or error code otherwise.

**Unions**

union **esp_ble_mesh_health_client_get_state_t**

```c
#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET

the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.
```

**Public Members**

union **esp_ble_mesh_health_client_set_state_t**

```c
#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK

the set_state parameter in the esp_ble_mesh_health_client_set_state function should not be set to NULL.
```
Public Members

`esp_ble_mesh_health_attention_set_t attention_set`
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

`esp_ble_mesh_health_period_set_t period_set`
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

`esp_ble_mesh_health_fault_test_t fault_test`
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

`esp_ble_mesh_health_fault_clear_t fault_clear`
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union `esp_ble_mesh_health_client_common_cb_param_t`
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

`esp_ble_mesh_health_current_status_cb_t current_status`
The health current status value

`esp_ble_mesh_health_fault_status_cb_t fault_status`
The health fault status value

`esp_ble_mesh_health_period_status_cb_t period_status`
The health period status value

`esp_ble_mesh_health_attention_status_cb_t attention_status`
The health attention status value

union `esp_ble_mesh_health_server_cb_param_t`

**Structures**

```c
struct esp_ble_mesh_health_srv_cb_t
ESP_BLE_MESH_HEALTH_SERVER_CALLBACK
```

### Public Members

- `esp_ble_mesh_cb_t fault_clear`
  Clear health registered faults. Initialized by the stack.

- `esp_ble_mesh_cb_t fault_test`
  Run a specific health test. Initialized by the stack.

- `esp_ble_mesh_cb_t attention_on`
  Health attention on callback. Initialized by the stack.

- `esp_ble_mesh_cb_t attention_off`
  Health attention off callback. Initialized by the stack.

```c
struct esp_ble_mesh_health_test_t
ESP_BLE_MESH_HEALTH_SERVER_TEST_CONTEXT
```

### Public Members

- `uint8_t id_count`
  Number of Health self-test ID

- `const uint8_t *test_ids`
  Array of Health self-test IDs

- `uint16_t company_id`
  Company ID used to identify the Health Fault state

- `uint8_t prev_test_id`
  Current test ID of the health fault test

- `uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
  Array of current faults

- `uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
  Array of registered faults
struct esp_ble_mesh_health_srv_t
    ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t *model
    Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
    Health callback struct

struct k_delayed_work attention_timer
    Attention Timer state

bool attention_timer_start
    Attention Timer start flag

esp_ble_mesh_health_test_t health_test
    Health Server fault test

struct esp_ble_mesh_health_fault_get_t
    Parameter of Health Fault Get

Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
    Parameter of Health Attention Set

Public Members

uint8_t attention
    Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
    Parameter of Health Period Set

Public Members

uint8_t fast_period_divisor
    Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
    Parameter of Health Fault Test
Public Members

\texttt{uint16_t company_id}
Bluetooth assigned 16-bit Company ID

\texttt{uint8_t test_id}
ID of a specific test to be performed

\texttt{struct esp_ble_mesh_health_fault_clear_t}
Parameter of Health Fault Clear

Public Members

\texttt{uint16_t company_id}
Bluetooth assigned 16-bit Company ID

\texttt{struct esp_ble_mesh_health_current_status_cb_t}
Parameters of Health Current Status

Public Members

\texttt{uint8_t test_id}
ID of a most recently performed test

\texttt{uint16_t company_id}
Bluetooth assigned 16-bit Company ID

\texttt{struct net_buf_simple *fault_array}
FaultArray field contains a sequence of 1-octet fault values

\texttt{struct esp_ble_mesh_health_fault_status_cb_t}
Parameters of Health Fault Status

Public Members

\texttt{uint8_t test_id}
ID of a most recently performed test

\texttt{uint16_t company_id}
Bluetooth assigned 16-bit Company ID

\texttt{struct net_buf_simple *fault_array}
FaultArray field contains a sequence of 1-octet fault values

\texttt{struct esp_ble_mesh_health_period_status_cb_t}
Parameter of Health Period Status
Public Members

uint8_t `fast_period_divisor`
Divider for the Publish Period

`struct esp_ble_mesh_health_attention_status_cb_t`
Parameter of Health Attention Status

Public Members

uint8_t `attention`
Value of the Attention Timer state

`struct esp_ble_mesh_health_client_cb_param_t`
Health Client Model callback parameters

Public Members

int `error_code`
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
The client common parameters.

`esp_ble_mesh_health_client_common_cb_param_t status_cb`
The health message status callback values

`struct esp_ble_mesh_health_fault_update_comp_cb_t`
Parameter of publishing Health Current Status completion event

Public Members

int `error_code`
The result of publishing Health Current Status

`esp_ble_mesh_elem_t *element`
Pointer to the element which contains the Health Server Model

`struct esp_ble_mesh_health_fault_clear_cb_t`
Parameters of Health Fault Clear event

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model
Chapter 2. API

uint16_t company_id
   Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
   Parameters of Health Fault Test event

   Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Health Server Model

   uint8_t test_id
      ID of a specific test to be performed

   uint16_t company_id
      Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
   Parameter of Health Attention On event

   Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Health Server Model

   uint8_t time
      Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
   Parameter of Health Attention Off event

   Public Members

   esp_ble_mesh_model_t *model
      Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
   Define a new Health Server Model.

备注: The Health Server Model can only be included by a Primary Element.

参数
   • srv – Pointer to the unique struct esp_ble_mesh_health_srv_t.
   • pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.

返回 New Health Server Model instance.
Chapter 2. API

**ESP_BLE_MESH_MODEL_HEALTH_CLI** (cli_data)

Define a new Health Client Model.

**备注:** This API needs to be called for each element on which the application needs to have a Health Client Model.

参数
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

返回
New Health Client Model instance.

**ESP_BLE_MESH_HEALTH_PUB_DEFINE** (name, _max, _role)

A helper to define a health publication context

参数
- **name** - Name given to the publication context variable.
- **_max** - Maximum number of faults the element can have.
- **_role** - Role of the device which contains the model.

**ESP_BLE_MESH_HEALTH_STANDARD_TEST**

SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.

**ESP_BLE_MESH_NO_FAULT**

Fault values of Health Fault Test. 0x33~0x7F: Reserved for Future Use. 0x80~0xFF: Vendor Specific Warning/Error.

**ESP_BLE_MESH_BATTERY_LOW_WARNING**

**ESP_BLE_MESH_BATTERY_LOW_ERROR**

**ESP_BLE_MESH_SUPPLY_VOLTAGE TOO LOW_WARNING**

**Type Definitions**

typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event,
        esp_ble_mesh_health_client_cb_param_t *param)

    Bluetooth Mesh Health Client and Server Model function.
    Health Client Model callback function type
    
    **Param event** Event type
    **Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event,
        esp_ble_mesh_health_server_cb_param_t *param)

    Health Server Model callback function type.
    
    **Param event** Event type
    **Param param** Pointer to callback parameter
Enumerations

enum esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model
Values:

enumerator ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model
Values:

enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File
• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t callback)
Register BLE Mesh Generic Client Model callback.
参数 callback - [in] Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_generic_client_get_state (esp_ble_mesh_client_common_param_t *params,
                                                 esp_ble_mesh_generic_client_get_state_t *get_state)
Get the value of Generic Server Model states using the Generic Client Model get messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

参数
- params [in] Pointer to BLE Mesh common client parameters.
- get_state [in] Pointer to generic get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                  esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

参数
- params [in] Pointer to BLE Mesh common client parameters.
- set_state [in] Pointer to generic set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

参数 callback [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Unions

```

**Structures**

**struct esp_ble_mesh_gen_onoff_set_t**
Bluetooth Mesh Generic Client Model Get and Set parameters structure.
Parameters of Generic OnOff Set.

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint8_t onoff`
  Target value of Generic OnOff state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_level_set_t**
Parameters of Generic Level Set.

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `int16_t level`
  Target value of Generic Level state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_delta_set_t**
Parameters of Generic Delta Set.
Public Members

`bool op_en`
   Indicate if optional parameters are included

`int32_t level`
   Delta change of Generic Level state

`uint8_t tid`
   Transaction ID

`uint8_t trans_time`
   Time to complete state transition (optional)

`uint8_t delay`
   Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_move_set_t`
   Parameters of Generic Move Set.

Public Members

`bool op_en`
   Indicate if optional parameters are included

`int16_t delta_level`
   Delta Level step to calculate Move speed for Generic Level state

`uint8_t tid`
   Transaction ID

`uint8_t trans_time`
   Time to complete state transition (optional)

`uint8_t delay`
   Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_def_trans_time_set_t`
   Parameter of Generic Default Transition Time Set.

Public Members

`uint8_t trans_time`
   The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_set_t`
   Parameter of Generic OnPowerUp Set.
Public Members

`uint8_t onpowerup`
The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_set_t`
Parameters of Generic Power Level Set.

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t power`
Target value of Generic Power Actual state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_power_default_set_t`
Parameter of Generic Power Default Set.

Public Members

`uint16_t power`
The value of the Generic Power Default state

`struct esp_ble_mesh_gen_power_range_set_t`
Parameters of Generic Power Range Set.

Public Members

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_gen_loc_global_set_t`
Parameters of Generic Location Global Set.
Public Members

```c
int32_t global_latitude
Global Coordinates (Latitude)
```

```c
int32_t global_longitude
Global Coordinates (Longitude)
```

```c
int16_t global_altitude
Global Altitude
```

```c
struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.
```

Public Members

```c
int16_t local_north
Local Coordinates (North)
```

```c
int16_t local_east
Local Coordinates (East)
```

```c
int16_t local_altitude
Local Altitude
```

```c
uint8_t floor_number
Floor Number
```

```c
uint16_t uncertainty
Uncertainty
```

```c
struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.
```

Public Members

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.
```

Public Members

```c
uint16_t property_id
Property ID identifying a Generic User Property
```
struct net_buf_simple *property_value
    Raw value for the User Property

struct esp_ble_mesh_gen_admin_property_get_t
    Parameter of Generic Admin Property Get.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Admin Property

    struct esp_ble_mesh_gen_admin_property_set_t
        Parameters of Generic Admin Property Set.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Admin Property

    uint8_t user_access
        Enumeration indicating user access

    struct net_buf_simple *property_value
        Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
    Parameter of Generic Manufacturer Property Get.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
    Parameters of Generic Manufacturer Property Set.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Manufacturer Property

    uint8_t user_access
        Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
    Parameter of Generic Client Properties Get.
**Public Members**

```c
uint16_t property_id
```
A starting Client Property ID present within an element

```c
struct esp_ble_mesh_gen_onoff_status_cb_t
```
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

**Public Members**

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint8_t present_onoff
```
Current value of Generic OnOff state

```c
uint8_t target_onoff
```
Target value of Generic OnOff state (optional)

```c
uint8_t remain_time
```
Time to complete state transition (C.1)

**Public Members**

```c
struct esp_ble_mesh_gen_level_status_cb_t
```
Parameters of Generic Level Status.

**Public Members**

```c
bool op_en
```
Indicate if optional parameters are included

```c
int16_t present_level
```
Current value of Generic Level state

```c
int16_t target_level
```
Target value of the Generic Level state (optional)

```c
uint8_t remain_time
```
Time to complete state transition (C.1)

**Public Members**

```c
struct esp_ble_mesh_gen_def_trans_time_status_cb_t
```
Parameter of Generic Default Transition Time Status.
uint8_t trans_time
  The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t

Public Members

uint8_t onpowerup
  The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
  Parameters of Generic Power Level Status.

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t present_power
  Current value of Generic Power Actual state

uint16_t target_power
  Target value of Generic Power Actual state (optional)

uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
  Parameter of Generic Power Last Status.

Public Members

uint16_t power
  The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
  Parameter of Generic Power Default Status.

Public Members

uint16_t power
  The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
  Parameters of Generic Power Range Status.
Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.

Public Members

uint32_t battery_level
Value of Generic Battery Level state

uint32_t time_to_discharge
Value of Generic Battery Time to Discharge state

uint32_t time_to_charge
Value of Generic Battery Time to Charge state

uint32_t flags
Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
Parameters of Generic Location Local Status.
**Public Members**

int16_t `local_north`
Local Coordinates (North)

int16_t `local_east`
Local Coordinates (East)

int16_t `local_altitude`
Local Altitude

uint8_t `floor_number`
Floor Number

uint16_t `uncertainty`
Uncertainty

```c
struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.
```

```c
struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs
```

```c
struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.
```

**Public Members**

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
uint8_t user_access
Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
Raw value for the User Property (C.1)
```

```c
struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.
```
Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
    Parameters of Generic Admin Property Status.

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID identifying a Generic Admin Property

uint8_t user_access
    Enumeration indicating user access (optional)

struct net_buf_simple *property_value
    Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
    Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
    Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID identifying a Generic Manufacturer Property

uint8_t user_access
    Enumeration indicating user access (optional)

struct net_buf_simple *property_value
    Raw value for the Manufacturer Property (C.1)
struct `esp_ble_mesh_gen_client_properties_status_cb_t`
Parameter of Generic Client Properties Status.

**Public Members**

```
struct net_buf_simple *property_ids
```
Buffer contains a sequence of N Client Property IDs

struct `esp_ble_mesh_generic_client_cb_param_t`
Generic Client Model callback parameters

**Public Members**

```
int error_code
```
Appropriate error code

```
esp_ble_mesh_client_common_param_t *params
```
The client common parameters.

```
esp_ble_mesh_gen_client_status_cb_t status_cb
```
The generic status message callback values

struct `esp_ble_mesh_gen_onoff_state_t`
Parameters of Generic OnOff state

**Public Members**

```
uint8_t onoff
```
The present value of the Generic OnOff state

```
uint8_t target_onoff
```
The target value of the Generic OnOff state

struct `esp_ble_mesh_gen_onoff_srv_t`
User data of Generic OnOff Server Model

**Public Members**

```
esp_ble_mesh_model_t *model
```
Pointer to the Generic OnOff Server Model. Initialized internally.

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```
Response control of the server model received messages

```
esp_ble_mesh_gen_onoff_state_t state
```
Parameters of the Generic OnOff state
**Chapter 2. API**

*esp_ble_mesh_last_msg_info_t* `last`
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition

**struct esp_ble_mesh_gen_level_state_t**
Parameters of Generic Level state

**Public Members**

`int16_t level`
The present value of the Generic Level state

`int16_t target_level`
The target value of the Generic Level state

`int16_t last_level`
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

`int32_t last_delta`
The last delta change of the Generic Level state

`bool move_start`
Indicate if the transition of the Generic Level state has been started

`bool positive`
Indicate if the transition is positive or negative

**struct esp_ble_mesh_gen_level_srv_t**
User data of Generic Level Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_level_state_t state`
Parameters of the Generic Level state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message
`esp_ble_mesh_state_transition_t` 
Parameters of state transition

`int32_t tt_delta_level`
Delta change value of level state transition

`struct esp_ble_mesh_gen_def_trans_time_state_t`
Parameters of Generic Default Transition Time state

**Public Members**

`uint8_t trans_time`
The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_def_trans_time_srv_t`
User data of Generic Default Transition Time Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Default Transition Time Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_def_trans_time_state_t state`
Parameters of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_state_t`
Parameter of Generic OnPowerUp state

**Public Members**

`uint8_t onpowerup`
The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_onoff_srv_t`
User data of Generic Power OnOff Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power OnOff Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages
Chapter 2. API

.esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_setup_srv_t
User data of Generic Power OnOff Setup Server Model

Public Members

.esp_ble_mesh_model_t *model
Point to the Generic Power OnOff Setup Server Model. Initialized internally.

.esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

.esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_state_t
Parameters of Generic Power Level state

Public Members

uint16_t power_actual
The present value of the Generic Power Actual state

uint16_t target_power_actual
The target value of the Generic Power Actual state

uint16_t power_last
The value of the Generic Power Last state

uint16_t power_default
The value of the Generic Power Default state

uint8_t status_code
The status code of setting Generic Power Range state

uint16_t power_range_min
The minimum value of the Generic Power Range state

uint16_t power_range_max
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model
**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`

Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`

Parameters of state transition

`int32_t ttDelta_level`

Delta change value of level state transition

`struct esp_ble_mesh_gen_power_level_setup_srv_t`  

User data of Generic Power Level Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`

Parameters of the Generic Power Level state

`struct esp_ble_mesh_gen_battery_state_t`  

Parameters of Generic Battery state

**Public Members**

`uint32_t battery_level`

The value of the Generic Battery Level state

`uint32_t time_to_discharge`

The value of the Generic Battery Time to Discharge state

`uint32_t time_to_charge`

The value of the Generic Battery Time to Charge state
Chapter 2. API

**Public Members**

`uint32_t battery_flags`

The value of the Generic Battery Flags state

`struct esp_ble_mesh_gen_battery_srv_t`

User data of Generic Battery Server Model

```

**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to the Generic Battery Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_battery_state_t state`

Parameters of the Generic Battery state

`struct esp_ble_mesh_gen_location_srv_t`

User data of Generic Location Server Model

**Public Members**

`int32_t global_latitude`

The value of the Global Latitude field

`int32_t global_longitude`

The value of the Global Longitude field

`int16_t global_altitude`

The value of the Global Altitude field

`int16_t local_north`

The value of the Local North field

`int16_t local_east`

The value of the Local East field

`int16_t local_altitude`

The value of the Local Altitude field

`uint8_t floor_number`

The value of the Floor Number field

`uint16_t uncertainty`

The value of the Uncertainty field

`struct esp_ble_mesh_gen_location_state_t`

Parameters of Generic Location state

Espressif Systems 654

Public Members

* esp_ble_mesh_model_t *model
  Pointer to the Generic Location Server Model. Initialized internally.

* esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

* esp_ble_mesh_gen_location_state_t *state
  Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
  User data of Generic Location Setup Server Model

Public Members

* esp_ble_mesh_model_t *model
  Pointer to the Generic Location Setup Server Model. Initialized internally.

* esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

* esp_ble_mesh_gen_location_state_t *state
  Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
  Parameters of Generic Property states

Public Members

uint16_t id
  The value of User/Admin/Manufacturer Property ID

uint8_t user_access
  The value of User Access field

uint8_t admin_access
  The value of Admin Access field

uint8_t manu_access
  The value of Manufacturer Access field

struct net_buf_simple *val
  The value of User/Admin/Manufacturer Property

struct esp_ble_mesh_gen_user_prop_srv_t
  User data of Generic User Property Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic User Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic User Property state

```c
struct esp_ble_mesh_gen_admin_prop_srv_t
User data of Generic Admin Property Server Model
```

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Admin Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Admin Property state

```c
struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model
```

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Manufacturer Property state
struct `esp_ble_mesh_gen_client_prop_srv_t`  
User data of Generic Client Property Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Client Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl`
Response control of the server model received messages

`uint8_t id_count`
Generic Client Property ID count

`uint16_t *property_ids`
Parameters of the Generic Client Property state

struct `esp_ble_mesh_state_change_gen_onoff_set_t`  
Parameter of Generic OnOff Set state change event

**Public Members**

`uint8_t onoff`
The value of Generic OnOff state

struct `esp_ble_mesh_state_change_gen_level_set_t`  
Parameter of Generic Level Set state change event

**Public Members**

`int16_t level`
The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_delta_set_t`  
Parameter of Generic Delta Set state change event

**Public Members**

`int16_t level`
The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_move_set_t`  
Parameter of Generic Move Set state change event
Public Members

int16_t level
    The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
    Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t trans_time
    The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
    Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
    The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
    Parameter of Generic Power Level Set state change event

Public Members

uint16_t power
    The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t
    Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
    The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
    Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
    The minimum value of Generic Power Range state
uint16_t `range_max`
  The maximum value of Generic Power Range state

`struct esp_ble_mesh_state_change_gen_loc_global_set_t`
Parameters of Generic Location Global Set state change event

**Public Members**

`int32_t latitude`
  The Global Latitude value of Generic Location state

`int32_t longitude`
  The Global Longitude value of Generic Location state

`int16_t altitude`
  The Global Altitude value of Generic Location state

`struct esp_ble_mesh_state_change_gen_loc_local_set_t`
Parameters of Generic Location Local Set state change event

**Public Members**

`int16_t north`
  The Local North value of Generic Location state

`int16_t east`
  The Local East value of Generic Location state

`int16_t altitude`
  The Local Altitude value of Generic Location state

`uint8_t floor_number`
  The Floor Number value of Generic Location state

`uint16_t uncertainty`
  The Uncertainty value of Generic Location state

`struct esp_ble_mesh_state_change_gen_user_property_set_t`
Parameters of Generic User Property Set state change event

**Public Members**

`uint16_t id`
  The property id of Generic User Property state
struct net_buf_simple *value
  The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
  Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
  The property id of Generic Admin Property state

uint8_t access
  The property access of Generic Admin Property state

struct net_buf_simple *value
  The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
  Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
  The property id of Generic Manufacturer Property state

uint8_t access
  The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
  Context of the received Generic User Property Get message

Public Members

uint16_t property_id
  Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
  Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
  Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
  Context of the received Generic Manufacturer Property message
Chapter 2. API Reference

**Public Members**

**uint16_t** `property_id`
- Property ID identifying a Generic Manufacturer Property

**struct esp_ble_mesh_server_recv_gen_client_properties_get_t**
- Context of the received Generic Client Properties Get message

**Public Members**

**uint16_t** `property_id`
- A starting Client Property ID present within an element

**struct esp_ble_mesh_server_recv_gen_onoff_set_t**
- Context of the received Generic OnOff Set message

**Public Members**

**bool** `op_en`
- Indicate if optional parameters are included

**uint8_t** `onoff`
- Target value of Generic OnOff state

**uint8_t** `tid`
- Transaction ID

**uint8_t** `trans_time`
- Time to complete state transition (optional)

**uint8_t** `delay`
- Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_level_set_t**
- Context of the received Generic Level Set message

**Public Members**

**bool** `op_en`
- Indicate if optional parameters are included

**int16_t** `level`
- Target value of Generic Level state

**uint8_t** `tid`
- Transaction ID
### Public Members

- **bool op_en**
  - Indicate if optional parameters are included

- **int32_t delta_level**
  - Delta change of Generic Level state

- **uint8_t tid**
  - Transaction ID

- **uint8_t trans_time**
  - Time to complete state transition (optional)

- **uint8_t delay**
  - Indicate message execution delay (C.1)

### Context of the received Generic Delta Set message

- **struct esp_ble_mesh_server_recv_gen_delta_set_t**

### Public Members

- **bool op_en**
  - Indicate if optional parameters are included

- **int16_t delta_level**
  - Delta Level step to calculate Move speed for Generic Level state

- **uint8_t tid**
  - Transaction ID

- **uint8_t trans_time**
  - Time to complete state transition (optional)

- **uint8_t delay**
  - Indicate message execution delay (C.1)

### Context of the received Generic Move Set message

- **struct esp_ble_mesh_server_recv_gen_move_set_t**

### Context of the received Generic Default Transition Time Set message

- **struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t**

---

uint8_t \texttt{trans\_time}

Time to complete state transition (optional)

uint8_t \texttt{delay}

Indicate message execution delay (C.1)

struct \texttt{esp\_ble\_mesh\_server\_recv\_gen\_delta\_set\_t}

Context of the received Generic Delta Set message

Public Members

bool \texttt{op\_en}

Indicate if optional parameters are included

int32_t \texttt{delta\_level}

Delta change of Generic Level state

uint8_t \texttt{tid}

Transaction ID

uint8_t \texttt{trans\_time}

Time to complete state transition (optional)

uint8_t \texttt{delay}

Indicate message execution delay (C.1)

struct \texttt{esp\_ble\_mesh\_server\_recv\_gen\_move\_set\_t}

Context of the received Generic Move Set message

Public Members

bool \texttt{op\_en}

Indicate if optional parameters are included

int16_t \texttt{delta\_level}

Delta Level step to calculate Move speed for Generic Level state

uint8_t \texttt{tid}

Transaction ID

uint8_t \texttt{trans\_time}

Time to complete state transition (optional)

uint8_t \texttt{delay}

Indicate message execution delay (C.1)

struct \texttt{esp\_ble\_mesh\_server\_recv\_gen\_def\_trans\_time\_set\_t}

Context of the received Generic Default Transition Time Set message
Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
Context of the received Generic Power Level Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
Context of the received Generic Power Default Set message

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
Context of the received Generic Power Range Set message
**Chapter 2. API 参考**

**Public Members**

```c
uint16_t range_min
  Value of Range Min field of Generic Power Range state
```

```c
uint16_t range_max
  Value of Range Max field of Generic Power Range state
```

```c
struct esp_ble_mesh_server_recv_gen_loc_global_set_t
  Context of the received Generic Location Global Set message
```

**Public Members**

```c
int32_t global_latitude
  Global Coordinates (Latitude)
```

```c
int32_t global_longitude
  Global Coordinates (Longitude)
```

```c
int16_t global_altitude
  Global Altitude
```

```c
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
  Context of the received Generic Location Local Set message
```

**Public Members**

```c
int16_t local_north
  Local Coordinates (North)
```

```c
int16_t local_east
  Local Coordinates (East)
```

```c
int16_t local_altitude
  Local Altitude
```

```c
uint8_t floor_number
  Floor Number
```

```c
uint16_t uncertainty
  Uncertainty
```

```c
struct esp_ble_mesh_server_recv_gen_user_property_set_t
  Context of the received Generic User Property Set message
```
Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

`struct net_buf_simple *property_value`
Raw value for the User Property

`struct esp_ble_mesh_server_recv_gen_admin_property_set_t`
Context of the received Generic Admin Property Set message

Public Members

`uint16_t property_id`
Property ID identifying a Generic Admin Property

`uint8_t user_access`
Enumeration indicating user access

`struct net_buf_simple *property_value`
Raw value for the Admin Property

`struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t`
Context of the received Generic Manufacturer Property Set message

Public Members

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`
Enumeration indicating user access

`struct esp_ble_mesh_generic_server_cb_param_t`
Generic Server Model callback parameters

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Generic Server Models

`esp_ble_mesh_msg_ctx_t *ctx`
Context of the received messages

`esp_ble_mesh_generic_server_cb_value_t value`
Value of the received Generic Messages
** Macros **

** ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data) **
Define a new Generic OnOff Client Model.

备注:  This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

参数
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

返回 New Generic OnOff Client Model instance.

** ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data) **
Define a new Generic Level Client Model.

备注:  This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

参数
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

返回 New Generic Level Client Model instance.

** ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data) **
Define a new Generic Default Transition Time Client Model.

备注:  This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

参数
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

返回 New Generic Default Transition Time Client Model instance.

** ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data) **
Define a new Generic Power OnOff Client Model.

备注:  This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

参数
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

返回 New Generic Power OnOff Client Model instance.

** ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data) **
Define a new Generic Power Level Client Model.

备注:  This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.
Chapter 2. API

**Define a new Generic Battery Client Model.**

```c
ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI(cli_pub, cli_data)
```

**Define a new Generic Location Client Model.**

```c
ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI(cli_pub, cli_data)
```

**Define a new Generic Property Client Model.**

```c
ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI(cli_pub, cli_data)
```

**Define a new Generic OnOff Server Model.**

```c
ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV(srv_pub, srv_data)
```

---

**Parameter**

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Return**

New Generic Power Level Client Model instance.

**备注:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

---

**Parameter**

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Return**

New Generic Battery Client Model instance.

**备注:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

---

**Parameter**

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Return**

New Generic Location Client Model instance.

**备注:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

---

**Parameter**

- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**Return**

New Generic Location Client Model instance.

**备注:** This API needs to be called for each element on which the application needs to have a Generic OnOff Server Model.

1. The Generic OnOff Server Model is a root model.
   a. This model shall support model publication and model subscription.

---

**Parameter**

- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**Return**

New Generic OnOff Server Model instance.
Chapter 2. API 参考

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

| 备注 | 1. The Generic Level Server Model is a root model.
| a. This model shall support model publication and model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**返回** New Generic Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

| 备注 | 1. The Generic Default Transition Time Server Model is a root model.
| a. This model shall support model publication and model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**返回** New Generic Default Transition Time Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

| 备注 | 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
| a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
| b. This model shall support model publication and model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

**返回** New Generic Power OnOff Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

| a. This model shall support model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

**返回** New Generic Power OnOff Setup Server Model instance.
ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

### Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

### Return
New Generic Power Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

### Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

### Return
New Generic Power Level Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

### Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

### Return
New Generic Battery Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)
Define a new Generic Location Server Model.

### Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

### Return
New Generic Location Server Model instance.
### ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

**备注:** 1. The Generic Location Setup Server model extends the Generic Location Server model.

   a. This model shall support model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**返回** New Generic Location Setup Server Model instance.

### ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

**备注:** 1. The Generic User Property Server model is a root model.

   a. This model shall support model publication and model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**返回** New Generic User Property Server Model instance.

### ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

**备注:** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

   a. This model shall support model publication and model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**返回** New Generic Admin Property Server Model instance.

### ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

**备注:** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

   a. This model shall support model publication and model subscription.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**返回** New Generic Manufacturer Property Server Model instance.

### ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic Client Property Server Model.

**备注:** 1. The Generic Client Property Server model is a root model.
This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** - Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

New Generic Client Property Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,
                                                esp_ble_mesh_generic_client_cb_param_t *param);
```

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type
- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,
                                                esp_ble_mesh_generic_server_cb_param_t *param);
```

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type
- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

*Values:*
- Enumerator `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`
- Enumerator `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`
- Enumerator `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`
- Enumerator `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`
- Enumerator `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

*Values:*
- Enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`
- Enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ`
- Enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`
enumerator ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property
Values:
	enumerator ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
	enumerator ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
	enumerator ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
	enumerator ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_manu_prop_access_t
This enum value is the access value of Generic Manufacturer Property
Values:
	enumerator ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
	enumerator ESP_BLE_MESH_GEN_MANU_ACCESS_READ

tenumerato
Chapter 2. API 参考

Functions

```c
esp_err_t esp_ble_mesh_register_sensor_client_callback(esp_ble_mesh_sensor_client_cb_t callback)
```

Register BLE Mesh Sensor Client Model callback.

参数 callback - [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_sensor_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)
```

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

```c
esp_err_t esp_ble_mesh_sensor_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)
```

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

```c
union esp_ble_mesh_sensor_client_get_state_t
```

#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.

Public Members

```c
esp_ble_mesh_sensor_descriptor_get_t descriptor_get
```

For ESP_BLE_MESH_MODEL_OP_SENSOR_DESCRIPTOR_GET

```c
esp_ble_mesh_sensor_cadence_get_t cadence_get
```

For ESP_BLE_MESH_MODEL_OP_SENSOR_CADENCE_GET

Unions

union esp_ble_mesh_sensor_client_get_state_t

#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.
Chapter 2. API

**esp_ble_mesh_sensor_settings_get_t** settings_get
For ESP_BLE_MESH_MODEL_OP_SENSOR_SETTINGS_GET

    set
ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
```
Chapter 2. API

Public Members

```c
uint16_t property_id
    Property ID for the sensor

uint8_t fast_cadence_period_divisor
    Divisor for the publish period

uint8_t status_trigger_type
    The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
    Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
    Delta up value that triggers a status message

uint8_t status_min_interval
    Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range
```

struct esp_ble_mesh_sensor_settings_get_t
    Parameter of Sensor Settings Get

Public Members

```c
uint16_t sensor_property_id
    Property ID of a sensor
```

struct esp_ble_mesh_sensor_setting_get_t
    Parameters of Sensor Setting Get

Public Members

```c
uint16_t sensor_property_id
    Property ID of a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor
```

struct esp_ble_mesh_sensor_setting_set_t
    Parameters of Sensor Setting Set
Public Members

`uint16_t sensor_property_id`
Property ID identifying a sensor

`uint16_t sensor_setting_property_id`
Setting ID identifying a setting within a sensor

`struct net_buf_simple *sensor_setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_get_t`
Parameters of Sensor Get

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID for the sensor (optional)

`struct esp_ble_mesh_sensor_column_get_t`
Parameters of Sensor Column Get

Public Members

`uint16_t property_id`
Property identifying a sensor

`struct net_buf_simple *raw_value_x`
Raw value identifying a column

`struct esp_ble_mesh_sensor_series_get_t`
Parameters of Sensor Series Get

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property identifying a sensor

`struct net_buf_simple *raw_value_x1`
Raw value identifying a starting column (optional)
struct net_buf_simple *raw_value_x2
    Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
    Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
    Parameter of Sensor Descriptor Status

    Public Members

    struct net_buf_simple *descriptor
        Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
    Parameters of Sensor Cadence Status

    Public Members

    uint16_t property_id
        Property for the sensor

    struct net_buf_simple *sensor_cadence_value
        Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
    Parameters of Sensor Settings Status

    Public Members

    uint16_t sensor_property_id
        Property ID identifying a sensor

    struct net_buf_simple *sensor_setting_property_ids
        A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
    Parameters of Sensor Setting Status

    Public Members

    bool op_en
        Indicate id optional parameters are included

    uint16_t sensor_property_id
        Property ID identifying a sensor
Chapter 2. API

`uint16_t sensor_setting_property_id`
Setting ID identifying a setting within a sensor

`uint8_t sensor_setting_access`
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`
Parameter of Sensor Status

**Public Members**

`struct net_buf_simple *marshalled_sensor_data`
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`
Parameters of Sensor Column Status

**Public Members**

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`
Parameters of Sensor Series Status

**Public Members**

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`
Sensor Client Model callback parameters

**Public Members**
Chapter 2. API

```c
int error_code

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

```exp_ble_mesh_client_common_param_t *params```

The client common parameters.

```exp_ble_mesh_sensor_client_status_cb_t status_cb```

The sensor status message callback values

```struct esp_ble_mesh_sensor_descriptor_t```

Parameters of Sensor Descriptor state

### Public Members

```uint32_t positive_tolerance```

The value of Sensor Positive Tolerance field

```uint32_t negative_tolerance```

The value of Sensor Negative Tolerance field

```uint32_t sampling_function```

The value of Sensor Sampling Function field

```uint8_t measure_period```

The value of Sensor Measurement Period field

```uint8_t update_interval```

The value of Sensor Update Interval field

```struct esp_ble_mesh_sensor_setting_t```

Parameters of Sensor Setting state

### Public Members

```uint16_t property_id```

The value of Sensor Setting Property ID field

```uint8_t access```

The value of Sensor Setting Access field

```struct net_buf_simple *raw```

The value of Sensor Setting Raw field

```struct esp_ble_mesh_sensor_cadence_t```

Parameters of Sensor Cadence state
Public Members

```c
uint8_t period_divisor
    The value of Fast Cadence Period Divisor field
```

```c
uint8_t trigger_type
    The value of Status Trigger Type field
```

```c
struct net_buf_simple* trigger_delta_down
    Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low &
    fast_cadence_high indicates the exact length of these four parameters, and they are associated with the
    Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta
    Down field
```

```c
struct net_buf_simple* trigger_delta_up
    The value of Status Trigger Delta Up field
```

```c
uint8_t min_interval
    The value of Status Min Interval field
```

```c
struct net_buf_simple* fast_cadence_low
    The value of Fast Cadence Low field
```

```c
struct net_buf_simple* fast_cadence_high
    The value of Fast Cadence High field
```

```c
struct esp_ble_mesh_sensor_data_t
    Parameters of Sensor Data state
```

Public Members

```c
uint8_t format
    Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
    Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 –
    127). The value 0x7F represents a length of zero. The value of the Sensor Data format
```

```c
uint8_t length
    The value of the Sensor Data length
```

```c
struct net_buf_simple* raw_value
    The value of Sensor Data raw value
```

```c
struct esp_ble_mesh_sensor_series_column_t
    Parameters of Sensor Series Column state
```

Public Members

Espressif Systems  Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
struct net_buf_simple *raw_value_x  
The value of Sensor Raw Value X field

struct net_buf_simple *column_width  
The value of Sensor Column Width field

struct net_buf_simple *raw_value_y  
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t  
Parameters of Sensor states

Public Members

uint16_t sensor_property_id  
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor  
Parameters of the Sensor Descriptor state

const uint8_t setting_count  
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings  
Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t *cadence  
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t sensor_data  
Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t series_column  
Parameters of the Sensor Series Column state

struct esp_ble_mesh_sensor_srv_t  
User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t *model  
Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl  
Response control of the server model received messages
const uint8_t state_count
    Sensor state count

esp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
    User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

const uint8_t state_count
    Sensor state count

esp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t
    Parameters of Sensor Cadence Set state change event

Public Members

uint16_t property_id
    The value of Sensor Property ID state

uint8_t period_divisor
    The value of Fast Cadence Period Divisor state

uint8_t trigger_type
    The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
    The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state
struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
Property ID of a sensor
struct esp_ble_mesh_server_recv_sensor_setting_get_t
  Context of the received Sensor Setting Get message

  **Public Members**

  uint16_t property_id
  Property ID of a sensor

  uint16_t setting_property_id
  Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
  Context of the received Sensor Get message

  **Public Members**

  bool op_en
  Indicate if optional parameters are included

  uint16_t property_id
  Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
  Context of the received Sensor Column Get message

  **Public Members**

  uint16_t property_id
  Property identifying a sensor

  struct net_buf_simple *raw_value_x
  Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t
  Context of the received Sensor Series Get message

  **Public Members**

  bool op_en
  Indicate if optional parameters are included

  uint16_t property_id
  Property identifying a sensor

  struct net_buf_simple *raw_value
  Raw value containing X1 and X2 (optional)
struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

  uint16_t property_id
  Property ID for the sensor

  struct net_buf_simple *cadence
  Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

  uint16_t property_id
  Property ID identifying a sensor

  uint16_t setting_property_id
  Setting ID identifying a setting within a sensor

  struct net_buf_simple *setting_raw
  Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

Public Members

  esp_ble_mesh_model_t *model
  Pointer to Sensor Server Models

  esp_ble_mesh_msg_ctx_t ctx
  Context of the received messages

  esp_ble_mesh_sensor_server_cb_value_t value
  Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

备注： This API needs to be called for each element on which the application needs to have a Sensor Client Model.
Chapter 2. API

参数
• cli_pub - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• cli_data - Pointer to the unique struct `esp_ble_mesh_client_t`.

返回 New Sensor Client Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** (srv_pub, srv_data)
Sensor Server Models related context.
Define a new Sensor Server Model.

备注: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

参数
• srv_pub - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data - Pointer to the unique struct `esp_ble_mesh_sensor srv_t`.

返回 New Sensor Server Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

   a. This model shall support model publication and model subscription.

参数
• srv_pub - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data - Pointer to the unique struct `esp_ble_mesh_sensor_setup srv_t`.

返回 New Sensor Setup Server Model instance.

**ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID**
Invalid Sensor Property ID

**ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN**
Length of Sensor Property ID

**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**
Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**
Unspecified Sensor Positive Tolerance

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE**
Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**
Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**
Not applicable Sensor Update Interval
ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.
Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
**ESP_BLE_MESH_GETSENSOR_DATA_FORMAT** (_data_

Get format of the sensor data.

**备注:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

**参数**

- _data_ – Pointer to the start of the sensor data.

**返回** Format of the sensor data.

**ESP_BLE_MESH_GETSENSOR_DATA_LENGTH** (_data_, _fmt_

Get length of the sensor data.

**备注:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

**参数**

- _data_ – Pointer to the start of the sensor data.
- _fmt_ – Format of the sensor data.

**返回** Length (zero-based) of the sensor data.

**ESP_BLE_MESH_GETSENSOR_DATA_PROPERTY_ID** (_data_, _fmt_

Get Sensor Property ID of the sensor data.

**备注:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**参数**

- _data_ – Pointer to the start of the sensor data.
- _fmt_ – Format of the sensor data.

**返回** Sensor Property ID of the sensor data.

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID** (_len_, _id_

Generate a MPID value for sensor data with Format A.

**备注:**

1. The Format field is 0b0 and indicates that Format A is used.
   a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
   b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
   c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x800.

**参数**

- _len_ – Length of Sensor Raw value.
- _id_ – Sensor Property ID.

**返回** 2-octet MPID value for sensor data with Format A.

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID** (_len_, _id_

Generate a MPID value for sensor data with Format B.

**备注:**

1. The Format field is 0b1 and indicates Format B is used.
a. The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
b. The Property ID is a 16-bit bit field representing a Property ID.
c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID.

参数
- \_len - Length of Sensor Raw value.
- \_id - Sensor Property ID.

返回 3-octet MPID value for sensor data with Format B.

Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Param event Event type
Param param Pointer to callback parameter

Enumerations
enum esp_ble_mesh_sensor_client_cb_event_t

This enum value is the event of Sensor Client Model

Values:

enumerator ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

denum esp_ble_mesh_sensor_sample_func

This enum value is value of Sensor Sampling Function

Values:

enumerator ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
enumerator ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
enumerator ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
enumerator ESP_BLE_MESH_SAMPLE_FUNC_RMS
enumerator ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
enumerator ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
enumerator ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
enumerator ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

enumerator ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)

Register BLE Mesh Time Scene Client Model callback.

参数 callback [in] Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.
\texttt{esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get\_state)}

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**备注:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to \texttt{esp\_ble\_mesh\_time\_scene\_message\_opcode_t} in \texttt{esp\_ble\_mesh\_defs.h}

参数

- **params** - [in] Pointer to BLE Mesh common client parameters.
- **get\_state** - [in] Pointer to time scene get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

\texttt{esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set\_state)}

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**备注:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to \texttt{esp\_ble\_mesh\_time\_scene\_message\_opcode_t} in \texttt{esp\_ble\_mesh\_defs.h}

参数

- **params** - [in] Pointer to BLE Mesh common client parameters.
- **set\_state** - [in] Pointer to time scene set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

\texttt{esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)}

Register BLE Mesh Time and Scenes Server Model callback.

参数 **callback** - [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

    \textit{Current difference between TAI and UTC in seconds}

    uint8_t \textit{time_zone_offset}
    \textit{The local timezone offset in 15-minute increments}
\end{verbatim}

struct \textit{esp_ble_mesh_time_zone_set_t}

Parameters of Time Zone Set

\textbf{Public Members}

\begin{verbatim}
    uint8_t \textit{time_zone_offset_new}
    \textit{Upcoming local timezone offset}

    uint8_t \textit{tai_zone_change}[5]
    \textit{TAI Second time of the upcoming Time Zone Offset change}
\end{verbatim}

struct \textit{esp_ble_mesh_tai_utc_delta_set_t}

Parameters of TAI-UTC Delta Set

\textbf{Public Members}

\begin{verbatim}
    uint16_t \textit{tai_utc_delta_new}
    \textit{Upcoming difference between TAI and UTC in seconds}
\end{verbatim}
Chapter 2. API

uint16_t padding
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Second time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
    Parameter of Time Role Set

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_scene_store_t
    Parameter of Scene Store

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
    Parameters of Scene Recall

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t scene_number
    The number of scenes to be recalled

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
    Parameter of Scene Delete
Chapter 2. API 参考

**Public Members**

```c
uint16_t scene_number
```

The number of scenes to be deleted

**struct esp_ble_mesh_scheduler_act_get_t**

Parameter of Scheduler Action Get

**Public Members**

```c
uint8_t index
```

Index of the Schedule Register entry to get

**struct esp_ble_mesh_scheduler_act_set_t**

Parameters of Scheduler Action Set

**Public Members**

```c
uint64_t index
```

Index of the Schedule Register entry to set

```c
uint64_t year
```

Scheduled year for the action

```c
uint64_t month
```

Scheduled month for the action

```c
uint64_t day
```

Scheduled day of the month for the action

```c
uint64_t hour
```

Scheduled hour for the action

```c
uint64_t minute
```

Scheduled minute for the action

```c
uint64_t second
```

Scheduled second for the action

```c
uint64_t day_of_week
```

Schedule days of the week for the action

```c
uint64_t action
```

Action to be performed at the scheduled time

```c
uint64_t trans_time
```

Transition time for this action
uint16_t scene_number
    Transition time for this action

struct esp_ble_mesh_time_status_cb_t
    Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t sub_second
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
    Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
    Current local time zone offset

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
    Parameters of TAI-UTC Delta Status
Public Members

uint16_t **tai_utc_delta_curr**
Current difference between TAI and UTC in seconds

uint16_t **padding_1**
Always 0b0. Other values are Prohibited.

uint16_t **tai_utc_delta_new**
Upcoming difference between TAI and UTC in seconds

uint16_t **padding_2**
Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change[5]**
TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_status_cb_t**
Parameter of Time Role Status

Public Members

uint8_t **time_role**
The Time Role for the element

struct **esp_ble_mesh_scene_status_cb_t**
Parameters of Scene Status

Public Members

bool **op_en**
Indicate if optional parameters are included

uint8_t **status_code**
Status code of the last operation

uint16_t **current_scene**
Scene Number of the current scene

uint16_t **target_scene**
Scene Number of the target scene (optional)

uint8_t **remain_time**
Time to complete state transition (C.1)

struct **esp_ble_mesh_scene_register_status_cb_t**
Parameters of Scene Register Status
Public Members

uint8_t **status_code
Status code for the previous operation

tuint16_t **current_scene
Scene Number of the current scene

struct net_buf_simple **scenes
A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
Parameter of Scheduler Status

Public Members

uint16_t **schedules
Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t **index
Enumerates (selects) a Schedule Register entry

uint64_t **year
Scheduled year for the action

uint64_t **month
Scheduled month for the action

uint64_t **day
Scheduled day of the month for the action

uint64_t **hour
Scheduled hour for the action

uint64_t **minute
Scheduled minute for the action

uint64_t **second
Scheduled second for the action

uint64_t **day_of_week
Scheduled days of the week for the action
uint64_t action
    Action to be performed at the scheduled time

uint64_t trans_time
    Transition time for this action

uint16_t scene_number
    Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
    Time Scene Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb
    The scene status message callback values

struct esp_ble_mesh_time_state_t
    Parameters of Time state

Public Members

uint8_t tai_seconds[5]
    The value of the TAI Seconds state

uint8_t subsecond
    The value of the Subsecond field

uint8_t uncertainty
    The value of the Uncertainty field

uint8_t timezone_offset_curr
    The value of the Time Zone Offset Current field

uint8_t timezone_offset_new
    The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
    The value of the TAI of Zone Chaneg field
uint16_t time_authority
    The value of the Time Authority bit

uint16_t tai_utc_delta_curr
    The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new
    The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
    The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
    Parameters of the Time state

uint8_t time_role
    The value of the Time Role state

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_time_state_t *state
    Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
    User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_time_state_t *state
    Parameters of the Time state
struct `esp_ble_mesh_scene_register_t`

a. Scene Store is an operation of storing values of a present state of an element.
b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state.

**Public Members**

`uint16_t scene_number`
- The value of the Scene Number.

`uint8_t scene_type`
- The value of the Scene Type.

`struct net_buf_simple *scene_value`
- Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value.

struct `esp_ble_mesh_scenes_state_t`

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

**Public Members**

`const uint16_t scene_count`
- The Scenes state’s scene count.

`esp_ble_mesh_scene_register_t *scenes`
- Parameters of the Scenes state.

`uint16_t current_scene`
- The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.
When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

\texttt{uint16_t target\_scene}

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

\texttt{uint8_t status\_code}

The status code of the last scene operation

\texttt{bool in\_progress}

Indicate if the scene transition is in progress

\texttt{struct esp\_ble\_mesh\_scene\_srv\_t}

User data of Scene Server Model

**Public Members**

\texttt{esp\_ble\_mesh\_model\_t *model}

Pointer to the Scene Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *rsp\_ctrl}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_scenes\_state\_t *state}

Parameters of the Scenes state

\texttt{esp\_ble\_mesh\_last\_msg\_info\_t *last}

Parameters of the last received set message

\texttt{esp\_ble\_mesh\_state\_transition\_t *transition}

Parameters of state transition

\texttt{struct esp\_ble\_mesh\_scene\_setup\_srv\_t}

User data of Scene Setup Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Scene Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`
Parameters of the Scenes state

`struct esp_ble_mesh_schedule_register_t`
Parameters of Scheduler Register state

Public Members

`bool in_use`
Indicate if the registered schedule is in use

`uint64_t year`
The value of Scheduled year for the action

`uint64_t month`
The value of Scheduled month for the action

`uint64_t day`
The value of Scheduled day of the month for the action

`uint64_t hour`
The value of Scheduled hour for the action

`uint64_t minute`
The value of Scheduled minute for the action

`uint64_t second`
The value of Scheduled second for the action

`uint64_t day_of_week`
The value of Schedule days of the week for the action

`uint64_t action`
The value of Action to be performed at the scheduled time

`uint64_t trans_time`
The value of Transition time for this action

`uint16_t scene_number`
The value of Scene Number to be used for some actions
struct `esp_ble_mesh_scheduler_state_t`  
Parameters of Scheduler state

**Public Members**

```c
const uint8_t schedule_count
```
Scheduler count

```c
esp_ble_mesh_schedule_register_t *schedules
```
Up to 16 scheduled entries

struct `esp_ble_mesh_scheduler_srv_t`  
User data of Scheduler Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Scheduler Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
```
Response control of the server model received messages

```c
esp_ble_mesh_scheduler_state_t *state
```
Parameters of the Scheduler state

struct `esp_ble_mesh_scheduler_setup_srv_t`  
User data of Scheduler Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Scheduler Setup Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
```
Response control of the server model received messages

```c
esp_ble_mesh_scheduler_state_t *state
```
Parameters of the Scheduler state

struct `esp_ble_mesh_state_change_time_set_t`  
Parameters of Time Set state change event

**Public Members**

```c
uint8_t tai_seconds[5]
```
The current TAI time in seconds
uint8_t _subsecond
The sub-second time in units of 1/256 second

uint8_t _uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t _time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t _tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t _time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t _tai_seconds[5]
The current TAI time in seconds

uint8_t _subsecond
The sub-second time in units of 1/256 second

uint8_t _uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t _time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t _tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t _time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t _time_zone_offset_new
Upcoming local time zone offset
uint8_t \texttt{tai\_zone\_change}[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct \texttt{esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t}
Parameters of TAI UTC Delta Set state change event

**Public Members**

uint16_t \texttt{tai\_utc\_delta\_new}
Upcoming difference between TAI and UTC in seconds

uint8_t \texttt{tai\_delta\_change}[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct \texttt{esp\_ble\_mesh\_state\_change\_time\_role\_set\_t}
Parameter of Time Role Set state change event

**Public Members**

uint8_t \texttt{time\_role}
The Time Role for the element

struct \texttt{esp\_ble\_mesh\_state\_change\_scene\_store\_t}
Parameter of Scene Store state change event

**Public Members**

uint16_t \texttt{scene\_number}
The number of scenes to be stored

struct \texttt{esp\_ble\_mesh\_state\_change\_scene\_recall\_t}
Parameter of Scene Recall state change event

**Public Members**

uint16_t \texttt{scene\_number}
The number of scenes to be recalled

struct \texttt{esp\_ble\_mesh\_state\_change\_scene\_delete\_t}
Parameter of Scene Delete state change event

**Public Members**

uint16_t \texttt{scene\_number}
The number of scenes to be deleted
struct esp_ble_mesh_state_change_scheduler_act_set_t
    Parameter of Scheduler Action Set state change event

Public Members

uint64_t index
    Index of the Schedule Register entry to set

uint64_t year
    Scheduled year for the action

uint64_t month
    Scheduled month for the action

uint64_t day
    Scheduled day of the month for the action

uint64_t hour
    Scheduled hour for the action

uint64_t minute
    Scheduled minute for the action

uint64_t second
    Scheduled second for the action

uint64_t day_of_week
    Schedule days of the week for the action

uint64_t action
    Action to be performed at the scheduled time

uint64_t trans_time
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
    Context of the received Scheduler Action Get message

Public Members

uint8_t index
    Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
    Context of the received Time Set message
Public Members

uint8_t **tai_seconds**[5]
   The current TAI time in seconds

uint8_t **subsecond**
   The sub-second time in units of 1/256 second

uint8_t **uncertainty**
   The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**
   0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**
   Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
   Context of the received TimeZone Set message

Public Members

uint8_t **time_zone_offset_new**
   Upcoming local time zone offset

uint8_t **tai_zone_change**[5]
   TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
   Context of the received TAI UTC Delta Set message

Public Members

uint16_t **tai_utc_delta_new**
   Upcoming difference between TAI and UTC in seconds

uint16_t **padding**
   Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]
   TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
   Context of the received Time Role Set message
**Public Members**

`uint8_t time_role`

The Time Role for the element

`struct esp_ble_mesh_server_recv_scene_store_t`

Context of the received Scene Store message

**Public Members**

`uint16_t scene_number`

The number of scenes to be stored

`struct esp_ble_mesh_server_recv_scene_recall_t`

Context of the received Scene Recall message

**Public Members**

`bool op_en`

Indicate if optional parameters are included

`uint16_t scene_number`

The number of scenes to be recalled

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_scene_delete_t`

Context of the received Scene Delete message

**Public Members**

`uint16_t scene_number`

The number of scenes to be deleted

`struct esp_ble_mesh_server_recv_scheduler_act_set_t`

Context of the received Scheduler Action Set message
Public Members

\texttt{\textbf{uint64_t index}}

Index of the Schedule Register entry to set

\texttt{\textbf{uint64_t year}}

Scheduled year for the action

\texttt{\textbf{uint64_t month}}

Scheduled month for the action

\texttt{\textbf{uint64_t day}}

Scheduled day of the month for the action

\texttt{\textbf{uint64_t hour}}

Scheduled hour for the action

\texttt{\textbf{uint64_t minute}}

Scheduled minute for the action

\texttt{\textbf{uint64_t second}}

Scheduled second for the action

\texttt{\textbf{uint64_t day_of_week}}

Scheduled day of the week for the action

\texttt{\textbf{uint64_t action}}

Action to be performed at the scheduled time

\texttt{\textbf{uint64_t trans_time}}

Transition time for this action

\texttt{\textbf{uint16_t scene_number}}

Scene number to be used for some actions

\texttt{\textbf{struct esp_ble_mesh_server_recv_time_status_t}}

Context of the received Time Status message

Public Members

\texttt{\textbf{uint8_t tai_seconds[5]}}

The current TAI time in seconds

\texttt{\textbf{uint8_t subsecond}}

The sub-second time in units of 1/256 second

\texttt{\textbf{uint8_t uncertainty}}

The estimated uncertainty in 10-millisecond steps
uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local timezone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t value
Value of the received Time and Scenes Messages

Macros
ESP_BLE_MESH_MODEL_TIME_CLI(cli_pub, cli_data)
Define a new Time Client Model.

备注: This API needs to be called for each element on which the application needs to have a Time Client Model.

参数
• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.
返回 New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI(cli_pub, cli_data)
Define a new Scene Client Model.

备注: This API needs to be called for each element on which the application needs to have a Scene Client Model.

参数
• cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data – Pointer to the unique struct esp_ble_mesh_client_t.
返回 New Scene Client Model instance.
**Chapter 2. API 参考**

**ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)**

Define a new Scheduler Client Model.

**备注**: This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**参数**
- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

**返回**: New Scheduler Client Model instance.

**ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)**

Time Scene Server Models related context.

Define a new Time Server Model.

**备注**: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
   - a. This model shall support model publication and model subscription.

**参数**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

**返回**: New Time Server Model instance.

**ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)**

Define a new Time Setup Server Model.

**备注**: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
   - a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   - b. This model does not support subscribing nor publishing.

**参数**
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

**返回**: New Time Setup Server Model instance.

**ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)**

Define a new Scene Server Model.

**备注**: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
   - a. This model shall support model publication and model subscription.
   - b. The model may be present only on the Primary element of a node.

**参数**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

Submit Document Feedback
Chapter 2. API

**ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV** (srv_pub, srv_data)
Define a new Scene Setup Server Model.

**备注**: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

**返回** New Scene Setup Server Model instance.

**ESP_BLE_MESH_MODEL_SCHEDULER_SRV** (srv_pub, srv_data)
Define a new Scheduler Server Model.

**备注**: 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.
   c. The model requires the Time Server model shall be present on the element.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

**返回** New Scheduler Server Model instance.

**ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV** (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

**备注**: 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

**参数**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**返回** New Scheduler Setup Server Model instance.

**ESP_BLE_MESH_UNKNOWN_TAI_SECONDS**
Unknown TAI Seconds

**ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE**
Unknown TAI of Zone Change

**ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE**
Unknown TAI of Delta Change
**ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE**
Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI_SECONDS_LEN**
Length of TAI Seconds

**ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN**
Length of TAI of Zone Change

**ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN**
Length of TAI of Delta Change

**ESP_BLE_MESH_INVALID_SCENE_NUMBER**
Invalid Scene Number

**ESP_BLE_MESH_SCENE_NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC**
Every 15 seconds of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLI_NET
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

Type Definitions
Chapter 2. API

```c
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event  Event type
Param param  Pointer to callback parameter
```

```c
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event  Event type
Param param  Pointer to callback parameter
```

**Enumerations**

```c
enum esp_ble_mesh_time_scene_client_cb_event_t

This enum value is the event of Time Scene Client Model
```

*Values:*

- `ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_time_scene_server_cb_event_t

This enum value is the event of Time Scene Server Model
```

*Values:*

- `ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT`
  
  i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
  
  ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT`
  
  When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT`
  
  When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

Lighting Client/Server Models

Header File

Functions

**esp_err_t esp_ble_mesh_register_light_client_callback**(esp_ble_mesh_light_client_cb_t callback)

Register BLE Mesh Light Client Model callback.

参数 `callback` [in] pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_light_client_get_state**(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

备注：If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

参数
- `params` [in] Pointer to BLE Mesh common client parameters.
- `get_state` [in] Pointer of light get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_light_client_set_state**(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

备注：If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

参数
- `params` [in] Pointer to BLE Mesh common client parameters.
- `set_state` [in] Pointer of light set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_lighting_server_callback**(esp_ble_mesh_lighting_server_cb_t callback)

Register BLE Mesh Lighting Server Model callback.

参数 `callback` [in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Structures

```
struct esp_ble_mesh_light_lightness_set_t
    Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.
    Parameters of Light Lightness Set

Public Members
```
bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of lightness actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_linear_set_t
   Parameters of Light Lightness Linear Set

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of lightness linear state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_default_set_t
   Parameter of Light Lightness Default Set

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

struct esp_ble_mesh_light_lightness_range_set_t
   Parameters of Light Lightness Range Set
Public Members

```c
uint16_t range_min
Value of range min field of light lightness range state
```

```c
uint16_t range_max
Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_light_ctl_set_t
Parameters of Light CTL Set
```

Public Members

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t ctl_lightness
Target value of light ctl lightness state
```

```c
uint16_t ctl_temperatrue
Target value of light ctl temperature state
```

```c
int16_t ctl_delta_uv
Target value of light ctl delta UV state
```

```c

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set

**Public Members**

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set

**Public Members**

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_set_t
Parameters of Light HSL Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Target value of light hsl lightness state
uint16_t hsl_hue
    Target value of light hsl hue state

uint16_t hsl_saturation
    Target value of light hsl saturation state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_hue_set_t
    Parameters of Light HSL Hue Set

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t hue
        Target value of light hsl hue state

    uint8_t tid
        Transaction ID

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
    Parameters of Light HSL Saturation Set

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t saturation
        Target value of light hsl hue state
uint8_t **tid**
  Transaction ID

uint8_t **trans_time**
  Time to complete state transition (optional)

uint8_t **delay**
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_hsl_default_set_t**
  Parameters of Light HSL Default Set

**Public Members**

uint16_t **lightness**
  Value of light lightness default state

uint16_t **hue**
  Value of light hue default state

uint16_t **saturation**
  Value of light saturation default state

**struct esp_ble_mesh_light_hsl_range_set_t**
  Parameters of Light HSL Range Set

**Public Members**

uint16_t **hue_range_min**
  Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**
  Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**
  Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**
  Value of saturation range max field of light hsl saturation range state

**struct esp_ble_mesh_light_xyl_set_t**
  Parameters of Light xyL Set

**Public Members**
bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The target value of the Light xyL Lightness state

uint16_t xyl_x
   The target value of the Light xyL x state

uint16_t xyl_y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
   Parameters of Light xyL Default Set

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t xyl_x
   The value of the Light xyL x Default state

uint16_t xyl_y
   The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
   Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t xyl_y_range_min
The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t xyl_y_range_max
The value of the xyl y Range Max field of the Light xyl y Range state

struct esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
Parameter of Light LC Property Get
Public Members

```c
uint16_t property_id
  Property ID identifying a Light LC Property
```

```c
struct esp_ble_mesh_light_lc_property_set_t
  Parameters of Light LC Property Set
```

Public Members

```c
uint16_t property_id
  Property ID identifying a Light LC Property
```

```c
struct net_buf_simple *property_value
  Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_light_lightness_status_cb_t
  Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
  Parameters of Light Lightness Status
```

Public Members

```c
bool op_en
  Indicate if optional parameters are included
```

```c
uint16_t present_lightness
  Current value of light lightness actual state
```

```c
uint16_t target_lightness
  Target value of light lightness actual state (optional)
```

```c
uint8_t remain_time
  Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_lightness_linear_status_cb_t
  Parameters of Light Lightness Linear Status
```

Public Members

```c
bool op_en
  Indicate if optional parameters are included
```

```c
uint16_t present_lightness
  Current value of light lightness linear state
```
Chapter 2. API

uint16_t target_lightness
   Target value of light lightness linear state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
   Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
   The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
   Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
   The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
   Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
   Status Code for the request message

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
   Parameters of Light CTL Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_ctl_lightness
   Current value of light ctl lightness state
uint16_t `present_ctl_temperature`
   Current value of light ctl temperature state

uint16_t `target_ctl_lightness`
   Target value of light ctl lightness state (optional)

uint16_t `target_ctl_temperature`
   Target value of light ctl temperature state (C.1)

uint8_t `remain_time`
   Time to complete state transition (C.1)

struct `esp_ble_mesh_light_ctl_temperature_status_cb_t`
   Parameters of Light CTL Temperature Status

   **Public Members**

   bool `op_en`
      Indicate if optional parameters are included

   uint16_t `present_ctl_temperature`
      Current value of light ctl temperature state

   uint16_t `present_ctl_delta_uv`
      Current value of light ctl delta UV state

   uint16_t `target_ctl_temperature`
      Target value of light ctl temperature state (optional)

   uint16_t `target_ctl_delta_uv`
      Target value of light ctl delta UV state (C.1)

   uint8_t `remain_time`
      Time to complete state transition (C.1)

struct `esp_ble_mesh_light_ctl_temperature_range_status_cb_t`
   Parameters of Light CTL Temperature Range Status

   **Public Members**

   uint8_t `status_code`
      Status code for the request message

   uint16_t `range_min`
      Value of temperature range min field of light ctl temperature range state
uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_status_cb_t
Parameters of Light HSL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Current value of light hsl lightness state

uint16_t hsl_hue
Current value of light hsl hue state

uint16_t hsl_saturation
Current value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_target_status_cb_t
Parameters of Light HSL Target Status

Public Members

bool op_en
Indicate if optional parameters are included
uint16_t hsl_lightness_target
    Target value of light hsl lightness state

uint16_t hsl_hue_target
    Target value of light hsl hue state

uint16_t hsl_saturation_target
    Target value of light hsl saturation state

uint8_t remain_time
    Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
    Parameters of Light HSL Hue Status

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t present_hue
        Current value of light hsl hue state

    uint16_t target_hue
        Target value of light hsl hue state (optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
    Parameters of Light HSL Saturation Status

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t present_saturation
        Current value of light hsl saturation state

    uint16_t target_saturation
        Target value of light hsl saturation state (optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
    Parameters of Light HSL Default Status
Public Members

```c
uint16_t lightness
  Value of light lightness default state

uint16_t hue
  Value of light hue default state

uint16_t saturation
  Value of light saturation default state
```

```c
struct esp_ble_mesh_light_hsl_range_status_cb_t
  Parameters of Light HSL Range Status
```

Public Members

```c
uint8_t status_code
  Status code for the request message

uint16_t hue_range_min
  Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
  Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
  Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
  Value of saturation range max field of light hsl saturation range state
```

```c
struct esp_ble_mesh_light_xyl_status_cb_t
  Parameters of Light xyL Status
```

Public Members

```c
bool op_en
  Indicate whether optional parameters included

uint16_t xyl_lightness
  The present value of the Light xyL Lightness state

uint16_t xyl_x
  The present value of the Light xyL x state

uint16_t xyl_y
  The present value of the Light xyL y state
```
uint8_t \texttt{remain\_time}

Time to complete state transition (optional)

\begin{verbatim}
struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light \text{xyL Target Status}

\textbf{Public Members}

bool \texttt{op\_en}

Indicate whether optional parameters included

uint16_t \texttt{target\_xyl\_lightness}

The target value of the Light \text{xyL Lightness} state

uint16_t \texttt{target\_xyl\_x}

The target value of the Light \text{xyL x} state

uint16_t \texttt{target\_xyl\_y}

The target value of the Light \text{xyL y} state

uint8_t \texttt{remain\_time}

Time to complete state transition (optional)
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light \text{xyL Default Status}

\textbf{Public Members}

uint16_t \texttt{lightness}

The value of the Light \text{Lightness Default} state

uint16_t \texttt{xyl\_x}

The value of the Light \text{xyL x Default} state

uint16_t \texttt{xyl\_y}

The value of the Light \text{xyL y Default} state
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light \text{xyL Range Status}

\textbf{Public Members}

uint8_t \texttt{status\_code}

Status Code for the requesting message
\end{verbatim}
Chapter 2. API

```c
uint16_t xyl_x_range_min
    The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
    The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
    The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
    The value of the xyL y Range Max field of the Light xyL y Range state
```

```c
struct esp_ble_mesh_light_lc_mode_status_cb_t
    Parameter of Light LC Mode Status

Public Members

uint8_t mode
    The present value of the Light LC Mode state
```

```c
struct esp_ble_mesh_light_lc_om_status_cb_t
    Parameter of Light LC OM Status

Public Members

uint8_t mode
    The present value of the Light LC Occupancy Mode state
```

```c
struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
    Parameters of Light LC Light OnOff Status

Public Members

bool op_en
    Indicate whether optional parameters included

uint8_t present_light_onoff
    The present value of the Light LC Light OnOff state

uint8_t target_light_onoff
    The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_lc_property_status_cb_t
    Parameters of Light LC Property Status
```
Chapter 2. API 参考

Public Members

uint16_t **property_id**
Property ID identifying a Light LC Property

struct net_buf_simple **property_value**
Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
Lighting Client Model callback parameters

Public Members

int **error_code**
Appropriate error code

*esp_ble_mesh_client_common_param_t* **params**
The client common parameters.

*esp_ble_mesh_light_client_status_cb_t* **status_cb**
The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
Parameters of Light Lightness state

Public Members

uint16_t **lightness_linear**
The present value of Light Lightness Linear state

uint16_t **target_lightness_linear**
The target value of Light Lightness Linear state

uint16_t **lightness_actual**
The present value of Light Lightness Actual state

uint16_t **target_lightness_actual**
The target value of Light Lightness Actual state

uint16_t **lightness_last**
The value of Light Lightness Last state

uint16_t **lightness_default**
The value of Light Lightness Default state

uint8_t **status_code**
The status code of setting Light Lightness Range state
\begin{verbatim}
uint16_t lightness_range_min
    The minimum value of Light Lightness Range state

uint16_t lightness_range_max
    The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
    User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
    Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
    Parameters of state transition

int32_t tt_delta_lightness_actual
    Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
    Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
    User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages
\end{verbatim}
**esp_ble_mesh_light_lightness_state_t** *state*
Parameters of the Light Lightness state

**struct esp_ble_mesh_light_ctl_state_t**
Parameters of Light CTL state

**Public Members**

uint16_t **lightness**
The present value of Light CTL Lightness state

uint16_t **target_lightness**
The target value of Light CTL Lightness state

uint16_t **temperature**
The present value of Light CTL Temperature state

uint16_t **target_temperature**
The target value of Light CTL Temperature state

int16_t **delta_uv**
The present value of Light CTL Delta UV state

int16_t **target_delta_uv**
The target value of Light CTL Delta UV state

uint8_t **status_code**
The status code of setting Light CTL Temperature Range state

uint16_t **temperature_range_min**
The minimum value of Light CTL Temperature Range state

uint16_t **temperature_range_max**
The maximum value of Light CTL Temperature Range state

uint16_t **lightness_default**
The value of Light Lightness Default state

uint16_t **temperature_default**
The value of Light CTL Temperature Default state

int16_t **delta_uv_default**
The value of Light CTL Delta UV Default state

**struct esp_ble_mesh_light_ctl_srv_t**
User data of Light CTL Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_ctl_temp_srv_t`
User data of Light CTL Temperature Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`struct esp_ble_mesh_light_ctl_temp_srv_t`
User data of Light CTL Temperature Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.
**Chapter 2. API 参考**

- `esp_ble_mesh_server_rsp_ctrl_t` **rsp_ctrl**
  - Response control of the server model received messages

- `esp_ble_mesh_light_ctl_state_t` **state**
  - Parameters of the Light CTL state

- `esp_ble_mesh_last_msg_info_t` **last**
  - Parameters of the last received set message

- `esp_ble_mesh_state_transition_t` **transition**
  - Parameters of state transition

- `int32_t` **tt_delta_temperature**
  - Delta change value of temperature state transition

- `int32_t` **tt_delta_delta_uv**
  - Delta change value of delta uv state transition

- `struct esp_ble_mesh_light_hsl_state_t`
  - Parameters of Light HSL state

**Public Members**

- `uint16_t` **lightness**
  - The present value of Light HSL Lightness state

- `uint16_t` **target_lightness**
  - The target value of Light HSL Lightness state

- `uint16_t` **hue**
  - The present value of Light HSL Hue state

- `uint16_t` **target_hue**
  - The target value of Light HSL Hue state

- `uint16_t` **saturation**
  - The present value of Light HSL Saturation state

- `uint16_t` **target_saturation**
  - The target value of Light HSL Saturation state

- `uint16_t` **lightness_default**
  - The value of Light Lightness Default state

- `uint16_t` **hue_default**
  - The value of Light HSL Hue Default state
uint16_t saturation_default
The value of Light HSL Saturation Default state

uint8_t status_code
The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_hue
Delta change value of hue state transition

int32_t tt_delta_saturation
Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
User data of Light HSL Setup Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`struct esp_ble_mesh_light_hsl_hue_srv_t`
User data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`struct esp_ble_mesh_light_hsl_sat_srv_t`
User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state
\textit{esp\_ble\_mesh\_last\_msg\_info\_t \texttt{last}}

Parameters of the last received set message

\textit{esp\_ble\_mesh\_state\_transition\_t \texttt{transition}}

Parameters of state transition

\texttt{int32\_t \texttt{tt\_delta\_saturation}}

Delta change value of saturation state transition

\texttt{struct \textit{esp\_ble\_mesh\_light\_xyl\_state\_t}}

Parameters of Light xyL state

\textbf{Public Members}

\texttt{uint16\_t \texttt{lightness}}

The present value of Light xyL Lightness state

\texttt{uint16\_t \texttt{target\_lightness}}

The target value of Light xyL Lightness state

\texttt{uint16\_t \texttt{x}}

The present value of Light xyL x state

\texttt{uint16\_t \texttt{target\_x}}

The target value of Light xyL x state

\texttt{uint16\_t \texttt{y}}

The present value of Light xyL y state

\texttt{uint16\_t \texttt{target\_y}}

The target value of Light xyL y state

\texttt{uint16\_t \texttt{lightness\_default}}

The value of Light Lightness Default state

\texttt{uint16\_t \texttt{x\_default}}

The value of Light xyL x Default state

\texttt{uint16\_t \texttt{y\_default}}

The value of Light xyL y Default state

\texttt{uint8\_t \texttt{status\_code}}

The status code of setting Light xyL x & y Range state

\texttt{uint16\_t \texttt{x\_range\_min}}

The minimum value of Light xyL x Range state
uint16_t \texttt{x\_range\_max}  
The maximum value of Light xyL x Range state

uint16_t \texttt{y\_range\_min}  
The minimum value of Light xyL y Range state

uint16_t \texttt{y\_range\_max}  
The maximum value of Light xyL y Range state

\textbf{Public Members}

\begin{verbatim}
\texttt{esp\_ble\_mesh\_model\_t *model}  
Pointer to the Lighting xyL Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *rsp\_ctrl}  
Response control of the server model received messages

\texttt{esp\_ble\_mesh\_light\_xyl\_state\_t *state}  
Parameters of the Light xyL state

\texttt{esp\_ble\_mesh\_last\_msg\_info\_t *last}  
Parameters of the last received set message

\texttt{esp\_ble\_mesh\_state\_transition\_t *transition}  
Parameters of state transition

\texttt{int32_t tt\_delta\_lightness}  
Delta change value of lightness state transition

\texttt{int32_t tt\_delta\_x}  
Delta change value of x state transition

\texttt{int32_t tt\_delta\_y}  
Delta change value of y state transition
\end{verbatim}

\textbf{struct \texttt{esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t}}  
User data of Light xyL Setup Server Model

\textbf{Public Members}

\begin{verbatim}
\texttt{esp\_ble\_mesh\_model\_t *model}  
Pointer to the Lighting xyL Setup Server Model. Initialized internally.
\end{verbatim}
Chapter 2. API 参考

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_xyl_state_t *state`
Parameters of the Light xyl state

`struct esp_ble_mesh_light_lc_state_t`
Parameters of Light LC states

**Public Members**

`uint32_t mode`
0b0 The controller is turned off.
- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

`uint32_t occupancy_mode`
The value of Light LC Occupancy Mode state

`uint32_t light_onoff`
The present value of Light LC Light OnOff state

`uint32_t target_light_onoff`
The target value of Light LC Light OnOff state

`uint32_t occupancy`
The value of Light LC Occupancy state

`uint32_t ambient_luxlevel`
The value of Light LC Ambient LuxLevel state

`uint16_t linear_output`
- Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

`struct esp_ble_mesh_light_lc_property_state_t`
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**
**uint32_t time_occupancy_delay**
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

**uint32_t time_fade_on**
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

**uint32_t time_run_on**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

**uint32_t time_fade**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

**uint32_t time_prolong**
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

**uint32_t time_fade_standby_auto**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

**uint32_t time_fade_standby_manual**
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

**uint16_t lightness_on**
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16_t lightness_prolong**
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16_t lightness_standby**
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16_t ambient_luxlevel_on**
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16_t ambient_luxlevel_prolong**
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state
uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade
uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define
the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of
the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC
Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t state
The value of Light LC state machine state

struct k_delayed_work timer
Timer of Light LC state machine

struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t state
Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t prop_state
Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t state_machine
Parameters of Light LC state machine

struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_control_t *lc
Parameters of the Light controller

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
```

**esp_ble_mesh_state_transition_t**

Parameters of state transition

**struct esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

**Public Members**

**esp_ble_mesh_model_t **

*model

Pointer to the Lighting LC Setup Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t **

*rsp_ctrl

Response control of the server model received messages

**esp_ble_mesh_light_control_t **

*lc

Parameters of the Light controller

**struct esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

**Public Members**

**uint16_t lightness**

The value of Light Lightness Default state

**struct esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event

**Public Members**

**uint16_t lightness**

The value of Light Lightness Range state change event
```
**Public Members**

```c
uint16_t range_min
```
The minimum value of Light Lightness Range state

```c
uint16_t range_max
```
The maximum value of Light Lightness Range state

**struct esp_ble_mesh_state_change_light_ctl_set_t**
Parameters of Light CTL state change event

**Public Members**

```c
uint16_t lightness
```
The value of Light CTL Lightness state

```c
uint16_t temperature
```
The value of Light CTL Temperature state

```c
int16_t delta_uv
```
The value of Light CTL Delta UV state

**struct esp_ble_mesh_state_change_light_ctl_temperature_set_t**
Parameters of Light CTL Temperature state change event

**Public Members**

```c
uint16_t temperature
```
The value of Light CTL Temperature state

```c
int16_t delta_uv
```
The value of Light CTL Delta UV state

**struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t**
Parameters of Light CTL Temperature Range state change event

**Public Members**

```c
uint16_t range_min
```
The minimum value of Light CTL Temperature Range state

```c
uint16_t range_max
```
The maximum value of Light CTL Temperature Range state

**struct esp_ble_mesh_state_change_light_ctl_default_set_t**
Parameters of Light CTL Default state change event
Public Members

uint16_t **lightness**
The value of Light Lightness Default state

uint16_t **temperature**
The value of Light CTL Temperature Default state

int16_t **delta_uv**
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t **lightness**
The value of Light HSL Lightness state

uint16_t **hue**
The value of Light HSL Hue state

uint16_t **saturation**
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t **hue**
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t **saturation**
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event
Public Members

uint16_t **lightness**

The value of Light HSL Lightness Default state

uint16_t **hue**

The value of Light HSL Hue Default state

uint16_t **saturation**

The value of Light HSL Saturation Default state

struct **esp_ble_mesh_state_change_light_hsl_range_set_t**

Parameters of Light HSL Range state change event

Public Members

uint16_t **hue_range_min**

The minimum hue value of Light HSL Range state

uint16_t **hue_range_max**

The maximum hue value of Light HSL Range state

uint16_t **saturation_range_min**

The minimum saturation value of Light HSL Range state

uint16_t **saturation_range_max**

The maximum saturation value of Light HSL Range state

struct **esp_ble_mesh_state_change_light_xyl_set_t**

Parameters of Light xyl state change event

Public Members

uint16_t **lightness**

The value of Light xyl Lightness state

uint16_t **x**

The value of Light xyl x state

uint16_t **y**

The value of Light xyl y state

struct **esp_ble_mesh_state_change_light_xyl_default_set_t**

Parameters of Light xyl Default state change event
Public Members

```c
uint16_t lightness
The value of Light Lightness Default state
```

```c
uint16_t x
The value of Light xyL x Default state
```

```c
uint16_t y
The value of Light xyL y Default state
```

```c
struct esp_ble_mesh_state_change_light_xy_l_range_set_t
Parameters of Light xyL Range state change event
```

Public Members

```c
uint16_t x_range_min
The minimum value of Light xyL x Range state
```

```c
uint16_t x_range_max
The maximum value of Light xyL x Range state
```

```c
uint16_t y_range_min
The minimum value of Light xyL y Range state
```

```c
uint16_t y_range_max
The maximum value of Light xyL y Range state
```

```c
struct esp_ble_mesh_state_change_light_xy_l_range_set_t
Parameter of Light LC Mode state change event
```

Public Members

```c
uint8_t mode
The value of Light LC Mode state
```

```c
struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Occupancy Mode state change event
```

Public Members

```c
uint8_t mode
The value of Light LC Occupancy Mode state
```

```c
struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event
```
Chapter 2. API Reference

Public Members

uint8_t onoff

The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t

Parameters of Light LC Property state change event

Public Members

uint16_t property_id

The property id of Light LC Property state

struct net_buf_simple *property_value

The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t

Parameters of Sensor Status state change event

Public Members

uint16_t property_id

The value of Sensor Property ID

uint8_t occupancy

The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay

The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel

The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state

Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t

Context of the received Light LC Property Get message

Public Members

uint16_t property_id

Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t

Context of the received Light Lightness Set message
Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light lightness actual state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
    Context of the received Light Lightness Linear Set message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light lightness linear state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
    Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
    The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
    Context of the received Light Lightness Range Set message
Chapter 2. API

Public Members

```c
uint16_t range_min
    Value of range min field of light lightness range state
```

```c
uint16_t range_max
    Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_server_recv_light_ctl_set_t
    Context of the received Light CTL Set message
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t lightness
    Target value of lightctl lightness state
```

```c
uint16_t temperature
    Target value of lightctl temperature state
```

```c
int16_t delta_uv
    Target value of lightctl delta UV state
```

```c
uint8_t tid
    Transaction ID
```

```c
uint8_t trans_time
    Time to complete state transition (optional)
```

```c
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
    Context of the received Light CTL Temperature Set message
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t temperature
    Target value of lightctl temperature state
```

```c
int16_t delta_uv
    Target value of lightctl delta UV state
```
uint8_t \texttt{tid}
    Transaction ID

uint8_t \texttt{trans\_time}
    Time to complete state transition (optional)

uint8_t \texttt{delay}
    Indicate message execution delay (C.1)

\textbf{struct \texttt{esp\_ble\_mesh\_server\_recv\_light\_ctl\_temperature\_range\_set\_t}}
    Context of the received Light CTL Temperature Range Set message

\textbf{Public Members}

uint16_t \texttt{range\_min}
    Value of temperature range min field of light ctl temperature range state

uint16_t \texttt{range\_max}
    Value of temperature range max field of light ctl temperature range state

\textbf{struct \texttt{esp\_ble\_mesh\_server\_recv\_light\_ctl\_default\_set\_t}}
    Context of the received Light CTL Default Set message

\textbf{Public Members}

uint16_t \texttt{lightness}
    Value of light lightness default state

uint16_t \texttt{temperature}
    Value of light temperature default state

int16_t \texttt{delta\_uv}
    Value of light delta UV default state

\textbf{struct \texttt{esp\_ble\_mesh\_server\_recv\_light\_hsl\_set\_t}}
    Context of the received Light HSL Set message

\textbf{Public Members}

bool \texttt{op\_en}
    Indicate if optional parameters are included

uint16_t \texttt{lightness}
    Target value of light hsl lightness state
Chapter 2. API

```c
uint16_t hue
    Target value of light hsl hue state

uint16_t saturation
    Target value of light hsl saturation state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
    Context of the received Light HSL Hue Set message

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t hue
        Target value of light hsl hue state

    uint8_t tid
        Transaction ID

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
    Context of the received Light HSL Saturation Set message

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t saturation
        Target value of light hsl hue state
```
uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
   Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state

uint16_t saturation
   Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
   Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
   Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
   Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
   Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
   Context of the received Light xyL Set message

Public Members
bool \texttt{op\_en}

Indicate whether optional parameters included

\texttt{uint16\_t lightness}

The target value of the Light xyL Lightness state

\texttt{uint16\_t x}

The target value of the Light xyL x state

\texttt{uint16\_t y}

The target value of the Light xyL y state

\texttt{uint8\_t tid}

Transaction Identifier

\texttt{uint8\_t trans\_time}

Time to complete state transition (optional)

\texttt{uint8\_t delay}

Indicate message execution delay (C.1)

\textbf{struct esp\_ble\_mesh\_server\_recv\_light\_xyl\_default\_set\_t}

Context of the received Light xyL Default Set message

\textbf{Public Members}

\texttt{uint16\_t lightness}

The value of the Light Lightness Default state

\texttt{uint16\_t x}

The value of the Light xyL x Default state

\texttt{uint16\_t y}

The value of the Light xyL y Default state

\textbf{struct esp\_ble\_mesh\_server\_recv\_light\_xyl\_range\_set\_t}

Context of the received Light xyL Range Set message

\textbf{Public Members}

\texttt{uint16\_t x\_range\_min}

The value of the xyL x Range Min field of the Light xyL x Range state

\texttt{uint16\_t x\_range\_max}

The value of the xyL x Range Max field of the Light xyL x Range state
Chapter 2. API

uint16_t y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message
**Public Members**

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

`struct esp_ble_mesh_server_recv_sensor_status_t`
Context of the received Sensor Status message

**Public Members**

`struct net_buf_simple *data`
Value of sensor data state (optional)

`struct esp_ble_mesh_lighting_server_cb_param_t`
Lighting Server Model callback parameters

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to Lighting Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_lighting_server_cb_value_t value`
Value of the received Lighting Messages

**Macros**

`ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)`
Define a new Light Lightness Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

参数
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

返回
- New Light Lightness Client Model instance.

`ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI(cli_pub, cli_data)`
Define a new Light CTL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Chapter 2. API 参考

### 参数
- **cli_pub** — Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** — Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)
Define a new Light HSL Client Model.

**备注**：This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

### 参数
- **cli_pub** — Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** — Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)
Define a new Light xyL Client Model.

**备注**：This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

### 参数
- **cli_pub** — Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** — Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)
Define a new Light LC Client Model.

**备注**：This API needs to be called for each element on which the application needs to have a Light LC Client Model.

### 参数
- **cli_pub** — Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** — Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Light Lightness Server Model.

**备注**：1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

### 参数
- **srv_pub** — Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** — Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.
**Chapter 2. API Reference**

### Define a new Light Lightness Setup Server Model

#### ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

**备注:** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

   a. This model shall support model subscription.

### Define a new Light CTL Server Model

#### ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

**备注:** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

### Define a new Light CTL Setup Server Model

#### ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

**备注:** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

   a. This model shall support model subscription.

### Define a new Light CTL Temperature Server Model

#### ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

**备注:** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

   a. This model shall support model publication and model subscription.
**Chapter 2. API 参考**

**参数**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

返回 New Light CTL Temperature Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** `(srv_pub, srv_data)`
Define a new Light HSL Server Model.

备注：1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

**参数**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

返回 New Light HSL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV** `(srv_pub, srv_data)`
Define a new Light HSL Setup Server Model.

备注：1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

a. This model shall support model subscription.

**参数**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

返回 New Light HSL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV** `(srv_pub, srv_data)`
Define a new Light HSL Hue Server Model.

备注：1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

a. This model shall support model publication and model subscription.

**参数**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

返回 New Light HSL Hue Server Model instance.
**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV** \((\text{srv}_\text{pub}, \text{srv}_\text{data})\)

Define a new Light HSL Saturation Server Model.

**备注:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

   a. This model shall support model publication and model subscription.

   **参数**
   
   • \texttt{srv\_pub} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
   • \texttt{srv\_data} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t}.

   **返回** New Light HSL Saturation Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV** \((\text{srv}_\text{pub}, \text{srv}_\text{data})\)

Define a new Light xyL Server Model.

**备注:** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   **参数**
   
   • \texttt{srv\_pub} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
   • \texttt{srv\_data} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_light\_xy\_srv\_t}.

   **返回** New Light xyL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV** \((\text{srv}_\text{pub}, \text{srv}_\text{data})\)

Define a new Light xyL Setup Server Model.

**备注:** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

   a. This model shall support model subscription.

   **参数**
   
   • \texttt{srv\_pub} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
   • \texttt{srv\_data} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_light\_xy\_srv\_t}.

   **返回** New Light xyL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV** \((\text{srv}_\text{pub}, \text{srv}_\text{data})\)

Define a new Light LC Server Model.

**备注:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.
   
   b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

   **参数**
   
   • \texttt{srv\_pub} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
   • \texttt{srv\_data} – Pointer to the unique struct \texttt{esp\_ble\_mesh\_light\_lc\_srv\_t}. 
Define a new Light LC Setup Server Model.

**Esp BLE Mesh Model Light LC Setup_SRV**(srv_pub, srv_data)

New Light LC Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,
 esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

**Lighting Client Model callback function type**

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,
 esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

**Lighting Server Model callback function type**

- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
typedef enum esp_ble_mesh_light_client_cb_event_t

This enum value is the event of Lighting Client Model

**Values:**

- **enumerator ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**
- **enumerator ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**
- **enumerator ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**
- **enumerator ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**

```c
typedef enum esp_ble_mesh_lc_state_t

This enum value is the Light LC State Machine states

**Values:**

- **enumerator ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**
```
Chapter 2. API

enumerator `ESP_BLE_MESH_LC_OFF`

enumerator `ESP_BLE_MESH_LC_STANDBY`

enumerator `ESP_BLE_MESH_LC_FADE_ON`

enumerator `ESP_BLE_MESH_LC_RUN`

enumerator `ESP_BLE_MESH_LC_FADE`

enumerator `ESP_BLE_MESH_LC_PROLONG`

enumerator `ESP_BLE_MESH_LC_FADE_STANDBY_AUTO`

enumerator `ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL`

enum `esp_ble_mesh_lighting_server_cb_event_t`

This enum value is the event of Lighting Server Model

Values:

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT`

i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.

ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT`

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT`

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT`

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

enumerator `ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX`

2.3.6 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features
of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all
the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the
application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. How-
ever, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering
schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between
NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for
maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the re-
quirements.

![ESP NimBLE Stack](image)

Thrading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flex-
ibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function
nimble_port_freertos_init. This behavior can be changed by overriding the same function. For BLE
Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using nvs_flash_init() API. This is because ESP controller uses NVS during
  initialization.
- Initialize the host and controller stack using nimble_port_init.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks_INITIALIZATION
- Run the thread for host stack using nimble_port_freertos_init

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming
sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

Functions
Chapter 2. API

**esp_err_t esp_nimble_hci_init**(void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**返回**
- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

**esp_err_t esp_nimble_hci_deinit**(void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**备注**: This function should be called after the NimBLE host is deinitialized.

**返回**
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

**Macros**

BLE_HCI_UART_H4_NONE

BLE_HCI_UART_H4_CMD

BLE_HCI_UART_H4_ACL

BLE_HCI_UART_H4_SCO

BLE_HCI_UART_H4_EVT

ESP-IDF 目前支持两个主机堆栈，基于 Bluedroid 的堆栈（默认）支持传统蓝牙和 BLE，而基于 Apache NimBLE 的堆栈仅支持 BLE，用户可参考如下信息进行选择:

- 对于同时涉及传统蓝牙和 BLE 的用例，应该选用 Bluedroid。
- 对于仅涉及 BLE 的用例，建议选用 NimBLE。在代码占用和运行时，NimBLE 对内存的要求较低，因此适用于此类场景。

请点击下方链接，查看 ESP32 蓝牙架构:

- [ESP32 蓝牙架构 (PDF)]

蓝牙 API 的示例代码存放于 ESP-IDF 示例项目的 bluetooth/bluedroid 目录下。

下面的示例给出了详细介绍:

- GATT 客户端示例
- GATT 服务器服务表格示例
- GATT 服务器端示例
- GATT 客户端安全性示例
- GATT 服务器安全性示例
- GATT 客户端多连接示例

### 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*. 

Espressif Systems 778 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
Chapter 2. API

ESP_FAIL (-1): Generic esp_err_t code indicating failure
ESP_OK (0): esp_err_t value indicating success (no error)
ESP_ERR_NO_MEM (0x101): Out of memory
ESP_ERR_INVALID_ARG (0x102): Invalid argument
ESP_ERR_INVALID_STATE (0x103): Invalid state
ESP_ERR_INVALID_SIZE (0x104): Invalid size
ESP_ERR_NOT_FOUND (0x105): Requested resource not found
ESP_ERR_NOT_SUPPORTED (0x106): Operation or feature not supported
ESP_ERR_TIMEOUT (0x107): Operation timed out
ESP_ERR_INVALID_RESPONSE (0x108): Received response was invalid
ESP_ERR_INVALID_CRC (0x109): CRC or checksum was invalid
ESP_ERR_INVALID_VERSION (0x10a): Version was invalid
ESP_ERR_INVALID_MAC (0x10b): MAC address was invalid
ESP_ERR_NOT_FINISHED (0x10c): There are items remained to retrieve
ESP_ERR_NVS_BASE (0x1100): Starting number of error codes
ESP_ERR_NVS_NOT_INITIALIZED (0x1101): The storage driver is not initialized
ESP_ERR_NVS_NOT_FOUND (0x1102): A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY
ESP_ERR_NVS_TYPE_MISMATCH (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS
ESP_ERR_NVS_READ_ONLY (0x1104): Storage handle was opened as read only
ESP_ERR_NVS_NOT_ENOUGH_SPACE (0x1105): There is not enough space in the underlying storage to save the value
ESP_ERR_NVS_INVALID_NAME (0x1106): Namespace name doesn’t satisfy constraints
ESP_ERR_NVS_INVALID_HANDLE (0x1107): Handle has been closed or is NULL
ESP_ERR_NVS_REMOVE_FAILED (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
ESP_ERR_NVS_KEY_TOO_LONG (0x1109): Key name is too long
ESP_ERR_NVS_PAGE_FULL (0x110a): Internal error; never returned by nvs API functions
ESP_ERR_NVS_INVALID_STATE (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.
ESP_ERR_NVS_INVALID_LENGTH (0x110c): String or blob length is not sufficient to store data
ESP_ERR_NVS_NO_FREE_PAGES (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.
ESP_ERR_NVS_VALUE_TOO_LONG (0x110e): Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation
ESP_ERR_NVS_PART_NOT_FOUND (0x110f): Partition with specified name is not found in the partition table
ESP_ERR_NVS_NEW_VERSION_FOUND (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code
ESP_ERR_NVS_XTS_ENCR_FAILED (0x1111): XTS encryption failed while writing NVS entry
ESP_ERR_NVS_XTS_DECR_FAILED (0x1112): XTS decryption failed while reading NVS entry
**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED** (0x1116): NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART** (0x1117): NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS** (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION** (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE** (0x1200): Offset for ULP-related error codes

**ESP_ERR_ULP_SIZE_TOO_BIG** (0x1201): Program doesn’t fit into RTC memory reserved for the ULP

**ESP_ERR_ULP_INVALID_LOAD_ADDR** (0x1202): Load address is outside of RTC memory reserved for the ULP

**ESP_ERR_ULP_DUPLICATE_LABEL** (0x1203): More than one label with the same number was defined

**ESP_ERR_ULP_UNDEFINED_LABEL** (0x1204): Branch instructions references an undefined label

**ESP_ERR_ULP_BRANCH_OUT_OF_RANGE** (0x1205): Branch target is out of range of B instruction (try replacing with BX)

**ESP_ERR_OTA_BASE** (0x1500): Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT** (0x1501): Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID** (0x1502): Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED** (0x1503): Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER** (0x1504): Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA_ROLLBACK_FAILED** (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE** (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**ESP_ERR_EFUSE** (0x1600): Base error code for efuse api.

**ESP_OK_EFUSE_CNT** (0x1601): OK the required number of bits is set.

**ESP_ERR_EFUSE_CNT_IS_FULL** (0x1602): Error field is full.

**ESP_ERR_EFUSE_REPEATED_PROG** (0x1603): Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING** (0x1604): Error while a encoding operation.

**ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS** (0x1605): Error not enough unused key blocks available

**ESP_ERR_DAMAGED_READING** (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**ESP_ERR_IMAGE_BASE** (0x2000)

**ESP_ERR_IMAGE_FLASH_FAIL** (0x2001)

**ESP_ERR_IMAGE_INVALID** (0x2002)

**ESP_ERR_WIFI_BASE** (0x3000): Starting number of WiFi error codes

**ESP_ERR_WIFI_NOT_INIT** (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF (0x3004): WiFi interface error
ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NV (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state(RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SM (0x3035): WPS state machine is not initialized
ESP_ERR_ESPNOW_BASE (0x3064): ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT (0x3065): ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG (0x3066): Invalid argument
ESP_ERR_ESPNOW_NO_MEM (0x3067): Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_DPP_FAILURE (0x3097): Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE (0x3098): DPP Frame Tx failed OR not Acked
ESP_ERR_DPP_INVALID_ATTR (0x3099): Encountered invalid DPP Attribute
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED (0x8038): wolfSSL api returned failed
ESP_ERR_HTTPS_OTA_BASE (0x9000)
ESP_ERR_HTTPS_OTA_IN_PROGRESS (0x9001)
ESP_ERR_PING_BASE (0xa000)
ESP_ERR_PING_INVALID_PARAMS (0xa001)
ESP_ERR_PING_NO_MEM (0xa002)
ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated
ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occurred while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread
ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes
ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem
ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)
ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)
ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)
ESP_ERR_MEMPROT_BASE (0xd000): Starting number of Memory Protection API error codes
ESP_ERR_MEMPROT_MEMORY_TYPE_INVALID (0xd001)
ESP_ERR_MEMPROT_SPLIT_ADDR_INVALID (0xd002)
ESP_ERR_MEMPROT_SPLIT_ADDR_OUT_OF_RANGE (0xd003)
ESP_ERR_MEMPROT_SPLIT_ADDR_UNALIGNED (0xd004)
ESP_ERR_MEMPROT_UNIMGMT_BLOCK_INVALID (0xd005)
ESP_ERR_MEMPROT_WORLD_INVALID (0xd006)
ESP_ERR_MEMPROT_AREA_INVALID (0xd007)
ESP_ERR_MEMPROT_CPUID_INVALID (0xd008)
ESP_ERR_TCP_TRANSPORT_BASE (0xe000): Starting number of TCP Transport error codes
ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out
ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY_FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)
ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer
ESP_ERR_TCP_TRANSPORT_NO_MEM (0xe004): Memory allocation failed
2.5 连网 API

2.5.1 Wi-Fi

ESP-NOW

概述 ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用来保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

帧格式 ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为:

<table>
<thead>
<tr>
<th>MAC 报头</th>
<th>分类代码</th>
<th>组织标识符</th>
<th>随机值</th>
<th>供应商特定内容</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 字节</td>
<td>1 字节</td>
<td>3 字节</td>
<td>4 字节</td>
<td>7~255 字节</td>
<td>4 字节</td>
</tr>
</tbody>
</table>

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字符。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示:

<table>
<thead>
<tr>
<th>元素 ID</th>
<th>长度</th>
<th>组织标识符</th>
<th>类型</th>
<th>版本</th>
<th>正文</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 字节</td>
<td>1 字节</td>
<td>3 字节</td>
<td>1 字节</td>
<td>1 字节</td>
<td>0~250 字节</td>
</tr>
</tbody>
</table>

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。
- 长度：长度是组织标识符，类型、版本和正文的总长度。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字符。
- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

安全

ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始 PMK（Pre-Shared Key），PMK 可使用 AES-128 算法加密 LMK。请调用 esp_now_set_pmk() 设置 PMK，如果未设置 PMK，将使用默认 PMK。
Chapter 2. API 参考

- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密，最多拥有 6 个不同的 LMK。如果未设置配置设备的 LMK，则动作帧不进行加密。

目前，不支持加密组播供应商特定的动作帧。

**初始化和反初始化** 调用 `esp_now_init()` 初始化 ESP-NOW，调用 `esp_now_deinit()` 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动前传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 `esp_now_deinit()` 时，配对设备的所有信息都将被删除。

**添加配对设备** 在将数据发送到其他设备之前，请先调用 `esp_now_add_peer()` 将其添加到配对设备列表中。如果启用了加密，则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。

配对设备的最大数量是 20，其中加密设备的数量不超过 16，默认值是 6。如果想要修改加密设备的数量，在 WiFi menuconfig 设置 `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM`。

在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 - 14。如果信道设置为 0，数据将在当前信道上发送。否则，必须使用本地设备所在的信道。

**发送 ESP-NOW 数据** 调用 `esp_now_send()` 发送 ESP-NOW 数据。调用 `esp_now_register_send_cb()` 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则，它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发送一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，调用 `esp_now_send()` 时需注意单次发送的数据不能超过 250 字节。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此，建议在发送 ESP-NOW 数据之前等一个应答 (ACK) 数据。发送回调函数在高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发送到队列，并交给优先级较低的任务处理。

**接收 ESP-NOW 数据** 调用 `esp_now_register_recv_cb()` 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发送到队列，并交给优先级较低的任务处理。

**配置 ESP-NOW 速率** 调用 `esp_wifi_config_espnow_rate()` 配置指定接口的 ESPNOW 速率。确保在配置速率之前使能接口。这个 API 应该在 `esp_wifi_start()` 之后调用。

**配置 ESP-NOW 功耗参数** 当且仅当 ESP32 配置为 STA 模式时，允许其进行休眠。

进行休眠时，调用 `esp_now_set_wake_window()` 为 ESP-NOW 收包配置 Window。默认情况下 Window 为最大值，将允许一直收包。

如果对 ESP-NOW 进功耗管理，也需要调用 `esp_wifi_connectionless_module_set_wake_interval()`。

请参考非连接模块功耗管理 获取更多信息。

**应用示例**

- 如何在设备间传输 ESP-NOW 数据：`wifi/espnsw`。
- 了解更多 ESP-NOW 的应用示例，请参考 README.md 文件。

**API 参考**

Functions

```c
esp_err_t esp_now_init (void)
Initialize ESPNOW function.
```

- ESP_OK: succeed
- ESP_ERR_ESPNOW_INTERNAL: Internal error

```c
esp_err_t esp_now_deinit (void)
De-initialize ESPNOW function.
```

- ESP_OK: succeed

```c
esp_err_t esp_now_get_version (uint32_t *version)
Get the version of ESPNOW.
```

- ESP_OK: succeed
- ESP_ERR_ESPNOW_ARG: invalid argument

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
Register callback function of receiving ESPNOW data.
```

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

```c
esp_err_t esp_now_unregister_recv_cb (void)
Unregister callback function of receiving ESPNOW data.
```

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
Register callback function of sending ESPNOW data.
```

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_unregister_send_cb (void)
Unregister callback function of sending ESPNOW data.
```

- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)
Send ESPNOW data.
```

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Chapter 2. API

3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

参数
- `peer_addr` – peer MAC address
- `data` – data to send
- `len` – length of data

返回
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_INTERNAL: internal error
- ESP_ERR_ESPNOW_NO_MEM: out of memory, when this happens, you can delay a while before sending the next data
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
- ESP_ERR_ESPNOW_IF: current WiFi interface doesn’t match that of peer

`esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)`
Add a peer to peer list.

参数 `peer` – peer information

返回
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full
- ESP_ERR_ESPNOW_NO_MEM: out of memory
- ESP_ERR_ESPNOW_EXIST: peer has existed

`esp_err_t esp_now_del_peer (const uint8_t *peer_addr)`
Delete a peer from peer list.

参数 `peer_addr` – peer MAC address

返回
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

`esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)`
Modify a peer.

参数 `peer` – peer information

返回
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full

`esp_err_t esp_wifi_config_espnow_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)`
Config ESPNOW rate of specified interface.

Attention 1. This API should be called after esp_wifi_start().

参数
- `ifx` – Interface to be configured.
- `rate` – Phy rate to be configured.

返回
- ESP_OK: succeed
Chapter 2. API Reference

- others: failed

```c
esp_err_t esp_now_get_peer (const uint8_t* peer_addr, esp_now_peer_info_t* peer)
```
Get a peer whose MAC address matches peer_addr from peer list.

- parameter
  - `peer_addr` - peer MAC address
  - `peer` - peer information

- return
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
  - ESP_ERR_ESPNOW_ARG: invalid argument
  - ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

```c
esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t* peer)
```
Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

- parameter
  - `from_head` - fetch from head of list or not
  - `peer` - peer information

- return
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
  - ESP_ERR_ESPNOW_ARG: invalid argument
  - ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

```c
bool esp_now_is_peer_exist (const uint8_t* peer_addr)
```
Peer exists or not.

- parameter
  - `peer_addr` - peer MAC address

- return
  - true: peer exists
  - false: peer not exists

```c
esp_err_t esp_now_get_peer_num (esp_now_peer_num_t* num)
```
Get the number of peers.

- parameter
  - `num` - number of peers

- return
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
  - ESP_ERR_ESPNOW_ARG: invalid argument

```c
esp_err_t esp_now_set_pmk (const uint8_t* pmk)
```
Set the primary master key.

**Attention**  1. primary master key is used to encrypt local master key

- parameter
  - `pmk` - primary master key

- return
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
  - ESP_ERR_ESPNOW_ARG: invalid argument

```c
esp_err_t esp_now_set_wake_window (uint16_t window)
```
Set wake window for esp_now to wake up in interval unit.
Attention 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 2. Default value is the maximum.

参数  window  —  Milliseconds would the chip keep waked each interval, from 0 to 65535.

返回
  •  ESP_OK : succeed
  •  ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

**Structures**

`struct esp_now_peer_info`  
ESPNOW peer information parameters.

**Public Members**

`uint8_t peer_addr[ESP_NOW_ETH_ALEN]`  
ESPNOW peer MAC address that is also the MAC address of station or softap

`uint8_t lmk[ESP_NOW_KEY_LEN]`  
ESPNOW peer local master key that is used to encrypt data

`uint8_t channel`  
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

`wifi_interface_t ifidx`  
Wi-Fi interface that peer uses to send/receive ESPNOW data

`bool encrypt`  
ESPNOW data that this peer sends/receives is encrypted or not

`void *priv`  
ESPNOW peer private data

`struct esp_now_peer_num`  
Number of ESPNOW peers which exist currently.

**Public Members**

`int total_num`  
Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

`int encrypt_num`  
Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
Chapter 2. API 参考

Macros

**ESP_ERR_ESPNOW_BASE**
ESPNOW error number base.

**ESP_ERR_ESPNOW_NOT_INIT**
ESPNOW is not initialized.

**ESP_ERR_ESPNOW_ARG**
Invalid argument

**ESP_ERR_ESPNOW_NO_MEM**
Out of memory

**ESP_ERR_ESPNOW_FULL**
ESPNOW peer list is full

**ESP_ERR_ESPNOW_NOT_FOUND**
ESPNOW peer is not found

**ESP_ERR_ESPNOW_INTERNAL**
Internal error

**ESP_ERR_ESPNOW_EXIST**
ESPNOW peer has existed

**ESP_ERR_ESPNOW_IF**
Interface error

**ESP_NOW_ETH_ALEN**
Length of ESPNOW peer MAC address

**ESP_NOW_KEY_LEN**
Length of ESPNOW peer local master key

**ESP_NOW_MAX_TOTAL_PEER_NUM**
Maximum number of ESPNOW total peers

**ESP_NOW_MAX_ENCRYPT_PEER_NUM**
Maximum number of ESPNOW encrypted peers

**ESP_NOW_MAX_DATA_LEN**
Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t*mac_addr, const uint8_t*data, int data_len)
Callback function of receiving ESPNOW data.

Param mac_addr peer MAC address
Param data received data
Param data_len length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t*mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.

Param mac_addr peer MAC address
Param status status of sending ESPNOW data (succeed or fail)

Enumerations

enum esp_now_send_status_t
Status of sending ESPNOW data.

Values:

enumerator ESP_NOW_SEND_SUCCESS
Send ESPNOW data successfully

enumerator ESP_NOW_SEND_FAIL
Send ESPNOW data fail

ESP-WIFI-MESH 編程指南

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. ESP-WIFI-MESH 编程模型
2. 编写 ESP-WIFI-MESH 应用程序
3. 自组网
4. 应用实例
5. API 参考

有关 ESP-WIFI-MESH 协议的文档，请见 ESP-WIFI-MESH API 指南。有关 ESP-WIFI-MESH 开发框架的更多内容，请见 ESP-WIFI-MESH 开发框架。

ESP-WIFI-MESH 编程模型

软件栈 ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

系统事件 应用程序可通过 ESP-WIFI-MESH 事件与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 Wi-Fi 事件任务与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

mesh_event_id_t 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过 esp_event_handler_register() 将 Mesh 事件处理程序注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。
Chapter 2. API 参考

图 2: ESP-WIFI-MESH 软件栈

图 3: ESP-WIFI-MESH 系统事件交互

Mesh 事件的典型应用场景包括：使用 MESH_EVENT_PARENT_CONNECTED 和 MESH_EVENT_CHILD_CONNECTED 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用 IP_EVENT_STA_GOT_IP 和 IP_EVENT_STA_LOST_IP 事件来指示根节点何时可以向外 IP 网络传输数据。

警告：在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为。因此，用户不应该在 esp_mesh_start() 和 esp_mesh_stop() 之间调用 Wi-Fi API。

LwIP & ESP-WIFI-MESH 应用程序无需通过 LwIP 层即可直接访问 ESP-WIFI-MESH 软件栈。LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自组网节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

可成为根节点的每个节点都需要通过调用 esp_netif_init() 来初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序不应使用 esp_netif API 创建或注册任何网络接口。

ESP-WIFI-MESH 的根节点必须与路由器连接。因此，当一个节点成为根节点时，该节点对应的应用程序必须启动 DHCP 客户端服务并立即获取 IP 地址。这样做将允许其他节点开始用于从外部 IP 网络发往/接收数据包。但是，如果使用静态 IP 设置，则不需要执行此步骤。

编写 ESP-WIFI-MESH 应用程序 ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下文代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。
```c
ESP_ERROR_CHECK(esp_netif_init());

/* 开始初始化 */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));

/* 注册 IP 事件处理器 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());

LwIP Wi-Fi 很可能 ESP-WIFI-MESH

ESP-WIFI-MESH

1. 初始化 Mesh
2. 配置 ESP-WIFI-MESH 网络
3. 启动 Mesh

初始化 Mesh 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```c
/* Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());

/* 注册 mesh 事件处理器 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL));
``` 

配置 ESP-WIFI-MESH 网络 ESP-WIFI-MESH 可通过 esp_mesh_set_config() 进行配置，并使用 mesh_cfg_t 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel (信道)</td>
<td>1 到 14 信道</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ESP-WIFI-MESH 网络的 ID，见 mesh_addr_t。</td>
</tr>
<tr>
<td>Router (路由器)</td>
<td>路由器配置，见 mesh_router_t。</td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP 配置，见 mesh_ap_cfg_t。</td>
</tr>
<tr>
<td>Crypto Functions (加密函数)</td>
<td>Mesh IE 的加密函数，见 mesh_crypto_funcs_t。</td>
</tr>
</tbody>
</table>

下方代码片段展示如何配置 ESP-WIFI-MESH。

```c
/* 默认启用 Mesh IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();

/* Mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);

/* 信道（需与路由器信道匹配）*/
cfg.channel = CONFIG_MESH_CHANNEL;

/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));

/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```
启动 Mesh 下方代码片段展示了如何启动 ESP-WIFI-MESH。

```c
/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());
```

启动 ESP-WIFI-MESH 后，应用程序应检查 ESP-WIFI-MESH 事件。以确定它何时连接到网络。连接后，应用程序可使用 `esp_mesh_send()` 和 `esp_mesh_recv()` 在 ESP-WIFI-MESH 网络中发送、接收数据包。

自组网 自组网是 ESP-WIFI-MESH 的功能之一，允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性，可适应变化的动态网络拓扑结构和环境。启用自组网功能后，ESP-WIFI-MESH 网络中的节点能够自主完成以下操作：

- 选择或选举根节点（见 [建立网络 中的 自动根节点选择]）
- 选择首席的父节点（见 [建立网络 中的 父节点选择]
- 网络断开时自动重新连接（见 [管理网络 中的 中间父节点失败]

启用自组网功能后，ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此，在启用自组网功能时，应用层不得调用 Wi-Fi API，否则会干扰 ESP-WIFI-MESH 的工作。

开关自组网 应用程序可以在运行时通过调用 `esp_mesh_set_self_organized()` 函数，启用或禁用自组网功能。该函数具有以下两个参数：

- bool enable 指定启用或禁用自组网功能。
- bool select_parent 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态，选择新的父节点具有不同的作用。在禁用自组网功能时，此参数不使用。

禁用自组网 下方代码片段展示了如何禁用自组网功能。

```c
//禁用自组网
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点先前尝试重新连接到父节点或路由器，则将停止重新连接。

启用自组网 ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

<table>
<thead>
<tr>
<th>是否选择父节点</th>
<th>是否为根结点</th>
<th>作用</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>N</td>
<td>已连接到父节点的节点将保持连接。 之后扫描父节点的节点将停止扫描。调用 <code>esp_mesh_connect()</code> 重新启动。</td>
</tr>
<tr>
<td>Y</td>
<td></td>
<td>已连接到路由器的根节点将保持连接。 从路由器断开的根结点需调用 <code>esp_mesh_connect()</code> 进行重连。</td>
</tr>
<tr>
<td>N</td>
<td></td>
<td>没有父节点的节点将自动选择首选父节点并连接。 从路由器断开的根结点需调用 <code>esp_mesh_connect()</code> 进行重连。</td>
</tr>
<tr>
<td>Y</td>
<td>N</td>
<td>已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。 从路由器断开的根结点需调用 <code>esp_mesh_connect()</code> 进行重连。</td>
</tr>
<tr>
<td>Y</td>
<td></td>
<td>根节点在连接至父节点前必须放弃“根结点”的角色。因此，根节点将断开与路由器和所有子节点的连接，选择首选父节点并进行连接。</td>
</tr>
</tbody>
</table>

下方代码片段展示了如何启用自组网功能。

```c
//启用自组网，选择一个新的父节点
esp_mesh_set_self_organized(true, true);
```

(下页继续)
调用 Wi-Fi API 在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描附近的接入点（AP）。但应用程序调用任何 Wi-Fi API 之前，必须先禁用自组网。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常使用。

应用程序不应在 esp_mesh_set_self_organized() 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用 esp_wifi_scan_start()。

```c
//禁用自组网
esp_mesh_set_self_organized(0, 0);
//停止任何正在进行的扫描
esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();
//进程扫描结果

... //如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

... //如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

... //如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0); //不选择新的父节点
esp_mesh_connect(); //手动重新连接到路由器
```

应用实例 ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目：

内部通信示例 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。

手动连网示例 展示了如何在禁止自组网功能的情况下使用 ESP-WIFI-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

API 参考

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

- esp_err_t esp_mesh_init (void)
  
  Mesh initialization.
• Check whether Wi-Fi is started.
• Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

```
return
  • ESP_OK
  • ESP_FAIL
```

`esp_err_t esp_mesh_deinit (void)`
Mesh de-initialization.

- Release resources and stop the mesh

```
return
  • ESP_OK
  • ESP_FAIL
```

`esp_err_t esp_mesh_start (void)`
Start mesh.

• Initialize mesh IE.
• Start mesh network management service.
• Create TX and RX queues according to the configuration.
• Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

```
return
  • ESP_OK
  • ESP_FAIL
  • ESP_ERR_MESH_NOT_INIT
  • ESP_ERR_MESH_NOT_CONFIG
  • ESP_ERR_MESH_NO_MEMORY
```

`esp_err_t esp_mesh_stop (void)`
Stop mesh.

• Deinitialize mesh IE.
• Disconnect with current parent.
• Disassociate all currently associated children.
• Stop mesh network management service.
• Unregister mesh packets receive callback.
• Delete TX and RX queues.
• Release resources.
• Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
• Set Wi-Fi Power Save type to WIFI_PS_NONE.

```
return
  • ESP_OK
  • ESP_FAIL
```
**esp_err_t esp_mesh_send**  
(const *to, const *data, int flag, const *opt[], int opt_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**参数**
- **to** [in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** [in] pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** [in] bitmap for data sent
  - Speed up the route search
    - If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - If the packet is to an internal device, MESH_DATA_P2P should be set.
    - If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    - If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
    - Specify whether this API is block or non-block, block by default
      - If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
    - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **opt** [in] options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** [in] option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**返回**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
• ESP_ERR_MESH_OPT_UNKNOWN
• ESP_ERR_MESH_EXCEED_MTU
• ESP_ERR_MESH_NO_MEMORY
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_NO_ROUTE_FOUND
• ESP_ERR_MESH_DISCARD

`esp_err_t esp_mesh_send_block_time (uint32_t time_ms)`
Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

参数  `time_ms` -in blocking time of esp_mesh_send(), unit: ms
返回  ESP_OK

`esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t *opt[], int opt_count)`
Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
• Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

参数
• `from` -out the address of the original source of the packet
• `data` -out pointer to the received mesh packet
  -- Field proto is the data protocol in use. Should follow it to parse the received data.
  -- Field tos is the transmission tos (type of service) in use.
• `timeout_ms` -in wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• `flag` -out bitmap for data received
  -- MESH_DATA_FROMDS represents data from external IP network
  -- MESH_DATA_TODS represents data directed upward within the mesh network
• `opt` -out options desired to receive
  -- MESH_OPT_RECV_DS_ADDR attaches the DS address
• `opt_count` -in option count desired to receive
  -- Currently, this API only takes one option, so opt_count is only supported to be 1.

返回
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD

`esp_err_t esp_mesh_recv_toDS (mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t *opt[], int opt_count)`
Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

参数

• from - [out] the address of the original source of the packet
• to - [out] the address contains remote IP address and port (IPv4:PORT)
• data - [out] pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• timeout_ms - [in] wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• flag - [out] bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
• opt - [out] options desired to receive
• opt_count - [in] option count desired to receive

返回

• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCONNECT
• ESP_ERR_MESH_RECV_RELEASE

esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)

Set mesh stack configuration.

• Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.
### Chapter 2. API 参考

#### esp_mesh_get_config

**Function:**
Get mesh stack configuration.

**Syntax:**
```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```

**Parameters:**
- `config` [in] pointer to mesh stack configuration

**Return Codes:**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

#### esp_mesh_set_router

**Function:**
Get router configuration.

**Syntax:**
```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```

**Parameters:**
- `router` [in] pointer to router configuration

**Return Codes:**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Attention:** This API is used to dynamically modify the router configuration after mesh is configured.

#### esp_mesh_get_router

**Function:**
Get router configuration.

**Syntax:**
```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```

**Parameters:**
- `router` [out] pointer to router configuration

**Return Codes:**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

#### esp_mesh_set_id

**Function:**
Set mesh network ID.

**Syntax:**
```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```

**Parameters:**
- `id` [in] pointer to mesh network ID

**Return Codes:**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Attention:** This API is used to dynamically modify the mesh network ID.

#### esp_mesh_get_id

**Function:**
Get mesh network ID.

**Syntax:**
```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```

**Parameters:**
- `id` [out] pointer to mesh network ID

**Return Codes:**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

#### esp_mesh_set_type

**Function:**
Designate device type over the mesh network.

**Syntax:**
```c
esp_err_t esp_mesh_set_type(mesh_type_t type)
```

**Parameters:**
- `type` device type

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router
mesh_type_t esp_mesh_get_type (void)
Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

返回 mesh type

esp_err_t esp_mesh_set_max_layer (int max_layer)
Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

参数 max_layer -[in] max layer value
返回
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

int esp_mesh_get_max_layer (void)
Get max layer value.

返回 max layer value

esp_err_t esp_mesh_set_ap_password (const uint8_t *pwd, int len)
Set mesh softAP password.

Attention This API shall be called before mesh is started.

参数 pwd -[in] pointer to the password
len -[in] password length
返回
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)
Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

参数 authmode -[in] authentication mode
返回
**Chapter 2. API 参考**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

`wifi_auth_mode_t esp_mesh_get_ap_authmode (void)`
Get mesh softAP authentication mode.

- 类型 authentication mode

`esp_err_t esp_mesh_set_ap_connections (int connections)`
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**参数**
- connections - [in] the number of max connections

- 返回
  - ESP_OK
  - ESP_ERR_MESH_ARGUMENT

`int esp_mesh_get_ap_connections (void)`
Get mesh max connection configuration.

- 返回 the number of mesh max connections

`int esp_mesh_get_non_mesh_connections (void)`
Get non-mesh max connection configuration.

- 返回 the number of non-mesh max connections

`int esp_mesh_get_layer (void)`
Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

- 返回 layer value

`esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)`
Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**参数**
- bssid - [out] pointer to parent BSSID

- 返回
  - ESP_OK
  - ESP_FAIL

`bool esp_mesh_is_root (void)`
Return whether the device is the root node of the network.

- 返回 true/false
**esp_err_t esp_mesh_set_self_organized** (bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**参数**
- **enable**  [in] enable or disable self-organized networking
- **select_parent**  [in] Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

**返回**
- ESP_OK
- ESP_FAIL

**bool esp_mesh_get_self_organized** (void)

Return whether enable self-organized networking or not.

**返回** true/false

**esp_err_t esp_mesh_waive_root** (const mesh_vote_t *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**参数**
- **vote**  [in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- **reason**  [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

**返回**
- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL
Chapter 2. API 参考

**esp_err_t esp_mesh_set_vote_percentage (float percentage)**
Set vote percentage threshold for approval of being a root (default: 0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

<table>
<thead>
<tr>
<th>参数</th>
<th>percentage</th>
<th>[in] vote percentage threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>返回</td>
<td>ESP_OK</td>
<td>ESP_FAIL</td>
</tr>
</tbody>
</table>

**float esp_mesh_get_vote_percentage (void)**
Get vote percentage threshold for approval of being a root.

| 返回 | percentage threshold |

**esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)**
Set mesh softAP associate expired time (default: 10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

<table>
<thead>
<tr>
<th>参数</th>
<th>seconds</th>
<th>[in] the expired time</th>
</tr>
</thead>
<tbody>
<tr>
<td>返回</td>
<td>ESP_OK</td>
<td>ESP_FAIL</td>
</tr>
</tbody>
</table>

**int esp_mesh_get_ap_assoc_expire (void)**
Get mesh softAP associate expired time.

| 返回 | seconds |

**int esp_mesh_get_total_node_num (void)**
Get total number of devices in current network (including the root).

**Attention** The returned value might be incorrect when the network is changing.

| 返回 | total number of devices (including the root) |

**int esp_mesh_get_routing_table_size (void)**
Get the number of devices in this device’s sub-network (including self)

| 返回 | the number of devices over this device’s sub-network (including self) |

**esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)**
Get routing table of this device’s sub-network (including itself)

<table>
<thead>
<tr>
<th>参数</th>
<th>mac [out] pointer to routing table</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>len [in] routing table size (in bytes)</td>
</tr>
<tr>
<td></td>
<td>size [out] pointer to the number of devices in routing table (including itself)</td>
</tr>
<tr>
<td>返回</td>
<td>ESP_OK</td>
</tr>
<tr>
<td></td>
<td>ESP_ERR_MESH_ARGUMENT</td>
</tr>
</tbody>
</table>
**esp_err_t esp_mesh_post_toDS_state (bool reachable)**

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

- **reachable** – [in] this state represents whether the root is able to access external IP network
- **ESP_OK**
- **ESP_FAIL**

**esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)**

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

- **pending** – [out] pointer to the TX pending
- **ESP_OK**
- **ESP_FAIL**

**esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)**

Return the number of packets available in the queue waiting to be received by applications.

- **pending** – [out] pointer to the RX pending
- **ESP_OK**
- **ESP_FAIL**

**int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)**

Return the number of packets could be accepted from the specified address.

- **addr** – [in] self address or an associate children address
- **xseqno_in** – [out] sequence number of the last received packet from the specified address
- **ESP_OK**
- **ESP_FAIL**

**esp_err_t esp_mesh_set_xon_qsize (int qsize)**

Set the number of queue.

**Attention** This API shall be called before mesh is started.

- **qsize** – [in] default:32 (min:16)
- **ESP_OK**
- **ESP_FAIL**

**int esp_mesh_get_xon_qsize (void)**

Get queue size.

- **ESP_OK**
- **ESP_FAIL**

**esp_err_t esp_mesh_allow_root_conflicts (bool allowed)**

Set whether allow more than one root existing in one network.

- **allowed** – [in] allow or not
- **ESP_OK**
- **ESP_WIFI_ERR_NOT_INIT**
- **ESP_WIFI_ERR_NOT_START**
bool esp_mesh_is_root_conflicts_allowed(void)
Check whether allow more than one root to exist in one network.

返回  true/false

esp_err_t esp_mesh_set_group_id (const mesh_addr_t *addr, int num)
Set group ID addresses.

参数
  • addr - [in] pointer to new group ID addresses
  • num - [in] the number of group ID addresses

返回
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

esp_err_t esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)
Delete group ID addresses.

参数
  • addr - [in] pointer to deleted group ID address
  • num - [in] the number of group ID addresses

返回
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

int esp_mesh_get_group_num (void)
Get the number of group ID addresses.

返回  the number of group ID addresses

esp_err_t esp_mesh_get_group_list (mesh_addr_t *addr, int num)
Get group ID addresses.

参数
  • addr - [out] pointer to group ID addresses
  • num - [in] the number of group ID addresses

返回
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

bool esp_mesh_is_my_group (const mesh_addr_t *addr)
Check whether the specified group address is my group.

返回  true/false

esp_err_t esp_mesh_set_capacity_num (int num)
Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

参数 num - [in] mesh network capacity

返回
  • ESP_OK
  • ESP_ERR_MESH_NOT_ALLOWED
  • ESP_MESH_ERR_ARGUMENT

int esp_mesh_get_capacity_num (void)
Get mesh network capacity.

返回  mesh network capacity
**esp_err_t esp_mesh_set_ie_crypto_funcs** (const mesh_crypto_funcs_t *crypto_funcs)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

- **参数** crypto_funcs - [in] crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.
  - **返回** ESP_OK

**esp_err_t esp_mesh_set_ie_crypto_key** (const char* key, int len)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

- **参数**
  - **key** - [in] ASCII crypto key
  - **len** - [in] length in bytes, range: 8~64
- **返回**
  - ESP_OK
  - ESP_MESH_ERR_ARGUMENT

**esp_err_t esp_mesh_set_root_healing_delay** (int delay_ms)

Set delay time before starting root healing.

- **参数** delay_ms - [in] delay time in milliseconds
  - **返回** ESP_OK

**int esp_mesh_get_root_healing_delay** (void)

Get delay time before network starts root healing.

- **返回** delay time in milliseconds

**esp_err_t esp_mesh_set_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disable automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

- **参数** enable - [in] enable or not
  - **返回** ESP_OK
bool esp_mesh_is_root_fixed(void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

返回 true/false

esp_err_t esp_mesh_set_parent(const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

参数
- parent - [in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- parent_mesh_id - [in] parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- my_type - [in] mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- my_layer - [in] mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

返回
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)

Get mesh networking IE length of one AP.

参数 len - [out] mesh networking IE length

返回
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)

Get AP record.

Attention Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

参数
- ap_record - [out] pointer to one AP record
- buffer - [out] pointer to the mesh networking IE of this AP

返回
Chapter 2. API 参数

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

```c
esp_err_t esp_mesh_flush_upstream_packets (void)
```
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

返回
- ESP_OK

```c
esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)
```
Get the number of nodes in the subnet of a specific child.

参数
- `child_mac` [in] an associated child address of this device
- `nodes_num` [out] pointer to the number of nodes in the subnet of a specific child

返回
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
```
Get nodes in the subnet of a specific child.

参数
- `child_mac` [in] an associated child address of this device
- `nodes` [out] pointer to nodes in the subnet of a specific child
- `nodes_num` [in] the number of nodes in the subnet of a specific child

返回
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_disconnect (void)
```
Disconnect from current parent.

返回
- ESP_OK

```c
esp_err_t esp_mesh_connect (void)
```
Connect to current parent.

返回
- ESP_OK

```c
esp_err_t esp_mesh_flush_scan_result (void)
```
Flush scan result.

返回
- ESP_OK

```c
esp_err_t esp_mesh_switch_channel (const uint8_t *new_bssid, int csa_newchan, int csa_count)
```
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function
**Attention** This API is only called by the root.

**参数**
- **new_bssid [in]** the new router BSSID if the router changes
- **csa_newchan [in]** the new channel number to which the whole network is moving
- **csa_count [in]** channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**返回**
- ESP_OK

```c
esp_err_t esp_mesh_get_router_bssid(uint8_t* router_bssid)
```
Get the router BSSID.

**参数**
- **router_bssid [out]** pointer to the router BSSID

**返回**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

```c
int64_t esp_mesh_get_tsf_time(void)
```
Get the TSF time.

**返回**
- the TSF time

```c
esp_err_t esp_mesh_set_topology(esp_mesh_topology_t topo)
```
Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**参数**
- **topo [in]** MESH_TOPO_TREE or MESH_TOPO_CHAIN

**返回**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_mesh_topology_t esp_mesh_get_topology(void)
```
Get mesh topology.

**返回**
- MESH_TOPO_TREE or MESH_TOPO_CHAIN

```c
esp_err_t esp_mesh_enable_ps(void)
```
Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**返回**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_disable_ps(void)
```
Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.
Chapter 2. API 参考

返回
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool esp_mesh_is_ps_enabled (void)
Check whether the mesh Power Save function is enabled.

返回 true/false

bool esp_mesh_is_device_active (void)
Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

返回 true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)
Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

参数
- dev_duty  [in] device duty cycle
- dev_duty_type  [in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

返回
- ESP_OK
- ESP_FAIL

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)
Get device duty cycle and type.

参数
- dev_duty  [out] device duty cycle
- dev_duty_type  [out] device PS duty cycle type

返回
- ESP_OK

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)
Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.
- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

**参数**
- nwk_duty - [in] network duty cycle
- duration_mins -[in] duration (unit: minutes)
- applied_rule -[in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

**返回**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_get_network_duty_cycle (int*nwk_duty, int*duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

**参数**
- nwk_duty - [out] current network duty cycle
- duration_mins -[out] the duration of current nwk_duty
- dev_duty_type -[out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- applied_rule -[out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

**返回**
- ESP_OK

```c
int esp_mesh_get_running_active_duty_cycle (void)
```

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons,
and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

返回 the running active duty cycle

```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
```

Duty signaling.

参数 `fwd_times` - [in] the times of forwarding duty signaling packets

返回
- ESP_OK

### Unions

```c
union mesh_addr_t
   #include <esp_mesh.h> Mesh address.
```

**Public Members**

```c
uint8_t addr[6]
   mac address
```

```c
mip_t mip
   mip address
```

```c
union mesh_event_info_t
   #include <esp_mesh.h> Mesh event information.
```

**Public Members**

```c
mesh_event_channel_switch_t channel_switch
   channel switch
```

```c
mesh_event_child_connected_t child_connected
   child connected
```

```c
mesh_event_child_disconnected_t child_disconnected
   child disconnected
```

```c
mesh_event_routing_table_change_t routing_table
   routing table change
```

```c
mesh_event_connected_t connected
   parent connected
```

```c
mesh_event_disconnected_t disconnected
   parent disconnected
```
```
Chapter 2. API 参考

mesh_event_no_parent_found_t no_parent
  no parent found

mesh_event_layer_change_t layer_change
  layer change

mesh_event_toDS_state_t toDS_state
  toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
  vote started

mesh_event_root_address_t root_addr
  root address

mesh_event_root_switch_req_t switch_req
  root switch request

mesh_event_root_conflict_t root_conflict
  other powerful root

mesh_event_root_fixed_t root_fixed
  fixed root

mesh_event_scan_done_t scan_done
  scan done

mesh_event_network_state_t network_state
  network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
  network found that can join

mesh_event_router_switch_t router_switch
  new router information

mesh_event_ps_duty_t ps_duty
  PS duty information

union mesh_rc_config_t
  #include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
  max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)
```
mesh_addr_t rc_addr
    a new root address specified by users for API esp_mesh_waive_root()

**Structures**

**struct mip_t**

IP address and port.

**Public Members**

ip4_addr_t ip4
    IP address

uint16_t port
    port

struct mesh_event_channel_switch_t
    Channel switch information.

**Public Members**

uint8_t channel
    new channel

struct mesh_event_connected_t
    Parent connected information.

**Public Members**

wifi_event_sta_connected_t connected
    parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer
    layer

uint8_t duty
    parent duty

struct mesh_event_no_parent_found_t
    No parent found information.

**Public Members**

int scan_times
    scan times being through
struct `mesh_event_layer_change_t`
Layer change information.

**Public Members**

`uint16_t new_layer`
new layer

struct `mesh_event_vote_started_t`
vote started information

**Public Members**

`int reason`
vote reason, vote could be initiated by children or by the root itself

`int attempts`
max vote attempts before stopped

`mesh_addr_t rc_addr`
root address specified by users via API `esp_mesh_waive_root()`

struct `mesh_event_find_network_t`
find a mesh network that this device can join

**Public Members**

`uint8_t channel`
channel number of the new found network

`uint8_t router_bssid[6]`
router BSSID

struct `mesh_event_root_switch_req_t`
Root switch request information.

**Public Members**

`int reason`
root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

`mesh_addr_t rc_addr`
the address of root switch requestor

struct `mesh_event_root_conflict_t`
Other powerful root address.
Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.

Public Members

uint16_t rt_size_new
the new value

uint16_t rt_size_change
the changed value

struct mesh_event_root_fixed_t
Root fixed.

Public Members

bool is_fixed
status

struct mesh_event_scan_done_t
Scan done event information.

Public Members

uint8_t number
the number of APs scanned

struct mesh_event_network_state_t
Network state information.

Public Members

bool is_rootless
whether current mesh network has a root
struct mesh_event_ps_duty_t
    PS duty information.

    Public Members

    uint8_t_t duty
        parent or child duty

    mesh_event_child_connected_t child_connected
        child info

struct mesh_opt_t
    Mesh option.

    Public Members

    uint8_t_t type
        option type

    uint16_t_t len
        option length

    uint8_t_t* val
        option value

struct mesh_data_t
    Mesh data for esp_mesh_send() and esp_mesh_recv()

    Public Members

    uint8_t_t* data
        data

    uint16_t_t size
        data size

    mesh_proto_t proto
        data protocol

    mesh_qos_t qos
        data type of service

struct mesh_router_t
    Router configuration.
Chapter 2. API

Public Members

```c
uint8_t ssid[32]
    SSID

uint8_t ssid_len
    length of SSID

uint8_t bssid[6]
    BSSID, if this value is specified, users should also specify “allow_router_switch”.

uint8_t password[64]
    password
```

bool allow_router_switch
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

```c
struct mesh_ap_cfg_t
    Mesh softAP configuration.
```

Public Members

```c
uint8_t password[64]
    mesh softAP password

uint8_t max_connection
    max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t nonmesh_max_connection
    max non-mesh connections
```

```c
struct mesh_cfg_t
    Mesh initialization configuration.
```

Public Members

```c
uint8_t channel
    channel, the mesh network on
```

bool allow_channel_switch
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.
mesh_addr_t mesh_id
mesh network identification

mesh_router_t router
router configuration

mesh_ap_cfg_t mesh_ap
mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
crypto functions

struct mesh_vote_t
Vote.

Public Members

float percentage
vote percentage threshold for approval of being a root

bool is_rc_specified
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
network start root election.

mesh_rc_config_t config
vote address configuration

struct mesh_tx_pending_t
The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
to parent queue

int to_parent_p2p
to parent (P2P) queue

int to_child
to child queue

int to_child_p2p
to child (P2P) queue

int mgmt
management queue
Chapter 2. API

int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS

int toSelf
    to self

Macros

MESH_ROOT_LAYER
    root layer value

MESH_MTU
    max transmit unit(in bytes)

MESH_MPS
    max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
    Mesh error code definition.
    Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
    mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
    mesh isn’t configured

ESP_ERR_MESH_NOT_START
    mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
    not supported yet

ESP_ERR_MESH_NOT_ALLOWED
    operation is not allowed

ESP_ERR_MESH_NO_MEMORY
    out of memory
ESP_ERR_MESH_ARGUMENT
    illegal argument

ESP_ERR_MESH_EXCEED_MTU
    packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
    timeout

ESP_ERR_MESH_DISCONNECTED
    disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
    queue fail

ESP_ERR_MESH_QUEUE_FULL
    queue full

ESP_ERR_MESH_NO_PARENT_FOUND
    no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
    no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
    no option found

ESP_ERR_MESH_OPTION_UNKNOWN
    unknown option

ESP_ERR_MESH_XON_NO_WINDOW
    no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
    low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
    discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
    discard the packet

ESP_ERR_MESH_VOTING
    vote in progress

ESP_ERR_MESH_XMIT
    XMIT
**Chapter 2. API 参考**

**ESP_ERR_MESH_QUEUE_READ**
error in reading queue

**ESP_ERR_MESH_PS**
mesh PS is not specified as enable or disable

**ESP_ERR_MESH_RECV_RELEASE**
release esp_mesh_recv_toDS

**MESH_DATA_ENC**
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

**MESH_DATA_P2P**
point-to-point delivery over the mesh network

**MESH_DATA_FROMDS**
receive from external IP network

**MESH_DATA_TODS**
identify this packet is target to external IP network

**MESH_DATA_NONBLOCK**
esp_mesh_send() non-block

**MESH_DATA_DROP**
in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH_DATA_GROUP**
identify this packet is target to a group address

**MESH_OPT_SEND_GROUP**
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

**MESH_OPT_RECV_DS_ADDR**
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

**MESH_ASSOC_FLAG_VOTE_IN_PROGRESS**
Flag of mesh networking IE.
vote in progress

**MESH_ASSOC_FLAG_NETWORK_FREE**
no root in current network

**MESH_ASSOC_FLAG_ROOTS_FOUND**
root conflict is found
**MESH_ASSOC_FLAG_ROOT_FIXED**

fixed root

**MESH_PS_DEVICE_DUTY_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

**MESH_INIT_CONFIG_DEFAULT**

### Type Definitions

typedef `mesh_addr_t` mesh_event_root_address_t

Root address.

typedef `wifi_event_sta_disconnected_t` mesh_event_disconnected_t

Parent disconnected information.

typedef `wifi_event_ap_staconnected_t` mesh_event_child_connected_t

Child connected information.

typedef `wifi_event_ap_stadisconnected_t` mesh_event_child_disconnected_t

Child disconnected information.

typedef `wifi_event_sta_connected_t` mesh_event_router_switch_t

New router information.

### Enumerations

enum mesh_event_id_t

Enumerated list of mesh event id.

Values:

enumerator **MESH_EVENT_STARTED**

mesh is started

enumerator **MESH_EVENT_STOPPED**

mesh is stopped
enumerator `MESH_EVENT_CHANNEL_SWITCH` 
channel switch

enumerator `MESH_EVENT_CHILD_CONNECTED` 
a child is connected on softAP interface

enumerator `MESH_EVENT_CHILD_DISCONNECTED` 
a child is disconnected on softAP interface

enumerator `MESH_EVENT_ROUTING_TABLE_ADD` 
routing table is changed by adding newly joined children

enumerator `MESH_EVENT_ROUTING_TABLE_REMOVE` 
routing table is changed by removing leave children

enumerator `MESH_EVENT_PARENT_CONNECTED` 
parent is connected on station interface

enumerator `MESH_EVENT_PARENT_DISCONNECTED` 
parent is disconnected on station interface

enumerator `MESH_EVENT_NO_PARENT_FOUND` 
no parent found

enumerator `MESH_EVENT_LAYER_CHANGE` 
layer changes over the mesh network

enumerator `MESH_EVENT_TODS_STATE` 
state represents whether the root is able to access external IP network

enumerator `MESH_EVENT_VOTE_STARTED` 
the process of voting a new root is started either by children or by the root

enumerator `MESH_EVENT_VOTE_STOPPED` 
the process of voting a new root is stopped

enumerator `MESH_EVENT_ROOT_ADDRESS` 
the root address is obtained. It is posted by mesh stack automatically.

enumerator `MESH_EVENT_ROOT_SWITCH_REQ` 
root switch request sent from a new voted root candidate

enumerator `MESH_EVENT_ROOT_SWITCH_ACK` 
root switch acknowledgment responds the above request sent from current root

enumerator `MESH_EVENT_ROOT_ASKED_YIELD` 
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.
Chapter 2. API

enumerator MESH_EVENT_ROOT_FIXED
    when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator MESH_EVENT_SCAN_DONE
    if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator MESH_EVENT_NETWORK_STATE
    network state, such as whether current mesh network has a root.

enumerator MESH_EVENT_STOP_RECONNECTION
    the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator MESH_EVENT_FIND_NETWORK
    when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator MESH_EVENT_ROUTER_SWITCH
    if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator MESH_EVENT_PS_PARENT_DUTY
    parent duty

enumerator MESH_EVENT_PS_CHILD_DUTY
    child duty

enumerator MESH_EVENT_PS_DEVICE_DUTY
    device duty

enumerator MESH_EVENT_MAX

enum mesh_type_t
    Device type.
    Values:

enumerator MESH_IDLE
    hasn’t joined the mesh network yet

enumerator MESH_ROOT
    the only sink of the mesh network. Has the ability to access external IP network

enumerator MESH_NODE
    intermediate device. Has the ability to forward packets over the mesh network

enumerator MESH_LEAF
    has no forwarding ability
enumerator **MESH_STA**
   connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**
   Protocol of transmitted application data.
   *Values:*
   
   enumerator **MESH_PROTO_BIN**
      binary
   
   enumerator **MESH_PROTO_HTTP**
      HTTP protocol
   
   enumerator **MESH_PROTO_JSON**
      JSON format
   
   enumerator **MESH_PROTO_MQTT**
      MQTT protocol
   
   enumerator **MESH_PROTO_AP**
      IP network mesh communication of node’s AP interface
   
   enumerator **MESH_PROTO_STA**
      IP network mesh communication of node’s STA interface

enum **mesh_tos_t**
   For reliable transmission, mesh stack provides three type of services.
   *Values:*
   
   enumerator **MESH_TOS_P2P**
      provide P2P (point-to-point) retransmission on mesh stack by default
   
   enumerator **MESH_TOS_E2E**
      provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
   
   enumerator **MESH_TOS_DEF**
      no retransmission on mesh stack

enum **mesh_vote_reason_t**
   Vote reason.
   *Values:*
   
   enumerator **MESH_VOTE_REASON_ROOT_INITIATED**
      vote is initiated by the root
   
   enumerator **MESH_VOTE_REASON_CHILD_INITIATED**
      vote is initiated by children
enum mesh_disconnect_reason_t
   Mesh disconnect reason code.
   Values:

   enumerator MESH_REASON_CYCLIC
cyclic is detected

   enumerator MESH_REASON_PARENT_IDLE
parent is idle

   enumerator MESH_REASON_LEAF
the connected device is changed to a leaf

   enumerator MESH_REASON_DIFF_ID
in different mesh ID

   enumerator MESH_REASON_ROOTS
root conflict is detected

   enumerator MESH_REASON_PARENT_STOPPED
parent has stopped the mesh

   enumerator MESH_REASON_SCAN_FAIL
scan fail

   enumerator MESH_REASON_IE_UNKNOWN
unknown IE

   enumerator MESH_REASON_WAIVE_ROOT
waive root

   enumerator MESH_REASON_PARENT_WORSE
parent with very poor RSSI

   enumerator MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent

   enumerator MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

enum esp_mesh_topology_t
   Mesh topology.
   Values:

   enumerator MESH_TOPO_TREE
tree topology
enumerator MESH_TOPO_CHAIN
chain topology

denum mesh_event_toDS_state_t

The reachability of the root to a DS (distribute system)

Values:

enumerator MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network

enumerator MESH_TODS_REACHABLE
the root is able to access external IP network

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check API.

Application Example Connect ESP32 to target AP using SmartConfig: wifi/smarty_config.

API Reference

Header File

• components/esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
Get the version of SmartConfig.

返倠
• SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

参数 config - pointer to smartconfig start configure structure
返回
• ESP_OK: succeed
• others: fail
**esp_err_t** **esp_smartconfig_stop**(void)

Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

返回
• ESP_OK: succeed
• others: fail

**esp_err_t** **esp_esptouch_set_timeout**(uint8_t time_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

参数 time_s – range 15s~255s, offset:45s.

返回
• ESP_OK: succeed
• others: fail

**esp_err_t** **esp_smartconfig_set_type**(smartconfig_type_t type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

参数 type – Choose from the smartconfig_type_t.

返回
• ESP_OK: succeed
• others: fail

**esp_err_t** **esp_smartconfig_fast_mode**(bool enable)

Set mode of SmartConfig. default normal mode.

**Attention**
1. Please call it before API esp_smartconfig_start.
2. Fast mode have corresponding APP(phone).
3. Two mode is compatible.

参数 enable – false-disable(default); true-enable;

返回
• ESP_OK: succeed
• others: fail

**esp_err_t** **esp_smartconfig_get_rvd_data**(uint8_t *rvd_data, uint8_t len)

Get reserved data of ESPTouch v2.

参数
• rvd_data – reserved data
• len – length of reserved data

返回
• ESP_OK: succeed
• others: fail
Structures

struct `smartconfig_event_got_ssid_pswd_t`
Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

`uint8_t ssid[32]`
SSID of the AP. Null terminated string.

`uint8_t password[64]`
Password of the AP. Null terminated string.

`bool bssid_set`
whether set MAC address of target AP or not.

`uint8_t bssid[6]`
MAC address of target AP.

`sxartconfig_type_t type`
Type of smartconfig(ESPTouch or AirKiss).

`uint8_t token`
Token from cellphone which is used to send ACK to cellphone.

`uint8_t cellphone_ip[4]`
IP address of cellphone.

struct `smartconfig_start_config_t`
Configure structure for esp_smartconfig_start

Public Members

`bool enable_log`
Enable smartconfig logs.

`bool esp_touch_v2_enable_crypt`
Enable ESPTouch v2 crypt.

`char *esp_touch_v2_key`
ESPTouch v2 crypt key, len should be 16.

Macros

`SMARTCONFIG_START_CONFIG_DEFAULT()`
Enumerations

enum smartconfig_type_t

Values:

- SC_TYPE_ESPTOUCH
  protocol: ESPTouch

- SC_TYPE_AIRKISS
  protocol: AirKiss

- SC_TYPE_ESPTOUCH_AIRKISS
  protocol: ESPTouch and AirKiss

- SC_TYPE_ESPTOUCH_V2
  protocol: ESPTouch v2

doc Section 2. API 参考

Wi-Fi 库

概述 Wi-Fi 库支持配置及监控 ESP32 Wi-Fi 连网功能。支持配置：
- station 模式 (即 STA 模式或 Wi-Fi 客户端模式)，此时 ESP32 连接到接入点 (AP)。
- AP 模式 (即 Soft-AP 模式或接入点模式)，此时基站连接到 ESP32。
- station/AP 共存模式 (ESP32 既是接入点，同时又作为基站连接到另外 一个接入点)。
- 上述模式的各种安全模式 (WPA、WPA2 及 WEP 等)。
- 扫描接入点 (包括主动扫描及被动扫描)。
- 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

应用示例 ESP-IDF 仓库的 wifi 目录下提供了演示 Wi-Fi 库功能的几个应用示例，请查看 README 了解更多详细信息。

Espressif Systems 833 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
Chapter 2. API参考

Header File
- components/esp_wifi/include/esp_wifi.h

Functions

**esp_err_t esp_wifi_init** (const wifi_init_config_t *config)
- Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called
- 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

参数 config - pointer to WiFi initialized configuration structure; can point to a temporary variable.
- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

**esp_err_t esp_wifi_deinit** (void)
- Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

参数 config - WiFi operating mode
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.**

**esp_err_t esp_wifi_set_mode** (wifi_mode_t mode)
- Set the WiFi operating mode.

参数 mode - WiFi operating mode
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

**esp_err_t esp_wifi_get_mode** (wifi_mode_t *mode)
- Get current operating mode of WiFi.

参数 mode -[out] store current WiFi mode
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
### Chapter 2. API 参考

**esp_err_t esp_wifi_start (void)**

Start WiFi according to current configuration. If mode is WIFI_MODE_STA, it create station control block and start station. If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP. If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument
- **ESP_ERR_NO_MEM**: out of memory
- **ESP_ERR_WIFI_CONN**: WiFi internal error, station or soft-AP control block wrong
- **ESP_FAIL**: other WiFi internal errors

**esp_err_t esp_wifi_stop (void)**

Stop WiFi. If mode is WIFI_MODE_STA, it stop station and free station control block. If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block. If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_restore (void)**

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_connect (void)**

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode

**Attention** 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_WIFI_CONN**: WiFi internal error, station or soft-AP control block wrong
- **ESP_ERR_WIFI_SSID**: SSID of AP which station connects is invalid

**esp_err_t esp_wifi_disconnect (void)**

Disconnect the ESP32 WiFi station from the AP.

- **ESP_OK**: succeed
Chapter 2. API 参考

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect (void)`
Currently this API is just an stub API.

返回
• ESP_OK: succeed
• others: fail

`esp_err_t esp_wifi_deauth_sta (uint16_t aid)`
deauthenticate all stations or associated id equals to aid

参数aid—when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_MODE: WiFi mode is wrong

`esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)`
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

参数
• config—configuration of scanning
• block—if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
• ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
• others: refer to error code in esp_err.h

`esp_err_t esp_wifi_scan_stop (void)`
Stop the scan in process.

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

`esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)`
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

参数 number—[out] store number of APIs found in last scan
**Chapter 2. API 参考**

### esp_err_t esp_wifi_scan_get_ap_records (uint16_t* number, wifi_ap_record_t *ap_records)

Get AP list found in last scan.

#### Parameters
- **number** - [inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** - wifi_ap_record_t array to hold the found APs

#### Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

### esp_err_t esp_wifi_clear_ap_list (void)

Clear AP list found in last scan.

**Attention** When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

#### Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

### esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information.

#### Parameter
- **ap_info** - the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

#### Return
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

### esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

#### Parameters
- **type** - power save type

#### Return
- ESP_OK: succeed
**esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)**

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

参数 type - [out] store current power save type

返回 ESP_OK: succeed

**esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)**

Set protocol type of specified interface. The default protocol is WiFi protocol bitmap.

**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

参数
- ifx - interfaces
- protocol_bitmap - WiFi protocol bitmap

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)**

Get the current protocol bitmap of the specified interface.

参数
- ifx - interface
- protocol_bitmap - [out] store current WiFi protocol bitmap of interface ifx

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)**

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

2. WIFI_BW_HT40 is supported only when the interface support 11N

参数
- ifx - interface to be configured
- bw - bandwidth

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)**

Get the bandwidth of ESP32 specified interface.
Chapter 2. API 

**Attention** 1. API return false if try to get a interface that is not enable

### Parameters
- **ifx** - interface to be configured
- **bw** - [out] store bandwidth of interface ifx

### Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_channel(uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of ESP32.

**Attention** 2. This API should be called after esp_wifi_start()

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remerber the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp_wifi_set_config() to store the channel info in NVS.

### Parameters
- **primary** - for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** - for HT20, second is ignored, for HT40, second is the second channel

### Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_channel(uint8_t* primary, wifi_second_chan_t* second)
```
Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

### Parameters
- **primary** - store current primary channel
- **second** - [out] store current second channel

### Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_country(const wifi_country_t* country)
```
Configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.
**Attention** 2. The default country is “01” (world safe mode) {.cc=’01’, .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO}.

**Attention** 3. The third octect of country code string is one of the following: ‘ ’, ‘O’, ‘1’, ‘X’, otherwise it is considered as ‘ ‘.

**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=”US”, .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=”JP”, .schan=1, .nchan=14} then the country info that will be used is {.cc=”JP”, .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc=”US”, .schan=1, .nchan=11} in the example.

**Attention** 5. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

```
country – the configured country info
```

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country (wifi_country_t *country)
```

get the current country info

```
country – country info
```

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled.

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

```
ifix – interface
```
```
mac – the MAC address
```

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

```
ifix – interface
```
Chapter 2. API 参考

- **mac** [out] store mac of the interface ifx

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

`esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)`

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

参数 **cb** - callback

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_set_promiscuous (bool en)`

Enable the promiscuous mode.

参数 **en** - false - disable, true - enable

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_get_promiscuous (bool *en)`

Get the promiscuous mode.

参数 **en** [out] store the current status of promiscuous mode

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)`

Enable the promiscuous mode packet type filter.

备注: The default filter is to filter all packets except WIFI_PKT_MISC

参数 **filter** - the packet type filtered in promiscuous mode.

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)`

Get the promiscuous filter.

参数 **filter** [out] store the current status of promiscuous filter

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)`

Enable subtype filter of the control packet in promiscuous mode.

备注: The default filter is to filter none control packet.

参数 **filter** - the subtype of the control packet filtered in promiscuous mode.
Chapter 2. API Reference

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_get_promiscuous_ctrl_filter (wifi_promiscuous_filter_t *filter)`
Get the subtype filter of the control packet in promiscuous mode.

参数 **filter** - [out] store the current status of subtype filter of the control packet in promiscuous mode

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument

`esp_err_t esp_wifi_set_config (wifi_interface_t interface, wifi_config_t *conf)`
Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail
**Attention** 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.
**Attention** 4. The configuration will be stored in NVS

参数
• **interface** – interface
• **conf** – station or soft-AP configuration

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_WIFI_MODE: invalid mode
• ESP_ERR_WIFI_PASSWORD: invalid password
• ESP_ERR_WIFI_NVS: WiFi internal NVS error
• others: refer to the erro code in esp_err.h

`esp_err_t esp_wifi_get_config (wifi_interface_t interface, wifi_config_t *conf)`
Get configuration of specified interface.

参数
• **interface** – interface
• **conf** – [out] station or soft-AP configuration

返回
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface

`esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)`
Get STAs associated with soft-AP.

**Attention** SSC only API

参数 **sta** – [out] station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode
Chapter 2. API

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)`
Get AID of STA connected with soft-AP.

参数
- `mac` - STA’s mac address
- `aid` - [out] Store the AID corresponding to STA mac

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_set_storage(wifi_storage_t storage)`
Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

参数 `storage` - storage type

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`
Set 802.11 Vendor-Specific Information Element.

参数
- `enable` - If true, specified IE is enabled. If false, specified IE is removed.
- `type` - Information Element type. Determines the frame type to associate with the IE.
- `idx` - Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie` - Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

`esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)`
Register Vendor-Specific Information Element monitoring callback.

参数
- `cb` - Callback function
- `ctx` - Context argument, passed to callback function.

Return

- ESP_OK: succeed
**ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_init()
```

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.
**Attention** 2. The value set by this API will be mapped to the max tx_power of the structure `wifi_country_t` variable.
**Attention** 3. Mapping Table `{Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}`.
**Attention** 4. Power unit is 0.25dBm, range is $[8, 84]$ corresponding to 2dBm - 20dBm.
**Attention** 5. Relationship between set value and actual value. As follows: `{set value range, actual value} = {{[8, 19], 8}, {[20, 27], 20}, {[28, 33], 28}, {[34, 43], 28}, {[44, 51], 44}, {[52, 55], 52}, {[56, 59], 56}, {[60, 65], 60}, {[66, 71], 66}, {[72, 79], 72}, {[80, 84], 80}}`.

**esp_err_t esp_wifi_set_max_tx_power** (int8_t power)

Set maximum transmitting power after WiFi start.

**参数** power – Maximum WiFi transmitting power.

**返回**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

```c
esp_err_t esp_wifi_get_max_tx_power (int8_t *power)
```

Get maximum transmitting power after WiFi start.

**参数** power – Maximum WiFi transmitting power, unit is 0.25dBm.

**返回**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_set_event_mask (uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
**Attention** 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**参数** mask – WiFi event mask.

**返回**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```

Get mask of WiFi events.

**参数** mask – WiFi event mask.

**返回**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument
**esp_err_t esp_wifi_80211_tx** *(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)*

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**参数**
- **ifx** – interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** – raw ieee80211 buffer
- **len** – the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** – indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq=true and en_sys_seq=false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

**返回**
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

**esp_err_t esp_wifi_set_csi_rx_cb** *(wifi_csi_cb_t cb, void *ctx)*

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**参数**
- **cb** – callback
- **ctx** – context argument, passed to callback function

**返回**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_set_csi_config** *(const wifi_csi_config_t *config)*

Set CSI data configuration.

**return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**参数**
- **config** – configuration

**esp_err_t esp_wifi_set_csi** *(bool en)*

Enable or disable CSI.
return
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
  • ESP_ERR_INVALID_ARG: invalid argument

参数 en - true - enable, false - disable

*esp_err_t* esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
Set antenna GPIO configuration.

参数 config - Antenna GPIO configuration.
返回
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL, invalid GPIO number etc

*esp_err_t* esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)
Get current antenna GPIO configuration.

参数 config - Antenna GPIO configuration.
返回
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

*esp_err_t* esp_wifi_set_ant (const wifi_ant_config_t *config)
Set antenna configuration.

参数 config - Antenna configuration.
返回
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

*esp_err_t* esp_wifi_get_ant (wifi_ant_config_t *config)
Get current antenna configuration.

参数 config - Antenna configuration.
返回
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

*int64_t* esp_wifi_get_tsf_time (wifi_interface_t interface)
Get the TSF time in Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

参数 interface - The interface whose tsf_time is to be retrieved.
返回 0 or the TSF time

*esp_err_t* esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)
Set the inactive time of the ESP32 STA or AP.
**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

- **参数**
  - *ifx* – interface to be configured.
  - *sec* – Inactive time. Unit seconds.

- **返回**
  - ESP_OK: succeed
  - ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  - ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
  - ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

### esp_wifi_send_inactive_time(wifi_interface_t ifx, uint16_t* sec)

Get inactive time of specified interface.

- **参数**
  - *ifx* – Interface to be configured.
  - *sec* – Inactive time. Unit seconds.

- **返回**
  - ESP_OK: succeed
  - ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  - ESP_ERR_WIFI_ARG: invalid argument

### esp_wifi_stats_dump(uint32_t modules)

Dump WiFi statistics.

- **参数**
  - *modules* – statistic modules to be dumped

- **返回**
  - ESP_OK: succeed
  - others: failed

### esp_wifi_set_rssi_threshold(int32_t rssi)

Set RSSI threshold below which APP will get an event.

- **参数**
  - *rssi* – threshold value in dbm between -100 to 0

- **返回**
  - ESP_OK: succeed
  - ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  - ESP_ERR_WIFI_ARG: invalid argument

### esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

- **Attention** Use this API only in Station mode

- **参数**
  - *cfg* – FTM Initiator session configuration

- **返回**
  - ESP_OK: succeed
  - others: failed
**Chapter 2. API 参考**

```c
esp_err_t esp_wifi_ftm_end_session (void)
End the ongoing FTM Initiator session.
```

**Attention** This API works only on FTM Initiator

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_resp_set_offset (int16_t offset_cm)
Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).
```

**Attention** Use this API only in AP mode before performing FTM as responder

- offset_cm – T1 Offset to be added in centimeters
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_config_11b_rate (wifi_interface_t ifx, bool disable)
Enable or disable 11b rate of specified interface.
```

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().
**Attention** 2. Only when really need to disable 11b rate call this API otherwise don’t call this.

- ifx – Interface to be configured.
- disable – true means disable 11b rate while false means enable 11b rate.
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_connectionless_module_set_wake_interval (uint16_t wake_interval)
Set wake interval for connectionless modules to wake up periodically.
```

**Attention** 1. Only one wake interval for all connectionless modules.
**Attention** 2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.
**Attention** 3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
**Attention** 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)
**Attention** 5. Recommend to configure interval to ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE to get stable performance at coexistence mode.

- wake_interval – Milliseconds after would the chip wake up, from 1 to 65535.

```c
esp_err_t esp_wifi_set_country_code (const char *country, bool ieee80211d_enabled)
configure country
```
Attention 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used.
E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

Attention 2. When ieee80211d_enabled is disabled, then the configured country info is used always.

Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 4. The country configuration is stored into flash.

Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.

Attention 8. The default country is “01” (world safe mode) and ieee80211d_enabled is TRUE.

Attention 9. The third octect of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.

参数
- country – the configured country ISO code
- ieee80211d_enabled – 802.11d is enabled or not

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```
esp_err_t esp_wifi_get_country_code(char *country)
```
get the current country code

参数 country – country code

返回
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Conf 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

参数
- ifx – Interface to be configured.
- rate – Phy rate to be configured.

返回
- ESP_OK: succeed
- others: failed

```
esp_err_t esp_wifi_disable_pmf_config(wifi_interface_t ifx)
```
Disable PMF configuration for specified interface.

Attention This API should be called after esp_wifi_set_config() and before esp_wifi_start().

参数 ifx – Interface to be configured.

返回
• ESP_OK: succeed
• others: failed

Structures

struct wifi_init_config_t
WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

wifi_osi_funcs_t *osi_funcs
WiFi OS functions

WIFI_CSI_ENABLED

WIFI_AMPDU_RX_ENABLED
typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.

Param type promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.

Param type Information element type, based on frame type received.

Param sa Source 802.11 address.
Chapter 2. API

### Param vnd_ie
Pointer to the vendor specific element data received.

### Param rssi
Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information (CSI) data.

> Each time a CSI data is received, the callback function will be called.

- **Param ctx** context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- **Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

#### Header File
- components/esp_wifi/include/esp_wifi_types.h

#### Unions

union wifi_config_t

```c
#include <esp_wifi_types.h>
```

Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

#### Public Members

```c
wifi_ap_config_t ap
```
configuration of AP

```c
wifi_sta_config_t sta
```
configuration of STA

#### Structures

struct wifi_country_t

Structure describing WiFi country-based regional restrictions.

#### Public Members

```c
char cc[3]
```
country code string

```c
uint8_t schan
```
start channel

```c
uint8_t nchan
```
total channel number
### Chapter 2. API

**int8_t max_tx_power**
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

**wifi_country_policy_t policy**
country policy

**struct wifi_active_scan_time_t**
Range of active scan times per channel.

#### Public Members

**uint32_t min**
minimum active scan time per channel, units: millisecond

**uint32_t max**
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

**struct wifi_scan_time_t**
Aggregate of active & passive scan time per channel.

#### Public Members

**wifi_active_scan_time_t active**
active scan time per channel, units: millisecond.

**uint32_t passive**
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

**struct wifi_scan_config_t**
Parameters for an SSID scan.

#### Public Members

**uint8_t *ssid**
SSID of AP

**uint8_t *bssid**
MAC address of AP

**uint8_t channel**
channel, scan the specific channel

**bool show_hidden**
enable to scan AP whose SSID is hidden
Chapter 2. API

**wifi_scan_type_t**  
scan type, active or passive

**wifi_scan_time_t**  
scan time per channel

**struct wifi_ap_record_t**  
Description of a WiFi AP.

**Public Members**

uint8_t bssid[6]  
MAC address of AP

uint8_t ssid[33]  
SSID of AP

uint8_t primary  
channel of AP

**wifi_second_chan_t**  
secondary channel of AP

int8_t rssi  
signal strength of AP

**wifi_auth_mode_t**  
authmode of AP

**wifi_cipher_type_t**  
pairwise cipher of AP

**wifi_cipher_type_t**  
group_cipher  
group cipher of AP

**wifi_ant_t**  
antenna used to receive beacon from AP

uint32_t phy_11b  
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g  
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n  
bit: 2 flag to identify if 11n mode is enabled or not
### Chapter 2. API 参考

**uint32_t phy_lr**
- bit: 3 flag to identify if low rate is enabled or not

**uint32_t wps**
- bit: 4 flag to identify if WPS is supported or not

**uint32_t ftmResponder**
- bit: 5 flag to identify if FTM is supported in responder mode

**uint32_t ftm_initiator**
- bit: 6 flag to identify if FTM is supported in initiator mode

**uint32_t reserved**
- bit: 7..31 reserved

**wifi_country_t country**
- country information of AP

**struct wifi_scan_threshold_t**
- Structure describing parameters for a WiFi fast scan.

**Public Members**

**int8_t rssi**
- The minimum rssi to accept in the fast scan mode

**wifi_auth_mode_t authmode**
- The weakest authmode to accept in the fast scan mode. Note: Incase this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won’t connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks

**struct wifi_pmf_config_t**
- Configuration structure for Protected Management Frame

**Public Members**

**bool capable**
- Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

**bool required**
- Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi_ap_config_t**
- Soft-AP configuration settings for the ESP32.
Public Members

uint8_t ssid[32]
SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t password[64]
Password of ESP32 soft-AP.

uint8_t ssid_len
Optional length of SSID field.

uint8_t channel
Channel of ESP32 soft-AP

wifi_auth_mode_t authmode
Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t ssid_hidden
Broadcast SSID or not, default 0, broadcast the SSID

uint8_t max_connection
Max number of stations allowed to connect in, default 4, max 10

uint16_t beacon_interval
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t pairwise_cipher
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool ftm_responder
Enable FTM Responder mode

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame

struct wifi_sta_config_t
STA configuration settings for the ESP32.

Public Members

uint8_t ssid[32]
SSID of target AP.
password[64]
Password of target AP.

scan_method

do all channel scan or fast scan

bool bssid_set

whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

bssid[6]
MAC address of target AP

channel

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

listen_interval

Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

sort_method

sort the connect AP in the list by rssi or security mode

threshold

When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

pmf_cfg

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

rm_enabled

Whether Radio Measurements are enabled for the connection

btm_enabled

Whether BSS Transition Management is enabled for the connection

mbo_enabled

Whether MBO is enabled for the connection

ft_enabled

Whether FT is enabled for the connection

owe_enabled

Whether OWE is enabled for the connection

reserved

Reserved for future feature set
**wifi_sae_pwe_method_t sae_pwe_h2e**

Whether SAE hash to element is enabled

**uint8_t failure_retry_cnt**

Number of connection retries station will do before moving to next AP. scan_method should be set as WIFI_ALL_CHANNEL_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn’t behave properly.

**struct wifi_sta_info_t**

Description of STA associated with AP.

**Public Members**

**uint8_t mac[6]**

mac address

**int8_t rssi**

current average rssi of sta connected

**uint32_t phy_11b**

bit: 0 flag to identify if 11b mode is enabled or not

**uint32_t phy_11g**

bit: 1 flag to identify if 11g mode is enabled or not

**uint32_t phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

**uint32_t phy_lr**

bit: 3 flag to identify if low rate is enabled or not

**uint32_t is_mesh_child**

bit: 4 flag to identify mesh child

**uint32_t reserved**

bit: 5..31 reserved

**struct wifi_sta_list_t**

List of stations associated with the ESP32 Soft-AP.

**Public Members**

**wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]**

station list

**int num**

number of stations in the list (other entries are invalid)
struct vendor_ie_data_t
Vendor Information Element header.
The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

uint8_t element_id
Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
Vendor identifier (OUI).

uint8_t vendor_oui_type
Vendor-specific OUI type.

uint8_t payload[0]
Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t
Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

signed rssi
Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__
reserved

unsigned sig_mode
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__
reserved

unsigned mcs
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)
unsigned `cwb`
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned `__pad2__`
reserved

unsigned `smoothing`
reserved

unsigned `not_sounding`
reserved

unsigned `__pad3__`
reserved

unsigned `aggregation`
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned `stbc`
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned `fec_coding`
Flag is set for 11n packets which are LDPC

unsigned `sgi`
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed `noise_floor`
noise floor of Radio Frequency Module(RF). unit: dBm

unsigned `ampdu_cnt`
ampdu cnt

unsigned `channel`
primary channel on which this packet is received

unsigned `secondary_channel`
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned `__pad4__`
reserved

unsigned `timestamp`
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned `__pad5__`
reserved
Chapter 2. API

unsigned __pad6__

reserved

unsigned ant

antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned sig_len

length of packet including Frame Check Sequence(FCS)

unsigned __pad7__

reserved

unsigned rx_state

state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t

Payload passed to `buf` parameter of promiscuous mode RX callback.

**Public Members**

* wifi_pkt_rx_ctrl_t rx_ctrl

metadata header

* uint8_t payload[0]

Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t

Mask for filtering different packet types in promiscuous mode.

**Public Members**

* uint32_t filter_mask

OR of one or more filter values WIFI_PROMIS_FILTER_*

struct wifi_csi_config_t

Channel state information(CSI) configuration type.

**Public Members**

* bool lltf_en

enable to receive legacy long training field(lltf) data. Default enabled

* bool htltf_en

enable to receive HT long training field(htltf) data. Default enabled
bool `stbc_htltf2_en`
enable to receive space time block code HT long training field (stbc-htltf2) data. Default enabled

bool `ltf_merge_en`
enable to generate ltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool `channel_filter_en`
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool `manu_scale`
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t `shift`
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct `wifi_csi_info_t`
CSI data type.

**Public Members**

`wifi_pkt_rx_ctrl_t rx_ctrl`
received packet radio metadata header of the CSI data

uint8_t `mac[6]`
source MAC address of the CSI data

bool `first_word_invalid`
first four bytes of the CSI data is invalid or not

int8_t *`buf`
buffer of CSI data

uint16_t `len`
length of CSI data

struct `wifi_ant_gpio_t`
WiFi GPIO configuration for antenna selection.

**Public Members**

uint8_t `gpio_select`
Whether this GPIO is connected to external antenna switch

uint8_t `gpio_num`
The GPIO number that connects to external antenna switch
struct wifi_ant_gpio_config_t
    WiFi GPIOs configuration for antenna selection.

    Public Members

    wifi_ant_gpio_t gpio_cfg[4]
        The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
    WiFi antenna configuration.

    Public Members

    wifi_ant_mode_t rx_ant_mode
        WiFi antenna mode for receiving

    wifi_ant_t rx_ant_default
        Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

    wifi_ant_mode_t tx_ant_mode
        WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

    uint8_t enabled_ant0
        Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

    uint8_t enabled_ant1
        Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
    Action Frame Tx Request.

    Public Members

    wifi_interface_t ifx
        WiFi interface to send request to

    uint8_t dest_mac[6]
        Destination MAC address

    bool no_ack
        Indicates no ack required

    wifi_action_rx_cb_t rx_cb
        Rx Callback to receive any response
uint32_t data_len
    Length of the appended Data

uint8_t data[0]
    Appended Data payload

struct wifi_ftm_initiator_cfg_t
    FTM Initiator configuration.

Public Members

uint8_t resp_mac[6]
    MAC address of the FTM Responder

uint8_t channel
    Primary channel of the FTM Responder

uint8_t frm_count
    No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t burst_period
    Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

struct wifi_event_sta_scan_done_t
    Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t status
    status of scanning APs: 0 — success, 1 - failure

uint8_t number
    number of scan results

uint8_t scan_id
    scan sequence number, used for block scan

struct wifi_event_sta_connected_t
    Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t ssid[32]
    SSID of connected AP
Chapter 2. API

uint8_t **ssid_len**
SSID length of connected AP

uint8_t **bssid[6]**
BSSID of connected AP

uint8_t **channel**
channel of connected AP

**wifi_auth_mode_t authmode**
authentication mode used by AP

```
struct wifi_event_sta_disconnected_t
  Argument structure for WIFI_EVENT_STA_DISCONNECTED event

  **Public Members**

  uint8_t **ssid[32]**
  SSID of disconnected AP

  uint8_t **ssid_len**
  SSID length of disconnected AP

  uint8_t **bssid[6]**
  BSSID of disconnected AP

  uint8_t **reason**
  reason of disconnection

  int8_t **rssi**
  rssi of disconnection

struct wifi_event_sta_authmode_change_t
  Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

  **Public Members**

  **wifi_auth_mode_t old_mode**
  the old auth mode of AP

  **wifi_auth_mode_t new_mode**
  the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
  Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event
```
Chapter 2. API Reference

Public Members

uint8_t pin_code[8]
    PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
    Number of AP credentials received

uint8_t ssid[MAX_SSID_LEN]
    SSID of AP

uint8_t passphrase[MAX_PASSPHRASE_LEN]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
    All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
    Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t mac[6]
    MAC address of the station connected to ESP32 soft-AP

uint8_t aid
    the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
    flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
    Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t mac[6]
    MAC address of the station disconnects to ESP32 soft-AP

uint8_t aid
    the aid that ESP32 soft-AP gave to the station disconnects to
bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength

uint8_t mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for

Public Members

uint8_t dlog_token
Dialog Token of the FTM frame

int8_t rssi
RSSI of the FTM frame received

uint32_t rtt
Round Trip Time in pSec with a peer

uint64_t t1
Time of departure of FTM frame from FTM Responder in pSec

uint64_t t2
Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t t3
Time of departure of ACK from FTM Initiator in pSec
Chapter 2. API

uint64_t t4
    Time of arrival of ACK at FTM Responder in pSec

struct wifi_event_ftm_report_t
    Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

uint8_t peer_mac[6]
    MAC address of the FTM Peer

wifi_ftm_status_t status
    Status of the FTM operation

uint32_t rtt_raw
    Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est
    Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t dist_est
    Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t *ftm_report_data
    Pointer to FTM Report with multiple entries, should be freed after use

uint8_t ftm_report_num_entries
    Number of entries in the FTM Report data

struct wifi_event_action_tx_status_t
    Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t ifx
    WiFi interface to send request to

uint32_t context
    Context to identify the request

uint8_t da[6]
    Destination MAC address

uint8_t status
    Status of the operation

struct wifi_event_roc_done_t
    Argument structure for WIFI_EVENT_ROC_DONE event
Chapter 2. API 参考

Public Members

```c
uint32_t context
```

Context to identify the request

Macros

```c
WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM
  max number of stations which can connect to ESP32/ESP32S3/ESP32S2/ESP32C3 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
  filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
  filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
  filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
  filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
  filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
  filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
  filter the AMPDU which is a kind of WIFI_PKT_DATA
```
Chapter 2. API

- `WIFI_PROMIS_FILTER_MASK_FCSFAIL` filter the FCS failed packets, do not open it in general
- `WIFI_PROMIS_CTRL_FILTER_MASK_ALL` filter all control packets
- `WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER` filter the control packets with subtype of Control Wrapper
- `WIFI_PROMIS_CTRL_FILTER_MASK_BAR` filter the control packets with subtype of Block Ack Request
- `WIFI_PROMIS_CTRL_FILTER_MASK_BA` filter the control packets with subtype of Block Ack
- `WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL` filter the control packets with subtype of PS-Poll
- `WIFI_PROMIS_CTRL_FILTER_MASK_RTS` filter the control packets with subtype of RTS
- `WIFI_PROMIS_CTRL_FILTER_MASK_CTS` filter the control packets with subtype of CTS
- `WIFI_PROMIS_CTRL_FILTER_MASK_ACK` filter the control packets with subtype of ACK
- `WIFI_PROMIS_CTRL_FILTER_MASK_CFEND` filter the control packets with subtype of CF-END
- `WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK` filter the control packets with subtype of CF-END+CF-ACK
- `WIFI_EVENT_MASK_ALL` mask all WiFi events
- `WIFI_EVENT_MASK_NONE` mask none of the WiFi events
- `WIFI_EVENT_MASK_AP_PROBEREQRECVED` mask SYSTEM_EVENT_AP_PROBEREQRECVED event

- `MAX_SSID_LEN`
- `MAX_PASSPHRASE_LEN`  
- `MAX_WPS_AP_CRED`
WIFI_STATIS_BUFFER
WIFI_STATIS_RXTX
WIFI_STATIS_HW
WIFI_STATIS_DIAG
WIFI_STATIS_PS
WIFI_STATIS_ALL

Type Definitions

typedef int (*wifi_action_rx_cb_t)(uint8_t*hdr,uint8_t*payload,size_tlen,uint8_t channel)
The Rx callback function of Action Tx operations.

Param hdr pointer to the IEEE 802.11 Header structure
Param payload pointer to the Payload following 802.11 Header
Param len length of the Payload
Param channel channel number the frame is received on

Enumerations

denum wifi_mode_t

Values:

enumerator WIFI_MODE_NULL
null mode

enumerator WIFI_MODE_STA
WiFi station mode

enumerator WIFI_MODE_AP
WiFi soft-AP mode

enumerator WIFI_MODE_APSTA
WiFi station + soft-AP mode

enumerator WIFI_MODE_MAX

enum wifi_interface_t

Values:

enumerator WIFI_IF_STA

enumerator WIFI_IF_AP
enum wifi_country_policy_t
Values:

enumerator WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

enumerator WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
Values:

enumerator WIFI_AUTH_OPEN
authenticate mode: open

enumerator WIFI_AUTH_WEP
authenticate mode: WEP

enumerator WIFI_AUTH_WPA_PSK
authenticate mode: WPA_PSK

enumerator WIFI_AUTH_WPA2_PSK
authenticate mode: WPA2_PSK

enumerator WIFI_AUTH_WPA2_WPA2_PSK
authenticate mode: WPA2_WPA2_PSK

enumerator WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode: WPA2_ENTERPRISE

enum wifi_second_chan_t
Values:

enumerator WIFI_SECOND_CHAN_NONE
the channel width is HT20
enumerator WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel
enumerator WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
Values:

enumerator WIFI_SCAN_TYPE_ACTIVE
active scan
enumerator WIFI_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t
Values:

enumerator WIFI_CIPHER_TYPE_NONE
the cipher type is none
enumerator WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40
enumerator WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104
divider

Chapter 2. API参考

enumerator **WIFI_CIPHER_TYPE_TKIP**
the cipher type is TKIP

enumerator **WIFI_CIPHER_TYPE_CCMP**
the cipher type is CCMP

enumerator **WIFI_CIPHER_TYPE_TKIP_CCMP**
the cipher type is TKIP and CCMP

enumerator **WIFI_CIPHER_TYPE_AES_CMAC128**
the cipher type is AES-CMAC-128

enumerator **WIFI_CIPHER_TYPE_SMS4**
the cipher type is SMS4

enumerator **WIFI_CIPHER_TYPE_GCMP**
the cipher type is GCMP

enumerator **WIFI_CIPHER_TYPE_GCMP256**
the cipher type is GCMP-256

enumerator **WIFI_CIPHER_TYPE_AES_GMAC128**
the cipher type is AES-GMAC-128

enumerator **WIFI_CIPHER_TYPE_AES_GMAC256**
the cipher type is AES-GMAC-256

enumerator **WIFI_CIPHER_TYPE_UNKNOWN**
the cipher type is unknown

divider

enum **wifi_ant_t**
WiFi antenna.

*Values:*
enumerator **WIFI_ANT_ANT0**
WiFi antenna 0
enumerator **WIFI_ANT_ANT1**
WiFi antenna 1
enumerator **WIFI_ANT_MAX**
Invalid WiFi antenna

divider

enum **wifi_scan_method_t**

*Values:*
enumerator **WIFI_FAST_SCAN**
Do fast scan, scan will end after find SSID match AP
enumerator WiFI_ALL_CHANNEL_SCAN
   All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
   Values:

   enumerator WiFI_CONNECT_AP_BY_SIGNAL
      Sort match AP in scan list by RSSI

   enumerator WiFI_CONNECT_AP_BY_SECURITY
      Sort match AP in scan list by security mode

enum wifi_ps_type_t
   Values:

   enumerator WiFI_PS_NONE
      No power save

   enumerator WiFI_PS_MIN_MODEM
      Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

   enumerator WiFI_PS_MAX_MODEM
      Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
   Values:

   enumerator WiFI_BW_HT20

   enumerator WiFI_BW_HT40

enum wifi_sae_pwe_method_t
   Configuration for SAE PWE derivation
   Values:

   enumerator WPA3_SAE_PWE_UNSPECIFIED

   enumerator WPA3_SAE_PWE_HUNT_AND_PECK

   enumerator WPA3_SAE_PWE_HASH_TO_ELEMENT

   enumerator WPA3_SAE_PWE_BOTH

enum wifi_storage_t
   Values:
enumerator **WIFI_STORAGE_FLASH**
all configuration will store in both memory and flash

enumerator **WIFI_STORAGE_RAM**
all configuration will only store in the memory

enum **wifi_vendor_ie_type_t**
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
*Values:*

enumerator **WIFI_VND_IE_TYPE_BEACON**

enumerator **WIFI_VND_IE_TYPE_PROBE_REQ**

enumerator **WIFI_VND_IE_TYPE_PROBE_RESP**

enumerator **WIFI_VND_IE_TYPE_ASSOC_REQ**

enumerator **WIFI_VND_IE_TYPE_ASSOC_RESP**

enum **wifi_vendor_ie_id_t**
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
*Values:*

enumerator **WIFI_VND_IE_ID_0**

enumerator **WIFI_VND_IE_ID_1**

enum **wifi_promiscuous_pkt_type_t**
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
*Values:*

enumerator **WIFI_PKT_MGMT**
    Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator **WIFI_PKT_CTRL**
    Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator **WIFI_PKT_DATA**
    Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator **WIFI_PKT_MISC**
    Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.
enum wifi_ant_mode_t

WiFi antenna mode.

Values:

enumerator WIFI_ANT_MODE_ANT0
    Enable WiFi antenna 0 only

enumerator WIFI_ANT_MODE_ANT1
    Enable WiFi antenna 1 only

enumerator WIFI_ANT_MODE_AUTO
    Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator WIFI_ANT_MODE_MAX
    Invalid WiFi enabled antenna

enum wifi_phy_rate_t

WiFi PHY rate encodings.

Values:

enumerator WIFI_PHY_RATE_1M_L
    1 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_L
    2 Mbps with long preamble

enumerator WIFI_PHY_RATE_5M_L
    5.5 Mbps with long preamble

enumerator WIFI_PHY_RATE_11M_L
    11 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_S
    2 Mbps with short preamble

enumerator WIFI_PHY_RATE_5M_S
    5.5 Mbps with short preamble

enumerator WIFI_PHY_RATE_11M_S
    11 Mbps with short preamble

enumerator WIFI_PHY_RATE_48M
    48 Mbps

enumerator WIFI_PHY_RATE_24M
    24 Mbps
enumerator WIFI_PHY_RATE_12M
   12 Mbps
enumerator WIFI_PHY_RATE_6M
   6 Mbps
enumerator WIFI_PHY_RATE_54M
   54 Mbps
enumerator WIFI_PHY_RATE_36M
   36 Mbps
enumerator WIFI_PHY_RATE_18M
   18 Mbps
enumerator WIFI_PHY_RATE_9M
   9 Mbps
enumerator WIFI_PHY_RATE_MCS0_LGI
   MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS1_LGI
   MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS2_LGI
   MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS3_LGI
   MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS4_LGI
   MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS5_LGI
   MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS6_LGI
   MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS7_LGI
   MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS0_SGI
   MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS1_SGI
   MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz
Chapter 2. API

enumerator `WIFI_PHY_RATE_MCS2_SGI`
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator `WIFI_PHY_RATE_MCS3_SGI`
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator `WIFI_PHY_RATE_MCS4_SGI`
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator `WIFI_PHY_RATE_MCS5_SGI`
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator `WIFI_PHY_RATE_MCS6_SGI`
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator `WIFI_PHY_RATE_MCS7_SGI`
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator `WIFI_PHY_RATE_LORA_250K`
250 Kbps

enumerator `WIFI_PHY_RATE_LORA_500K`
500 Kbps

enumerator `WIFI_PHY_RATE_MAX`

enum `wifi_event_t`

WiFi event declarations

Values:

enumerator `WIFI_EVENT_WIFI_READY`
ESP32 WiFi ready

enumerator `WIFI_EVENT_SCAN_DONE`
ESP32 finish scanning AP

enumerator `WIFI_EVENT_STA_START`
ESP32 station start

enumerator `WIFI_EVENT_STA_STOP`
ESP32 station stop

enumerator `WIFI_EVENT_STA_CONNECTED`
ESP32 station connected to AP

enumerator `WIFI_EVENT_STA_DISCONNECTED`
ESP32 station disconnected from AP
enumerator **WIFI_EVENT_STA_AUTHMODE_CHANGE**
the auth mode of AP connected by ESP32 station changed

enumerator **WIFI_EVENT_STA_WPS_ER_SUCCESS**
ESP32 station wps succeeds in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_FAILED**
ESP32 station wps fails in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_TIMEOUT**
ESP32 station wps timeout in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PIN**
ESP32 station wps pin code in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP**
ESP32 station wps overlap in enrollee mode

enumerator **WIFI_EVENT_AP_START**
ESP32 soft-AP start

enumerator **WIFI_EVENT_AP_STOP**
ESP32 soft-AP stop

enumerator **WIFI_EVENT_AP_STACONNECTED**
a station connected to ESP32 soft-AP

enumerator **WIFI_EVENT_AP_STADISCONNECTED**
a station disconnected from ESP32 soft-AP

enumerator **WIFI_EVENT_AP_PROBEREQRECEIVED**
Receive probe request packet in soft-AP interface

enumerator **WIFI_EVENT_FTM_REPORT**
Receive report of FTM procedure

enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**
AP’s RSSI crossed configured threshold

enumerator **WIFI_EVENT_ACTION_TX_STATUS**
Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**
Remain-on-Channel operation complete

enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**
ESP32 station beacon timeout
Chapter 2. API

enumerator WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START
    ESP32 connectionless module wake interval start

enumerator WIFI_EVENT_MAX
    Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event
    Values:

enumerator WPS_FAIL_REASON_NORMAL
    ESP32 WPS normal fail reason

enumerator WPS_FAIL_REASON_RECV_M2D
    ESP32 WPS receive M2D frame

enumerator WPS_FAIL_REASON_MAX

enum wifi_ftm_status_t
    FTM operation status types.
    Values:

enumerator FTM_STATUS_SUCCESS
    FTM exchange is successful

enumerator FTM_STATUS_UNSUPPORTED
    Peer does not support FTM

enumerator FTM_STATUS_CONF_REJECTED
    Peer rejected FTM configuration in FTM Request

enumerator FTM_STATUS_NO_RESPONSE
    Peer did not respond to FTM Requests

enumerator FTM_STATUS_FAIL
    Unknown error during FTM exchange

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone:

```bash
code
wifi/wifi_easy_connect/dpp-enrollee
```

**API Reference**

**Header File**

- `components/wpa_supplicant/esp_supplicant/include/esp_dpp.h`

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
```

Initializes DPP Supplicant.

```
Starts DPP Supplicant and initializes related Data Structures.
```

```
return
```

- `ESP_OK`: Success
- `ESP_FAIL`: Failure

```c
esp_err_t esp_supp_dpp_bootstrap_gen (const char* chan_list, esp_supp_dpp_bootstrap_t type, const char* key, const char* info)
```

Generates Bootstrap Information as an Enrollee.

```
Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.
```

```
参数
```

- `chan_list` - List of channels device will be available on for listening
- `type` - Bootstrap method type, only QR Code method is supported for now.
- `key` - (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- `info` - (Optional) Ancilliary Device Information like Serial Number

```
返回
```
Chapter 2. API 参考

- ESP_OK: Success
- ESP_FAIL: Failure

`esp_err_t esp_supp_dpp_start_listen(void)`
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

```
Listens on every Channel from Channel List for a pre-defined wait time.
```

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

`void esp_supp_dpp_stop_listen(void)`
Stop listening on Channels.

```
Stops listening on Channels and cancels ongoing listen operation.
```

**Macros**

**ESP_ERR_DPP_FAILURE**
Generic failure during DPP Operation

**ESP_ERR_DPP_TX_FAILURE**
DPP Frame Tx failed OR not Acked

**ESP_ERR_DPP_INVALID_ATTR**
Encountered invalid DPP Attribute

**Type Definitions**

typedef enum `dpp_bootstrap_type` `esp_supp_dpp_bootstrap_t`
Types of Bootstrap Methods for DPP.

typedef void (`*esp_supp_dpp_event_cb_t`)(`esp_supp_dpp_event_t` evt, void *data)
Callback function for receiving DPP Events from Supplicant.

```
Callback function will be called with DPP related information.
```

- Param `evt` DPP event ID
- Param `data` Event data payload

**Enumerations**

type `enum dpp_bootstrap_type`
Types of Bootstrap Methods for DPP.

- Values:
enumerator DPP_BOOTSTRAP_QR_CODE
QR Code Method

enumerator DPP_BOOTSTRAP_PKEX
Proof of Knowledge Method

enumerator DPP_BOOTSTRAP_NFC_URI
NFC URI record Method

enum esp_supp_dpp_event_t
Types of Callback Events received from DPP Supplicant.
Values:

enumerator ESP_SUPP_DPP_URI_READY
URI is ready through Bootstrapping

enumerator ESP_SUPP_DPP_CFG_RECVD
Config received via DPP Authentication

enumerator ESP_SUPP_DPP_FAIL
DPP Authentication failure

本部分的 Wi-Fi API 示例代码存放在 ESP-IDF 示例项目的 wifi 目录下。ESP-WIFI-MESH 的示例代码存放在 ESP-IDF 示例项目的 mesh 目录下。

2.5.2 以太网

以太网

概述 ESP-IDF 提供一系列功能强大且兼具一致性的 API，为内部以太网 MAC (EMAC) 控制器和外部 SPI-Ethernet 模块提供支持。

本编程指南分为以下几个部分：
1. 以太网基本概念
2. 配置 MAC 和 PHY
3. 连接驱动程序至 TCP/IP 协议栈
4. 以太网驱动程序的条目控制

以太网基本概念 以太网是一种异步的带冲突检测的载波侦听多路访问 (CSMA/CD) 协议接口。通常来说，以太网不太适用于低功率应用。然而，得益于其广泛的部署、高效的网络连接、高数据率以及范围不限的可扩展性，几乎所有的有线通信都可以通过以太网进行。

符合 IEEE 802.3 标准的正常以太网帧的长度在 64 至 1518 字节之间，由五个或六个不同的字段组成：目的地 MAC 地址 (DA)、源 MAC 地址 (SA)、类型/长度字段、数据有效载荷字段、可选的填充字段和帧校验序列字段 (CRC)。此外，在以太网上传输时，以太网数据包的开头需附加 7 字节的前导码和 1 字节的帧起始符 (SOF)。

因此，双绞线上的通信如图所示:
### Ethernet Data Frame Format

<table>
<thead>
<tr>
<th>No.</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Preamble (7 Bytes)</td>
</tr>
<tr>
<td>2</td>
<td>Start-of-Frame Delimiter (1 Byte)</td>
</tr>
<tr>
<td>3</td>
<td>Destination Address (6 Bytes)</td>
</tr>
<tr>
<td>4</td>
<td>Source Address (6 Bytes)</td>
</tr>
<tr>
<td>5</td>
<td>Type / Length (2 Bytes)</td>
</tr>
<tr>
<td>6</td>
<td>Payload (0 ~ 1500 Bytes)</td>
</tr>
<tr>
<td>7</td>
<td>Pad (if necessary)</td>
</tr>
<tr>
<td>8</td>
<td>Frame Check Sequence (4 Bytes)</td>
</tr>
</tbody>
</table>

图 4: 以太网数据帧格式

**前导码和帧起始符** 前导码包含 7 字节的 55H，作用是使接收器在实际帧到达之前锁定数据流。

帧前界定符 (SFD) 为二进制序列 10101011（物理介质层可见），有时它也被视作前导码的一部分。

在传输和接收数据时，协议将自动从数据包中生成/移除前导码和帧起始符。

**目的地址 (DA)** 目的地址字段包含一个 6 字节长的设备 MAC 地址，数据包将发送到该地址。如果 MAC 地址第一个字节中的最低有效位是 1，则该地址为组播地址。例如，01-00-00-F0-00 和 33-45-67-89-AB-CD 是组播地址，而 00-00-00-F0-00 和 32-45-67-89-AB-CD 不是。

带有组播地址的数据包将到达选定的一组以太网节点，并发挥重要作用。如果目的地址字段是保留的多播地址，即 FF-FF-FF-FF-FF-FF，则该数据包是一个广播数据包，指向共享网络中的每个对象。如果 MAC 地址的第一个字节中的最低有效位为 0，则该地址为单播地址，仅供寻址节点使用。

通常，EMAC 控制器会集成接收过滤器，用于丢弃或接收带有组播、广播或单播目的地址的数据包。传输数据包时，由主机控制器将所需的目标地址写入传输缓冲区。

**源地址 (SA)** 源地址字段包含一个 6 字节长的节点 MAC 地址，以太网数据包通过该节点创建。以太网的用户需为所使用的任意控制生成唯一的 MAC 地址。MAC 地址由两部分组成：前三个字节称为组织唯一标识符 (OUI)，由 IEEE 分配；后三个字节是地址字节，由购买 OUI 的公司配置。有关 ESP-IDF 中使用的 MAC 地址的详细信息，请参阅 MAC 地址分配。

传输数据包时，由主机控制器将分配的源 MAC 地址写入传输缓冲区。

**类型/长度** 类型/长度字段长度为 2 字节。如果其值 <= 1500 （十进制），则该字段为长度字段，指定在数据字段后的非填充数据量；如果其值 >= 1536，则该字段值表示后续数据包所属的协议。以下为该字段的常见值：

- IPv4 = 0800H
Chapter 2. API 参考

- IPv6 = 86DDH
- ARP = 0806H

使用专有网络的用户可以将此字段配置为长度字段。然而，对于使用互联网协议 (IP) 或地址解析协议 (ARP) 等协议的应用程序，在传输数据包时，应将此字段配置为协议规范定义的适当类型。

数据有效载荷 数据有效载荷字段是一个可变长度的字段，长度从 0 到 1500 字节不等。更大的数据包会因违反以太网标准而被大多数以太网节点丢弃。

数据有效载荷字段包含客户端数据，如 IP 数据报。

填充及帧校验序列 (FCS) 填充字段是一个可变长度的字段。数据有效载荷较小时，将添加填充字段以满足 IEEE 802.3 规范的要求。

以太网数据包的 DA、SA、类型、数据有效载荷和填充字段共计必须不少于 60 字节。加上所需的 4 字节 FCS 字段，数据包的长度必须不少于 64 字节。如果数据有效载荷字段小于 46 字节，则需要加上一个填充字段。

帧校验序列字段 (FCS) 长度为 4 字节，其中包含一个行业标准的 32 位 CRC，该 CRC 是根据 DA、SA、类型、数据有效载荷和填充字段的数据计算的。鉴于计算 CRC 的复杂性，硬件通常会自动生成一个有效的 CRC 进行传输。否则，需由主机控制器生成 CRC 并将其写入传输缓冲区。

通常情况下，主机控制器无需关注填充字段和 CRC 字段，因为这两部分可以在传输或接收时由硬件 EMAC 自动生成或验证。然而，当数据包到达时，填充字段和 CRC 字段将被写入接收缓冲区。因此，如果需要的话，主机控制器也可以对它们进行评估。

备注：除了上述的基本数据帧，在 10/100 Mbps 以太网中还有两种常见的帧类型：控制帧和 VLAN 标记帧。ESP-IDF 不支持这两种帧类型。

配置 MAC 和 PHY 以太网驱动器由两部分组成：MAC 和 PHY。

MAC 和 PHY 之间的通信可以通过多种方式进行，如：MII（媒体独立接口）、RMII（简化媒体独立接口）等。

MII 和 RMII 的一个明显区别在于其所需的信号数。MII 通常需要多达 18 个信号，RMII 接口则仅需要 9 个信号。

在 RMII 模式下，接收器和发送器信号的参考时钟为 REF_CLK。在访问 PHY 和 MAC 时，REF_CLK 必须保持稳定，一般来说，根据您设计的 PHY 设备的特征，可通过对以下三种方式生成 REF_CLK：

- 一些 PHY 芯片可以从此外部连接的 25 MHz 晶体振荡器中获取 REF_CLK（如图中的选项 a 所示）。对于此类芯片，请在 CONFIG_ETH_RMII_CLK_MODE 中选择 CONFIG_ETH_RMII_CLK_INPUT。
- 一些 PHY 芯片使用可以作为 MAC 端 REF_CLK 的外接 50 MHz 晶体振荡器或其他时钟源（如图中的选项 b 所示）。对于此类芯片，请同样在 CONFIG_ETH_RMII_CLK_MODE 中选择 CONFIG_ETH_RMII_CLK_INPUT。
- 一些 EMAC 控制器可以使用其内部的高精度 PLL 生成 REF_CLK（如图中的选项 c 所示）。此种情况下，请在 CONFIG_ETH_RMII_CLK_MODE 中选择 CONFIG_ETH_RMII_CLK_OUTPUT。

备注：如上所述，REF_CLK 默认通过项目配置进行配置。然而，通过设置 eth.esp32_emac_config_t::interface 和 eth.esp32_emac_config_t::clock_config，也可以实现在用户应用代码中覆盖该时钟。更多细节，请参见 emac_rmii_clock_mode_t 和 emac_rmii_clock_gpio_t。

警告：如果配置 RMII 时钟模式为 CONFIG_ETH_RMII_CLK_OUTPUT，那么就可以使用 GPIO0 输出 REF_CLK 信号。更多细节，请参见 CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0。
Chapter 2. API 参考

图 5: 以太网 RMII 接口
Chapter 2. API 参考

值得一体的是，如果您在设计中并未使用 PSRAM，则 GPIO16 和 GPIO17 也可以用来输出参考时钟。更多细节，请参见 CONFIG_ETH_RMI_CLK_OUT_GPIO。

如果配置 RMII 时钟模式为 CONFIG_ETH_RMII_CLK_INPUT，那么有且只有 GPIO0 可以用来输入 REF_CLK 信号。请注意，GPIO0 同时也是 ESP32 上一个重要的 strapping GPIO 管脚。如果 GPIO0 在上电时来样为低电平，ESP32 将进入下载模式，需进行手动复位重启系统。解决这个问题的方法是，在硬件中默认禁用 REF_CLK，从而避免 strapping 管脚在启动阶段受到其他信号的干扰。随后，再在以太网驱动安装阶段重新启用 REF_CLK。

可以通过以下方法禁用 REF_CLK 信号：

- 禁用或关闭晶体谐振器的电（对数图中的项 b）。
- 强制复位 PHY 设备（对图中的项 a）。此方法并不适用于所有 PHY 设备，即便处于复位状态，某些 PHY 设备仍会向 GPIO0 输出信号。

无论选择哪种 RMII 时钟模式，都请确保硬件设计中 REF_CLK 的信号完整性！信号线越短越好，并请保持信号线与 RF 设备和天线距离的距离。

备注：ESP-IDF 只支持 RMII 接口（即在 Kconfig 选项 CONFIG_ETH_PHY_INTERFACE 中始终选择 CONFIG_ETH_PHY_INTERFACE_RMII）。

在数据平面使用的信号通过 MUX 连接至特定的 GPIO。这些信号无法配置至其他 GPIO。在控制平面使用的信号则可以通过 Matrix 矩阵路由到任何空闲 GPIO。相关的硬件设计示例，请参考 ESP32-Ethernet-Kit。

根据您的以太网板设计，需要分别为 MAC 和 PHY 配置必要的参数。通过两个完成驱动程序的安装。

MAC 相关配置可以在 eth_mac_config_t 中找到，具体包括：

- `eth_mac_config_t::sw_reset_timeout_ms`：软件复位超时值，单位为毫秒。通常，MAC 复位应为 100ms 内完成。
- `eth_mac_config_t::rx_task_stack_size` 和 `eth_mac_config_t::rx_task_prio`。MAC 驱动会创建一个任务来处理传入的数据包，这两个参数用于设置该任务的堆栈大小和优先级。
- `eth_mac_config_t::flags`：指定 MAC 驱动应支持的额外功能，尤其适用于某些特殊情况。这个字段的值支持以 ETH_MAC_FLAG_ 为前缀的宏进行 OR 运算。例如，如果 MAC 驱动应禁用缓存后开始工作，那么则需要用 `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE` 配置这个字段。
- `eth_esp32_emac_config_t::smi_mdio_gpio_num` 和 `eth_esp32_emac_config_t::smi_mdio_gpio_num`。连接 SMI 信号的 GPIO 编号。
- `eth_esp32_emac_config_t::interface`：配置到 PHY（MII/RMII）的 MAC 数据接口。
- `eth_esp32_emac_config_t::clock_config`：配置 EMAC 接口时钟（RMII 模式下的 REF_CLK 模式以及 GPIO0 引脚）。

MAC 相关配置可以在 eth_phy_config_t 中找到，具体包括：

- `eth_phy_config_t::phy_addr`：同一条 SMI 总线上可以存在多个 PHY 设备。所以有必要为各个 PHY 设备分配唯一地址。通常，这个地址是在硬件设计期间，通过拉高/拉低一些 PHY strapping 管脚来分配的。根据不同的以太网开发板，可配置值为 0 到 15。需注意，如果 SMI 总线上仅有一个 PHY 设备，将该值配置为 -1，即可使驱动程序自动检测 PHY 地址。
- `eth_phy_config_t::reset_timeout_ms`：复位超时值，单位为毫秒。通常，PHY 复位应在 100ms 内完成。
- `eth_phy_config_t::autonego_timeout_ms`：自动协商超时值，单位为毫秒。以太网驱动程序会自动与对等的以太网节点进行协商，以确定双工和速模式。此值通常取决于您电路板上 PHY 设备的性能。
- `eth_phy_config_t::reset_gpio_num`：如果您的开发板同时将 PHY 复位管脚连接至了任意 GPIO 管脚，请使用该字段进行配置。否则，配置为 -1。
ESP-IDF 在宏 `ETH_MAC_DEFAULT_CONFIG` 和 `ETH_PHY_DEFAULT_CONFIG` 中为 MAC 和 PHY 提供了默认配置。

## 创建 MAC 和 PHY 实例
以太网驱动是以面向对象的方式实现的。对 MAC 和 PHY 的任何操作都应基于实例。

### 内部 MAC + 外部 PHY

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();      // 应用默认的 MAC 配置
mac_config.smii_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO;  // 更改用于 MDC
                // 信号的 GPIO
mac_config.smii_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDI0_GPIO;  // 更改用于 MDIO
                // 信号的 GPIO
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config);     // 创建 MAC 实例

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();        // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;            // 根据开发板设计更改
                // PHY 地址
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;  // 更改用于 PHY
                // 复位的 GPIO
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config);      // 创建 PHY 实例
                // ESP-IDF 为数种以太网 PHY 芯片驱动提供官方支持
                // esp_eth_phy_t *phy = esp_eth_phy_new_rt18201(&phy_config);
                // esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
                // esp_eth_phy_t *phy = esp_eth_phy_new_dp83848(&phy_config);
```

### 可选的运行时 MAC 时钟配置
可以通过用户应用程序代码，选择性配置 EMAC 中的 REF_CLK。

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();      // 应用默认的 MAC 配置
                // ...
mac_config.interface = EMAC_DATA_INTERFACE_RMII;             // 更改 EMAC 数据接口
mac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT;     // 配置 EMAC REF_CLK 模式
mac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // 配置用于输入/输出
                // EMAC REF_CLK 的 GPIO 编号
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config);    // 创建 MAC 实例
```

### SPI-Ethernet 模块

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();      // 应用默认的 MAC 配置
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();      // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;           // 根据开发板设计更改
                // PHY 地址
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // 更改用于 PHY
                // 复位的 GPIO
                // 安装 GPIO 中断服务（因为 SPI-Ethernet 模块为中断驱动）
gpio_install_isr_service(0);
                // 配置 SPI 总线
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
                // 配置 SPI 从机设备
```

(下页继续)
Chapter 2. API 参考

(续上页)

spi_device_interface_config_t spi_devcfg = {
.mode = 0,
.clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
.spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
.queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
,→SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

备注:
• 当为 SPI-Ethernet 模块（例如 DM9051）创建 MAC 和 PHY 实例时，由于 PHY 是集成在模块中的，因此
调用的实例创建函数的后缀须保持一致（例如 esp_eth_mac_new_dm9051 和 esp_eth_phy_new_dm9051
搭配使用）
。
• 针 对 不 同 的 以 太 网 模 块， 或 是 为 了 满 足 特 定 PCB 上 的 SPI 时 序，SPI 从 机 设 备 配 置 （即
spi_device_interface_config_t）可能略有不同。具体配置请查看模块规格以及 ESP-IDF 中的示例。

安装驱动程序 安装以太网驱动程序需要结合 MAC 和 PHY 实例，并在esp_eth_config_t 中配置一
些额外的高级选项（即不仅限于 MAC 或 PHY 的选项）：

• esp_eth_config_t::mac：由 MAC 生成器创建的实例（例如esp_eth_mac_new_esp32()）
。
• esp_eth_config_t::phy：由 PHY 生成器创建的实例（例如esp_eth_phy_new_ip101()）。
• esp_eth_config_t::check_link_period_ms：以太网驱动程序会启用操作系统定时器来定
期检查链接状态。该字段用于设置间隔时间，单位为毫秒。
• esp_eth_config_t::stack_input：在大多数的以太网物联网应用中，驱动器接收的以太网
帧会被传递到上层（如 TCP/IP 栈）
。经配置，该字段为负责处理传入帧的函数。您可以在安装驱动
程序后，通过函数esp_eth_update_input_path() 更新该字段。该字段支持在运行过程中进
行更新。
• esp_eth_config_t::on_lowlevel_init_done 和esp_eth_config_t::on_lowlevel_deinit_done：
这两个字段用于指定钩子函数，当去初始化或初始化低级别硬件时，会调用钩子函数。
ESP-IDF 在宏ETH_DEFAULT_CONFIG 中为安装驱动程序提供了一个默认配置。
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // 应 用 默 认 驱 动 程 序 配 置
esp_eth_handle_t eth_handle = NULL; // 驱 动 程 序 安 装 完 毕 后 ， 将 得 到 驱 动 程 序 的 句 柄
esp_eth_driver_install(&config, &eth_handle); // 安 装 驱 动 程 序

以太网驱动程序包含事件驱动模型，该模型会向用户空间发送有用及重要的事件。安装以太网驱动程序
之前，需要首先初始化事件循环。有关事件驱动编程的更多信息，请参考ESP Event.
/** 以 太 网 事 件 的 事 件 处 理 程 序 */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
int32_t event_id, void *event_data)
{
uint8_t mac_addr[6] = {0};
/* 可 从 事 件 数 据 中 获 得 以 太 网 驱 动 句 柄 */
esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;
switch (event_id) {
case ETHERNET_EVENT_CONNECTED:
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet Link Up");
ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
,→addr[4], mac_addr[5]);
(下页继续)

Release v5.1-dev-2066-g7869f4e151


break;
case ETHERNET_EVENT_DISCONNECTED:
    ESP_LOGI(TAG, "Ethernet Link Down");
    break;
case ETHERNET_EVENT_START:
    ESP_LOGI(TAG, "Ethernet Started");
    break;
case ETHERNET_EVENT_STOP:
    ESP_LOGI(TAG, "Ethernet Stopped");
    break;
default:
    break;
}
}

esp_event_loop_create_default(); // 创建一个在后台运行的默认事件循环
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL); // 注册以太网事件处理程序（用于在发生 link up/down 等事件时，处理特定的用户相关内容）

启动以太网驱动程序 安装驱动程序后，可以立即启动以太网。

esp_eth_start(eth_handle); // 启动以太网驱动程序状态机

连接驱动程序至 TCP/IP 协议栈 现在，以太网驱动程序已经完成安装。但对应 OSI（开放系统互连模型）来看，目前阶段仍然属于第二层（即数据链路层）。这意味着可以检测到 link up/down 事件，获得用户空间的 MAC 地址，但无法获得 IP 地址，当然也无法发送 HTTP 请求。ESP-IDF 中使用的 TCP/IP 协议栈是 LwIP，关于 LwIP 的更多信息，请参考 LwIP。

要将以太网驱动程序连接到 TCP/IP 协议栈，需要以下三步：
1. 为以太网驱动程序创建网络接口
2. 将网络接口连接到以太网驱动程序
3. 注册 IP 事件处理程序

有关网络接口的更多信息，请参考 Network Interface。

/** IP_EVENT_ETH_GOT_IP 的事件处理程序 */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP: %s", IPSTR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK: %s", IPSTR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW: %s", IPSTR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~");
}

esp_netif_init(); // 初始化 TCP/IP 网络接口（在应用程序中应仅调用一次）
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // 应用以太网的默认网络接口配置
esp_netif_t *eth_netif = esp_netif_new(cfg); // 为以太网驱动程序创建网络接口
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); //...

-- 将以太网驱动程序连接到 TCP/IP 协议栈
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, got_ip_event_handler, NULL); // 注册用户定义的 IP 事件处理程序

(下页继续)
esp_eth_start(eth_handle);  // 启动以太网驱动程序状态机

警告：推荐在完成整个以太网驱动和网络接口的初始化后，再注册用户定义的以太网/IP 事件处理程序。也就是把注册事件处理程序作为启动以太网驱动程序的最后一步。这样可以确保以太网驱动程序或网络接口将首先执行以太网/IP 事件，从而保证在执行用户定义的处理程序时，系统处于预期状态。

以太网驱动程序的杂项控制：以下功能只支持在安装以太网驱动程序后调用。

- 关闭以太网驱动程序： esp_eth_stop()
- 更新以太网数据输入路径： esp_eth_update_input_path()
- 获取/设置以太网驱动程序简要内容： esp_eth_ioctl()

```
/* 获取 MAC 地址 */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
        addr[5]);

/* 获取 PHY 地址 */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

数据流量控制：受 RAM 大小限制，在网络拥挤时，MCU 上的以太网通常仅能处理有限数量的帧。发送站的数据传输速度可能快于对等端的接收能力。以太网数据流量控制机制允许接收节点向发送方发出信号，要求暂停传输，直到接收方跟上。这项功能是通过暂停帧实现的，该帧定义在 IEEE 802.3x 中。

暂停帧是一种特殊的以太帧，用于携带暂停命令，其 EtherType 字段为 0x8808，控制操作码为 0x0001。只有配置为全双工操作的节点组可以发送暂停帧。当节点组希望暂停链路的另一端时，它可以发送一个暂停帧到 48 位的保留组播地址 01-80-C2-00-00-01。暂停帧中也包括请求暂停的时间段，以两字节的整数形式发送，值的范围从 0 到 65535。

安装以太网驱动程序后，数据流量控制功能默认禁用，可以通过以下方式启用此功能：

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

需注意，暂停帧是在自协商期间由 PHY 向对等端公布的。只有当链路的两边都支持暂停帧时，以太网驱动程序才会发送暂停帧。

应用示例：
- 以太网基本示例： ethernet/basic
- 以太网 iperf 示例： ethernet/iperf
- 以太网到 Wi-Fi AP “路由器”： ethernet/eth2ap
- 大多数协议示例也适用于以太网： protocols

进阶操作：

自定义 PHY 驱动程序：目前市面上已有多家 PHY 制造商提供了大量的芯片组合。ESP-IDF 现已支持数种 PHY 芯片，但是由于价格、功能、库存等原因，有时用户还是无法找到一款能满足其实际需求的芯片。
Chapter 2. API 参考

好在 IEEE 802.3 在其 22.2.4 管理功能部分对 EMAC 和 PHY 之间的管理接口进行了标准化。该部分定义了所谓的” MII 管理接口”规范，用于控制 PHY 和收集 PHY 的状态，还定义了一组管理寄存器控制芯片行为、链接属性、自动协商配置等。在 ESP-IDF 中，这项基本的管理功能是由 esp_eth/src/esp_eth_phy_802_3.c 实现的，这也大大降低了创建新的自定义 PHY 芯片驱动的难度。

备注：由于一些 PHY 芯片可能不符合 IEEE 802.3 第 22.2.4 节的规定，所以请首先查看 PHY 数据手册。不过，就算芯片不符合规定，您依旧可以创建自定义 PHY 驱动程序，只是由于需要自行定义所有的 PHY 管理功能，这个过程将变得较为复杂。

ESP-IDF 以太网驱动程序所需的大部分 PHY 管理功能都已涵盖在 esp_eth/src/esp_eth_phy_802_3.c 中。不过对于以下几项，可能仍需针对不同芯片开发具体的管理功能：

- 链接状态。此项总使用以使用的具体芯片决定
- 芯片初始化。即使不存在严格的限制，也应进行自定义，以确保使用的是符合预期的芯片
- 芯片的具体功能配置

创建自定义 PHY 驱动程序的步骤：

1. 请根据 PHY 数据手册，定义针对供应商的特定注册布局。示例如参见 esp_eth/src/esp_eth_phy_ip101.c。
2. 准备衍生的 PHY 管理对象信息结构，该结构：
   - 必须至少包含 IEEE 802.3 phy_802_3_t 父对象
   - 可选包含支持非 IEEE 802.3 或自定义功能所需的额外变量。示例如参见 esp_eth/src/esp_eth_phy_ksz80xx.c。
3. 定义针对芯片的特定管理回调功能。
4. 初始化 IEEE 802.3 父对象并重新分配针对芯片的特定管理回调功能。

实现新的自定义 PHY 驱动程序后，你可以通过 IDF 组件管理器将驱动分享给其他用户。

API 参考

Header File

- components/esp_eth/include/esp_eth.h

Header File

- components/esp_eth/include/esp_eth_driver.h

Functions

- esp_err_t esp_eth_driver_install (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
  - 安装以太网驱动。
  - 参数
    - config  - [in] 配置的以太网驱动
    - out_hdl - [out] 以太网驱动句柄
  - 返回
    - ESP_OK: 安装以太网驱动成功
    - ESP_ERR_INVALID_ARG: 安装以太网驱动失败，因为有无效参数
    - ESP_ERR_NO_MEM: 安装以太网驱动失败，因为没有内存
    - ESP_FAIL: 安装以太网驱动失败，因为其他错误发生

- esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdld)
  - 卸载以太网驱动。
Chapter 2. API 参考

It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

参数 `hdl` –[in] handle of Ethernet driver

返回
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

```c
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```
Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

备注： This API will start driver state machine and internal software timer (for checking link status).

参数 `hdl` –[in] handle of Ethernet driver

返回
- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

```c
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```
Stop Ethernet driver.

备注： This function does the opposite operation of `esp_eth_start`.

参数 `hdl` –[in] handle of Ethernet driver

返回
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

```c
esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)
```
Update Ethernet data input path (i.e. specify where to pass the input buffer)

备注： After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

参数
- `hdl` –[in] handle of Ethernet driver
- `stack_input` –[in] function pointer, which does the actual process on incoming packets
Chapter 2. API

• **priv** - [in] private resource, which gets passed to `stack_input` callback without any modification
  
  返回
  • ESP_OK: update input path successfully
  • ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
  • ESP_FAIL: update input path failed because some other error occurred

`esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, size_t length)`

General Transmit.

参数
  • hdl - [in] handle of Ethernet driver
  • buf - [in] buffer of the packet to transfer
  • length - [in] length of the buffer to transfer
  
  返回
  • ESP_OK: transmit frame buffer successfully
  • ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
  • ESP_ERR_INVALID_STATE: invalid driver state (e.i. driver is not started)
  • ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
  • ESP_FAIL: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_transmit_vargs(esp_eth_handle_t hdl, uint32_t argc, ...)`

Special Transmit with variable number of arguments.

参数
  • hdl - [in] handle of Ethernet driver
  • argc - [in] number variable arguments
  • ... - variable arguments
  
  返回
  • ESP_OK: transmit successfull
  • ESP_ERR_INVALID_STATE: invalid driver state (e.i. driver is not started)
  • ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
  • ESP_FAIL: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)`

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

• **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.

• **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.

• **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.

• **ETH_CMD_G_PHY_ADDR** gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.

• **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.

• **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype to which the current configuration is to be stored.

• **ETH_CMD_S_SPEED** sets the Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
Chapter 2. API 参考

- **ETH_CMD_G_SPEED** gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_DUPLEX_MODE** sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

### Parameters
- **hdl** - [in] handle of Ethernet driver
- **cmd** - [in] IO control command
- **data** - [inout] address of data for set command or address where to store the data when used with get command

### Return
- **ESP_OK**: process io command successfully
- **ESP_ERR_INVALID_ARG**: process io command failed because of some invalid argument
- **ESP_FAIL**: process io command failed because some other error occurred
- **ESP_ERR_NOT_SUPPORTED**: requested feature is not supported

```c
esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)
```
Increase Ethernet driver reference.

备注：Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver; this API must be invoked so that the driver won’t be uninstalled during your using time.

```c
esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)
```
Decrease Ethernet driver reference.

### Structures

```c
struct esp_eth_config_t
```
Configuration of Ethernet driver.
Public Members

`esp_eth_mac_t *mac`
Ethernet MAC object.

`esp_eth_phy_t *phy`
Ethernet PHY object.

`uint32_t check_link_period_ms`
Period time of checking Ethernet link status.

`esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t*buffer, uint32_t length, void *priv)`
Input frame buffer to user’s stack.

- **Param eth_handle [in]** handle of Ethernet driver
- **Param buffer [in]** frame buffer that will get input to upper stack
- **Param length [in]** length of the frame buffer
- **Return**
  - ESP_OK: input frame buffer to upper stack successfully
  - ESP_FAIL: error occurred when inputting buffer to upper stack

`esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)`
Callback function invoked when lowlevel initialization is finished.

- **Param eth_handle [in]** handle of Ethernet driver
- **Return**
  - ESP_OK: process extra lowlevel initialization successfully
  - ESP_FAIL: error occurred when processing extra lowlevel initialization

`esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)`
Callback function invoked when lowlevel deinitialization is finished.

- **Param eth_handle [in]** handle of Ethernet driver
- **Return**
  - ESP_OK: process extra lowlevel deinitialization successfully
  - ESP_FAIL: error occurred when processing extra lowlevel deinitialization

`esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`
Read PHY register.

- **Param eth_handle [in]** handle of Ethernet driver
- **Param phy_addr [in]** PHY chip address (0-31)
- **Param phy_reg [in]** PHY register index code
- **Param reg_value [out]** PHY register value
- **Return**
  - ESP_OK: read PHY register successfully
  - ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
  - ESP_ERR_TIMEOUT: read PHY register failed because of timeout
  - ESP_FAIL: read PHY register failed because some other error occurred

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.
`esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)`

Write PHY register.

**Param**
- `eth_handle` [in] handle of Ethernet driver
- `phy_addr` [in] PHY chip address (0-31)
- `phy_reg` [in] PHY register index code
- `reg_value` [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Macros**

```c
ETH_DEFAULT_CONFIG(emac, ephy)
```

Default configuration for Ethernet driver.

**Type Definitions**

```c
typedef void *esp_eth_handle_t
```

Handle of Ethernet driver.

**Enumerations**

```c
typedef enum esp_eth_io_cmd_t
```

Command list for ioctl API.

**Values:**

```c
enumerator ETH_CMD_G_MAC_ADDR
        Get MAC address
```

```c
enumerator ETH_CMD_S_MAC_ADDR
        Set MAC address
```

```c
enumerator ETH_CMD_G_PHY_ADDR
        Get PHY address
```

```c
enumerator ETH_CMD_S_PHY_ADDR
        Set PHY address
```

```c
enumerator ETH_CMD_G_AUTONEGO
        Get PHY Auto Negotiation
```

```c
enumerator ETH_CMD_S_AUTONEGO
        Set PHY Auto Negotiation
```

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.
enumerator **ETH_CMD_G_SPEED**
   Get Speed

enumerator **ETH_CMD_S_SPEED**
   Set Speed

enumerator **ETH_CMD_S_PROMISCUOUS**
   Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**
   Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**
   Get Duplex mode

enumerator **ETH_CMD_S_DUPLEX_MODE**
   Set Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**
   Set PHY loopback

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

**Header File**

- components/esp_eth/include/esp_eth_com.h

**Structures**

struct **esp_eth_mediator_s**

   Ethernet mediator.

**Public Members**

```c
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [out] PHY register value

**Return**

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred
**esp_err_t (**phy_reg_write**)(**esp_eth_mediator_t** *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)**

Write PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

**esp_err_t (**stack_input**)(**esp_eth_mediator_t** *eth, uint8_t *buffer, uint32_t length)**

Deliver packet to upper stack.

- **Param eth** [in] mediator of Ethernet driver
- **Param buffer** [in] packet buffer
- **Param length** [in] length of the packet

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

**esp_err_t (**on_state_changed**)(**esp_eth_mediator_t** *eth, **esp_eth_state_t** state, void *args)**

Callback on Ethernet state changed.

- **Param eth** [in] mediator of Ethernet driver
- **Param state** [in] new state
- **Param args** [in] optional argument for the new state

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

### Type Definitions

typedef struct **esp_eth_mediator_s** *esp_eth_mediator_t

Ethernet mediator.

### Enumerations

enum **esp_eth_state_t**

Ethernet driver state.

**Values:**

- enumerator **ETH_STATE_LLINIT**
  Low level init done

- enumerator **ETH_STATE_DEINIT**
  Deinit done

- enumerator **ETH_STATE_LINK**
  Link status changed

- enumerator **ETH_STATE_SPEED**
  Speed updated
enumerator ETH_STATE_DUPLEX
    Duplex updated

eenumerator ETH_STATE_PAUSE
    Pause ability updated

eenum eth_event_t
    Ethernet event declarations.
    Values:

eenumerator ETHERNET_EVENT_START
    Ethernet driver start

eenumerator ETHERNET_EVENT_STOP
    Ethernet driver stop

eenumerator ETHERNET_EVENT_CONNECTED
    Ethernet got a valid link

eenumerator ETHERNET_EVENT_DISCONNECTED
    Ethernet lost a valid link

**Header File**

- components/esp_eth/include/esp_eth_mac.h

**Functions**

*esp_eth_mac_t* esp_eth_mac_new_esp32 (const *eth_esp32_emac_config_t* esp32_config, const *eth_mac_config_t* config)

Create ESP32 Ethernet MAC instance.

**参数**

- esp32_config - EMAC specific configuration
- config - Ethernet MAC configuration

**返回**

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

**Unions**

union eth_mac_clock_config_t
    #include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

**Public Members**

struct eth_mac_clock_config_t::[anonymous] mii
    EMAC MII Clock Configuration

emac_rmii_clock_mode_t clock_mode
    RMII Clock Mode Configuration
**Chapter 2. API**

```c
emac_rmii_clock_gpio_t clock_gpio
```
RMII Clock GPIO Configuration

```c
struct eth_mac_clock_config_t [anonymous] rmii
```
EMAC RMII Clock Configuration

### Structures

```c
struct esp_eth_mac_s
```
Ethernet MAC.

#### Public Members

```c
esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
```
Set mediator for Ethernet MAC.

- **Param** `mac [in]` Ethernet MAC instance
- **Param** `eth [in]` Ethernet mediator

**Return**
- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

```c
esp_err_t (*init)(esp_eth_mac_t *mac)
```
Initialize Ethernet MAC.

- **Param** `mac [in]` Ethernet MAC instance

**Return**
- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

```c
esp_err_t (*deinit)(esp_eth_mac_t *mac)
```
Deinitialize Ethernet MAC.

- **Param** `mac [in]` Ethernet MAC instance

**Return**
- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some other error occurred

```c
esp_err_t (*start)(esp_eth_mac_t *mac)
```
Start Ethernet MAC.

- **Param** `mac [in]` Ethernet MAC instance

**Return**
- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

```c
esp_err_t (*stop)(esp_eth_mac_t *mac)
```
Stop Ethernet MAC.

- **Param** `mac [in]` Ethernet MAC instance

**Return**
- ESP_OK: stop Ethernet MAC successfully
• **ESP_FAIL**: stop Ethernet MAC failed because some error occurred

```
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
```

Transmit packet from Ethernet MAC.

<table>
<thead>
<tr>
<th>Param</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac</td>
<td>[in]</td>
<td>Ethernet MAC instance</td>
</tr>

<td>receive packet failed because of invalid argument</td>
</tr>
<tr>
<td></td>
<td>ESP_ERR_INVALID_SIZE</td>
<td>input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.</td>
</tr>
<tr>
<td></td>
<td>ESP_FAIL</td>
<td>receive packet failed because some other error occurred</td>
</tr>
</tbody>
</table>

备注: Returned error codes may differ for each specific MAC chip.

备注: Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

备注: Memory of buf is allocated in the Layer2, make sure it get free after process.

备注: Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.
### Chapter 2. API

**esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)**

Read PHY register.

**Param**

- **mac** [in] Ethernet MAC instance
- **phy_addr** [in] PHY chip address (0~31)
- **phy_reg** [in] PHY register index code
- **reg_value** [out] PHY register value

**Return**

- **ESP_OK**: read PHY register successfully
- **ESP_ERR_INVALID_ARG**: read PHY register failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: read PHY register failed because of wrong state of MAC
- **ESP_ERR_TIMEOUT**: read PHY register failed because of timeout
- **ESP_FAIL**: read PHY register failed because some other error occurred

**esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)**

Write PHY register.

**Param**

- **mac** [in] Ethernet MAC instance
- **phy_addr** [in] PHY chip address (0~31)
- **phy_reg** [in] PHY register index code
- **reg_value** [in] PHY register value

**Return**

- **ESP_OK**: write PHY register successfully
- **ESP_ERR_INVALID_STATE**: write PHY register failed because of wrong state of MAC
- **ESP_ERR_TIMEOUT**: write PHY register failed because of timeout
- **ESP_FAIL**: write PHY register failed because some other error occurred

**esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)**

Set MAC address.

**Param**

- **mac** [in] Ethernet MAC instance
- **addr** [in] MAC address

**Return**

- **ESP_OK**: set MAC address successfully
- **ESP_ERR_INVALID_ARG**: set MAC address failed because of invalid argument
- **ESP_FAIL**: set MAC address failed because some other error occurred

**esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)**

Get MAC address.

**Param**

- **mac** [in] Ethernet MAC instance
- **addr** [out] MAC address

**Return**

- **ESP_OK**: get MAC address successfully
- **ESP_ERR_INVALID_ARG**: get MAC address failed because of invalid argument
- **ESP_FAIL**: get MAC address failed because some other error occurred

**esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)**

Set speed of MAC.

**Param**

- **mac** [in] Ethernet MAC instance
- **speed** [in] MAC speed

**Return**

- **ESP_OK**: set MAC speed successfully
• ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
• ESP_FAIL: set MAC speed failed because some other error occurred

```
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```

Set duplex mode of MAC.

**Param**
- mac [in] Ethernet MAC instance
- duplex [in] MAC duplex

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

```
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```

Set link status of MAC.

**Param**
- mac [in] Ethernet MAC instance
- link [in] Link status

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

```
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```

Set promiscuous of MAC.

**Param**
- mac [in] Ethernet MAC instance
- enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

```
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```

Enable flow control on MAC layer or not.

**Param**
- mac [in] Ethernet MAC instance
- enable [in] set true to enable flow control; set false to disable flow control

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

```
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```

Set the PAUSE ability of peer node.

**Param**
- mac [in] Ethernet MAC instance
- ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some other error occurred

```
esp_err_t (*custom_ioctl)(esp_eth_mac_t *mac, uint32_t cmd, void *data)
```

Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

---

**Note:** This function may not be assigned when the MAC chip supports only most common set of
configuration options.

**Param** mac [in] Ethernet MAC instance

**Param** cmd [in] IO control command

**Param** data [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

`esp_err_t (*del)(esp_eth_mac_t *mac)`

Free memory of Ethernet MAC.

**Param** mac [in] Ethernet MAC instance

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

```
struct eth_mac_config_t

Configuration of Ethernet MAC object.

**Public Members**

`uint32_t sw_reset_timeout_ms`

Software reset timeout value (Unit: ms)

`uint32_t rx_task_stack_size`

Stack size of the receive task

`uint32_t rx_task_prio`

Priority of the receive task

`uint32_t flags`

Flags that specify extra capability for mac driver
```

```

```

```

`struct eth_esp32_emac_config_t`

EMAC specific configuration.

**Public Members**

`int smi_mdc_gpio_num`

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

`int smi_mdio_gpio_num`

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration
Chapter 2. API

**EMAC Data interface to PHY (MII/RMII)**

- **eth_data_interface_t**
  - Interface type for EMAC Data

- **eth_mac_clock_config_t**
  - Interface clock configuration type

- **eth_mac_dma_burst_len_t**
  - EMAC DMA burst length for both Tx and Rx

**Macros**

- **ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE**
  - MAC driver can work when cache is disabled

- **ETH_MAC_FLAG_PIN_TO_CORE**
  - Pin MAC task to the CPU core where driver installation happened

- **ETH_MAC_DEFAULT_CONFIG()**
  - Default configuration for Ethernet MAC object.

- **ETH_ESP32_EMAC_DEFAULT_CONFIG()**
  - Default ESP32’s EMAC specific configuration.

**Type Definitions**

```c
typedef struct esp_eth_mac_s esp_eth_mac_t
```

- **Ethernet MAC**

**Enumerations**

- **emac_rmii_clock_mode_t**
  - RMII Clock Mode Options.
  - **Values:**
    - **enumerator EMAC_CLK_DEFAULT**
      - Default values configured using Kconfig are going to be used when “Default” selected.
    - **enumerator EMAC_CLK_EXT_IN**
      - Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.
      - **Notes:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
    - **enumerator EMAC_CLK_OUT**
      - Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

- **emac_rmii_clock_gpio_t**
  - RMII Clock GPIO number Options.
  - **Values:**
enumerator **EMAC_CLK_IN_GPIO**
MAC will get RMII clock from outside at this GPIO.

备注：ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**
Output RMII Clock from internal APLL Clock available at GPIO0.

备注：GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**
Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**
Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

**Header File**
- components/esp_eth/include/esp_eth_phy.h

**Functions**

```c
esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)
Create a PHY instance of IP101.
```

参数 config [in] configuration of PHY

返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_rtl8201 (const eth_phy_config_t *config)
Create a PHY instance of RTL8201.
```

参数 config [in] configuration of PHY

返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_lan87xx (const eth_phy_config_t *config)
Create a PHY instance of LAN87xx.
```

参数 config [in] configuration of PHY

返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_dp83848 (const eth_phy_config_t *config)
Create a PHY instance of DP83848.
```

参数 config [in] configuration of PHY

返回
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth Phy_new_ksz80xx(const eth Phy_config_t *config)
```

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

参数 config [in] configuration of PHY
返回
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

**Structures**

```c
struct esp_eth_phy_s
```

Ethernet PHY.

**Public Members**

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```

Set mediator for PHY.

Param phy [in] Ethernet PHY instance
Param mediator [in] mediator of Ethernet driver
Return
• ESP_OK: set mediator for Ethernet PHY instance successfully
• ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```

Software Reset Ethernet PHY.

Param phy [in] Ethernet PHY instance
Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```

Hardware Reset Ethernet PHY.

备注: Hardware reset is mostly done by pull down and up PHY’s nRST pin

```c
Param phy [in] Ethernet PHY instance
Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (*init)(esp_eth_phy_t *phy)
```

Initialize Ethernet PHY.
**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```

Deinitialize Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```

Configure auto negotiation.

**Param phy** [in] Ethernet PHY instance

**Param cmd** [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego_en_stat** [out] Address where to store current status of auto negotiation configuration

**Return**
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

```c
esp_err_t (*get_link)(esp_eth_phy_t *phy)
```

Get Ethernet PHY link status.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

```c
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
```

Power control of Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Param enable** [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY

**Return**
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

```c
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```

Set PHY chip address.

**Param phy** [in] Ethernet PHY instance

**Param addr** [in] PHY chip address

**Return**
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

```c
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
```

Get PHY chip address.

**Param phy** [in] Ethernet PHY instance

**Param addr** [out] PHY chip address

**Return**
• ESP_OK: get Ethernet PHY address successfully
• ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

`esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)`
Advertise pause function supported by MAC layer.

Param `phy` [in] Ethernet PHY instance
Param `addr` [out] Pause ability
Return
• ESP_OK: Advertise pause ability successfully
• ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

`esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)`
Sets the PHY to loopback mode.

Param `phy` [in] Ethernet PHY instance
Param `enable` [in] enables or disables PHY loopback
Return
• ESP_OK: PHY instance loopback mode has been configured successfully
• ESP_FAIL: PHY instance loopback configuration failed because some error occurred

`esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)`
Sets PHY speed mode.

备注: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param `phy` [in] Ethernet PHY instance
Param `speed` [in] Speed mode to be set
Return
• ESP_OK: PHY instance speed mode has been configured successfully
• ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

`esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)`
Sets PHY duplex mode.

备注: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param `phy` [in] Ethernet PHY instance
Param `duplex` [in] Duplex mode to be set
Return
• ESP_OK: PHY instance duplex mode has been configured successfully
• ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

`esp_err_t (*custom_ioctl)(esp_eth_phy_t *phy, uint32_t cmd, void *data)`
Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.
This function may not be assigned when the PHY chip supports only most common set of configuration options.

**Param**  
phy [in] Ethernet PHY instance  
**Param**  
cmd [in] IO control command  
**Param**  
data [inout] address of data for set command or address where to store the data when used with get command  

**Return**  
- ESP_OK: process io command successfully  
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument  
- ESP_FAIL: process io command failed because some other error occurred  
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```
esp_err_t (*del)(esp_eth_phy_t *phy)
```
Free memory of Ethernet PHY instance.

**Param**  
phy [in] Ethernet PHY instance  

**Return**  
- ESP_OK: free PHY instance successfully  
- ESP_FAIL: free PHY instance failed because some error occurred

```
struct eth_phy_config_t
```

Ethernet PHY configuration.

**Public Members**

```
int32_t phy_addr
```
PHY address, set -1 to enable PHY address detection at initialization stage

```
uint32_t reset_timeout_ms
```
Reset timeout value (Unit: ms)

```
uint32_t autonego_timeout_ms
```
Auto-negotiation timeout value (Unit: ms)

```
int reset_gpio_num
```
Reset GPIO number, -1 means no hardware reset

**Macros**

```
ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG()
```
Default configuration for Ethernet PHY object.

**Type Definitions**

typedef struct esp_eth_phy_s esp_eth_phy_t
Ethernet PHY.
Enumerations

```c
enum eth_phy_autoneg_cmd_t
    Auto-negotiation control commands.
    Values:
```

enumerator ESP_ETH_PHY_AUTONEGO_RESTART
enumerator ESP_ETH_PHY_AUTONEGO_EN
enumerator ESP_ETH_PHY_AUTONEGO_DIS
enumerator ESP_ETH_PHY_AUTONEGO_G_STAT

Header File

- components/esp_eth/include/esp_eth_phy_802_3.h

Functions

```c
esp_err_t esp_eth_phy_802_3_reset_hw (phy_802_3_t *phy_802_3, uint32_t reset_assert_us)
    Performs hardware reset with specific reset pin assertion time.
```

参数

- phy_802_3 – IEEE 802.3 PHY object infrastructure
- reset_assert_us – Hardware reset pin assertion time

返回

- ESP_OK: reset Ethernet PHY successfully

```c
esp_err_t esp_eth_phy_802_3_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)
    Detect PHY address.
```

参数

- eth – Mediator of Ethernet driver
- detected_addr – [out] a valid address after detection

返回

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)
    Performs basic PHY chip initialization.
```

备注：It should be called as the first function in PHY specific driver instance

```c
参数 phy_802_3 – IEEE 802.3 PHY object infrastructure
返回
- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation
```

**Chapter 2. API**

*esp_err_t* `esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)`

Performs basic PHY chip de-initialization.

**备注:** It should be called as the last function in PHY specific driver instance

Chapter 2. API 参考

Structures

struct phy_802_3_t
IEEE 802.3 PHY object info structure.

Public Members

*esp_eth_phy_t parent
    Parent Ethernet PHY instance

*esp_eth_mediator_t *eth
    Mediator of Ethernet driver

int addr
    PHY address

uint32_t reset_timeout_ms
    Reset timeout value (Unit: ms)

uint32_t autonego_timeout_ms
    Auto-negotiation timeout value (Unit: ms)

eth_link_t link_status
    Current Link status

int reset_gpio_num
    Reset GPIO number, -1 means no hardware reset

Header File

  • components/esp_eth/include/esp_eth_netif_glue.h

Functions

esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
Create a netif glue for Ethernet driver.

备注: netif glue is used to attach io driver to TCP/IP netif

参数 eth_hdl – Ethernet driver handle
返回 glue object, which inherits esp_netif_driver_base_t

esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
Delete netif glue of Ethernet driver.

参数 eth_netif_glue – netif glue
返回 -ESP_OK: delete netif glue successfully

Type Definitions

typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
Handle of netif glue - an intermediate layer between netif and Ethernet driver.
本部分的以太网 API 示例代码存放在 ESP-IDF 示例项目的 ethernet 目录下。
2.5.3 Thread

Introduction  Thread is an IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

Application Examples  The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli.
- The Thread border router openthread/ot_br.
- The Thread radio co-processor openthread/ot_rcc.

API Reference  For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File  
- components/openthread/include/esp_openthread.h

Functions

```c
esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)
```

Initializes the full OpenThread stack.

备注: The OpenThread instance will also be initialized in this function.

参数  init_config  [in]  The initialization configuration.
返回
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

```c
esp_err_t esp_openthread_launch_mainloop(void)
```

Launches the OpenThread main loop.

备注: This function will not return unless error happens when running the OpenThread stack.

返回
- ESP_OK on success
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_deinit(void)
```

This function performs OpenThread stack and platform driver deinitialization.

返回
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
otInstance *\texttt{esp\_openthread\_get\_instance} (void)

This function acquires the underlying OpenThread instance.

\textbf{备注：} This function can be called on other tasks without lock.

The OpenThread instance pointer

\textbf{Header File}

- components/openthread/include/esp_openthread_types.h

\textbf{Structures}

\textbf{struct} \texttt{esp\_openthread\_mainloop\_context\_t}

This structure represents a context for a select() based mainloop.

\textbf{Public Members}

\begin{itemize}
  \item \texttt{fd\_set read\_fds}
    \begin{itemize}
      \item The read file descriptors
    \end{itemize}
  \item \texttt{fd\_set write\_fds}
    \begin{itemize}
      \item The write file descriptors
    \end{itemize}
  \item \texttt{fd\_set error\_fds}
    \begin{itemize}
      \item The error file descriptors
    \end{itemize}
  \item \texttt{int max\_fd}
    \begin{itemize}
      \item The max file descriptor
    \end{itemize}
  \item \texttt{struct timeval timeout}
    \begin{itemize}
      \item The timeout
    \end{itemize}
\end{itemize}

\textbf{struct} \texttt{esp\_openthread\_uart\_config\_t}

The uart port config for OpenThread.

\textbf{Public Members}

\begin{itemize}
  \item \texttt{uart\_port\_t port}
    \begin{itemize}
      \item UART port number
    \end{itemize}
  \item \texttt{uart\_config\_t uart\_config}
    \begin{itemize}
      \item UART configuration, see \texttt{uart\_config\_t} docs
    \end{itemize}
  \item \texttt{int rx\_pin}
    \begin{itemize}
      \item UART RX pin
    \end{itemize}
\end{itemize}
int tx_pin
UART TX pin

struct esp_openthread_radio_config_t
The OpenThread radio configuration.

Public Members

datatype esp_openthread_radio_mode_t radio_mode
The radio mode

datatype esp_openthread_uart_config_t radio_uart_config
The uart configuration to RCP

struct esp_openthread_host_connection_config_t
The OpenThread host connection configuration.

Public Members

datatype esp_openthread_host_connection_mode_t host_connection_mode
The host connection mode

datatype esp_openthread_uart_config_t host_uart_config
The uart configuration to host

struct esp_openthread_port_config_t
The OpenThread port specific configuration.

Public Members

const char storage_partition_name
The partition for storing OpenThread dataset

uint8_t netif_queue_size
The packet queue size for the network interface

uint8_t task_queue_size
The task queue size

struct esp_openthread_platform_config_t
The OpenThread platform configuration.

Public Members

datatype esp_openthread_radio_config_t radio_config
The radio configuration
**esp_openthread_host_connection_config_t** host_config

The host connection configuration

**esp_openthread_port_config_t** port_config

The port configuration

### Type Definitions

typedef void (*esp_openthread_rcp_failure_handler)(void)

### Enumerations

enum **esp_openthread_event_t**

OpenThread event declarations.

**Values:**

- enumerator **OPENTHREAD_EVENT_START**
  OpenThread stack start
- enumerator **OPENTHREAD_EVENT_STOP**
  OpenThread stack stop
- enumerator **OPENTHREAD_EVENT_IF_UP**
  OpenThread network interface up
- enumerator **OPENTHREAD_EVENT_IF_DOWN**
  OpenThread network interface down
- enumerator **OPENTHREAD_EVENT_GOT_IP6**
  OpenThread stack added IPv6 address
- enumerator **OPENTHREAD_EVENT_LOST_IP6**
  OpenThread stack removed IPv6 address
- enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**
  OpenThread stack joined IPv6 multicast group
- enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**
  OpenThread stack left IPv6 multicast group
- enumerator **OPENTHREAD_EVENT_TREL_ADD_IP6**
  OpenThread stack added TREL IPv6 address
- enumerator **OPENTHREAD_EVENT_TREL_REMOVE_IP6**
  OpenThread stack removed TREL IPv6 address
- enumerator **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**
  OpenThread stack joined TREL IPv6 multicast group
enum \texttt{esp\_openthread\_radio\_mode\_t}

The radio mode of OpenThread.

\textit{Values:}

- \texttt{RADIO\_MODE\_NATIVE} \texttt{enumerator}
  
  Use the native 15.4 radio

- \texttt{RADIO\_MODE\_UART\_RCP} \texttt{enumerator}
  
  UART connection to a 15.4 capable radio co-processor (RCP)

- \texttt{RADIO\_MODE\_SPI\_RCP} \texttt{enumerator}
  
  SPI connection to a 15.4 capable radio co-processor (RCP)

enum \texttt{esp\_openthread\_host\_connection\_mode\_t}

How OpenThread connects to the host.

\textit{Values:}

- \texttt{HOST\_CONNECTION\_MODE\_NONE} \texttt{enumerator}
  
  Disable host connection

- \texttt{HOST\_CONNECTION\_MODE\_CLI\_UART} \texttt{enumerator}
  
  CLI UART connection to the host

- \texttt{HOST\_CONNECTION\_MODE\_RCP\_UART} \texttt{enumerator}
  
  RCP UART connection to the host

\textbf{Header File}

- components/openthread/include/esp_openthread_lock.h

\textbf{Functions}

\texttt{esp\_err\_t esp\_openthread\_lock\_init (void)}

This function initializes the OpenThread API lock.

\begin{itemize}
  \item ESP\_OK on success
  \item ESP\_ERR\_NO\_MEM if allocation has failed
  \item ESP\_ERR\_INVALID\_STATE if already initialized
\end{itemize}

\textbf{void esp\_openthread\_lock\_deinit (void)}

This function deinitializes the OpenThread API lock.

\textbf{bool esp\_openthread\_lock\_acquire (TickType\_t block\_ticks)}

This function acquires the OpenThread API lock.

\begin{itemize}
  \item ESP\_OK on success
  \item ESP\_ERR\_NO\_MEM if allocation has failed
  \item ESP\_ERR\_INVALID\_STATE if already initialized
\end{itemize}

\hrulewidth 0.5pt

\textbf{备注:} Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

\begin{itemize}
  \item block\_ticks \texttt{[in]} The maximum number of RTOS ticks to wait for the lock.
  \item True on lock acquired
\end{itemize}
Chapter 2. API

- False on failing to acquire the lock with the timeout.

```c
void esp_openthread_lock_release (void)
This function releases the OpenThread API lock.
```

**Header File**
- components/openthread/include/esp_openthread_netif_glue.h

**Functions**

```c
void* esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
This function initializes the OpenThread network interface glue.
```

参数 `config` [in] The platform configuration.
返回
- glue pointer on success
- NULL on failure

```c
void esp_openthread_netif_glue_deinit (void)
This function deinitializes the OpenThread network interface glue.
```

```c
esp_netif_t *esp_openthread_get_netif (void)
This function acquires the OpenThread netif.
```

返回 The OpenThread netif or NULL if not initialized.

**Macros**

```c
ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD ()
Default configuration reference of OT esp-netif.
ESP_NETIF_DEFAULT_OPENTHREAD ()
```

**Header File**
- components/openthread/include/esp_openthread_border_router.h

**Functions**

```c
void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
Sets the backbone interface used for border routing.
```

备注: This function must be called before esp_openthread_init

参数 `backbone_netif` [in] The backbone network interface (WiFi or ethernet)

```c
esp_err_t esp_openthread_border_router_init (void)
Initializes the border router features of OpenThread.
```

备注: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

返回
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FAIL on other failures
**Chapter 2. API Reference**

`esp_err_t esp_openthread_border_router_deinit (void)`

Deinitializes the border router features of OpenThread.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FAIL on other failures

`esp_netif_t *esp_openthread_get_backbone_netif (void)`

Gets the backbone interface of OpenThread border router.

- The backbone interface or NULL if border router not initialized.

`void esp_openthread_register_rcp_failure_handler (esp_openthread_rcp_failure_handler handler)`

Registers the callback for RCP failure.

`void esp_openthread_rcp_deinit (void)`

Deinitializes the connection to RCP.

Thread 是一种基于 IPv6 的物联网网状网络技术。本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 `openthread` 目录下。

### 2.5.4 IP 网络层协议

**ESP-NETIF**

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

**ESP-NETIF architecture**

![ESP-NETIF Architecture Diagram]
Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate

Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with

- ESP-NETIF specific options (flags, behaviour, name)
- Network stack options (netif init and input functions, not publicly available)
- IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps

4) Configures event handlers
   • use default handlers for common interfaces defined in IO drivers; or define a specific handlers for
     customised behaviour/new interfaces
   • register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API
   • Getting and setting TCP/IP related parameters (DHCP, IP, etc)
   • Receiving IP events (connect/disconnect)
   • Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver
   Communication driver plays these two important roles in relation with ESP-NETIF:
   1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
   2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
      • Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
      • Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF
   ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:
   1) Initialization APIs (to create and configure ESP-NETIF instance)
   2) Input/Output API (for passing data between IO driver and network stack)
   3) Event or Action API
      • Used for network interface lifecycle management
      • ESP-NETIF provides building blocks for designing event handlers
   4) Setters and Getters for basic network interface properties
   5) Network stack abstraction: enabling user interaction with TCP/IP stack
      • Set interface up or down
      • DHCP server and client API
      • DNS API
   6) Driver conversion utilities

D) Network stack
   Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface
   The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.
   From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like open(), read(), write(), etc). Refer to 虚拟文件系统组件 to learn more.
   There is only one ESP-NETIF L2 TAP interface device (pathname) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be
configured to give an access to specific Network Interface identified by \texttt{if\_key} (e.g. \texttt{ETH\_DEF}) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

**ESP-NETIF L2 TAP Interface Usage Manual**

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by \texttt{CONFIG_ESP_NETIF_L2_TAP} first and then registered by \texttt{esp\_vfs\_l2tap\_intf\_register()} prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path name can be opened multiple times up to \texttt{CONFIG_ESP_NETIF_L2_TAP_MAX_FDS} and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with \texttt{O\_NONBLOCK} file status flag to the \texttt{read()} does not block. Note that the \texttt{write()} may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using \texttt{fcntl()}.

On success, \texttt{open()} returns the new file descriptor (a nonnegative integer). On error, -1 is returned and \texttt{errno} is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- \texttt{L2TAP\_S\_INTF\_DEVICE} - bounds the file descriptor to specific Network Interface which is identified by its \texttt{if\_key}. ESP-NETIF Network Interface \texttt{if\_key} is passed to \texttt{ioctl()} as the third parameter. Note that default Network Interfaces \texttt{if\_key}’s used in ESP-IDF can be found in \texttt{esp\_netif\_include\_esp\_netif\_defaults.h}.
- \texttt{L2TAP\_S\_DEVICE\_DRV\_HNDL} - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. \texttt{esp\_eth\_handle\_t} in case of Ethernet). The IO Driver handle is passed to \texttt{ioctl()} as the third parameter.
- \texttt{L2TAP\_S\_RCV\_FILTER} - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval \textless 0, 0x05DC\textgreater at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to specific Network Interface by \texttt{L2TAP\_S\_INTF\_DEVICE} or \texttt{L2TAP\_S\_DEVICE\_DRV\_HNDL} to be \texttt{L2TAP\_S\_RCV\_FILTER} option available.

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.
Chapter 2. API 参考

备注：L2TAP_S_DEVICE_DRV_HNDL is particularly useful when user’s application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its if_key and hence it needs to be identified directly by its IO Driver handle.

On success, ioctl() returns 0. On error, -1 is returned, and errno is set to indicate the error.

EBADF - not a valid file descriptor.

EACCES - option change is denied in this state (e.g. file descriptor has not been bounded to Network interface yet).

EINVAL - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

ENODEV - no such Network Interface which is tried to be assigned to the file descriptor exists.

ENOSYS - unsupported operation, passed configuration option does not exists.

fcntl() is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- F_GETFD - the function returns the file descriptor flags, the third argument is ignored.
- F_SETFD - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and errno is set to indicate the error.

EBADF - not a valid file descriptor.

ENOSYS - unsupported command.

read() Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by read() to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of O_NONBLOCK file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, read() returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and errno is set to indicate the error.

EBADF - not a valid file descriptor.

EAGAIN - the file descriptor has been marked non-blocking (O_NONBLOCK), and the read would block.

write() A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+----------------------------
  | Destination MAC  | Source MAC        | Type/Length | Payload (protocol header/
  ← ---               ← ---                        data) ...                     
+-------------------+-------------------+-------------+----------------------------
  6B                 6B                  2B          0-1486B
```
In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

### close()
Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first’s task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

### select()
Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

### ESP-NETIF programmer’s manual
Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- L2 TAP: `protocols/l2tap/main/l2tap_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases please consult this guide: `ESP-NETIF Custom I/O Driver`.

### WiFi default initialization
The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

### API Reference
Chapter 2. API 参考

Header File

- components/esp_netif/include/esp_netif.h

Functions

`esp_err_t esp_netif_init (void)`
Initialize the underlying TCP/IP stack.

备注: This function should be called exactly once from application code, when the application starts up.

返回
- ESP_OK on success
- ESP_FAIL if initializing failed

`esp_err_t esp_netif_deinit (void)`
Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

返回
- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new (const esp_netif_config_t *esp_netif_config)`
Creates an instance of new esp-netif object based on provided config.

参数 esp_netif_config — pointer esp-netif configuration
返回
- pointer to esp-netif object on success
- NULL otherwise

`void esp_netif_destroy (esp_netif_t *esp_netif)`
Destroys the esp_netif object.

参数 esp_netif — [in] pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`
Configures driver related options of esp_netif object.

参数
- esp_netif — [inout] pointer to the object to be configured
- driver_config — [in] pointer esp-netif io driver related configuration
返回
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

`esp_err_t esp_netif_attach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`
Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

参数
- esp_netif — [inout] pointer to esp_netif object to be attached
- driver_handle — [in] pointer to the driver handle

返回
**Chapter 2. API Reference**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s pot_attach callback failed

```c
esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
```

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

- **esp_netif** - [in] Handle to esp-netif instance
- **buffer** - [in] Received data
- **len** - [in] Length of the data frame
- **eb** - [in] Pointer to internal buffer (used in Wi-Fi driver)

**Return**
- ESP_OK

```c
void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Remark:** This API can be directly used as event handler

```c
void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver stop event.

**Remark:** This API can be directly used as event handler

```c
void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver connected event.

**Remark:** This API can be directly used as event handler

```c
```
void **esp_netif_action_disconnected** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

备注: This API can be directly used as event handler

参数
- esp_netif - [in] Handle to esp-netif instance
- base -
- event_id -
- data -

void **esp_netif_action_got_ip** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

备注: This API can be directly used as event handler

参数
- esp_netif - [in] Handle to esp-netif instance
- base -
- event_id -
- data -

void **esp_netif_action_join_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

备注: This API can be directly used as event handler

参数
- esp_netif - [in] Handle to esp-netif instance
- base -
- event_id -
- data -

void **esp_netif_action_leave_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

备注: This API can be directly used as event handler

参数
- esp_netif - [in] Handle to esp-netif instance
- base -
- event_id -
- data -

void **esp_netif_action_add_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.
Chapter 2. API 参考

备注：This API can be directly used as event handler

### 参数
- **esp_netif** - [in] Handle to esp-netif instance
- **base** -
- **event_id** -
- **data** -

void **esp_netif_action_remove_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

备注：This API can be directly used as event handler

### 参数
- **esp_netif** - [in] Handle to esp-netif instance
- **base** -
- **event_id** -
- **data** -

**esp_err_t esp_netif_set_default_netif** (**esp_netif_t** *esp_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

参数 **esp_netif** - [in] Handle to esp-netif instance
返回 ESP_OK on success

**esp_err_t esp_netif_set_mac** (**esp_netif_t** *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

参数 **esp_netif** - [in] Handle to esp-netif instance
参数 **mac** - [in] Desired mac address for the related network interface
返回
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**esp_err_t esp_netif_get_mac** (**esp_netif_t** *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

参数 **esp_netif** - [in] Handle to esp-netif instance
参数 **mac** - [out] Resultant mac address for the related network interface
返回
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**esp_err_t esp_netif_set_hostname** (**esp_netif_t** *esp_netif, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.
Chapter 2. API 参考

参数
- esp_netif – [in] Handle to esp-netif instance

返回
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**esp_err_t** esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)

Get interface hostname.

参数
- esp_netif – [in] Handle to esp-netif instance
- hostname – [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

返回
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**bool** esp_netif_is_netif_up (esp_netif_t *esp_netif)

Test if supplied interface is up or down.

参数 esp_netif – [in] Handle to esp-netif instance

返回
- true - Interface is up
- false - Interface is down

**esp_err_t** esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

参数
- esp_netif – [in] Handle to esp-netif instance
- ip_info – [out] If successful, IP information will be returned in this argument.

返回
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t** esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

参数
- esp_netif – [in] Handle to esp-netif instance
- ip_info – [out] If successful, IP information will be returned in this argument.

返回
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t** esp_netif_set_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.
The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

备注: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

备注: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

参数
- esp_netif --[in] Handle to esp-netif instance
- ip_info --[in] IP information to set on the specified interface

返回
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

\[
\text{esp_err_t } \text{esp_netif_set_old_ip_info}(\text{esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info})
\]

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

参数
- esp_netif --[in] Handle to esp-netif instance
- ip_info --[in] Store the old IP information for the specified interface

返回
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

\[
\text{int } \text{esp_netif_get_netif_impl_index}(\text{esp_netif_t *esp_netif})
\]

Get net interface index from network stack implementation.

备注: This index could be used in setsockopt() to bind socket with multicast interface

参数 esp_netif --[in] Handle to esp-netif instance

返回 implementation specific index of interface represented with supplied esp_netif

\[
\text{esp_err_t } \text{esp_netif_get_netif_impl_name}(\text{esp_netif_t *esp_netif, char *name})
\]

Get net interface name from network stack implementation.

备注: This name could be used in setsockopt() to bind socket with appropriate interface

参数
- esp_netif --[in] Handle to esp-netif instance
Chapter 2. API

- **name** [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**esp_err_t esp_netif_dhcps_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)**

Set or Get DHCP server option.

**参数**

- **esp_netif** [in] Handle to esp-netif instance
- **opt_op** [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** [in] Option index to get or set, must be one of the supported enum values.
- **opt_val** [inout] Pointer to the option parameter.
- **opt_len** [in] Length of the option parameter.

**返回**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcpc_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)**

Set or Get DHCP client option.

**参数**

- **esp_netif** [in] Handle to esp-netif instance
- **opt_op** [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** [in] Option index to get or set, must be one of the supported enum values.
- **opt_val** [inout] Pointer to the option parameter.
- **opt_len** [in] Length of the option parameter.

**返回**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcpc_start (esp_netif_t *esp_netif)**

Start DHCP client (only if enabled in interface object)

**esp_err_t esp_netif_dhcpc_stop (esp_netif_t *esp_netif)**

Stop DHCP client (only if enabled in interface object)
备注：Calling action_netif_stop() will also stop the DHCP Client if it is running.

参数 esp_netif –[in] Handle to esp-netif instance
返回
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t esp_netif_dhcpc_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
Get DHCP client status.

参数
• esp_netif –[in] Handle to esp-netif instance
• status –[out] If successful, the status of DHCP client will be returned in this argument.
返回
• ESP_OK

esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
Get DHCP Server status.

参数
• esp_netif –[in] Handle to esp-netif instance
• status –[out] If successful, the status of the DHCP server will be returned in this argument.
返回
• ESP_OK

esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)
Start DHCP server (only if enabled in interface object)

参数 esp_netif –[in] Handle to esp-netif instance
返回
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)
Stop DHCP server (only if enabled in interface object)

参数 esp_netif –[in] Handle to esp-netif instance
返回
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t esp_netif_dhcps_get_clients_by_mac (esp_netif_t *esp_netif, int num,
    esp_netif_pair_mac_ip_t *mac_ip_pair)
Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

参数
• esp_netif –[in] Handle to esp-netif instance
• num –[in] Number of clients with specified MAC addresses in the array of pairs
• mac_ip_pair –[inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)
返回
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
• ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

```c
esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled.

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

### 参数

- **esp_netif** [in] Handle to esp-netif instance
- **type** [in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** [in] DNS Server address to set

### 返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

### 参数

- **esp_netif** [in] Handle to esp-netif instance
- **type** [in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** [out] DNS Server result is written here on success

### 返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

### 参数 **esp_netif** [in] Handle to esp-netif instance

### 返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.
If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

参数
- esp_netif –[in] Handle to esp-netif instance
- if_ip6 –[out] IPv6 information will be returned in this argument if successful.

返回
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

参数
- esp_netif –[in] Handle to esp-netif instance
- if_ip6 –[out] IPv6 information will be returned in this argument if successful.

返回
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
Get all IPv6 addresses of the specified interface.

参数
- esp_netif –[in] Handle to esp-netif instance
- if_ip6 –[out] Array of IPv6 addresses will be copied to the argument

返回 number of returned IPv6 addresses

void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
Sets IPv4 address to the specified octets.

参数
- addr –[out] IP address to be set
- a –the first octet (127 for IP 127.0.0.1)
- b –
- c –
- d –

char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
Converts numeric IP address into decimal dotted ASCII representation.

参数
- addr –ip address in network order to convert
- buf –target buffer where the string is stored
- buflen –length of buf

返回 either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t esp_ip4addr_aton (const char *addr)
Ascii internet address interpretation routine The value returned is in network order.

参数 addr –IP address in ascii representation (e.g. “127.0.0.1” )
返回 ip address in network order

esp_err_t esp_netif_str_to_ip4 (const char *src, esp_ip4_addr_t *dst)
Converts Ascii internet IPv4 address into esp_ip4_addr_t.

参数
- src –[in] IPv4 address in ascii representation (e.g. “127.0.0.1” )
Chapter 2. API

Esperrf Systems 942 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback

• dst –[out] Address of the target esp_ip4_addr_t structure to receive converted address

ESP_OK on success
ESP_FAIL if conversion failed
ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_err_t esp_netif_str_to_ip6 (const char *src, esp_ip6_addr_t *dst)
Converts Ascii internet IPv6 address into esp_ip4_addr_t. Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

src –[in] IPv6 address in ascii representation (e.g. “2001:0db8:85a3:0000:0000:0000:0002:0001”)

dst –[out] Address of the target esp_ip6_addr_t structure to receive converted address

ESP_OK on success
ESP_FAIL if conversion failed
ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)
Gets media driver handle for this esp-netif instance.

esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)
Searches over a list of created objects to find an instance with supplied if key.

if_key –Textual description of network interface

don –Handle to esp-netif instance

esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)
Returns configured flags for this interface.

esp_netif_t –[in] Handle to esp-netif instance

Configuration flags

const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)
Returns configured interface key for this esp-netif instance.

esp_netif_t –[in] Handle to esp-netif instance

Textual description of related interface

const char *esp_netif_get_desc (esp_netif_t *esp_netif)
Returns configured interface type for this esp-netif instance.

esp_netif_t –[in] Handle to esp-netif instance

Enumerated type of this interface, such as station, AP, ethernet

int esp_netif_get_route_prio (esp_netif_t *esp_netif)
Returns configured routing priority number.

esp_netif_t –[in] Handle to esp-netif instance

Integer representing the instance’s route-prio, or -1 if invalid parameters

int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
Returns configured event for this esp-netif instance and supplied event type.

esp_netif_t –[in] Handle to esp-netif instance

event_type – (either get or lost IP)

specific event id which is configured to be raised if the interface lost or acquired IP address

-1 if supplied event_type is not known
**esp_netif_t** *esp_netif_next (esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

- **参数** esp_netif - [in] Handle to esp-netif instance
- **返回** First netif from the list if supplied parameter is NULL, next one otherwise

**size_t esp_netif_get_nr_of_ifs (void)**

Returns number of registered esp_netif objects.

- **返回** Number of esp_netifs

**void esp_netif_netstack_buf_ref (void *netstack_buf)**

Increases the reference counter of net stack buffer

- **参数** netstack_buf - [in] the net stack buffer

**void esp_netif_netstack_buf_free (void *netstack_buf)**

Frees the netstack buffer

- **参数** netstack_buf - [in] the net stack buffer

**Header File**

Interface IPV4 address

**esp_ip4_addr_t netmask**

Interface IPV4 netmask

**esp_ip4_addr_t gw**

Interface IPV4 gateway address

**struct esp_netif_ip6_info_t**

IPV6 IP address information.
Public Members

*esp_ip6_addr_t* `ip`
- Interface IPV6 address

struct `ip_event_got_ip_t`
- Event structure for IP_EVENT_GOT_IP event.

Public Members

*esp_netif_t* `*esp_netif`
- Pointer to corresponding esp-netif object

*esp_netif_ip_info_t* `ip_info`
- IP address, netmask, gateway IP address

bool `ip_changed`
- Whether the assigned IP has changed or not

struct `ip_event_got_ip6_t`
- Event structure for IP_EVENT_GOT_IP6 event

Public Members

*esp_netif_t* `*esp_netif`
- Pointer to corresponding esp-netif object

*esp_netif_ip6_info_t* `ip6_info`
- IPv6 address of the interface

int `ip_index`
- IPv6 address index

struct `ip_event_add_ip6_t`
- Event structure for ADD_IP6 event

Public Members

*esp_ip6_addr_t* `addr`
- The address to be added to the interface

bool `preferred`
- The default preference of the address

struct `ip_event_ap_staipassigned_t`
- Event structure for IP_EVENT_AP_STAIPASSIGNED event
Chapter 2. API 参考

Public Members

\textit{esp_netif_t *} \textit{esp_netif}

  Pointer to the associated netif handle

\textit{esp_ip4_addr_t} \textit{ip}

  IP address which was assigned to the station

uint8_t \textit{mac}[6]

  MAC address of the connected client

struct \textit{bridgeif_config}

  LwIP bridge configuration

Public Members

uint16_t \textit{max_fdb_dyn_entries}

  maximum number of entries in dynamic forwarding database

uint16_t \textit{max_fdb_sta_entries}

  maximum number of entries in static forwarding database

uint8_t \textit{max_ports}

  maximum number of ports the bridge can consist of

struct \textit{esp_netif_inherent_config}

  ESP-netif inherent config parameters.

Public Members

\textit{esp_netif_flags_t} \textit{flags}

  flags that define esp-netif behavior

uint8_t \textit{mac}[6]

  initial mac address for this interface

const \textit{esp_netif_ip_info_t *} \textit{ip_info}

  initial ip address for this interface

uint32_t \textit{get_ip_event}

  event id to be raised when interface gets an IP

uint32_t \textit{lost_ip_event}

  event id to be raised when interface losts its IP

const char \textit{*if_key}

  string identifier of the interface
const char *if_desc
    textual description of the interface

int route_prio
    numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t *bridge_info
    LwIP bridge configuration

struct esp_netif_driver_base_s
    ESP-netif driver base handle.

Public Members

esp_err_t (*post_attach)(esp_netif_t *netif, esp_netif_iodriver_handle h)
    post attach function pointer

esp_netif_t *netif
    netif handle

struct esp_netif_driver_ifconfig
    Specific IO driver configuration.

Public Members

esp_netif_iodriver_handle handle
    io-driver handle

esp_err_t (*transmit)(void *h, void *buffer, size_t len)
    transmit function pointer

esp_err_t (*transmit_wrap)(void *h, void *buffer, size_t len, void *netstack_buffer)
    transmit wrap function pointer

void (*driver_free_rx_buffer)(void *h, void *buffer)
    free rx buffer function pointer

struct esp_netif_config
    Generic esp_netif configuration.

Public Members

const esp_netif_inherent_config_t *base
    base config
const esp_netif_driver_ifconfig_t *driver
driver config

const esp_netif_netstack_config_t *stack
stack config

struct esp_netif_pair_mac_ip_t
DHCP client’s addr info (pair of MAC and IP address)

Public Members

uint8_t mac[6]
Clients MAC address

esp_ip4_addr_t ip
Clients IP address

Header File
• components/esp_netif/include/esp_vfs_l2tap.h

Functions
`esp_err_t esp_vfs_l2tap_intf_register (l2tap_vfs_config_t *config)`
Add L2 TAP virtual filesystem driver.
This function must be called prior usage of ESP-NETIF L2 TAP Interface
参数 config - L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tap is used when this parameter is NULL.
返回 esp_err_t
• ESP_OK on success

`esp_err_t esp_vfs_l2tap_intf_unregister (const char*base_path)`
Removes L2 TAP virtual filesystem driver.
参数 base_path - Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.
返回 esp_err_t
• ESP_OK on success

`esp_err_t esp_vfs_l2tap_eth_filter (l2tap_iodriver_handle driver_handle, void *buff, size_t *size)`
Filters received Ethernet L2 frames into L2 TAP infrastructure.
参数
• driver_handle - handle of driver at which the frame was received
• buff - received L2 frame
• size - input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP
返回 esp_err_t
• ESP_OK is always returned

Structures
`struct l2tap_vfs_config_t`
L2Tap VFS config parameters.

Public Members

const char *base_path
vfs base path

Macros

L2TAP_VFS_DEFAULT_PATH
L2TAP_VFS_CONFIG_DEFAULT ()
**Type Definitions**

typedef void *l2tap_iodriver_handle

**Enumerations**

eenum l2tap_ioctl_opt_t
    Values:
    
    enumerator L2TAP_S_RCV_FILTER
    enumerator L2TAP_G_RCV_FILTER
    enumerator L2TAP_S_INTF_DEVICE
    enumerator L2TAP_G_INTF_DEVICE
    enumerator L2TAP_SDEVICE_DRV_HNDL
    enumerator L2TAP_GDEVICE_DRV_HNDL

**WiFi default API reference**

**Header File**

- components/esp_wifi/include/esp_wifi_default.h

**Functions**

- `esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)`
  Attaches wifi station interface to supplied netif.
  
  参数 `esp_netif` – instance to attach the wifi station to
  返回 • ESP_OK on success
  • ESP_FAIL if attach failed

- `esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)`
  Attaches wifi soft AP interface to supplied netif.
  
  参数 `esp_netif` – instance to attach the wifi AP to
  返回 • ESP_OK on success
  • ESP_FAIL if attach failed

- `esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)`
  Sets default wifi event handlers for STA interface.
  
  返回 • ESP_OK on success, error returned from esp_event_handler_register if failed

- `esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)`
  Sets default wifi event handlers for AP interface.
  
  返回 • ESP_OK on success, error returned from esp_event_handler_register if failed
**esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void *esp_netif)**
Cleans default wifi event handlers for supplied network interface.

**参数** esp_netif – instance of corresponding if object

**返回**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_netif_t *esp_netif_create_default_wifi_ap (void)**
Creates default WIFI AP. In case of any init error this API aborts.

**备注**：The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

**返回** pointer to esp-netif instance

**esp_netif_t *esp_netif_create_default_wifi_sta (void)**
Creates default WIFI STA. In case of any init error this API aborts.

**备注**：The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

**返回** pointer to esp-netif instance

**void esp_netif_destroy_default_wifi (void *esp_netif)**
Destroys default WIFI netif created with esp_netif_create_default_wifi…() API.

**备注**：This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**参数** esp_netif – [in] object to detach from WiFi and destroy

**esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, const esp_netif_inherent_config_t *esp_netif_config)**
Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**参数**
- wifi_if – [in] type of wifi interface
- esp_netif_config – inherent esp-netif configuration pointer

**返回** pointer to esp-netif instance

**esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)**
Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**参数**
- p_netif_sta – [out] pointer where the resultant STA interface is saved (if non NULL)
• **p_netif_ap** [out] pointer where the resultant AP interface is saved (if non NULL)

ESP_OK on success

### 2.5.5 IP 网络层协议

**ESP-NETIF Custom I/O Driver**

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

• `esp_netif_transmit()`
• `esp_netif_free_rx_buffer()`
• `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle...
driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

• post-attach function callback
• related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;  /*!< base structure reserved as...
    "esp_netif_driver */
    driver_impl *h;  /*!< handle of driver...
    "implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args) {
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
    }
    (下页続き)
```
Default handlers

I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_,
    EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_,
    EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection

The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

### Header File

- `components/esp_netif/include/esp_netif_net_stack.h`

### Functions

- `esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)`
  - Returns esp-netif handle.
  - 参数 `dev` – [in] opaque ptr to network interface of specific TCP/IP stack
  - 返回 handle to related esp-netif instance

- `void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)`
  - Returns network stack specific implementation handle (if supported)
  - Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode
  - 参数 `esp_netif` – [in] Handle to esp-netif instance
  - 返回 handle to related network stack netif handle

- `esp_err_t esp_netif_set_link_speed(esp_netif_t *esp_netif, uint32_t speed)`
  - Set link-speed for the specified network interface.
  - 参数
    - `esp_netif` – [in] Handle to esp-netif instance
    - `speed` – [in] Link speed in bit/s
  - 返回 ESP_OK on success
**esp_err_t esp_netif_transmit** *(esp_netif_t *esp_netif, void *data, size_t len)*

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

- **esp_netif** – [in] Handle to esp-netif instance
- **data** – [in] Data to be transmitted
- **len** – [in] Length of the data frame

返回 ESP_OK on success, an error passed from the I/O driver otherwise

**esp_err_t esp_netif_transmit_wrap** *(esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)*

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

- **esp_netif** – [in] Handle to esp-netif instance
- **data** – [in] Data to be transmitted
- **len** – [in] Length of the data frame
- **netstack_buf** – [in] net stack buffer

返回 ESP_OK on success, an error passed from the I/O driver otherwise

**void esp_netif_free_rx_buffer** *(void *esp_netif, void *buffer)*

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

- **esp_netif** – [in] Handle to esp-netif instance
- **buffer** – [in] Rx buffer pointer

#### 2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

**Introduction**

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

The ADC on ESP32 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.
Chapter 2. API

Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- **Resource Allocation** - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- **Unit Configuration** - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- **Read Conversion Result** - covers how to get ADC conversion raw result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - describes tips on how to read ADC conversion raw result when cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**

The ADC oneshot mode driver is implemented based on ESP32 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver’s point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

**Create an ADC Unit Handle under Normal Oneshot Mode**

```c
adc_oneshot_unit_handle_t adcl_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adcl_handle));
```

**Recycle the ADC Unit**

```c
ESP_ERROR_CHECK(adc_oneshot_del_unit(adcl_handle));
```

**Unit Configuration**

After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.
Chapter 2. API 参考

### For the IO corresponding ADC channel number. Check datasheet to know the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with above configuration structure. You should specify an ADC channel to be configured as well. This function (`adc_oneshot_config_channel()`) can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.

#### Configure Two ADC Channels

```c
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adcl_handle, EXAMPLE_ADC1_CHAN0, &config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adcl_handle, EXAMPLE_ADC1_CHAN1, &config));
```

#### Read Conversion Result

After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers / peripherals, see Hardware Limitations. This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = \frac{D_{out} \times V_{max}}{D_{max}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is (2^{\text{bitwidth}}), where <code>bitwidth</code> is the <code>adc_oneshot_chan_cfg_t:bitwidth</code> configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc Analog to Digital Converter (ADC) Calibration Driver.

#### Read Raw Result

```c
ESP_ERROR_CHECK(adc_oneshot_read(adcl_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, adc_raw[0][0]);
ESP_ERROR_CHECK(adc_oneshot_read(adcl_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1, adc_raw[0][1]);
```
Hardware Limitations

- Random Number Generator uses ADC as a input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.
- ADC2 is also used by the Wi-Fi. `adc_oneshot_read()` has provided the protection between Wi-Fi driver and ADC oneshot mode driver.
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

Power Management

When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won’t be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe

By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs executes when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread safe. Besides, concurrently calling this function may result in failures of above thread-safe APIs.

Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see IRAM Safe for more details.

Application Examples

- ADC oneshot mode example: `peripherals/adc/oneshot_read`.

Structures

```c
struct adc_digi_pattern_config_t

ADC digital controller pattern configuration.
```
Public Members

uint8_t atten
   Attenuation of this ADC channel.

uint8_t channel
   ADC channel.

uint8_t unit
   ADC unit.

uint8_t bit_width
   ADC output bit width.

struct adc_digi_output_data_t
   ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

备注: ESP32: Only type1 is valid. ADC2 does not support DMA mode.

备注: ESP32-S2: Member channel can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

Public Members

uint16_t data
   ADC real output data info. Resolution: 12 bit.
   ADC real output data info. Resolution: 11 bit.

uint16_t channel
   ADC channel index info.
   ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type1
   ADC type1

uint16_t unit
   ADC unit index info. 0: ADC1; 1: ADC2.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
   When the configured output format is 11bit.

uint16_t val
   Raw data value
Enumerations

```c
enum adc_unit_t
    ADC unit.
    Values:
```

```c
to
    ADC_UNIT_1
        SAR ADC 1.
```

```c
to
    ADC_UNIT_2
        SAR ADC 2.
```

```c
enum adc_channel_t
    ADC channels.
    Values:
```

```c
to
    ADC_CHANNEL_0
        ADC channel.
```

```c
to
    ADC_CHANNEL_1
        ADC channel.
```

```c
to
    ADC_CHANNEL_2
        ADC channel.
```

```c
to
    ADC_CHANNEL_3
        ADC channel.
```

```c
to
    ADC_CHANNEL_4
        ADC channel.
```

```c
to
    ADC_CHANNEL_5
        ADC channel.
```

```c
to
    ADC_CHANNEL_6
        ADC channel.
```

```c
to
    ADC_CHANNEL_7
        ADC channel.
```

```c
to
    ADC_CHANNEL_8
        ADC channel.
```

```c
to
    ADC_CHANNEL_9
        ADC channel.
```

```c
enum adc_atten_t
    ADC attenuation parameter. Different parameters determine the range of the ADC.
    Values:
```

```c
enumerator ADC_ATTEN_DB_0
    No input attenuation, ADC can measure up to approx.

enumerator ADC_ATTEN_DB_2_5
    The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator ADC_ATTEN_DB_6
    The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator ADC_ATTEN_DB_11
    The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enum adc_bitwidth_t
    Values:

enumerator ADC_BITWIDTH_DEFAULT
    Default ADC output bits, max supported width will be selected.

enumerator ADC_BITWIDTH_9
    ADC output width is 9Bit.

enumerator ADC_BITWIDTH_10
    ADC output width is 10Bit.

enumerator ADC_BITWIDTH_11
    ADC output width is 11Bit.

enumerator ADC_BITWIDTH_12
    ADC output width is 12Bit.

enumerator ADC_BITWIDTH_13
    ADC output width is 13Bit.

enum adc_ulp_mode_t
    Values:

enumerator ADC_ULP_MODE_DISABLE
    ADC ULP mode is disabled.

enumerator ADC_ULP_MODE_FSM
    ADC is controlled by ULP FSM.

enumerator ADC_ULP_MODE_RISCV
    ADC is controlled by ULP RISCV.
enum `adc_digi_convert_mode_t`
ADC digital controller (DMA mode) work mode.

Values:

enumerator `ADC_CONV_SINGLE_UNIT_1`
Only use ADC1 for conversion.

enumerator `ADC_CONV_SINGLE_UNIT_2`
Only use ADC2 for conversion.

enumerator `ADC_CONV_BOTH_UNIT`
Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator `ADC_CONV_ALTER_UNIT`
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

enum `adc_digi_output_format_t`
ADC digital controller (DMA mode) output data format option.

Values:

enumerator `ADC_DIGI_OUTPUT_FORMAT_TYPE1`
See `adc_digi_output_data_t.type1`

enumerator `ADC_DIGI_OUTPUT_FORMAT_TYPE2`
See `adc_digi_output_data_t.type2`

Functions

```c
esp_err_t adc_oneshot_new_unit(const adc_oneshot_unit_init_cfg_t *init_config,
                                adc_oneshot_unit_handle_t *ret_unit)
```
Create a handle to a specific ADC unit.

备注: This API is thread-safe. For more details, see ADC programming guide

参数
- `init_config` [in] Driver initial configurations
- `ret_unit` [out] ADC unit handle

返回
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use

```c
esp_err_t adc_oneshot_config_channel(const adc_oneshot_unit_handle_t *handle,
                                     adc_channel_t channel,
                                     const adc_oneshot_chan_cfg_t *config)
```
Set ADC oneshot mode required configurations.

<table>
<thead>
<tr>
<th>参数</th>
<th>Description</th>

**返回**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad
```c
esp_err_t adc_oneshot_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int* io_num)
```

Get GPIO number from the given ADC channel.

**Parameters**
- `unit_id` - [in] ADC unit
- `channel` - [in] ADC channel
- `io_num` - [out] GPIO number
- - ESP_OK: On success
- - ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

struct `adc_oneshot_unit_init_cfg_t`

ADC oneshot driver initial configurations.

**Public Members**

- `adc_unit_t unit_id`
  
  ADC unit.

- `adc_ulp_mode_t ulp_mode`
  
  ADC controlled by ULP, see `adc_ulp_mode_t` struct

struct `adc_oneshot_chan_cfg_t`

ADC channel configurations.

**Public Members**

- `adc_atten_t atten`
  
  ADC attenuation.

- `adc_bitwidth_t bitwidth`
  
  ADC conversion result bits.

**Type Definitions**

typedef struct adc_oneshot_unit_ctx_t *`adc_oneshot_unit_handle_t`

Type of ADC unit handle for oneshot mode.

### 2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

**Introduction**

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

The ADC on ESP32 can be used in scenario(s) like:
- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.
Driver Concepts ADC continuous mode conversion is made up with multiple Conversion Frames.

- **Conversion Frame**: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes.
- **Conversion Result**: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- **Resource Allocation** - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations** - describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control** - describes ADC control functions.
- **Register Event Callbacks** - describes how to hook users specific code to an ADC continuous mode event callback function.
- **Read Conversion Result** - covers how to get ADC conversion result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - covers the IRAM safe functions.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

Resource Allocation The ADC continuous mode driver is implemented based on ESP32 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the I2S0 peripheral is in use. See Hardware Limitations for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

Initialize the ADC Continuous Mode Driver
adc_continuous_handle_cfg_t
.
adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));

Recycle the ADC Unit
ESP_ERROR_CHECK(adc_continuous_deinit());

ADC Configurations After the ADC continuous mode driver is initialized, set up the adc_continuous_config_t to configure ADC IOs to measure analog signal:

- **adc_continuous_config_t::pattern_num**, number of ADC channels that will be used.
- **adc_continuous_config_t::adc_pattern**, list of configs for each ADC channel that will be used, see below description.
- **adc_continuous_config_t::sample_freg_hz**, expected ADC sampling frequency in Hz.
- **adc_continuous_config_t::conv_mode**, continuous conversion mode.
- **adc_continuous_config_t::format**, conversion output format.

For **adc_digi_pattern_config_t**:

- **adc_digi_pattern_config_t::atten**, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- **adc_digi_pattern_config_t::channel**, the IO corresponding ADC channel number. See below note.
- **adc_digi_pattern_config_t::unit**, the ADC that the IO is subordinate to.
- **adc_digi_pattern_config_t::bit_width**, the bitwidth of the raw conversion result.

备注: For the IO corresponding ADC channel number. Check datasheet to acquire the ADC IOs. On the other hand, **adc_continuous_io_to_channel()** and **adc_continuous_channel_to_io()** can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call **adc_continuous_config()** with the configuration structure above. This API may fail due to reasons like ESP_ERR_INVALID_ARG. When it returns ESP_ERR_INVALID_STATE, this means the ADC continuous mode driver is started, you shouldn’t call this API at this moment.

See ADC continuous mode example peripherals/adc/continuous_read to see configuration codes.

ADC Control

Start and Stop Calling **adc_continuous_start()** will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling **adc_continuous_stop()** will stop the ADC conversion.

Register Event Callbacks By calling **adc_continuous_register_event_callbacks()**, you can hook your own function to the driver ISR. Supported event callbacks are listed in adc_continuous_evt_cbs_t:

- **adc_continuous_evt_cbs_t::on_conv_done**, this is invoked when one conversion frame finishes.
- **adc_continuous_evt_cbs_t::on_pool_ovf**, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in **adc_continuous_callback_t**.

Submit Document Feedback

Release v5.1-dev-2066-g7869f4e151
You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren’t in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t add callback at this moment.

**Conversion Done Event** The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won’t fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn’t reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:
- `V_{out}`: Digital output result, standing for the voltage.
- `D_{out}`: ADC raw digital reading result.
- `V_{max}`: Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.
- `D_{max}`: Maximum of the output ADC raw digital reading result, which is \(2^\text{bitwidth}\), where bitwidth is the `::cpp::member::adc_digi_pattern_config_t::bit_width` configured before.
To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

**Hardware Limitations**

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. *adc_continuous_start()* has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by the Wi-Fi. *adc_continuous_start()* has provided the protection between Wi-Fi driver and ADC continuous mode driver.
- ADC continuous mode driver uses I2S0 peripheral as hardware DMA fifo. Therefore, if I2S0 is in use already, *adc_continuous_new_handle()* will return ESP_ERR_NOT_FOUND.
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

**Power Management**

When power management is enabled (i.e. *CONFIG_PM_ENABLE* is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type *ESP_PM_APB_FREQ_MAX*. The lock is acquired after the continuous conversion is started by *adc_continuous_start()*). Similarly, the lock will be released after *adc_continuous_stop()*). Therefore, *adc_continuous_start()* and *adc_continuous_stop()* should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe**

All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option *CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE*, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety**

ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See *Hardware Limitations* for more details.

**Application Examples**

- ADC continuous mode example: *peripherals/adc/continuous_read*.

**API Reference**

**Header File**

- *components/esp_adc/include/esp_adc/adc_continuous.h*

**Functions**

```c
esp_err_t adc_continuous_new_handle (const adc_continuous_handle_cfg_t *hdl_config,
                                  adc_continuous_handle_t *ret_handle)
```

Initialize ADC continuous driver and get a handle to it.

参数

- **hdl_config** - [in] Pointer to ADC initilization config. Refer to *adc_continuous_handle_cfg_t*.
- **ret_handle** - [out] ADC continuous mode driver handle

返回

Espressif Systems 972 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
• ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
• ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
• ESP_ERR_NO_MEM If out of memory
• ESP_OK On success

**esp_err_t adc_continuous_config**(adc_continuous_handle_t handle, const adc_continuous_config_t *config)

Set ADC continuous mode required configurations.

**参数**
- handle [in] ADC continuous mode driver handle
- config [in] Refer to adc_digi_config_t.

**返回**
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

**esp_err_t adc_continuous_register_event_callbacks**(adc_continuous_handle_t handle, const adc_continuous_evt_cbs_t *cbs, void *user_data)

Register callbacks.

**备注**: User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member int the cbs structure to NULL.

**备注**: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including user_data) should be in internal RAM as well.

**备注**: You should only call this API when the ADC continuous mode driver isn’t started. Check return value to know this.

**参数**
- handle [in] ADC continuous mode driver handle
- cbs [in] Group of callback functions
- user_data [in] User data, which will be delivered to the callback functions directly

**返回**
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment

**esp_err_t adc_continuous_start**(adc_continuous_handle_t handle)

Start the ADC under continuous mode. After this, the hardware starts working.

**参数**
- handle [in] ADC continuous mode driver handle

**返回**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

**esp_err_t adc_continuous_read**(adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)

Read bytes from ADC under continuous mode.

**参数**
Chapter 2. API

- **handle** - [in] ADC continuous mode driver handle
- **buf** - [out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See @brief Driver Backgrounds to know this concept.
- **length_max** - [in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** - [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** - [in] Time to wait for data via this API, in millisecond.

### esp_err_t adc_continuous_stop (adc_continuous_handle_t handle)
Stop the ADC. After this, the hardware stops working.

- 参数 **handle** - [in] ADC continuous mode driver handle
- 返回
  - ESP_ERR_INVALID_STATE: Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
  - ESP_ERR_TIMEOUT: Operation timed out
  - ESP_OK: On success

### esp_err_t adc_continuous_deinit (adc_continuous_handle_t handle)
Deinitialize the ADC continuous driver.

- 参数 **handle** - [in] ADC continuous mode driver handle
- 返回
  - ESP_ERR_INVALID_STATE: Driver state is invalid.
  - ESP_OK: On success

### esp_err_t adc_continuous_io_to_channel (int io_num, adc_unit_t *unit_id, adc_channel_t *channel)
Get ADC channel from the given GPIO number.

- 参数
  - **io_num** - [in] GPIO number
  - **unit_id** - [out] ADC unit
  - **channel** - [out] ADC channel
- 返回
  - ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument
  - ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

### esp_err_t adc_continuous_channel_to_io (adc_unit_t unit_id, adc_channel_t channel, int *io_num)
Get GPIO number from the given ADC channel.

- 参数
  - **unit_id** - [in] ADC unit
  - **channel** - [in] ADC channel
  - **io_num** - [out] GPIO number
  - ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument

### Structures

**struct adc_continuous_handle_cfg_t**
ADC continuous mode driver initial configurations.

### Public Members
uint32_t max_store_buf_size
Max length of the conversion Results that driver can store, in bytes.

uint32_t conv_frame_size
Conversion frame size, in bytes. This should be in multiples of
SOC_ADC_DIGI_DATA_BYTES_PER_CONV.

struct adc_continuous_config_t
ADC continuous mode driver configurations.

Public Members

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Please refer to soc/soc_caps.h to know available
sampling frequency range

adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.

struct adc_continuous_evt_data_t
Event data structure.

The conv_frame_buffer is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t *conv_frame_buffer
Pointer to conversion result buffer for one conversion frame.

uint32_t size
Conversion frame size.

struct adc_continuous_evt_cbs_t
Group of ADC continuous mode callbacks.

These callbacks are all running in an ISR environment.
When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

```c
void adc_continuous_callback_t on_conv_done(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data);
```

- Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.

```c
void adc_continuous_callback_t on_pool_ovf(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data);
```

- Event callback, invoked when the internal pool is full.

Macros

```c
#define ADC_MAX_DELAY Driver Backgrounds
```

Type Definitions

```c
typedef struct adc_continuous_ctx_t *adc_continuous_handle_t
```

- Type of adc continuous mode driver handle.

```c
typedef bool (*adc_continuous_callback_t)(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data);
```

- Prototype of ADC continuous mode event callback.

Function Parameters:
- `handle` [in] ADC continuous mode driver handle
- `edata` [in] Pointer to ADC continuous mode event data
- `user_data` [in] User registered context, registered when in adc_continuous_register_event_callbacks()

Return: Whether a high priority task is woken up by this function

2.6.3 Analog to Digital Converter (ADC) Calibration Driver

Introduction

Based on series of comparisons with the reference voltage, ESP32 ADC determines each bit of the output digital result. Per design the ESP32 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- **Calibration Scheme Creation** - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- **Calibration Configuration** - covers how to configure the calibration driver to calculate necessary characteristics used for calibration.
- **Result Conversion** - covers how to convert ADC raw result to calibrated result.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Minimize Noise** - describes a general way to minimize the noise.
**Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From calibration driver’s point of view, an ADC calibration scheme is created to an ADC calibration handle `adc_cal_handle_t`. `adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Line Fitting Scheme** ESP32 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

There is also a configuration `adc_cali_line_fitting_config_t::default_vref`. Normally this can be simply set to 0. Line Fitting scheme doesn’t rely on this value. However, if the Line Fitting scheme required eFuse bits are not burnt on your board, driver will rely on this value to do the calibration.

You can use `adc_cali_scheme_line_fitting_check_efuse()` to check the eFuse bits. Normally the Line Fitting scheme eFuse value will be `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP` or `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF`. This means Line Fitting scheme will use calibration parameters burnt in the eFuse to do the calibration.

When the Line Fitting scheme eFuse value is `ADC_CALI_LINE_FITTING_EFUSE_VAL_DEFAULT_VREF`, you need to set the `esp_adc_cali_line_fitting_init::default_vref`. Default vref is an estimate of the ADC reference voltage provided by the users as a parameter during calibration.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

```c
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

**Delete Line Fitting Scheme**

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

**备注:** For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in components/esp_adc/interface/adc_cali_interface.h to know the ESP ADC calibration interface.
Result Conversion After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme isn’t created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_adc1_CHAN0, voltage[0][0]);
```

Thread Safety The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks. Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, disable this to decrease the code size, if you are aware of the calibration eFuse value ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP isn’t this one.
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, disable this to decrease the code size, if you are aware of the calibration eFuse value ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF isn’t this one.
- `CONFIG_ADC_CAL_LUT_ENABLE`, disable this to decrease the code size, if you don’t calibrate the ADC raw results under ADC_ATTEN_DB_11.

Minimize Noise The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`

Functions

```c
esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)
```

Check the supported ADC calibration scheme.

参数 `scheme_mask` -[out] Supported ADC calibration scheme(s)

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_SUPPORTED: No supported calibration scheme

```c
esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)
```

Convert ADC raw data to calibrated voltage.

参数

- `handle` -[in] ADC calibration handle
- `raw` -[in] ADC raw data
- `voltage` -[out] Calibrated ADC voltage (in mV)
图 6: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

返回
• ESP_OK: On success
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_INVALID_STATE: Invalid state, scheme didn’t registered

Type Definitions
typedef struct adc_cali_scheme_t *adc_cali_handle_t
ADC calibration handle.

Enumerations
enum adc_cali_scheme_ver_t
ADC calibration scheme.
Values:

enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
Line fitting scheme.

enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
Curve fitting scheme.

Header File
• components/esp_adc/include/esp_adc/adc_cali_scheme.h
Chapter 2. API

2.6.4 Clock Tree

This section lists definitions of the ESP32’s supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

Root Clocks

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32’s root clocks are listed in \texttt{soc_root_clk_t}:

- **Internal 8MHz RC Oscillator (RC_FAST)**
  This RC oscillator generates a \(\sim 8.5\)MHz clock signal output as the RC_FAST_CLK. The \(\sim 8.5\)MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a RC_FAST_D256_CLK. The exact frequency of RC_FAST_CLK can be computed in runtime through calibration on the RC_FAST_D256_CLK.

- **External 2~40MHz Crystal (XTAL)**

- **Internal 150kHz RC Oscillator (RC_SLOW)**
  This RC oscillator generates a \(\sim 150\)kHz clock signal output as the RC_SLOW_CLK. The exact frequency of this clock can be computed in runtime through calibration.

- **External 32kHz Crystal - optional (XTAL32K)**
  The clock source for this XTAL32K_CLK can be either a 32kHz crystal connecting to the 32K_XP and 32K_XN pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the 32K_XN pin. Additionally, a 1nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin. XTAL32K_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32 provides several clock source options for the RTC_SLOW_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to \texttt{RTC} for more details).

Module Clocks

ESP32’s available module clocks are listed in \texttt{soc_module_clk_t}. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

API Reference

Header File

- \texttt{components/soc/esp32/include/soc/clk_tree_defs.h}

Macros

\texttt{SOC_CLK_RC_FAST_FREQ_APPROX}

Approximate RC_FAST_CLK frequency in Hz

\texttt{SOC_CLK_RC_SLOW_FREQ_APPROX}

Approximate RC_SLOW_CLK frequency in Hz
**Chapter 2. API**

**SOC_CLK_RC_FAST_D256_FREQ_APPROX**
Approximate RC_FAST_D256_CLK frequency in Hz

**SOC_CLK_XTAL32K_FREQ_APPROX**
Approximate XTAL32K_CLK frequency in Hz

**SOC_GPTIMER_CLKS**
Array initializer for all supported clock sources of GPTimer.
The following code can be used to iterate all possible clocks:

```c
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

**SOC_LCD_CLKS**
Array initializer for all supported clock sources of LCD.

**SOC_RMT_CLKS**
Array initializer for all supported clock sources of RMT.

**SOC_MCPWM_TIMER_CLKS**
Array initializer for all supported clock sources of MCPWM Timer.

**SOC_MCPWM_CAPTURE_CLKS**
Array initializer for all supported clock sources of MCPWM Capture Timer.

**SOC_I2S_CLKS**
Array initializer for all supported clock sources of I2S.

**SOC_I2C_CLKS**
Array initializer for all supported clock sources of I2C.

**SOC_SDM_CLKS**
Array initializer for all supported clock sources of SDM.

**SOC_DAC_DIGI_CLKS**
Array initializer for all supported clock sources of DAC digital controller.

**SOC_DAC_COSINE_CLKS**
Array initializer for all supported clock sources of DAC cosine wave generator.

**SOC_TWAI_CLKS**
Array initializer for all supported clock sources of TWAI.

**Enumerations**
enum soc_root_clk_t
    Root clock.
    Values:

    enumerator SOC_ROOT_CLK_INT_RC_FAST
        Internal 8MHz RC oscillator
    enumerator SOC_ROOT_CLK_INT_RC_SLOW
        Internal 150kHz RC oscillator
    enumerator SOC_ROOT_CLK_EXT_XTAL
        External 2~40MHz crystal
    enumerator SOC_ROOT_CLK_EXT_XTAL32K
        External 32kHz crystal/clock signal

enum soc_cpu_clk_src_t
    CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.
    Values:

    enumerator SOC_CPU_CLK_SRC_XTAL
        Select XTAL_CLK as CPU_CLK source
    enumerator SOC_CPU_CLK_SRC_PLL
        Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)
    enumerator SOC_CPU_CLK_SRC_RC_FAST
        Select RC_FAST_CLK as CPU_CLK source
    enumerator SOC_CPU_CLK_SRC_APLL
        Select APLL_CLK as CPU_CLK source
    enumerator SOC_CPU_CLK_SRC_INVALID
        Invalid CPU_CLK source

enum soc_rtc_slow_clk_src_t
    RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.
    Values:

    enumerator SOC_RTC_SLOW_CLK_SRC_RC_SLOW
        Select RC_SLOW_CLK as RTC_SLOW_CLK source
enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**
Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**
Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

**备注:** Enum values are matched with the register field values on purpose

**Values:**

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D4**
Select XTAL_D4_CLK (may referred as XTAL_CLK_DIV_4) as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**
Alias name for **SOC_RTC_FAST_CLK_SRC_XTAL_D4**

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**
Invalid RTC_FAST_CLK source

enum **soc_module_clk_t**
Supported clock sources for modules (CPU, peripherals, RTC, etc.)

**备注:** enum starts from 1, to save 0 for special purpose

**Values:**

enumerator **SOC_MOD_CLK_CPU**
CPU_CLK can be sourced from XTAL, PLL, RC_FAST, or APLL by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**
RTC_FAST_CLK can be sourced from XTAL_D4 or RC_FAST by configuring soc_rtc_fast_clk_src_t

enumerator **SOC_MOD_CLK_RTC_SLOW**
RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

enumerator **SOC_MOD_CLK_APB**
APB_CLK is highly dependent on the CPU_CLK source
Chapter 2. API 参考

enumerator SOC_MOD_CLK_PLL_D2
    PLL_D2_CLK is derived from PLL, it has a fixed divider of 2

enumerator SOC_MOD_CLK_PLL_F160M
    PLL_F160M_CLK is derived from PLL, and has a fixed frequency of 160MHz

enumerator SOC_MOD_CLK_XTAL32K
    XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator SOC_MOD_CLK_RC_FAST
    RC_FAST_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals

enumerator SOC_MOD_CLK_RC_FAST_D256
    RC_FAST_D256_CLK comes from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator SOC_MOD_CLK_XTAL
    XTAL_CLK comes from the external crystal (2~40MHz)

enumerator SOC_MOD_CLK_REF_TICK
    REF_TICK is derived from APB, it has a fixed frequency of 1MHz even when APB frequency changes

enumerator SOC_MOD_CLK_APLL
    APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enum soc_periph_systimer_clk_src_t
    Type of SYSTIMER clock source.
    Values:
    enumerator SYSTIMER_CLK_SRC_XTAL
        SYSTIMER source clock is XTAL
    enumerator SYSTIMER_CLK_SRC_DEFAULT
        SYSTIMER source clock default choice is XTAL

enum soc_periph_gptimer_clk_src_t
    Type of GPTimer clock source.
    Values:
    enumerator GPTIMER_CLK_SRC_APB
        Select APB as the source clock
    enumerator GPTIMER_CLK_SRC_DEFAULT
        Select APB as the default choice

enum soc_periph_tg_clk_src_legacy_t
    Type of Timer Group clock source, reserved for the legacy timer group driver.
    Values:
enumerator **TIMER_SRC_CLK_APB**
Timer group source clock is APB

denumator **TIMER_SRC_CLK_DEFAULT**
Timer group source clock default choice is APB

denum **soc_periph_lcd_clk_src_t**
Type of LCD clock source.
*Values:*

denumator **LCD_CLK_SRC_PLL160M**
Select PLL_D2 (default to 160MHz) as the source clock

denumator **LCD_CLK_SRC_APLL**
Select APLL as the source clock

denumator **LCD_CLK_SRC_XTAL**
Select XTAL as the source clock

denumator **LCD_CLK_SRC_DEFAULT**
Select PLL_D2 (default to 160MHz) as the default choice

denum **soc_periph_rmt_clk_src_t**
Type of RMT clock source.
*Values:*

denumator **RMT_CLK_SRC_APB**
Select APB as the source clock

denumator **RMT_CLK_SRC_REF_TICK**
Select REF_TICK as the source clock

denumator **RMT_CLK_SRC_DEFAULT**
Select APB as the default choice

denum **soc_periph_rmt_clk_src_legacy_t**
Type of RMT clock source, reserved for the legacy RMT driver.
*Values:*

denumator **RMT_BASECLK_APB**
RMT source clock is APB CLK

denumator **RMT_BASECLK_REF**
RMT source clock is REF_TICK

denumator **RMT_BASECLK_DEFAULT**
RMT source clock default choice is APB
enum `soc_periph_uart_clk_src_legacy_t`
Type of UART clock source, reserved for the legacy UART driver.

*Values:*

enumerator `UART_SCLK_APB`
UART source clock is APB CLK

enumerator `UART_SCLK_REF_TICK`
UART source clock is REF_TICK

enumerator `UART_SCLK_DEFAULT`
UART source clock default choice is APB

enum `soc_periph_mcpwm_timer_clk_src_t`
Type of MCPWM timer clock source.

*Values:*

enumerator `MCPWM_TIMER_CLK_SRC_PLL160M`
Select PLL_F160M as the source clock

enumerator `MCPWM_TIMER_CLK_SRC_DEFAULT`
Select PLL_F160M as the default clock choice

enum `soc_periph_mcpwm_capture_clk_src_t`
Type of MCPWM capture clock source.

*Values:*

enumerator `MCPWM_CAPTURE_CLK_SRC_APB`
Select APB as the source clock

enumerator `MCPWM_CAPTURE_CLK_SRC_DEFAULT`
Select APB as the default clock choice

enum `soc_periph_i2s_clk_src_t`
I2S clock source enum.

*Values:*

enumerator `I2S_CLK_SRC_DEFAULT`
Select PLL_D2 as the default source clock

enumerator `I2S_CLK_SRC_PLL_160M`
Select PLL_D2 as the source clock

enumerator `I2S_CLK_SRC_APLL`
Select APLL as the source clock
enum `soc_periph_i2c_clk_src_t`
Type of I2C clock source.
*Values:*

enumerator `I2C_CLK_SRC_APB`
enumerator `I2C_CLK_SRC_DEFAULT`

enum `soc_periph_sdm_clk_src_t`
Sigma Delta Modulator clock source.
*Values:*

enumerator `SDM_CLK_SRC_APB`
   Select APB as the source clock
enumerator `SDM_CLK_SRC_DEFAULT`
   Select APB as the default clock choice

enum `soc_periph_dac_digi_clk_src_t`
DAC digital controller clock source.
*Values:*

enumerator `DAC_DIGI_CLK_SRC_PLLD2`
   Select PLLD2 as the source clock
enumerator `DAC_DIGI_CLK_SRC_APLL`
   Select APLL as the source clock
enumerator `DAC_DIGI_CLK_SRC_DEFAULT`
   Select PLLD2 as the default source clock

enum `soc_periph_dac_cosine_clk_src_t`
DAC cosine wave generator clock source.
*Values:*

enumerator `DAC_COSINE_CLK_SRC_RTC_FAST`
   Select RTC FAST as the source clock
enumerator `DAC_COSINE_CLK_SRC_DEFAULT`
   Select RTC FAST as the default source clock

enum `soc_periph_twai_clk_src_t`
TWAI clock source.
*Values:*

enumerator `TWAI_CLK_SRC_APB`
   Select APB as the source clock
### Digital To Analog Converter (DAC)

#### Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2). Which means each channel of DAC can convert digital value 0~255 to the analog voltage 0~Vref, the output voltage can be calculate by:

\[
\text{out\_voltage} = \text{Vref} \times \frac{\text{digi\_val}}{255}
\]

The DAC peripheral supports outputting analog signal in following ways:

1. Outputting a voltage directly. The DAC channel will keep outputting a specified voltage.
2. Outputting continuous analog signal by DMA. The DAC will convert the data in a buffer at the specified frequency.
3. Outputting a cosine wave by the cosine wave generator. The DAC channel can output a cosine wave with specified frequency and amplitude.

For other analog output options, see the **Sigma-delta Modulation module** and the **LED Control module**. Both modules produce high-frequency PWM/PDM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

#### DAC File Structure

Public headers that need to be included in the DAC application:

- **dac.h**: The top header file of legacy DAC driver, only included in the apps which use legacy driver API
- **dac_oneshot.h**: The top header file of new DAC driver, should be included in the apps which use the new driver API with oneshot mode.
- **dac_cosine.h**: The top header file of new DAC driver, should be included in the apps which use the new driver API with cosine mode.
- **dac_continuous.h**: The top header file of new DAC driver, should be included in the apps which use the new driver API with continuous mode.
Chapter 2. API

备注： The legacy driver can’t coexist with the new driver. Including dac.h to use the legacy driver or dac_oneshot.h, dac_cosine.h and dac_continuous.h to use the new driver. The legacy driver might be removed in future.

Functional Overview

Resources Management The DAC on ESP32 has two channels, due to the software resources are separate, they could be managed by the dac_oneshot_handle_t, dac_cosine_handle_t and dac_continuous_handle_t according to the usage. Of course, registering different modes on a same DAC channel is not allowed.

Direct Voltage Output (One-shot/Direct Mode) The DAC channels in the group can convert a 8-bit digital value into the analog every time calling dac_oneshot_output_voltage() (it can be called in ISR), and then the analog voltage will be kept on the DAC channel until next conversion start. To start to convert the voltage, the DAC channels need to be registered by dac_oneshot_new_channel() first, and the channel will be enabled after it is registered.

Continuous Wave Output (Continuous/DMA Mode) DAC channels can convert digital data continuously via the DMA. There are three ways to writing DAC data:

1. Normal writing (synchronous): It can transmit the data one time and keep blocking until all data has been loaded into the DMA buffer, and the voltage will be kept according to the last conversion value while no more data inputted, usually it is used to transport a long signal like an audio. To convert data continuously, the continuous channel handle need to be allocated by calling dac_continuous_new_channels() and the DMA conversion should be enabled by dac_continuous_enable(), then data can be written by dac_continuous_write() synchronously. Referring to peripherals/dac/dac_continuous/dac_audio for example.

2. Cyclical writing: It can convert a piece of data cyclically without blocking, no more operation needed after the data are loaded into the DMA buffer, but note that the inputted buffer size is limited by the descriptor number and the DMA buffer size, usually it is used to transport some short signal that need to be repeated, for example, a sine wave. To achieve cyclical writing, dac_continuous_write_cyclically() can be called after the DAC continuous mode is enabled. For the cyclical writing example, please refer to peripherals/dac/dac_continuous/signal_generator.

3. Asynchronous writing: It can transmit the data asynchronously based on the event callback. Thus dac_event_callbacks_t::on_convert_done must be registered to use asynchronous mode, and then users can get the dac_event_data_t in the callback which contains the DMA buffer address and length, allowing user to load the data into it directly. As mentioned, to use the asynchronous writing, dac_continuous_register_event_callback() need to be called to register the dac_event_callbacks_t::on_convert_done before enabling, and then calling dac_continuous_start_async_writing() to start the asynchronous writing, note that once the asynchronous writing started, the callback function will be triggered continuously, dac_continuous_write_asynchronously() can help to load the data either in a separate task or the callback directly. For the asynchronous example, please refer to peripherals/dac/dac_continuous/dac_audio as well.

On ESP32, DAC digital controller can be connected internally to the I2S0 and use its DMA for continuous conversion. Although the DAC only needs 8-bit data for conversion, it has to be left shifted 8 bits (i.e. the high 8 bits in 16-bit slot) to satisfy the I2S communication format. But the driver can help to expand automatically, if you want to expand manually, please disable CONFIG_DAC_DMA_AUTO_16BIT_ALIGN in the menuconfig.

The clock of DAC digital controller comes from I2S0 as well, so there are two kinds of clock source can be selected:

• dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_PLL_D2 can support frequency between 19.6 KHz to several MHz. It is the default clock which can also be selected by dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_DEFAULT.
• dac_continuous_dig_clk_src_t::DAC_DIGI_CLK_SRC_APLL can support frequency between 648 Hz to several MHz, however, it might be occupied by other peripherals, then it may not provide the required frequency. But it doesn’t mean APLL is not available in this case, it can still work as long as it can be divided to the target DAC DMA frequency correctly.

**Cosine Wave Output (Cosine Mode)** The DAC peripheral has one cosine wave generator, it can generate cosine wave on the channels, users can specify the frequency, amplitude and phase of the cosine wave. To output the cosine wave, please acquire the DAC to cosine mode handle by `dac_cosine_new_channel()` first, and then start the cosine wave generator by `dac_cosine_start()`.

Currently, the source clock of the cosine wave generator only comes from RTC_FAST which can be chosen by `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_FAST`, it is also the default clock source which is same as `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_DEFAULT`.

**Power Management** When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of DAC before going into light sleep, thus potentially influence to the DAC signals may lead the data conversion goes wrong.

When using DAC driver in continuous mode, it can prevent the system from changing or stopping the source clock in DMA or cosine wave mode by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (only in DMA mode), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the DAC is converting (i.e. DMA or cosine wave generator is working), the driver will guarantee that the power management lock is acquired after calling `dac_continuous_enable()`. Likewise, the driver will release the lock when `dac_continuous_disable()` is called.

**IRAM Safe** By default, the DAC DMA interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the DMA EOF interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_DAC_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** All the public DAC APIs are guaranteed to be thread safe by the driver, which means, users can call them from different RTOS tasks without protection by extra locks. Notice that DAC driver uses mutex lock to ensure the thread safety, thus the APIs except `dac_oneshot_output_voltage()` are not allowed to be used in ISR.

**Kconfig Options**

- `CONFIG_DAC_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_DAC_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy DAC driver.
- `CONFIG_DAC_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.
- `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` will auto expand the 8-bit data to 16-bit data in the driver to satisfy the I2S DMA format.
Chapter 2. API 参考

Application Example

The basic examples for the One-shot Mode, Continuous Mode and Cosine Mode can be found in:

- peripherals/dac/dac_oneshot
- peripherals/dac/dac_continuous
- peripherals/dac/dac_cosine_wave

API Reference

Header File

- components/driver/include/driver/dac_oneshot.h

Functions

```c
esp_err_t dac_oneshot_new_channel(const dac_oneshot_config_t *oneshot_cfg, dac_oneshot_handle_t *ret_handle)
```

Allocate a new DAC oneshot channel.

**备注**: The channel will be enabled as well when the channel allocated

参数

- oneshot_cfg - [in] The configuration for the oneshot channel
- ret_handle - [out] The returned oneshot channel handle

返回

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NO_MEM No memory for the DAC oneshot channel resources
- ESP_OK Allocate the new DAC oneshot channel success

```c
esp_err_t dac_oneshot_del_channel(dac_oneshot_handle_t handle)
```

Delete the DAC oneshot channel.

**备注**: The channel will be disabled as well when the channel deleted

参数

- handle - [in] The DAC oneshot channel handle

返回

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has already been de-registered
- ESP_OK Delete the oneshot channel success

```c
esp_err_t dac_oneshot_output_voltage(dac_oneshot_handle_t handle, uint8_t diigi_value)
```

Output the voltage.

**备注**: Generally it’ll take 7~11 us on ESP32 and 10~21 us on ESP32-S2

参数

- handle - [in] The DAC oneshot channel handle
- diigi_value  - [in] The digital value that need to be converted

返回

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_OK Convert the digital value success
**Structures**

```c
struct dac_oneshot_config_t
    DAC oneshot channel configuration.
```

**Public Members**

```c
dac_channel_t chan_id
    DAC channel id
```

**Type Definitions**

```c
typedef struct dac_oneshot_s *dac_oneshot_handle_t
    DAConeshotchannelhandle
```

**Header File**

```c
• components/driver/include/driver/dac_cosine.h
```

**Functions**

```c
esp_err_t dac_cosine_new_channel (const dac_cosine_config_t *cos_cfg, dac_cosine_handle_t *ret_handle)
    Allocate a new DAC cosine wave channel.
```

**备注:** Since there is only one cosine wave generator, only the first channel can set the frequency of the cosine wave. Normally, the latter one is not allowed to set a different frequency, but the it can be forced to set by setting the bit force_set_freq in the configuration, notice that another channel will be affected as well when the frequency is updated.

```c
esp_err_t dac_cosine_del_channel (dac_cosine_handle_t handle)
    Delete the DAC cosine wave channel.
```

```c
esp_err_t dac_cosine_start (dac_cosine_handle_t handle)
    Start outputting the cosine wave on the channel.
```

**参数**

- **cos_cfg** [in] The configuration of cosine wave channel
- **ret_handle** [out] The returned cosine wave channel handle

**返回**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NO_MEM No memory for the DAC cosine wave channel resources
- ESP_OK Allocate the new DAC cosine wave channel success

**参数**

- **handle** [in] The DAC cosine wave channel handle

**返回**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_OK OK The channel has already been deregistered
- ESP_OK Delete the cosine wave channel success

**参数**

- **handle** [in] The DAC cosine wave channel handle

**返回**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has been started already
Chapter 2. API 参考

- ESP_OK Start the cosine wave success

```c
esp_err_t dac_cosine_stop(dac_cosine_handle_t handle)
```

Stop outputting the cosine wave on the channel.

参数 handle -[in] The DAC cosine wave channel handle

返回
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERRINVALID_STATE The channel has been stopped already
- ESP_OK Stop the cosine wave success

**Structures**

struct dac_cosine_config_t

DAC cosine channel configurations.

**Public Members**

`dac_channel_t chan_id`

The cosine wave channel id

`uint32_t freq_hz`

The frequency of cosine wave, unit: Hz. The cosine wave generator is driven by RTC_FAST clock which is divide from RC_FAST. With the default RTC clock, the minimum frequency of cosine wave is about 130 Hz. Although it can support up to several MHz frequency theoretically, the waveform will distort at high frequency due to the hardware limitation. Typically not suggest to set the frequency higher than 200 KHz

`dac_cosine_clk_src_t clk_src`

The clock source of the cosine wave generator, currently only support

DAC_COSINE_CLK_SRC_DEFAULT

`dac_cosine_atten_t atten`

The attenuation of cosine wave amplitude

`dac_cosine_phase_t phase`

The phase of cosine wave, can only support DAC_COSINE_PHASE_0 or DAC_COSINE_PHASE_180, default as 0 while setting an unsupported phase

`int8_t offset`

The DC offset of cosine wave

`bool force_set_freq`

Force to set the cosine wave frequency

struct dac_cosine_config_t:[anonymous] flags

Flags of cosine mode

**Type Definitions**

typedef struct dac_cosine_s *dac_cosine_handle_t

DAC cosine wave channel handle
Chapter 2. API 参考

Header File

- components/driver/include/driver/dac_continuous.h

Functions

esp_err_t dac_continuous_new_channels(const dac_continuous_config_t *cont_cfg, dac_continuous_handle_t *ret_handle)

Allocate new DAC channels in continuous mode.

备注：The DAC channels can’t be registered to continuous mode separately

参数
- cont_cfg [in] Continuous mode configuration
- ret_handle [out] The returned continuous mode handle

返回
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NOT_FOUND Not found the available dma peripheral, might be occupied
- ESP_ERR_NO_MEM No memory for the DAC continuous mode resources
- ESP_OK Allocate the new DAC continuous mode success

esp_err_t dac_continuous_del_channels(dac_continuous_handle_t handle)

Delete the DAC continuous handle.

参数 handle *[in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'

返回
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have already been deregistered or not disabled
- ESP_OK Delete the continuous channels success

esp_err_t dac_continuous_enable(dac_continuous_handle_t handle)

Enabled the DAC continuous mode.

备注：Must enable the channels before

参数 handle *[in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'

返回
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have been enabled already
- ESP_OK Enable the continuous output success

esp_err_t dac_continuous_disable(dac_continuous_handle_t handle)

Disable the DAC continuous mode.

参数 handle *[in] The DAC continuous channel handle that obtained from 'dac_continuous_new_channels'

返回
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have been enabled already
- ESP_OK Disable the continuous output success
**esp_err_t** `dac_continuous_write` *(dac_continuous_handle_t handle, uint8_t* buf, size_t buf_size, size_t *bytes_loaded, int timeout_ms)*

Write DAC data continuously.

**备注:** The data in buffer will only be converted one time. This function will be blocked until all data loaded or timeout then the DAC output will keep outputting the voltage of the last data in the buffer.

**参数:**
- **handle** –[in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- **buf** –[in] The digital data buffer to convert
- **buf_size** –[in] The buffer size of digital data buffer
- **bytes_loaded** –[out] The bytes that has been loaded into DMA buffer, can be NULL if don’t need it
- **timeout_ms** –[in] The timeout time in millisecond, set a minus value means will block forever

**返回:**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC continuous mode has not been enabled yet
- ESP_ERR_TIMEOUT Waiting for semaphore or message queue timeout
- ESP_OK Success to output the acyclic DAC data

**esp_err_t** `dac_continuous_write_cyclically` *(dac_continuous_handle_t handle, uint8_t* buf, size_t buf_size, size_t *bytes_loaded)*

Write DAC continuous data cyclically.

**备注:** The data in buffer will be converted cyclically using DMA once this function is called, This function will return once the data loaded into DMA buffers.

**备注:** The buffer size of cyclically output is limited by the descriptor number and dma buffer size while initializing the continuous mode. Concretely, in order to load all the data into descriptors, the cyclic buffer size is not supposed to be greater than `desc_num * buf_size`

**备注:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available. The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` in menuconfig.

**参数:**
- **handle** –[in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- **buf** –[in] The digital data buffer to convert
- **buf_size** –[in] The buffer size of digital data buffer
- **bytes_loaded** –[out] The bytes that has been loaded into DMA buffer, can be NULL if don’t need it

**返回:**
- ESP_ERR_INVALID_ARG The input parameter is invalid
Chapter 2. API

- ESP_ERR_INVALID_STATE The DAC continuous mode has not been enabled yet
- ESP_OK Success to output the acyclic DAC data

\[ \text{esp_err_t dac_continuous_register_event_callback (dac_continuous_handle_t handle, const dac_event_callbacks_t *callbacks, void *user_data)} \]

Set event callbacks for DAC continuous mode.

**备注**: User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

**备注**: When CONFIG_DAC_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in this function, including the `user_data`, should be in the internal RAM as well.

参数
- `handle` – [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- `callbacks` – [in] Group of callback functions, input NULL to clear the former callbacks
- `user_data` – [in] User data, which will be passed to callback functions directly

返回
- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument

\[ \text{esp_err_t dac_continuous_start_async_writing (dac_continuous_handle_t handle)} \]

Start the async writing.

**备注**: When the asynchronous writing start, the DAC will keep outputting ‘0’ until the data are loaded into the DMA buffer. To loaded the data into DMA buffer, ‘on_convert_done’ callback is required, which can be registered by `dac_continuous_register_event_callback` before enabling

参数 `handle` – [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`

返回
- ESP_OK Start asynchronous writing successfully
- ESP_ERR_INVALID_ARG The handle is NULL
- ESP_ERR_INVALID_STATE The channel is not enabled or the ‘on_convert_done’ callback is not registered

\[ \text{esp_err_t dac_continuous_stop_async_writing (dac_continuous_handle_t handle)} \]

Stop the sync writing.

参数 `handle` – [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`

返回
- ESP_OK Stop asynchronous writing successfully
- ESP_ERR_INVALID_ARG The handle is NULL
- ESP_ERR_INVALID_STATE Asynchronous writing has not started

\[ \text{esp_err_t dac_continuous_write_asynchronously (dac_continuous_handle_t handle, uint8_t dma_buf, size_t dma_buf_len, const uint8_t *data, size_t data_len, size_t *bytes_loaded)} \]

Write DAC data asynchronously.
This function can be called when the asynchronous writing started, and it can be called in the callback directly but recommend to writing data in a task, referring to :example:`peripherals/dac/dac_continuous/dac_audio`

参数

- **handle** [-in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- **dma_buf** [-in] The DMA buffer address, it can be acquired from `dac_event_data_t` in the `on_convert_done` callback
- **dma_buf_len** [-in] The DMA buffer length, it can be acquired from `dac_event_data_t` in the `on_convert_done` callback
- **data** [-in] The data that need to be written
- **data_len** [-in] The data length the need to be written
- **bytes_loaded** [-out] The bytes number that has been loaded/written into the DMA buffer

返回

- ESP_OK Write the data into DMA buffer successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE The channels haven’t start the asynchronous writing
- ESP_ERR_NOT_FOUND The param ‘dam_buf’ not match any existed DMA buffer

Structures

struct **dac_continuous_config_t**

DAC continuous channels’ configurations.

Public Members

`dac_channel_mask_t chan_mask`

DAC channels’ mask for selecting which channels are used

`uint32_t desc_num`

The number of DMA descriptor, at least 2 descriptors are required The number of descriptors is directly proportional to the max data buffer size while converting in cyclic output but only need to ensure it is greater than 1 in acyclic output Typically, suggest to set the number bigger than 5, in case the DMA stopped while sending a short buffer

`size_t buf_size`

The DMA buffer size, should be within 32~4092 bytes. Each DMA buffer will be attached to a DMA descriptor, i.e., the number of DMA buffer will be equal to the DMA descriptor number The DMA buffer size is not allowed to be greater than 4092 bytes The total DMA buffer size equal to desc_num * buf_size Typically, suggest to set the size to the multiple of 4

`uint32_t freq_hz`

The frequency of DAC conversion in continuous mode, unit: Hz The supported range is related to the target and the clock source. For the clock `DAC_DIGI_CLK_SRC_DEFAULT`: the range is 19.6 KHz to several MHz on ESP32 and 77 Hz to several MHz on ESP32-S2. For the clock `DAC_DIGI_CLK_SRC_APLL`: the range is 648 Hz to several MHz on ESP32 and 6 Hz to several MHz on ESP32-S2. Typically not suggest to set the frequency higher than 2 MHz, otherwise the severe distortion will appear
### Chapter 2. API 参考

#### int8_t offset

The offset of the DAC digital data. Range -128~127

#### dac_continuous_digi_clk_src_t clk_src

The clock source of digital controller, which can affect the range of supported frequency. Currently DAC_DIGI_CLK_SRC_DEFAULT and DAC_DIGI_CLK_SRC_APLL are available.

#### dac_continuous_channel_mode_t chan_mode

The channel mode of continuous mode, only take effect when multiple channels enabled, depends converting the buffer alternately or simultaneously.

#### struct dac_event_data_t

Event structure used in DAC event queue.

### Public Members

#### void *buf

The pointer of DMA buffer that just finished sending.

#### size_t buf_size

The writable buffer size of the DMA buffer, equal to `dac_continuous_config_t::buf_size`

#### size_t write_bytes

The number of bytes that be written successfully.

#### struct dac_event_callbacks_t

Group of DAC callbacks.

<table>
<thead>
<tr>
<th>备注</th>
<th>The callbacks are all running under ISR environment</th>

</table>

| 备注 | When CONFIG_DAC_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. |

### Public Members

#### dac_isr_callback_t on_convert_done

Callback of data conversion done event. An event data buffer previously loaded to the driver has been output and converted. The event data includes DMA buffer address and size that just finished converting.

#### dac_isr_callback_t on_stop

Callback of finished sending all the data. All loaded event data buffers are converted. Driver is pending for new data buffers to be loaded. The event data will be NULL in this callback.

### Type Definitions

typedef struct dac_continuous_s *dac_continuous_handle_t

DAC continuous channel handle
typedef bool (*dac_isr_callback_t)(dac_continuous_handle_t *handle, const dac_event_data_t *event, void *user_data)

DAC event callback.

**Param handle** [in] DAC channel handle, created from dac_continuous_new_channels()

**Param event** [in] DAC event data

**Param user_data** [in] User registered context, passed from dac_continuous_register_event_callback()

**Return** Whether a high priority task has been waken up by this callback function

### Enumerations

**enum dac_channel_mask_t**

DAC channel mask.

**Values:**

- enumerator **DAC_CHANNEL_MASK_CH0**
  
  DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

- enumerator **DAC_CHANNEL_MASK_CH1**
  
  DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

- enumerator **DAC_CHANNEL_MASK_ALL**
  
  Both DAC channel 0 and channel 1

---

### Header File

- components/driver/include/driver/dac_types.h

---

### Type Definitions

**typedef soc_periph_dac_digi_clk_src_t dac_continuous_digi_clk_src_t**

DAC DMA (digital controller) clock source.

**typedef soc_periph_dac_cosine_clk_src_t dac_cosine_clk_src_t**

DAC cosine wave generator clock source.

---

### Enumerations

**enum dac_continuous_channel_mode_t**

DAC channel work mode in dma mode.

---

**备注：** Only take effect when multiple channels enabled.

---

**备注：** Assume the data in buffer is ‘A B C D E F’

- DAC_CHANNEL_MODE_SIMUL:
  - channel 0: A B C D E F
  - channel 1: A B C D E F

- DAC_CHANNEL_MODE_ALTER:
  - channel 0: A C E
  - channel 1: B D F
Chapter 2. API

Values:

enumerator `DAC_CHANNEL_MODE_SIMUL`
   The data in the DMA buffer is simultaneously output to the enable channel of the DAC.

enumerator `DAC_CHANNEL_MODE_ALTER`
   The data in the DMA buffer is alternately output to the enable channel of the DAC.

Header File

- components/hal/include/hal/dac_types.h

Enumerations

enum `dac_channel_t`

Values:

enumerator `DAC_CHAN_0`
   DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator `DAC_CHAN_1`
   DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator `DAC_CHANNEL_1`
   Alias of ‘DAC_CHAN_0’, now the channel index start from ‘0’

enumerator `DAC_CHANNEL_2`
   Alias of ‘DAC_CHAN_1’, now the channel index start from ‘0’

enum `dac_cosine_atten_t`

The attenuation of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

Values:

enumerator `DAC_COSINE_ATTEN_DEFAULT`
   No attenuation to the DAC cosine wave amplitude. Default.

enumerator `DAC_COSINE_ATTEN_DB_0`
   Original amplitude of the DAC cosine wave, equals to DAC_COSINE_ATTEN_DEFAULT

enumerator `DAC_COSINE_ATTEN_DB_6`
   1/2 amplitude of the DAC cosine wave

enumerator `DAC_COSINE_ATTEN_DB_12`
   1/4 amplitude of the DAC cosine wave

enumerator `DAC_COSINE_ATTEN_DB_18`
   1/8 amplitude of the DAC cosine wave
enum **dac_cosine_phase_t**

Set the phase of the cosine wave generator output.

**Values:**

enumerator **DAC_COSINE_PHASE_0**
Phase shift +0°

enumerator **DAC_COSINE_PHASE_180**
Phase shift +180°

### 2.6.6 GPIO & RTC GPIO

**GPIO** 汇总

ESP32芯片具有34个物理GPIO管脚（GPIO0 ~ GPIO19，GPIO21 ~ GPIO23，GPIO25 ~ GPIO27和GPIO32 ~ GPIO39）。每个管脚都可用作一个通用IO，或连接一个内部的外设信号。通过IO MUX、RTC IO MUX和GPIO交换矩阵，可配置外设模块的输入信号来源于任何的IO管脚，并且外设模块的输出信号也可连接到任意IO管脚。这些模块共同组成了芯片的IO控制。更多详细信息，请参阅ESP32技术参考手册> IO MUX和GPIO矩阵（GPIO，IO_MUX）[PDF]。

下表提供了各管脚的详细信息，部分GPIO具有特殊的使用限制，具体可参考表中的注释列。

备注：
• Strapping 管脚：GPIO0, GPIO2, GPIO5, GPIO12 (MTDI) 和 GPIO15 (MTDO) 是 Strapping 管脚。更多信息请参考 ESP32 技术规格书。
• SPI0/1：GPIO6-11 和 GPIO16-17 通常连接到模块内的 SPI flash 和 PSRAM，因此不能用于其他用途。
• JTAG：GPIO12-15 通常用于在线调试。
• GPIO：GPIO34-39 只能设置为输入模式，不具备软件使能的上拉或下拉功能。
• TXD & RXD 通常用于烧录和调试。
• ADC2：使用 Wi-Fi 时不能使用 ADC2 管脚。因此，如果您在使用 Wi-Fi 时无法从 ADC2 GPIO 获取值，可以考虑使用 ADC1 GPIO 来解决该问题。更多详情请参考 ADC 连续转换模式下的硬件限制以及 ADC 单次转换模式下的硬件限制。
• 使用 ADC 或睡眠模式下使用 Wi-Fi 和蓝牙时，请不要使用 GPIO36 和 GPIO39 的中断。有关问题的详细描述，请参考 ESP32 ECO 和 Bug 解决方法 > 中的第 3.11 节。

当 GPIO 连接到“RTC”低功耗模拟子系统时，ESP32 芯片还单独支持“RTC GPIO”。可在以下情况时使用这些管脚功能：

- 处于 Deep-sleep 模式时
- 超低功耗处理器 (ULP) 运行时
- 使用 ADC/DAC 等模拟功能时

应用示例

- GPIO 输出和输入中断示例：peripherals/gpio/generic_gpio。

API 参考 - 普通 GPIO

Header File

- components/driver/include/driver/gpio.h

Functions

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

参数 pGPIOConfig - Pointer to GPIO configure struct
**Chapter 2. API 参考**

**API**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gpio_reset_pin(gpio_num_t gpio_num)</code></td>
<td>Reset an gpio to default state (select gpio function, enable pullup and disable input and output).</td>
</tr>
</tbody>
</table>

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**GPIO number.**

**Function**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)</code></td>
<td>GPIO set interrupt trigger type.</td>
</tr>
</tbody>
</table>

**Parameters**

- `gpio_num` - GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `intr_type` - Interrupt type, select from `gpio_int_type_t`;

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

<table>
<thead>

<tbody>
<tr>
<td><code>gpio_set_level(gpio_num_t gpio_num, uint32_t level)</code></td>
<td>GPIO set output level.</td>
</tr>
</tbody>
</table>
Chapter 2. API 参考

备注: This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM

参数
- **gpio_num** - GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **level** - Output level. 0: low ; 1: high

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

int **gpio_get_level**(gpio_num_t gpio_num)

GPIO get input level.

警告: If the pad is not configured for input (or input and output) the returned value is always 0.

参数 **gpio_num** - GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

返回
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**esp_err_t gpio_set_direction**(gpio_num_t gpio_num, gpio_mode_t mode)

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

参数
- **gpio_num** - Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** - GPIO direction

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**esp_err_t gpio_set_pull_mode**(gpio_num_t gpio_num, gpio_pull_mode_t pull)

Configure GPIO pull-up/pull-down resistors.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数
- **gpio_num** - GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** - GPIO pull up/down mode.

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Parameter error

**esp_err_t gpio_wakeup_enable**(gpio_num_t gpio_num, gpio_int_type_t intr_type)

Enable GPIO wake-up function.

参数
- **gpio_num** - GPIO number.
Chapter 2. API

- **intr_type** - GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

  **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)**

Disable GPIO wake-up function.

  **参数**
  - gpio_num - GPIO number

  **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_isr_register (void (*fn)(void*), void*arg, int intr_alloc_flags, gpio_isr_handle_t*handle)**

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

  **参数**
  - fn - Interrupt handler function.
  - arg - Parameter for handler function
  - intr_alloc_flags - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_ *values. See esp_intr_alloc.h for more info.
  - handle - Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

  **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO error
  - ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

**esp_err_t gpio_pullup_en (gpio_num_t gpio_num)**

Enable pull-up on GPIO.

  **参数**
  - gpio_num - GPIO number

  **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_pullup_dis (gpio_num_t gpio_num)**

Disable pull-up on GPIO.

  **参数**
  - gpio_num - GPIO number

  **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_pulldown_en (gpio_num_t gpio_num)**

Enable pull-down on GPIO.

  **参数**
  - gpio_num - GPIO number

  **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_pulldown_dis (gpio_num_t gpio_num)**

Disable pull-down on GPIO.

  **参数**
  - gpio_num - GPIO number

  **返回**
Chapter 2. API

esp_err_t gpio_install_isr_service(int intr_alloc_flags)
Install the GPIO driver’s ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

参数 intr_alloc_flags – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_*. * values. See esp_intr_alloc.h for more info.

返回
ESP_OK Success
ESP_ERR_NO_MEM No memory to install this service
ESP_ERR_INVALID_STATE ISR service already installed.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
ESP_ERR_INVALID_ARG GPIO error

void gpio_uninstall_isr_service()
Uninstall the driver’s GPIO ISR service, freeing related resources.

esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

参数
- gpio_num – GPIO number
- isr_handler – ISR handler function for the corresponding GPIO number.
- args – parameter for ISR handler.

返回
ESP_OK Success
ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
ESP_ERR_INVALID_ARG Parameter error

esp_err_t gpio_isr_handler_remove(gpio_num_t gpio_num)
Remove ISR handler for the corresponding GPIO pin.

参数 gpio_num – GPIO number

返回
ESP_OK Success
ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
ESP_ERR_INVALID_ARG Parameter error

esp_err_t gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set GPIO pad drive capability.

参数
- gpio_num – GPIO number, only support output GPIOs
- strength – Drive capability of the pad

返回
ESP_OK Success
ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API

```c
esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```

Get GPIO pad drive capability.

### Parameters
- **gpio_num** - GPIO number, only support output GPIOs
- **strength** - Pointer to accept drive capability of the pad

### Return Values
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_hold_en (gpio_num_t gpio_num)
```

Enable gpio pad hold function.

When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). It can be used to retain the pin state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: input read value can still reflect the changes of the input signal.

The state of the digital gpio cannot be held during Deep-sleep, and it will resume to hold at its default pin state when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

### Parameters
- **gpio_num** - GPIO number, only support output-capable GPIOs

### Return Values
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

```c
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

### Parameters
- **gpio_num** - GPIO number, only support output-capable GPIOs

### Return Values
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

```c
void gpio_deep_sleep_hold_en (void)
```

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad’s sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

```c
void gpio_deep_sleep_hold_dis (void)
```

Disable all digital gpio pads hold function during Deep-sleep.
**void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)**

Set pad input to a peripheral signal through the IOMUX.

- **gpio_num** - GPIO number of the pad.
- **signal_idx** - Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

**void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)**

Set peripheral output to an GPIO pad through the IOMUX.

- **gpio_num** - GPIO number of the pad.
- **func** - The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- **oen_inv** - True if the output enable needs to be inverted, otherwise False.

**esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)**

Enable SLP_SEL to change GPIO status automatically in lightsleep.

- **gpio_num** - GPIO number of the pad.
  - **ESP_OK** Success

**esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)**

Disable SLP_SEL to change GPIO status automatically in lightsleep.

- **gpio_num** - GPIO number of the pad.
  - **ESP_OK** Success

**esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)**

GPIO set direction at sleep.

Configure GPIO direction, such as output_only, input_only, output_and_input

- **gpio_num** - Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  - **mode** - GPIO direction
  - **ESP_OK** Success
  - **ESP_ERR_INVALID_ARG** GPIO error

**esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)**

Configure GPIO pull-up/pull-down resistors at sleep.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.
struct `gpio_config_t`  
Configuration parameters of GPIO pad for `gpio_config` function.

**Public Members**

`uint64_t pin_bit_mask`
GPIO pin: set with bitmask, each bit maps to a GPIO

`gpio_mode_t mode`
GPIO mode: set input/output mode

`gpio_pullup_t pull_up_en`
GPIO pull-up

`gpio_pulldown_t pull_down_en`
GPIO pull-down

`gpio_int_type_t intr_type`
GPIO interrupt type

**Macros**

`GPIO_PIN_COUNT`

`GPIO_IS_VALID_GPIO(gpio_num)`  
Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO(gpio_num)`  
Check whether it can be a valid GPIO number of output mode.

`GPIO_IS_VALID_DIGITAL_IO_PAD(gpio_num)`  
Check whether it can be a valid digital I/O pad.

**Type Definitions**

typedef `intr_handle_t gpio_isr_handle_t`

typedef void (`*gpio_isr_t`(void *arg)`)
GPIO interrupt handler.

**Param arg**  
User registered data

GPIO_PIN_REG_48

Enumerations

defined enum gpio_port_t

    Values:

    enumerator GPIO_PORT_0

    enumerator GPIO_PORT_MAX

defined enum gpio_num_t

    Values:

    enumerator GPIO_NUM_NC
        Use to signal not connected to S/W

    enumerator GPIO_NUM_0
        GPIO0, input and output

    enumerator GPIO_NUM_1
        GPIO1, input and output

    enumerator GPIO_NUM_2
        GPIO2, input and output

    enumerator GPIO_NUM_3
        GPIO3, input and output

    enumerator GPIO_NUM_4
        GPIO4, input and output

    enumerator GPIO_NUM_5
        GPIO5, input and output

    enumerator GPIO_NUM_6
        GPIO6, input and output

    enumerator GPIO_NUM_7
        GPIO7, input and output

    enumerator GPIO_NUM_8
        GPIO8, input and output

    enumerator GPIO_NUM_9
        GPIO9, input and output

    enumerator GPIO_NUM_10
        GPIO10, input and output
enumerator GPIO_NUM_11
    GPIO11, input and output

enumerator GPIO_NUM_12
    GPIO12, input and output

enumerator GPIO_NUM_13
    GPIO13, input and output

enumerator GPIO_NUM_14
    GPIO14, input and output

enumerator GPIO_NUM_15
    GPIO15, input and output

enumerator GPIO_NUM_16
    GPIO16, input and output

enumerator GPIO_NUM_17
    GPIO17, input and output

enumerator GPIO_NUM_18
    GPIO18, input and output

enumerator GPIO_NUM_19
    GPIO19, input and output

enumerator GPIO_NUM_20
    GPIO20, input and output

enumerator GPIO_NUM_21
    GPIO21, input and output

enumerator GPIO_NUM_22
    GPIO22, input and output

enumerator GPIO_NUM_23
    GPIO23, input and output

enumerator GPIO_NUM_25
    GPIO25, input and output

enumerator GPIO_NUM_26
    GPIO26, input and output

enumerator GPIO_NUM_27
    GPIO27, input and output
enumerator GPIO_NUM_28
GPIO28, input and output

enumerator GPIO_NUM_29
GPIO29, input and output

enumerator GPIO_NUM_30
GPIO30, input and output

enumerator GPIO_NUM_31
GPIO31, input and output

enumerator GPIO_NUM_32
GPIO32, input and output

enumerator GPIO_NUM_33
GPIO33, input and output

enumerator GPIO_NUM_34
GPIO34, input mode only

enumerator GPIO_NUM_35
GPIO35, input mode only

enumerator GPIO_NUM_36
GPIO36, input mode only

enumerator GPIO_NUM_37
GPIO37, input mode only

enumerator GPIO_NUM_38
GPIO38, input mode only

enumerator GPIO_NUM_39
GPIO39, input mode only

enumerator GPIO_NUM_MAX

enum gpio_int_type_t

Values:

enumerator GPIO_INTR_DISABLE
GPIO interrupt

enumerator GPIO_INTR_POSEDGE
GPIO interrupt type: rising edge

enumerator GPIO_INTR_NEGEDGE
GPIO interrupt type: falling edge
enumerator GPIO_INTR_ANYEDGE
   GPIO interrupt type: both rising and falling edge

enumerator GPIO_INTR_LOW_LEVEL
   GPIO interrupt type: input low level trigger

enumerator GPIO_INTR_HIGH_LEVEL
   GPIO interrupt type: input high level trigger

enumerator GPIO_INTR_MAX

enum gpio_mode_t
   Values:

enumerator GPIO_MODE_DISABLE
   GPIO mode: disable input and output

enumerator GPIO_MODE_INPUT
   GPIO mode: input only

enumerator GPIO_MODE_OUTPUT
   GPIO mode: output only mode

enumerator GPIO_MODE_OUTPUT_OD
   GPIO mode: output only with open-drain mode

enumerator GPIO_MODE_INPUT_OUTPUT_OD
   GPIO mode: output and input with open-drain mode

enumerator GPIO_MODE_INPUT_OUTPUT
   GPIO mode: output and input mode

enum gpio_pullup_t
   Values:

enumerator GPIO_PULLUP_DISABLE
   Disable GPIO pull-up resistor

enumerator GPIO_PULLUP_ENABLE
   Enable GPIO pull-up resistor

enum gpio pulldown t
   Values:

enumerator GPIO_PULLDOWN_DISABLE
   Disable GPIO pull-down resistor

enumerator GPIO_PULLDOWN_ENABLE
   Enable GPIO pull-down resistor
enum gpio_pull_mode_t

Values:

enumerator GPIO_PULLUP_ONLY
    Pad pull up

enumerator GPIO_PULLDOWN_ONLY
    Pad pull down

enumerator GPIO_PULLUP_PULLDOWN
    Pad pull up + pull down

enumerator GPIO_FLOATING
    Pad floating

denum gpio_drive_cap_t

Values:

enumerator GPIO_DRIVE_CAP_0
    Pad drive capability: weak

enumerator GPIO_DRIVE_CAP_1
    Pad drive capability: stronger

enumerator GPIO_DRIVE_CAP_2
    Pad drive capability: medium

enumerator GPIO_DRIVE_CAP_DEFAULT
    Pad drive capability: medium

enumerator GPIO_DRIVE_CAP_3
    Pad drive capability: strongest

enumerator GPIO_DRIVE_CAP_MAX

API 参考 - RTC GPIO

Header File

- components/driver/include/driver/rtc_io.h

Functions

bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)

Determine if the specified GPIO is a valid RTC GPIO.

参数 gpio_num - GPIO number
返回 true if GPIO is valid for RTC GPIO use. false otherwise.

int rtc_io_number_get (gpio_num_t gpio_num)

Get RTC IO index number by gpio number.

参数 gpio_num - GPIO number
**Chapter 2. API 参考**

### esp_err_t rtc_gpio_init (gpio_num_t gpio_num)

Init a GPIO as RTC GPIO.

- **参数** `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
- **返回**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)

Init a GPIO as digital GPIO.

- **参数** `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
- **返回**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)

Get the RTC IO input level.

- **参数** `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
- **返回**
  - 1 High level
  - 0 Low level
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)

Set the RTC IO output level.

- **参数**
  - `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
  - `level` - output level
- **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

- **参数**
  - `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
  - `mode` - GPIO direction
- **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

### esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

**NOTE:** ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT ONLY, INPUT_OUTPUT mode.

- **参数**
  - `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
  - `mode` - GPIO direction
- **返回**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO
esp_err_t rtc_gpio_pullup_en (gpio_num_t gpio_num)
RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal
GPIOs and RTC IOs.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12)

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_pulldown_en (gpio_num_t gpio_num)
RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal
GPIOs and RTC IOs.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12)

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_pullup_dis (gpio_num_t gpio_num)
RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal
GPIOs and RTC IOs.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12)

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_pulldown_dis (gpio_num_t gpio_num)
RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal
GPIOs and RTC IOs.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12)

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set RTC GPIO pad drive capability.

参数
• gpio_num - GPIO number, only support output GPIOs
• strength - Drive capability of the pad

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t rtc_gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get RTC GPIO pad drive capability.

参数
• gpio_num - GPIO number, only support output GPIOs
• strength - Pointer to accept drive capability of the pad

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
**esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)**
Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12)
返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)**
Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12)
返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)**
Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

参数 gpio_num - GPIO number (e.g. GPIO_NUM_12).
返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

**esp_err_t rtc_gpio_force_hold_en_all(void)**
Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all(void)**
Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)**
Enable wakeup from sleep mode using specific GPIO.

参数
- gpio_num - GPIO number
- intr_type - Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)**
Disable wakeup from sleep mode using specific GPIO.

参数 gpio_num - GPIO number
返回
- ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Macros**

```c
RTC_GPIO_IS_VALID_GPIO(gpio_num)
```

**Header File**

- components/hal/include/hal/rtc_io_types.h

**Enumerations**

```c
enum rtc_gpio_mode_t
{
    RTC_GPIO_MODE_INPUT_ONLY,
    RTC_GPIO_MODE_OUTPUT_ONLY,
    RTC_GPIO_MODE_INPUT_OUTPUT,
    RTC_GPIO_MODE_DISABLED,
    RTC_GPIO_MODE_OUTPUT_OD,
    RTC_GPIO_MODE_INPUT_OUTPUT_OD,
};
```

2.6.7 通用定时器

**简介**

通用定时器是 ESP32 定时器组外设的驱动程序。ESP32 硬件定时器分辨率高，具有灵活的报警功能。定时器内部计数器达到特定目标数值的行为被称为定时器报警。定时器报警时将调用用户注册的不同定时器回调函数。

通用定时器通常在以下场景中使用：
- 同时挂钟一般自由运行，随时随地获取高分辨率时间戳；
- 生成周期性警报，定期触发事件；
- 生成一次性警报，在目标时间内响应。
功能概述

下文介绍了配置和操作定时器的常规步骤:

- 资源分配 - 获取定时器句柄应设置的参数，以及如何在通用定时器完成工作时回收资源。
- 设置和获取计数值 - 如何强制定时器从起点开始计数，以及如何随时获取计数值。
- 设置报警动作 - 启动警报事件应设置的参数。
- 注册事件回调函数 - 如何将用户的特定代码挂接到警报事件回调函数。
- 使能和禁用定时器 - 如何使能和禁用定时器。
- 启动和停止定时器 - 通过不同报警行为启动定时器的典型使用场景。
- 电源管理 - 选择不同的时钟源将会如何影响功耗。
- IRAM 安全 - 在 cache 禁用的情况下，如何更好地让定时器处理中断事务以及实现 IO 控制功能。
- 线程安全 - 驱动程序保证哪些 API 线程安全。
- Kconfig 选项 - 支持的 Kconfig 选项，这些选项会对驱动程序行为产生不同影响。

资源分配

不同的 ESP 芯片可能有不同数量的独立定时器组，每组内也可能有若干个独立定时器。1

通用定时器实例由 `gptimer_handle_t` 表示。后台驱动会在资源池中管理所有可用的硬件资源，这样便于无需考虑硬件所属的定时器以及定时器组。

要安装一个定时器实例，需要提前提供配置结构体 `gptimer_config_t`:

```c
.gptimer_config_t timer_config = {
  .clk_src = GPTIMER_CLK_SRC_DEFAULT,
  .direction = GPTIMER_COUNT_UP,
  .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
```

完成上述结构配置之后，可以将结构传递给 `gptimer_new_timer()`，用以实例化定时器实例并返回定时器句柄。

该函数可能由于内存不足、参数无效或错误而失败。具体来说，当没有更多的空闲定时器（即所有硬件资源已用完）时，将返回 ESP_ERR_NOT_FOUND。可用定时器总数由 SOC_TIMER_GROUP_TOTAL_TIMERS 表示，不同的 ESP 芯片该数值不同。

如已不再需要之前创建的通用定时器实例，应通过调用 `gptimer_del_timer()` 回收定时器，以便底层硬件定时器用于其他目的。在删除通用定时器句柄之前，请通过 `gptimer_disable()` 禁用定时器，或者通过 `gptimer_enable()` 确定定时器尚未使能。

创建分辨率为 1 MHz 的通用定时器句柄

```c
gptimer_handle_t gtimer = NULL;
gptimer_config_t timer_config = {
  .clk_src = GPTIMER_CLK_SRC_DEFAULT,
  .direction = GPTIMER_COUNT_UP,
  .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gtimer));
```

设置和获取计数值

创建通用定时器时，内部计数器将默认重置为零。计数值可以通过 `gptimer_set_raw_count()` 异步更新。最大计数值取决于硬件定时器的位宽，也会在 SOC 宏 SOC_TIMER_GROUP_COUNTER_BIT_WIDTH 中有所反映。当更新活动定时器的原始计数值时，定时器将立即重新启动计数。

1 不同 ESP 芯片系列的通用定时器实例数量可能不同。了解详细信息，请参考《ESP32 技术参考手册》> 章节定时器组 (TIMG) (PDF)。驱动程序不会禁止您申请更多的定时器，但是当所有可用的硬件资源用完时将会返回错误。在分配资源时，请务必检查返回值（例如 `gptimer_new_timer()`）。
### Chapter 2. API 参考

计数值可以随时通过 gptimer_get_raw_count() 获取。

#### 设置警报动作

对于大多数通用定时器使用场景而言，应在启动定时器之前设置警报动作，但不包括简单的挂钟场景，该场景仅需自由运行的定时器。设置警报动作，需要根据如何使用警报事件来配置 gptimer_alarm_config_t 的不同参数:

- gptimer_alarm_config_t::alarm_count 设置触发警报事件的目标计数值。设置警报值时还需考虑计数方向。尤其是当 gptimer_alarm_config_t::auto_reload_on_alarm 为 true 时，gptimer_alarm_config_t::alarm_count 和 gptimer Alarm_config_t::reload_count 不能设置为相同的值，因为警报值和重载值相同时没有意义。
- gptimer_alarm_config_t::reload_count 代表警报事件发生时要重载的计数值。此配置仅在 gptimer_alarm_config_t::auto_reload_on_alarm 设置为 true 时生效。
- gptimer Alarm_config_t::auto_reload_on_alarm 标志设置是否使能自动重载功能。如果使能，硬件定时器将在警报事件发生时立即将 gptimer alarm config_t::reload_count 的值重载到计数器中。

要使警报配置生效，需要调用 gptimer_set_alarm_action()。特别地，当 gptimer_alarm_config_t 设置为 NULL 时，报警功能将被禁用。

#### 备注：

如果警报值已设置且定时器超过该值，则会立即触发警报。

#### 注册事件回调函数

定时器启动后，可动态产生特定事件（如“警报事件”）。如需在事件发生时调用某些函数，可以通过 gptimer_register_event_callbacks() 将函数挂载到中断服务例程 (ISR)。gptimer_event_callbacks_t 中列出了所有支持的事件回调函数:

- gptimer_event_callbacks_t::on_alarm 设置警报事件的回调函数。由于此函数在 ISR 上下文中调用，必须确保该函数不会试图阻塞（例如，确保仅从函数内调用具有 ISR 后缀的 FreeRTOS API）。函数原型在 gptimer_alarm_config_t::reload_count 中有所声明。

您也可以通过参数 user_data 将自己的上下文保存到 gptimer_register_event_callbacks() 中，用户数据将直接传递给回调函数。

此功能将为定时器延迟安装中断服务，但不使能中断服务。所以，请在 gptimer_enable() 之前调用这一函数，否则将返回 ESP_ERR_INVALID_STATE 错误。了解详细信息，请查看章节 使能和禁用定时器。

#### 使能和禁用定时器

在对定时器进行 IO 控制之前，需要先调用 gptimer_enable() 使能定时器。此函数功能如下:

- 此函数将把定时器驱动程序的状态从 init 切换为 enable。
- 如果 gptimer_register_event_callbacks() 已经延迟安装中断服务，此函数将使能中断服务。
- 如果选择了特定的时钟源（例如 APB 时钟），此函数将获取适当的电源管理器，了解更多信息，请查看章节 电源管理。

调用 gptimer_disable() 会进行相反的操作，即将定时器驱动程序恢复到 init 状态，禁用中断服务并释放电源管理器。

#### 启动和停止定时器

启动和停止是定时器的基本 IO 操作。调用 gptimer_start() 可以使内部计数器开始工作，而 gptimer_stop() 可以使计数器停止工作。下文说明了如何在存在或不存在警报事件的情况下启动定时器。

#### 将定时器作为挂钟启动

```c
ESP_OK = gptimer_enable(gptimer);  // 使能定时器
ESP_OK = gptimer_start(gptimer);   // 开始计数器工作
```

(下页继续)
触发周期性事件

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don't introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

触发一次性事件

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
}
```c
// return whether we need to yield at the end of ISR
return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

### 警报值动态更新
通过更改 `gptimer_alarm_event_data_t::alarm_value`，可以在 ISR 程序回调中动态更新警报值。警报值将在回调函数返回后更新。

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

### 电源管理
当使能电源管理时（即 `CONFIG_PM_ENABLE` 已打开），系统将在进入 Light-sleep 模式之前调整 APB 频率，从而可能会改变通用定时器的计数步骤周期，导致计时不准确。

然而，驱动程序可以通过获取类型为 `ESP_PM_APB_FREQ_MAX` 的电源管理锁来阻止系统更改 APB 频率。

---

**Espressif Systems 1024**

*Release v5.1-dev-2066-g7869f4e151*

[Submit Document Feedback]
每当驱动程序创建一个通用定时器实例，且该实例选择`GPTIMER_CLK_SRC_APB`作为其时钟源时，驱动程序会确保在通过`gptimer_enable()`使能定时器时，已经获取了电源管理锁。同样，当为该定时器调用`gptimer_disable()`时，驱动程序会释放电源管理锁。

如果选择`GPTIMER_CLK_SRC_XTAL`等其他时钟源，那么驱动程序不会安装电源管理锁。只要时钟源仍可提供足够的分辨率，XTAL 时钟源就更适合低功耗应用。

**IRAM 安全** 默认情况下，当 cache 因写入或擦除 flash 等原因而被禁用时，通用定时器的中断服务将延迟，造成警报中断无法及时执行。在实时应用程序中通常需要避免这一情况发生。

调用 Kconfig 选项`CONFIG_GPTIMER_ISR_IRAM_SAFE`可实现如下功能：
- 即使禁用 cache 也可使能正在运行的中断
- 将 ISR 使用的所有函数放入 IRAM
- 将驱动程序对象放入 DRAM（以防意外映射到 PSRAM）

这将允许中断在 cache 禁用时运行，但会增加 IRAM 使用量。

调用另一 Kconfig 选项`CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`也可将常用的 IO 控制功能放入 IRAM，以便这些函数在 cache 禁用时也能执行。常用的 IO 控制功能如下：
- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**线程安全** 驱动程序会保证工厂函数`gptimer_new_timer()`的线程安全，这意味着您可以从不同的RTOS 任务中调用这一函数，而无需额外的锁保护。

由于驱动程序通过使用临界区来防止这些函数在任务和 ISR 中同时被调用，所以以下函数能够在 ISR 上下文中运行。
- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

将`gptimer_handle_t`作为第一个位置参数的其他函数不被视作线程安全，也就是说应该避免从多个任务中调用这些函数。

**Kconfig 选项**
- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` 控制放置通用定时器控制函数（IRAM 或 flash）的位置。了解更多信息，请参考章节`IRAM 安全`。
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` 控制默认 ISR 程序在 cache 禁用时是否可以运行。了解更多信息，请参考章节`IRAM 安全`。
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用这一选项将增加固件二进制文件大小。

**应用示例**
- 示例`peripherals/timer_group/gptimer`中列出了通用定时器的典型用例。

\[^2\]`gptimer_event_callbacks_t::on_alarm`回调函数和这一函数调用的函数也需放在 IRAM 中，请自行处理。
Chapter 2. API 参考

API 参考

- components/driver/include/driver/gptimer.h

Functions

gptimer_new_timer (const gptimer_config_t *config, gptimer_handle_t *ret_timer)

Create a new General Purpose Timer, and return the handle.

备注: The newly created timer is put in the init state.

参数
- config [in] GPTimer configuration
- ret_timer [out] Returned timer handle

返回
- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

gptimer_del_timer (gptimer_handle_t timer)

Delete the GPTimer handle.

备注: A timer can’t be in the enable state when this function is invoked. See also gptimer_disable for how to disable a timer.

参数 timer [in] Timer handle created by gptimer_new_timer

返回
- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
- ESP_FAIL: Delete GPTimer failed because of other error

gptimer_set_raw_count (gptimer_handle_t timer, uint64_t value)

Set GPTimer raw count value.

备注: When updating the raw count of an active timer, the timer will immediately start counting from the new value.

备注: This function is allowed to run within ISR context

备注: This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

参数
- timer [in] Timer handle created by gptimer_new_timer
Chapter 2. API

• **value** - [in] Count value to be set

返回
• ESP_OK: Set GPTimer raw count value successfully
• ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
• ESP_FAIL: Set GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_get_raw_count (gptimer_handle_t timer, uint64_t *value)
```

Get GPTimer raw count value.

备注: This function will trigger a software capture event and then return the captured count value.

备注: With the raw count value and the resolution set in the gptimer_config_t, you can convert the count value into seconds.

备注: This function is allowed to run within ISR context

备注: This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

参数
• **timer** - [in] Timer handle created by gptimer_new_timer
• **value** - [out] Returned GPTimer count value

返回
• ESP_OK: Get GPTimer raw count value successfully
• ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
• ESP_FAIL: Get GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_get_captured_count (gptimer_handle_t timer, uint64_t *value)
```

Get GPTimer captured count value.

备注: The capture action can be issued either by external event or by software (see also gptimer_get_raw_count).

备注: This function is allowed to run within ISR context

备注: This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

参数
• **timer** - [in] Timer handle created by gptimer_new_timer
• **value** - [out] Returned captured count value

返回
• ESP_OK: Get GPTimer captured count value successfully
• ESP_ERR_INVALID_ARG: Get GPTimer captured count value failed because of invalid argument
**Chapter 2. API 参考**

- **ESP_FAIL**: Get GPTimer captured count value failed because of other error

```c
esp_err_t gptimer_register_event_callbacks(gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for GPTimer.

**备注**: User registered callbacks are expected to be runnable within ISR context

**备注**: The first call to this function needs to be before the call to `gptimer_enable`

**备注**: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

### 参数
- `timer` **[in]** Timer handle created by `gptimer_new_timer`
- `cbs` **[in]** Group of callback functions
- `user_data` **[in]** User data, which will be passed to callback functions directly

### 返回
- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Set event callbacks failed because the timer is not in init state
- **ESP_FAIL**: Set event callbacks failed because of other error

```c
esp_err_t gptimer_set_alarm_action(gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```

Set alarm event actions for GPTimer.

**备注**: This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

**备注**: This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

### 参数
- `timer` **[in]** Timer handle created by `gptimer_new_timer`
- `config` **[in]** Alarm configuration, especially, set config to NULL means disabling the alarm function

### 返回
- **ESP_OK**: Set alarm action for GPTimer successfully
- **ESP_ERR_INVALID_ARG**: Set alarm action for GPTimer failed because of invalid argument
- **ESP_FAIL**: Set alarm action for GPTimer failed because of other error

```c
esp_err_t gptimer_enable(gptimer_handle_t timer)
```

Enable GPTimer.

**备注**: This function will transit the timer state from init to enable.
**备 注:** This function will enable the interrupt service, if it’s lazy installed in `gptimer_register_event_callbacks`.

**备 注:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

**备 注:** Enable a timer doesn’t mean to start it. See also `gptimer_start` for how to make the timer start counting.

**参数** `timer` -[in] Timer handle created by `gptimer_new_timer`

**返回**
- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

`esp_err_t` `gptimer_disable` (*gptimer_handle_t* `timer`)

Disable GPTimer.

**备 注:** This function will do the opposite work to the `gptimer_enable`.

**备 注:** Disable a timer doesn’t mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

**参数** `timer` -[in] Timer handle created by `gptimer_new_timer`

**返回**
- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

`esp_err_t` `gptimer_start` (*gptimer_handle_t* `timer`)

Start GPTimer (internal counter starts counting)

**备 注:** This function should be called when the timer is in the enable state (i.e. after calling `gptimer_enable`)

**备 注:** This function is allowed to run within ISR context.

**备 注:** This function will be placed into IRAM if `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled.

**参数** `timer` -[in] Timer handle created by `gptimer_new_timer`

Chapter 2. API 参考

返回
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Start GPTimer failed because of other error

\[ \text{esp_err_t gptimer_stop (gptimer_handle_t timer)} \]

Stop GPTimer (internal counter stops counting)

备注: This function should be called when the timer is in the enable state (i.e. after calling gptimer_enable)

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

参数 timer - [in] Timer handle created by gptimer_new_timer

返回
- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Stop GPTimer failed because of other error

Structures

\[ \text{struct gptimer_config_t} \]

General Purpose Timer configuration.

Public Members

\[ gptimer_clock_source_t \text{clk_src} \]

GPTimer clock source

\[ gptimer_count_direction_t \text{direction} \]

Count direction

uint32_t \text{resolution_hz} \]

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to \((1 / \text{resolution_hz})\) seconds

uint32_t \text{intr_shared} \]

Set true, the timer interrupt number can be shared with other peripherals

struct gptimer_config_t::[anonymous] \text{flags} \]

GPTimer config flags
Chapter 2. API 参考

```c
struct gptimer_event_callbacks_t
    Group of supported GPTimer callbacks.
```

备注: The callbacks are all running under ISR environment

备注: When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

### Public Members

```c
gptimer_alarm_cb_t on_alarm
    Timer alarm callback
```

```c
struct gptimer_alarm_config_t
    General Purpose Timer alarm configuration.
```

### Public Members

```c
uint64_t alarm_count
    Alarm target count value
```

```c
uint64_t reload_count
    Alarm reload count value, effect only when auto_reload_on_alarm is set to true
```

```c
uint32_t auto_reload_on_alarm
    Reload the count value by hardware, immediately at the alarm event
```

```c
struct gptimer_alarm_config_t::[anonymous] flags
    Alarm config flags
```

### Header File

- components/driver/include/driver/gptimer_etm.h

### Functions

```c
esp_err_t gptimer_new_etm_event (gptimer_handle_t timer, gptimer_etm_event_type_t event_type,
                                esp_etm_event_handle_t*out_event)
```

Get the ETM event for GPTimer.

备注: The created ETM event object can be deleted later by calling esp_etm_del_event.

参数

- timer -[in] Timer handle created by gptimer_new_timer
- event_type -[in] GPTimer ETM event type
- out_event -[out] Returned ETM event handle

返回
Chapter 2. API Reference

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

```c
esp_err_t gptimer_new_etm_task(gptimer_handle_t timer, gptimer_etm_task_type_t task_type, esp_etm_task_handle_t *out_task)
```

Get the ETM task for GPTimer.

**备注:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

### Parameters
- **timer** [in] Timer handle created by `gptimer_new_timer`
- **task_type** [in] GPTimer ETM task type
- **out_task** [out] Returned ETM task handle

### Return
- ESP_OK: Get ETM task successfully
- ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
- ESP_FAIL: Get ETM task failed because of other error

**Header File**
- `components/driver/include/driver/gptimer_types.h`

**Structures**

```c
struct gptimer_alarm_event_data_t
```

GPTimer alarm event data.

**Public Members**

- **count_value**
  - Current count value
- **alarm_value**
  - Current alarm value

**Type Definitions**

```c
typedef struct gptimer_t *gptimer_handle_t
```

Type of General Purpose Timer handle.

```c
typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
```

Timer alarm callback prototype.

- **timer** [in] Timer handle created by `gptimer_new_timer`
- **edata** [in] Alarm event data, fed by driver
- **user_ctx** [in] User data, passed from `gptimer_register_event_callbacks`

**Return** Whether a high priority task has been woken up by this function

**Header File**
- `components/hal/include/hal/timer_types.h`
Chapter 2. API 参考

Type Definitions
typedef soc_periph_gptimer_clk_src_t gptimer_clock_source_t
GPTimer clock source.

备注：User should select the clock source based on the power and resolution requirement

Enumerations
enum gptimer_count_direction_t
GPTimer count direction.
Values:
enumerator GPTIMER_COUNT_DOWN
Decrease count value
enumerator GPTIMER_COUNT_UP
Increase count value

enum gptimer_etm_task_type_t
GPTimer specific tasks that supported by the ETM module.
Values:
enumerator GPTIMER_ETM_TASK_START_COUNT
Start the counter
enumerator GPTIMER_ETM_TASK_STOP_COUNT
Stop the counter
enumerator GPTIMER_ETM_TASK_EN_ALARM
Enable the alarm
enumerator GPTIMER_ETM_TASK_RELOAD
Reload preset value into counter
enumerator GPTIMER_ETM_TASK_CAPTURE
Capture current count value into specific register
enumerator GPTIMER_ETM_TASK_MAX
Maximum number of tasks

enum gptimer_etm_event_type_t
GPTimer specific events that supported by the ETM module.
Values:
enumerator GPTIMER_ETM_EVENT_ALARM_MATCH
Count value matches the alarm target value
enumerator GPTIMER_ETM_EVENT_MAX
Maximum number of events
2.6.8 I2C 驱动程序

概述
I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线 (SDA) 和串行时钟线 (SCL) 线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32 有 2 个 I2C 控制器（也称为端口），负责处理在 I2C 总线上的通信。每个控制器都可以设置为主机或从机。

驱动程序的功能
I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. 配置驱动程序 - 设置初始化参数（如主机模式或从机模式、SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. 安装驱动程序 - 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机
3. 根据是主机还是从机配置驱动程序，选择合适的项目
   a) 主机模式下通信 - 发起通信（主机模式）
   b) 从机模式下通信 - 响应主机消息（从机模式）
4. 中断处理 - 配置 I2C 中断服务
5. 用户自定义配置 - 调整默认的 I2C 通信参数（如时序、位序等）
6. 错误处理 - 如何识别和处理驱动程序配置和通信错误
7. 删除驱动程序 - 在通信结束时释放 I2C 驱动程序所使用的资源

配置驱动程序

建立 I2C 通信第一步是配置驱动程序，这需要设置 i2c_config_t 结构中的几个参数：

- 设置 I2C 工作模式 - 从 i2c_mode_t 中选择主机模式或从机模式
- 设置 通信管脚
  - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
  - 是否启用 ESP32 的内部上拉电阻
- （仅限主机模式）设置 I2C 时钟速度
- （仅限从机模式）设置以下内容:
  - 是否应启用 10 位寻址模式
  - 定义 从机地址

然后，初始化给定 I2C 端口的配置，请使用端口号和 i2c_config_t 作为函数调用参数来调用 i2c_param_config() 函数。

配置示例（主机）:

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,    // select GPIO specific to your
    .scl_io_num = I2C_MASTER_SCL_IO,
    .expansion_bits = 0,
    .flags = 0,
    .frequency_hz = 100000,
    .operation = I2C_OPERATION_NORMAL,
    .polarity = I2C_POLARITY_LOW,
    .clock_polarity = I2C Clock POLARITY_LOW
};
```
配置示例（从机）：

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,  // select GPIO specific to your project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,  // select GPIO specific to your project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,  // address of your project
    .clk_flags = 0,
};
```

在此阶段，`i2c_param_config()` 还将其他 I2C 配置参数设置为 I2C 总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考用户自定义配置。

### 源时钟配置

增加了时钟源分配器，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如 `i2c_config_t::clk_flags` 中的要求）。

当 `i2c_config_t::clk_flags` 为 0 时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如 APB 之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将 `i2c_config_t::clk_flags` 设置为 0。有关时钟特性，请参见下表。

**备注：** 如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位（`clk_flags`）在时钟的功能中均为 0。

### 表 3: ESP32 时钟源特性

<table>
<thead>
<tr>
<th>时钟名称</th>
<th>时钟频率</th>
<th>SCL 的最大频率</th>
<th>时钟功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB 时钟</td>
<td>80 MHz</td>
<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

对 `i2c_config_t::clk_flags` 的解释如下：

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`：当 APB 时钟改变时，时钟的波特率不会改变。
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`：支持轻度睡眠模式，APB 时钟则不支持。
3. ESP32 可能不支持某些标志，请在使用前阅读技术参考手册。

**备注：** 在主机模式下，SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。
### 备注：SCL 的时钟频率会被上拉电阻和线上电容（或是从机电容）一起影响。因此，用户需要自己选择合适的上拉电阻去保证 SCL 时钟频率是准确的。尽管 I2C 协议推荐上拉电阻值为 1K 欧姆到 10K 欧姆，但是需要根据不同的频率需要选择不同的上拉电阻。

通常来说，所选择的频率越高，需要的上拉电阻越小（但是不要小于 1K 欧姆）。这是因为高电阻会减小电流，这会延长上升时间从而是频率变慢。通常我们推荐的上拉阻值范围为 2K 欧姆到 5K 欧姆，但是用户可能也需要根据他们的实际情况做出一些调整。

### 安装驱动程序

配置好 I2C 驱动程序后，使用以下参数调用函数 `i2c_driver_install()` 安装驱动程序:

- 端口号，从 `i2c_port_t` 中二选一
- 主机或从机模式，从 `i2c_mode_t` 中选择
  - （仅限从机模式）分配用于在从机模式下发送和接收数据的缓存区大小。I2C 是一个以主机为中心的总线，数据只能根据主机的需求从从机传输到主机。因此，从机通常有一个发送缓存区，供从应用程序写入数据使用。数据保存在发送缓存区中，由主机自行读取。
  - 用于分配中断的标志（请参考 `esp_hw_support/include/esp_intr_alloc.h` 中 ESP_INTR_FLAG_* 值）

### 主机模式下通信

安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

ESP32 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信，并发送命令让从机响应，如进行测量并将结果发给主机。

为优化通信流程，驱动程序提供一个名为“命令链接”的容器，该容器应填充一系列命令，然后传递给 I2C 控制器执行。

### 主机写入数据

下面的示例展示如何为 I2C 主机构建命令链接，从而向从机发送 n 个字节。

![图 7: I2C command link - master write example](image)

下面介绍如何为“主机写入数据”设置命令链接及其内部内容:

1. 使用 `i2c_cmd_link_create()` 创建一个命令链接。
   - 然后，将一系列待发送给从机的数据填充命令链接:
     a) 启动位 - `i2c_master_start()`
     b) 从机地址 - `i2c_master_write_byte()`。提供单字节地址作为调用此函数的实参。
     c) 数据 - 一个或多个字节的数据作为 `i2c_master_write()` 的实参。

---

Espressif Systems 1036 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
d) 停止位 - \texttt{i2c\_master\_stop()}

函数 \texttt{i2c\_master\_write\_byte()} 和 \texttt{i2c\_master\_write()} 都有额外的实参，规定主机是否应确认其有无接受到 ACK 位。

2. 通过调用 \texttt{i2c\_master\_cmd\_begin()} 来触发 I2C 控制器执行命令链接。一旦开始执行，就不能再修改命令链接。

3. 命令发送后，通过调用 \texttt{i2c\_cmd\_link\_delete()} 释放命令链接使用的资源。

**主机读取数据** 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取 n 个字节。

在读取数据时，在上图的步骤 4 中，不是用 \texttt{i2c\_master\_write()}，而是用 \texttt{i2c\_master\_read\_byte()} 和 \texttt{i2c\_master\_read()} 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

**指示写入或读取数据** 发送从机地址后，请参考图中第 3 步，主机可以写人或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址 (ESP\_SLAVE\_ADDR << 1) | I2C\_MASTER\_WRITE，如下所示：

\begin{verbatim}
i2c\_master\_write\_byte(cmd, (ESP\_SLAVE\_ADDR << 1) | I2C\_MASTER\_WRITE, ACK\_EN);
\end{verbatim}

同理，指示从从机读取数据的命令链接如下所示：

\begin{verbatim}
i2c\_master\_write\_byte(cmd, (ESP\_SLAVE\_ADDR << 1) | I2C\_MASTER\_READ, ACK\_EN);
\end{verbatim}

**从机模式下通信** 安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

API 为从机提供以下功能：

- \texttt{i2c\_slave\_read\_buffer()}

当主机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数 \texttt{i2c\_slave\_read\_buffer()}。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。

- \texttt{i2c\_slave\_write\_buffer()}

发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数 \texttt{i2c\_slave\_write\_buffer()} 有一个参数，用于指定发送缓存区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。
在 peripherals/i2c 中可找到介绍如何使用这些功能的代码示例。

中断处理 安装驱动程序时，默认情况下会安装中断处理程序。

用户自定义配置 如本节末尾所述 配置驱动程序，函数i2c_param_config()在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 I2C 总线协议规范规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。APB 的频率在I2C_APB_CLK_FREQ 中指定。

<td>优先发送接收最高有效位 (LSB) 或最低有效位 (MSB)，可在 i2c_trans_mode_t 定义的模式中选择</td>
<td>i2c_set_data_mode()</td>
</tr>
</tbody>
</table>

上述每个函数都有一个_get_ 对应项来检查当前设置的值。例如，调用 i2c_get_timeout() 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值，请参考文件 driver/i2c.c 并查找带有后缀 _DEFAULT 的定义。

通过函数i2c_set_pin() 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值，请使用函数i2c_param_config()。

### 备注: ESP32 的内部上拉电阻范围为几万欧姆，因此在大多数情况下，它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 I2C 总线协议规范规定范围内的上拉电阻。计算阻值的具体方法，可参考 TI 应用说明

错误处理 大多数 I2C 驱动程序的函数在成功完成时会返回 ESP_OK，或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息，其中包含错误说明，例如检查输入配置的正确性。有关详细信息，请参考文件 driver/i2c.c 并用后缀 _ERR_STR 查找定义。

使用专用中断来捕获通信故障。例如，如果主机将数据发送回主机耗费太长时间，会触发 I2C.TIME_OUT_INT 中断。详细信息请参考中断处理。

如果出现通信失败，可以分别为发送和接收缓存区调用 i2c_reset_tx_fifo() 和 i2c_reset_rx_fifo() 来重置内部硬件缓存区。

### 删除驱动程序 当使用 i2c_driver_install() 建立 I2C 通信，一段时间后不再需要 I2C 通信时，可以通过调用 i2c_driver_delete() 来移除驱动程序以释放分配的资源。

由于函数i2c_driver_delete() 无法保证线程安全性，请在调用该函数移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

### 应用示例

I2C 主机和从机示例： peripherals/i2c。

Espressif Systems 1038 Release v5.1-dev-2066-g7869f4e151 Submit Document Feedback
## API 参考

### Header File

- components/driver/include/driver/i2c.h

### Functions

**esp_err_t i2c_driver_install**

```c
i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)
```

Install an I2C driver.

**备注:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

**备注:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**参数**

- **i2c_num** – I2C port number
- **mode** – I2C mode (either master or slave).
- **slv_rx_buf_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**返回**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**esp_err_t i2c_driver_delete**

```c
i2c_driver_delete(i2c_port_t i2c_num)
```

Delete I2C driver.

**备注:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**参数**

- **i2c_num** – I2C port to delete

**返回**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_param_config**

```c
i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)
```

Configure an I2C bus with the given configuration.

**参数**

- **i2c_num** – I2C port to configure
- **i2c_conf** – Pointer to the I2C configuration

**返回**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t i2c_reset_tx_fifo (i2c_port_t i2c_num)**
reset I2C tx hardware fifo

参数 i2c_num – I2C port number

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_reset_rx_fifo (i2c_port_t i2c_num)**
reset I2C rx fifo

参数 i2c_num – I2C port number

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_set_pin (i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)**
Configure GPIO pins for I2C SCK and SDA signals.

参数
- i2c_num – I2C port number
- sda_io_num – GPIO number for I2C SDA signal
- scl_io_num – GPIO number for I2C SCL signal
- sda_pullup_en – Enable the internal pullup for SDA pin
- scl_pullup_en – Enable the internal pullup for SCL pin
- mode – I2C mode

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_master_write_to_device (i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)**
Perform a write to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc… It shall only be called in I2C master mode.

参数
- i2c_num – I2C port number to perform the transfer on
- device_address – I2C device’s 7-bit address
- write_buffer – Bytes to send on the bus
- write_size – Size, in bytes, of the write buffer
- ticks_to_wait – Maximum ticks to wait before issuing a timeout.

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**esp_err_t i2c_master_read_from_device (i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)**
Perform a read to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc… It shall only be called in I2C master mode.

参数
- i2c_num – I2C port number to perform the transfer on
- device_address – I2C device’s 7-bit address
- read_buffer – Buffer to store the bytes received on the bus
- read_size – Size, in bytes, of the read buffer
• **ticks_to_wait** – Maximum ticks to wait before issuing a timeout.

### esp_err_t i2c_master_write_read_device

```
esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc. It shall only be called in I2C master mode.

### Parameters

- **i2c_num** – I2C port number to perform the transfer on
- **device_address** – I2C device’s 7-bit address
- **write_buffer** – Bytes to send on the bus
- **write_size** – Size, in bytes, of the write buffer
- **read_buffer** – Buffer to store the bytes received on the bus
- **read_size** – Size, in bytes, of the read buffer
- **ticks_to_wait** – Maximum ticks to wait before issuing a timeout.

### Return Values

- ESP_OK – Success
- ESP_ERR_INVALID_ARG – Parameter error
- ESP_FAIL – Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE – I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT – Operation timeout because the bus is busy.

### i2c_cmd_handle_t i2c_cmd_link_create_static

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

#### Parameters

- **buffer** – Buffer to use for commands allocations
- **size** – Size in bytes of the buffer

#### Return Value

Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

### i2c_cmd_handle_t i2c_cmd_link_create

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

#### Parameters

- **cmd_handle** – I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

---

**Note:** It is highly advised not to allocate this buffer on the stack. The size of the data used underneat may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).
void i2c_cmd_link_delete (i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

参数 cmd_handle - I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function

esp_err_t i2c_master_start (i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

参数 cmd_handle - I2C commands list

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write_byte (i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

参数
- cmd_handle - I2C commands list
- data - Byte to send on the port
- ack_en - Enable ACK signal

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write (i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

参数
- cmd_handle - I2C commands list
- data - Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and intr_flag is set to ESP_INTR_FLAG_IRAM, data should be allocated from internal RAM.
- data_len - Length, in bytes, of the data buffer
- ack_en - Enable ACK signal

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_read_byte (i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

参数
- cmd_handle - I2C commands list
- data - Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
- ack - ACK signal

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API

• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

参数

• **cmd_handle** - I2C commands list
• **data** - Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
• **data_len** - Size, in bytes, of the data buffer
• **ack** - ACK signal

返回

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

参数 **cmd_handle** - I2C commands list

返回

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

参数

• **i2c_num** - I2C port number
• **cmd_handle** - I2C commands list
• **ticks_to_wait** - Maximum ticks to wait before issuing a timeout.

返回

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
```

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

备注：This function shall only be called in I2C slave mode.

参数

• **i2c_num** - I2C port number
• **data** - Bytes to write into internal buffer
• **size** - Size, in bytes, of data buffer
**Chapter 2. API**

### `i2c_slave_read_buffer`

```c
int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t* data, size_t max_size, TickType_t ticks_to_wait)
```

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

**备注:** This function shall only be called in I2C slave mode.

**参数**
- `i2c_num` – I2C port number
- `data` – Buffer to fill with ringbuffer’s bytes
- `max_size` – Maximum bytes to read
- `ticks_to_wait` – Maximum waiting ticks

**返回**
- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

### `i2c_set_period`

```c
esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)
```

Set I2C master clock period.

**参数**
- `i2c_num` – I2C port number
- `high_period` – Clock cycle number during SCL is high level, high_period is a 14 bit value
- `low_period` – Clock cycle number during SCL is low level, low_period is a 14 bit value

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### `i2c_get_period`

```c
esp_err_t i2c_get_period(i2c_port_t i2c_num, int* high_period, int* low_period)
```

Get I2C master clock period.

**参数**
- `i2c_num` – I2C port number
- `high_period` – pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- `low_period` – pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### `i2c_filter_enable`

```c
esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus. Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**备注:** Enable filter will slow down the SCL clock.

**参数**
- `i2c_num` – I2C port number to filter
• cyc_num – the APB cycles need to be filtered (0<=cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_filter_disable(i2c_port_t i2c_num)
Disable filter on I2C bus.
参数 i2c_num – I2C port number
返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
set I2C master start signal timing
参数
• i2c_num – I2C port number
• setup_time – clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
• hold_time – clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.
返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
get I2C master start signal timing
参数
• i2c_num – I2C port number
• setup_time – pointer to get setup time
• hold_time – pointer to get hold time
返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
set I2C master stop signal timing
参数
• i2c_num – I2C port number
• setup_time – clock number between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
• hold_time – clock number after the STOP bit’s rising-edge, it’s a 14-bit value.
返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
get I2C master stop signal timing
参数
• i2c_num – I2C port number
• setup_time – pointer to get setup time.
• hold_time – pointer to get hold time.
返回
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
**Chapter 2. API**

### esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)

**set I2C data signal timing**

**参数**
- `i2c_num` – I2C port number
- `sample_time` – clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- `hold_time` – clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)

**get I2C data signal timing**

**参数**
- `i2c_num` – I2C port number
- `sample_time` – pointer to get sample time
- `hold_time` – pointer to get hold time

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)

**set I2C timeout value**

**参数**
- `i2c_num` – I2C port number
- `timeout` – timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)

**get I2C timeout value**

**参数**
- `i2c_num` – I2C port number
- `timeout` – pointer to get timeout value

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)

**set I2C data transfer mode**

**参数**
- `i2c_num` – I2C port number
- `tx_trans_mode` – I2C sending data mode
- `rx_trans_mode` – I2C receiving data mode

**返回**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)

**get I2C data transfer mode**

**参数**
- `i2c_num` – I2C port number
Chapter 2. API 参考

- **tx_trans_mode** - pointer to I2C sending data mode
- **rx_trans_mode** - pointer to I2C receiving data mode

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Structures**

struct `i2c_config_t`

I2C initialization parameters.

**Public Members**

- `i2c_mode_t mode`
  I2C mode

- `int sda_io_num`
  GPIO number for I2C sda signal

- `int scl_io_num`
  GPIO number for I2C scl signal

- `bool sda_pullup_en`
  Internal GPIO pull mode for I2C sda signal

- `bool scl_pullup_en`
  Internal GPIO pull mode for I2C scl signal

- `uint32_t clk_speed`
  I2C clock frequency for master mode, (no higher than 1MHz for now)

- `struct i2c_config_t::[anonymous]::[anonymous] master`
  I2C master config

- `uint8_t addr_10bit_en`
  I2C 10bit address mode enable for slave mode

- `uint16_t slave_addr`
  I2C address for slave mode

- `uint32_t maximum_speed`
  I2C expected clock speed from SCL.

- `struct i2c_config_t::[anonymous]::[anonymous] slave`
  I2C slave config

- `uint32_t clk_flags`
  Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice
Macros

I2C_APB_CLK_FREQ
I2C source clock is APB clock, 80MHz

I2C_SCLK_SRC_FLAG_FOR_NOMAL
Any one clock source that is available for the specified frequency may be chosen

I2C_SCLK_SRC_FLAG_AWARE_DFS
For REF tick clock, it won’t change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)
The following macro is used to determine the recommended size of the buffer to pass to i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands required are the following:

• write device register
• read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

Type Definitions

typedef void *i2c_cmd_handle_t
I2C command handle

Header File

• components/hal/include/hal/i2c_types.h

Structures

struct i2c_hal_clk_config_t
Data structure for calculating I2C bus timing.

Public Members

uint16_t clkm_div
I2C core clock devider

uint16_t scl_low
I2C scl low period
uint16_t scl_high
I2C scl high period

uint16_t scl_wait_high
I2C scl wait_high period

uint16_t sda_hold
I2C scl low period

uint16_t sda_sample
I2C sda sample time

uint16_t setup
I2C start and stop condition setup period

uint16_t hold
I2C start and stop condition hold period

uint16_t tout
I2C bus timeout period

struct i2c_hal_timing_config_t
Timing configuration structure. Used for I2C reset internally.

**Public Members**

int high_period
high_period time

int low_period
low_period time

int wait_high_period
wait_high_period time

int restart_setup
restart setup

int start_hold
start hold time

int stop_setup
stop setup

int stop_hold
stop hold time
```c
int sda_sample
    high_period time

int sda_hold
    sda hold time

int timeout
    timeout value
```

**Type Definitions**

typedef `soc_periph_i2c_clk_src_t` \_i2c\_clock\_source\_t
I2C group clock source.

**Enumerations**

eenum \_i2c\_port\_t
    I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).
    Values:

    enumerator \_I2C\_NUM\_0
        I2C port 0

    enumerator \_I2C\_NUM\_1
        I2C port 1

    enumerator \_I2C\_NUM\_MAX
        I2C port max

enumerator I2C_MASTER_ACK_MAX

2.6.9 Inter-IC Sound (I2S)

Introduction

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicate in Standard or TDM mode consists of the following lines:

- **MCLK**: Master clock line. It’s an optional signal depends on slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK**: Bit clock line. The bit clock for data line.
• **WS**: Word(Slot) select line. It is usually used to identify the vocal tract except PDM mode.
• **DIN/DOUT**: Serial data input/output line. (Data will loopback internally if din and dout are set to a same GPIO)

And for the I2S bus that communicate in PDM mode, the lines are:
• **CLK**: PDM clock line.
• **DIN/DOUT**: Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:
• Operation as system master or slave
• Capable of acting as transmitter or receiver
• DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in simplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

### I2S File Structure

Public headers that need to be included in the I2S application
• `i2s.h`: The header file of legacy I2S APIs (for apps using legacy driver).
• `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
• `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
• `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

Public headers that have been included in the headers above
• `i2s_types_legacy.h`: The legacy public types that only used in the legacy driver.
• `i2s_types.h`: The header file that provides public types.
• `i2s_common.h`: The header file that provides common APIs for all communication modes.
Chapter 2. API

I2S Clock

Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate, but if APLL has been occupied by emac or other channels already, the APLL frequency is not allowed to change, the driver will try to work under this APLL frequency, if this APLL frequency can’t meet the requirements of I2S, the clock configuration will fail.

Clock Terminology

- **sample rate**: The number of sampled data in one second per slot.
- **sclk**: Source clock frequency. It is the frequency of the clock source.
- **mclk**: Master clock frequency. bclk is generate from this clock, mclk is mostly needed in the case that requires the MCLK signal as a reference clock to synchronize BCLK and WS between I2S master role and slave role.
- **bclk**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. It means there will be 8/16/24/32 bclk ticks in one slot, because the number of bclk ticks in one slot is equal to the `i2s_std_slot_config_t::slot_bit_width`.
- **lrck / ws**: Left/Right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**备注**: Normally mclk should be the multiple of sample rate and bclk at the same time. This field `i2s_std_clk_config_t::mclk_multiple` means the multiple of mclk to the sample rate. If slot_bit_width is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep mclk a multiple to the bclk, `i2s_std_clk_config_t::mclk_multiple` should be set to `I2S_MCLK_MULTIPLE_384`, otherwise the ws will be inaccurate. But in the most other cases, `I2S_MCLK_MULTIPLE_256` should be enough.

I2S Communication Mode

**Standard Mode** Standard mode always has left and right two sound channels which are called ‘slots’. These slots can support 8/16/24/32 bits width sample data. And the communication format for the slots mainly includes these following formats:

- **Philips Format**: Data signal have one bit shift comparing to the WS(word select) signal. And the duty of WS signal is 50%.
**Chapter 2. API 参考**

### Standard Philips Timing Diagram

- **BCLK**
- **WS**
- **DIN / DOUT**

- **slot_bit_width**
- **data_bit_width**

- **MSB**
- **LSB**

- **Left Slot**
- **Right Slot**

**MSB Format:** Almost same as philips format, but its data have no shift.

**PDM Mode (TX)**

PDM(Pulse-density Modulation) mode for tx channel can convert PCM data into PDM format which always has left and right slots. PDM TX can only support 16 bits width sample data. PDM TX is only supported on I2S0, it needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e. WS and SD signal in the following figure, the BCK signal is an internal bit sampling clock, not needed between PDM devices). This mode allows user to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by `up_sample_rate = fp / fs`, there are up-sampling modes in PDM TX:

- **Fixed Clock Frequency:** In this mode the up-sampling rate will change according to the sample rate. Setting `fp = 960` and `fs = sample_rate / 100`, then the clock frequency(Fpdm) on CLK pin will be fixed to `128 * 48 KHz = 6.144 MHz`, note that this frequency is not equal to the sample rate(Fpcm).
- **Fixed Up-sampling Rate:** In this mode the up-sampling rate is fixed to 2. Setting `fp = 960` and `fs = 480`, then the clock frequency(Fpdm) on CLK pin will be `128 * sample_rate`
PDM Mode (RX)  PDM (Pulse-density Modulation) mode for rx channel can receive PDM format data and convert the data into PCM format. PDM RX is only supported on I2S0, it can only support 16 bits width sample data. PDM RX needs at least a CLK pin for clock signal and a DIN pin for data signal. This mode allows user to configure the down-sampling parameter `i2s_pdm_rx_clk_config_t::dn_sample_mode`, there are two down-sampling modes in PDM RX:

- `i2s_pdm_dsr_t::I2S_PDM_DSR_8S`: In this mode, the clock frequency (Fpdm) on WS pin will be `sample_rate(Fpcm) * 64`.
- `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`: In this mode, the clock frequency (Fpdm) on WS pin will be `sample_rate(Fpcm) * 128`.

LCD/Camera Mode  LCD/Camera mode are only supported on I2S0 over a parallel bus. For LCD mode, I2S0 should working at master tx mode. For camera mode, I2S0 should working at slave rx mode. These two modes are not implemented by I2S driver, please refer to LCD for LCD implementation. For more information, see ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

ADC/DAC Mode  ADC and DAC modes only exist on ESP32 and are only supported on I2S0. Actually, they are two sub-modes of LCD/Camera mode. I2S0 can be routed directly to the internal analog-to-digital converter (ADC) and digital-to-analog converter (DAC). In other words, ADC and DAC peripherals can read or write continuously via I2S0 DMA. As they are not an actual communication mode, the I2S driver does not implement them.

Functional Overview

The I2S driver offers following services:

Resources Management  There are three levels' resources in I2S driver:

- platform level: Resources of all I2S controllers in the current target.
- controller level: Resources in one I2S controller.
- channel level: Resources of tx or rx channel in one I2S controller.

The public APIs are all channel level APIs, the channel handle `i2s_chan_handle_t` can help user to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and will be managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

Power Management  When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before going into light sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if target support APLL), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever user is reading or writing via I2S (i.e. calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after reading or writing finished.
Finite-State Machine  There are three states for an I2S channel, they are registered, ready and running. Their relationship is shown in the following diagram:

The <mode> in the diagram can be replaced by corresponding I2S communication mode like std for standard two-slot mode, for other information of communication mode, please refer to I2S Communication Mode section.

Data Transport  The data transport of I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call i2s_channel_enable() to enable the specific channel. When the sent or received data reach the size of one DMA buffer, I2S_OUT_EOF or I2S_IN_SUC_EOF interrupt will be triggered. Note that the DMA buffer size is not equal to i2s_chan_config_t::dma_frame_num, one frame here means all the sampled data in one WS circle. Therefore, dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8. For the transmit case, users can input the data by calling i2s_channel_write(). This function will help users to copy the data from the source buffer to the DMA tx buffer and wait for the transmission finished. Then it’ll repeat until the sent bytes reach the given size. For the receive case, the function i2s_channel_read() will wait for receiving the message queue which contains the DMA buffer address, it will help users to copy the data from DMA rx buffer to the destination buffer.

Both i2s_channel_write() and i2s_channel_read() are blocking functions, they will keep waiting until the whole source buffer are sent or the whole destination buffer loaded, unless they exceed the max blocking time, then the error code ESP_ERR_TIMEOUT will return in this case. To send or receive data asynchronously, callbacks can be registered by i2s_channel_register_event_callback(), users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, don’t do complex logic, floating operation or call non-reentrant functions in the callback.

Configuration Setting  Users can initialize a channel by corresponding function (i.e. i2s_channel_init_std_mode(), i2s_channel_init_pdm_rx_mode(),
Chapter 2. API

i2s_channel_init_pdm_tx_mode() or i2s_channel_init_tdm_mode(), the channel will be initialized to the specific mode. If the configurations need to be updated after initialization, i2s_channel_disable() has to be called first to ensure the channel has stopped, and then calling corresponding reconfig functions, like i2s_channel_reconfig_std_slot(), i2s_channel_reconfig_std_clock(), i2s_channel_reconfig_std_gpio().

IRAM Safe By default, the I2S interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the EOF interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option CONFIG_I2S_ISR_IRAM_SAFE that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

Thread Safety All the public I2S APIs are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Notice that I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

Kconfig Options

- CONFIG_I2S_ISR_IRAM_SAFE controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- CONFIG_I2S_SUPPRESS_DEPRECATED_WARN controls whether to suppress the compiling warning message while using the legacy I2S driver.
- CONFIG_I2S_ENABLE_DEBUG_LOG is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Application Example

The examples of the I2S driver can be found in the directory peripherals/i2s. Here are some simple usages of each mode:

Standard TX/RX Usage Different slot communication formats can be generated by following helper macros for standard mode. As described above, there are three formats in standard mode, their helper macros are:

- I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG
- I2S_STD_PCM_SLOT_DEFAULT_CONFIG
- I2S_STD_MSB_SLOT_DEFAULT_CONFIG

The clock config helper macro is:

- I2S_STD_CLK_DEFAULT_CONFIG

Please refer to Standard Mode for STD API information. And for more details, please refer to driver/include/driver/i2s_std.h.

STD TX Mode Take 16-bit data width for example, when the data in a uint16_t writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|--------|--------|--------|--------|--------|--------|--------|--------|-------|
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ...

Here is the table of the real data on the line with different i2s_std_slot_config_t::slot_mode and i2s_std_slot_config_t::slot_mask

</tbody>
</table>

备注：It’s similar when the data is 32-bit width, but take care when using 8-bit and 24-bit data width. For 8-bit width, the written buffer should still use uint16_t (i.e. align with 2 bytes), and only the high 8 bits will be valid, the low 8 bits are dropped, and for 24-bit width, the buffer is supposed to use uint32_t (i.e. align with 4 bytes), and only the high 24 bits valid, the low 8 bits are dropped.

Another point is that, for the 8-bit and 16-bit mono mode, the real data on the line are swapped. To get the correct sequence, the writing buffer need to swap the data every two bytes.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by helper macro. */
/* This helper macro is defined in 'i2s_common.h' and shared by all the i2s_-
 communication mode. */
/* It can help to specify the I2S role, and port id */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE-
MASTER);
/* Allocate a new tx channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can-
be generated by the macros */
/* These two helper macros is defined in 'i2s_std.h' which can only be used in STD-
mode. */
/* They can help to specify the slot and clock configurations for initialization-
or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(32BIT, I2S_SLOT-
MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);
/* Before write data, start the tx channel first */
i2s_channel_enable(tx_handle);
```

(下頁續接)
Chapter 2. API 参考

```c
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_wait);

/* If the configurations of slot or clock need to be updated, */
/* stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel resources */
i2s_del_channel(tx_handle);
```

### STD RX Mode

Take 16-bit data width for example, when the data on the line are:

- **ws low**
- **ws high**
- **ws low**
- **ws high**
- **ws low**
- **ws high**
- **ws low**
- **ws high**

Here is the table of the data that received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`:

<table>
<thead>
<tr>
<th>Data width</th>
<th>Bit width</th>
<th>Slot mode</th>
<th>Slot mask</th>
<th>Data 0</th>
<th>Data 1</th>
<th>Data 2</th>
<th>Data 3</th>
<th>Data 4</th>
<th>Data 5</th>
<th>Data 6</th>
<th>Data 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 bit</td>
<td>16 bit</td>
<td>mono</td>
<td>left</td>
<td>0x0001</td>
<td>0x0000</td>
<td>0x0005</td>
<td>0x0003</td>
<td>0x0009</td>
<td>0x0007</td>
<td>0x000d</td>
<td>0x000b</td>
</tr>
<tr>
<td></td>
<td></td>
<td>right</td>
<td>0x0002</td>
<td>0x0000</td>
<td>0x0006</td>
<td>0x0004</td>
<td>0x000a</td>
<td>0x0008</td>
<td>0x000c</td>
<td>0x000e</td>
<td>0x000c</td>
</tr>
<tr>
<td></td>
<td></td>
<td>stereo</td>
<td>any</td>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
</tr>
</tbody>
</table>

备注：The receive case is a little bit complicated on ESP32. Firstly, when the data width are 8-bit or 24-bit, the received data will still align with two bytes or four bytes, which means the valid data are put in the high 8 bits in every two bytes and high 24 bits in every four bytes. For example, the received data will be 0x5A00 when the data on the line is 0x5A in 8-bit width, and receive 0x0000 5A00 if the data 0x00 005A on the line. Secondly, for 8-bit and 16-bit mono case, the data in buffer are swapped every two data, they may need to be swapped back manually to get the correct order.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;
/* Get the default channel configuration by helper macro. */
/* This helper macro is defined in 'i2s_common.h' and shared by all the i2s communication mode. */
/* It can help to specify the I2S role, and port id */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate a new rx channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros */
/* These two helper macros is defined in 'i2s_std.h' which can only be used in STD mode. */
```

(下頁続き)
* They can help to specify the slot and clock configurations for initialization.*

```c
i2s_std_config_t std_cfg = {
  .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
  .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
  .gpio_cfg = {
    .mclk = I2S_GPIO_UNUSED,
    .bclk = GPIO_NUM_4,
    .ws = GPIO_NUM_5,
    .dout = I2S_GPIO_UNUSED,
    .din = GPIO_NUM_19,
    .invert_flags = {
      .mclk_inv = false,
      .bclk_inv = false,
      .ws_inv = false,
    },
  },
};
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);
/* Before read data, start the rx channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);
/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel resources */
i2s_del_channel(rx_handle);
```

**PDM TX usage**

For PDM mode in tx channel, the slot configuration helper macro is:

- `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

Please refer to [PDM Mode](#) for PDM TX API information. And for more details, please refer to `driver/include/driver/i2s_pdm.h`.

The PDM data width is fixed to 16-bit, when the data in a `int16_t` writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
<table>

#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Allocate an I2S rx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);
/* Init the channel into PDM RX mode */
i2s_pdm_rx_config_t pdm_rx_cfg = {
    .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);

Full-duplex  Full-duplex mode will register tx and rx channel in an I2S port at the same time, and they will share the BCLK and WS signal. Currently STD and TDM communication mode are able to adopt full-duplex mode in following way, but PDM full-duplex is not supported because PDM TX and RX clock are not same.

Note that one handle can only stand for one channel, the slot and clock configurations for both tx and rx channel should be set one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2sChan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate for tx and rx channel at the same time, then they will work in full-duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since tx and rx channel have to be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_init_channel(tx_handle, &std_cfg);
```
Chapter 2. API

Simplex Mode To allocate a channel handle in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and gpio pins of TX/RX channel on ESP32 are not separate, therefore TX and RX channel can’t coexist on a same I2S port in simplex mode.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
i2s_new_channel(chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* rx channel will be registered on another I2S, if no other available I2S unit... */
i2s_new_channel(chan_cfg, NULL, &rx_handle);
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
Application Notes

How to Prevent Data Lost  For the applications that need a high frequency sample rate, sometimes the massive throughput of receiving data may cause data lost. Users can receive data lost event by registering isr callback function to receive event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t *handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle rx queue overflow event ...
    return false;
}
```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happened, the interval should be the bigger the better, it can help to reduce the interrupt times, i.e., dma_frame_num should be as big as possible while the DMA buffer size won’t exceed its maximum value 4092. The relationships are:

   \[
   \text{interrupt interval (unit: sec)} = \frac{\text{dma_frame_num}}{\text{sample rate}}
   \]

   \[
   \text{dma_buffer_size} = \frac{\text{dma_frame_num} \times \text{slot_num} \times \text{data_bit_width}}{8} < 4092
   \]

2. Determine the dma_desc_num. The dma_desc_num is decided by the max time of `i2s_channel_read` polling cycle, all the received data are supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting gpio signal. The relationship is:

   \[
   \text{dma_desc_num} > \frac{\text{polling_cycle}}{\text{interrupt interval}}
   \]

3. Determine the receiving buffer size. The receiving buffer that offered by user in `i2s_channel_read` should be able to take all the data in all dma buffers, that means it should be bigger than the total size of all the dma buffers:

   \[
   \text{recv_buffer_size} > \text{dma_desc_num} \times \text{dma_buffer_size}
   \]

For example, if there is an I2S application, and the known values are:

- `sample_rate = 144000 Hz`
- `data_bit_width = 32 bits`
- `slot_num = 2`
- `polling_cycle = 10ms`

Then the parameters `dma_frame_num`, `dma_desc_num` and `recv_buf_size` can be calculated according to the given known values:

\[
\text{dma_frame_num} \times \text{slot_num} \times \text{data_bit_width} / 8 = \text{dma_buffer_size} < 4092
\]

\[
\text{dma_frame_num} < 511
\]
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)...
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

API Reference

Standard Mode

Header File

- components/driver/include/driver/i2s_std.h

Functions

esp_err_t i2s_channel_init_std_mode(i2s_chan_handle_t handle, const i2s_std_config_t *std_cfg)

Initialize i2s channel to standard mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- handle [in] I2S channel handler
- std_cfg [in] Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro
  I2S_STD_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro
  I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG or
  I2S_STD_MSB_SLOT_DEFAULT_CONFIG

返回

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t i2s_channel_reconfig_std_clock(i2s_chan_handle_t handle, const i2s_std_clk_config_t *clk_cfg)

Reconfigure the I2S clock for standard mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

备注: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

参数

- handle [in] I2S channel handler
- clk_cfg [in] Standard mode clock configuration, can be generated by
  I2S_STD_CLK_DEFAULT_CONFIG
Chapter 2. API

**ESP_OK** Set clock successfully  
**ESP_ERR_INVALID_ARG** NULL pointer, invalid configuration or not standard mode  
**ESP_ERR_INVALID_STATE** This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_slot (i2s_chan_handle_t handle, const i2s_std_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for standard mode.

**备注**: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**备注**: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

---

**参数**

- **handle**  [in] I2S channel handler
- **slot_cfg**  [in] Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

**返回**

- **ESP_OK** Set clock successfully
- **ESP_ERR_NO_MEM** No memory for DMA buffer
- **ESP_ERR_INVALID_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP_ERR_INVALID_STATE** This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_gpio (i2s_chan_handle_t handle, const i2s_std_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for standard mode.

**备注**: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**备注**: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

---

**参数**

- **handle**  [in] I2S channel handler
- **gpio_cfg**  [in] Standard mode gpio configuration, specified by user

**返回**

- **ESP_OK** Set clock successfully
- **ESP_ERR_NO_MEM** No memory for DMA buffer
- **ESP_ERR_INVALID_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP_ERR_INVALID_STATE** This channel is not initialized or not stopped

**Structures**

```c
struct i2s_std_slot_config_t
```

I2S slot configuration for standard mode.

**Public Members**

```c
i2s_data_bit_width_t data_bit_width
```
I2S sample data bit width (valid data bits per sample)

```c
i2s_slot_bit_width_t slot_bit_width
```
I2S slot bit width (total bits per slot)

```c
i2s_slot_mode_t slot_mode
```
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

```c
i2s_std_slot_mask_t slot_mask
```
Select the left, right or both slot

```c
uint32_t ws_width
```
WS signal width (i.e. the number of belk ticks that ws signal is high)

```c
bool ws_pol
```
WS signal polarity, set true to enable high lever first

```c
bool bit_shift
```
Set to enable bit shift in Philips mode

```c
bool msb_right
```
Set to place right channel data at the MSB in the FIFO

```c
struct i2s_std_clk_config_t
```
I2S clock configuration for standard mode.

**Public Members**

```c
uint32_t sample_rate_hz
```
I2S sample rate

```c
i2s_clock_src_t clk_src
```
Choose clock source

```c
i2s_mclk_multiple_t mclk_multiple
```
The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of ‘3’ (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

```c
struct i2s_std_gpio_config_t
```
I2S standard mode GPIO pins configuration.
Chapter 2. API

Public Members

gpio_num_t mclk
   MCK pin, output

gpio_num_t bclk
   BCK pin, input in slave role, output in master role

gpio_num_t ws
   WS pin, input in slave role, output in master role

gpio_num_t dout
   DATA pin, output

gpio_num_t din
   DATA pin, input

uint32_t mclk_inv
   Set 1 to invert the mclk output

uint32_t bclk_inv
   Set 1 to invert the bclk input/output

uint32_t ws_inv
   Set 1 to invert the ws input/output

struct i2s_std_gpio_config_t::{anonymous} invert_flags
   GPIO pin invert flags

struct i2s_std_config_t
   I2S standard mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_std_clk_config_t clk_cfg
   Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG

i2s_std_slot_config_t slot_cfg
   Standard mode slot configuration, can be generated by macros I2S_STD_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

i2s_std_gpio_config_t gpio_cfg
   Standard mode gpio configuration, specified by user

Macros

I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
   Philips format in 2 slots.
   This file is specified for I2S standard communication mode Features:
• Philips/MSB/PCM are supported in standard mode
• Fixed to 2 slots

参数
• \texttt{bits\_per\_sample} - i2s data bit width
• \texttt{mono\_or\_stereo} - I2S SLOT_MODE_MONO or I2S SLOT_MODE_STEREO

\texttt{I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG}(\texttt{bits\_per\_sample, mono\_or\_stereo})

PCM(short) format in 2 slots.

备注: PCM(long) is same as philips in 2 slots

参数
• \texttt{bits\_per\_sample} - i2s data bit width
• \texttt{mono\_or\_stereo} - I2S SLOT_MODE_MONO or I2S SLOT_MODE_STEREO

\texttt{I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG}(\texttt{bits\_per\_sample, mono\_or\_stereo})

MSB format in 2 slots.

参数
• \texttt{bits\_per\_sample} - i2s data bit width
• \texttt{mono\_or\_stereo} - I2S SLOT_MODE_MONO or I2S SLOT_MODE_STEREO

\texttt{I2S\_STD\_CLK\_DEFAULT\_CONFIG}(\texttt{rate})

i2s default standard clock configuration

备注: Please set the mclk\_multiple to I2S\_MCLK\_MULTIPLE\_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

参数
• \texttt{rate} - sample rate

PDM Mode

Header File
• \texttt{components/driver/include/driver/i2s\_pdm.h}

Functions
\texttt{esp\_err\_t i2s\_channel\_init\_pdm\_rx\_mode}(i2s\_chan\_handle\_t handle, const i2s\_pdm\_rx\_config\_t *pdm\_rx\_cfg)

Initialize i2s channel to PDM RX mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数
• \texttt{handle} - [in] I2S rx channel handler
• \texttt{pdm\_rx\_cfg} - [in] Configurations for PDM RX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro \texttt{I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG} The slot configuration can be generated by the helper macro \texttt{I2S\_PDM\_RX\_SLOT\_DEFAULT\_CONFIG}

**esp_err_t i2s_channel_reconfig_pdm_rx_clock**

```c
i2s_channel_reconfig_pdm_rx_clock(i2s_chan_handle_t handle, const i2s_pdm_rx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM RX mode.

**备注:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function will not change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

**参数**
- **handle** [in] I2S rx channel handler
- **clk_cfg** [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

**返回**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

**esp_err_t i2s_channel_reconfig_pdm_rx_slot**

```c
i2s_channel_reconfig_pdm_rx_slot(i2s_chan_handle_t handle, const i2s_pdm_rx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM RX mode.

**备注:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function will not change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

**参数**
- **handle** [in] I2S rx channel handler
- **slot_cfg** [in] PDM RX mode slot configuration, can be generated by `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

**返回**
- ESP_OK Set slot successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

**esp_err_t i2s_channel_reconfig_pdm_rx_gpio**

```c
i2s_channel_reconfig_pdm_rx_gpio(i2s_chan_handle_t handle, const i2s_pdm_rx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM RX mode.
Chapter 2. API

![Image of a document page]

**Chapter 2. API**

**备注:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function will not change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**备注:** The input channel handle has to be initialized to PDM RX mode, i.e., ‘i2s_channel_init_pdm_rx_mode’ has been called before reconfiguring.

**参数**
- `handle` - [in] I2S rx channel handler
- `gpio_cfg` - [in] PDM RX mode gpio configuration, specified by user

**返回**
- ESP_OK: Set clock successfully
- ESP_ERR_INVALID_ARG: NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE: This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_init_pdm_rx_mode(i2s_chan_handle_t handle, const i2s_pdm_rx_config_t *pdm_rx_cfg)
```

Initialize i2s channel to PDM RX mode.

**备注:** Only allowed to be called when the channel state is REGISTRED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**参数**
- `handle` - [in] I2S tx channel handler
- `pdm_tx_cfg` - [in] Configurations for PDM TX mode, including clock, slot and gpio. The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`.

**返回**
- ESP_OK: Initialize successfully
- ESP_ERR_NO_MEM: No memory for storing the channel information
- ESP_ERR_INVALID_ARG: NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE: This channel is not registered

```c
esp_err_t i2s_channel_reconfig_pdm_tx_clock(i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM TX mode.

**备注:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function will not change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**备注:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring.

**参数**
- `handle` - [in] I2S tx channel handler
- `clk_cfg` - [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`.
Chapter 2. API

### i2s_channel_reconfig_pdm_tx_slot

```c
esp_err_t i2s_channel_reconfig_pdm_tx_slot(i2s_chan_handle_t handle, const i2s_pdm_tx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM TX mode.

**备注:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

**参数**

- `handle` - [in] I2S tx channel handler
- `slot_cfg` - [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**返回**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

### i2s_channel_reconfig_pdm_tx_gpio

```c
esp_err_t i2s_channel_reconfig_pdm_tx_gpio(i2s_chan_handle_t handle, const i2s_pdm_tx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM TX mode.

**备注:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

**参数**

- `handle` - [in] I2S tx channel handler
- `gpio_cfg` - [in] PDM TX mode gpio configuration, specified by user

**返回**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

### Structures

```c
struct i2s_pdm_rx_slot_config_t
```

I2S slot configuration for pdm rx mode.
Public Members

\texttt{i2s\_data\_bit\_width\_t data\_bit\_width}
I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

\texttt{i2s\_slot\_bit\_width\_t slot\_bit\_width}
I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

\texttt{i2s\_slot\_mode\_t slot\_mode}
Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

\texttt{i2s\_pdm\_slot\_mask\_t slot\_mask}
Choose the slots to activate

\texttt{struct i2s\_pdm\_rx\_clk\_config\_t}
I2S clock configuration for pdm rx mode.

Public Members

\texttt{uint32\_t sample\_rate\_hz}
I2S sample rate

\texttt{i2s\_clock\_src\_t clk\_src}
Choose clock source

\texttt{i2s\_mclk\_multiple\_t mclk\_multiple}
The multiple of mclk to the sample rate

\texttt{i2s\_pdm\_dsr\_t dn\_sample\_mode}
Down-sampling rate mode

\texttt{struct i2s\_pdm\_rx\_gpio\_config\_t}
I2S PDM tx mode GPIO pins configuration.

Public Members

\texttt{gpio\_num\_t clk}
PDM clk pin, output

\texttt{gpio\_num\_t din}
DATA pin 0, input

\texttt{gpio\_num\_t dins[n(U)]}
DATA pins, input, only take effect when corresponding I2S\_PDM\_RX\_LINE\_SLOT\_xxx is enabled in i2s\_pdm\_rx\_slot\_config\_t::slot\_mask

\texttt{uint32\_t clk\_inv}
Set 1 to invert the clk output
struct `i2s_pdm_rx_gpio_config_t`::[anonymous] `invert_flags`
  GPIO pin invert flags

struct `i2s_pdm_rx_config_t`
  I2S PDM RX mode major configuration that including clock/slot/gpio configuration.

**Public Members**

`i2s_pdm_rx_clk_config_t` `clk_cfg`
  PDM RX clock configurations, can be generated by macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

`i2s_pdm_rx_slot_config_t` `slot_cfg`
  PDM RX slot configurations, can be generated by macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

`i2s_pdm_rx_gpio_config_t` `gpio_cfg`
  PDM RX slot configurations, specified by user

struct `i2s_pdm_tx_slot_config_t`
  I2S slot configuration for pdm tx mode.

**Public Members**

`i2s_data_bit_width_t` `data_bit_width`
  I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

`i2s_slot_bit_width_t` `slot_bit_width`
  I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

`i2s_slot_mode_t` `slot_mode`
  Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

`i2s_pdm_slot_mask_t` `slot_mask`
  Slot mask to choose left or right slot

`uint32_t` `sd_prescale`
  Sigma-delta filter prescale

`i2s_pdm_sig_scale_t` `sd_scale`
  Sigma-delta filter scaling value

`i2s_pdm_sig_scale_t` `hp_scale`
  High pass filter scaling value

`i2s_pdm_sig_scale_t` `lp_scale`
  Low pass filter scaling value
Chapter 2. API 参考

\textit{i2s_pdm_sig_scale_t} \textbf{sinc\_scale}
Sinc filter scaling value

\textbf{struct i2s_pdm_tx_clk_config_t}
I2S clock configuration for pdm tx mode.

\textbf{Public Members}

\textbf{uint32_t} \textit{sample\_rate\_hz}
I2S sample rate

\textbf{i2s_clock_src_t} \textit{clk\_src}
Choose clock source

\textbf{i2s_mclk_multiple_t} \textit{mclk\_multiple}
The multiple of mclk to the sample rate

\textbf{uint32_t} \textit{up\_sample\_fp}
Up-sampling param fp

\textbf{uint32_t} \textit{up\_sample\_fs}
Up-sampling param fs

\textbf{struct i2s_pdm_tx_gpio_config_t}
I2S PDM tx mode GPIO pins configuration.

\textbf{Public Members}

\textbf{gpio\_num\_t} \textit{clk}
PDM clk pin, output

\textbf{gpio\_num\_t} \textit{dout}
DATA pin, output

\textbf{uint32\_t} \textit{clk\_inv}
Set 1 to invert the clk output

\textbf{struct i2s_pdm_tx_gpio_config_t::[anonymous]} \textbf{invert\_flags}
GPIO pin invert flags

\textbf{struct i2s_pdm_tx_config_t}
I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

\textbf{Public Members}
Chapter 2. API 参考

**i2s_pdm_tx_clk_config_t clk_cfg**

PDM TX clock configurations, can be generated by macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

**i2s_pdm_tx_slot_config_t slot_cfg**

PDM TX slot configurations, can be generated by macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**i2s_pdm_tx_gpio_config_t gpio_cfg**

PDM TX gpio configurations, specified by user

### Macros

**I2S_PDM_RX_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo)

PDM format in 2 slots (RX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM tx/rx mode
- Fixed to 2 slots
- Data bit width only support 16 bits

参数

- **bits_per_sample** - i2s data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

**I2S_PDM_RX_CLK_DEFAULT_CONFIG** (rate)

i2s default pdm rx clock configuration

参数

- **rate** - sample rate

**I2S_PDM_TX_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo)

PDM style in 2 slots (TX)

参数

- **bits_per_sample** - i2s data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

**I2S_PDM_TX_CLK_DEFAULT_CONFIG** (rate)

i2s default pdm tx clock configuration

### 备注: TX PDM can only be set to the following two up-sampling rate configurations:

1. \( fp = 960, fs = \text{sample\_rate}\_hz\_/100, \) in this case, \( Fpdm = 128*48000 \)
2. \( fp = 960, fs = 480, \) in this case, \( Fpdm = 128*Fpcm = 128*\text{sample\_rate}\_hz \)

If the pdm receiver do not care the pdm serial clock, it’s recommended set \( Fpdm = 128*48000 \). Otherwise, the second configuration should be adopted.

参数

- **rate** - sample rate

### I2S Driver

**Header File**

- components/driver/include/driver/i2s_common.h
Chapter 2. API 参考

Functions

```c
esp_err_t i2s_new_channel(const i2s_chan_config_t *chan_cfg, i2s_chan_handle_t *ret_tx_handle, i2s_chan_handle_t *ret_rx_handle)
```

Allocate new I2S channel(s)

**备注**: The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**备注**: When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

**备注**: If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can’t guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

**备注**: If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

### Parameters
- `chan_cfg` [in] I2S controller channel configurations
- `ret_tx_handle` [out] I2S channel handler used for managing the sending channel(optional)
- `ret_rx_handle` [out] I2S channel handler used for managing the receiving channel(optional)

### Return
- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in i2s_chan_config_t
- ESP_ERR_NOT_FOUND No available I2S channel found

```c
esp_err_t i2s_del_channel(i2s_chan_handle_t handle)
```

Delete the i2s channel.

**备注**: Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

**备注**: Resource will be free automatically if all channels in one port are deleted.

### Parameters
- `handle` [in] I2S channel handler
  - ESP_OK Delete successfully
  - ESP_ERR_INVALID_ARG NULL pointer

```c
esp_err_t i2s_channel_get_info(i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
```

Get I2S channel information.
### Chapter 2. API 参考

#### 参数
- handle - [in] I2S channel handler
- chan_info - [out] I2S channel basic information

#### 返回
- ESP_OK Get i2s channel information success
- ESP_ERR_NOT_FOUND The input handle doesn’t match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

**esp_err_t i2s_channel_enable (i2s_chan_handle_t handle)**

Enable the i2s channel.

**备注**: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

**备注**: Enable the channel can start the I2S communication on hardware. It will start outputting blck and ws signal. For mclk signal, it will start to output when initialization is finished

#### 参数
- handle - [in] I2S channel handler
- ESP_OK Start successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not initialized or already started

**esp_err_t i2s_channel_disable (i2s_chan_handle_t handle)**

Disable the i2s channel.

**备注**: Only allowed to be called when the channel state is READY / RUNNING, (i.e., channel has been initialized) the channel will enter READY state once it is disabled successfully.

**备注**: Disable the channel can stop the I2S communication on hardware. It will stop blck and ws signal but not mclk signal

#### 参数
- handle - [in] I2S channel handler
- ESP_OK Stop successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not stated

**esp_err_t i2s_channel_write (i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)**

I2S write data.

**备注**: Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

#### 参数
- handle - [in] I2S channel handler
- src - [in] The pointer of sent data buffer
- size - [in] Max data buffer length
Chapter 2. API Reference

- **bytes_written** - [out] Byte number that actually be sent
- **timeout_ms** - [in] Max block time

**Returned**:
- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not tx handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

```c
esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)
```

I2S read data.

**备注**: Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

**Parameters**:
- **handle** - [in] I2S channel handler
- **dest** - [in] The pointer of receiving data buffer
- **size** - [in] Max data buffer length
- **bytes_read** - [out] Byte number that actually be read
- **timeout_ms** - [in] Max block time

**Returned**:
- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not rx handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

```c
esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)
```

Set event callbacks for I2S channel.

**备注**: Only allowed to be called when the channel state is REGISTARED / READY, (i.e., before channel starts)

**备注**: User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.

**备注**: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM or internal RAM as well.

**Parameters**:
- **handle** - [in] I2S channel handler
- **callbacks** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

**Returned**:
- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
ESP_ERR_INVALID_STATE – Set event callbacks failed because the current channel state is not REGISTERED or READY

**Structures**

```c
define i2s_event_callbacks_t
    Group of I2S callbacks.
```

备注: The callbacks are all running under ISR environment

备注: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
typedef i2s_isr_callback_t on_recv
    Callback of data received event, only for rx channel The event data includes DMA buffer address and size that just finished receiving data
```

```c
typedef i2s_isr_callback_t on_recv_q_ovf
    Callback of receiving queue overflowed event, only for rx channel The event data includes buffer size that has been overwritten
```

```c
typedef i2s_isr_callback_t on_sent
    Callback of data sent event, only for tx channel The event data includes DMA buffer address and size that just finished sending data
```

```c
typedef i2s_isr_callback_t on_send_q_ovf
    Callback of sending queue overflowed event, only for tx channel The event data includes buffer size that has been overwritten
```

```c
struct i2s_chan_config_t
    I2S controller channel configuration.
```

**Public Members**

```c
typedef i2s_port_t id
    I2S port id
```

```c
typedef i2s_role_t role
    I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE
```

```c
uint32_t dma_desc_num
    I2S DMA buffer number, it is also the number of DMA descriptor
```

```c
uint32_t dma_frame_num
    I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of ‘3’ when the data bit width is 24.
```
bool auto_clear

Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct i2s_chan_info_t
I2S channel information.

Public Members

i2s_port_t id
I2S port id

i2s_role_t role
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

i2s_dir_t dir
I2S channel direction

i2s_comm_mode_t mode
I2S channel communication mode

i2s_chan_handle_t pair_chan
I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros

I2S_CHANNEL_DEFAULT_CONFIG (i2s_num, i2s_role)
get default I2S property

I2S_GPIO_UNUSED
Used in i2s_gpio_config_t for signals which are not used

I2S Types

Header File

* components/driver/include/driver/i2s_types.h

Structures

struct i2s_event_data_t
Event structure used in I2S event queue.

Public Members

void *data
The pointer of DMA buffer that just finished sending or receiving for on_recv and on_sent callback
NULL for on_recv_q_ovf and on_send_q_ovf callback
size_t size

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when data_bit_width is not changed.

Type Definitions

typedef struct i2s_channel_obj_t *i2s_chan_handle_t
i2s channel object handle, the control unit of the i2s driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum i2s_port_t
I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator I2S_NUM_0
I2S controller port 0

enumerator I2S_NUM_1
I2S controller port 1

enumerator I2S_NUM_AUTO
Select whichever port is available

enum i2s_comm_mode_t
I2S controller communication mode.

Values:

enumerator I2S_COMM_MODE_STD
I2S controller using standard communication mode, support philips/MSB/PCM format

enumerator I2S_COMM_MODE_PDM
I2S controller using PDM communication mode, support PDM output or input

enumerator I2S_COMM_MODE_NONE
Unspecified I2S controller mode

enum i2s_mclk_multiple_t
The multiple of mclk to sample rate.

Values:
enumerator **I2S_MCLK_MULTIPLE_128**
\[
mclk = \text{sample} \cdot \text{rate} \times 128
\]

enumerator **I2S_MCLK_MULTIPLE_256**
\[
mclk = \text{sample} \cdot \text{rate} \times 256
\]

enumerator **I2S_MCLK_MULTIPLE_384**
\[
mclk = \text{sample} \cdot \text{rate} \times 384
\]

enumerator **I2S_MCLK_MULTIPLE_512**
\[
mclk = \text{sample} \cdot \text{rate} \times 512
\]

**Header File**

- components/hal/include/hal/i2s_types.h

**Type Definitions**

typedef `soc_periph_i2s_clk_src_t` **i2s_clock_src_t**

I2S clock source

**Enumerations**

enum **i2s_slot_mode_t**

I2S channel slot mode.

*Values:*

enumerator **I2S_SLOT_MODE_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**

I2S channel direction.

*Values:*

enumerator **I2S_DIR_RX**

I2S channel direction RX

enumerator **I2S_DIR_TX**

I2S channel direction TX

enum **i2s_role_t**

I2S controller role.

*Values:*
enumerator **I2S_ROLE_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S_ROLE_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

**enum i2s_data_bit_width_t**

Available data bit width in one slot.

*Values:*

enumerator **I2S_DATA_BIT_WIDTH_8BIT**

I2S channel data bit-width: 8

enumerator **I2S_DATA_BIT_WIDTH_16BIT**

I2S channel data bit-width: 16

enumerator **I2S_DATA_BIT_WIDTH_24BIT**

I2S channel data bit-width: 24

enumerator **I2S_DATA_BIT_WIDTH_32BIT**

I2S channel data bit-width: 32

**enum i2s_slot_bit_width_t**

Total slot bit width in one slot.

*Values:*

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S_SLOT_BIT_WIDTH_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S_SLOT_BIT_WIDTH_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S_SLOT_BIT_WIDTH_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S_SLOT_BIT_WIDTH_32BIT**

I2S channel slot bit-width: 32

**enum i2s_pdm_dsr_t**

I2S PDM RX down-sampling mode.

*Values:*

enumerator **I2S_PDM_DSR_8S**

downsampling number is 8 for PDM RX mode
enumerator I2S_PDM_DSR_16S
downsampling number is 16 for PDM RX mode

enumerator I2S_PDM_DSR_MAX

enum i2s_pdm_sig_scale_t
pdm tx signal scaling mode
Values:

enumerator I2S_PDM_SIG_SCALING_DIV_2
I2S TX PDM signal scaling: /2

enumerator I2S_PDM_SIG_SCALING_MUL_1
I2S TX PDM signal scaling: x1

enumerator I2S_PDM_SIG_SCALING_MUL_2
I2S TX PDM signal scaling: x2

enumerator I2S_PDM_SIG_SCALING_MUL_4
I2S TX PDM signal scaling: x4

enum i2s_std_slot_mask_t
I2S slot select in standard mode.
Values:

enumerator I2S_STD SLOT_LEFT
I2S transmits or receives left slot

enumerator I2S_STD SLOT_RIGHT
I2S transmits or receives right slot

enumerator I2S_STD SLOT BOTH
I2S transmits or receives both left and right slot

enum i2s_pdm_slot_mask_t
I2S slot select in PDM mode.
Values:

enumerator I2S_PDM SLOT RIGHT
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator I2S_PDM SLOT LEFT
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down
enumerator I2S_PDM_SLOT_BOTH

I2S PDM transmits or receives both two slots

2.6.10 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, 80 LCD (a.k.a Intel 8080 parallel LCD), RGB/RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- **RGB LCD panel** - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- **Controller based LCD panel** involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are similar for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Universal SPI LCD example with SPI touch - peripherals/lcd/spi_lcd_touch
- Jpeg decoding and LCD display - peripherals/lcd/tjgpd
- i80 controller based LCD and LVGL animation UI - peripherals/lcd/i80_controller
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

Other LCD drivers

Drivers for some LCD and touch controllers are available in IDF Component Registry. The list of available and planned drivers with links is in this table.

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Type Definitions

typedef soc_periph_lcd_clk_src_t lcd_clock_source_t

LCD clock source.
Enumerations

enum *lcd_color_rgb_endian_t*

  RGB color endian.

  *Values:*

  enumerator *LCD_RGB_ENDIAN_RGB*
  
  RGB data endian: RGB

  enumerator *LCD_RGB_ENDIAN_BGR*
  
  RGB data endian: BGR

enum *lcd_color_space_t*

  LCD color space.

  *Values:*

  enumerator *LCD_COLOR_SPACE_RGB*
  
  Color space: RGB

  enumerator *LCD_COLOR_SPACE_YUV*
  
  Color space: YUV

enum *lcd_color_range_t*

  LCD color range.

  *Values:*

  enumerator *LCD_COLOR_RANGE_LIMIT*
  
  Limited color range

  enumerator *LCD_COLOR_RANGE_FULL*
  
  Full color range

enum *lcd_yuv_sample_t*

  YUV sampling method.

  *Values:*

  enumerator *LCD_YUV_SAMPLE_422*
  
  YUV 4:2:2 sampling

  enumerator *LCD_YUV_SAMPLE_420*
  
  YUV 4:2:0 sampling

  enumerator *LCD_YUV_SAMPLE_411*
  
  YUV 4:1:1 sampling

enum *lcd_yuv_conv_std_t*

  The standard used for conversion between RGB and YUV.

  *Values:*

  enumerator *LCD_YUV_CONV_STD_1087*
  
  YUV 1087 conversion standard
Chapter 2. API

enumerator **LCD_YUV_CONV_STD_BT601**
YUV<->RGB conversion standard: BT.601

enumerator **LCD_YUV_CONV_STD_BT709**
YUV<->RGB conversion standard: BT.709

**Header File**

- components/esp_lcd/include/esp_lcd_types.h

**Type Definitions**

typedef struct esp_lcd_panel_io_t * **esp_lcd_panel_io_handle_t**
Type of LCD panel IO handle

typedef struct esp_lcd_panel_t * **esp_lcd_panel_handle_t**
Type of LCD panel handle

**Header File**

- components/esp_lcd/include/esp_lcd_panel_io.h

**Functions**

```c
esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)
```
Transmit LCD command and receive corresponding parameters.

**备注:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

```c
io – [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
```

```c
lcd_cmd – [in] The specific LCD command, set to -1 if no command needed
```

```c
param – [out] Buffer for the command data
```

```c
param_size – [in] Size of param buffer
```

**返回**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```
Transmit LCD command and corresponding parameters.

**备注:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).
### Chapter 2. API 参考

**参数**

- **io** – [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- **lcd_cmd** – [in] The specific LCD command (set to -1 if no command needed - only in SPI and I2C)
- **param** – [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** – [in] Size of param in memory, in bytes, set to zero if no parameter is needed for the command

**返回**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void* color, size_t color_size)
```

Transmit LCD RGB data.

**备注:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback on_color_trans_done().

### 参数

- **io** – [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- **lcd_cmd** – [in] The specific LCD command, set to -1 if no command needed
- **color** – [in] Buffer that holds the RGB color data
- **color_size** – [in] Size of color in memory, in bytes

**返回**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)
```

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**参数**

- **io** – [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

**返回**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_register_event_callbacks(esp_lcd_panel_io_handle_t io, const esp_lcd_panel_io_callbacks_t* cbs, void* user_ctx)
```

Register LCD panel IO callbacks.

**参数**

- **io** – [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- **cbs** – [in] structure with all LCD panel IO callbacks
- **user_ctx** – [in] User private data, passed directly to callback’s user_ctx

**返回**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_spi(esp_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t* io_config, esp_lcd_panel_io_handle_t* ret_io)
```

Create LCD panel IO handle, for SPI interface.
### Chapter 2. API 参考

**参数**
- `bus` - [in] SPI bus handle
- `io_config` - [in] IO configuration, for SPI interface
- `ret_io` - [out] Returned IO handle

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const
                                 esp_lcd_panel_io_i2c_config_t *io_config,
                                 esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

**参数**
- `bus` - [in] I2C bus handle
- `io_config` - [in] IO configuration, for I2C interface
- `ret_io` - [out] Returned IO handle

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config,
                              esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

**参数**
- `bus_config` - [in] Bus configuration
- `ret_bus` - [out] Returned bus handle

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

**参数**
- `bus` - [in] Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const
                                   esp_lcd_panel_io_i80_config_t *io_config,
                                   esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

**参数**
- `bus` - [in] Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
- `io_config` - [in] IO configuration, for i80 interface
- `ret_io` - [out] Returned panel IO handle

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
Chapter 2. API Reference

Structures

struct esp_lcd_panel_io_event_data_t
Type of LCD panel IO event data.

struct esp_lcd_panel_io_callbacks_t
Type of LCD panel IO callbacks.

Public Members

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished

struct esp_lcd_panel_io_spi_config_t
Panel IO configuration structure, for SPI interface.

Public Members

int cs_gpio_num
GPIO used for CS line

int dc_gpio_num
GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int spi_mode
Traditional SPI mode (0~3)

unsigned int pclk_hz
Frequency of pixel clock

size_t trans_queue_depth
Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter

unsigned int dc_low_on_data
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa
unsigned int `octal_mode`
transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int `sio_mode`
Read and write through a single data line (MOSI)

unsigned int `lsb_first`
transmit LSB bit first

unsigned int `cs_high_active`
CS line is high active

struct `esp_lcd_panel_io_spi_config_t`: [anonymous] `flags`
Extra flags to fine-tune the SPI device

struct `esp_lcd_panel_io_i2c_config_t`
Panel IO configuration structure, for I2C interface.

**Public Members**

```
uint32_t `dev_addr`
I2C device address
```

```
estp_lcd_panel_io_color_trans_doneCb_t `on_color_trans_done`
Callback invoked when color data transfer has finished
```

```
void *`user_ctx`
User private data, passed directly to on_color_trans_done’s user_ctx
```

```
size_t `control_phase_bytes`
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes
```

```
unsigned int `dc_bit_offset`
Offset of the D/C selection bit in control phase
```

```
int `lcd_cmd_bits`
Bit-width of LCD command
```

```
int `lcd_param_bits`
Bit-width of LCD parameter
```

```
unsigned int `dc_low_on_data`
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa
```

```
unsigned int `disable_control_phase`
If this flag is enabled, the control phase isn’t used
```
struct esp_lcd_panel_io_i2c_config_t::[anonymous] flags
    Extra flags to fine-tune the I2C device

struct esp_lcd_i80_bus_config_t
    LCD Intel 8080 bus configuration structure.

Public Members

int dc_gpio_num
    GPIO used for D/C line

int wr_gpio_num
    GPIO used for WR line

lcd_clock_source_t clk_src
    Clock source for the I80 LCD peripheral

int data_gpio_nums[24]
    GPIOs used for data lines

size_t bus_width
    Number of data lines, 8 or 16

size_t max_transfer_bytes
    Maximum transfer size, this determines the length of internal DMA link

size_t psram_trans_align
    DMA transfer alignment for data allocated from PSRAM

size_t sram_trans_align
    DMA transfer alignment for data allocated from SRAM

struct esp_lcd_panel_io_i80_config_t
    Panel IO configuration structure, for intel 8080 interface.

Public Members

int cs_gpio_num
    GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

uint32_t pclk_hz
    Frequency of pixel clock

size_t trans_queue_depth
    Transaction queue size, larger queue, higher throughput
### Chapter 2. API 参考

**esp_lcd_panel_io_color_trans_done cb_t on_color_trans_done**

Callback invoked when color data was transferred done

```c
void *user_ctx
```

User private data, passed directly to on_color_trans_done’s user_ctx

```c
int lcd_cmd_bits
```

Bit-width of LCD command

```c
int lcd_param_bits
```

Bit-width of LCD parameter

```c
unsigned int dc_idle_level
```

Level of DC line in IDLE phase

```c
unsigned int dc_cmd_level
```

Level of DC line in CMD phase

```c
unsigned int dc_dummy_level
```

Level of DC line in DUMMY phase

```c
unsigned int dc_data_level
```

Level of DC line in DATA phase

```c
struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
```

Each i80 device might have its own D/C control logic

```c
unsigned int cs_active_high
```

If set, a high level of CS line will select the device, otherwise, CS line is low level active

```c
unsigned int reverse_color_bits
```

Reverse the data bits, D[N:0] -> D[0:N]

```c
unsigned int swap_color_bytes
```

Swap adjacent two color bytes

```c
unsigned int pclk_active_neg
```

The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

```c
unsigned int pclk_idle_low
```

The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

```c
struct esp_lcd_panel_io_i80_config_t::[anonymous] flags
```

Panel IO config flags

### Type Definitions

```c
typedef void *esp_lcd_spi_bus_handle_t
```

Type of LCD SPI bus handle
typedef void *esp_lcd_i2c_bus_handle_t

Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t

Type of LCD intel 8080 bus handle

typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io, esp_lcd_panel_io_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

  Param panel_io [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
  Param edata [in] Panel IO event data, fed by driver
  Param user_ctx [in] User data, passed from esp_lcd_panel_io_xxx_config_t
  Return Whether a high priority task has been waken up by this function

Header File

• components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)

Reset LCD panel.

备注: Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().

参数 panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

返回
  • ESP_OK on success

esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)

Initialize LCD panel.

备注: Before calling this function, make sure the LCD panel has finished the reset stage by esp_lcd_panel_reset().

参数 panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

返回
  • ESP_OK on success

esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)

Deinitialize the LCD panel.

参数 panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

返回
  • ESP_OK on success

esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)

Draw bitmap on LCD panel.
### Chapter 2. API 参考

#### 参数

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_start** - [in] Start index on x-axis (x_start included)
- **y_start** - [in] Start index on y-axis (y_start included)
- **x_end** - [in] End index on x-axis (x_end not included)
- **y_end** - [in] End index on y-axis (y_end not included)
- **color_data** - [in] RGB color data that will be dumped to the specific window range

#### 返回

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_mirror(esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)
```

Mirror the LCD panel on specific axis.

**备注：** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation.

#### 参数

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** - [in] Whether the panel will be mirrored about the x axis
- **mirror_y** - [in] Whether the panel will be mirrored about the y axis

#### 返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_swap_xy(esp_lcd_panel_handle_t panel, bool swap_axes)
```

Swap/Exchange x and y axis.

**备注：** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation.

#### 参数

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** - [in] Whether to swap the x and y axis

#### 返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
```

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**备注：** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

#### 参数

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** - [in] Extra gap on x axis, in pixels
- **y_gap** - [in] Extra gap on y axis, in pixels

#### 返回

- ESP_OK on success
Esp_err_t esp_lcd_panel_invert_color(esp_lcd_panel_handle_t panel, bool invert_color_data)
Invert the color (bit-wise invert the color data line)

参数
• panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• invert_color_data –[in] Whether to invert the color data

返回
• ESP_OK on success

Esp_err_t esp_lcd_panel_disp_on_off(esp_lcd_panel_handle_t panel, bool on_off)
Turn on or off the display.

参数
• panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• on_off –[in] True to turn on display, False to turn off display

返回
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)
Turn off the display.

参数
• panel –[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• off –[in] Whether to turn off the screen

返回
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Header File
• components/esp_lcd/include/esp_lcd_panel_rgb.h

Header File
• components/esp_lcd/include/esp_lcd_panel_vendor.h

Functions
Esp_err_t esp_lcd_new_panel_st7789( const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel )
Create LCD panel for model ST7789.

参数
• io –[in] LCD panel IO handle
• panel_dev_config –[in] general panel device configuration
• ret_panel –[out] Returned LCD panel handle

返回
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Esp_err_t esp_lcd_new_panel_nt35510( const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel )
Create LCD panel for model NT35510.
### Chapter 2. API 参考

**参数**
- `io` [in] LCD panel IO handle
- `panel_dev_config` [in] general panel device configuration
- `ret_panel` [out] Returned LCD panel handle

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_ssd1306(esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

**参数**
- `io` [in] LCD panel IO handle
- `panel_dev_config` [in] general panel device configuration
- `ret_panel` [out] Returned LCD panel handle

**返回**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

** Structures**

```c
struct esp_lcd_panel_dev_config_t
```

Configuration structure for panel device.

**Public Members**

```c
int reset_gpio_num
```

GPIO used to reset the LCD panel, set to -1 if it’s not used

```c
lcd_color_rgb_endian_t color_space
```

Deprecated:
- Set RGB color space, please use rgb_endian instead

```c
lcd_color_rgb_endian_t rgb_endian
```

Set RGB data endian: RGB or BGR

```c
unsigned int bits_per_pixel

2.6.11 LED PWM 控制器

概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 16 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LEDC 通道共有两组，分别为 8 路高速通道和 8 路低速通道。高速通道模式在硬件中实现，可以自动且无干扰地改变 PWM 占空比。低速通道模式下，PWM 占空比需要由软件中的驱动器改变。每组通道都可以使用不同的时钟源。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

功能概览

设置 LEDC 通道在高速模式或低速模式下运行，需要进行如下配置：

1. 定时器配置 指定 PWM 信号的频率和占空比分辨率。
2. 通道配置 绑定定时器和输出 PWM 信号的 GPIO。
3. 改变 PWM 信号 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

另一个可选步骤是可以在渐变终端设置一个中断。

图 9: LED PWM 控制器 API 的关键配置

定时器配置 要设置定时器，可调用函数 ledc_timer_config()，并将包括如下配置参数的数据结构 ledc_timer_config_t 传递给该函数:

- 速度模式 ledc_mode_t
- 定时器索引 ledc_timer_t
- PWM 信号频率
- PWM 占空比分辨率
- 时钟源 ledc_clk_cfg_t
频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见频率和占空比分辨率支持范围一节。

时钟源同样可以限制 PWM 频率。选择的时钟源频率越高，可以配置的 PWM 频率上限就越高。

<table>
<thead>
<tr>
<th>时钟名称</th>
<th>时钟频率</th>
<th>速度模式</th>
<th>时钟功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB_CLK</td>
<td>80 MHz</td>
<td>高速 / 低速</td>
<td>/</td>
</tr>
<tr>
<td>REF_TICK</td>
<td>1 MHz</td>
<td>高速 / 低速</td>
<td>支持动态调频 (DFS) 功能</td>
</tr>
<tr>
<td>RTC8M_CLK</td>
<td>~8 MHz</td>
<td>低速</td>
<td>支持动态调频 (DFS) 功能，支持 Light-sleep 模式</td>
</tr>
</tbody>
</table>

备注：
1. 如果 ESP32 的定时器选用了 RTCxM_CLK 作为其时钟源，驱动会通过内部校准来得知这个时钟源的实频频率。这样确保了输出 PWM 信号频率的精确性。

通道配置 定时器设置好后，配置所需的通道（ledc_channel_t 之一）。配置通道需调用函数

ledc_channel_config()。

通过的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体

ledc_channel_config_t。

此时，通道会按照ledc_channel_config_t 的配置开始运作，并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中，可以随时通过调用函数 ledc_stop() 将其暂停。

改变 PWM 信号 通道开始运行，生成具有恒定占空比和频率的 PWM 信号之后，有几种方式可以改变该信号。驱动 LED 时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM 信号的频率也可更改，详见改变 PWM 频率 一节。

使用软件改变 PWM 占空比 调用函数

ledc_set_duty() 可以设置新的占空比。之后，调用函数

ledc_update_duty() 使新配置生效。要查看当前设置的占空比，可使用 _get_ 函数

ledc_get_duty()。

另外一种设置占空比和其他通道参数的方式是调用通道配置一节提到的函数

ledc_channel_config()。

传递给函数的占空比数值范围取决于选定的 duty_resolution，应为 0 至 (2 ** duty_resolution) - 1。例如，如选定的占空比分辨率为 10，则占空比的数值范围为 0 至 1023。此时分辨率为 ~0.1%。

使用硬件改变 PWM 占空比 LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数

ledc_fade_func_install() 使能渐变。之后用下列可用渐变函数之一配置：

• ledc_set_fade_with_time()
• ledc_set_fade_with_step()
• ledc_set_fade()

最后需调用 ledc_fade_start() 开启渐变。渐变可以在阻塞或非阻塞模式下运行，具体区别请查看

ledc_fade_mode_t，需要特别注意的是，不管在哪种模式下，一次渐变或单次占空比配置的指令生效都必须等到前一次渐变结束。由于 ESP32 的硬件限制，在渐变达到预先预期的占空比前想要中止本次渐变是不被支持的。

此外，在使能渐变后，每个通道都可以额外通过调用 ledc_cb_register() 注册一个回调函数用以获得渐变完成的事件通知。
如不需渐变和渐变中断，可用函数 `ledc_fade_func_uninstall()` 关闭。

**改变 PWM 频率**  LED PWM 控制器 API 有多种方式即时改变 PWM 频率：
- 通过调用函数 `ledc_set_freq()` 设置频率。可用函数 `ledc_get_freq()` 查看当前频率。
- 通过调用函数 `ledc_bind_channel_timer()` 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数 `ledc_channel_config()` 改变通道的定时器。

**控制 PWM 的更多方式** 有些较底层的定时器固定函数可用于更改 PWM 设置：
- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数 `ledc_channel_config()` 在后台运行，在定时器配置后启动。

**使用中断配置** LED PWM 控制器通道时，可在 `ledc_channel_config_t` 中选取参数 `ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数 `ledc_isr_register()`。

**LED PWM 控制器高速和低速模式**

高速模式的优点是平稳地改变定时器设置。也就是说，高速模式下如定时器设置改变，此变更会自动应用于定时器的下一次溢出中断。而更新低速定时器时，设置更应由软件显示触发。LED PWM 驱动的设置将在硬件层面被修改。比如在调用函数 `ledc_timer_config()` 或 `ledc_timer_set()` 时。

更多关于速度模式的详细信息请参阅 ESP32 技术参考手册 > LED PWM 控制器 (LEDC) [PDF]。

**频率和占空比分辨率支持范围**

LED PWM 控制器主要用于驱动 LED，该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比可为 0 至 100% 之间的任意值，分辨率约为 0.012% (2^13 = 8192 LED 频率的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器定时的时钟信号。LED PWM 控制器为通道提供时钟（具体可参考定时器配置和 ESP32 技术参考手册 > LED PWM 定时器 (LEDC) [PDF])。

LED PWM 控制器可用于生成频率较高的信号。足以作为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率可为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz、占空比分辨率设置为 3 位时，串行端口监视器上会报告如下错误：

```plaintext
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```plaintext
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用 `ledc_timer_bit_t` 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。
Chapter 2. API 参考

应用实例

使用 LEDC 改变占空比和渐变控制的实例请参照 peripherals/ledc/ledc_fade。
使用 LEDC 基本实例请参照 peripherals/ledc/ledc_basic。

Functions

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

参数 ledc_conf – Pointer of LEDC channel configure struct
返回
\[
\begin{align*}
&\text{ESP_OK Success} \\
&\text{ESP_ERR_INVALID_ARG Parameter error}
\end{align*}
\]

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

参数 timer_conf – Pointer of LEDC timer configure struct
返回
\[
\begin{align*}
&\text{ESP_OK Success} \\
&\text{ESP_ERR_INVALID_ARG Parameter error} \\
&\text{ESP_FAIL Cannot find a proper pre-dividernumberbase on the given frequency and the current duty_resolution.}
\end{align*}
\]

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

LEDC update channel parameters.

备注：Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.

备注：ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

参数
\[
\begin{align*}
&\text{speed_mode } \text{– Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.} \\
&\text{channel } \text{– LEDC channel } (0 - \text{ LEDC_CHANNEL_MAX-1}), \text{ select from ledc_channel_t}
\end{align*}
\]
返回
\[
\begin{align*}
&\text{ESP_OK Success} \\
&\text{ESP_ERR_INVALID_ARG Parameter error}
\end{align*}
\]

`esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)`

Set LEDC output gpio.
Chapter 2. API参

备注：This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

参数
- `gpio_num` - The LEDC output gpio
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `ledc_channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t ledc_stop (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)`
LEDC stop. Disable LEDC output, and set idle level.

参数
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `idle_level` - Set output idle level after LEDC stops.

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t ledc_set_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)`
LEDC set channel frequency (Hz)

参数
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num` - LEDC timer index (0-3), select from `ledc_timer_t`
- `freq_hz` - Set the LEDC frequency

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

`uint32_t ledc_get_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num)`
LEDC get channel frequency (Hz)

参数
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num` - LEDC timer index (0-3), select from `ledc_timer_t`

返回
- 0 error
- Others Current LEDC frequency

`esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`
LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

备注：`ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is
ledc_set_duty_and_update

**备注:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### 参数
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **hpoint** - Set the LEDC hpoint value(max: 0xfffff)

### 返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

### 参数
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

### 返回
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**备注:** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**备注:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### 参数
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]

### 返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.
### 章节2. API

#### 参数

- **speed_mode** - 选择 LEDC 频率组与指定频率模式。注意不是所有目标支持高速模式。
- **channel** - LEDC 通道 (0 - LEDC_CHANNEL_MAX-1)，从 ledc_channel_t 选择。

#### 返回

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**esp_err_t** `ledc_set_fade(speed_mode, channel, uint32_t duty, fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)`

设置 LEDC 梯度。在该函数调用 lede_update_duty 函数之后，该函数才能生效。

**备注：** 为 ESP32，硬件不支持任何梯度更改，当在坡度操作运行时，该坡度操作将不会影响梯度。

#### 参数

- **speed_mode** - 选择 LEDC 频率组与指定频率模式。注意不是所有目标支持高速模式。
- **channel** - LEDC 通道 (0 - LEDC_CHANNEL_MAX-1)，从 ledc_channel_t 选择。
- **duty** - 设置梯度开始的载荷，设置范围是 [0, (2**duty_resolution) - 1]
- **fade_direction** - 设置梯度的方向
- **step_num** - 设置梯度的数量
- **duty_cycle_num** - 设置每个 LEDC 时钟周期的梯度持续时间
- **duty_scale** - 设置梯度变化幅度

#### 返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** `ledc_isr_register(void (*fn)(void*), void* arg, int intr_alloc_flags, ledc_isr_handle_t *handle)`

注册 LEDC 中断处理器，处理器是一个中断服务函数。处理器将被附加到相同的 CPU 核上，此时这个函数正在运行。

**参数**

- **fn** - 中断处理器函数。
- **arg** - 用户提供的函数传递的参数。
- **intr_alloc_flags** - 用于分配中断的标志。一个或多个（ORed）ESP_INTR_FLAG_*值。更多信息，请参见 esp_intr_alloc.h。
- **handle** - 返回句柄的指针。如果非-NULL，句柄将返回给用户。

#### 返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error

**esp_err_t** `ledc_timer_set(speed_mode, timer_sel, uint32_t clock_divider, uint32_t duty_resolution, ledc_clk_src_t clk_src)`

配置 LEDC 设置。

**参数**

- **speed_mode** - 选择 LEDC 频率组与指定频率模式。注意不是所有目标支持高速模式。
- **timer_sel** - 时钟索引 (0-3)，有 4 个时钟在 LEDC 模块
- **clock_divider** - 时钟分频值，时钟被分割成所选的时钟源
• **duty_resolution** – Resolution of duty setting in number of bits. The range of duty values is \([0, (2^{\text{duty_resolution}})]\)
• **clk_src** – Select LEDC source clock.

返回
• (-1) Parameter error
• Other Current LEDC duty

`esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Reset LEDC timer.

参数
• **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

返回
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Pause LEDC timer counter.

参数
• **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

返回
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Resume LEDC timer.

参数
• **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

返回
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)`
Bind LEDC channel with the selected timer.

参数
• **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

返回
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_set_fade_with_step (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)`
Set LEDC fade function.

备注: Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.
Chapter 2. API

备注：ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

备注：For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** - Target duty of fading [0, (2**duty_resolution) - 1]
- **scale** - Controls the increase or decrease step scale.
- **cycle_num** - increase or decrease the duty every cycle_num cycles

返回
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

备注：Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

备注：ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

备注：For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** - Target duty of fading [0, (2**duty_resolution) - 1]
- **max_fade_time_ms** - The maximum time of the fading (ms).

返回
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.
参数 `intr_alloc_flags` — Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

返回
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

`void ledc_fade_func_uninstall (void)`
Uninstall LEDC fade function.

`esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)`
Start LEDC fading.

备注： Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

备注： Starting fade operation with this API is not thread-safe, use with care.

备注： For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数
- `speed_mode` — Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` — LEDC channel number
- `fade_mode` — Whether to block until fading done. See `ledc_types.h ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

返回
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

`esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`
A thread-safe API to set duty for LEDC channel and return when duty updated.

备注： For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数
- `speed_mode` — Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` — LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty` — Set the LEDC duty, the range of duty setting is `[0, (2**duty_resolution) - 1]`
- `hpoint` — Set the LEDC hpoint value(max: 0xfffff)

`esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)`
A thread-safe API to set and start LEDC fade function, with a limited time.
Chapter 2. API 参考

Call `ledc_fade_func_install()` once, before calling this function.

For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### 参数
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `max fade time ms` - The maximum time of the fading ( ms ).
- `fade_mode` - Choose blocking or non-blocking mode

### 返回
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

Call `ledc_fade_func_install()` once before calling this function.

For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### 参数
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `scale` - Controls the increase or decrease step scale.
- `cycle_num` - Increase or decrease the duty every cycle_num cycles
- `fade_mode` - Choose blocking or non-blocking mode

### 返回
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.
参数

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** - Group of LEDC callback functions
- **user_arg** - user registered data for the callback function

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Structures**

struct **ledc_channel_config_t**

Configuration parameters of LEDC channel for ledc_channel_config function.

**Public Members**

```c
int gpio_num
```

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

```c
ledc_mode_t speed_mode
```

LEDC speed speed_mode, high-speed mode or low-speed mode

```c
ledc_channel_t channel
```

LEDC channel (0 - 7)

```c
ledc_intr_type_t intr_type
```

configure interrupt, Fade interrupt enable or Fade interrupt disable

```c
ledc_timer_t timer_sel
```

Select the timer source of channel (0 - 3)

```c
uint32_t duty
```

LEDC channel duty, the range of duty setting is \([0, (2^{*}duty\_resolution)]\)

```c
int hpoint
```

LEDC channel hpoint value, the max value is 0xffffffff

```c
unsigned int output_invert
```

Enable (1) or disable (0) gpio output invert

```c
struct ledc_channel_config_t::[anonymous] flags
```

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC Timer timer for ledc_timer_config function.
Public Members

`ledc_mode_t speed_mode`
LEDC speed speed_mode, high-speed mode or low-speed mode

`ledc_timer_bit_t duty_resolution`
LEDC channel duty resolution

`ledc_timer_t timer_num`
The timer source of channel (0 - 3)

`uint32_t freq_hz`
LEDC timer frequency (Hz)

`ledc_clk_cfg_t clk_cfg`
Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RTC8M_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You cannot have one LEDC timer uses RTC8M_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct `ledc_cb_param_t`
LEDC callback parameter.

Public Members

`ledc_cb_event_t event`
Event name

`uint32_t speed_mode`
Speed mode of the LEDC channel group

`uint32_t channel`
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

`uint32_t duty`
LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]

struct `ledc_cbs_t`
Group of supported LEDC callbacks.

备注: The callbacks are all running under ISR environment

Public Members

`ledc_cb_t fade_cb`
LEDC fade_end callback function
Chapter 2. API

Macros

LEDC_APB_CLK_HZ
Frequency of one of the LEDC peripheral clock sources, APB_CLK.

备注: This macro should have no use in your application, we keep it here only for backward compatible

LEDC_REF_CLK_HZ
Frequency of one of the LEDC peripheral clock sources, REF_TICK.

备注: This macro should have no use in your application, we keep it here only for backward compatible

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef intr_handle_t ledc_isr_handle_t

typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
Type of LEDC event callback.

Param param LEDC callback parameter
Param user_arg User registered data
Return Whether a high priority task has been waken up by this function

Enumerations

enum ledc_cb_event_t
LEDC callback event type.

Values:

enumerator LEDC_FADE_END_EVT
LEDC fade end event

Header File

• components/hal/include/hal/ledc_types.h

Enumerations

enum ledc_mode_t

Values:

enumerator LEDC_HIGH_SPEED_MODE
LEDC high speed speed_mode

enumerator LEDC_LOW_SPEED_MODE
LEDC low speed speed_mode
enumerator **LEDC_SPEED_MODE_MAX**
   LEDC speed limit

enum **ledc_intr_type_t**

*Values:*

enumerator **LEDC_INTR_DISABLE**
   Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**
   Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

*Values:*

enumerator **LEDC_DUTY_DIR_DECREASE**
   LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**
   LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

*Values:*

enumerator **LEDC_SLOW_CLK_RTC8M**
   LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC_SLOW_CLK_APB**
   LEDC low speed timer clock source is 80MHz APB clock

enum **ledc_clk_cfg_t**

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, **ledc_clk_src_t**, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

*Values:*

enumerator **LEDC_AUTO_CLK**
   The driver will automatically select the source clock based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**
   LEDC timer select APB clock as source clock

enumerator **LEDC_USE_RTC8M_CLK**
   LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels
Chapter 2. API

**enumerator** `LEDC_USE_REF_TICK`
- LEDC timer select REF_TICK clock as source clock

**enum** `ledc_clk_src_t`
- **enumerator** `LEDC_REF_TICK`
  - LEDC timer clock divided from reference tick (1Mhz)
- **enumerator** `LEDC_APB_CLK`
  - LEDC timer clock divided from APB clock (80Mhz)
- **enumerator** `LEDC_SCLK`
  - Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

**enum** `ledc_timer_t`
- **enumerator** `LEDC_TIMER_0`
  - LEDC timer 0
- **enumerator** `LEDC_TIMER_1`
  - LEDC timer 1
- **enumerator** `LEDC_TIMER_2`
  - LEDC timer 2
- **enumerator** `LEDC_TIMER_3`
  - LEDC timer 3
- **enumerator** `LEDC_TIMER_MAX`

**enum** `ledc_channel_t`
- **enumerator** `LEDC_CHANNEL_0`
  - LEDC channel 0
- **enumerator** `LEDC_CHANNEL_1`
  - LEDC channel 1
- **enumerator** `LEDC_CHANNEL_2`
  - LEDC channel 2
- **enumerator** `LEDC_CHANNEL_3`
  - LEDC channel 3
enumerator LEDC_CHANNEL_4
   LEDC channel 4

enumerator LEDC_CHANNEL_5
   LEDC channel 5

enumerator LEDC_CHANNEL_6
   LEDC channel 6

enumerator LEDC_CHANNEL_7
   LEDC channel 7

enumerator LEDC_CHANNEL_MAX

enum ledc_timer_bit_t

   Values:

enumerator LEDC_TIMER_1_BIT
   LEDC PWM duty resolution of 1 bits

enumerator LEDC_TIMER_2_BIT
   LEDC PWM duty resolution of 2 bits

enumerator LEDC_TIMER_3_BIT
   LEDC PWM duty resolution of 3 bits

enumerator LEDC_TIMER_4_BIT
   LEDC PWM duty resolution of 4 bits

enumerator LEDC_TIMER_5_BIT
   LEDC PWM duty resolution of 5 bits

enumerator LEDC_TIMER_6_BIT
   LEDC PWM duty resolution of 6 bits

enumerator LEDC_TIMER_7_BIT
   LEDC PWM duty resolution of 7 bits

enumerator LEDC_TIMER_8_BIT
   LEDC PWM duty resolution of 8 bits

enumerator LEDC_TIMER_9_BIT
   LEDC PWM duty resolution of 9 bits

enumerator LEDC_TIMER_10_BIT
   LEDC PWM duty resolution of 10 bits

enumerator LEDC_TIMER_11_BIT
   LEDC PWM duty resolution of 11 bits
Chapter 2. API Reference

**enum** `LEDC_TIMER_12_BIT`  
LEDC PWM duty resolution of 12 bits

**enum** `LEDC_TIMER_13_BIT`  
LEDC PWM duty resolution of 13 bits

**enum** `LEDC_TIMER_14_BIT`  
LEDC PWM duty resolution of 14 bits

**enum** `LEDC_TIMER_15_BIT`  
LEDC PWM duty resolution of 15 bits

**enum** `LEDC_TIMER_16_BIT`  
LEDC PWM duty resolution of 16 bits

**enum** `LEDC_TIMER_17_BIT`  
LEDC PWM duty resolution of 17 bits

**enum** `LEDC_TIMER_18_BIT`  
LEDC PWM duty resolution of 18 bits

**enum** `LEDC_TIMER_19_BIT`  
LEDC PWM duty resolution of 19 bits

**enum** `LEDC_TIMER_20_BIT`  
LEDC PWM duty resolution of 20 bits

**enum** `LEDC_TIMER_BIT_MAX`  
LEDC PWM duty resolution of 20 bits

**enum** `ledc_fade_mode_t`  
*Values:*

**enum** `LEDC_FADE_NO_WAIT`  
LEDC fade function will return immediately

**enum** `LEDC_FADE_WAIT_DONE`  
LEDC fade function will block until fading to the target duty

**enum** `LEDC_FADE_MAX`  

### 2.6.12 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g. brushed/brushless DC motor, RC servo motor
- Switch mode based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog value like speed, distance
• **Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)**

The main submodules are listed in the following diagram:

![Diagram of MCPWM submodules](image)

**图 10: MCPWM Overview**

- **MCPWM Timer**: The time base of the final PWM signal, it also determines the event timing of other sub-modules.
- **MCPWM Operator**: The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead-time and carrier modulator.
- **MCPWM Comparator**: The compare module takes the time-base count value as input, and continuously compare to the threshold value that configured by user. When the time-base counter is equal to any of the threshold value, an compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator**: One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered from other submodules like MCPWM Timer, MCPWM Comparator.
- **MCPWM Fault**: The fault module is used to detect the fault condition from outside, mainly via GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state, to protect the system from damage.
- **MCPWM Sync**: The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from GPIO matrix or from MCPWM Timer event.
- **Dead Time**: This submodule is used to insert extra delay to the existing PWM edges that generated in the previous steps.
- **Carrier Modulation**: The carrier submodule allows a high-frequency carrier signal to modulate the PWM waveforms generated by the generator and dead time submodules. This capability is mandatory if you need pulse transformer-based gate drivers to control the power switching elements.
- **Brake**: MCPWM operator can set how to brake the generators when particular fault is detected. We can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depends on how critical the fault is.
- **MCPWM Capture**: This is a standalone submodule which can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels. Each channel is connected to the GPIO, a pulse on the GPIO will trigger the capture timer to store the time-base count value and then notify the user by interrupt. Using this feature, we can measure a pulse width precisely. What’s more, the capture timer can also be synchronized by the MCPWM Sync submodule.

**Functional Overview**

Description of the MCPWM functionality is divided into the following sections:

- **Resource Allocation and Initialization** - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
• **Timer Operations and Events** - describes control functions and event callbacks that supported by the MCPWM timer.

• **Comparator Operations and Events** - describes control functions and event callbacks that supported by the MCPWM comparator.

• **Generator Actions on Events** - describes how to set actions for MCPWM generators on particular events that generated by the MCPWM timer and comparators.

• **Classical PWM Waveforms and Generator Configurations** - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.

• **Dead Time** - describes how to set dead time for MCPWM generators.

• **Classical PWM Waveforms and Dead Time Configurations** - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.

• **Carrier Modulation** - describes how to set modulate a high frequency onto the final PWM waveforms.

• **Faults and Brake Actions** - describes how to set brake actions for MCPWM operators on particular fault event.

• **Generator Force Actions** - describes how to control the generator output level asynchronously in a forceful way.

• **Synchronization** - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.

• **Capture** - describes how to use the MCPWM capture module to measure the pulse width of a signal.

• **Power Management** - describes how different source clock will affect power consumption.

• **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.

• **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

• **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization** As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers** You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, timers located in different groups are totally independent.

- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.

- `mcpwm_timer_config_t::resolution_hz` set the expected resolution of the timer, the driver internally will set a proper divider based on the clock source and the resolution.

- `mcpwm_timer_config_t::count_mode` set the count mode of the timer.

- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).

- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.

- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free timers in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.\(^1\)

On the contrary, calling `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators** You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, operators located in different groups are totally independent.

\(^1\) Different ESP chip series might have different number of MCPWM resources (e.g. groups, timers, comparators, operators, generators and so on). Please refer to the [TRM] for details. The driver won’t forbid you from applying for more MCPWM resources, but it will return error when there’s no hardware resources available. Please always check the return value when doing Resource Allocation.
• `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
• `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
• `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
• `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
• `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to peak.
• `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` function will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free operators in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

**MCPWM Comparators** You can allocate a MCPWM comparator object by calling `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`(). The configuration structure is defined as:

• `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
• `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to peak.
• `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` function will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_comparator()` function will free the allocated comparator object.

**MCPWM Generators** You can allocate a MCPWM generator object by calling `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`(). The configuration structure is defined as:

• `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
• `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
• `mcpwm_generator_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_generator()` function will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software. To allocate a GPIO fault object, you can call `mcpwm_new_gpio_fault()` function, with configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:
Chapter 2. API

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, GPIO fault located in different groups are totally independent, i.e. GPIO fault in group 0 cannot be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

Software fault object can be used to trigger a fault by calling a function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the fault object, this function will return `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, but the returned fault handle is of the same type.

On the contrary, calling `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources** The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There’re three types of sync sources: A sync source reflected from the GPIO, a sync source generated by software and a sync source generated by MCPWM timer event.

To allocate a GPIO sync source, you can call `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, GPIO sync source located in different groups are totally independent, i.e. GPIO sync source in group 0 cannot be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edge.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.

To allocate a Timer event sync source, you can call `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e. the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, if a sync source has been allocated from the same timer before, this function will return `ESP_ERR_INVALID_STATE` error.
Last but not least, to allocate a software sync source, you can call \texttt{mcpwm_new_soft_sync_src()} function, with configuration structure \texttt{mcpwm_soft_sync_config_t} as the parameter. Currently this configuration structure is left for future purpose. \texttt{mcpwm_new_soft_sync_src()} will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the sync source object, this function will return \texttt{ESP\_ERR\_NO\_MEM} error. Please note, to make a software sync source take effect, don’t forget to call \texttt{mcpwm_soft_sync_activate()}.

On the contrary, calling \texttt{mcpwm_del_sync_src()} function will free the allocated sync source object, this function works for all types of sync sources.

**MCPWM Capture Timer and Channels** The MCPWM group has a dedicated timer which is used to capture the timestamp when specific event occurred. The capture timer is connected with several independent channels, each channel is assigned with a GPIO.

To allocate a capture timer, you can call \texttt{mcpwm_new_capture_timer()} function, with configuration structure \texttt{mcpwm_capture_timer_config_t} as the parameter. The configuration structure is defined as:

- \texttt{mcpwm_capture_timer_config_t::group_id} sets the MCPWM group ID. The ID should belong to \([0, SOC\_MCPWM\_GROUPS - 1]\) range.
- \texttt{mcpwm_capture_timer_config_t::clk_src} sets the clock source of the capture timer.

The \texttt{mcpwm_new_capture_timer()} will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture timer left in the MCPWM group, this function will return \texttt{ESP\_ERR\_NOT\_FOUND} error.

Next, to allocate a capture channel, you can call \texttt{mcpwm_new_capture_channel()} function, with a capture timer handle and configuration structure \texttt{mcpwm_capture_channel_config_t} as the parameter. The configuration structure is defined as:

- \texttt{mcpwm_capture_channel_config_t::gpio_num} sets the GPIO number used by the capture channel.
- \texttt{mcpwm_capture_channel_config_t::prescale} sets the prescaler of the input signal.
- \texttt{mcpwm_capture_channel_config_t::pos_edge} and \texttt{mcpwm_capture_channel_config_t::neg_edge} set whether to capture on the positive and/or negative edge of the input signal.
- \texttt{mcpwm_capture_channel_config_t::pull_up} and \texttt{mcpwm_capture_channel_config_t::pull_down} set whether to pull up and/or pull down the GPIO internally.
- \texttt{mcpwm_capture_channel_config_t::invert_cap_signal} sets whether to invert the capture signal.
- \texttt{mcpwm_capture_channel_config_t::io_loop_back} sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The \texttt{mcpwm_new_capture_channel()} will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture channel left in the capture timer, this function will return \texttt{ESP\_ERR\_NOT\_FOUND} error.

On the contrary, calling \texttt{mcpwm_del_capture_channel()} and \texttt{mcpwm_del_capture_timer()} function will free the allocated capture channel and timer object accordingly.

**Timer Operations and Events**

**Register Event Callbacks** The MCPWM timer can generate different events at runtime. If you have some function that should be called when particular event happens, you should hook your function to the interrupt service routine by calling \texttt{mcpwm_timer_register_event_callbacks()} function prototype is declared in \texttt{mcpwm_timer_event_cb_t}. All supported event callbacks are listed in the \texttt{mcpwm_timer_event_callbacks_t}:

- \texttt{mcpwm_timer_event_callbacks_t::on_full} sets callback function for timer when it counts to peak value.
- \texttt{mcpwm_timer_event_callbacks_t::on_empty} sets callback function for timer when it counts to zero.
Chapter 2. API

**mcpwm_timer_event_callbacks_t::on_stop** sets callback function for timer when it is stopped.

The callback functions above are called within the ISR context, so they should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with **ISR** suffix is called within the function).

The parameter **user_data** of **mcpwm_timer_register_event_callbacks()** function is used to save user’s own context, it will be passed to each callback function directly.

This function will lazy install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before before **mcpwm_timer_enable()**, otherwise the **ESP_ERR_INVALID_STATE** error will be returned. See also *Enable and Disable timer* for more information.

**Enable and Disable Timer** Before doing IO control to the timer, user needs to enable the timer first, by calling **mcpwm_timer_enable()**. Internally, this function will:

- switch the timer state from **init** to **enable**.
- enable the interrupt service if it has been lazy installed by **mcpwm_timer_register_event_callbacks()**.
- acquire a proper power management lock if a specific clock source (e.g. PLL_160M clock) is selected. See also *Power management* for more information.

On the contrary, calling **mcpwm_timer_disable()** will put the timer driver back to **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling **mcpwm_timer_start_stop()** with different **mcpwm_timer_start_stop_cmd_t** commands can start the timer immediately or stop the timer at a specific event. What’s more, you can even start the timer for only one round, that means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator** The allocated MCPWM Timer should be connected with a MCPWM operator by calling **mcpwm_operator_connect_timer()**, so that the operator can take that timer as its time base, and generate the required PWM waves. Make sure the MCPWM timer and operator are in the same group, otherwise, this function will return **ESP_ERR_INVALID_ARG** error.

**Comparator Operations and Events**

**Register Event Callbacks** The MCPWM comparator can inform the user when the timer counter equals to the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling **mcpwm_comparator_register_event_callbacks()**. The callback function prototype is declared in **mcpwm_compare_event_cb_t**. All supported event callbacks are listed in the **mcpwm_comparator_event_callbacks_t**:

- **mcpwm_comparator_event_callbacks_t::on_reach** sets callback function for comparator when the timer counter equals to the compare value.

  The callback function will provide event specific data of type **mcpwm_compare_event_data_t** to the user. The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with **ISR** suffix is called within the function).

  The parameter **user_data** of **mcpwm_comparator_register_event_callbacks()** function is used to save user’s own context, it will be passed to the callback function directly.

  This function will lazy install interrupt service for the MCPWM comparator, whereas the service can only be removed in **mcpwm_del_comparator**.

**Set Compare Value** You can set the compare value for the MCPWM comparator at runtime by calling **mcpwm_comparator_set_compare_value()**. There’re a few points to note:
Chapter 2. API

- New compare value might won’t take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_sync`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()` otherwise, it will return error code `ESP_ERR_INVALID_STATE`.
- The compare value shouldn’t exceed timer’s count peak, otherwise, the compare event will never get triggered.

**Generator Actions on Events**

**Set Generator Action on Timer Event** One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There’s a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

**Set Generator Action on Compare Event** One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See `MCPWM Comparators` for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There’s a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

**Classical PWM Waveforms and Generator Configurations** This section will demonstrate the classical PWM waveforms that can be generated by the pair of the generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The Symmetric or Asymmetric of the waveforms are determined by the count mode of the MCPWM timer.
- The active level of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer’s period and count mode.
- The duty cycle of the PWM waveform is determined by the generator’s various action combinations.

                    MCPWM_GEN_ACTION_LOW),
                    MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_DOWN, cmpb,
                    MCPWM_GEN_ACTION_HIGH),
                    MCPWM_GEN_COMPARE_EVENT_ACTION_END()));
}
```

**Dead Time**  In power electronics, the rectifier and inverter are commonly used. This requires the use of rectifier bridge and inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm can’t conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, but the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave that generated by setting `Generator Actions on Events`.

The dead-time driver works like a *decorator*, which is also reflected in the function parameters of `mcpwm_generator_set_dead_time()`, where it takes the primary generator handle (`in_generator`), and returns a generator (`out_generator`) after applying the dead-time. Please note, if the `out_generator` and `in_generator` are the same, it means we’re adding the time delay to the PWM waveform in a “in-place” fashion. In turn, if the `out_generator` and `in_generator` are different, it means we’re deriving a new PWM waveform from the existing `in_generator`.

Dead-time specific configuration is listed in the `mcpwm_dead_time_config_t` structure:

- `mcpwm_dead_time_config_t::posedge_delay_ticks` and `mcpwm_dead_time_config_t::negedge_delay_ticks` set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means to bypass the dead-time module. The resolution of the dead-time tick is the same to the timer that is connected with the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_dead_time_config_t::invert_output`: Whether to invert the signal after applying the dead-time, which can be used to control the delay edge polarity.

**备注：** It is also possible to generate the required dead time by setting `Generator Actions on Events`, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead-time submodule should be used.

**Classical PWM Waveforms and Dead Time Configurations**  This section will demonstrate the classical PWM waveforms that can be generated by the dead-time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.
Active High, Complementary

```
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, 
                             mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{

    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_timer_event(genb, MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, MCPWM_GEN_ACTION_HIGH, MCPWM_GEN_TIMER_EVENT_ACTION_END()));
    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_compare_event(genb, MCPWM_TIMER_DIRECTION_UP, cmpb, MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpb, MCPWM_GEN_ACTION_LOW), MCPWM_GEN_COMPARE_EVENT_ACTION_END()));
}

static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb)
{
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 0,
        .negedge_delay_ticks = 0,
    };
    // generator_a bypass the deadtime module (no delay)
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, gena, &dead_time_config));
    // apply dead time on both edge for generator_b
    dead_time_config.negedge_delay_ticks = 50;
    dead_time_config.posedge_delay_ticks = 50;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, genb, &dead_time_config));
}

Carrier Modulation The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g. isolated digital power application) by passing the PWM output signals through transformers. Any of PWM output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call mcpwm_operator_apply_carrier(), and provide configuration structure mcpwm_carrier_config_t:

- mcpwm_carrier_config_t::frequency_hz: The carrier frequency in Hz.
- mcpwm_carrier_config_t::duty_cycle: The duty cycle of the carrier. Note that, the supported choices of duty cycle are discrete, the driver will search the nearest one based the user configuration.
- mcpwm_carrier_config_t::first_pulse_duration_us: The duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the
Chapter 2. API

mcpwm_carrier_config_t::frequency_hz. The first pulse duration can’t be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.

- mcpwm_carrier_config_t::invert_before_modulate and mcpwm_carrier_config_t::invert_after_modulate: Set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling mcpwm_operator_applyCarrier() with a NULL configuration.

Faults and Brake Actions  The MCPWM operator is able to sense external signals with information about failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

Set Operator Brake Mode on Fault  The way that MCPWM operator reacts to the fault is called Brake. The MCPWM operator can be configured to perform different brake modes for each fault object by calling mcpwm_operator_set_brake_on_fault(). Brake specific configuration is passed as a structure mcpwm_brake_config_t:

- mcpwm_brake_config_t::fault set which fault that the operator should react to.
- mcpwm_brake_config_t::brake_mode set the brake mode that should be used for the fault. The supported brake modes are listed in the mcpwm_operator_brake_mode_t. For MCPWM_OPER_BRAKE_MODE_CBC mode, the operator will recover itself automatically as long as the fault disappears. You can specify the recovery time in mcpwm_brake_config_t::cbc_recover_on_tez and mcpwm_brake_config_t::cbc_recover_on_tep. For MCPWM_OPER_BRAKE_MODE_OST mode, the operator can’t recover even though the fault disappears. User has to call mcpwm_operator_recover_from_fault() to manually recover it.

Set Generator Action on Brake Event  One generator can set multiple actions on different brake events, by calling mcpwm_generator_set_actions_on_brake_event() with variable number of action configurations. The action configuration is defined in mcpwm_gen_brake_event_action_t:

- mcpwm_gen_brake_event_action_t::direction specific the timer direction. The supported directions are listed in mcpwm_timer_direction_t.
- mcpwm_gen_brake_event_action_t::brake_mode specifies the brake mode. The supported brake modes are listed in the mcpwm_operator_brake_mode_t.
- mcpwm_gen_brake_event_action_t::action specifies the generator action to be taken. The supported actions are listed in mcpwm_generator_action_t.

There’s a helper macro MCPWM_GEN_BRAKE_EVENT_ACTION to simplify the construction of a brake event action entry.

Please note, the argument list of mcpwm_generator_set_actions_on_brake_event() must be terminated by MCPWM_GEN_BRAKE_EVENT_ACTION_END.

Register Fault Event Callbacks  The MCPWM fault detector can inform the user when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such event happens, you should hook your function to the interrupt service routine by calling mcpwm_fault_register_event_callbacks(). The callback function prototype is declared in mcpwm_fault_event_cb_t. All supported event callbacks are listed in the mcpwm_fault_event_callbacks_t:

- mcpwm_fault_event_callbacks_t::on_fault_enter sets callback function that will be called when a fault is detected.
- mcpwm_fault_event_callbacks_t::on_fault_exit sets callback function that will be called when a fault is cleared.
Chapter 2. API

The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

### Register Brake Event Callbacks

The MCPWM operator can inform the user when it going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets callback function that will be called when the operator is going to take a CBC action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets callback function that will be called when the operator is going to take an OST action.

The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_operator_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

### Generator Force Actions

Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g. `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator’s output level will be controlled by the event actions again.
- Set the `hold_on` to true, the force output level will keep alive, until it’s removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, any upcoming event can override it.

### Synchronization

When a sync signal is taken by the MCPWM timer, the timer will be forced into a predefined phase, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See **MCPWM Sync Sources** for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the MCPWM capture timer **MCPWM Capture Timer** can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See **MCPWM Sync Sources** for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
**mcpwm_capture_timer_sync_phase_config_t::direction** sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: **MCPWM_TIMER_DIRECTION_UP**.

```
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0,                                        // GPIO fault should be in the same group of...
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false,                           // by default, a posedge pulse can trigger a...
        .sync_src = gpio_sync_source,
    };
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0,                                     // sync phase: target count value
        .direction = MCPWM_TIMER_DIRECTION_UP,                // sync phase: count direction
        .sync_src = gpio_sync_source,                         // sync source
    };
    for (int i = 0; i < 3; i++) {
        ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_config));
    }
}
```

**Capture** The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantity like distance or speed.
in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, we can use the capture submodule to sense the rotor position from Hall sensor.

![Diagram of MCPWM BLDC with Hall Sensor](image)

**Register Event Callbacks** The MCPWM capture channel can inform the user when there’s a valid edge detected on the signal. You have to register a callback function to get the timer count value of the capture moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets callback function for the capture channel when a valid edge is detected.

The callback function will provide event specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should not attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save user’s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the
channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, user needs to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function will:

- switch the capture timer state from `init` to `enable`.
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to `init` state, and release the power management lock.

**Start and Stop Capture Timer** The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

**Trigger a Software Capture Event** Sometime, the software also wants to trigger a “fake” capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it’s a “fake” capture event, it can still cause an interrupt, thus your capture event callback function will get invoked as well.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the PLL, APB frequency before going into light sleep, thus potentially changing the period of a MCPWM timers’ counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a MCPWM timer instance that has selected `MCPWM_TIMER_CLK_SRC_PLL160M` as its clock source, the driver will guarantee that the power management lock is acquired when enable the timer by `mcpwm_timer_enable()`. Likewise, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, Whenever the driver creates a MCPWM capture timer instance that has selected `MCPWM_CAPTURE_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the timer by `mcpwm_capture_timer_enable()`. And will release the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe** By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `mcpwm_comparator_set_compare_value()`

---

2 Callback function and the sub-functions invoked by itself should also be placed in IRAM, users need to take care of this by themselves.
**Thread Safety**  The factory functions like `mcpwm_new_timer()` are guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, as the driver uses a critical section to prevent them being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`

Other functions that are not related to Resource Allocation, are not thread safe. Thus, you should avoid calling them in different tasks without mutex protection.

**Kconfig Options**

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see IRAM Safe for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Examples**

- Brushed DC motor speed control by PID algorithm: `peripherals/mcpwm/mcpwm_bdc_speed_control`
- BLDC motor control with hall sensor feedback: `peripherals/mcpwm/mcpwm_bldc_hall_control`
- Ultrasonic sensor (HC-SR04) distance measurement: `peripherals/mcpwm/mcpwm_capture_hc_sr04`
- Servo motor angle control: `peripherals/mcpwm/mcpwm_servo_control`
- MCPWM synchronization between timers: `peripherals/mcpwm/mcpwm_sync`

**API Reference**

**Header File**

- `components/driver/include/driver/mcpwm_timer.h`

**Functions**

`esp_err_t mcpwm_new_timer(const mcpwm_timer_config_t *config, mcpwm_timer_handle_t *ret_timer)`  
Create MCPWM timer.

参数  
- `config` - [in] MCPWM timer configuration  
- `ret_timer` - [out] Returned MCPWM timer handle

返回  
- ESP_OK: Create MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Create MCPWM timer failed because of invalid argument  
- ESP_ERR_NO_MEM: Create MCPWM timer failed because out of memory  
- ESP_ERR_NOT_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one  
- ESP_FAIL: Create MCPWM timer failed because of other error

`esp_err_t mcpwm_del_timer(mcpwm_timer_handle_t timer)`  
Delete MCPWM timer.

参数  
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

返回  
- ESP_OK: Delete MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Delete MCPWM timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Delete MCPWM timer failed because timer is not in init state  
- ESP_FAIL: Delete MCPWM timer failed because of other error
**esp_err_t mcpwm_timer_enable** *(mcpwm_timer_handle_t timer)*

Enable MCPWM timer.

- **timer** - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **返回**
  - ESP_OK: Enable MCPWM timer successfully
  - ESP_ERR_INVALID_ARG: Enable MCPWM timer failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Enable MCPWM timer failed because timer is enabled already
  - ESP_FAIL: Enable MCPWM timer failed because of other error

**esp_err_t mcpwm_timer_disable** *(mcpwm_timer_handle_t timer)*

Disable MCPWM timer.

- **timer** - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **返回**
  - ESP_OK: Disable MCPWM timer successfully
  - ESP_ERR_INVALID_ARG: Disable MCPWM timer failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Disable MCPWM timer failed because timer is disabled already
  - ESP_FAIL: Disable MCPWM timer failed because of other error

**esp_err_t mcpwm_timer_start_stop** *(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command)*

Send specific start/stop commands to MCPWM timer.

- **timer** - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** - [in] Supported command list for MCPWM timer
- **返回**
  - ESP_OK: Start or stop MCPWM timer successfully
  - ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled
  - ESP_FAIL: Start or stop MCPWM timer failed because of other error

**esp_err_t mcpwm_timer_register_event_callbacks** *(mcpwm_timer_handle_t timer, const mcpwm_timer_event_callbacks_t *cbs, void *user_data)*

Set event callbacks for MCPWM timer.

**备注:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

**备注:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

- **参数**
  - **timer** - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
  - **cbs** - [in] Group of callback functions
  - **user_data** - [in] User data, which will be passed to callback functions directly
- **返回**
  - ESP_OK: Set event callbacks successfully
  - ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Set event callbacks failed because timer is not in init state
  - ESP_FAIL: Set event callbacks failed because of other error
**esp_err_t mcpwm_timer_set_phase_on_sync**

```c
mcpwm_timer_set_phase_on_sync(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_phase_config_t *config)
```

Sets sync phase for MCPWM timer.

- **timer** - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** - [in] MCPWM timer sync phase configuration

**Return**
- ESP_OK: Set sync phase for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM timer failed because of other error

**Structures**

- **struct mcpwm_timer_event_callbacks_t**
  - Group of supported MCPWM timer event callbacks.

  备注：The callbacks are all running under ISR environment

**Public Members**

- **mcpwm_timer_event_cb_t on_full**
  - callback function when MCPWM timer counts to peak value

- **mcpwm_timer_event_cb_t on_empty**
  - callback function when MCPWM timer counts to zero

- **mcpwm_timer_event_cb_t on_stop**
  - callback function when MCPWM timer stops

- **struct mcpwm_timer_config_t**
  - MCPWM timer configuration.

  **Public Members**

- **int group_id**
  - Specify from which group to allocate the MCPWM timer

- **mcpwm_timer_clock_source_t clk_src**
  - MCPWM timer clock source

- **uint32_t resolution_hz**
  - Counter resolution in Hz, ranges from around 300KHz to 80MHz. The step size of each count tick equals to \((1 / \text{resolution}_hz)\) seconds

- **mcpwm_timer_count_mode_t count_mode**
  - Count mode
uint32_t **period_ticks**
Number of count ticks within a period

uint32_t **update_period_on_empty**
Whether to update period when timer counts to zero

uint32_t **update_period_on_sync**
Whether to update period on sync event

struct **mcpwm_timer_config_t**::[anonymous] **flags**
Extra configuration flags for timer

struct **mcpwm_timer_sync_phase_config_t**
MCPWM Timer sync phase configuration.

**Public Members**

**mcpwm_sync_handle_t** **sync_src**
The sync event source. Set to NULL will disable the timer being synced by others

uint32_t **count_value**
The count value that should lock to upon sync event

**mcpwm_timer_direction_t** **direction**
The count direction that should lock to upon sync event

**Header File**

- components/driver/include/driver/mcpwm_oper.h

**Functions**

```c
esp_err_t mcpwm_new_operator (const mcpwm_operator_config_t *config, mcpwm_oper_handle_t *ret_oper)
```
Create MCPWM operator.

参数
- **config** - [in] MCPWM operator configuration
- **ret_oper** - [out] Returned MCPWM operator handle

返回
- ESP_OK: Create MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM operator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM operator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM operator failed because can’t find free resource
- ESP_FAIL: Create MCPWM operator failed because of other error

```c
esp_err_t mcpwm_del_operator (mcpwm_oper_handle_t oper)
```
Delete MCPWM operator.

参数 **oper** - [in] MCPWM operator, allocated by mcpwm_new_operator()

返回
- ESP_OK: Delete MCPWM operator successfully
Chapter 2. API 参考

- ESP_ERR_INVALID_ARG: Delete MCPWM operator failed because of invalid argument
- ESP_FAIL: Delete MCPWM operator failed because of other error

*esp_err_t* `mcpwm_operator_connect_timer`(mcpwm_oper_handle_t `oper`, mcpwm_timer_handle_t `timer`)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

参数

- `oper` : [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- `timer` : [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

返回

- ESP_OK: Connect MCPWM operator and timer successfully
- ESP_ERR_INVALID_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP_FAIL: Connect MCPWM operator and timer failed because of other error

*esp_err_t* `mcpwm_operator_set_brake_on_fault`(mcpwm_oper_handle_t `oper`, const mcpwm_brake_config_t *`config`)

Set brake method for MCPWM operator.

参数

- `oper` : [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `config` : [in] MCPWM brake configuration

返回

- ESP_OK: Set trip for operator successfully
- ESP_ERR_INVALID_ARG: Set trip for operator failed because of invalid argument
- ESP_FAIL: Set trip for operator failed because of other error

*esp_err_t* `mcpwm_operator_recover_from_fault`(mcpwm_oper_handle_t `oper`, mcpwm_fault_handle_t `fault`)

Try to make the operator recover from fault.

备注: To recover from fault or escape from trip, you make sure the fault signal has dissappeared already. Otherwise the recovery can’t succeed.

参数

- `oper` : [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- `fault` : [in] MCPWM fault handle

返回

- ESP_OK: Recover from fault successfully
- ESP_ERR_INVALID_ARG: Recover from fault failed because of invalid argument
- ESP_ERR_INVALID_STATE: Recover from fault failed because the fault source is still active
- ESP_FAIL: Recover from fault failed because of other error

*esp_err_t* `mcpwm_operator_register_event_callbacks`(mcpwm_oper_handle_t `oper`, const mcpwm_operator_event_callbacks_t *`cbs`, void *`user_data`)

Set event callbacks for MCPWM operator.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.
Chapter 2. API

- **user_data** - [in] User data, which will be passed to callback functions directly

返回
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_operator_apply_carrier (mcpwm_oper_handle_t oper, const mcpwm_carrier_config_t *config)
```

Apply carrier feature for MCPWM operator.

参数
- oper - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- config - [in] MCPWM carrier specific configuration

返回
- ESP_OK: Set carrier for operator successfully
- ESP_ERR_INVALID_ARG: Set carrier for operator failed because of invalid argument
- ESP_FAIL: Set carrier for operator failed because of other error

**Structures**

```c
struct mcpwm_operator_config_t
```

MCPWM operator configuration.

**Public Members**

```c
int group_id
```

Specify from which group to allocate the MCPWM operator

```c
uint32_t update_gen_action_on_tez
```

Whether to update generator action when timer counts to zero

```c
uint32_t update_gen_action_on_tep
```

Whether to update generator action when timer counts to peak

```c
uint32_t update_gen_action_on_sync
```

Whether to update generator action on sync event

```c
uint32_t update_dead_time_on_tez
```

Whether to update dead time when timer counts to zero

```c
uint32_t update_dead_time_on_tep
```

Whether to update dead time when timer counts to peak

```c
uint32_t update_dead_time_on_sync
```

Whether to update dead time on sync event

```c
struct mcpwm_operator_config_t::[anonymous] flags
```

Extra configuration flags for operator

```c
struct mcpwm_brake_config_t
```

MCPWM brake configuration structure.
Public Members

`mcpwm_fault_handle_t fault`  
Which fault causes the operator to brake

`mcpwm_operator_brake_mode_t brake_mode`  
Brake mode

`uint32_t cbc_recover_on_tez`  
Recovery CBC brake state on tez event

`uint32_t cbc_recover_on_tep`  
Recovery CBC brake state on tep event

`struct mcpwm_brake_config_t::[anonymous] flags`  
Extra flags for brake configuration

`struct mcpwm_operator_event_callbacks_t`  
Group of supported MCPWM operator event callbacks.

---

备注: The callbacks are all running under ISR environment

Public Members

`mcpwm_brake_event_cb_t on_brake_cbc`  
callback function when mcpwm operator brakes in CBC

`mcpwm_brake_event_cb_t on_brake_ost`  
callback function when mcpwm operator brakes in OST

`struct mcpwm_carrier_config_t`  
MCPWM carrier configuration structure.

Public Members

`uint32_t frequency_hz`  
Carrier frequency in Hz

`uint32_t first_pulse_duration_us`  
The duration of the first PWM pulse, in us

`float duty_cycle`  
Carrier duty cycle

`uint32_t invert_before_modulate`  
Invert the raw signal
uint32_t invert_after_modulate
Invert the modulated signal

struct mcpwm_carrier_config_t::{anonymous} flags
Extra flags for carrier configuration

Header File

Functions

esp_err_t mcpwm_new_comparator (mcpwm_oper_handle_t oper, const mcpwm_comparator_config_t *config, mcpwm_cmpr_handle_t *ret_cmpr)
Create MCPWM comparator.
参数
- oper - [in] MCPWM operator, allocated by mcpwm_new_operator(), the new comparator will be allocated from this operator
- config - [in] MCPWM comparator configuration
- ret_cmpr - [out] Returned MCPWM comparator
返回
- ESP_OK: Create MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM comparator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM comparator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM comparator failed because can’t find free resource
- ESP_FAIL: Create MCPWM comparator failed because of other error

esp_err_t mcpwm_del_comparator (mcpwm_cmpr_handle_t cmpr)
Delete MCPWM comparator.
参数 cmpr - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()
返回
- ESP_OK: Delete MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM comparator failed because of invalid argument
- ESP_FAIL: Delete MCPWM comparator failed because of other error

esp_err_t mcpwm_comparator_register_event_callbacks (mcpwm_cmpr_handle_t cmpr, const mcpwm_comparator_event_callbacks_t *cbs, void *user_data)
Set event callbacks for MCPWM comparator.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

参数
- cmpr - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()
- cbs - [in] Group of callback functions
- user_data - [in] User data, which will be passed to callback functions directly
返回
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error
esp_err_t mcpwm_comparator_set_compare_value(mcpwm_cmpr_handle_t cmpr, uint32_t cmp_ticks)

Set MCPWM comparator’s compare value.

参数
- cmpr - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()
- cmp_ticks - [in] The new compare value

返回
- ESP_OK: Set MCPWM compare value successfully
- ESP_ERR_INVALID_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the cmp_ticks is out of range)
- ESP_ERR_INVALID_STATE: Set MCPWM compare value failed because the operator doesn’t have a timer connected
- ESP_FAIL: Set MCPWM compare value failed because of other error

Structures

struct mcpwm_comparator_config_t

MCPWM comparator configuration.

Public Members

uint32_t update_cmp_on_tez

Whether to update compare value when timer count equals to zero (tez)

uint32_t update_cmp_on_tep

Whether to update compare value when timer count equals to peak (tep)

uint32_t update_cmp_on_sync

Whether to update compare value on sync event

struct mcpwm_comparator_config_t::[anonymous] flags

Extra configuration flags for comparator

struct mcpwm_comparator_event_callbacks_t

Group of supported MCPWM compare event callbacks.

备注: The callbacks are all running under ISR environment

Public Members

mcpwm_compare_event_cb_t on_reach

ISR callback function which would be invoked when counter reaches compare value

Header File

- components/driver/include/driver/mcpwm_gen.h
Functions

\[ \text{esp_err_t mcpwm_new_generator} \left( \text{mcpwm_oper_handle_t} \ oper, \ \text{const mcpwm_generator_config_t} \ *\text{config}, \ 
\text{mcpwm_gen_handle_t} \ *\text{ret_gen} \right) \]

Allocate MCPWM generator from given operator.

参数
- \text{oper} - [in] MCPWM operator, allocated by \text{mcpwm_new_operator}()
- \text{config} - [in] MCPWM generator configuration
- \text{ret_gen} - [out] Returned MCPWM generator

返回
- ESP_OK: Create MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM generator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM generator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM generator failed because can’t find free resource
- ESP_FAIL: Create MCPWM generator failed because of other error

\[ \text{esp_err_t mcpwm_del_generator} \left( \text{mcpwm_gen_handle_t} \ gen \right) \]

Delete MCPWM generator.

参数 \text{gen} - [in] MCPWM generator handle, allocated by \text{mcpwm_new_generator}()

返回
- ESP_OK: Delete MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM generator failed because of invalid argument
- ESP_FAIL: Delete MCPWM generator failed because of other error

\[ \text{esp_err_t mcpwm_generator_set_force_level} \left( \text{mcpwm_gen_handle_t} \ gen, \ \text{int} \ level, \ \text{bool} \ \text{hold_on} \right) \]

Set force level for MCPWM generator.

备注: The force level will be applied to the generator immediately, regardless any other events that would change the generator’s behaviour.

备注: If the \text{hold_on} is true, the force level will retain forever, until user removes the force level by setting the force level to -1.

备注: If the \text{hold_on} is false, the force level can be overridden by the next event action.

参数
- \text{gen} - [in] MCPWM generator handle, allocated by \text{mcpwm_new_generator}()
- \text{level} - [in] GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
- \text{hold_on} - [in] Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

返回
- ESP_OK: Set force level for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP_FAIL: Set force level for MCPWM generator failed because of other error

\[ \text{esp_err_t mcpwm_generator_set_actions_on_timer_event} \left( \text{mcpwm_gen_handle_t} \ gen, \ 
\text{mcpwm_gen_timer_event_action_t} \ ev_act, \ldots \right) \]

Set generator actions on different MCPWM timer events.
参数
• gen [in] MCPWM generator handle, allocated by mcpwm_new_generator()
• ev_act [in] MCPWM timer event action list, must be terminated by MCPWM_GEN TIMER_EVENT_ACTION_END()

返回
• ESP_OK: Set generator actions successfully
• ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
• ESP_ERR_INVALID_STATE: Set generator actions failed because of timer is not connected to operator
• ESP_FAIL: Set generator actions failed because of other error

esp_err_t mcpwm_generator_set_actions_on_compare_event (mcpwm_gen_handle_t generator,
                      mcpwm_gen_compare_event_action_t ev_act, ...)

Set generator actions on different MCPWM compare events.

参数
• generator [in] MCPWM generator handle, allocated by mcpwm_new_generator()
• ev_act [in] MCPWM compare event action list, must be terminated by MCPWM GEN_COMPARE_EVENT_ACTION_END()

返回
• ESP_OK: Set generator actions successfully
• ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
• ESP_FAIL: Set generator actions failed because of other error

esp_err_t mcpwm_generator_set_actions_on_brake_event (mcpwm_gen_handle_t generator,
                                      mcpwm_gen_brake_event_action_t ev_act, ...)

Set generator actions on different MCPWM brake events.

参数
• generator [in] MCPWM generator handle, allocated by mcpwm_new_generator()
• ev_act [in] MCPWM brake event action list, must be terminated by MCPWM_GEN_BRAKE_EVENT_ACTION_END()

返回
• ESP_OK: Set generator actions successfully
• ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
• ESP_FAIL: Set generator actions failed because of other error

esp_err_t mcpwm_generator_set_dead_time (mcpwm_gen_handle_t in_generator, mcpwm_gen_handle_t out_generator,
                                       const mcpwm_dead_time_config_t *config)

Set dead time for MCPWM generator.

参数
• in_generator [in] MCPWM generator, before adding the dead time
• out_generator [in] MCPWM generator, after adding the dead time
• config [in] MCPWM dead time configuration

返回
• ESP_OK: Set dead time for MCPWM generator successfully
• ESP_ERR_INVALID_ARG: Set dead time for MCPWM generator failed because of invalid argument
• ESP_FAIL: Set dead time for MCPWM generator failed because of other error

Structures

struct mcpwm_generator_config_t
MCPWM generator configuration.
Public Members

int gen_gpio_num
    The GPIO number used to output the PWM signal

uint32_t invert_pwm
    Whether to invert the PWM signal (done by GPIO matrix)

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct mcpwm_generator_config_t::[anonymous] flags
    Extra configuration flags for generator

Public Members

mcpwm_timer_direction_t direction
    Timer direction

mcpwm_timer_event_t event
    Timer event

mcpwm_generator_action_t action
    Generator action should perform

struct mcpwm_gen_timer_event_action_t
    Generator action on specific timer event.

Public Members

mcpwm_timer_direction_t direction
    Timer direction

mcpwm_cmpr_handle_t comparator
    Comparator handle

mcpwm_generator_action_t action
    Generator action should perform

struct mcpwm_gen_compare_event_action_t
    Generator action on specific comparator event.

Public Members

mcpwm_timer_direction_t direction
    Timer direction

mcpwm_gen_brake_event_action_t
    Generator action on specific brake event.
Public Members

**mcpwm_timer_direction_t** `direction`
Timer direction

**mcpwm_operator_brake_mode_t** `brake_mode`
Brake mode

**mcpwm_generator_action_t** `action`
Generator action should perform

```c
struct mcpwm_dead_time_config_t
MCPWM dead time configuration structure.
```

Public Members

```c
uint32_t `posedge_delay_ticks`
delay time applied to rising edge, 0 means no rising delay time

uint32_t `negedge_delay_ticks`
delay time applied to falling edge, 0 means no falling delay time

uint32_t `invert_output`
Invert the signal after applied the dead time

struct mcpwm_dead_time_config_t::[anonymous] flags
Extra flags for dead time configuration
```

Macros

```c
MCPWM_GEN_TIMER_EVENT_ACTION (dir, ev, act)
Help macros to construct a mcpwm_gen_timer_event_action_t entry.

MCPWM_GEN_TIMER_EVENT_ACTION_END ()

MCPWM_GEN_COMPARE_EVENT_ACTION (dir, cmp, act)
Help macros to construct a mcpwm_gen_compare_event_action_t entry.

MCPWM_GEN_COMPARE_EVENT_ACTION_END ()

MCPWM_GEN_BRAKE_EVENT_ACTION (dir, mode, act)
Help macros to construct a mcpwm_gen_brake_event_action_t entry.

MCPWM_GEN_BRAKE_EVENT_ACTION_END ()
```

Header File

- `components/driver/include/driver/mcpwm_fault.h`
Chapter 2. API 参考

Functions

```c
esp_err_t mcpwm_new_gpio_fault (const mcpwm_gpio_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)
```

Create MCPWM GPIO fault.

参数

- `config` [in] MCPWM GPIO fault configuration
- `ret_fault` [out] Returned GPIO fault handle

返回

- ESP_OK: Create MCPWM GPIO fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP_FAIL: Create MCPWM GPIO fault failed because of other error

```c
esp_err_t mcpwm_new_soft_fault (const mcpwm_soft_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)
```

Create MCPWM software fault.

参数

- `config` [in] MCPWM software fault configuration
- `ret_fault` [out] Returned software fault handle

返回

- ESP_OK: Create MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software fault failed because out of memory
- ESP_FAIL: Create MCPWM software fault failed because of other error

```c
esp_err_t mcpwm_del_fault (mcpwm_fault_handle_t fault)
```

Delete MCPWM fault.

参数 `fault` [in] MCPWM fault handle allocated by `mcpwm_new_gpio_fault()` or `mcpwm_new_soft_fault()`

返回

- ESP_OK: Delete MCPWM fault successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM fault failed because of invalid argument
- ESP_FAIL: Delete MCPWM fault failed because of other error

```c
esp_err_t mcpwm_soft_fault_activate (mcpwm_fault_handle_t fault)
```

Activate the software fault, trigger the fault event for once.

参数 `fault` [in] MCPWM soft fault, allocated by `mcpwm_new_soft_fault()`

返回

- ESP_OK: Activate MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Activate MCPWM software fault event failed because of invalid argument
- ESP_FAIL: Activate MCPWM software fault event failed because of other error

```c
esp_err_t mcpwm_fault_register_event_callbacks (mcpwm_fault_handle_t fault, const mcpwm_fault_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM fault.

备注：User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.
Chapter 2. API

- **fault** - [in] MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

### Structures

**struct mcpwm_gpio_fault_config_t**

MCPWM GPIO fault configuration structure.

#### Public Members

- **int group_id**
  - In which MCPWM group that the GPIO fault belongs to

- **int gpio_num**
  - GPIO used by the fault signal

- **uint32_t active_level**
  - On which level the fault signal is treated as active

- **uint32_t io_loop_back**
  - For debug/test, the signal output from the GPIO will be fed to the input path as well

- **uint32_t pull_up**
  - Whether to pull up internally

- **uint32_t pull_down**
  - Whether to pull down internally

- **struct mcpwm_gpio_fault_config_t::[anonymous] flags**
  - Extra configuration flags for GPIO fault

**struct mcpwm_soft_fault_config_t**

MCPWM software fault configuration structure.

**struct mcpwm_fault_event_callbacks_t**

Group of supported MCPWM fault event callbacks.

### 注释:
The callbacks are all running under ISR environment

#### Public Members
Chapter 2. API 参考

`mcpwm_fault_event_cb_t on_fault_enter`
ISR callback function that would be invoked when fault signal becomes active

`mcpwm_fault_event_cb_t on_fault_exit`
ISR callback function that would be invoked when fault signal becomes inactive

**Header File**
- components/driver/include/driver/mcpwm_sync.h

**Functions**

```c
esp_err_t mcpwm_new_timer_sync_src(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_src_config_t *config, mcpwm_sync_handle_t *ret_sync)
```
Create MCPWM timer sync source.

**参数**
- `timer` [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` [in] MCPWM timer sync source configuration
- `ret_sync` [out] Returned MCPWM sync handle

**返回**
- ESP_OK: Create MCPWM timer sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer sync source failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer sync source failed because out of memory
- ESP_ERR_INVALID_STATE: Create MCPWM timer sync source failed because the timer has created a sync source before
- ESP_FAIL: Create MCPWM timer sync source failed because of other error

```c
esp_err_t mcpwm_new_gpio_sync_src(const mcpwm_gpio_sync_src_config_t *config, mcpwm_sync_handle_t *ret_sync)
```
Create MCPWM GPIO sync source.

**参数**
- `config` [in] MCPWM GPIO sync source configuration
- `ret_sync` [out] Returned MCPWM GPIO sync handle

**返回**
- ESP_OK: Create MCPWM GPIO sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO sync source failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO sync source failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO sync source failed because can’t find free resource
- ESP_FAIL: Create MCPWM GPIO sync source failed because of other error

```c
esp_err_t mcpwm_new_soft_sync_src(const mcpwm_soft_sync_config_t *config, mcpwm_sync_handle_t *ret_sync)
```
Create MCPWM software sync source.

**参数**
- `config` [in] MCPWM software sync source configuration
- `ret_sync` [out] Returned software sync handle

**返回**
- ESP_OK: Create MCPWM software sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software sync failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software sync failed because out of memory
- ESP_FAIL: Create MCPWM software sync failed because of other error

Submit Document Feedback
Release v5.1-dev-2066-g7869f4e151
esp_err_t mcpwm_del_sync_src (mcpwm_sync_handle_t sync)
Delete MCPWM sync source.

参数 sync - [in] MCPWM sync handle, allocated by mcpwm_new_timer_sync_src() or mcpwm_new_gpio_sync_src() or mcpwm_new_soft_sync_src()

返回
- ESP_OK: Delete MCPWM sync source successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM sync source failed because of invalid argument
- ESP_FAIL: Delete MCPWM sync source failed because of other error

esp_err_t mcpwm_soft_sync_activate (mcpwm_sync_handle_t sync)
Activate the software sync, trigger the sync event for once.

参数 sync - [in] MCPWM soft sync handle, allocated by mcpwm_new_soft_sync_src()

返回
- ESP_OK: Trigger MCPWM software sync event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software sync event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software sync event failed because of other error

Structures

struct mcpwm_timer_sync_src_config_t
MCPWM timer sync source configuration.

Public Members

mcpwm_timer_event_t timer_event
Timer event, upon which MCPWM timer will generate the sync signal

uint32_t propagate_input_sync
The input sync signal would be routed to its sync output

struct mcpwm_timer_sync_src_config_t::[anonymous] flags
Extra configuration flags for timer sync source

struct mcpwm_gpio_sync_src_config_t
MCPWM GPIO sync source configuration.

Public Members

int group_id
MCPWM group ID

int gpio_num
GPIO used by sync source

uint32_t active_neg
Whether the sync signal is active on negedge, by default, the sync signal’s posedge is treated as active
uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t pull_up
    Whether to pull up internally

uint32_t pull_down
    Whether to pull down internally

struct mcpwm_gpio_sync_src_config_t::[anonymous] flags
    Extra configuration flags for GPIO sync source

struct mcpwm_soft_sync_config_t
    MCPWM software sync configuration structure.

Header File

Functions

esp_err_t mcpwm_new_capture_timer (const mcpwm_capture_timer_config_t *config,
                                    mcpwm_cap_timer_handle_t *ret_cap_timer)

Create MCPWM capture timer.

参数
• config [in] MCPWM capture timer configuration
• ret_cap_timer [out] Returned MCPWM capture timer handle

返回
• ESP_OK: Create MCPWM capture timer successfully
• ESP_ERR_INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM capture timer failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM capture timer failed because can’t find free resource
• ESP_FAIL: Create MCPWM capture timer failed because of other error

esp_err_t mcpwm_del_capture_timer (mcpwm_cap_timer_handle_t cap_timer)

Delete MCPWM capture timer.

参数 cap_timer [in] MCPWM capture timer, allocated by mcpwm_new_capture_timer()

返回
• ESP_OK: Delete MCPWM capture timer successfully
• ESP_ERR_INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument
• ESP_FAIL: Delete MCPWM capture timer failed because of other error

esp_err_t mcpwm_capture_timer_enable (mcpwm_cap_timer_handle_t cap_timer)

Enable MCPWM capture timer.

参数 cap_timer [in] MCPWM capture timer handle, allocated by mcpwm_new_capture_timer()

返回
• ESP_OK: Enable MCPWM capture timer successfully
• ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_disable (mcpwm_cap_timer_handle_t cap_timer)
```

Disable MCPWM capture timer.

Chapter 2. API

ESP_OK: Set sync phase for MCPWM capture timer successfully
ESP_ERR_INVALID_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
ESP_FAIL: Set sync phase for MCPWM capture timer failed because of other error

```
esp_err_t mcpwm_new_capture_channel (mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_channel_config_t *config, mcpwm_cap_channel_handle_t *ret_cap_channel)
```

Create MCPWM capture channel.

- `cap_timer` [in] MCPWM capture timer, allocated by mcpwm_new_capture_timer(), will be connected to the new capture channel
- `config` [in] MCPWM capture channel configuration
- `ret_cap_channel` [out] Returned MCPWM capture channel

ESP_OK: Create MCPWM capture channel successfully
ESP_ERR_INVALID_ARG: Create MCPWM capture channel failed because of invalid argument
ESP_ERR_NO_MEM: Create MCPWM capture channel failed because of other error
ESP_ERR_NOT_FOUND: Create MCPWM capture channel failed because can’t find free resource
ESP_FAIL: Create MCPWM capture channel failed because of other error

```
esp_err_t mcpwm_del_capture_channel (mcpwm_cap_channel_handle_t cap_channel)
```

Delete MCPWM capture channel.

- `cap_channel` [in] MCPWM capture channel handle, allocated by mcpwm_new_capture_channel()

ESP_OK: Delete MCPWM capture channel successfully
ESP_ERR_INVALID_ARG: Delete MCPWM capture channel failed because of invalid argument
ESP_FAIL: Delete MCPWM capture channel failed because of other error

```
esp_err_t mcpwm_capture_channel_enable (mcpwm_cap_channel_handle_t cap_channel)
```

Enable MCPWM capture channel.

- `cap_channel` [in] MCPWM capture channel handle, allocated by mcpwm_new_capture_channel()

ESP_OK: Enable MCPWM capture channel successfully
ESP_ERR_INVALID_ARG: Enable MCPWM capture channel failed because of invalid argument

备注：This function will transit the channel state from init to enable.

备注：This function will enable the interrupt service, if it’s lazy installed in mcpwm_capture_channel_register_event_callbacks().
• ESP_ERR_INVALID_STATE: Enable MCPWM capture channel failed because the channel is already enabled
• ESP_FAIL: Enable MCPWM capture channel failed because of other error

\texttt{esp_err_t mcpwm_capture_channel_disable(mcpwm_cap_channel_handle_t cap\_channel)}

Disable MCPWM capture channel.

参数 \texttt{cap\_channel} — [in] MCPWM capture channel handle, allocated by \texttt{mcpwm_new_capture_channel()}

返回
• ESP_OK: Disable MCPWM capture channel successfully
• ESP_ERR_INVALID_ARG: Disable MCPWM capture channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Disable MCPWM capture channel failed because the channel is not enabled yet
• ESP_FAIL: Disable MCPWM capture channel failed because of other error

\texttt{esp_err_t mcpwm_capture_channel_register_event_callbacks(mcpwm_cap_channel_handle_t cap\_channel, const mcpwm_capture_event_callbacks_t\* cbs, void* user\_data)}

Set event callbacks for MCPWM capture channel.

备注：The first call to this function needs to be before the call to \texttt{mcpwm_capture_channel_enable}

备注：User can deregister a previously registered callback by calling this function and setting the callback member in the \texttt{cbs} structure to NULL.

参数
• \texttt{cap\_channel} — [in] MCPWM capture channel handle, allocated by \texttt{mcpwm_new_capture_channel()}
• \texttt{cbs} — [in] Group of callback functions
• \texttt{user\_data} — [in] User data, which will be passed to callback functions directly

返回
• ESP_OK: Set event callbacks successfully
• ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_ERR_INVALID_STATE: Set event callbacks failed because the channel is not in init state
• ESP_FAIL: Set event callbacks failed because of other error

\texttt{esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap\_channel)}

Trigger a catch by software.

参数 \texttt{cap\_channel} — [in] MCPWM capture channel handle, allocated by \texttt{mcpwm_new_capture_channel()}

返回
• ESP_OK: Trigger software catch successfully
• ESP_ERR_INVALID_ARG: Trigger software catch failed because of invalid argument
• ESP_ERR_INVALID_STATE: Trigger software catch failed because the channel is not enabled yet
• ESP_FAIL: Trigger software catch failed because of other error

\textbf{Structures}
struct mcpwm_capture_timer_config_t
MCPWM capture timer configuration structure.

Public Members

int group_id
Specify from which group to allocate the capture timer

mcpwm_capture_clock_source_t clk_src
MCPWM capture timer clock source

struct mcpwm_capture_timer_sync_phase_config_t
MCPWM Capture timer sync phase configuration.

Public Members

mcpwm_sync_handle_t sync_src
The sync event source

uint32_t count_value
The count value that should lock to upon sync event

mcpwm_timer_direction_t direction
The count direction that should lock to upon sync event

struct mcpwm_capture_channel_config_t
MCPWM capture channel configuration structure.

Public Members

int gpio_num
GPIO used capturing input signal

uint32_t prescale
Prescale of input signal, effective frequency = cap_input_clk/prescale

uint32_t pos_edge
Whether to capture on positive edge

uint32_t neg_edge
Whether to capture on negative edge

uint32_t pull_up
Whether to pull up internally

uint32_t pull_down
Whether to pull down internally
uint32_t invert_cap_signal
  Invert the input capture signal

uint32_t io_loop_back
  For debug/test, the signal output from the GPIO will be fed to the input path as well

struct mcpwm_capture_channel_config_t::[anonymous] flags
  Extra configuration flags for capture channel

struct mcpwm_capture_event_callbacks_t
  Group of supported MCPWM capture event callbacks.

备注：The callbacks are all running under ISR environment

公共成员

mcpwm_capture_event_cb_t on_cap
  Callback function that would be invoked when capture event occurred

header file

• components/driver/include/driver/mcpwm_types.h

结构体

struct mcpwm_timer_event_data_t
  MCPWM timer event data.

公共成员

uint32_t count_value
  MCPWM timer count value

mcpwm_timer_direction_t direction
  MCPWM timer count direction

struct mcpwm_brake_event_data_t
  MCPWM brake event data.

struct mcpwm_fault_event_data_t
  MCPWM fault event data.

struct mcpwm_compare_event_data_t
  MCPWM compare event data.
Public Members

uint32_t compare_ticks
    Compare value

mcpwm_timer_direction_t direction
    Count direction

struct mcpwm_capture_event_data_t
    MCPWM capture event data.

Public Members

uint32_t cap_value
    Captured value

mcpwm_capture_edge_t cap_edge
    Capture edge

Type Definitions

typedef struct mcpwm_timer_t *mcpwm_timer_handle_t
    Type of MCPWM timer handle.

typedef struct mcpwm_oper_t *mcpwm_oper_handle_t
    Type of MCPWM operator handle.

typedef struct mcpwm_cmpr_t *mcpwm_cmpr_handle_t
    Type of MCPWM comparator handle.

typedef struct mcpwm_gen_t *mcpwm_gen_handle_t
    Type of MCPWM generator handle.

typedef struct mcpwm_fault_t *mcpwm_fault_handle_t
    Type of MCPWM fault handle.

typedef struct mcpwm_sync_t *mcpwm_sync_handle_t
    Type of MCPWM sync handle.

typedef struct mcpwm_cap_timer_t *mcpwm_cap_timer_handle_t
    Type of MCPWM capture timer handle.

typedef struct mcpwm_cap_channel_t *mcpwm_cap_channel_handle_t
    Type of MCPWM capture channel handle.

typedef bool (*mcpwm_timer_event_cb_t)(mcpwm_timer_handle_t timer, const mcpwm_timer_event_data_t *edata, void *user_ctx)
    MCPWM timer event callback function.

    Param timer [in] MCPWM timer handle
Chapter 2. API

**Param edata** [in] MCPWM timer event data, fed by driver
**Param user_ctx** [in] User data, set in `mcpwm_timer_register_eventcallbacks()`
**Return** Whether a high priority task has been waken up by this function

typedef bool (`mcpwm_brake_event_cb_t`)(`mcpwm_oper_handle_t` oper, const `mcpwm_brake_event_data_t` *edata, void *user_ctx)

MCPWM operator brake event callback function.

**Param oper** [in] MCPWM operator handle
**Param edata** [in] MCPWM brake event data, fed by driver
**Param user_ctx** [in] User data, set in `mcpwm_operator_register_eventcallbacks()`
**Return** Whether a high priority task has been waken up by this function

typedef bool (`mcpwm_fault_event_cb_t`)(`mcpwm_fault_handle_t` fault, const `mcpwm_fault_event_data_t` *edata, void *user_ctx)

MCPWM fault event callback function.

**Param fault** MCPWM fault handle
**Param edata** MCPWM fault event data, fed by driver
**Param user_ctx** User data, set in `mcpwm_fault_register_eventcallbacks()`
**Return** Whether a task switch is needed after the callback returns

typedef bool (`mcpwm_compare_event_cb_t`)(`mcpwm_cmpr_handle_t` comparator, const `mcpwm_compare_event_data_t` *edata, void *user_ctx)

MCPWM comparator event callback function.

**Param comparator** MCPWM comparator handle
**Param edata** MCPWM comparator event data, fed by driver
**Param user_ctx** User data, set in `mcpwm_comparator_register_eventcallbacks()`
**Return** Whether a high priority task has been waken up by this function

typedef bool (`mcpwm_capture_event_cb_t`)(`mcpwm_cap_channel_handle_t` cap_channel, const `mcpwm_capture_event_data_t` *edata, void *user_ctx)

MCPWM capture event callback function.

**Param cap_channel** MCPWM capture channel handle
**Param edata** MCPWM capture event data, fed by driver
**Param user_ctx** User data, set in `mcpwm_capture_channel_register_eventcallbacks()`
**Return** Whether a high priority task has been waken up by this function

**Header File**

- components/hal/include/hal/mcpwm_types.h

**Type Definitions**

typedef `soc_periph_mcpwm_timer_clk_src_t` `mcpwm_timer_clock_source_t`

MCPWM timer clock source.

typedef `soc_periph_mcpwm_capture_clk_src_t` `mcpwm_capture_clock_source_t`

MCPWM capture clock source.

**Enumerations**

enum `mcpwm_timer_direction_t`

MCPWM timer count direction.

**Values:**
enumerator MCPWM_TIMER_DIRECTION_UP
    Counting direction: Increase

enumerator MCPWM_TIMER_DIRECTION_DOWN
    Counting direction: Decrease

enum mcpwm_timer_event_t
    MCPWM timer events.
    Values:
    enumerator MCPWM_TIMER_EVENT_EMPTY
        MCPWM timer counts to zero (i.e. counter is empty)
    enumerator MCPWM_TIMER_EVENT_FULL
        MCPWM timer counts to peak (i.e. counter is full)
    enumerator MCPWM_TIMER_EVENT_INVALID
        MCPWM timer invalid event

enum mcpwm_timer_count_mode_t
    MCPWM timer count modes.
    Values:
    enumerator MCPWM_TIMER_COUNT_MODE_PAUSE
        MCPWM timer paused
    enumerator MCPWM_TIMER_COUNT_MODE_UP
        MCPWM timer counting up
    enumerator MCPWM_TIMER_COUNT_MODE_DOWN
        MCPWM timer counting down
    enumerator MCPWM_TIMER_COUNT_MODE_UP_DOWN
        MCPWM timer counting up and down

enum mcpwm_timer_start_stop_cmd_t
    MCPWM timer commands, specify the way to start or stop the timer.
    Values:
    enumerator MCPWM_TIMER_STOP_EMPTY
        MCPWM timer stops when next count reaches zero
    enumerator MCPWM_TIMER_STOP_FULL
        MCPWM timer stops when next count reaches peak
    enumerator MCPWM_TIMER_START_NO_STOP
        MCPWM timer starts couting, and don’t stop until received stop command
enumerator **MCPWM_TIMER_START_STOP_EMPTY**
MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM_TIMER_START_STOP_FULL**
MCPWM timer starts counting and stops when next count reaches peak

**enum mcpwm_generator_action_t**
MCPWM generator actions.
Values:

enumerator **MCPWM_GEN_ACTION_KEEP**
Generator action: Keep the same level

enumerator **MCPWM_GEN_ACTION_LOW**
Generator action: Force to low level

enumerator **MCPWM_GEN_ACTION_HIGH**
Generator action: Force to high level

enumerator **MCPWM_GEN_ACTION_TOGGLE**
Generator action: Toggle level

**enum mcpwm_operator_brake_mode_t**
MCPWM operator brake mode.
Values:

enumerator **MCPWM_OPER_BRAKE_MODE_CBC**
Brake mode: CBC (cycle by cycle)

enumerator **MCPWM_OPER_BRAKE_MODE_OST**
Brake mode, OST (one shot)

enumerator **MCPWM_OPER_BRAKE_MODE_INVALID**
MCPWM operator invalid brake mode

**enum mcpwm_capture_edge_t**
MCPWM capture edge.
Values:

enumerator **MCPWM_CAP_EDGE_POS**
Capture on the positive edge

enumerator **MCPWM_CAP_EDGE_NEG**
Capture on the negative edge
2.6.13 脉冲计数器 (PCNT)

概述
PCNT 用于统计输入信号的上升沿和/或下降沿的数量。ESP32 集成了多个脉冲计数单元，每个单元都是包含多个通道的独立计数器。通道可独立配置为统计上升沿或下降沿数量的递增计数器或递减计数器。
PCNT 通道可检测 边沿 信号及 电平 信号。对于比较简单的应用，检测边沿信号就足够了。PCNT 通道可检测上升沿信号、下降沿信号、同时也能设置为递增计数、递减计数，或停止计数。电平信号就是所谓的 控制信号，可用来控制边沿信号的计数模式。通过设置电平信号与边沿信号的检测模式，PCNT 单元可用作 正交解码器。
每个 PCNT 单元还包含一个滤波器，用于滤除线路毛刺。
PCNT 模块通常用于：
- 对一段时间内的脉冲计数，进而计算得到周期信号的频率；
- 对正交信号进行解码，进而获得速度和方向信号。

功能描述
PCNT 的功能从以下几个方面进行说明：
- 分配资源 - 说明如何通过配置分配 PCNT 单元和通道，以及在相应操作完成之后，如何回收单元和通道。
- 设置通道操作 - 说明如何设置通道针对不同信号沿和电平进行操作。
- PCNT 观察点 - 说明如何配置观察点，即当计数器达到某个数值时，命令 PCNT 单元触发某个事件。
- 注册事件回调函数 - 说明如何将您的代码挂载到观察点事件的回调函数上。
- 设置毛刺滤波器 - 说明如何使能毛刺滤波器并设置其时序参数。
- 使能和禁用单元 - 说明如何使能和关闭 PCNT 单元。
- 控制单元 IO 操作 - 说明 PCNT 单元的 IO 控制功能，例如使能毛刺滤波器，开启和停止 PCNT 单元，获取和清除计数。
- 电源管理 - 说明那些功能会阻止芯片进入低功耗模式。
- 支持 IRAM 安全中断 - 说明在缓存禁止的情况下，如何执行 PCNT 中断和 IO 控制功能。
- 支持线程安全 - 列出线程安全的 API。
- 支持的 Kconfig 选项 - 列出了支持的 Kconfig 选项，这些选项可实现不同的驱动效果。

分配资源 PCNT 单元和通道分别用 pcnt_unit_handle_t 与 pcnt_channel_handle_t 表示。所有的可用单元和通道都由驱动在资源池中进行维护，无需了解底层实例 ID。

安装 PCNT 单元 安装 PCNT 单元时，需要先完成配置 pcnt_unit_config_t:
- pcnt_unit_config_t::low_limit 与 pcnt_unit_config_t::high_limit 用于指定内部计数器的最小值和最大值。当计数器超过任一限值时，计数器将归零。
- pcnt_unit_config_t::accum_count 用于设置是否需要在硬件计数值溢出的时候进行累加保存。这有助于“拓宽”计数器的实际位宽。默认情况下，计数器的位宽最高只有 16 比特。请参考计数溢出补偿 了解如何利用此功能来补偿硬件计数器的溢出损失。
调用函数 pcnt_new_unit() 并将 pcnt_unit_config_t 作为其输入值，可对 PCNT 单元进行分配和初始化。该函数正常运行时，会返回一个 PCNT 单元句柄。没有可用的 PCNT 单元时，即 PCNT 单元全部被占用，该函数会返回错误 ESP_ERR_NOT_FOUND。可用的 PCNT 单元总数记录在 SOC_PCNT_UNITS_PER_GROUP 中，以供参考。

如果不再需要之前创建的某个 PCNT 单元，建议通过调用 pcnt_del_unit() 来回收该单元，从而该单元可用于其他用途。删除某个 PCNT 单元之前，需要满足以下条件：
- 该单元处于初始状态，即该单元要么已经被 pcnt_unit_disable() 禁用，要么尚未使能。

1 在不同的 ESP 芯片系列中，PCNT 单元和通道的数量可能会有差异。具体信息请参考 [TRM]，驱动不会禁止用户申请更多的 PCNT 单元和通道，但是当单元和通道资源全部被占用时，再调用单元和通道会返回错误。因此分配资源时，应注意检查返回值。如 pcnt_new_unit()。
安装 PCNT 通道 安装 PCNT 通道时，需要先初始化 pcnt_chan_config_t，然后调用 pcnt_new_channel()。对 pcnt_chan_config_t 配置如下所示:

- pcnt_chan_config_t::edge_gpio_num 与 pcnt_chan_config_t::level_gpio_num 用于指定边沿信号的 GPIO 编号。请注意，这两个参数未被使用时，可以设置为 -1，即成为虚拟 IO。对于一些简单的脉冲计数应用，电平信号或边沿信号是固定的（即不会发生改变），可将其设置为虚拟 IO，然后该信号会被连接到一个固定的高/低电平电平，这样就可以在通道分配时回收一个 GPIO。节省一个 GPIO 管脚资源。
- pcnt_chan_config_t::virt_edge_io_level 与 pcnt_chan_config_t::virt_level_io_level 用于指定边沿信号和电平信号的虚拟 IO 电平，以保证这些控制信号处于初始化状态。请注意，只有在 pcnt_chan_config_t::edge_gpio_num 或 pcnt_chan_config_t::level_gpio_num 设置为 -1 时，这两个参数才有效。
- pcnt_chan_config_t::invert_edge_input 与 pcnt_chan_config_t::invert_level_input 用于确定信号在输入 PCNT 之前是否需要被翻转，信号翻转由 GPIO 矩阵（不是 PCNT 单元）执行。
- pcnt_chan_config_t::io_loop back 仅用于调试，它可以达成 GPIO 的输入和输出路径。这样，就可以通过调用用于同一 GPIO 上的函数 gpio_set_level() 来模拟脉冲信号。

调用函数 pcnt_new_channel()，将 pcnt_chan_config_t 作为输入值并调用 pcnt_new_unit() 返回的 PCNT 单元句柄，可对 PCNT 通道进行分配和初始化。如果该函数正常运行，会返回一个 PCNT 通道句柄。如果没有可用的 PCNT 通道（PCNT 通道资源全部被占用），该函数会返回错误 ESP_ERR_NOT_FOUND。可用的 PCNT 通道总数记录在 SOC_PCNT_CHANNELS_PER_UNIT，供参考。注意，为某个单元安装 PCNT 通道时，应确保该单元处于初始化状态，否则函数 pcnt_new_channel() 会返回错误 ESP_ERR_INVALID_STATE。

如果不再需要之前创建的某个 PCNT 通道，建议通过调用 pcnt_del_channel() 回收该通道，从而该通道可用于其他用途。

设置通道操作 当输入脉冲信号切换时，PCNT 通道会增加，减少或停止计数。边沿信号及电平信号可设置为不同的计数器操作。

- pcnt_channel_set_edge_action() 为输入到 pcnt_chan_config_t::edge_gpio_num 的信号上升沿和下降沿设置操作，pcnt_channel_edge_action_t 中列出了支持的操作。
- pcnt_channel_set_level_action() 为输入到 pcnt_chan_config_t::level_gpio_num 的信号高电平和低电平设置操作，pcnt_channel_level_action_t 中列出了支持的操作。使用 pcnt_new_channel() 分配 PCNT 通道时，如果 pcnt_chan_config_t::level_gpio_num 被设置为 -1，就无需对该函数进行设置了。
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_¬DECREASE, PCNT_CHANNEL_EDGE_ACTION_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_¬counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_¬KEEP, PCNT_CHANNEL_LEVEL_ACTION_ACTION_INVERSE));

PCNT 观察点 PCNT 单元可被设置为观察几个特定的数值，这些被观察的数值被称为观察点。观察点不能超过 pcnt_unit_config_t 设置的范围，最小值和最大值分别为 pcnt_unit_config_t::low_limit 和 pcnt_unit_config_t::high_limit。当计数器到达任一观察点时，会触发一个观察事件，如果在 pcnt_unit_register_event_callbacks() 注册过事件回调函数，该事件就会通过中断通知您。关于如何注册事件回调函数，请参考注册事件回调函数。

观察点分别可以通过 pcnt_unit_add_watch_point() 和 pcnt_unit_remove_watch_point() 进行添加和删除。常用的观察点包括过零、最大/最小计数以及其他阈值。可用的观察点是有限的，如果 pcnt_unit_add_watch_point() 无法获得空闲硬件资源来存储观察点，会返回错误 ESP_ERR_NOT_FOUND。不能多次添加同一个观察点，否则将返回错误 ESP_ERR_INVALID_STATE。

建议通过 pcnt_unit_remove_watch_point() 删除未使用的观察点来回收资源。

备注：由于硬件上的限制，在添加一个新的观察点后，你需要调用 pcnt_unit_clear_count() 函数来使之生效。

注册事件回调函数 当 PCNT 单元的数值达到任一使用的观察点的数值时，会触发相应的事件并通知 CPU。如果您想在事件触发时执行相关函数，可通过调用 pcnt_unit_register_event_callbacks() 将函数挂载到中断服务程序 (ISR) 上。

pcnt_event_callbacks_t 列出了所有支持的事件回调函数：
• pcnt_event_callbacks_t::on_reach 用于为观察点事件设置回调函数。由于该回调函数是在 ISR 的上下文中被调用的，必须确保该函数不会阻塞调用的任务。(例如，可确保只有以 ISR 为后缀的 FreeRTOS API 才能在函数中调用。) pcnt_watch_cb_t 中声明了该回调函数的原型。

可使用 user_ctx 将函数上下文保存到 pcnt_unit_register_event_callbacks() 中，这些数据会直接传递给回调函数。

驱动程序会将特定事件的数据写入回调函数中，例如，观察点事件数据被声明为 pcnt_watch_event_data_t：
• pcnt_watch_event_data_t::watch_point_value 用于保存触发该事件的观察点数值。
• pcnt_watch_event_data_t::zero_cross_mode 用于保存上一次 PCNT 单元的过零模式，pcnt_unit_zero_cross_mode_t 中列出了所有可能的过零模式，通常，不同的过零模式意味着不同的计数方向和计数步长。

注册回调函数会导致中断服务延迟安装，因此回调函数只能在 PCNT 单元被 pcnt_unit_enable() 使能之前调用，否则，回调函数会返回错误 ESP_ERR_INVALID_STATE。

static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_¬data_t *data, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
}
xQueueSendFromISR(queue, &edata->watch_point_value), &high_task_wakeup);
// return whether a high priority task has been waken up by this function
return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));

### 设置毛刺滤波器
PCNT单元的滤波器可滤除信号中的短时毛刺。`pcnt_glitch_filter_config_t`中列出了毛刺滤波器的配置参数：

- `pcnt_glitch_filter_config_t::max_glitch_ns`设置最大的毛刺宽度。单位为微秒。如果一个信号脉冲的宽度小于该数值，则该信号会被认定为噪声而不会触发计数器操作。

可通过调用`pcnt_unit_set_glitch_filter()`来使能毛刺滤波器，并对上述参数进行配置。之后，还可通过调用`pcnt_unit_set_glitch_filter()`来关闭毛刺滤波器，并将上述参数设置为`NULL`。

调用该函数时，PCNT单元应处于初始状态。否则，函数将返回错误`ESP_ERR_INVALID_STATE`。

```c
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

### 使能和禁用单元
在对PCNT单元进行IO控制之前，需要通过调用函数`pcnt_unit_enable()`来使能该PCNT单元。该函数将完成以下操作：

- 将PCNT单元的驱动状态从初始切换为使能。
- 如果中断服务已经在`pcnt_unit_register_event_callbacks()`延迟安装，使能中断服务。
- 如果电源管理锁已经在`pcnt_unit_set_glitch_filter()`延迟安装，获取该电源管理锁。请参考电源管理获取更多信息。

调用函数`pcnt_unit_disable()`会进行相反的操作，即PCNT单元的驱动状态切换回初始状态，禁用中断服务并释放电源管理锁。

### 控制单元IO操作

#### 启用/停用及清零
通过调用`pcnt_unit_start()`可启用PCNT单元，根据不同脉冲信号进行递增或递减计数；通过调用`pcnt_unit_stop()`可停用PCNT单元，当前的计数值会保留；通过调用`pcnt_unit_clear_count()`可将计数器清零。

注意`pcnt_unit_start()`和`pcnt_unit_stop()`应该在PCNT单元被`pcnt_unit_enable()`使能后调用，否则将返回错误`ESP_ERR_INVALID_STATE`。
获取计数器数值  
调用 `pcnt_unit_get_count()` 可随时获取当前计数器的数值。返回的计数值是一个带符号的整型数，其符号反映了计数的方向。

```c
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

计数溢出补偿  
PCNT 内部的硬件计数器会在计数达到高/低门限时自动清零。如果你想补偿该计数值的溢出损失，以期进一步拓宽计数器的实际位宽，你可以：

1. 在安装 PCNT 计数单元的时候使能 `pcnt_unit_config_t::accum_count` 选项。
2. 将高/低计数门限设置为 `PCNT` 观察点。
3. 现在，`pcnt_unit_get_count()` 函数返回的计数值就会包含硬件计数器当前的计数值，累加上计数器溢出造成的损失。

备注：`pcnt_unit_clear_count()` 会复位该软件累加器。

电源管理  
使能电源管理（即 `CONFIG_PM_ENABLE` 开启）后，在进入 Light-sleep 模式之前，系统会调整 APB 的频率。这会改变 PCNT 毛刺滤波器的参数，从而可能导致有效信号被滤除。

驱动通过获取 `ESP_PM_APB_FREQ_MAX` 类型的电源管理锁来防止系统修改 APB 频率。每当通过 `pcnt_unit_set_glitch_filter()` 使能毛刺滤波器时，驱动可以保证系统在 `pcnt_unit_enable()` 使能 PCNT 单元后获取电源管理锁。而系统调用 `pcnt_unit_disable()` 之后，驱动会释放电源管理锁。

支持 IRAM 安全中断  
当缓存由于写入/擦除 flash 等原因被禁用时，PCNT 中断会默认被延迟。这会导致报警中断无法及时执行，从而无法满足实时性应用的要求。

Konfig 选项 `CONFIG_PCNT_ISR_IRAM_SAFE` 可以实现以下功能：

1. 即使缓存被禁用也可以使能中断服务
2. 将 ISR 使用的所有函数都放入 IRAM 中
3. 将驱动对象放入 DRAM（防止驱动对象被意外映射到 PSRAM 中）

这样，在缓存被禁用时，中断也可运行，但是这也会增加 IRAM 的消耗。

另外一个 Konfig 选项 `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` 也可以把常用的 IO 控制函数放在 IRAM 中。这样，当缓存禁用时，这些函数仍然可以执行。这些 IO 控制函数如下所示：

```
• pcnt_unit_start()
• pcnt_unit_stop()
• pcnt_unit_clear_count()
• pcnt_unit_get_count()
```

支持线程安全  
驱动保证工厂函数 `pcnt_new_unit()` 与 `pcnt_new_channel()` 是线程安全的，因此您可以从 RTOS 任务中调用这些函数而无需使用额外的电源管理锁。以下函数可以在 ISR 上下文中运行，驱动可以防止这些函数在任务和 ISR 中同时被调用。

```
• pcnt_unit_start()
• pcnt_unit_stop()
• pcnt_unit_clear_count()
• pcnt_unit_get_count()
```

其他以 `pcnt_unit_handle_t` 和 `pcnt_channel_handle_t` 作为第一个参数的函数被视为线程不安全函数。在多任务场景下应避免调用这些函数。

```
• pcnt_event_callbacks_t::on_reach
```

2 `pcnt_event_callbacks_t::on_reach` 回调函数和其调用的函数也应该放在 IRAM 中。
支持的 Kconfig 选项

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` 用于确定 PCNT 控制函数的位置 (放在 IRAM 还是 flash 中)，请参考支持 IRAM 安全中断 获取更多信息。
- `CONFIG_PCNT_ISR_IRAM_SAFE` 用于控制当缓存禁用时，默认的 ISR 姿构是否可以工作，请参考支持 IRAM 安全中断 获取更多信息。
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` 用于使能调试日志输出，而这一会增大固件二进制文件。

应用实例

- 对旋转编码器的正转信号进行解码的实例请参考：peripherals/pcnt/rotary_encoder。

API 参考

Header File

- components/driver/include/driver/pulse_cnt.h

Functions

```c
esp_err_t pcnt_new_unit (const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)
```

Create a new PCNT unit, and return the handle.

备注: The newly created PCNT unit is put in the init state.

参数

- `config` [in] PCNT unit configuration
- `ret_unit` [out] Returned PCNT unit handle

返回

- ESP_OK: Create PCNT unit successfully
- ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
- ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP_FAIL: Create PCNT unit failed because of other error

```c
esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)
```

Delete the PCNT unit handle.

备注: A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

参数

- `unit` [in] PCNT unit handle created by `pcnt_new_unit()`

返回

- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_set_glitch_filter (pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)
```
Set glitch filter for PCNT unit.

备注: The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

备注: This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

参数
- `unit` [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` [in] PCNT filter configuration, set config to NULL means disabling the filter function

返回
- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

`esp_err_t pcnt_unit_enable (pcnt_unit_handle_t unit)`
Enable the PCNT unit.

备注: This function will transit the unit state from init to enable.

备注: This function will enable the interrupt service, if it’s lazy installed in `pcnt_unit_register_event_callbacks()`.

备注: This function will acquire the PM lock if it’s lazy installed in `pcnt_unit_set_glitch_filter()`.

备注: Enable a PCNT unit doesn’t mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

参数 `unit` [in] PCNT unit handle created by `pcnt_new_unit()`

返回
- ESP_OK: Enable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Enable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP_FAIL: Enable PCNT unit failed because of other error

`esp_err_t pcnt_unit_disable (pcnt_unit_handle_t unit)`
Disable the PCNT unit.
This function will do the opposite work to the `pcnt_unit_enable()` function.

Disable a PCNT unit doesn’t mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

**Parameters**
- `unit`: PCNT unit handle created by `pcnt_new_unit()`

**Return**
- `ESP_OK`: Disable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Disable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Disable PCNT unit failed because of other error

**Declaration**
```c
esp_err_t pcnt_unit_start(pcnt_unit_handle_t unit)
```

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

**Parameters**
- `unit`: PCNT unit handle created by `pcnt_new_unit()`

**Return**
- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

**Declaration**
```c
esp_err_t pcnt_unit_stop(pcnt_unit_handle_t unit)
```

Stop PCNT from counting.

**Parameters**
- `unit`: PCNT unit handle created by `pcnt_new_unit()`

**Return**
- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error
Chapter 2. API参考

参数 unit - [in] PCNT unit handle created by pcnt_new_unit()
返回
- ESP_OK: Stop PCNT unit successfully
- ESP_ERR_INVALID_ARG: Stop PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Stop PCNT unit failed because of other error

**esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t unit)**
Clear PCNT pulse count value to zero.

注: It’s recommended to call this function after adding a watch point by pcnt_unit_add_watch_point(), so that the newly added watch point is effective immediately.

注: This function is allowed to run within ISR context

注: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it’s allowed to be executed when Cache is disabled

参数 unit - [in] PCNT unit handle created by pcnt_new_unit()
返回
- ESP_OK: Clear PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Clear PCNT pulse count failed because of invalid argument
- ESP_FAIL: Clear PCNT pulse count failed because of other error

**esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t unit, int* value)**
Get PCNT count value.

注: This function is allowed to run within ISR context

注: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it’s allowed to be executed when Cache is disabled

参数
- unit - [in] PCNT unit handle created by pcnt_new_unit()
- value - [out] Returned count value
返回
- ESP_OK: Get PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
- ESP_FAIL: Get PCNT pulse count failed because of other error

**esp_err_t pcnt_unit_register_event_callbacks (pcnt_unit_handle_t unit, const pcnt_event_callbacks_t *cbs, void *user_data)**
Set event callbacks for PCNT unit.

注: User registered callbacks are expected to be runnable within ISR context

注: The first call to this function needs to be before the call to pcnt_unit_enable
Chapter 2. API

[Chapter content]

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Function:** `pcnt_unit_add_watch_point`

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

**Parameters:**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `watch_point` - [in] Value to be watched

**Return Values:**
- `ESP_OK`: Add watch point successfully
- `ESP_ERR_INVALID_ARG`: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add watch point failed because the same watch point has already been added
- `ESP_ERR_NOT_FOUND`: Add watch point failed because no more hardware watch point can be configured
- `ESP_FAIL`: Add watch point failed because of other error

**Function:** `pcnt_unit_remove_watch_point`

Remove a watch point for PCNT unit.

**Parameters:**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `watch_point` - [in] Watch point value

**Return Values:**
- `ESP_OK`: Remove watch point successfully
- `ESP_ERR_INVALID_ARG`: Remove watch point failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- `ESP_FAIL`: Remove watch point failed because of other error

**Function:** `pcnt_new_channel`

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

**Parameters:**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT channel configuration
- `ret_chan` - [out] Returned channel handle

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)
• ESP_OK: Create PCNT channel successfully
• ESP_ERR_INVALID_ARG: Create PCNT channel failed because of invalid argument
• ESP_ERR_NO_MEM: Create PCNT channel failed because of insufficient memory
• ESP_ERR_NOT_FOUND: Create PCNT channel failed because all PCNT channels are used up and no more free one
• ESP_ERR_INVALID_STATE: Create PCNT channel failed because the unit is not in the init state
• ESP_FAIL: Create PCNT channel failed because of other error

Esp_err_t pcnt_del_channel (pcnt_channel_handle_t chan)
Delete the PCNT channel.

参数 chan - [in] PCNT channel handle created by pcnt_new_channel()

返回
• ESP_OK: Delete the PCNT channel successfully
• ESP_ERR_INVALID_ARG: Delete the PCNT channel failed because of invalid argument
• ESP_FAIL: Delete the PCNT channel failed because of other error

Esp_err_t pcnt_channel_set_edge_action (pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)
Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the edge_gpio_num configured in pcnt_chan_config_t. We use these actions to control when and how to change the counter value.

参数
• chan - [in] PCNT channel handle created by pcnt_new_channel()
• pos_act - [in] Action on posedge signal
• neg_act - [in] Action on negedge signal

返回
• ESP_OK: Set edge action for PCNT channel successfully
• ESP_ERR_INVALID_ARG: Set edge action for PCNT channel failed because of invalid argument
• ESP_FAIL: Set edge action for PCNT channel failed because of other error

Esp_err_t pcnt_channel_set_level_action (pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)
Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the level_gpio_num configured in pcnt_chan_config_t. We use these actions to control when and how to change the counting mode.

参数
• chan - [in] PCNT channel handle created by pcnt_new_channel()
• high_act - [in] Action on high level signal
• low_act - [in] Action on low level signal

返回
• ESP_OK: Set level action for PCNT channel successfully
• ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
• ESP_FAIL: Set level action for PCNT channel failed because of other error

Structures

struct pcnt_watch_event_data_t
PCNT watch event data.

Public Members
int watch_point_value
    Watch point value that triggered the event

pcnt_unit_zero_cross_mode_t zero_cross_mode
    Zero cross mode

struct pcnt_event_callbacks_t
    Group of supported PCNT callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

pcnt_watch_cb_t on_reach
    Called when PCNT unit counter reaches any watch point

struct pcnt_unit_config_t
    PCNT unit configuration.

Public Members

int low_limit
    Low limitation of the count unit, should be lower than 0

int high_limit
    High limitation of the count unit, should be higher than 0

uint32_t accum_count
    Whether to accumulate the count value when overflows at the high/low limit

struct pcnt_unit_config_t::[anonymous] flags
    Extra flags

struct pcnt_chan_config_t
    PCNT channel configuration.

Public Members

int edge_gpio_num
    GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused
int level_gpio_num
    GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t invert_edge_input
    Invert the input edge signal

uint32_t invert_level_input
    Invert the input level signal

uint32_t virt_edge_io_level
    Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t virt_level_io_level
    Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct pcnt_chan_config_t::[anonymous] flags
    Channel config flags

struct pcnt_glitch_filter_config_t
    PCNT glitch filter configuration.

Public Members

uint32_t max_glitch_ns
    Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

Type Definitions

typedef struct pcnt_unit_t *pcnt_unit_handle_t
    Type of PCNT unit handle.

typedef struct pcnt_chan_t *pcnt_channel_handle_t
    Type of PCNT channel handle.

typedef bool (*)(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx) pcnt_watch_cb_t
    PCNT watch event callback prototype.

备注： The callback function is invoked from an ISR context, so it should meet the restrictions of not calling
any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

Param unit [in] PCNT unit handle
Param edata [in] PCNT event data, fed by the driver
Param user_ctx [in] User data, passed from pcnt_unit_register_event_callbacks()
Return Whether a high priority task has been woken up by this function
Header File

- components/hal/include/hal/pcnt_types.h

Enumerations

```c
enum pcnt_channel_level_action_t
    PCNT channel action on control level.

Values:

enumerator PCNT_CHANNEL_LEVEL_ACTION_KEEP
    Keep current count mode

enumerator PCNT_CHANNEL_LEVEL_ACTION_INVERSE
    Invert current count mode (increase -> decrease, decrease -> increase)

enumerator PCNT_CHANNEL_LEVEL_ACTION_HOLD
    Hold current count value
```

```c
enum pcnt_channel_edge_action_t
    PCNT channel action on signal edge.

Values:

enumerator PCNT_CHANNEL_EDGE_ACTION_HOLD
    Hold current count value

enumerator PCNT_CHANNEL_EDGE_ACTION_INCREASE
    Increase count value

enumerator PCNT_CHANNEL_EDGE_ACTION_DECREASE
    Decrease count value
```

```c
enum pcnt_unit_zero_cross_mode_t
    PCNT unit zero cross mode.

Values:

enumerator PCNT_UNIT_ZERO_CROSS_POS_ZERO
    start from positive value, end to zero, i.e. +N->0

enumerator PCNT_UNIT_ZERO_CROSS_NEGZERO
    start from negative value, end to zero, i.e. -N->0

enumerator PCNT_UNIT_ZERO_CROSS_NEG_POS
    start from negative value, end to positive value, i.e. -N->+M

enumerator PCNT_UNIT_ZERO_CROSS_POS_NEG
    start from positive value, end to negative value, i.e. +N->-M
```
2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, the functionality of RMT can be extended to a versatile and general purpose transceiver. From the perspective of network layering, the RMT hardware contains both physical and data link layer. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called RMT symbol, which is represented by \texttt{rmt_symbol_word_t} in the driver.

ESP32 contains multiple channels in the RMT peripheral. Each channel can be configured as either transmitter or receiver, independently.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g. NEC
- General purpose sequence generator
- Transmit signals in a hardware controlled loop, with finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols

The RMT hardware defines data in its own pattern—the RMT symbol. Each symbol consists of two pairs of two values. The first value in a pair describes the signal duration in RMT ticks and is 15 bits long. The second provides the signal level (high or low) and is contained in a single bit, as shown below:

![Structure of RMT symbols (L - signal level)](image)

RMT Transmitter Overview

The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver will encode user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high frequency carrier signal before being routed to a GPIO pad.

RMT Receiver Overview

The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It’s feasible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high frequency carrier from the base signal.

1 Different ESP chip series might have different number of RMT channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more RMT channels, but it will return error when there’s no hardware resources available. Please always check the return value when doing Resource Allocation.
图 14: RMT Transmitter Overview

图 15: RMT Receiver Overview
Chapter 2. API

Functional Overview

Description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate RMT channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **Carrier Modulation and Demodulation** - describes how to modulate carrier for TX channel and demodulate carrier for RX channel.
- **Register Event Callbacks** - covers how to hook user specific code to RMT channel specific events.
- **Enable and Disable channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group and start transaction at the same time.
- **RMT Encoder** - focuses on how to write a customized encoder in a combination way, with the help of the primitive encoders provided by the driver.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation**

Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The available channels are managed in a resource pool, which will hand out a free channel on request.

**Install RMT TX Channel**

To install an RMT TX channel, there’s a configuration structure that needs to be given in advance: `rmt_tx_channel_config_t`:

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` sets the size of the dedicated memory block or DMA buffer that is used to store RMT encoding artifacts.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both the GPIO’ s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.
- `rmt_tx_channel_config_t::io_od_mode` configures the GPIO as open-drain mode. It is useful for simulating bi-directional buses, such as 1-wire bus, combined with `rmt_tx_channel_config_t::io_loop_back`.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return `ESP_ERR_NOT_FOUND` error. If some feature (e.g. DMA backend) is not supported by hardware, it will return `ESP_ERR_NOT_SUPPORTED` error.
Chapter 2. API

rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,  // select source clock
    .gpio_num = 0,                   // GPIO number
    .mem_block_symbols = 64,         // memory block size, 64 * 4 = 256Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
    .trans_queue_depth = 4,          // set the number of transactions that can... pend in the background
    .flags.invert_out = false,       // don't invert output signal
    .flags.with_dma = false,         // don't need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));

Install RMT RX Channel To install an RMT RX channel, there’s a configuration structure that needs to be given in advance: rmt_rx_channel_config_t:

- rmt_rx_channel_config_t::gpio_num sets the GPIO number used by the receiver.
- rmt_rx_channel_config_t::clk_src selects the source clock for the RMT channel. The available clocks are listed in rmt_clock_source_t. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to Power Management section.
- rmt_rx_channel_config_t::resolution_hz sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
- rmt_rx_channel_config_t::mem_block_symbols sets the size of the dedicated memory block or DMA buffer that used to store RMT encoding artifacts.
- rmt_rx_channel_config_t::invert_in is used to decide whether to invert the input signals before they going into RMT receiver. The inversion is done by GPIO matrix instead of by the RMT peripheral.
- rmt_rx_channel_config_t::with_dma is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter ESP_ERR_NOT_SUPPORTED error.
- rmt_rx_channel_config_t::io_loop_back is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.

Once the rmt_rx_channel_config_t structure is populated with mandatory parameters, users can call rmt_new_rx_channel() to allocate and initialize a RX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return ESP_ERR_NOT_FOUND error. If some feature (e.g. DMA backend) is not supported by hardware, it will return ESP_ERR_NOT_SUPPORTED error.

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it’s recommended to recycle the resources by calling rmt_del_channel(), which in return allows the underlying hardware to be usable for other purposes.
Carrying Modulation and Demodulation. The RMT transmitter can generate a carrier wave and modulate it onto the base signal. Compared to the base signal, the carrier frequency is usually high. In addition, the user can only set the frequency and duty cycle for the carrier. The RMT receiver can demodulate the carrier from the incoming signal. Note that, carrier modulation and demodulation is not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a ESP_ERR_NOT_SUPPORTED error.

Carrier related configurations lie in rmt_carrier_config_t:

- rmt_carrier_config_t::frequency_hz sets the carrier frequency, in Hz.
- rmt_carrier_config_t::duty_cycle sets the carrier duty cycle.
- rmt_carrier_config_t::polarity_active_low sets the carrier polarity, i.e. on which level the carrier is applied.
- rmt_carrier_config_t::always_on sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for TX channel.

For RX channel, we shouldn’t set the carrier frequency exactly to the theoretical value. It’s recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25KHz, instead of the 38KHz that configured on the TX side. The reason is that reflection and refraction will occur when a signal travels through the air, leading to a distortion on the receiver side.

```c
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 38000, // 38KHz
    .flags.polarity_active_low = false, // carrier should modulated to high level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 25000, // 25KHz carrier, should be smaller than...
    .transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks. When an RMT channel finishes transmitting or receiving, a specific event will be generated and notify the CPU by interrupt. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling rmt_tx_register_event_callbacks() and rmt_rx_register_event_callbacks() for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn’t attempt to block (e.g. by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

TX channel supported event callbacks are listed in the rmt_tx_event_callbacks_t:

- rmt_tx_event_callbacks_t::on_trans_done sets a callback function for trans done event. The function prototype is declared in rmt_tx_done_callback_t.

RX channel supported event callbacks are listed in the rmt_rx_event_callbacks_t:

- rmt_rx_event_callbacks_t::on_recv_done sets a callback function for receive complete event. The function prototype is declared in rmt_rx_done_callback_t.

User can save own context in rmt_tx_register_event_callbacks() and rmt_rx_register_event_callbacks() as well, via the parameter user_data. The user data will be directly passed to each callback function.
In the callback function, users can fetch the event specific data that is filled by the driver in the edata. Note that the edata pointer is only valid for the duration of the callback.

The TX done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` tells the number of transmitted RMT symbols. This also reflects the size of encoding artifacts.

The RX complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the buffer parameter of `rmt_receive()` function. User shouldn’t free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` tells the number of received RMT symbols. This value won’t be bigger than buffer_size parameter of `rmt_receive()` function. If the buffer_size is not sufficient to accommodate all the received RMT symbols, the driver will truncate it.

Enable and Disable channel  
`rmt_enable()` must be called in advanced before transmitting or receiving RMT symbols. For transmitters, enabling a channel will enable a specific interrupt and prepare the hardware to dispatch transactions. For RX channels, enabling a channel will enable an interrupt, but the receiver is not started during this time, as it has no idea about the characteristics of the incoming signals. The receiver will be started in `rmt_receive()`.

`rmt_disable()` does the opposite work by disabling the interrupt and clearing pending status. The transmitter and receiver will be disabled as well.

```c
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

Initiate TX Transaction  
RMT is a special communication peripheral as it’s unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware doesn’t help to convert the user data into RMT symbols, this can only be done in software — by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then write to RMT memory block or DMA buffer. For how to create an RMT encoder, please refer to [RMT Encoder].

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, payload buffer. Besides that, we also need to provide a transmission specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loop. After the transmitter finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences at the cost of a very little CPU intervention. Specially, setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this situation, the channel won’t stop until manually call of `rmt_disable()`. And the trans done event won’t be generated as well. If `rmt_transmit_config_t::loop_count` is set to a positive number, the trans done event won’t be generated until target number of loop transmission have finished. Note that, the loop transmit feature is not supported on all ESP chips, please refer to [TRM] before you configure this option. Or you might encounter ESP_ERR_NOT_SUPPORTED error.
- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
• Increase the \texttt{rmt\_tx\_channel\_config\_t::mem\_block\_symbols}. This approach doesn’t work if the DMA backend is also enabled.
• Customize an encoder and construct a forever loop in the encoding function. See also \textit{RMT Encoder}.

Internally, \texttt{rmt\_transmit()} will construct a transaction descriptor and send to a job queue, which will be dispatched in the ISR. So it is possible that the transaction is not started yet when \texttt{rmt\_transmit()} returns. To ensure all pending transaction to complete, user can use \texttt{rmt\_tx\_wait\_all\_done()}. 

**Multiple Channels Simultaneous Transmission** In some real-time control applications, we don’t want any time drift in between when startup multiple TX channels. For example, to make two robotic arms move simultaneously. The RMT driver can help to manage this by creating a so-called \textbf{Sync Manager}. The sync manager is represented by \texttt{rmt\_sync\_manager\_handle\_t} in the driver. The procedure of RMT sync transmission is shown as follows:

![Diagram of RMT TX Sync](image)

**Install RMT Sync Manager** To create a sync manager, user needs to tell which channels are going to be managed in the \texttt{rmt\_sync\_manager\_config\_t}:

- \texttt{rmt\_sync\_manager\_config\_t::tx\_channel\_array} points to the array of TX channels to be managed.
- \texttt{rmt\_sync\_manager\_config\_t::array\_size} sets the number of channels to be managed.

\texttt{rmt\_new\_sync\_manager()} can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Specially, when the sync manager has been installed before, and there’re no hardware resources to create another manager, this function will report \texttt{ESP\_ERR\_NOT\_FOUND} error. In addition, if the sync manager is not supported by the hardware, it will report \texttt{ESP\_ERR\_NOT\_SUPPORTED} error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it won’t start the machine until all the channels in the \texttt{rmt\_sync\_manager\_config\_t::tx\_channel\_array} are called with \texttt{rmt\_transmit()}.

Before that, the channel is just put in a waiting state. Different channel usually take different time to finish the job if the transaction is different, which results in a loss of sync. So user needs to call \texttt{rmt\_sync\_reset()} to pull the channels back to the starting line again before restarting a simultaneous transmission.

Calling \texttt{rmt\_del\_sync\_manager()} can recycle the sync manager and enable the channels to initiate transactions independently afterwards.
Initiate RX Transaction  As also discussed in the Enable and Disable channel, the RX channel still doesn’t get ready to receive RMT symbols even user calls rmt_enable(). User needs to specify the basic characteristics of the incoming signals in rmt_receive_config_t:

- rmt_receive_config_t::signal_range_min_ns specifies the minimal valid pulse duration (either high or low level). A pulse whose width is smaller than this value will be treated as glitch and ignored by the hardware.
- rmt_receive_config_t::signal_range_max_ns specifies the maximum valid pulse duration (either high or low level). A pulse whose width is bigger than this value will be treated as Stop Signal, and the receiver will generate receive complete event immediately.

The RMT receiver will start the RX machine after user calls rmt_receive() with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, user needs to sets the rmt_receive_config_t again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of rmt_symbol_word_t. Due to the limited size of memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames will be truncated by the hardware, and the driver will report an error message: hw buffer too small, received symbols truncated.

The copy destination should be provided in the buffer parameter of rmt_receive() function. If this buffer size is not sufficient, the receiver can continue to work but later incoming symbols will be dropped and report an error message: user buffer too small, received symbols truncated. Please take care of the lifecycle of the buffer parameter, user shouldn’t recycle the buffer before the receiver finished or stopped working.

The receiver will be stopped by the driver when it finishes working (i.e. received a signal whose duration is bigger than rmt_receive_config_t::signal_range_max_ns). User needs to call rmt_receive() again to restart the receiver, is necessary. User can get the received data in the rmt_rx_event_callbacks_t::on_recv_done callback. See also Register Event Callbacks for more information.
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_rx_done_event_data_t *edata, void *user_data) {
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250,  // the shortest duration for NEC signal is...
    .signal_range_max_ns = 12000000,  // the longest duration for NEC signal is...
};
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a...
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_config));
// wait for RX done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the receive symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

RMT Encoder

An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory (or DMA buffer) at specific time. There’re some special restrictions for an encoding function:

- An encoding function might be called for several times within a single transaction. This is because the target RMT memory block can’t accommodate all the artifacts at once. We have to use the memory in a ping-pong way, thus the encoding session is divided into multiple parts. This requires the encoder to be stateful.
- The encoding function is running in the ISR context. To speed up the encoding session, it’s high recommend to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with RMT driver faster, some commonly used encoders are provided out-of-the box. They can either work alone or chained together into a new encoder. See also Composite Pattern for the principle behind. The driver has defined the encoder interface in rmt_encoder_t, it contains the following functions:

- rmt_encoder_t::encode is the fundamental function of an encoder. This is where the encoding session happens. Please note, the rmt_encoder_t::encode function might be called for multiple times within a single transaction. The encode function should return the state of current encoding session. The supported states are listed in the rmt_encode_state_t. If the result contains RMT_ENCODING_COMPLETE, it means the current encoder has finished work. If the result contains RMT_ENCODING_MEM_FULL, we need to yield from current session, as there’s no space to save more encoding artifacts.
- rmt_encoder_t::reset should reset the encoder state back to initial. The RMT encoder is stateful, if RMT transmitter stopped manually without its corresponding encoder being reset, then the following encoding session can be wrong. This function is also called implicitly in rmt_disable().
- rmt_encoder_t::del function should free the resources allocated by the encoder.
Copy Encoder  A copy encoder is created by calling `rmt_new_copy_encoder()`. Copy encoder’s main functionality is to copy the RMT symbols from user space into the driver layer. It’s usually used to encode const data (i.e. data won’t change at runtime after initialization), for example, the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion.

Bytes Encoder  A bytes encoder is created by calling `rmt_new_bytes_encoder()`. Bytes encoder’s main functionality is to convert the user space byte stream into RMT symbols dynamically. It’s usually used to encode dynamic data, for example, the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to tell the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the encoding order for of byte. If it is set to true, the encoder will encode the Most Significant Bit first. Otherwise, it will encode the Least Significant Bit first.

Besides the primitive encoders provided by the driver, user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

![RMT Encoder Chain Diagram](image)

图 17: RMT Encoder Chain

Customize RMT Encoder for NEC Protocol  In this section, we will demonstrate on how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5µs in length, logical bits are transmitted as follows. It is worth mentioning, the bytes of data bits are sent least significant bit first.

- Logical 0: a 562.5µs pulse burst followed by a 562.5µs space, with a total transmit time of 1.125ms
- Logical 1: a 562.5µs pulse burst followed by a 1.6875ms space, with a total transmit time of 2.25ms

When a key is pressed on the remote controller, the message transmitted consists of the following, in order:

![IR NEC Frame Diagram](image)

图 18: IR NEC Frame
Chapter 2. API

- 9ms leading pulse burst (also called the “AGC pulse”)
- 4.5ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 362.5µs pulse burst to signify the end of message transmission

Then we can construct the NEC rmt_encoder_t::encode function in the same order, for example:

```c
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct a encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base;         // the base "class", declares the standard
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT
    int state; // record the current encoding state (i.e. we're in which encoding phase)
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state) {
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_t, base);
    rmt_encode_state_t session_state = 0;
    rmt_encode_state_t state = 0;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_leading_symbol, sizeof(rmt_symbol_word_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to next state when current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there's no free space to put other encoding artifacts
            }
            // fall-through
        case 1: // send address
            encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->address, sizeof(uint16_t), &session_state);
            break;
    }
}
```

(continued)
if (session_state & RMT_ENCODING_COMPLETE) {
    nec_encoder->state = 2; // we can only switch to next state when
    // current encoder finished
}
if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT_ENCODING_MEM_FULL;
    goto out; // yield if there's no free space to put other encoding
    // artifacts
}

    // fall-through

    // send command
    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->command, sizeof(uint16_t), &session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 3; // we can only switch to next state when
        // current encoder finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there's no free space to put other encoding
        // artifacts
    }
    // fall-through

    // send ending code
    encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_ending_symbol,
        sizeof(rmt_symbol_word_t), &session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 0; // back to the initial encoding session
        state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding
        // has finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there's no free space to put other encoding
        // artifacts
    }
}

out:
    *ret_state = state;
    return encoded_symbols;

A full sample code can be found in peripherals/rmt/ir_nec_transceiver. In the above snippet, we use a switch-case plus several goto statements to implement a state machine. With this pattern, user can construct a lot more complex IR protocols.

**Power Management**  When power management is enabled (i.e. CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the resolution of RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever user creates an RMT channel that has selected RMT_CLK_SRC_APB as the clock source, the driver will guarantee that the power management lock is acquired after the channel enabled by rmt_enable(). Likewise, the driver releases the lock after rmt_disable() is called for the same channel. This also reveals that the rmt_enable() and rmt_disable() should appear in pairs.

If the channel clock source is selected to others like RMT_CLK_SRC_XTAL, then the driver won’t install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.
IRAM Safe  By default, the RMT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing the main Flash. Thus the transaction done interrupt will not get executed in time, which is not expected in a real-time application. What’s worse, when the RMT transaction relies on ping-pong interrupt to successively encode or copy RMT symbols, such delayed response can lead to an unpredictable result.

There’s a Kconfig option CONFIG_RMT_ISR_IRAM_SAFE that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM\(^2\)
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This Kconfig option will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

Thread Safety  The factory function rmt_new_tx_channel(), rmt_new_rx_channel() and rmt_new_sync_manager() are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the rmt_channel_handle_t and rmt_sync_manager_handle_t as the first positional parameter, are not thread safe. which means the user should avoid calling them from multiple tasks.

Kconfig Options

- CONFIG_RMT_ISR_IRAM_SAFE controls whether the default ISR handler can work when cache is disabled, see also IRAM Safe for more information.
- CONFIG_RMT_ENABLE_DEBUG_LOG is used to enabled the debug log at the cost of increased firmware binary size.

Application Examples

- RMT based RGB LED strip customized encoder: peripherals/rmt/led_strip
- RMT IR NEC protocol encoding and decoding: peripherals/rmt/ir_nec_transceiver
- RMT transactions in queue: peripherals/rmt/musical_buzzer
- RMT based stepper motor with S-curve algorithm: peripherals/rmt/stepper_motor
- RMT infinite loop for driving DShot ESC: peripherals/rmt/dshot_esc
- RMT simulate 1-wire protocol (take DS18B20 as example): peripherals/rmt/onewire_ds18b20

API Reference

Header File

- components/driver/include/driver/rmt_tx.h

Functions

esp_err_t rmt_new_tx_channel (const rmt_tx_channel_config_t *config, rmt_channel_handle_t *ret_chan)  
Create a RMT TX channel.

参数

- config [in] TX channel configurations
- ret_chan [out] Returned generic RMT channel handle

返回

- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one

\(^2\) Callback function (e.g. rmt_tx_event_callbacks_t::on_trans_done) and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.
Chapter 2. API

- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

```c
esp_err_t rmt_transmit(rmt_channel_handle_t tx_channel, rmt_encoder_handle_t encoder, const void *payload, size_t payload_bytes, const rmt_transmit_config_t *config)
```

Transmit data by RMT TX channel.

### Notes:
This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it’s dispatched in the ISR. If there’re too many transactions pending in the queue, this function will block until the queue has free space.

### Parameters:
- `tx_channel` [in] RMT TX channel that created by `rmt_new_tx_channel()`
- `encoder` [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- `payload` [in] The raw data to be encoded into RMT symbols
- `payload_bytes` [in] Size of the `payload` in bytes
- `config` [in] Transmission specific configuration

### Return:
- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

```c
esp_err_t rmt_tx_wait_all_done(rmt_channel_handle_t tx_channel, int timeout_ms)
```

Wait for all pending TX transactions done.

### Notes:
This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

### Parameters:
- `tx_channel` [in] RMT TX channel that created by `rmt_new_tx_channel()`

### Return:
- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

```c
esp_err_t rmt_tx_register_event_callbacks(rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for RMT TX channel.

### Notes:
User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

### Notes:
When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it
should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

### 参数
- `tx_channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

### 返回
- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

```c
esp_err_t rmt_new_sync_manager (const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchro)
```
Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

### 备注: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

### 参数
- `config` - [in] Synchronization manager configuration
- `ret_synchro` - [out] Returned synchronization manager handle

### 返回
- `ESP_OK`: Create sync manager successfully
- `ESP_ERR_INVALID_ARG`: Create sync manager failed because of invalid argument
- `ESP_ERR_NOT_SUPPORTED`: Create sync manager failed because it is not supported by hardware
- `ESP_ERR_INVALID_STATE`: Create sync manager failed because not all channels are enabled
- `ESP_ERR_NO_MEM`: Create sync manager failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create sync manager failed because all sync controllers are used up and no more free one
- `ESP_FAIL`: Create sync manager failed because of other error

```c
esp_err_t rmt_del_sync_manager (rmt_sync_manager_handle_t synchro)
```
Delete synchronization manager.

### 参数
- `synchro` - [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

### 返回
- `ESP_OK`: Delete the synchronization manager successfully
- `ESP_ERR_INVALID_ARG`: Delete the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Delete the synchronization manager failed because of other error

```c
esp_err_t rmt_sync_reset (rmt_sync_manager_handle_t synchro)
```
Reset synchronization manager.

### 参数
- `synchro` - [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

### 返回
- `ESP_OK`: Reset the synchronization manager successfully
- `ESP_ERR_INVALID_ARG`: Reset the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Reset the synchronization manager failed because of other error
Chapter 2. API 参考

**Structures**

struct rmt_tx_event_callbacks_t

Group of RMT TX callbacks.

备注: The callbacks are all running under ISR environment

备注： When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

*rmt_tx_done_callback_t on_trans_done

Event callback, invoked when transmission is finished

struct rmt_tx_channel_config_t

RMT TX channel specific configuration.

**Public Members**

int gpio_num

GPIO number used by RMT TX channel. Set to -1 if unused

rmt_clock_source_t clk_src

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t resolution_hz

Channel clock resolution, in Hz

size_t mem_block_symbols

Size of memory block, in number of rmt_symbol_word_t, must be an even

size_t trans_queue_depth

Depth of internal transfer queue, increase this value can support more transfers pending in the background

uint32_t invert_out

Whether to invert the RMT channel signal before output to GPIO pad

uint32_t with_dma

If set, the driver will allocate an RMT channel with DMA capability

uint32_t io_loop_back

The signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode

Configure the GPIO as open-drain mode
struct rmt_tx_channel_config_t::[anonymous] flags
TX channel config flags

struct rmt_transmit_config_t
RMT transmit specific configuration.

Public Members

int loop_count
Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t eot_level
Set the output level for the "End Of Transmission"

struct rmt_transmit_config_t::[anonymous] flags
Transmit config flags

struct rmt_sync_manager_config_t
Synchronous manager configuration.

Public Members

const rmt_channel_handle_t *tx_channel_array
Array of TX channels that are about to be managed by a synchronous controller

size_t array_size
Size of the tx_channel_array

Header File

• components/driver/include/driver/rmt_rx.h

Functions

esp_err_t rmt_new_rx_channel (const rmt_rx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
Create a RMT RX channel.

参数
• config [in] RX channel configurations
• ret_chan [out] Returned generic RMT channel handle

返回
• ESP_OK: Create RMT RX channel successfully
• ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
• ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
• ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
• ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
• ESP_FAIL: Create RMT RX channel failed because of other error
### Chapter 2. API Reference

#### esp_err_t rmt_receive(rmt_channel_handle_t rx_channel, void *buffer, size_t buffer_size, const rmt_receive_config_t *config)

Initiate a receive job for RMT RX channel.

**备注:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

**参数**
- `rx_channel` 【in】RMT RX channel that created by `rmt_new_rx_channel()`
- `buffer` 【in】The buffer to store the received RMT symbols
- `buffer_size` 【in】 size of the `buffer`, in bytes
- `config` 【in】Receive specific configurations

**返回**
- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

#### esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)

Set callbacks for RMT RX channel.

**备注:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**备注:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**参数**
- `rx_channel` 【in】RMT generic channel that created by `rmt_new_rx_channel()`
- `cbs` 【in】Group of callback functions
- `user_data` 【in】User data, which will be passed to callback functions directly

**返回**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

### Structures

**struct rmt_rx_event_callbacks_t**

Group of RMT RX callbacks.

**备注:** The callbacks are all running under ISR environment

**备注:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.
Chapter 2. API

Public Members

\texttt{rmt\_rx\_done\_callback\_t} \texttt{on\_recv\_done}

Event callback, invoked when one RMT channel receiving transaction completes

\texttt{struct rmt\_rx\_channel\_config\_t}

RMT RX channel specific configuration.

Public Members

\texttt{int gpio\_num}

GPIO number used by RMT RX channel. Set to -1 if unused

\texttt{rmt\_clock\_source\_t} \texttt{clk\_src}

Clock source of RMT RX channel, channels in the same group must use the same clock source

\texttt{uint32\_t resolution\_hz}

Channel clock resolution, in Hz

\texttt{size\_t mem\_block\_symbols}

Size of memory block, in number of \texttt{rmt\_symbol\_word\_t}, must be an even

\texttt{uint32\_t invert\_in}

Whether to invert the incoming RMT channel signal

\texttt{uint32\_t with\_dma}

If set, the driver will allocate an RMT channel with DMA capability

\texttt{uint32\_t io\_loop\_back}

For debug/test, the signal output from the GPIO will be fed to the input path as well

\texttt{struct rmt\_rx\_channel\_config\_t::[anonymous] flags}

RX channel config flags

\texttt{struct rmt\_receive\_config\_t}

RMT receive specific configuration.

Public Members

\texttt{uint32\_t signal\_range\_min\_ns}

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

\texttt{uint32\_t signal\_range\_max\_ns}

RMT will stop receiving if one symbol level has kept more than \texttt{signal\_range\_max\_ns}

Header File

- \texttt{components/driver/include/driver/rmt\_common.h}
Functions

### esp_err_t rmt_del_channel(rmt_channel_handle_t channel)
Delete an RMT channel.

- **channel** - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

- **返回**
  - ESP_OK: Delete RMT channel successfully
  - ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
  - ESP_FAIL: Delete RMT channel failed because of other error

### esp_err_t rmt_apply_carrier(rmt_channel_handle_t channel, const rmt_carrier_config_t *config)
Apply modulation feature for TX channel or demodulation feature for RX channel.

- **channel** - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** - [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

- **返回**
  - ESP_OK: Apply carrier configuration successfully
  - ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
  - ESP_FAIL: Apply carrier configuration failed because of other error

### esp_err_t rmt_enable(rmt_channel_handle_t channel)
Enable the RMT channel.

- **channel** - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

- **返回**
  - ESP_OK: Enable RMT channel successfully
  - ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
  - ESP_FAIL: Enable RMT channel failed because of other error

### esp_err_t rmt_disable(rmt_channel_handle_t channel)
Disable the RMT channel.

- **channel** - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

- **返回**
  - ESP_OK: Disable RMT channel successfully
  - ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Disable RMT channel failed because it’s not enabled yet
  - ESP_FAIL: Disable RMT channel failed because of other error

Structures

struct rmt_carrier_config_t
RMT carrier wave configuration (for either modulation or demodulation)
Chapter 2. API 参考

Public Members

```c
uint32_t frequency_hz
Carrier wave frequency, in Hz, 0 means disabling the carrier
```

```c
float duty_cycle
Carrier wave duty cycle (0~100%)
```

```c
uint32_t polarity_active_low
Specify the polarity of carrier, by default it’s modulated to base signal’s high level
```

```c
uint32_t always_on
If set, the carrier can always exist even there’s not transfer undergoing
```

```c
struct rmt_carrier_config_t::[anonymous] flags
Carrier config flags
```

Header File

- components/driver/include/driver/rmt_encoder.h

Functions

```c
esp_err_t rmt_new_bytes_encoder (const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

**参数**
- `config` - [in] Bytes encoder configuration
- `ret_encoder` - [out] Returned encoder handle

**返回**
- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

```c
esp_err_t rmt_new_copy_encoder (const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

**参数**
- `config` - [in] Copy encoder configuration
- `ret_encoder` - [out] Returned encoder handle

**返回**
- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

```c
esp_err_t rmt_del_encoder (rmt_encoder_handle_t encoder)
```

Delete RMT encoder.

**参数**
- `encoder` - [in] RMT encoder handle, created by e.g rmt_new_bytes_encoder()

**返回**
- ESP_OK: Delete RMT encoder successfully
• ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
• ESP_FAIL: Delete RMT encoder failed because of other error

`esp_err_t rmt_encoder_reset (rmt_encoder_handle_t encoder)`
Reset RMT encoder.

参数 encoder — [in] RMT encoder handle, created by `e.g. rmt_new_bytes_encoder()`
返回
• ESP_OK: Reset RMT encoder successfully
• ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
• ESP_FAIL: Reset RMT encoder failed because of other error

**Structures**

`struct rmt_encoder_t`
Interface of RMT encoder.

**Public Members**

`size_t(*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)`
Encode the user data into RMT symbols and write into RMT memory.

备注: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

备注: It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder [in] Encoder handle
Param tx_channel [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`
Param primary_data [in] App data to be encoded into RMT symbols
Param data_size [in] Size of primary_data, in bytes
Param ret_state [out] Returned current encoder’s state
Return Number of RMT symbols that the primary data has been encoded into

`esp_err_t (*reset)(rmt_encoder_t *encoder)`
Reset encoding state.

Param encoder [in] Encoder handle
Return
• ESP_OK: reset encoder successfully
• ESP_FAIL: reset encoder failed

`esp_err_t (*del)(rmt_encoder_t *encoder)`
Delete encoder object.

Param encoder [in] Encoder handle
Return
• ESP_OK: delete encoder successfully
• ESP_FAIL: delete encoder failed
struct rmt_bytes_encoder_config_t
Bytes encoder configuration.

Public Members

rmt_symbol_word_t bit0
How to represent BIT0 in RMT symbol

rmt_symbol_word_t bit1
How to represent BIT1 in RMT symbol

uint32_t msb_first
Whether to encode MSB bit first

struct rmt_bytes_encoder_config_t::[anonymous] flags
Encoder config flag

struct rmt_copy_encoder_config_t
Copy encoder configuration.

Type Definitions
typedef struct rmt_encoder_t rmt_encoder_t
Type of RMT encoder.

Enumerations
enum rmt_encode_state_t
RMT encoding state.

Values:

enumerator RMT_ENCODING_COMPLETE
The encoding session is finished, the caller can continue with subsequent encoding

enumerator RMT_ENCODING_MEM_FULL
The encoding artifact memory is full, the caller should return from current encoding session

Header File

• components/driver/include/driver/rmt_types.h

Structures

struct rmt_tx_done_event_data_t
Type of RMT TX done event data.
Public Members

size_t num_symbols
The number of transmitted RMT symbols (only one round is counted if it’s a loop transmission)

struct rmt_rx_done_event_data_t
Type of RMT RX done event data.

Public Members

rmt_symbol_word_t *received_symbols
Point to the received RMT symbols

size_t num_symbols
The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t *rmt_channel_handle_t
Type of RMT channel handle.

typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t
Type of RMT synchronization manager handle.

typedef struct rmt_encoder_t *rmt_encoder_handle_t
Type of RMT encoder handle.

typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, const rmt_tx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from rmt_new_tx_channel()
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from rmt_tx_register_event_callbacks()
Return Whether a high priority task has been waken up by this callback function

typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const rmt_rx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from rmt_new_rx_channel()
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from rmt_rx_register_event_callbacks()
Return Whether a high priority task has been waken up by this function

Header File

- components/hal/include/hal/rmt_types.h
Unions

union rmt_symbol_word_t
#include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

unsigned int duration0
Duration of level0

unsigned int level0
Level of the first part

unsigned int duration1
Duration of level1

unsigned int level1
Level of the second part

struct rmt_symbol_word_t::[anonymous] [anonymous]

unsigned int val
Equivalent unsigned value for the RMT symbol

Type Definitions

typedef soc_periph_rmt_clk_src_t rmt_clock_source_t
RMT group clock source.

**2.6.15 SD Pull-up Requirements**

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see MTDI Strapping Pin below.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information
Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip
- ESP32-D2WD:
  - No Pull-ups
  - No Pull-up on GPIO12

Systems in Packages (SIP)

- ESP32-PICO-D4:
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Modules

  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - No Pull-ups
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  - Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  - Download Mode Not Working (minor issue) (v2, v1)
  - You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
    - ESP32-WROVER-B on v4.1
    - ESP32-WROVER on v3
    - ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSC
  - Required pull-ups are provided
  - Conflicts Between Bootstrap and SDIO on DAT2
• ESP32-LyraT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13

Non-Espressif Hosts Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

Solutions

No Pull-ups If you use a development board without pull-ups, you can do the following:

• If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
• Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13 If DAT3 of your device is not properly pulled up, you have the following options:

• Use 1-bit SD mode and tie the device’s DAT3 to VDD
• Use SPI mode
• Perform one of the following actions on the GPIO13 pin:
  – Remove the pull-down resistors
  – Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  – Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2 There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

警告： Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on https://www.espressif.com/. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....

Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:
If running from an automated flashing script, espefuse.py has an option `--do-not-confirm`. For more details, see ESP32 Technical Reference Manual [PDF].

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one of the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and reflash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin** MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see **Overview of Compatibility**.

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups/pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.
The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

### Table 6: Default pull-up and pull-down states of the CMD and DATA pins

### 2.6.16 SDMMC Host Driver

**Overview**

ESP32’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

- Slot 0 (SDMMC_HOST_SLOT_0) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (SDMMC_HOST_SLOT_1) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Slot 0</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the cd and wp members of the sdmmc_slot_config_t structure before calling sdmmc_host_init_slot(). Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**WARNING**: Pins used by Slot 0 (HS1_* ) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

**Supported Speed Modes**

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
Chapter 2. API

- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:
- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

If you need a specific frequency other than standard speeds, you are free to use any value from within appropriate range of the SD interface given (SDMMC or SDSPI). However, the real clock frequency shall be calculated by the underlying driver and the value can be different from the one required. For the SDMMC, `max_freq_khz` works as the upper limit so the final frequency value shall be always lower or equal. For the SDSPI, the nearest fitting frequency is supplied and thus the value can be greater than / equal to / lower than `max_freq_khz`.

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

DDR Mode for eMMC chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping `SDMMC_FREQ_HIGHSPEED` frequency, clear `SDMMC_HOST_FLAG_DDR` bit in flags field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

See **SD/SDIO/MMC Driver** for the higher level driver which implements the protocol layer.

See **SD SPI Host Driver** for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See **SD Pull-up Requirements** for pullup support and compatibilities of modules and development kits.

### API Reference

#### Header File

- components/driver/include/driver/sdmmc_host.h

#### Functions

**esp_err_t sdmmc_host_init**(void)

Initialize SDMMC host peripheral.

备注：This function is not thread safe

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
- ESP_ERR_NO_MEM if memory cannot be allocated

**esp_err_t sdmmc_host_init_slot**(int slot, const sdmmc_slot_config_t *slot_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

备注：This function is not thread safe

**参数

- slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- slot_config - additional configuration for the slot

**返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

**esp_err_t sdmmc_host_set_bus_width**(int slot, size_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

备注：This function is not thread safe

**参数

- slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- width - bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)
Chapter 2. API Reference

size_t sdmmc_host_get_slot_width (int slot)
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

参数 slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

返回 ESP_OK on success
ESP_ERR_INVALID_ARG if slot number or width is not valid

esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)
Set card clock frequency.
Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

备注: This function is not thread safe

参数
slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
freq_khz - card clock frequency, in kHz

返回 ESP_OK on success
other error codes may be returned in the future

esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)
Enable or disable DDR mode of SD interface.

参数
slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
ddr_enabled - enable or disable DDR mode

返回 ESP_OK on success
ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)
Send command to the card and get response.
This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Attention Data buffer passed in cmdinfo->data must be in DMA capable memory

备注: This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

参数
slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
cmdinfo - pointer to structure describing command and data to transfer

返回 ESP_OK on success
ESP_ERR_TIMEOUT if response or data transfer has timed out
ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory
### Chapter 2. API 参考

**esp_err_t sdmmc_host_io_int_enable** (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

参数: slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

返回: returns ESP_OK, other errors possible in the future

**esp_err_t sdmmc_host_io_int_wait** (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

参数:
- slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks - number of RTOS ticks to wait for the interrupt

返回:
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

**esp_err_t sdmmc_host_deinit** (void)

Disable SDMMC host and release allocated resources.

备注: This function is not thread safe

返回:
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

**esp_err_t sdmmc_host_get_real_freq** (int slot, int *real_freq_khz)

Provides a real frequency used for an SD card installed on specific slot of SD/MMC host controller.

This function calculates real working frequency given by current SD/MMC host controller setup for required slot: it reads associated host and card dividers from corresponding SDMMC registers, calculates respective frequency and stores the value into the ‘real_freq_khz’ parameter

参数:
- slot - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- real_freq_khz - [out] output parameter for the result frequency (in kHz)

返回:
- ESP_OK on success
- ESP_ERR_INVALID_ARG on real_freq_khz == NULL or invalid slot number used

### Structures

**struct sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

### Public Members

**gpio_num_t gpio_cd**

GPIO number of card detect signal.

**gpio_num_t cd**

GPIO number of card detect signal; shorter name.
**Chapter 2. API**

```c
gpio_num_t gpio_wp
GPIO number of write protect signal.
```

```c
gpio_num_t wp
GPIO number of write protect signal; shorter name.
```

```c
uint8_t width
Bus width used by the slot (might be less than the max width supported)
```

```c
uint32_t flags
Features used by this slot.
```

**Macros**

```c
SDMMC_HOST_SLOT_0
SDMMC slot 0.
```

```c
SDMMC_HOST_SLOT_1
SDMMC slot 1.
```

```c
SDMMC_HOST_DEFAULT()
Default sdmmc_host_t structure initializer for SDMMC peripheral.
Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz
```

```c
SDMMC_SLOT_FLAG_INTERNAL_PULLUP
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.
```

```c
SDMMC_SLOT_NO_CD
indicates that card detect line is not used
```

```c
SDMMC_SLOT_NO_WP
indicates that write protect line is not used
```

```c
SDMMC_SLOT_WIDTH_DEFAULT
use the maximum possible width for the slot
```

```c
SDMMC_SLOT_CONFIG_DEFAULT()
Macro defining default configuration of SDMMC host slot
```

**2.6.17 SD SPI Host Driver**

**Overview**

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

This driver’s naming pattern was adopted from the SDMMC Host driver due to their similarity. Likewise, the APIs of both drivers are also very similar.
SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (see SDMMC Host) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

**How to Use**

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

**Other Details**

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

备注: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

警告: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see Sharing the SPI bus among SD card and other SPI devices.

**Related Docs**

**Sharing the SPI bus among SD card and other SPI devices** The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading** SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing
requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: launch edge: at which clock edge the data start to toggle; latch edge: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it’s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

**DC loading**

The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

**Initialization sequence**

备注： If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using ab SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.
   This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!

**API Reference**

**Header File**
Chapter 2. API 参考

- components/driver/include/driver/sdspi_host.h

**Functions**

```c
esp_err_t sdspi_host_init (void)
```

Initialize SD SPI driver.

备注：This function is not thread safe.

返回

- ESP_OK on success
- other error codes may be returned in future versions

```c
esp_err_t sdspi_host_init_device (const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)
```

Attach and initialize an SD SPI device on the specific SPI bus.

备注：This function is not thread safe.

备注：Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

备注：The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

参数

- `dev_config` - pointer to device configuration structure
- `out_handle` - Output of the handle to the sdspi device.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_host_init_device` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

```c
esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)
```

Remove an SD SPI device.

参数 `handle` - Handle of the SD SPI device

返回 Always ESP_OK

```c
esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)
```

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

备注：This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

参数

- `handle` - Handle of the sdspi device
- `cmdinfo` - pointer to structure describing command and data to transfer
Chapter 2. API

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

```c
esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)
```

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

```
备注: This function is not thread safe
```

参数

- host - Handle of the sdspi device
- freq_khz - card clock frequency, in kHz

返回

- ESP_OK on success
- other error codes may be returned in the future

```c
esp_err_t sdspi_host_get_real_freq (sdspi_dev_handle_t handle, int *real_freq_khz)
```

Calculate working frequency for specific device.

参数

- handle - SDSPI device handle
- real_freq_khz - [out] output parameter to hold the calculated frequency (in kHz)

返回

- ESP_ERR_INVALID_ARG : handle is NULL or invalid or real_freq_khz parameter is NULL
- ESP_OK : Success

```c
esp_err_t sdspi_host_deinit (void)
```

Release resources allocated using sdspi_host_init.

```
备注: This function is not thread safe
```

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
```

Enable SDIO interrupt.

参数 handle - Handle of the sdspi device

返回 ESP_OK on success

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```

Wait for SDIO interrupt until timeout.

参数 handle - Handle of the sdspi device
- timeout_ticks - Ticks to wait before timeout.

返回 ESP_OK on success
Structures

struct sdspi_device_config_t
Extra configuration for SD SPI device.

Public Members

spi_host_device_t host_id
SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t gpio_cs
GPIO number of CS signal.

gpio_num_t gpio_cd
GPIO number of card detect signal.

gpio_num_t gpio_wp
GPIO number of write protect signal.

gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.

Macros

SDSPI_DEFAULT_HOST
Default sdmmc_host_t structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
‘slo’t should be set to an sdspi device initialized by sdspi_host_init_device().

SDSPI_SLOT_NO_CS
indicates that card select line is not used

SDSPI_SLOT_NO_CD
indicates that card detect line is not used

SDSPI_SLOT_NO_WP
indicates that write protect line is not used

SDSPI_SLOT_NO_INT
indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT()
Macro defining default configuration of SD SPI device.
Type Definitions

typedef int sdspi_dev_handle_t
  Handle representing an SD SPI device.

2.6.18 SDIO Card Slave Driver

Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

<table>
<thead>
<tr>
<th>Connections</th>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>
<th>Slot1</th>
<th>Slot2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CLK</td>
<td>SCLK</td>
<td>6</td>
<td>14</td>
</tr>
<tr>
<td></td>
<td>CMD</td>
<td>MOSI</td>
<td>11</td>
<td>15</td>
</tr>
<tr>
<td></td>
<td>DAT0</td>
<td>MISO</td>
<td>7</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>DAT1</td>
<td>Interrupt</td>
<td>8</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td>DAT2</td>
<td>N.C. (pullup)</td>
<td>9</td>
<td>12</td>
</tr>
<tr>
<td></td>
<td>DAT3</td>
<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

备注： Please check if CMD and DATAlines D0-D3 of the card are properly pulled up by 10 Kohm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check Overview of Compatibility to see whether your development boards have such pullups.

备注： Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See Overview of Compatibility to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to SD Pull-up Requirements for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.
After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology** The SDIO slave driver uses the following terms:

- **Transfer**: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending**: slave to host transfers.
- **Receiving**: host to slave transfers.

**Remark**: Register names in ESP32 Technical Reference Manual > SDIO Slave Controller [PDF] are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- **FIFO**: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: requested length = 0x1F800-address.
- **Ownership**: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length**: The length requested in one transfer determined by the FIFO address.
- **Transfer length**: The length requested in one transfer determined by the CMD53 byte/block count field.

**Remark**: Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be filled with 0 (sending) or discard (receiving).

- **Receiving buffer size**: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the recv_buffer_size member of sdio_slave_config_t.
- **Interrupts**: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in Interrupts.
- **Registers**: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in ESP SDIO Slave Initialization.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to ESP SDIO Slave Protocol. There is also a component ESP Serial Slave Link for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the slave_intr_cb member in the sdio_slave_config_t structure.
The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If non-blocking call is needed, set `wait=0`.

The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers. When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host. Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.

If the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.

4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- Stream Mode: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- Packet Mode: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.
To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the `wait` is not `portMAX_DELAY` (wait until success), the application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

   ```c
   typedef struct {
       uint8_t* buffer;
       size_t size;
       int id;
    } sdio_transfer_t;

    // and send as:
    sdio_transfer_t trans = {
        .buffer = ADDRESS_TO_SEND,
        .size = 8,
        .id = 3, // the 3rd transfer so far
    };
    sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

    //... maybe more transfers are sent here

    // and deal with finished transfer as:
    sdio_transfer_t* arg = NULL;
    sdio_slave_send_get_finished((void*)arg, portMAX_DELAY);
    ESP_LOGI("tag", "(id) successfully send %d bytes of %p", arg->id, arg->size,...
    some_post_callback(arg); // do more things

   3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

   ```c
   uint8_t buffer[256]={1,2,3,4,5,6,7,8};
   sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
   sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

   //... maybe more transfers are sent here

   // and load finished buffer to receive as
   sdio_slave_buf_handle_t handle = NULL;
   sdio_slave_send_get_finished((void*)handle, portMAX_DELAY);
   sdio_slave_recv_load_buf(handle);
   ```
More about this, see peripherals/sdio.

Application Example

Slave/master communication: peripherals/sdio.

API Reference

Header File

- components/hal/include/hal/sdio_slave_types.h

Enumerations

enum sdio_slave_hostint_t

Mask of interrupts sending to the host.

Values:

enumerator SDIO_SLAVE_HOSTINT_BIT0

General purpose interrupt bit 0.

ee

enumerator SDIO_SLAVE_HOSTINT_BIT1

e

enumerator SDIO_SLAVE_HOSTINT_BIT2

e

enumerator SDIO_SLAVE_HOSTINT_BIT3

e

enumerator SDIO_SLAVE_HOSTINT_BIT4

e

enumerator SDIO_SLAVE_HOSTINT_BIT5

e

enumerator SDIO_SLAVE_HOSTINT_BIT6

e

enumerator SDIO_SLAVE_HOSTINT_BIT7

e

enumerator SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET

New packet available.

enum sdio_slave_timing_t

Timing of SDIO slave.

Values:

enumerator SDIO_SLAVE_TIMING_PSEND_PSAMPLE

Send at posedge, and sample at posedge. Default value for HS mode. If `:macro:SDIO_SLAVE_FLAG_HIGH_SPEED` is specified in :cpp:class:sdio_slave_config_t, this should be selected. Normally there’s no problem using this to work in DS mode.
enumerator SDIO_SLAVE_TIMING_NSEND_PSAMPLE
Send at negedge, and sample at posedge. Default value for DS mode and below. If \texttt{SDIO_SLAVE_FLAG_DEFAULT_SPEED} is specified in \texttt{sdio_slave_config_t}, this should be selected.

denumerator SDIO_SLAVE_TIMING_PSEND_NSAMPLE
Send at posedge, and sample at negedge.

denumerator SDIO_SLAVE_TIMING_NSEND_NSAMPLE
Send at negedge, and sample at negedge.

enum sdio_slave_sending_mode_t
Configuration of SDIO slave mode.

Values:

denumerator SDIO_SLAVE_SEND_STREAM
Stream mode, all packets to send will be combined as one if possible.

denumerator SDIO_SLAVE_SEND_PACKET
Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

Header File

- components/driver/include/driver/sdio_slave.h

Functions

\texttt{esp_err_t sdio_slave_init\_initialize(sdio_slave_config_t *config)}

Initialize the sdio slave driver

参数 config - Configuration of the sdio slave driver.

返回
- ESP_OK if success
- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

void sdio_slave_deinit (void)

De-initialize the sdio slave driver to release the resources.

\texttt{esp_err_t sdio_slave_start (void)}

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

备注: The driver will continue sending from previous data and PKT_LEN counting. keep data received as well as start receiving from current TOKEN1 counting. See \texttt{sdio_slave_reset}.

返回
- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.
void `sdio_slave_stop` (void)
Stop hardware from sending and receiving, also set IREADY1 to 0.

**备注:** this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

```c
esp_err_t `sdio_slave_reset` (void)
```
Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**备注:** always return ESP_OK.

```c
sdio_slave_buf_handle_t `sdio_slave_recv_register_buf` (uint8_t* start)
```
Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**备注:** The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

- **参数** `start` – The start address of the buffer.
- **返回** The buffer handle if success, otherwise NULL.

```c
esp_err_t `sdio_slave_recv_unregister_buf` (sdio_slave_buf_handle_t handle)
```
Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

- **参数** `handle` – Handle to the buffer to release.
- **返回** ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

```c
esp_err_t `sdio_slave_recv_load_buf` (sdio_slave_buf_handle_t handle)
```
Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

- **参数** `handle` – Handle to the buffer ready to receive data.

- **返回**
  - ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
  - ESP_OK if success

```c
esp_err_t `sdio_slave_recv_packet` (sdio_slave_buf_handle_t *handle_ret, TickType_t wait)
```
Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler `sdio_slave_recv` instead, if the host never send data longer than the Receiving buffersize, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

**备注:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

- **参数**
  - `handle_ret` – Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
**Chapter 2. API**

- **wait** - Time to wait before data received.

**返回**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host.
  
  should call this API again until the end of a packet
- ESP_OK if success

```c
esp_err_t sdio_slave_recv (sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len,
TickType_t wait)
```

Get received data if exist. The driver returns the ownership of the buffer to the app.

**备注:** Call sdio_slave_load_buf with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from sdio_slave_get_buffer.

**参数**
- **handle_ret** - Handle to the buffer holding received data. Use this handle in sdio_slave_recv_load_buf to receive in the same buffer again.
- **out_addr** – [out] Output of the start address, set to NULL if not needed.
- **out_len** – [out] Actual length of the data in the buffer, set to NULL if not needed.
- **wait** – Time to wait before data received.

**返回**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

```c
uint8_t *sdio_slave_recv_get_buf (sdio_slave_buf_handle_t handle, size_t *len_o)
```

Retrieve the buffer corresponding to a handle.

**参数**
- **handle** - Handle to get the buffer.
- **len_o** – Output of buffer length

**返回**
- buffer address if success, otherwise NULL.

```c
esp_err_t sdio_slave_send_queue (uint8_t *addr, size_t len, void *arg, TickType_t wait)
```

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

**参数**
- **addr** – Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len** – Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- **arg** – Argument to returned in sdio_slave_send_get_finished. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- **wait** – Time to wait if the buffer is full.

**返回**
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

```c
esp_err_t sdio_slave_send_get_finished (void **out_arg, TickType_t wait)
```

Return the ownership of a finished transaction.

**参数**
- **out_arg** – Argument of the finished transaction. Set to NULL if unused.
- **wait** – Time to wait if there’s no finished sending transaction.
**Chapter 2. API 参考**

返回 ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

`esp_err_t sdio_slave_transmit (uint8_t *addr, size_t len)`

Start a new sending transfer, and wait for it (blocked) to be finished.

参数
- `addr` - Start address of the buffer to send
- `len` - Length of buffer to send.

返回
- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

`uint8_t sdio_slave_read_reg (int pos)`

Read the spi slave register shared with host.

备注: register 28 to 31 are reserved for interrupt vector.

参数 `pos` - register address, 0-27 or 32-63.
返回 value of the register.

`esp_err_t sdio_slave_write_reg (int pos, uint8_t reg)`

Write the spi slave register shared with host.

备注: register 29 and 31 are used for interrupt vector.

参数
- `pos` - register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- `reg` - the value to write.

返回 ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

`sdio_slave_hostint_t sdio_slave_get_host_intena (void)`

Get the interrupt enable for host.

返回 the interrupt mask.

`void sdio_slave_set_host_intena (sdio_slave_hostint_t mask)`

Set the interrupt enable for host.

参数 `mask` - Enable mask for host interrupt.

`esp_err_t sdio_slave_send_host_int (uint8_t pos)`

Interrupt the host by general purpose interrupt.

参数 `pos` - Interrupt num, 0-7.

返回
- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise

`void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)`

Clear general purpose interrupt to host.

参数 `mask` - Interrupt bits to clear, by bit mask.

`esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)`

Wait for general purpose interrupt from host.

备注: this clears the interrupt at the same time.
### Structures

```c
struct sdio_slave_config_t
```

Configuration of SDIO slave.

### Public Members

- `sdio_slave_timing_t timing`
  - timing of `sdio_slave`. see `sdio_slave_timing_t`.

- `sdio_slave_sending_mode_t sending_mode`
  - mode of `sdio_slave`. `SDIO_SLAVE_MODE_STREAM` if the data needs to be sent as much as possible; `SDIO_SLAVE_MODE_PACKET` if the data should be sent in packets.

- `int send_queue_size`
  - max buffers that can be queued before sending.

- `size_t recv_buffer_size`
  - If buffer size is too small, it costs more CPU time to handle larger number of buffers. If buffer size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

- `sdio_event_cb_t event_cb`
  - when the host interrupts slave, this callback will be called with interrupt number (0-7).

- `uint32_t flags`
  - Features to be enabled for the slave, combinations of `SDIO_SLAVE_FLAG_*`.

### Macros

- **SDIO_SLAVE_RECV_MAX_BUFFER**
- **SDIO_SLAVE_FLAG_DAT2_DISABLED**
  - It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

- **SDIO_SLAVE_FLAG_HOST_INTR_DISABLED**
  - The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.
Chapter 2. API

SDIO_SLAVE_FLAG_INTERNAL_PULLUP

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

SDIO_SLAVE_FLAG_DEFAULT_SPEED

Disable the highspeed support of the hardware.

SDIO_SLAVE_FLAG_HIGH_SPEED

Enable the highspeed support of the hardware. This is the default option. The host will see highspeed capability, but the mode actually used is determined by the host.

Type Definitions

typedef void (*sdio_event_cb_t)(uint8_t event)

typedef void *sdio_slave_buf_handle_t

Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

2.6.19 Sigma-Delta Modulation (SDM)

Introduction

ESP32 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.1

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate a SDM channel:

- **Resource Allocation** - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- **Enable and Disable Channel** - covers how to enable and disable the channel.
- **Set Equivalent Duty Cycle** - describes how to set the equivalent duty cycle of the PDM pulses.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - lists which functions are supposed to work even when the cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

---

1 Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32 Technical Reference Manual for more details. The driver won’t forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `sdm_new_channel()`).
Resource Allocation  A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don’t need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not enabled yet by `sdm_channel_enable()`.

Creating a SDM Channel with Sample Rate of 1MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel  Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function will:

- switch the channel state from init to enable
- acquire a proper power management lock is a specific clock source (e.g. APB clock) is selected. See also Power management for more information.

On the contrary, calling `sdm_channel_disable()` will do the opposite, that is, put the channel back to the init state and release the power management lock.

Set Equivalent Duty Cycle  For the output PDM signals, the duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage from the channel is calculated by

\[
V_{out} = \frac{VDD_{IO}}{256} \times \text{duty} + \frac{VDD_{IO}}{2}
\]

Thus the range of the duty input parameter of `sdm_channel_set_duty()` is from -128 to 127 (eight bit signed integer). For example, if zero value is set, then the output signal’s duty will be about 50%.

Power Management  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.
**IRAM Safe** There’s a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_duty()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_duty()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see IRAM Safe for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Convert to analog signal (Optional)**

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Sallen-Key Low Pass Filter](image)

图 19: Sallen-Key Low Pass Filter
Application Example

- LED driven by a GPIO that is modulated with Sigma-Delta: peripherals/sigma_delta.

API Reference

Header File

- components/driver/include/driver/sdm.h

Functions

`esp_err_t sdm_new_channel (const sdm_config_t *config, sdm_channel_handle_t *ret_chan)`
Create a new Sigma Delta channel.

参数
- `config` - [in] SDM configuration
- `ret_chan` - [out] Returned SDM channel handle

返回
- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

`esp_err_t sdm_del_channel (sdm_channel_handle_t chan)`
Delete the Sigma Delta channel.

参数 `chan` - [in] SDM channel created by sdm_new_channel

返回
- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

`esp_err_t sdm_channel_enable (sdm_channel_handle_t chan)`
Enable the Sigma Delta channel.

备注: This function will transit the channel state from init to enable.

备注: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the sdm_config_t, while CONFIG_PM_ENABLE is enabled.

参数 `chan` - [in] SDM channel created by sdm_new_channel

返回
- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
- ESP_FAIL: Enable SDM channel failed because of other error

`esp_err_t sdm_channel_disable (sdm_channel_handle_t chan)`
Disable the Sigma Delta channel.
This function will do the opposite work to the `sdm_channel_enable()` function.

### Parameters
- **chan** - [in] SDM channel created by `sdm_new_channel`

### Returs
- `ESP_OK`: Disable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Disable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable SDM channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable SDM channel failed because of other error

```c
esp_err_t sdm_channel_set_duty(sdm_channel_handle_t chan, int8_t duty)
```

Set the duty cycle of the PDM output signal.

### Notes
- For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage could be \[ V_{out} = \frac{V_{DD, IO}}{256} \times \text{duty} + \frac{V_{DD, IO}}{2} \].
- If the duty is set to zero, the output signal is like a 50% duty cycle square wave, with a frequency around \( \frac{\text{sample_rate}_{hz}}{4} \).
- The duty is proportional to the equivalent output voltage after a low-pass-filter.
- This function is allowed to run within ISR context
- This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

### Notes
- **chan** - [in] SDM channel created by `sdm_new_channel`
- **duty** - [in] Equivalent duty cycle of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

### Returns
- `ESP_OK`: Set duty cycle successfully
- `ESP_ERR_INVALID_ARG`: Set duty cycle failed because of invalid argument
- `ESP_FAIL`: Set duty cycle failed because of other error

### Structures

```c
struct sdm_config_t
```

Sigma Delta channel configuration.

### Public Members

```c
int gpios_num
```

GPIO number
Chapter 2. API

```c
sdm_clock_source_t clk_src

Clock source
```

```c
uint32_t sample_rate_hz

Sample rate in Hz, it determines how frequent the modulator outputs a pulse
```

```c
uint32_t invert_out

Whether to invert the output signal
```

```c
uint32_t io_loop_back

For debug/test, the signal output from the GPIO will be fed to the input path as well
```

```c
struct sdm_config_t::[anonymous] flags

Extra flags
```

**Type Definitions**

typedef struct sdm_channel_t *sdm_channel_handle_t

Type of Sigma Delta channel handle.

**Header File**

- components/hal/include/hal/sdm_types.h

**Type Definitions**

typedef soc_periph_sdm_clk_src_t sdm_clock_source_t

### 2.6.20 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

**Overview of ESP32’s SPI peripherals**

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.

**Terminology**

The terms used in relation to the SPI master driver are given in the table below.
# Chapter 2. API

## Host

The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.

## Device

SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.

## Bus

A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.

## MOSI

Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.

## MISO

Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.

## SCLK

Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.

## CS

Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.

## QUADWP

Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.

## QUADHD

Signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.

## DATA4

Data4 signal in Octal/OPI mode.

## DATA5

Data5 signal in Octal/OPI mode.

## DATA6

Data6 signal in Octal/OPI mode.

## DATA7

Data7 signal in Octal/OPI mode.

### Assertion

The action of activating a line.

### De-assertion

The action of returning the line back to inactive (back to idle) status.

### Transaction

One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.

### Launch edge

Edge of the clock at which the source register launches the signal onto the line.

### Latch edge

Edge of the clock at which the destination register latches in the signal.

## Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI.

### Warning:

The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI 特性

SPI 主机

SPI 总线锁 为了多路复用来自不同驱动的不同设备，包括 SPI 主机、SPI Flash 等驱动，每个 SPI 总线上都只有一个 SPI 总线锁。驱动程序可以通过对锁的仲裁，将设备连接到总线上。

每个总线锁都已经初始化并注册了后台服务（BG）。所有请求在总线上进行传输的设备都应等到 BG 被成功禁用后再开始传输。

- 在 SPI 总线上，BG 为高速缓存。总线锁可以在设备操作开始前禁用高速缓存，并在设备释放锁后再次启用它，SPI 上的任何设备都无法使用 ISR，因为当高速缓存被禁用时，让出当前任务的执行权是没有意义的。
- 在 SPI 总线上使用 SPI 主机驱动程序时，存在一些限制。请参见 Notes on Using the SPI Master driver on SPI Bus。
- 对于其他总线，驱动程序可以将其 ISR 注册为 BG。当一个设备任务要求独占总线时，总线锁将阻塞该任务，同时禁用 ISR，并在 ISR 被成功禁用后，解除对该任务的阻塞。当任务释放锁时，如果 ISR 中还有待处理的事务，锁也将尝试恢复 ISR。

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.
The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

<table>
<thead>
<tr>
<th>Mode name</th>
<th>Command Line Width</th>
<th>Address Line Width</th>
<th>Data Line Width</th>
<th>Transaction Flag</th>
<th>Bus IO setting Flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal SPI</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Dual Output</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>SPI_TRANS_MODE_DIO</td>
<td>SPICOM-MON_BUSFLAG_DUAL</td>
</tr>
<tr>
<td>Dual I/O</td>
<td>1</td>
<td>2</td>
<td>2</td>
<td>SPI_TRANS_MODE_DIO SPI_TRANS_MULTILINE_ADDR</td>
<td></td>
</tr>
<tr>
<td>Quad Output</td>
<td>1</td>
<td>4</td>
<td>4</td>
<td>SPI_TRANS_MODE_QIO</td>
<td>SPICOM-MON_BUSFLAG_QUAD</td>
</tr>
<tr>
<td>Quad I/O</td>
<td>1</td>
<td>4</td>
<td>4</td>
<td>SPI_TRANS_MODE_QIO SPI_TRANS_MULTILINE_ADDR</td>
<td></td>
</tr>
</tbody>
</table>

**Command and Address Phases** During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

Submit Document Feedback
If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see `Transaction Line Mode`
