- 一款 **ESP32** 开发板
- **USB 数据线** (A 转 Micro-B)
- 电脑 (Windows、Linux 或 macOS)

---

**备注：** 目前一些开发板使用的是 USB Type C 接口。请确保使用合适的数据线来连接开发板！

以下是 ESP32 官方开发板，点击链接可了解更多硬件信息。

**ESP32-DevKitS(-R)**

本指南介绍了乐鑫专为 ESP32 设计的烧录底板 ESP32-DevKitS(-R)。

ESP32-DevKitS(-R) 包括两款开发板，分别是 ESP32-DevKitS 和 ESP32-DevKitS-R。S 代表弹簧 (spring)，R 代表 WROVER 模组。

本指南包括如下内容：

- **入门指南**: 简要介绍了 ESP32-DevKitS(-R) 和硬件、软件设置指南。
- **硬件参考**: 详细介绍了 ESP32-DevKitS(-R) 的硬件。
- **相关文档**: 列出了相关文档的链接。

**入门指南** 本节介绍了如何快速上手 ESP32-DevKitS(-R)。开头部分介绍了 ESP32-DevKitS(-R)，[如何烧录开发板](#) 小节介绍了怎样在 ESP32-DevKitS(-R) 上安装模组、配置及烧录固件。

**概述** ESP32-DevKitS(-R) 是乐鑫专为 ESP32 设计的烧录底板，无需将 ESP32 模组与电源和信号线焊接便可进行烧录。ESP32-DevKitS(-R) 搭载模组后，可作为类似 ESP32-DevKitC 的小型开发板使用。

ESP32-DevKitS 和 ESP32-DevKitS-R 仅在弹簧布局上有所不同，用于适配不同的 ESP32 模组。

- **ESP32-DevKitS:**
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE
- **ESP32-DevKitS-R:**
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E

2.54 mm 排母	连接板上搭载模组的引脚。关于排母的描述，请见 <a href="#">针座</a> 小节。
USB-to-UART 桥接器	单芯片 USB 转 UART 桥接器，可提供高达 3 Mbps 的传输速率。
LDO	5V-to-3.3V 低压差线性稳压器 (LDO)。
Micro-USB 连接器/Micro USB 端口	USB 接口。可用作开发板的供电电源或连接电脑和开发板的通信接口。
EN 键	复位按键。
Boot 键	下载按键。按住 <b>Boot</b> 键的同时按一下 <b>EN</b> 键进入“固件下载”模式，通过串口下载固件。
电源指示 LED	开发板通电后 (USB 或供电电源)，该指示灯亮起。

**如何烧录开发板** 通电前，请确保 ESP32-DevKitS(-R) 完好无损。

### 必备硬件

- 任选一款 ESP32 模组
- USB 2.0 数据线 (标准 A 型转 Micro-B 型)
- 电脑 (Windows、Linux 或 macOS)

**硬件设置** 请按照下列步骤将模组安装到 ESP32-DevKitS(-R) 烧录底板上：

- 将模组轻放到 ESP32-DevKitS(-R) 烧录底板上。确保模组上方的邮票孔与底板上的引脚弹簧对齐。
- 将模组向下压，听到“咔哒”一声即说明模组已经压入底板。
- 检查所有引脚弹簧是否均已卡进邮票孔中。如发现错位，可使用镊子将引脚弹簧拨入邮票孔中。

### 软件设置

**首选方式** 使用 ESP-IDF 开发框架是将二进制文件 (\*.bin) 烧录到 ESP32-DevKitS(-R) 的首选方式。请前往 [快速入门](#)，在 [安装](#) 一节查看如何快速设置开发环境，将应用程序烧录至 ESP32-DevKitS(-R)。

**备选方式** Windows 用户也可以使用 [Flash 下载工具](#) 烧录二进制文件。请下载该工具、解压并参照 *doc* 文件夹内的使用指南。

---

#### 备注：

1. 烧录二进制文件时需将 ESP32 芯片设置成固件下载模式。这一步骤可由烧录工具自动执行，也可按住 **Boot** 按键并点按 **EN** 按键手动执行。
  2. 烧录完成后，烧录工具默认情况下会重启模组，运行已烧录的程序。

## 1.2.2 软件：

如需在 **ESP32** 上使用 ESP-IDF，请安装以下软件：

- 设置 **工具链**，用于编译 ESP32 代码；
- **编译构建工具**——CMake 和 Ninja 编译构建工具，用于编译 ESP32 应用程序；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32 使用的 API（软件库和源代码）和运行 **工具链** 的脚本；

## 1.3 安装

我们提供以下方法帮助安装所有需要的软件，可根据需要选择其中之一。

### 1.3.1 IDE

---

**备注：**建议您通过自己喜欢的集成开发环境 (IDE) 安装 ESP-IDF。

---

- [Eclipse Plugin](#)
- [VSCode Extension](#)

### 1.3.2 手动安装

请根据您的操作系统选择对应的手动安装流程。

#### Windows 平台工具链的标准设置

**概述** ESP-IDF 需要安装一些必备工具，才能围绕 ESP32 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过 **命令提示符** 进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 [Eclipse Plugin](#) 或其他支持 CMake 的图形化工具 IDE。

---

**备注：**限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致构建失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地域-勾选选项“Beta：使用 Unicode UTF-8 支持全球语言”-点击确定-重启电脑。

---

**ESP-IDF 工具安装器** 安装 ESP-IDF 必备工具最简易的方式是下载一个 ESP-IDF 工具安装器。

**在线安装与离线安装的区别** 在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 [Git For Windows](#) 安装器。在线安装程序会将下载的文件存储在缓存目录 `%userprofile%/espressif` 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 [Git For Windows](#) 安装器。

**安装内容** 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 `%userprofile%\Desktop\esp-idf` 目录下，其中 `%userprofile%` 代表家目录。

**启动 ESP-IDF 环境** 安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (`cmd.exe`)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

图 9: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (`cmd.exe`):

**使用命令提示符** 在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

图 12: ESP-IDF 命令提示符窗口

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 `cmd.exe`），并运行 `export.bat` 脚本以设置各环境变量（比如 `PATH`，`IDF_PATH` 等）。此外，您还可以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 `cmd.exe`，并切换至您希望使用的 ESP-IDF 目录，然后运行 `export.bat`。注意，这种方法要求 `PATH` 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

**开始使用 ESP-IDF** 现在您已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始您的第一个工程。

本指南将帮助您完成使用 ESP-IDF 的第一步。按照本指南，您将使用 ESP32 创建第一个工程，并构建、烧录和监控设备输出。

---

**备注：**如果您还未安装 ESP-IDF，请参照[安装](#)中的步骤，获取使用本指南所需的所有软件。

---

**开始创建工程** 现在，您可以准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

---

**重要：**ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

---

将 `get-started/hello_world` 工程复制至您本地的 `~/esp` 目录下：

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

---

**备注：**ESP-IDF 的 `examples` 目录下有一系列示例工程，您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

---

**连接设备** 现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

在 Windows 操作系统中，串口名称通常以 COM 开头。

有关如何查看串口名称的详细信息，请见与 [ESP32 创建串口连接](#)。

---

**备注：**请记住串口名，您会在后续步骤中使用。

---

**配置工程** 请进入 `hello_world` 目录，设置 ESP32 为目标芯片，然后运行工程配置工具 `menuconfig`。

## Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

打开一个新工程后，应首先使用 `idf.py set-target esp32` 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见[选择目标芯片：set-target](#)。

正确操作上述步骤后，系统将显示以下菜单：

```

      Espressif IoT Development Framework Configuration

[F] Toggle show-help mode   [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

图 13: 工程配置—主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

**注意：** 如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组）或 ESP32-DevKitM-1（板载 ESP32-MINI-1(1U) 模组），请在烧写示例程序前，前往 `menuconfig` 中使能单核模式（[CONFIG\\_FREERTOS\\_UNICORE](#)）。

**备注：** 您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。请运行 `idf.py menuconfig --help` 命令，获取更多信息。

如果您使用的是支持的开发板，可以通过板级支持包 (BSP) 来协助您的开发。更多信息，请见其他提示。

**编译工程** 请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```
$ idf.py build

Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...

```

如果一切正常，编译完成后将生成.bin 文件。

**烧录到设备** 请运行以下命令，将刚刚生成的二进制文件烧录至您的 ESP32 开发板：

```
idf.py -p PORT flash
```

请将 `PORT` 替换为 ESP32 开发板的串口名称。如果 `PORT` 未经定义，`idf.py` 将尝试使用可用的串口自动连接。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

---

**备注：**勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

---

若在烧录过程中遇到问题，请前往[烧录故障排除](#) 或与 [ESP32 创建串口连接](#) 获取更多详细信息。

**常规操作** 在烧录过程中，您会看到类似如下的输出日志：

```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello\_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 [Eclipse Plugin](#)，以及 [VSCode Extension](#)。

**监视输出** 您可以使用 `idf.py -p PORT monitor` 命令，监视“hello\_world”工程的运行情况。注意，不要忘记将 `PORT` 替换为您的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动：

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]esp/hello_world/build
Executing "python [...]esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_

...

```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```

Restarting in 7 seconds...

```

您可使用快捷键 `Ctrl+]`，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（如下），很有可能是因为您的开发板采用了 26 MHz 晶振，而 ESP-IDF 默认支持大多数开发板使用的 40 MHz 晶振。

```

e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi|0+z5Ymvp

```

此时，您可以：

1. 退出监视器。
2. 返回 `menuconfig`。
3. 进入 `Component config --> Hardware Settings --> Main XTAL Config --> Main XTAL frequency` 进行配置，将 `CONFIG_XTAL_FREQ_SEL` 设置为 26 MHz。

#### 4. 重新编译和烧录应用程序。

在当前的 ESP-IDF 版本中，ESP32 支持的主晶振频率如下：

- 26 MHz
- 40 MHz

---

**备注：**您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

---

此外，

- 请前往 [IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往 [idf.py](#)，查看更多 `idf.py` 命令和选项。

**恭喜，您已完成 ESP32 的入门学习！**

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

---

**重要：**一些示例程序不支持 ESP32，因为 ESP32 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32，或者不存在这个表格，那么即表示 ESP32 支持这个示例程序。

---

### 其他提示

**权限问题 /dev/ttyUSB0** 使用某些 Linux 版本向 ESP32 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 [Linux Dialout 组](#)。

**兼容的 Python 版本** ESP-IDF 支持 Python 3.7 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

**上手板级支持包** 您可以使用 [板级支持包 \(BSP\)](#)，协助您在开发板上的原型开发。仅需要调用几个函数，便可以完成对特定开发板的初始化。

一般来说，BSP 支持开发板上所有硬件组件。除了管脚定义和初始化功能外，BSP 还附带如传感器、显示器、音频编解码器等外部元件的驱动程序。

BSP 通过 [IDF 组件管理器](#) 发布，您可以前往 [IDF 组件注册器](#) 进行下载。

以下示例演示了如何将 **ESP-WROVER-KIT BSP** 添加到项目中：

```
idf.py add-dependency esp_wrover_kit
```

更多有关使用 BSP 的示例，请前往 [BSP 示例文件夹](#)。

**擦除 flash** ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令：

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

**相关文档** 想要自定义安装流程的高阶用户可参照：

- 在 *Windows* 环境下更新 *ESP-IDF* 工具
- 与 *ESP32* 创建串口连接
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- *IDF* 监视器

## 在 *Windows* 环境下更新 *ESP-IDF* 工具

**使用脚本安装 *ESP-IDF* 工具** 请从 *Windows* “命令提示符”窗口，切换至 *ESP-IDF* 的安装目录。然后运行：

```
install.bat
```

对于 *Powershell*，请切换至 *ESP-IDF* 的安装目录。然后运行：

```
install.ps1
```

该命令可下载并安装 *ESP-IDF* 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 *ESP-IDF* 工具安装器的设置决定，默认情况下为：`C:\Users\username\.espressif`。

**使用“导出脚本”将 *ESP-IDF* 工具添加至 *PATH* 环境变量** *ESP-IDF* 工具安装器将在“开始菜单”为“*ESP-IDF* 命令提示符”创建快捷方式。点击该快捷方式可打开 *Windows* 命令提示符窗口，您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 *ESP-IDF*，您可以根据下方步骤将 *ESP-IDF* 工具添加至 *PATH* 环境变量。

首先，请打开需要使用 *ESP-IDF* 的命令提示符窗口，切换至安装 *ESP-IDF* 的目录，然后执行 `export.bat`，具体命令如下：

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 *Powershell* 用户，请同样切换至安装 *ESP-IDF* 的目录，然后执行 `export.ps1`，具体命令如下：

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 *ESP-IDF* 工具了。

## 与 *ESP32* 创建串口连接

可以使用 *USB* 至 *UART* 桥，与 *ESP32* 创建串口连接。

部分开发板中已经安装有 *USB* 至 *UART* 桥。如未安装，可使用外部桥。

**安装有 *USB* 至 *UART* 桥的开发板** 在安装有 *USB* 至 *UART* 桥的开发板中，*PC* 和桥之间通过 *USB* 连接，桥和 *ESP32* 之间通过 *UART* 连接。

**外部 *USB* 至 *UART* 桥** 部分开发板使用外部 *USB* 至 *UART* 桥。这种情况通常出现在需要控制空间和成本的产品中，例如一些小型开发板或成品。

**使用 *UART* 进行烧录** 本节描述如何使用 *USB* 至 *UART* 桥在 *ESP32* 和 *PC* 之间建立串行连接。板上桥与外部桥均适用。

图 14: 安装有 USB 至 UART 桥的开发板

图 15: 外部 USB 至 UART 桥

**连接 ESP32 和 PC** 用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 至 UART 桥（或外部转 UART 适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 开发板驱动程序的链接：

- CP210x: [CP210x USB 至 UART 桥 VCP 驱动程序](#)
- FTDI: [FTDI 虚拟 COM 端口驱动程序](#)

以上驱动仅供参考，请查看开发板用户指南，了解开发板具体使用的 USB 至 UART 桥芯片。一般情况下，当 ESP32 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

对于使用 USB 至 UART 桥下载的设备，您可以运行以下命令，包括定义波特率的可选参数。

```
idf.py -p PORT [-b BAUD] flash
```

如需改变烧录器的波特率，请用需要的波特率代替 BAUD。默认的波特率为 460800。

**备注：**如果设备不支持自动下载模式，则需要手动进入下载模式。请按住 BOOT 按钮，同时按一下 RESET 按钮。之后，松开 BOOT 按钮。

**在 Windows 上查看端口** 检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

图 16: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

图 17: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

**在 Linux 和 macOS 上查看端口** 查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口：

Linux:

```
ls /dev/tty*
```

macOS:

```
ls /dev/cu.*
```

**备注：**对于 macOS 用户：若没有看到串口，请检查是否安装 USB/串口驱动程序。具体应使用的驱动程序，见章节[连接 ESP32 和 PC](#)。对于 macOS High Sierra (10.13) 的用户，您可能还需要手动允许驱动程序的加载，具体可打开系统偏好设置 -> 安全和隐私 -> 通用，检查是否有信息显示：“来自开发人员的系统软件...”，其中开发人员的名称为 Silicon Labs 或 FTDI。

**在 Linux 中添加用户到 dialout** 当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，从而获许读写权限：

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限生效。

**确认串口连接** 现在，请使用串口终端程序，查看重置 ESP32 后终端上是否有输出，从而验证串口连接是否可用。

ESP32 的控制台波特率默认为 115200。

**Windows 和 Linux 操作系统** 在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。您也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200（如有需要，请更改为使用芯片的默认波特率），数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

然后，请检查 ESP32 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32 的应用程序，请参考[输出示例](#)。

**备注：**请在验证完串口通信正常后，关闭串口终端。如果您让终端一直保持打开的状态，之后上传固件时将无法访问串口。

**macOS 操作系统** macOS 提供了 `screen` 命令，因此您不用安装串口终端程序。

- 参考在 [Linux 和 macOS 上查看端口](#)，运行以下命令：

```
ls /dev/cu.*
```

- 您会看到类似如下输出：

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↔USBtoUART7
```

图 18: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

图 19: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

- 根据您连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令（如有需要，请将“115200”更改为使用芯片的默认波特率）：

```
screen /dev/cu.device_name 115200
```

将 `device_name` 替换为运行 `ls /dev/cu.*` 后出现的设备串口号。

- 您需要的正是 **屏幕** 显示的日志。日志内容取决于加载到 ESP32 的应用程序，请参考 [输出示例](#)。请使用 `Ctrl-A + \` 键退出 **屏幕** 会话。

**备注：**请在验证完串口通信正常后，关闭 **屏幕** 会话。如果直接关闭终端窗口而没有关闭 **屏幕**，之后上传固件时将无法访问串口。

**输出示例** 以下是一个日志示例。如果没看到任何输出，请尝试重置开发板。

```
ets Jun  8 2016 00:22:57

```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32。

**备注：**在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 [esptool 文档](#)。

如您在安装 ESP32 硬件开发的软件环境时，从 [第五步：开始使用 ESP-IDF 吧](#) 跳转到了这里，请从 [第五步：开始使用 ESP-IDF 吧](#) 继续阅读。

## 烧录故障排除

**连接失败** 如果在运行给定命令时出现如“连接失败”这样的错误，造成该错误的原因之一可能是运行 `esptool.py` 时出现错误。`esptool.py` 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。可以按照以下步骤进行手动复位，轻松解决该问题。如果问题仍未解决，请参考 [esptool 故障排除](#) 获取更多信息。

`esptool.py` 通过使 USB 至 UART 桥（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32（请参考 [ESP32 创建串口连接](#) 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32 的 GPIO0 和 CHIP\_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 [原理图](#)。

一般来说，使用官方的 ESP-IDF 开发板不会出现问题。但是，`esptool.py` 在以下情况下不能自动重置硬件：

- 您的硬件没有连接到 GPIO0 和 CHIP\_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同。
- 不存在这样的串行控制线路。

根据硬件的种类，也可以将您的 ESP32 开发板手动设置为固件下载模式（复位）。

- 对于乐鑫开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 Boot 按钮 (GPIO0) 再按住 EN 按钮 (CHIP\_PU) 来手动复位 ESP-IDF 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

### **IDF 监视器**

IDF 监视器是一个串行终端程序，使用了 `esp-idf-monitor` 包，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用 `idf.py monitor` 可以启用此监视器。

**操作快捷键** 为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。

快捷键	操作	描述
Ctrl+] ]	退出监视器程序	
Ctrl+T	菜单退出键	按下如下给出的任意键之一，并按指示操作。
• Ctrl+T	将菜单字符发送至远程	
• Ctrl+] ]	将 exit 字符发送至远程	
• Ctrl+P	重置目标设备，进入引导加载程序，通过 RTS 线暂停应用程序	重置目标设备，通过 RTS 线（如已连接）进入引导加载程序，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。
• Ctrl+R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl+F	编译并烧录此项目	暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+A (或者 A)	仅编译及烧录应用程序	暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+Y	停止/恢复在屏幕上打印日志输出	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl+L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）。
• Ctrl+I (或者 I)	停止/恢复打印时间标记	IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 --timestamp-format 命令行参数来改变。
• Ctrl+H (或者 H)	显示所有快捷键	
• Ctrl+X (或者 X)	退出监视器程序	
Ctrl+C	中断正在运行的应用程序	暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启用:ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

### 兼具 IDF 特性

**自动解码地址** 每当芯片输出指向可执行代码的十六进制地址时，IDF 监视器将查找该地址在源代码中的位置（文件名和行号），并在下一行用黄色打印出该位置。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```

IDF 监视器在后台运行以下命令, 解码各地址:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

如果在应用程序源代码中找不到匹配的地址, IDF 监视器还会检查 ROM 代码。此时不会打印源文件名和行号, 只显示函数名 in ROM:

ROM ELF 文件会根据 `IDF_PATH` 和 `ESP_ROM_ELF_DIR` 环境变量的路径自动加载。如需覆盖此行为, 可以通过调用 `esp_idf_monitor` 并指定特定的 ROM ELF 文件路径: `python -m esp_idf_monitor --rom-elf-file [ROM ELF 文件的路径]`。

**备注:** 将环境变量 `ESP_MONITOR_DECODE` 设置为 0 或者调用 `esp_idf_monitor` 的特定命令行选项 `python -m esp_idf_monitor --disable-address-decoding` 来禁止地址解码。

**连接时复位目标芯片** 默认情况下, IDF 监视器会在目标芯片连接时通过 DTR 和 RTS 串行线自动复位芯片。要防止 IDF 监视器在连接时自动复位, 请在调用 IDF 监视器时加上选项 `--no-reset`, 如 `idf.py monitor --no-reset`。

**备注:** `--no-reset` 选项在 IDF 监视器连接到特定端口时可以实现同样的效果, 如 `idf.py monitor --no-reset -p [PORT]`。

**配置 GDBStub 以启用 GDB** GDBStub 支持在运行时进行调试。GDBStub 在目标上运行, 并通过串口连接到主机从而接收调试命令。GDBStub 支持读取内存和变量、检查调用堆栈帧等命令。虽然没有 JTAG 调试通用, 但由于 GDBStub 完全通过串行端口完成通信, 故不需要使用特殊硬件 (如 JTAG/USB 桥接器)。

通过将 `CONFIG_ESP_SYSTEM_PANIC` 设置为 `GDBStub on runtime`, 可以将目标配置为在后台运行 GDBStub。GDBStub 将保持在后台运行, 直到通过串行端口发送 `Ctrl+C` 导致应用程序中断 (即停止程序执行), 从而让 GDBStub 处理调试命令。

此外, 还可以通过设置 `CONFIG_ESP_SYSTEM_PANIC` 为 `GDBStub on panic` 来配置 `panic` 处理程序, 使其在发生 `crash` 事件时运行 GDBStub。当 `crash` 发生时, GDBStub 将通过串口输出特殊的字符串模式, 表示 GDBStub 正在运行。

无论是通过发送 `Ctrl+C` 还是收到特殊字符串模式, IDF 监视器都会自动启动 GDB, 从而让用户发送调试命令。GDB 退出后, 通过 RTS 串口线复位目标。如果未连接 RTS 串口线, 请按复位键, 手动复位开发板。

**备注:** IDF 监视器在后台运行如下命令启用 GDB:

```

xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex
↳interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`

```

**输出筛选** 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，即打印所有内容。支持使用环境变量 `ESP_IDF_MONITOR_PRINT_FILTER` 调整筛选设置。

**备注：**同时使用环境变量 `ESP_IDF_MONITOR_PRINT_FILTER` 和参数 `--print-filter` 时，通过命令行输入的 CLI 参数 `--print-filter` 优先级更高。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 {N, E, W, I, D, V, \*} 集合中的一个字母，指的是日志级别。

例如，`--print-filter="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

**备注：**编译时，可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 `*`、冒号 `:`，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

### 筛选规则示例

- `*` 可用于匹配任何类型标签。但 `--print-filter="*:I tag1:E"` 打印关于 `tag1` 的输出时会报错，这是因为 `tag1` 规则比 `*` 规则的优先级高。
- 默认规则（空）等价于 `*:V`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `*:N` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 详细度级别或更低级别打印 `tag1`，在 Warning 详细度级别或更低级别打印 `tag2`。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 `tag3:N` 指定 `tag3` 不打印。
- `tag3:N` 在规则 `"tag1:I tag2:W tag3:N *:V"` 中更有意义，这是因为如果没有 `tag3:N`，`tag3` 信息就可能打印出来了；`tag1` 和 `tag2` 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

**高级筛选规则示例** 如下日志是在没有设置任何筛选选项的情况下获得的：

## IDF 监视器已知问题

### Windows 环境下已知问题

- 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
- 偶然情况下，idf.py 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
- GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

### Linux 和 macOS 平台工具链的标准设置

**详细安装步骤** 请根据下方详细步骤，完成安装过程。

**设置开发环境** 以下是为 ESP32 设置 ESP-IDF 的具体步骤。

- 第一步: 安装准备
- 第二步: 获取 *ESP-IDF*
- 第三步: 设置工具
- 第四步: 设置环境变量
- 第五步: 开始使用 *ESP-IDF* 吧

**第一步: 安装准备** 为了在 ESP32 中使用 ESP-IDF，需要根据操作系统安装一些软件包。以下安装指南可协助您安装 Linux 和 macOS 的系统上所有需要的软件包。

**Linux 用户** 编译 ESP-IDF 需要以下软件包。请根据使用的 Linux 发行版本，选择合适的安装命令。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-
↵venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 ↵
↵python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja
↳ccache dfu-util libusb
```

#### 备注:

- 使用 ESP-IDF 需要 CMake 3.16 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装“cmake”）。
- 如果上述列表中没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。

**macOS 用户** ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 CMake 和 Ninja 编译工具：
  - 若有 [HomeBrew](#)，您可以运行：

```
brew install cmake ninja dfu-util
```

- 若有 [MacPorts](#)，您可以运行：

```
sudo port install cmake ninja dfu-util
```

- 若以上均不适用，请访问 [CMake](#) 和 [Ninja](#) 主页，查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 [ccache](#) 以获得更快的编译速度。如有 [HomeBrew](#)，可通过 [MacPorts](#) 上的 brew install ccache 或 sudo port install ccache 完成安装。

**备注:** 如您在上述任何步骤中遇到以下错误：

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

则必须安装 XCode 命令行工具，可运行 xcode-select --install 命令进行安装。

**Apple M1 用户** 如果您使用的是 Apple M1 系列且看到如下错误提示：

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is
↳present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to
↳install it.
```

或者：

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-
↳patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

您需要运行如下命令来安装 Apple Rosetta 2：

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**安装 Python 3** [Catalina 10.15 发布说明](#) 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本：

```
python --version
```

如果输出结果是 Python 2.7.17，则代表您的默认解析器是 Python 2.7。这时需要您运行以下命令检查电脑上是否已经安装过 Python 3：

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3：

- 使用 [HomeBrew](#) 进行安装的方法如下：

```
brew install python3
```

- 使用 [MacPorts](#) 进行安装的方法如下：

```
sudo port install python38
```

**第二步：获取 ESP-IDF** 在围绕 ESP32 构建应用程序之前，请先获取乐鑫提供的软件库文件 [ESP-IDF 仓库](#)。

获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

打开终端，运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b release/v5.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

**第三步：设置工具** 除了 ESP-IDF 本身，您还需要为支持 ESP32 的项目安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

```
cd ~/esp/esp-idf
./install.sh esp32
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish esp32
```

上述命令仅仅为 ESP32 安装所需工具。如果需要为多个目标芯片开发项目，则可以一次性指定多个目标，如下所示：

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

如果需要一次性为所有支持的目标芯片安装工具，可以运行如下命令：

```
cd ~/esp/esp-idf
./install.sh all
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish all
```

**备注：**对于 macOS 用户，如果您在上述任何步骤中遇到以下错误：

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable
↳to get local issuer certificate (_ssl.c:xxx)
```

可运行您电脑 Python 文件夹中的 `Install Certificates.command` 安装证书。了解更多信息，请参考 [安装 ESP-IDF 工具时出现的下载错误](#)。

**下载工具备选方案** ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，可以设置一个环境变量，从而优先选择 Espressif 的下载服务器进行 Github 资源下载。

**备注：**该设置只影响从 Github 发布版本中下载的单一个工具，它并不会改变访问任何 Git 仓库的 URL。

要在安装工具时优先选择 Espressif 下载服务器，请在运行 `install.sh` 时使用以下命令：

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**自定义工具安装路径** 本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 系统中的 `$HOME/.espressif` 目录。您可以选择将工具安装到其他目录中，但请在运行安装脚本前，重新设置环境变量 `IDF_TOOLS_PATH`。注意，请确保您的用户账号已经具备了读写该路径的权限。

如果修改了 `IDF_TOOLS_PATH` 变量，请确保该变量在每次执行安装脚本 (`install.bat`、`install.ps1` 或 `install.sh`) 和导出脚本 (`export.bat`、`export.ps1` 或 `export.sh`) 均保持一致。

**第四步：设置环境变量** 此时，您刚刚安装的工具尚未添加至 `PATH` 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量。这可以通过 ESP-IDF 提供的另一个脚本进行设置。

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
. $HOME/esp/esp-idf/export.sh
```

对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
. $HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 `export.sh` 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中（`.profile`、`.bashrc`、`.zprofile` 等）

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 `esp-idf` 环境。

不建议直接将 `export.sh` 添加到 shell 的配置文件。这样做会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的会话）。这违背了使用虚拟环境的目的，还可能影响其他软件的使用。

**第五步：开始使用 ESP-IDF 吧** 现在您已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始您的第一个工程。

本指南将帮助您完成使用 ESP-IDF 的第一步。按照本指南，您将使用 ESP32 创建第一个工程，并构建、烧录和监控设备输出。

**备注：**如果您还未安装 ESP-IDF，请参照[安装](#)中的步骤，获取使用本指南所需的所有软件。

---

**开始创建工程** 现在，您可以准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 [examples](#) 目录下的 [get-started/hello\\_world](#) 工程开始。

**重要：**ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

---

将 [get-started/hello\\_world](#) 工程复制至您本地的 `~/esp` 目录下：

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

---

**备注：**ESP-IDF 的 [examples](#) 目录下有一系列示例工程，您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

---

**连接设备** 现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Linux 操作系统：**以 `/dev/tty` 开头
- **macOS 操作系统：**以 `/dev/cu.` 开头

有关如何查看串口名称的详细信息，请见与 [ESP32 创建串口连接](#)。

---

**备注：**请记住串口名，您会在后续步骤中使用。

---

**配置工程** 请进入 `hello_world` 目录，设置 ESP32 为目标芯片，然后运行工程配置工具 `menuconfig`。

```
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

---

打开一个新工程后，应首先使用 `idf.py set-target esp32` 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见[选择目标芯片：set-target](#)。

正确操作上述步骤后，系统将显示以下菜单：

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

**注意：**如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组）或 ESP32-DevKitM-1（板载 ESP32-MINI-1(1U) 模组），请在烧写示例程序前，前往 `menuconfig` 中使能单核模式（[CONFIG\\_FREERTOS\\_UNICORE](#)）。

---

**备注：**您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。请运行 `idf.py menuconfig --help` 命令，获取更多信息。

---

如果您使用的是支持的开发板，可以通过板级支持包 (BSP) 来协助您的开发。更多信息，请见其他提示。

**编译工程** 请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```

$ idf.py build

Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...

↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

如果一切正常，编译完成后将生成 `.bin` 文件。

**烧录到设备** 请运行以下命令，将刚刚生成的二进制文件烧录至您的 ESP32 开发板：

```
idf.py -p PORT flash
```

请将 `PORT` 替换为 ESP32 开发板的串口名称。如果 `PORT` 未经定义，`idf.py` 将尝试使用可用的串口自动连接。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

**备注：**勾选 flash 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

若在烧录过程中遇到问题，请前往[烧录故障排除](#) 或与 [ESP32 创建串口连接](#) 获取更多详细信息。

**常规操作** 在烧录过程中，您会看到类似如下的输出日志：

```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello\_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 `idf.py`，请参考 [Eclipse Plugin](#)，以及 [VSCode Extension](#)。

**监视输出** 您可以使用 `idf.py -p PORT monitor` 命令，监视“hello\_world”工程的运行情况。注意，不要忘记将 `PORT` 替换为您的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动：

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...] /esp/hello_world/build
```

(下页继续)

(续上页)

```

```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```

```

您可使用快捷键 Ctrl+]，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（如下），很有可能是因为您的开发板采用了 26 MHz 晶振，而 ESP-IDF 默认支持大多数开发板使用的 40 MHz 晶振。

```

e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp

```

此时，您可以：

1. 退出监视器。
2. 返回 menuconfig。
3. 进入 Component config --> Hardware Settings --> Main XTAL Config --> Main XTAL frequency 进行配置，将 `CONFIG_XTAL_FREQ_SEL` 设置为 26 MHz。
4. 重新编译和烧录应用程序。

在当前的 ESP-IDF 版本中，ESP32 支持的主晶振频率如下：

- 26 MHz
- 40 MHz

**备注：**您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往 [IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往 [idf.py](#)，查看更多 idf.py 命令和选项。

**恭喜，您已完成 ESP32 的入门学习！**

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

**重要：**一些示例程序不支持 ESP32，因为 ESP32 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32，或者不存在这个表格，那么即表示 ESP32 支持这个示例程序。

## 其他提示

**权限问题 /dev/ttyUSB0** 使用某些 Linux 版本向 ESP32 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 [Linux Dialout 组](#)。

**兼容的 Python 版本** ESP-IDF 支持 Python 3.7 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

**上手板级支持包** 您可以使用 [板级支持包 \(BSP\)](#)，协助您在开发板上的原型开发。仅需要调用几个函数，便可以完成对特定开发板的初始化。

一般来说，BSP 支持开发板上所有硬件组件。除了管脚定义和初始化功能外，BSP 还附带如传感器、显示器、音频编解码器等外部元件的驱动程序。

BSP 通过 [IDF 组件管理器](#) 发布，您可以前往 [IDF 组件注册器](#) 进行下载。

以下示例演示了如何将 **ESP-WROVER-KIT BSP** 添加到项目中：

```
idf.py add-dependency esp_wrover_kit
```

更多有关使用 BSP 的示例，请前往 [BSP 示例文件夹](#)。

**擦除 flash** ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令：

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

**建议：更新 ESP-IDF** 乐鑫会不时推出新版本的 ESP-IDF，修复 bug 或提供新的功能。请注意，ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，用户可将项目升级到最新的 ESP-IDF 版本。更多关于支持期限的信息，请参考 [ESP-IDF 版本](#)。

因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，然后按照 [第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

另一种方法是仅更新变更的部分。具体方式，请前往 [更新 ESP-IDF](#) 章节查看。具体更新步骤会根据您使用的 ESP-IDF 版本有所不同。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考 [第三步：设置工具](#)。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考 [第四步：设置环境变量](#)。

# API 参考

### 2.1 API 约定

本文介绍了 ESP-IDF 应用程序编程接口 (API) 中常见的约定和假设。

ESP-IDF 提供了几种编程接口：

- 在 ESP-IDF 组件的公共头文件中声明的 C 函数、结构体、枚举、类型定义和预处理器宏。编程指南的 API 参考部分描述了这些函数、结构体和类型。
- 编译系统函数、预定义变量和选项，详情请参阅[ESP-IDF CMake 构建系统 API](#)。
- [Kconfig](#) 选项，可用于代码及编译系统文件 (CMakeLists.txt)。
- [主机工具](#) 及其命令行参数。

ESP-IDF 由多个组件组成，组件中包含专门为 ESP 芯片编写的代码或第三方库（即第三方组件）。对于某些第三方库，ESP-IDF 提供专用的包装器和接口，以简化对第三方库的使用，或提高其与 ESP-IDF 其他功能的兼容性。某些情况下，第三方组件将直接呈现底层库的原始 API。

以下各节介绍了部分 ESP-IDF API 及其使用的相关内容。

#### 2.1.1 错误处理

多数 ESP-IDF API 会返回由 `esp_err_t` 类型定义的错误代码。有关出错处理的更多信息，请参阅[错误处理](#) 部分。有关 ESP-IDF 组件返回的错误代码列表，请参阅[错误代码参考](#)。

#### 2.1.2 配置结构体

---

**重要：** 为确保应用程序与未来 ESP-IDF 版本的兼容性，请正确初始化配置结构体。

---

多数 ESP-IDF 中的初始化、配置和安装函数（通常以 `..._init()`、`..._config()` 和 `..._install()` 命名）都需要一个指向配置结构体的指针作为参数。例如：

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
```

(下页继续)

```
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

初始化函数不会存储指向配置结构体的指针，因此在栈上分配结构体是安全的。

应用程序必须初始化结构体的所有字段，以下为错误示例：

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* 错误！字段 .arg 和 .name 未初始化 */
esp_timer_create(&my_timer_args, &my_timer);
```

大多数 ESP-IDF 示例使用 C99 的 [指定初始化器](#) 来完成结构体初始化，从而以简洁的方式设置子集字段，并将剩余字段初始化为零：

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* 正确，字段 .arg 和 .name 已初始化为零 */
};
```

C++ 语言同样支持指定初始化器语法，但初始化器必须遵循声明顺序。在 C++ 代码中使用 ESP-IDF API 时，可以考虑使用以下模式：

```
/* 正确：.dispatch_method、.name 以及 .skip_unhandled_events 初始化为零 */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

///  
/* 错误：esp_timer_create_args_t 中，.arg 在 .callback 之后声明 */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

了解指定初始化器的更多信息，请参见[指定初始化器](#)。注意，C++20 之前的 C++ 语言不是当前 ESP-IDF 的默认版本，不支持指定初始化器。如需使用 C++20 之前的 C++ 标准编译代码，可以借助 GCC 扩展生成以下模式：

```
esp_timer_create_args_t my_timer_args = {};
/* 所有字段初始化为零 */
my_timer_args.callback = &my_timer_callback;
```

## 默认初始化器

ESP-IDF 为某些配置结构体提供了用于设置字段默认值的宏：

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG_
↳ 扩展到一个指定的初始化器。此时，所有字段均已设置为默认值，且支持编辑：*/
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

当特定配置结构体提供了默认初始化器宏时，推荐使用该默认初始化器宏。

### 2.1.3 私有 API

在 ESP-IDF 中，某些头文件包含的 API 仅限于在 ESP-IDF 源代码中使用，不支持在应用程序中使用。此类头文件的名称或路径通常带有 `private` 或 `esp_private`。某些组件（如 `hal`）则仅包含私有 API。

私有 API 可能在次要或补丁版本之间以不兼容的方式被删除或更改。

### 2.1.4 示例项目组件

ESP-IDF 示例中提供了一系列演示 ESP-IDF API 使用方式的工程。为避免在各个示例中重复引用相同的代码片段，示例的常用组件中定义了一些通用辅助工具。这些常用组件包括 `common_components` 目录下的组件和示例本身的部分组件，它们不属于 ESP-IDF API 的范畴。

不建议在自定义项目中通过 `EXTRA_COMPONENT_DIRS` 编译系统变量直接引用这些组件，因为在不同的 ESP-IDF 版本中，组件可能存在显著变化。基于 ESP-IDF 示例开始新项目时，需将项目及其所依赖的公共组件从 ESP-IDF 中复制出来，并将公共组件视为项目的一部分。请注意，公共组件是针对示例编写的，可能不包括生产应用程序所需的所有出错处理。在使用前，需阅读代码并判断它是否适用于所需用例。

### 2.1.5 API 稳定性

ESP-IDF 使用 [语义版本管理办法](#)，详情请参阅 [版本管理](#)。

ESP-IDF 的次要版本和错误修复版本会保证与过往版本的兼容性。以下各节解释了兼容性的不同方面和限制。

#### 源代码级别兼容性

ESP-IDF 确保在 ESP-IDF 组件的公共头文件中声明的 C 函数、结构体、枚举、类型定义和预处理宏的源代码级别兼容性。源代码级别兼容性意味着应用程序无需修改即可在新版本的 ESP-IDF 上重新编译。

以下在次要版本之间的更改不会破坏源代码级别兼容性：

- 使用 `deprecated` 属性废弃函数、使用预处理器 `#warning` 废弃头文件。废弃功能已在 ESP-IDF 发布说明中列出。建议更新源代码以使用替换被废弃的函数或文件的新函数或文件。ESP-IDF 的主要版本将移除废弃的函数和文件。
- 重命名组件，在组件间移动源代码和头文件，但需确保编译系统仍可以找到正确的文件。
- 重命名 Kconfig 选项。Kconfig 系统的 [向后兼容性](#) 确保应用程序在 `sdkconfig` 文件、CMake 文件和源代码中仍然可以使用原始的 Kconfig 选项名称。

#### 缺少二进制兼容性

ESP-IDF 无法确保版本间的二进制兼容性。这意味着，如果使用某个 ESP-IDF 版本构建了一个预编译库，在下一个次要或错误修复版本中，无法确保该库将以相同方式运行。以下更改可以保持源代码级别兼容性，但不保证二进制兼容性：

- 更改 C 枚举成员的数值。
- 添加新的结构体成员或更改成员顺序。关于有助于确保兼容性的提示，请参阅 [配置结构体](#)。
- 用具有相同签名的 `static inline` 函数替换 `extern` 函数，反之亦然。
- 用兼容的 C 函数替换类似于函数的宏。

#### 其他不兼容情况

尽管我们致力于让 ESP-IDF 版本升级更加容易，但是在次要版本之间，ESP-IDF 的某些部分可能会以不兼容的方式发生更改。如有不属于下列情况的意外重大更新，欢迎向我们发送报告：

- [私有 API](#)。
- [示例项目组件](#)。

- 明确标记为“beta”、“preview”或“experimental”的功能。
- 为缓解安全问题做出的更改，或以更安全的行为取代不安全的默认行为的更改。
- 从未运行成功的功能。例如，如果某个函数或枚举值从未成功使用，则可能会以修复的形式将其重命名或删除。这包括依赖于非功能芯片硬件功能的软件功能。
- 未明确记录的意外或未定义行为可能会被修复或更改，如缺少参数范围验证。
- 在菜单配置中 *Kconfig* 选项的位置。
- 示例项目的位置和名称。

## 2.2 应用层协议

### 2.2.1 ASIO port

Asio is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component *ASIO* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`

### 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component *freemodbus* has been moved from ESP-IDF since version v5.0 to a separate repository:

### 2.2.3 ESP-MQTT

#### 概述

ESP-MQTT 是 MQTT 协议客户端的实现，MQTT 是一种基于发布/订阅模式的轻量级消息传输协议。ESP-MQTT 当前支持 MQTT v5.0。

#### 特性

- 支持基于 TCP 的 MQTT、基于 Mbed TLS 的 SSL、基于 WebSocket 的 MQTT 以及基于 WebSocket Secure 的 MQTT
- 通过 URI 简化配置流程
- 多个实例（一个应用程序中有多个客户端）
- 支持订阅、发布、认证、遗嘱消息、保持连接心跳机制以及 3 个服务质量 (QoS) 级别（组成全功能客户端）

#### 应用示例

- `protocols/mqtt/tcp`: 基于 TCP 的 MQTT，默认端口 1883
- `protocols/mqtt/ssl`: 基于 TLS 的 MQTT，默认端口 8883
- `protocols/mqtt/ssl_ds`: 基于 TLS 的 MQTT，使用数字签名外设进行身份验证，默认端口 8883
- `protocols/mqtt/ssl_mutual_auth`: 基于 TLS 的 MQTT，使用证书进行身份验证，默认端口 8883
- `protocols/mqtt/ssl_psk`: 基于 TLS 的 MQTT，使用预共享密钥进行身份验证，默认端口 8883
- `protocols/mqtt/ws`: 基于 WebSocket 的 MQTT，默认端口 80
- `protocols/mqtt/wss`: 基于 WebSocket Secure 的 MQTT，默认端口 443
- `protocols/mqtt5`: 使用 ESP-MQTT 库连接 MQTT v5.0 的服务器

#### MQTT 消息重传

调用 `esp_mqtt_client_publish` 或其非阻塞形式 `esp_mqtt_client_enqueue`，可以创建新的 MQTT 消息。

QoS 0 的消息将只发送一次，QoS 1 和 2 具有不同行为，因为协议需要执行额外步骤来完成该过程。

ESP-MQTT 库将始终重新传输未确认的 QoS 1 和 2 发布消息，以避免连接错误导致信息丢失，虽然 MQTT 规范要求仅在重新连接且 Clean Session 标志设置为 0 时重新传输（针对此行为，将 `disable_clean_session` 设置为 true）。

可能需要重传的 QoS 1 和 2 消息总是处于排队状态，但若使用 `esp_mqtt_client_publish` 则会立即进行第一次传输尝试。未确认消息的重传将在 `message_retransmit_timeout` 之后进行。在 `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` 之后，消息会过期并被删除。如已设置 `CONFIG_MQTT_REPORT_DELETED_MESSAGES`，则会发送事件来通知用户。

#### 配置

通过设置 `esp_mqtt_client_config_t` 结构体中的字段来进行配置。配置结构体包含以下子结构体，用于配置客户端的多种操作。

- `esp_mqtt_client_config_t::broker_t` - 允许设置地址和安全验证。

- `esp_mqtt_client_config_t::credentials_t` - 用于身份验证的客户端凭据。
- `esp_mqtt_client_config_t::session_t` - MQTT 会话相关配置。
- `esp_mqtt_client_config_t::network_t` - 网络相关配置。
- `esp_mqtt_client_config_t::task_t` - 允许配置 FreeRTOS 任务。
- `esp_mqtt_client_config_t::buffer_t` - 输入输出的缓冲区大小。

下文将详细介绍不同配置。

## 服务器

**地址** 通过 `address` 结构体的 `uri` 字段或者 `hostname`、`transport` 以及 `port` 的组合，可以设置服务器地址。您也可以选择设置 `path`，该字段对 WebSocket 连接而言非常有用。

使用 `uri` 字段的格式为 `scheme://hostname:port/path`。

- 当前支持 mqtt、mqtts、ws 和 wss 协议
- 基于 TCP 的 MQTT 示例：
  - `mqtt://mqtt.eclipseprojects.io`: 基于 TCP 的 MQTT，默认端口 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: 基于 TCP 的 MQTT，端口 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: 基于 TCP 的 MQTT，端口 1884，带有用户名和密码
- 基于 SSL 的 MQTT 示例：
  - `mqtts://mqtt.eclipseprojects.io`: 基于 SSL 的 MQTT，端口 8883
  - `mqtts://mqtt.eclipseprojects.io:8884`: 基于 SSL 的 MQTT，端口 8884
- 基于 WebSocket 的 MQTT 示例：
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- 基于 WebSocket Secure 的 MQTT 示例：
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- 最简配置：

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

**备注：**默认情况下，MQTT 客户端使用事件循环库来发布相关 MQTT 事件（已连接、已订阅、已发布等）。

**验证** 为验证服务器身份，对于使用 TLS 的安全链接，必须设置 `verification` 结构体。服务器证书可设置为 PEM 或 DER 格式。如要选择 DER 格式，必须设置等效 `certificate_len` 字段，否则应在 `certificate` 字段传入以空字符结尾的 PEM 格式字符串。

- 从服务器获取证书，例如：`mqtt.eclipseprojects.io`

```
openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↪null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
```

- 检查示例应用程序：[protocols/mqtt/ssl](#)
- 配置：

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
```

(下页继续)

```

        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};

```

了解其他字段的详细信息，请查看[API 参考](#) 以及[TLS Server verification](#)。

**客户端凭据** `credentials` 字段下包含所有客户端相关凭据。

- `username`: 指向用于连接服务器用户名的指针，也可通过 URI 设置
- `client_id`: 指向客户端 ID 的指针，默认为 ESP32\_%CHIPID%，其中 %CHIPID% 是十六进制 MAC 地址的最后 3 个字节

**认证** 可以通过 `authentication` 字段设置认证参数。客户端支持以下认证方式：

- `password`: 使用密码
- `certificate` 和 `key`: 进行双向 TLS 身份验证，PEM 或 DER 格式均可
- `use_secure_element`: 使用 ESP32-WROOM-32SE 中的安全元素
- `ds_data`: 使用某些乐鑫设备的数字签名外设

**会话** 使用 `session` 字段进行 MQTT 会话相关配置。

**遗嘱消息 (LWT)** 通过设置 `last_will` 结构体的以下字段，MQTT 会在一个客户端意外断开连接时通过遗嘱消息通知其他客户端。

- `topic`: 指向 LWT 消息主题的指针
- `msg`: 指向 LWT 消息的指针
- `msg_len`: LWT 消息的长度，`msg` 不以空字符结尾时需要该字段
- `qos`: LWT 消息的服务质量
- `retain`: 指定 LWT 消息的保留标志

**在项目配置菜单中设置 MQTT** 通过 `idf.py menuconfig`，可以在 Component config > ESP-MQTT Configuration 中找到 MQTT 设置。

相关设置如下：

- `CONFIG_MQTT_PROTOCOL_311`: 启用 MQTT 协议 3.1.1 版本
- `CONFIG_MQTT_TRANSPORT_SSL` 和 `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: 启用特定 MQTT 传输层，例如 SSL、WEBSOCKET 和 WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: 禁用 `mqtt_outbox` 默认实现，因此可以提供特定实现

## 事件

MQTT 客户端可能会发布以下事件：

- `MQTT_EVENT_BEFORE_CONNECT`: 客户端已初始化并即将开始连接至服务器。
- `MQTT_EVENT_CONNECTED`: 客户端已成功连接至服务器。客户端已准备好收发数据。
- `MQTT_EVENT_DISCONNECTED`: 由于无法读取或写入数据，例如因为服务器无法使用，客户端已终止连接。
- `MQTT_EVENT_SUBSCRIBED`: 服务器已确认客户端的订阅请求。事件数据将包含订阅消息的消息 ID。
- `MQTT_EVENT_UNSUBSCRIBED`: 服务器已确认客户端的退订请求。事件数据将包含退订消息的消息 ID。
- `MQTT_EVENT_PUBLISHED`: 服务器已确认客户端的发布消息。消息将仅针对 QoS 级别 1 和 2 发布，因为级别 0 不会进行确认。事件数据将包含发布消息的消息 ID。

`esp_err_t esp_mqtt_client_stop` (`esp_mqtt_client_handle_t` client)

Stops *MQTT* client tasks.

- Notes:
- Cannot be called from the *MQTT* event handler

参数 `client` -- *MQTT* client handle

返回 `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` if client is in invalid state

int **esp\_mqtt\_client\_subscribe\_single** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

参数

- **client** -- *MQTT* client handle
- **topic** -- topic filter to subscribe
- **qos** -- Max qos level of the subscription

返回 message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_subscribe\_multiple** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_topic\_t* \*topic\_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

参数

- **client** -- *MQTT* client handle
- **topic\_list** -- List of topics to subscribe
- **size** -- size of topic\_list

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe_single` for details

参数

- **client** -- *MQTT* client handle
- **topic** --

返回 message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

参数

- **client** -- *MQTT* client handle

- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag

**返回** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success.  
-1 on failure, -2 in case of full outbox.

**int esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp\_mqtt\_client\_publish() which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of esp\_mqtt\_client\_publish().

#### 参数

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag
- **store** -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**返回** message\_id if queued successfully, -1 on failure, -2 in case of full outbox.

*esp\_err\_t* **esp\_mqtt\_client\_destroy** (*esp\_mqtt\_client\_handle\_t* client)

## Structures

struct **esp\_mqtt\_error\_codes**

Use this structure directly checking error\_type first and then appropriate error code depending on the source of the error:

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
├── private_include
│   ├── esp_tls_mbedtls.h
│   └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert\_buf** and **cacert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf` - pointer to the buffer which contains the CA cert.
  - `cacert_bytes` - size of the CA certificate in bytes.

- **use\_global\_ca\_store:** The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **cert\_bundle\_attach:** The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk\_hint\_key:** To use pre-shared keys for server verification, [CONFIG\\_ESP\\_TLS\\_PSK\\_VERIFICATION](#) should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification:** This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling [CONFIG\\_ESP\\_TLS\\_INSECURE](#) and [CONFIG\\_ESP\\_TLS\\_SKIP\\_SERVER\\_CERT\\_VERIFY](#) in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca\_store etc.*

### ESP-TLS Server cert selection hook

The ESP-TLS component provides an option to set the server cert selection hook when using the mbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc). To enable this feature, please enable [CONFIG\\_ESP\\_TLS\\_SERVER\\_CERT\\_SELECT\\_HOOK](#) in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**备注:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA\_COMPONENT\_DIRS in CMakeLists.txt of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

**备注:** These values are subject to change with change in configuration options and version of respective libraries.

### ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedTLS as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.

**备注:** ATECC608A chip on ESP32-WROOM-32SE must be already configured and provisioned, for details refer [esp\\_cryptoauth\\_utility](#)

To enable the secure element support, and use it in you project for TLS connection, you will have to follow below steps

- 1) Add [esp-cryptoauthlib](#) in your project, for details please refer [esp-cryptoauthlib with ESP\\_IDF](#)
- 2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-
->TLS
```

- 3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit [ATECC608A chip type](#)

4) Enable use of ATECC608A in ESP-TLS by providing following config option in *esp\_tls\_cfg\_t*

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

## 2.2.5 ESP HTTP 客户端

### 概述

`esp_http_client` 提供了一组 API，用于从 ESP-IDF 应用程序中发起 HTTP/S 请求，具体的使用步骤如下：

- 首先调用 `esp_http_client_init()`，创建一个 `esp_http_client_handle_t` 实例，即基于给定的 `esp_http_client_config_t` 配置创建 HTTP 客户端句柄。此函数必须第一个被调用。若用户未明确定义参数的配置值，则使用默认值。
- 其次调用 `esp_http_client_perform()`，执行 `esp_http_client` 的所有操作，包括打开连接、交换数据、关闭连接（如需要），同时当前任务完成前阻塞该任务。所有相关的事件（在 `esp_http_client_config_t` 中指定）将通过事件处理程序被调用。
- 最后调用 `esp_http_client_cleanup()` 来关闭连接（如有），并释放所有分配给 HTTP 客户端实例的内存。此函数必须在操作完成后最后一个被调用。

### 应用示例

使用 ESP HTTP 客户端发起 HTTP/S 请求的简单示例，可参考 [protocols/esp\\_http\\_client](#)。

### HTTP 基本请求

如需了解实现细节，请参考应用示例中的 `http_rest_with_url` 和 `http_rest_with_hostname_path` 函数。

### 持久连接

持久连接是 HTTP 客户端在多次交换中重复使用同一连接的方法。如果服务器没有使用 `Connection: close` 头来请求关闭连接，连接就会一直保持开放，用于其他新请求。

为了使 ESP HTTP 客户端充分利用持久连接的优势，建议尽可能多地使用同一个句柄实例来发起请求，可参考应用示例中的函数 `http_rest_with_url` 和 `http_rest_with_hostname_path`。示例中，一旦创建连接，即会在连接关闭前发出多个请求（如 GET、POST、PUT 等）。

**为 TLS 使用安全元件 (ATECC608)** 安全元件 (ATECC608) 也可用于 HTTP 客户端连接中的底层 TLS 连接。请参考 [ESP-TLS 文档](#) 中的 [ESP-TLS](#) 中的 [ATECC608A](#)（安全元件）支持小节，了解更多细节。如需支持安全元素，必须首先在 `menuconfig` 中通过 `CONFIG_ESP_TLS_USE_SECURE_ELEMENT` 对其进行启用，此后，可配置 HTTP 客户端使用安全元素，如下所示：

```
esp_http_client_config_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

### HTTPS 请求

ESP HTTP 客户端支持使用 **mbedTLS** 的 SSL 连接，需将 `url` 配置为以 `https` 开头，或将 `transport_type` 设置为 `HTTP_TRANSPORT_OVER_SSL`。可以通过 `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` 来配置 HTTPS 支持（默认启用）。

**备注：**在发起 HTTPS 请求时，如需服务器验证，首先需要向 `esp_http_client_config_t` 配置中的 `cert_pem` 成员提供额外的根证书（PEM 格式）。用户还可以通过 `esp_http_client_config_t` 配置中的 `crt_bundle_attach` 成员，使用 ESP x509 Certificate Bundle 进行服务器验证。

如需了解上文备注中的实现细节，请参考应用示例中的函数 `https_with_url` 和 `https_with_hostname_path`。

## HTTP 流

有些应用程序需要主动打开连接并控制数据交换（数据流）。在这种情况下，应用流程与常规请求不同。请参考以下示例：

- `esp_http_client_init()`：创建一个 HTTP 客户端句柄。
- `esp_http_client_set_*` 或 `esp_http_client_delete_*`：修改 HTTP 连接参数（可选）。
- `esp_http_client_open()`：用 `write_len`（该参数为需要写入服务器的内容长度）打开 HTTP 连接，设置 `write_len=0` 为只读连接。
- `esp_http_client_write()`：向服务器写入数据，最大长度为 `esp_http_client_open()` 函数中的 `write_len` 值；配置 `write_len=0` 无需调用此函数。
- `esp_http_client_fetch_headers()`：在发送完请求头和服务器数据（如有）后，读取 HTTP 服务器的响应头。从服务器返回 `content-length`，并可以由 `esp_http_client_get_status_code()` 继承，以获取连接的 HTTP 状态。
- `esp_http_client_read()`：读取 HTTP 流。
- `esp_http_client_close()`：关闭连接。
- `esp_http_client_cleanup()`：释放分配的资源。

如需了解实现细节，请参考应用示例中的函数 `http_perform_as_stream_reader`。

## HTTP 认证

**ESP HTTP 客户端同时支持基本和摘要认证。**

- 用户可以在 `url` 或 `esp_http_client_config_t` 配置中的 `username` 和 `password` 处输入用户名和密码。对于 `auth_type = HTTP_AUTH_TYPE_BASIC`，HTTP 客户端只需执行一项操作就可通过认证过程。
- 如果 `auth_type = HTTP_AUTH_TYPE_NONE`，但配置中有 `username` 和 `password` 字段，HTTP 客户端需要执行两项操作。客户端在第一次尝试连接服务器时，会收到 401 Unauthorized 头，而后再根据这些信息来选择认证方法，并在第二项操作中执行。
- 如需了解实现细节，请参考应用示例中的函数 `http_auth_basic`、`http_auth_basic_redirect`（用于基本认证）和 `http_auth_digest`（用于摘要认证）。

## 认证配置示例

- 基于 URI 的认证

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- 基于用户名和密码的认证

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

## 事件处理

ESP HTTP 客户端支持事件处理，发生相关事件时会触发相应的事件处理程序。`esp_http_client_event_id_t` 中包含了所有使用 ESP HTTP 客户端执行 HTTP 请求时可能发生的事件。

通过 `esp_http_client_config_t::event_handler` 设置回调函数即可启用事件处理功能。

## ESP HTTP 客户端诊断信息

诊断信息可以帮助用户深入了解出现的问题。在 ESP HTTP 客户端中，可以通过在事件循环库中注册事件处理程序来获取诊断信息。此功能的增加基于 ESP Insights 框架，该框架可帮助收集诊断信息。然而，即使不依赖 ESP Insights 框架，也可以获取诊断信息。事件处理程序可通过 `esp_event_handler_register()` 函数注册到事件循环中。

事件循环中不同 HTTP 客户端事件的预期数据类型如下所示：

- `HTTP_EVENT_ERROR`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_CONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_HEADERS_SENT`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_HEADER`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_DATA`: `esp_http_client_on_data_t`
- `HTTP_EVENT_ON_FINISH`: `esp_http_client_handle_t`
- `HTTP_EVENT_DISCONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_REDIRECT`: `esp_http_client_redirect_event_data_t`

在无法接收到 `HTTP_EVENT_DISCONNECTED` 之前，与事件数据一起接收到的 `esp_http_client_handle_t` 将始终有效。这个句柄主要是为了区分不同的客户端连接，无法用于其他目的，因为它可能会随着客户端连接状态的变化而改变。

### Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` \*config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**参数** `config` -- [in] The configurations, see `http_client_config_t`

**返回**

- `esp_http_client_handle_t`
- NULL if any errors

`esp_err_t esp_http_client_perform` (`esp_http_client_handle_t` client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to reuse the same connection for

the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

---

**备注:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

## 2.2.6 ESP Local Control

### Overview

ESP Local Control (**esp\_local\_ctrl**) component in ESP-IDF provides capability to control an ESP device over HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp\_local\_ctrl** service over BLE transport is performed as follows:

```

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----*/
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    }
};

```

(下页继续)

```

},
.handlers = {
    /* User defined handler functions */
    .get_prop_values = get_property_values,
    .set_prop_values = set_property_values,
    .usr_ctx         = NULL,
    .usr_ctx_free_fn = NULL
},
/* Maximum number of properties that may be set */
.max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTOCOL\_SEC2*: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. *PROTOCOL\_SEC1*: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. *PROTOCOL\_SEC0*: specifies that data will be exchanged as a plain text (no security).
4. *PROTOCOL\_SEC\_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom\_handle* of type *protocomm\_security\_t* \* in this context.

---

**备注:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocol security version section in *Protocol Communication* for more details.

## Creating a property

Now that we know how to start the **esp\_local\_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp\_local\_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE\_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name         = "timestamp",
    .type         = TYPE_TIMESTAMP,
    .size         = sizeof(int32_t),
    .flags        = READONLY,
    .ctx          = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
↳values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t
↳*prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↳props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see [protocols/esp\\_local\\_ctrl](#)

### Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. *get\_prop\_count* : This should simply return the total number of properties supported by the service
2. *get\_prop\_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set\_prop\_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get\_prop\_count* and then *get\_prop\_values*, hence form an index to name mapping for all properties. Now when calling *set\_prop\_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

表 1: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS + mDNS)	Description

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

**Communication with ESP SDIO Slave** This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.

**SDIO Slave Capabilities of Espressif chips** The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

Services	ESP32
SDIO slave	Y
<i>Tohost intr</i>	8
<i>Frhost intr</i>	8
<i>TX DMA</i>	Y
<i>RX DMA</i>	Y
<i>Shared registers</i>	56*

- \* Not including the interrupt registers

**ESP SDIO Slave Initialization** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of [SDIO Simplified Specification](#)). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000  
 CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)  
**Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXXXFFF0.  
 Keep sending CMD5 with arg=0x00FFFFF0 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)  
**Example:** Arg of R6 after CMD3 is 0x0001xxxx.  
 Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)  
 CMD52/53 (Write 0x10=0x00)  
 CMD52/53 (Write 0x11=0x02)  
 CMD52/53 (Read 0x10~0x11, read to check the final value)
11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)  
 CMD52/53 (Write 0x110=0x00)  
 CMD52/53 (Write 0x111=0x02)  
 CMD52/53 (Read 0x110~0x111, read to check the final value)

**ESP SDIO Slave Protocol** The ESP SDIO Slave protocol is based on the SDIO Specification's I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see *ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers* [\[PDF\]](#))
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example [peripherals/sdio](#).

The *ESP Serial Slave Link* component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

## Slave register table

### 32-bit

- 0x044 (TOKEN\_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT\_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT\_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT\_CLR): write 1 to clear interrupt bits corresponding to INT\_ST.
- 0x0DC (INT\_ENA): mask bits for interrupts from slave to host.

**8-bit** Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.

- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE\_INT): bits for host to interrupt slave. auto clear.

**FIFO (sending and receiving)** 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

$$\text{requested length} = 0x1F800 - \text{address}$$

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the *requested length*, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

---

**备注:** The function number should be set to 1, OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write/get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-**1031**.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

---

**Interrupts** SDIO interrupts are "level sensitive". For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT\_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT\_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT\_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host\_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE\_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

**Receiving FIFO** To write to the slave's receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN\_RDATA (0x044).** The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** (*buffer\_size* x *buffer\_num* is greater than the data to write, *buffer\_size* is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the *requested length* should not exceed the length calculated at Step 2, and the FIFO address is related to *requested length*.
4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

**Sending FIFO** To read the slave's sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT\_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT\_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT\_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT\_LEN.
4. **Read from the FIFO using CMD53.** Note that the *requested length* should not be greater than calculated at Step 3, and the FIFO address is related to *requested length*.

## 5. Update the read length.

**警告:** The driver for ESP32 hasn't been developed yet.

**ESP SPI Slave HD (Half Duplex) Mode Protocol****SPI Slave Capabilities of Espressif chips**

	ESP32	ESP32-S2	ESP32-C3	ESP32-S3	ESP32-C2	ESP32-C6	ESP32-H2
SPI Slave HD	N	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)
Tohost intr		N	N	N	N	N	N
Frhost intr		2 *	2 *	2 *	2 *	2 *	2 *
TX DMA		Y	Y	Y	Y	Y	Y
RX DMA		Y	Y	Y	Y	Y	Y
Shared registers		72	64	64	64	64	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave  
This phase determines the rest phases of the transactions. See [Supported Commands](#).
- **Address:** 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional  
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See [Supported Commands](#)), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

**备注:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in

segments. This way the master doesn't have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is `WR_DONE (0x07)` for the WRDMA and `CMD8 (0x08)` for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends `CMD8` to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the `CMD8`

### Terminology

- **ESSL:** Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master:** The device running the `esp_serial_slave_link` component.
- **ESSL device:** a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle:** a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave:** the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus:** The bus over which the master and the slave communicate with each other.
- **Slave protocol:** The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num:** a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size:** a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts:** The slave can inform the master about certain events by the interrupt line. (optional)
2. **Frhost Interrupts:** The master can inform the slave about certain events.
3. **Tx FIFO (master to slave):** the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. **Rx FIFO (slave to master):** the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. **Shared registers:** the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SDIO Slave Capabilities of Espressif chips* and *SPI Slave Capabilities of Espressif chips* for more details.

## Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:` Document of SDMMC driver </api-reference/storage/sdmmc>` structure).
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

## ESP SPI Slave

**备注:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Hasn't been supported yet.

## APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

## Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

## 2.2.8 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**备注:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jan 10 04:12:06 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**备注:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

---

## Configuration

Most configuration is done through `menuconfig`. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

## Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

## Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

## Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**参数** **conf** -- **[in]** The config struct for the SSL connection.

**返回**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**参数** **conf** -- **[in]** The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set** (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**参数**

- **x509\_bundle** -- **[in]** A pointer to the certificate bundle.
- **bundle\_size** -- **[in]** Size of the certificate bundle in bytes.

**返回**

- ESP\_OK if adding certificates was successful.

Check if the given CA certificate chain is the default "dummy" certificate chain attached by the `esp_cert_bundle`.

**参数** **ca\_chain** -- A pointer to the CA chain.

**返回** true if the `ca_chain` is the dummy CA chain attached by `esp_cert_bundle`

**返回** false otherwise

### 概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- `httpd_start()`：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 `httpd_start()` 传递 `httpd_config_t` 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。
- `httpd_stop()`：根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- `httpd_register_uri_handler()`：通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员：`uri` 名字，`method` 类型（比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等），`esp_err_t *handler (httpd_req_t *req)` 类型的函数指针，指向用户上下文数据的 `user_ctx` 指针。

### 应用示例

```

/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST/uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区
     * httpd_req_recv() 只接收 char* 数据，但也可以是
     * 任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，
     * content_len 会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试
             * 简单起见，这里我们直接
             * 响应 HTTP 408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误，返回 ESP_FAIL 可以确保
         * 底层套接字被关闭 */
        return ESP_FAIL;
    }
}

```

(下页继续)

```

    }

    /* 发送简单的响应数据包 */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST/uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

    /* 启动 httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* 注册 URI 处理程序 */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* 如果服务器启动失败，返回的句柄是 NULL */
    return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}

```

**简单 HTTP 服务器示例** 请查看位于 [protocols/http\\_server/simple](#) 的 HTTP 服务器示例，该示例演示了如何处理任意内容长度的数据，读取请求头和 URL 查询参数，设置响应头。

## HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定好自定义的回调函数，以便

在连接/会话被关闭时释放这部分内存资源。

### 长连接示例

```

/* 自定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 若上下文中不存在会话，则新建一个 */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func; /*!< 释放上下文数据的函数_
→*/
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* 响应 */
    .....
    .....
    .....

    return ESP_OK;
}

```

详情请参考位于 [protocols/http\\_server/persistent\\_sockets](#) 的示例代码。

### Websocket 服务器

HTTP 服务器组件提供 websocket 支持。可以在 menuconfig 中使用 `CONFIG_HTTPD_WS_SUPPORT` 选项启用 websocket 功能。有关如何使用 websocket 功能，请参阅 [protocols/http\\_server/ws\\_echo\\_server](#) 目录下的示例代码。

### 事件处理

ESP HTTP 服务器有各种事件，当特定事件发生时，[事件循环库](#) 可以触发处理程序。必须使用 `esp_event_handler_register()` 注册处理程序以便 ESP HTTP 服务器进行事件处理。

`esp_http_server_event_id_t` 包含 ESP HTTP 服务器可能发生的所有事件。

以下为事件循环中不同 ESP HTTP 服务器事件的预期数据类型：

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

---

**备注:** This API is supposed to be called either from the context of

-

- **sockfd** -- **[in]** Session socket FD
- **pending\_func** -- **[in]** The receive function to be set for this session

#### 返回

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd\_sess\_get\_ctx(), httpd\_sess\_trigger\_close(), httpd\_sess\_update\_lru\_counter().

---

**备注:** This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.

---

**参数** **r** -- **[in]** The request whose socket descriptor should be found

#### 返回

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd\_req\_recv** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content\_len provided in httpd\_req\_t structure to know the length of data to be fetched. If content\_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

#### 参数

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that the data will be read into
- **buf\_len** -- **[in]** Length of the buffer

**返回**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

size\_t **httpd\_req\_get\_hdr\_value\_len** (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it's value.

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**参数**

- **r** -- [in] The request being responded to
- **field** -- [in] The header field to be searched in the request

**返回**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

esp\_err\_t **httpd\_req\_get\_hdr\_value\_str** (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use *httpd\_req\_get\_hdr\_value\_len()* to know the right buffer length

**参数**

- **r** -- [in] The request being responded to
- **field** -- [in] The field to be searched in the header
- **val** -- [out] Pointer to the buffer into which the value will be copied if the field is found

**备注:** This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid

**参数** **r** -- **[in]** The request being responded to  
**返回**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**备注:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
  - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
  - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
- 

**参数**

- **r** -- **[in]** The request being responded to
- **buf** -- **[out]** Pointer to the buffer into which the query string will be copied (if found)
- **buf\_len** -- **[in]** Length of output buffer

**返回**

- ESP\_OK : Query is found in the request URL and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Query not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Query string truncated

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**备注:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
  - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
- 

**参数**

- **qry** -- **[in]** Pointer to query string
- **key** -- **[in]** The key to be searched in the query string
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** -- **[in]** Size of the user buffer "val"

**返回**

- ESP\_OK : Key is found in the URL query string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

#### 返回

- ESP\_OK : Key is found in the cookie string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated
- ESP\_ERR\_NO\_MEM : Memory allocation failure

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "\*" for a wildcard match, and "?\*" to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters "?" and "\*" anywhere else in the template will be taken literally.

#### 参数

- **uri\_template** -- [in] URI template (pattern)
- **uri\_to\_match** -- [in] URI to be matched
- **match\_upto** -- [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

#### 备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**参数**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the content is to be fetched
- **buf\_len** -- **[in]** Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**返回**

- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**参数**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that stores the data

This API sets any additional header fields that need to be sent in the response.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - The header isn't sent out until any of the send APIs is executed.
  - The maximum allowed number of additional headers is limited to value of *max\_resp\_headers* in config structure.
  - Make sure that the lifetime of the field value strings are valid till send function is called.

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.

int **httpd\_send** (*httpd\_req\_t* \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

#### 备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
-

{
    // Ensure handle is non NULL
    if (server != NULL) {

void \***httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**参数**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**返回**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**备注:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

**参数**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor of the session for which LRU counter is to be updated

**void \*global\_user\_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

*[httpd\\_free\\_ctx\\_fn\\_t](#)* **global\_user\_ctx\_free\_fn**

**void \*global\_transport\_ctx**

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

*[httpd\\_free\\_ctx\\_fn\\_t](#)* **global\_transport\_ctx\_free\_fn**

*[httpd\\_open\\_func\\_t](#)* **open\_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

***httpd\_close\_func\_t* close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

***httpd\_uri\_match\_func\_t* uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

Length of the request body

**void \*aux**

Internally used members

**void \*user\_ctx**

User context pointer passed during URI registration.

**void \*sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

#### *httpd\_free\_ctx\_fn\_t* **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

#### bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**备注:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd\_resp\_send\_err() must be invoked inside this function if user wishes to generate HTTP error responses.
  - When invoked, the validity of uri, method, content\_len and user\_ctx fields of the httpd\_req\_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
  - The function must return ESP\_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD\_500\_INTERNAL\_SERVER\_ERROR and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

## 2.2.10 HTTPS 服务器

### 概述

HTTPS 服务器组件建立在 [HTTP 服务器](#) 组件的基础上。该服务器借助常规 HTTP 服务器中的钩子注册函数，注册 SSL 会话回调处理函数。

[HTTP 服务器](#) 组件的所有文档同样适用于用户按照本文档搭建的服务器。

### API 说明

下列 [HTTP 服务器](#) 的 API 已不适用于 [HTTPS 服务器](#)。这些 API 仅限内部使用，用于处理安全会话和维护内部状态。

- “send”、“receive” 和 “pending” 回调注册函数——处理安全套接字
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context”——传输层上下文
  - `httpd_sess_get_transport_ctx()`: 返回会话使用的 SSL
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()`: 返回共享的 SSL 上下文
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn`: 用于设置安全套接字

其他 API 均可使用，没有其他限制。

### 如何使用

请参考示例 [protocols/https\\_server](#) 来学习如何搭建安全的服务器。

总体而言，您只需要生成证书，将其嵌入到固件中，并且在初始化结构体中配置好正确的证书地址和长度后，将其传入服务器启动函数。

通过改变初始化配置结构体中的标志 `httpd_ssl_config::transport_mode`，可以选择是否需要 SSL 连接来启动服务器。在测试时或在速度比安全性更重要的可信环境中，您可以使用此功能。

## 性能

建立起始会话大约需要两秒，在时钟速度较慢或日志记录冗余信息较多的情况下，可能需要花费更多时间。后续通过已打开的安全套接字建立请求的速度会更快，最快只需不到 100 ms。

## API 参考

#### 2.2.11 ICMP Echo

## Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↵
    ↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↵
    ↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
}
```

(下页继续)

```

    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## 2.2.12 mDNS 服务

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

自 v5.0 版本起，ESP-IDF 组件 *mDNS* 已从 ESP-IDF 中迁出至独立的仓库：

- [GitHub 上 mDNS 组件](#)

运行 `idf.py add-dependency espressif/mdns`，在项目中添加 mDNS 组件。

### 2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

---

**备注：** ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

---

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

---

**备注：** Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the [old Mbed TLS site](#) .

---

### Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF [here](#).

---

**备注：** Please refer the [ESP-IDF Migration Guide](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

---

### Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https\\_server/simple](#) (Simple HTTPS server) and [protocols/https\\_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https\\_mbedtls](#).

### Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

### Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found [here](#).

- [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_2](#): Support for TLS 1.2
- [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#): Support for TLS 1.3
- [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#): Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- [CONFIG\\_MBEDTLS\\_CLIENT\\_SSL\\_SESSION\\_TICKETS](#): Support for TLS Session Resumption: Client session tickets
- [CONFIG\\_MBEDTLS\\_SERVER\\_SSL\\_SESSION\\_TICKETS](#): Support for TLS Session Resumption: Server session tickets
- [CONFIG\\_MBEDTLS\\_HARDWARE\\_SHA](#): Support for hardware SHA acceleration
- [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#): Support for hardware AES acceleration
- [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#): Support for hardware MPI (bignum) acceleration

**备注:** Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out [here](#).

### Performance and Memory Tweaks

**Reducing Heap Usage** The following table shows typical memory usage with different configs when the [protocols/https\\_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed TLS Test	Related Configs	Heap Usage (approx.)
Default	NA	42196 B
Enable SSL Variable Length	<a href="#">CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</a>	42120 B
Disable Keep Peer Certificate	<a href="#">CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</a>	38533 B
Enable Dynamic TX/RX Buffer	<a href="#">CONFIG_MBEDTLS_DYNAMIC_BUFFER</a> <a href="#">FIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</a> <a href="#">FIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</a>	<a href="#">CON-</a> <a href="#">CON-</a> 22013 B

**备注:** These values are subject to change with change in configuration options and versions of Mbed TLS.

**Reducing Binary Size** Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

*esp\_err\_t* **esp\_ble\_gatts\_open** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda, bool is\_direct)

Create an ACL connection when BT\_BLE\_42\_FEATURES\_SUPPORTED is enabled in the menuconfig.

---

#### 备注:

- The function always triggers ESP\_GATTS\_CONNECT\_EVT and ESP\_GATTS\_OPEN\_EVT.
  - When the device acts as GATT Server, besides the above two events, this function triggers ESP\_GATTS\_CONNECT\_EVT as well.
  - This function will establish an ACL connection as a Central and a virtual connection as a GATT Server. If the ACL connection already exists, it will create a virtual connection only.
- 

#### 参数

- **gatts\_if** -- [in] GATT Server access interface
- **remote\_bda** -- [in] Remote device address
- **is\_direct** -- [in] True indicates a direct connection, while False indicates a background auto connection. Currently, background auto connection is not supported, so please always set this parameter to True.

*esp\_err\_t* **esp\_ble\_gatts\_close** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id)

Close a connection with a remote device.

---

**备注:**

- This function triggers ESP\_GATTS\_CLOSE\_EVT.
  - There may be multiple virtual GATT server connections when multiple app\_id got registered.
  - This API closes one virtual GATT server connection only, if there exist other virtual GATT server connections. It does not close the physical connection.
  - The API `esp_ble_gap_disconnect` can be used to disconnect the physical connection directly.
  - If there is only one virtual GATT connection left, this API will terminate the ACL connection in addition, and trigger ESP\_GATTS\_DISCONNECT\_EVT. Then there is no need to call `esp_ble_gap_disconnect` anymore.
- 

**参数**

- **gatts\_if** -- [in] GATT Server access interface
- **conn\_id** -- [in] Connection ID to be closed

**返回**

- ESP\_OK: Success

---

**备注:** This function triggers ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT.

---

**参数**

- **gatts\_if** -- [in] GATT Server access interface
- **remote\_bda** -- [in] Remote device address. If remote\_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device.

**返回**

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* **esp\_ble\_gatts\_show\_local\_database** (void)

Create an ACL connection when BT\_BLE\_50\_FEATURES\_SUPPORTED is enabled in the menuconfig.

---

#### 备注:

- The function always triggers ESP\_GATTC\_CONNECT\_EVT and ESP\_GATTC\_OPEN\_EVT.
  - When the device acts as GATT server, besides the above two events, this function triggers ESP\_GATTS\_CONNECT\_EVT as well.
  - This function will establish an ACL connection as a Central and a virtual connection as a GATT Client. If the ACL connection already exists, it will create a virtual connection only.
- 

#### 参数

- gattc\_if** -- [in] GATT Client access interface
- remote\_bda** -- [in] Remote device address
- remote\_addr\_type** -- [in] Remote device address type
- is\_direct** -- [in] True indicates a direct connection, while False indicates a background auto connection. By now, background auto connection is not supported, please always pass True to this parameter.

#### 返回

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Close the virtual GATT Client connection.

---

#### 备注:

- This function triggers ESP\_GATTC\_CLOSE\_EVT.
  - There may be multiple virtual GATT server connections when multiple app\_id got registered.
  - This API closes one virtual GATT server connection only, if there exist other virtual GATT server connections. It does not close the physical connection.
  - The API `esp_ble_gap_disconnect` can be used to disconnect the physical connection directly.
  - If there is only one virtual GATT connection left, this API will terminate the ACL connection in addition and triggers ESP\_GATTC\_DISCONNECT\_EVT. Then there is no need to call `esp_ble_gap_disconnect` anymore.
- 

#### 参数

- gattc\_if** -- [in] GATT Client access interface
- conn\_id** -- [in] Connection ID to be closed

#### 返回

---

#### 备注:

- This function triggers ESP\_GATTC\_CFG\_MTU\_EVT.
  - You could call `esp_ble_gatt_set_local_mtu` to set the desired MTU size locally before this API. If not set, the GATT channel uses the default MTU size (23 bytes).

- ESP\_FAIL: Failure due to other reasons

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* remote\_bda)

Refresh the cache of the remote device.

**备注:**

- a. If the device is connected, this API will restart the discovery of service information of the remote device.
- b. This function triggers ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT only after the ACL connection is established. Otherwise, no events will be triggered.

**参数** **remote\_bda** -- [in] Remote device address

**返回**

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* **esp\_ble\_gattc\_cache\_assoc** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* src\_addr, *esp\_bd\_addr\_t* assoc\_addr, bool is\_assoc)

Add or remove the association between the address in the local GATTC cache with the source address of the remote device.

**备注:**

- a. This API is primarily used when the client has a stored server-side database (`assoc_addr`) and needs to connect to another device (`src_addr`) with the same attribute database. By invoking this API, the stored database is utilized as the peer server database, eliminating the need for attribute database search and discovery. This reduces processing time and accelerates the connection process.
- b. The attribute table of a device with `assoc_addr` must be stored in the local GATTC cache first. Then, the attribute table of the device with `src_addr` must be the same as the one with `assoc_addr`.
- c. This function triggers `ESP_GATTC_SET_ASSOC_EVT`.

**参数**

- **gattc\_if** -- **[in]** GATT Client access interface
- **src\_addr** -- **[in]** The source address intended to be associated to the `assoc_addr` which has been stored in the local GATTC cache
- **assoc\_addr** -- **[in]** The associated device address intended to share the attribute table with the source address
- **is\_assoc** -- **[in]** True if adding the association; false if removing the association.

**返回**

- `ESP_OK`: Success
- `ESP_FAIL`: Failure

*esp\_err\_t* **esp\_ble\_gattc\_cache\_get\_addr\_list** (*esp\_gatt\_if\_t* gattc\_if)

Get the address list stored in the local GATTC cache.

---

**备注:** This function triggers `ESP_GATTC_GET_ADDR_LIST_EVT`.

---

**参数** **gattc\_if** -- **[in]** GATT Client access interface

**返回**

- `ESP_OK`: Success
- `ESP_FAIL`: Failure

*esp\_err\_t* **esp\_ble\_gattc\_cache\_clean** (*esp\_bd\_addr\_t* remote\_bda)

Clean the service cache of the target device in the local GATTC cache.

**参数** **remote\_bda** -- **[in]** Remote device address

**返回**

- `ESP_OK`: Success
- `ESP_FAIL`: Failure

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the "Key Exchange/Negotiation" procedure.

**Application Example** Check `bluetooth` folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32's wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

## Bluetooth A2DP API

**Application Example** Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - [bluetooth/bluedroid/classic\\_bt/a2dp\\_sink](#)

## API Reference

### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_a2dp\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_a2d\_register\_callback** (*esp\_a2d\_cb\_t* callback)

Register application callback function to A2DP module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by both A2DP source and sink.

参数 **callback** -- [in] A2DP event callback function

返回

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

*esp\_err\_t* **esp\_a2d\_sink\_register\_data\_callback** (*esp\_a2d\_sink\_data\_cb\_t* callback)

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after `esp_bluedroid_enable()` completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through `menuconfig`.

参数 **callback** -- [in] A2DP sink data callback function

返回

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

*esp\_err\_t* **esp\_a2d\_sink\_init** (void)

Initialize the bluetooth A2DP sink module. This function should be called after `esp_bluedroid_enable()` completes successfully, and `ESP_A2D_PROF_STATE_EVT` with `ESP_A2D_INIT_SUCCESS` will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRCP together, you should initiate AVRCP first. This function should be called after `esp_bluedroid_enable()` completes successfully.

返回

- ESP\_OK: if the initialization request is sent successfully
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled

- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_sink\_deinit** (void)

De-initialize for A2DP sink module. This function should be called only after `esp_bluetooth_enable()` completes successfully, and ESP\_A2D\_PROF\_STATE\_EVT with ESP\_A2D\_DEINIT\_SUCCESS will be reported to APP layer.

返回

- ESP\_OK: if the deinitialization request is sent successfully
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_sink\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote bluetooth A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

Operate on the type *esp\_avrc\_rn\_evt\_cap\_mask\_t* with regard to a specific event.

For operation ESP\_AVRC\_BIT\_MASK\_OP\_TEST, return true if the corresponding bit is set, otherwise false.

#### 参数

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

#### 参数

- **event\_id** -- **[in]** notification event ID that remote AVRCP CT registers
- **rsp** -- **[in]** notification response code
- **param** -- **[in]** parameters included in the specific notification

#### 返回

- ESP\_OK: success

## SPP API

**Application Example** Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data `bluetooth/bluedroid/classic_bt/bt_spp_acceptor`, `bluetooth/bluedroid/classic_bt/bt_spp_initiator`

## API Reference

### Header File

- `components/bt/host/bluedroid/api/include/api/esp_spp_api.h`

### Functions

*esp\_err\_t* **esp\_spp\_register\_callback** (*esp\_spp\_cb\_t* callback)

This function is called to init callbacks with SPP module.

**参数 callback** -- [in] pointer to the init callback function.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_init** (*esp\_spp\_mode\_t* mode)

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP\_SPP\_INIT\_EVT. This function should be called after `esp_bluedroid_enable()` completes successfully.

**参数 mode** -- [in] Choose the mode of SPP, ESP\_SPP\_MODE\_CB or ESP\_SPP\_MODE\_VFS.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_enhanced\_init** (const *esp\_spp\_cfg\_t* \*cfg)

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP\_SPP\_INIT\_EVT. This function should be called after `esp_bluedroid_enable()` completes successfully.

---

**备注:** The member variable `enable_l2cap_etrn` in *esp\_spp\_cfg\_t* can affect all L2CAP channel configurations of the upper layer RFCOMM protocol.

---

**参数 cfg** -- [in] SPP configuration.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_deinit** (void)

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP\_SPP\_CLOSE\_EVT, and the number of ESP\_SPP\_CLOSE\_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP\_SPP\_UNINIT\_EVT. This function should be called after esp\_spp\_init()/esp\_spp\_enhanced\_init() completes successfully.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_start\_discovery** (*esp\_bd\_addr\_t* bd\_addr)

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP\_SPP\_DISCOVERY\_COMP\_EVT. This function must be called after esp\_spp\_init()/esp\_spp\_enhanced\_init() successful and before esp\_spp\_deinit().

**参数** **bd\_addr** -- [in] Remote device bluetooth device address.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_connect** (*esp\_spp\_sec\_t* sec\_mask, *esp\_spp\_role\_t* role, uint8\_t remote\_scn, *esp\_bd\_addr\_t* peer\_bd\_addr)

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP\_SPP\_CL\_INIT\_EVT. When the connection is established or failed, the callback is called with ESP\_SPP\_OPEN\_EVT. This function must be called after esp\_spp\_init()/esp\_spp\_enhanced\_init() successful and before esp\_spp\_deinit().

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP\_SPP\_START\_EVT. When the connection is established, the callback is called with ESP\_SPP\_SRV\_OPEN\_EVT. This function must be called after esp\_spp\_init()/esp\_spp\_enhanced\_init() successful and before esp\_spp\_deinit().

## Type Definitions

typedef void (\***esp\_hf\_client\_incoming\_data\_cb\_t**)(const uint8\_t \*buf, uint32\_t len)

HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

**Param buf [in]** : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

**Param len [in]** : size(in bytes) in buf

typedef uint32\_t (\***esp\_hf\_client\_outgoing\_data\_cb\_t**)(uint8\_t \*buf, uint32\_t len)

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Param buf [in]** : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

**Param len [in]** : size(in bytes) in buf

**Return** length of data successfully read

typedef void (\***esp\_hf\_client\_cb\_t**)(*esp\_hf\_client\_cb\_event\_t* event, *esp\_hf\_client\_cb\_param\_t* \*param)

HFP client callback function type.

**Param event** : Event type

**Param param** : Pointer to callback parameter

## Type Definitions

`typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)`

AG incoming data callback function, the callback is useful in case of Voice Over HCI.

**Param buf [in]** : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

**Param len [in]** : size(in bytes) in buf

```
typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
```

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

## Bluetooth HID Device API

**Overview** A Bluetooth HID device is a device providing the service of human or other data input and output to and from a Bluetooth HID Host. Users can use the Bluetooth HID Device APIs to make devices like keyboards, mice, joysticks and so on.

**Application Example** Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is an example of Bluetooth HID mouse device. The device running this example can be discovered and connected by a Bluetooth HID Host device such as a PC, and the pointer will move left and right after HID connection is established - `bluetooth/bluedroid/classic_bt/bt_hid_mouse_device`

## Bluetooth HID Host API

**Overview** A Bluetooth HID host is a device or software that is capable of connecting and communicating with Bluetooth HID devices, such as keyboards, mice. Users can use the Bluetooth HID Host APIs to send output data or control commands to the HID devices, enabling them to control the behavior or settings of the devices.

**Application Example** Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- Example [bluetooth/esp\\_hid\\_host](#) is implemented using the generic esp\_hid APIs. esp\_hid APIs are build upon the Bluetooth HID APIs and can be a reference.

### Functions

*esp\_err\_t* **esp\_bt\_l2cap\_register\_callback** (*esp\_bt\_l2cap\_cb\_t* callback)

This function is called to init callbacks with L2CAP module.

**参数** **callback** -- [in] pointer to the init callback function.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_bt\_l2cap\_init** (void)

This function is called to init L2CAP module. When the operation is completed, the callback function will be called with ESP\_BT\_L2CAP\_INIT\_EVT. This function should be called after `esp_bluedroid_enable()` completes successfully.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_bt\_l2cap\_deinit** (void)

This function is called to uninit l2cap module. The operation will close all active L2CAP connection first, then the callback function will be called with ESP\_BT\_L2CAP\_CLOSE\_EVT, and the number of ESP\_BT\_L2CAP\_CLOSE\_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP\_BT\_L2CAP\_UNINIT\_EVT. This function should be called after `esp_bt_l2cap_init()` completes successfully.

- other: failed

*esp\_err\_t* **esp\_bt\_l2cap\_start\_srv** (*esp\_bt\_l2cap\_cntl\_flags\_t* cntl\_flag, uint16\_t local\_psm)

This function create a L2CAP server and starts listening for an L2CAP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with `ESP_BT_L2CAP_START_EVT`. When the connection is established, the callback is called with `ESP_BT_L2CAP_OPEN_EVT`. This function must be called after `esp_bt_l2cap_init()` successful and before `esp_bt_l2cap_deinit()`.

#### 参数

## 2.3.4 Controller && VHCI

### Application Example

Check [bluetooth/hci](#) folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller\\_vhci\\_ble\\_adv](#).

#### Functions

`esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)`

Initialize the Bluetooth Controller to allocate tasks and other resources.

---

**备注:** This function should be called only once, before any other Bluetooth functions.

---

**参数** `cfg` -- [in] Initial Bluetooth Controller configuration

**返回**

- `ESP_OK`: Success

- ESP\_ERR\_INVALID\_STATE: Invalid Bluetooth Controller state
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NO\_MEM: Out of memory

*esp\_err\_t* **esp\_bt\_controller\_deinit** (void)

De-initialize Bluetooth Controller to free resources and delete tasks.

---

**备注:**

- You should stop advertising and scanning, and disconnect all existing connections before de-initializing Bluetooth Controller.
  - This function should be called after `esp_bt_controller_disable` if the Controller was enabled before.
  - This function should be called only once, after any other Bluetooth functions.
- 

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_STATE: Invalid Bluetooth Controller state

*esp\_err\_t* **esp\_bt\_controller\_enable** (*esp\_bt\_mode\_t* mode)

Enable Bluetooth Controller.

For API compatibility, retain this argument. This mode must match the mode specified in the `cfg` of `esp_bt_controller_init()`.

---

**备注:**

- Bluetooth Controller cannot be enabled in `ESP_BT_CONTROLLER_STATUS_IDLE` status. It has to be initialized first.
  - Due to a known issue, you cannot call `esp_bt_controller_enable()` for the second time to change the Controller mode dynamically. To change the Controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.
- 

**参数 mode** -- [in] The Bluetooth Controller mode (BLE/Classic Bluetooth/BTDM) to enable

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_STATE: Invalid Bluetooth Controller state
- ESP\_ERR\_INVALID\_ARG: Invalid arguments

*esp\_err\_t* **esp\_bt\_controller\_disable** (void)

Disable Bluetooth Controller.

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_STATE: Invalid Bluetooth Controller state

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get Bluetooth Controller status.

**返回**

- ESP\_BT\_CONTROLLER\_STATUS\_IDLE: The Controller is not initialized or has been de-initialized.
- ESP\_BT\_CONTROLLER\_STATUS\_INITED: The Controller has been initialized, but not enabled or has been disabled.

- `ESP_BT_CONTROLLER_STATUS_ENABLED`: The Controller has been initialized and enabled.

*esp\_err\_t* `esp_bt_controller_mem_release` (*esp\_bt\_mode\_t* mode)

Release the Controller memory as per the mode.

This function releases the BSS, data and other sections of the Controller to heap. The total size is about 70 KB.

If you never intend to use Bluetooth in a current boot-up cycle, calling `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` could release the BSS and data consumed by both Classic Bluetooth and BLE Controller to heap.

If you intend to use BLE only, calling `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` could release the BSS and data consumed by Classic Bluetooth Controller. You can then continue using BLE.

If you intend to use Classic Bluetooth only, calling `esp_bt_controller_mem_release(ESP_BT_MODE_BLE)` could release the BSS and data consumed by BLE Controller. You can then continue using Classic Bluetooth.

---

#### 备注:

- This function is optional and should be called only if you want to free up memory for other components.
  - This function should only be called when the Controller is in `ESP_BT_CONTROLLER_STATUS_IDLE` status.
  - Once Bluetooth Controller memory is released, the process cannot be reversed. This means you cannot use the Bluetooth Controller mode that you have released using this function.
  - If your firmware will upgrade the Bluetooth Controller mode later (such as switching from BLE to Classic Bluetooth or from disabled to enabled), then do not call this function.
- 

**参数** `mode` -- [in] The Bluetooth Controller mode

**返回**

- `ESP_OK`: Success
- `ESP_ERR_INVALID_STATE`: Invalid Bluetooth Controller state
- `ESP_ERR_NOT_FOUND`: Requested resource not found

*esp\_err\_t* `esp_bt_mem_release` (*esp\_bt\_mode\_t* mode)

Release the Controller memory, BSS and data section of the Classic Bluetooth/BLE Host stack as per the mode.

This function first releases Controller memory by internally calling `esp_bt_controller_mem_release()`, then releases Host memory.

If you never intend to use Bluetooth in a current boot-up cycle, calling `esp_bt_mem_release(ESP_BT_MODE_BTDM)` could release the BSS and data consumed by both Classic Bluetooth and BLE stack to heap.

If you intend to use BLE only, calling `esp_bt_mem_release(ESP_BT_MODE_CLASSIC_BT)` could release the BSS and data consumed by Classic Bluetooth. You can then continue using BLE.

If you intend to use Classic Bluetooth only, calling `esp_bt_mem_release(ESP_BT_MODE_BLE)` could release the BSS and data consumed by BLE. You can then continue using Classic Bluetooth.

For example, if you only use Bluetooth for setting the Wi-Fi configuration, and do not use Bluetooth in the rest of the product operation, after receiving the Wi-Fi configuration, you can disable/de-init Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```

esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);

```

**备注:**

- This function is optional and should be called only if you want to free up memory for other components.
- This function should only be called when the Controller is in `ESP_BT_CONTROLLER_STATUS_IDLE` status.
- Once Bluetooth Controller memory is released, the process cannot be reversed. This means you cannot use the Bluetooth Controller mode that you have released using this function.
- If your firmware will upgrade the Bluetooth Controller mode later (such as switching from BLE to Classic Bluetooth or from disabled to enabled), then do not call this function.

**参数** `mode` -- [in] The Bluetooth Controller mode

**返回**

- `ESP_OK`: Success
- `ESP_ERR_INVALID_STATE`: Invalid Bluetooth Controller state
- `ESP_ERR_NOT_FOUND`: Requested resource not found

*esp\_err\_t* **esp\_bt\_sleep\_enable**(void)

Enable Bluetooth modem sleep.

There are currently two options for Bluetooth modem sleep: `ORIG` mode and `EVED` mode. The latter is intended for BLE only. The modem sleep mode could be configured in `menuconfig`.

In `ORIG` mode, if there is no event to process, the Bluetooth Controller will periodically switch off some components and pause operation, then wake up according to the scheduled interval and resume work. It can also wakeup earlier upon external request using function `esp_bt_controller_wakeup_request()`.

**备注:** This function shall not be invoked before `esp_bt_controller_enable()`.

**返回**

- `ESP_OK`: Success
- `ESP_ERR_INVALID_STATE`: Invalid Bluetooth Controller state
- `ESP_ERR_NOT_SUPPORTED`: Operation or feature not supported

*esp\_err\_t* **esp\_bt\_sleep\_disable**(void)

Disable Bluetooth modem sleep.

**备注:**

- Bluetooth Controller will not be allowed to enter modem sleep after calling this function.
- In `ORIG` modem sleep mode, calling this function may not immediately wake up the Controller if it is currently dormant. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the wake-up time.
- This function shall not be invoked before `esp_bt_controller_enable()`.

**返回**

- `ESP_OK`: Success
- `ESP_ERR_INVALID_STATE`: Invalid Bluetooth Controller state
- `ESP_ERR_NOT_SUPPORTED`: The modem sleep mode is not supported

*esp\_err\_t* **esp\_ble\_tx\_power\_set** (*esp\_ble\_power\_type\_t* power\_type, *esp\_power\_level\_t* power\_level)

Set BLE TX power.

---

**备注:** Connection TX power should only be set after the connection is established.

---

**参数**

- **power\_type** -- [in] The type of TX power. It could be Advertising, Connection, Default, etc.
- **power\_level** -- [in] Power level (index) corresponding to the absolute value (dBm)

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_power\_level\_t* **esp\_ble\_tx\_power\_get** (*esp\_ble\_power\_type\_t* power\_type)

Get BLE TX power.

---

**备注:** Connection TX power should only be retrieved after the connection is established.

---

**参数** **power\_type** -- [in] The type of TX power. It could be Advertising/Connection/Default and etc.

**返回**

- Power level

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush** (void)

Manually clear the BLE scan duplicate list.

---

**备注:**

- This function name is incorrectly spelled, it will be fixed in release 5.x version.
  - The scan duplicate list will be automatically cleared when the maximum amount of devices in the filter is reached. The amount of devices in the filter can be configured in menuconfig.
- 

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_STATE: Invalid Bluetooth Controller state

*esp\_err\_t* **esp\_ble\_scan\_dupilcate\_list\_flush** (void)

*esp\_err\_t* **esp\_bredr\_tx\_power\_set** (*esp\_power\_level\_t* min\_power\_level, *esp\_power\_level\_t* max\_power\_level)

Set BR/EDR TX power.

BR/EDR power control will use the power within the range of minimum value and maximum value. The power level will affect the global BR/EDR TX power for operations such as inquiry, page, and connection.

---

**备注:**

- Please call this function after `esp_bt_controller_enable()` and before any functions that cause RF transmission, such as performing discovery, profile initialization, and so on.
  - For BR/EDR to use the new TX power for inquiry, call this function before starting an inquiry. If BR/EDR is already inquiring, restart the inquiry after calling this function.
- 

**参数**

- **min\_power\_level** -- [in] The minimum power level. The default value is ESP\_PWR\_LVL\_N0.
- **max\_power\_level** -- [in] The maximum power level. The default value is ESP\_PWR\_LVL\_P3.

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_INVALID\_STATE: Invalid Bluetooth Controller state

*esp\_err\_t* **esp\_bredr\_tx\_power\_get** (*esp\_power\_level\_t* \*min\_power\_level, *esp\_power\_level\_t* \*max\_power\_level)

Get BR/EDR TX power.

The corresponding power levels will be stored into the arguments.

**参数**

- **min\_power\_level** -- [out] Pointer to store the minimum power level
- **max\_power\_level** -- [out] The maximum power level

**返回**

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

### 2.3.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [快速入门](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [架构](#).

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_unprov\_dev** (*esp\_ble\_mesh\_unprov\_dev\_add\_t* \*add\_dev, *esp\_ble\_mesh\_dev\_add\_flag\_t* flags)

Add unprovisioned device info to the unprov\_dev queue.

---

**备注:** : 1. Currently address type only supports public address and static random address.

- If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
- For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.
  - In this situation, the Provisioner can set bearers with each one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled, and cannot set flags with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
- Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
  - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_ADV enabled and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_GATT enabled, and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.

- If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
- Note: ESP\_BLE\_MESH\_PROV\_ADV, ESP\_BLE\_MESH\_PROV\_GATT and ADD\_DEV\_START\_PROV\_NOW\_FLAG can not be enabled at the same time.

### 参数

- **add\_dev** -- **[in]** Pointer to a struct containing the device information
- **flags** -- **[in]** Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr (const uint8_t uuid[16],
                                                         esp_ble_mesh_bd_addr_t addr,
                                                         esp_ble_mesh_addr_type_t
                                                         addr_type,
                                                         esp_ble_mesh_prov_bearer_t
                                                         bearer, uint16_t oob_info,
                                                         uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

备注: : 1. Currently address type only supports public address and static random address.

- a. Bearer must be equal to ESP\_BLE\_MESH\_PROV\_ADV or ESP\_BLE\_MESH\_PROV\_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT event.
- b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
- c. Recommend to use only one of the functions "esp\_ble\_mesh\_provisioner\_add\_unprov\_dev" and "esp\_ble\_mesh\_provisioner\_prov\_device\_with\_addr" by a Provisioner.

### 参数

- **uuid** -- **[in]** Device UUID of the unprovisioned device

- **addr\_type** -- **[in]** Device address type of the unprovisioned device
- **bearer** -- **[in]** Provisioning bearer going to be used by Provisioner
- **oob\_info** -- **[in]** OOB info of the unprovisioned device
- **unicast\_addr** -- **[in]** Unicast address going to be allocated for the unprovisioned device

```

Delete device from queue, and reset current provisioning link with the device.

备注: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**返回** ESP\_OK on success or error code otherwise.

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**参数**

- **match\_val** -- [in] Value to be compared with the part of the device UUID.
- **match\_len** -- [in] Length of the compared match value.
- **offset** -- [in] Offset of the device UUID to be compared (based on zero).
- **prov\_after\_match** -- [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_prov_data_info` (*esp\_ble\_mesh\_prov\_data\_info\_t* \*prov\_data\_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

**参数** `prov_data_info` -- [in] Pointer to a struct containing net\_idx or flags or iv\_index.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_static_oob_value` (const uint8\_t \*value, uint8\_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

---

**备注:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

---

**参数**

- **value** -- [in] Pointer to the static oob value.
- **length** -- [in] Length of the static oob value.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_primary_elem_addr` (uint16\_t addr)

This function is called by Provisioner to set own Primary element address.

---

**备注:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the `prov_unicast_addr` value in the struct *esp\_ble\_mesh\_prov\_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

---

**参数** `addr` -- [in] Unicast address of the Primary element of Provisioner.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_info** (*esp\_ble\_mesh\_fast\_prov\_info\_t* \*fast\_prov\_info)

This function is called to set provisioning data information before starting fast provisioning.

**参数 fast\_prov\_info** -- [in] Pointer to a struct containing unicast address range, net\_idx, etc.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_action** (*esp\_ble\_mesh\_fast\_prov\_action\_t* action)

This function is called to start/suspend/exit fast provisioning.

**参数 action** -- [in] fast provisioning action (i.e. enter, suspend, exit).

返回 ESP\_OK on success or error code otherwise.

struct net\_buf\_simple \***scene\_value**

struct **esp\_ble\_mesh\_scenes\_state\_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

## 2.3.6 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Blueroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features

of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

### Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

图 1: ESP NimBLE Stack

### Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

### Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

**Typical programming sequence with NimBLE stack consists of the following steps:**

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

#### Functions

**`esp_err_t esp_nimble_hci_init`** (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**返回**

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

**`esp_err_t esp_nimble_hci_deinit`** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

---

**备注:** This function should be called after the NimBLE host is deinitialized.

---

**返回**

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

ESP-IDF 目前支持两个主机堆栈。基于 `Bluedroid` 的堆栈（默认）支持传统蓝牙和 BLE，而基于 `Apache NimBLE` 的堆栈仅支持 BLE。用户可参考如下信息进行选择：

- 对于同时涉及传统蓝牙和 BLE 的用例，应该选用 `Bluedroid`。
- 对于仅涉及 BLE 的用例，建议选用 `NimBLE`。在代码占用和运行时，`NimBLE` 对内存的要求较低，因此适用于此类场景。

## 2.5 连网 API

### 2.5.1 Wi-Fi

#### ESP-NOW

**概述** ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用于保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

**帧格式** ESP-NOW 使用供应商的动作帧传输数据，默认比特率为 1 Mbps。目前 ESP-NOW 支持一个版本：v1.0。v1.0 的设备支持的最大数据包长度为 ESP\_NOW\_MAX\_DATA\_LEN bytes。v1.0 设备可以接收长度不超过 ESP\_NOW\_MAX\_IE\_DATA\_LEN 的数据包，而对于长度超过 ESP\_NOW\_MAX\_IE\_DATA\_LEN 的数据包，会丢弃数据包。

供应商的动作帧格式为：

MAC 报头	分类代码	组织标识符	随机值	供应商特定内容	FCS
24 字节	1 字节	3 字节	4 字节	7-x 字节	4 字节

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含一个特定供应商元素字段， $x = 257(250+7)$ 。

特定供应商元素的帧格式为：

元素 ID	长度	组织标识符	类型	保留	版本	正文
1 字节	1 字节	3 字节	1 字节	7~4 比特	3~0 比特	1 字节
						0-250 字节

- 元素 ID: 元素 ID 字段可用于指示特定于供应商的元素。
- 长度: 长度是组织标识符、类型、版本和正文的总长度, 最大值为 255。
- 组织标识符: 组织标识符包含一个唯一标识符 (比如 0x18fe34), 为乐鑫指定的 MAC 地址的前三个字节。
- 类型: 类型字段设置为 4, 代表 ESP-NOW。
- 版本: 版本字段设置为 ESP-NOW 的版本。
- 正文: 正文包含实际要发送的 ESP-NOW 数据。

由于 ESP-NOW 是无连接的, 因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

## 安全

ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全, 具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始

- PMK 可使用 AES-128 算法加密 LMK。请调用 `esp_now_set_pmk()` 设置 PMK。如果未设置 PMK, 将使用默认 PMK。
- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密, 如果未设置配对设备的 LMK, 则动作帧不进行加密。

目前, 不支持加密组播供应商特定的动作帧。

**初始化和反初始化** 调用 `esp_now_init()` 初始化 ESP-NOW, 调用 `esp_now_deinit()` 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输, 因此建议在初始化 ESP-NOW 之前启动 Wi-Fi, 并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 `esp_now_deinit()` 时, 配对设备的所有信息都将被删除。

**添加配对设备** 在将数据发送到其他设备之前, 请先调用 `esp_now_add_peer()` 将其添加到配对设备列表中。如果启用了加密, 则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。

配对设备的最大数量是 20, 其中加密设备的数量不超过 17, 默认值是 7。如果想要修改加密设备的数量, 在 Wi-Fi menuconfig 设置 `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM`。

在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 ~ 14。如果信道设置为 0, 数据将在当前信道上发送。否则, 必须使用本地设备所在的通道。

**发送 ESP-NOW 数据** 调用 `esp_now_send()` 发送 ESP-NOW 数据, 调用 `esp_now_register_send_cb()` 注册发送回调函数。如果 MAC 层成功接收到数据, 则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则, 它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因, 比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要, 应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时, 则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号, 从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送, 调用 `esp_now_send()` 时需注意单次发送的数据不能超过 250 字节。请注意, 两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此, 建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此, 不要在回调函数中执行冗长的操作。相反, 将必要的数据发布到队列, 并交给优先级较低的任务处理。

**接收 ESP-NOW 数据** 调用 `esp_now_register_rcv_cb()` 注册接收回调函数。当接收 ESP-NOW 数据时, 需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此, 不要在回调函数中执行冗长的操作。相反, 将必要的数据发布到队列, 并交给优先级较低的任务处理。

**配置 ESP-NOW 速率** 调用 `esp_wifi_config_espnow_rate()` 配置指定接口的 ESPNOW 速率。确保在配置速率之前使能接口。这个 API 应该在 `esp_wifi_start()` 之后调用。

**配置 ESP-NOW 功耗参数** 当且仅当 ESP32 配置为 STA 模式时，允许其进行休眠。

进行休眠时，调用 `esp_now_set_wake_window()` 为 ESP-NOW 收包配置 Window。默认情况下 Window 为最大值，将允许一直收包。

如果对 ESP-NOW 功耗管理，也需要调用 `esp_wifi_connectionless_module_set_wake_interval()`。请参考 [非连接模块功耗管理](#) 获取更多信息。

## ESP-WIFI-MESH 编程指南

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. [ESP-WIFI-MESH 编程模型](#)
2. [编写 ESP-WIFI-MESH 应用程序](#)
3. [自组网](#)
4. [应用实例](#)
5. [API 参考](#)

有关 ESP-WIFI-MESH 协议的文档，请见[ESP-WIFI-MESH API 指南](#)。有关 ESP-WIFI-MESH 开发框架的更多内容，请见 [ESP-WIFI-MESH 开发框架](#)。

## ESP-WIFI-MESH 编程模型

**软件栈** ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

图 2: ESP-WIFI-MESH 软件栈

**系统事件** 应用程序可通过 **ESP-WIFI-MESH 事件** 与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 **Wi-Fi 事件任务** 与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

`mesh_event_id_t` 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过 `esp_event_handler_register()`

图 3: ESP-WIFI-MESH 系统事件交付

将 **Mesh 事件处理程序** 注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

Mesh 事件的典型应用场景包括：使用 `MESH_EVENT_PARENT_CONNECTED` 和 `MESH_EVENT_CHILD_CONNECTED` 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用 `IP_EVENT_STA_GOT_IP` 和 `IP_EVENT_STA_LOST_IP` 事件来指示根节点何时可以向外部 IP 网络传输数据。

**警告：** 在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为。因此，用户不应该在 `esp_mesh_start()` 和 `esp_mesh_stop()` 之间调用 Wi-Fi API。

**LwIP & ESP-WIFI-MESH** 应用程序无需通过 LwIP 层便可直接访问 ESP-WIFI-MESH 软件栈，LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

可成为根节点的每个节点都需要通过调用 `esp_netif_init()` 来初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序不应使用 `esp_netif` API 创建或注册任何网络接口。

ESP-WIFI-MESH 的根节点必须与路由器连接。因此，当一个节点成为根节点时，**该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址**。这样做将允许其他节点开始向/从外部 IP 网络发送/接收数据包。但是，如果使用静态 IP 设置，则不需要执行此步骤。

**编写 ESP-WIFI-MESH 应用程序** ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。

```
ESP_ERROR_CHECK(esp_netif_init());

/*事件初始化*/
ESP_ERROR_CHECK(esp_event_loop_create_default());

/*Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/*注册 IP 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↵event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

在完成 LwIP 和 Wi-Fi 的初始化后，需完成以下三个步骤以启动并运行 ESP-WIFI-MESH。

1. 初始化 Mesh

2. 配置 ESP-WIFI-MESH 网络
3. 启动 Mesh

**初始化 Mesh** 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```
/*Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/*注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));
```

**配置 ESP-WIFI-MESH 网络** ESP-WIFI-MESH 可通过 `esp_mesh_set_config()` 进行配置，并使用 `mesh_cfg_t` 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数：

参数	描述
Channel (信道)	1 到 14 信道
Mesh ID	ESP-WIFI-MESH 网络的 ID，见 <code>mesh_addr_t</code> 。
Router (路由器)	路由器配置，见 <code>mesh_router_t</code> 。
Mesh AP	Mesh AP 配置，见 <code>mesh_ap_cfg_t</code>
Crypto Functions (加密函数)	Mesh IE 的加密函数，见 <code>mesh_crypto_funcs_t</code> 。

下方代码片段展示如何配置 ESP-WIFI-MESH。

```
/* 默认启用 MESH IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* Mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 信道 (需与路由器信道匹配) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
    strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
    strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

**启动 Mesh** 下方代码片段展示如何启动 ESP-WIFI-MESH。

```
/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());
```

启动 ESP-WIFI-MESH 后，应用程序应检查 ESP-WIFI-MESH 事件，以确定它是何时连接到网络的。连接后，应用程序可使用 `esp_mesh_send()` 和 `esp_mesh_recv()` 在 ESP-WIFI-MESH 网络中发送、接收数据包。

**自组网** 自组网是 ESP-WIFI-MESH 的功能之一，允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性，可适应变化的动态网络拓扑结构和环境。启用自组网功能后，ESP-WIFI-MESH 网络中的节点能够自主完成以下操作：

- 选择或选举根节点（见 [建立网络](#) 中的 **自动根节点选择**）
- 选择首选的父节点（见 [建立网络](#) 中的 **父节点选择**）
- 网络断开时自动重新连接（见 [管理网络](#) 中的 **中间父节点失败**）

启用自组网功能后，ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此，在启用自组网功能时，应用层不得调用 Wi-Fi API，否则会干扰 ESP-WIFI-MESH 的工作。

**开关自组网** 应用程序可以在运行时通过调用 `esp_mesh_set_self_organized()` 函数，启用或禁用自组网功能。该函数具有以下两个参数：

- `bool enable` 指定启用或禁用自组网功能。
- `bool select_parent` 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态，选择新的父节点具有不同的作用。在禁用自组网功能时，此参数不使用。

**禁用自组网** 下方代码片段展示了如何禁用自组网功能。

```
//禁用自组网
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

**启用自组网** ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

是否选择父节点	是否为根结点	作用
N	N	已连接到父节点的节点将保持连接。 之前扫描父节点的节点将停止扫描。调用 <code>esp_mesh_connect()</code> 重新启动。
	Y	已连接到路由器的根节点将保持连接。 从路由器断开的根节点需调用 <code>esp_mesh_connect()</code> 进行重连。
Y	N	没有父节点的节点将自动选择首选父节点并连接。 已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。
	Y	根结点在连接至父节点前必须放弃“根结点”的角色。因此，根节点将断开与路由器和所有子节点的连接，选择首选父节点并进行连接。

下方代码片段展示了如何启用自组网功能。

```
//启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...

//启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**调用 Wi-Fi API** 在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描邻近的接入点 (AP)。但在应用程序调用任何 Wi-Fi API 之前，必须先禁用自组网。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。

应用程序不应在 `esp_mesh_set_self_organized()` 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用 `esp_wifi_scan_start()`。

```
//禁用自组网
esp_mesh_set_self_organized(0, 0);

//停止任何正在进行的扫描
```

(下页继续)

```

esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();

//进程扫描结果

...

//如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

...

//如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

...

//如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0); //不选择新的父节点
esp_mesh_connect(); //手动重新连接到路由器

```

**应用实例** ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目：

**内部通信示例** 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。

**手动连网示例** 展示了如何在禁用自组网功能的情况下使用 ESP-WIFI-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

*esp\_err\_t* **esp\_mesh\_send** (const *mesh\_addr\_t* \*to, const *mesh\_data\_t* \*data, int flag, const *mesh\_opt\_t* opt[], int opt\_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**参数**

- **to** -- [**in**] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.

- If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** -- **[in]** pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
    - \* If the packet is to the root, MESH\_TOS\_P2P must be set to ensure reliable transmission.
    - \* As long as the MESH\_TOS\_P2P is set, the API is blocking, even if the flag is set with MESH\_DATA\_NONBLOCK.
    - \* As long as the MESH\_TOS\_DEF is set, the API is non-blocking.
- **flag** -- **[in]** bitmap for data sent
  - Flag is at least one of the three MESH\_DATA\_P2P/MESH\_DATA\_FROMDS/MESH\_DATA\_TODS, which represents the direction of packet sending.
  - Speed up the route search
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ("to" parameter isn't NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is blocking or non-blocking, blocking by default.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn't read out in time by esp\_mesh\_rcv\_toDS().  
Generally, we suggest esp\_mesh\_rcv\_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp\_mesh\_rcv\_toDS() which avoids unnecessary memory copy.
- **opt** -- **[in]** options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- **opt\_count** -- **[in]** option count
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

*esp\_err\_t* esp\_mesh\_send\_block\_time (uint32\_t time\_ms)

Set blocking time of esp\_mesh\_send()

- Suggest to set the blocking time to at least 5s when the environment is poor. Otherwise, `esp_mesh_send()` may timeout frequently.

**Attention** This API shall be called before mesh is started.

**参数** `time_ms` -- **[in]** blocking time of `esp_mesh_send()`, unit:ms

**返回**

- ESP\_OK

`esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**参数**

- **from** -- **[out]** the address of the original source of the packet
- **data** -- **[out]** pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout\_ms** -- **[in]** wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** -- **[out]** bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network
- **opt** -- **[out]** options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- **opt\_count** -- **[in]** option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the

pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

#### 参数

- **from** -- **[out]** the address of the original source of the packet
- **to** -- **[out]** the address contains remote IP address and port (IPv4:PORT)
- **data** -- **[out]** pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout\_ms** -- **[in]** wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** -- **[out]** bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** -- **[out]** options desired to receive
- **opt\_count** -- **[in]** option count desired to receive

*esp\_err\_t* **esp\_mesh\_set\_config** (const *mesh\_cfg\_t* \*config)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max\_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

*esp\_err\_t* **esp\_mesh\_set\_network\_duty\_cycle** (int nwk\_duty, int duration\_mins, int applied\_rule)

Set the network duty cycle, duration and rule.

- The range of nwk\_duty values is 1 to 100. The default value is 10.
- nwk\_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk\_duty is known as a NWK-DUTY-MASTER.

- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins = (-1)` represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to `(-1)`.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins(-1)` set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to `(-1)`; (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

#### 参数

- **`nwk_duty`** -- **[in]** network duty cycle
- **`duration_mins`** -- **[in]** duration (unit: minutes)
- **`applied_rule`** -- **[in]** only support `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

- **`applied_rule`** -- **[out]** `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### 返回

- `ESP_OK`

int **esp\_mesh\_get\_running\_active\_duty\_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons,

and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

返回 the running active duty cycle

SmartConfig

## 概述

SmartConfig™ 是由 TI 开发的配网技术，用于将新的 Wi-Fi 设备连接到 Wi-Fi 网络。它使用移动应用程序将无线网凭据从智能手机或平板电脑端广播给未配网的 Wi-Fi 设备。

这项技术的优势在于，设备无需直接获知 AP 的 SSID 或密码，而是通过智能手机获取。这对于没有用户界面的无头设备和系统而言十分重要。

目前，ESP32 支持三种类型的 SmartConfig 配网：AirKiss、ESPTouch 和 ESPTouch v2。ESPTouch v2 自 SmartConfig v3.0（SmartConfig 的版本可以从 [esp\\_smartconfig\\_get\\_version\(\)](#) 获取）起开始支持，ESPTouch v2 和 vESPTouch 采用完全不同的配网算法，因此配网速度更快。此外，ESPTouch v2 还增加了 AES 加密功能和自定义数据字段。

从 SmartConfig v3.0.2 开始，ESPTouch v2 的 AES 加密支持随机 IV。在应用程序端，当随机 IV 的选项关闭的时候，默认的 IV 为 0，与旧版本保持一致，当随机 IV 的选项打开的时候，IV 为随机值。需要注意的是，当启用 AES 加密且 IV 为随机值时，配网时间会延长，因为需要将 IV 传输到配网设备。在配网设备端，设备会根据配网包中的 flag 来识别 AES 的随机 IV 是否开启。

如需通过其他方式为 ESP32 设备配网，请参阅 [配网 API](#)。

*esp\_err\_t* **esp\_wifi\_set\_country** (const *wifi\_country\_t* \*country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use `esp_wifi_set_country_code` instead.

**Attention** 2. The default country is "01" (world safe mode) `{.cc="01", .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO}`.

**Attention** 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

**Attention** 4. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is `{.cc="US", .schan=1, .nchan=11}` and the country info of the AP to which the station is connected is `{.cc="JP", .schan=1, .nchan=14}` then the country info that will be used is `{.cc="JP", .schan=1, .nchan=14}`. If the station disconnected from the AP the country info is set back to the country info of the station automatically, `{.cc="US", .schan=1, .nchan=11}` in the example.

**Attention** 5. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

## Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

## Wi-Fi Aware™ (NAN)

Wi-Fi Aware™ or NAN (Neighbor Awareness Networking) is a protocol that allows Wi-Fi devices to discover services in their proximity. Typically, location-based services are based on querying servers for information about the environment and the location knowledge is based on GPS or other location reckoning techniques. However NAN does not require real-time connection to servers, GPS or other geo-location, but instead uses direct device-to-device Wi-Fi to discover and exchange information. NAN scales effectively in dense Wi-Fi environments and complements the connectivity of Wi-Fi by providing information about people and services in the proximity.

Multiple NAN devices which are in the vicinity will form a NAN cluster which allows them to communicate with each other. Devices within a NAN cluster can advertise (Publish method) or look for (Subscribe method) services using NAN Service Discovery protocols. Matching of services is done by service name, once a match is found a device can either send a message or establish an IPv6 datapath with the peer.

ESP32 supports Wi-Fi Aware in standalone mode with support for both Service Discovery and Datapath. Wi-Fi Aware is still an evolving protocol. Please refer to Wi-Fi Alliance's official page on [Wi-Fi Aware](#) for more information. Many Android smartphones with Android 8 or higher support Wi-Fi Aware. Refer to Android's developer guide on Wi-Fi Aware [Wi-Fi Aware](#) for more information.

## 2.5.2 以太网

### 以太网

**概述** ESP-IDF 提供一系列功能强大且兼具一致性的 API，为内部以太网 MAC (EMAC) 控制器和外部 SPI-Ethernet 模块提供支持。

本编程指南分为以下几个部分：

1. 以太网基本概念
2. 配置 *MAC* 和 *PHY*
3. 连接驱动程序至 *TCP/IP* 协议栈
4. 以太网驱动程序的杂项控制

**以太网基本概念** 以太网是一种异步的带冲突检测的载波侦听多路访问 (CSMA/CD) 协议/接口。通常来说，以太网不太适用于低功率应用。然而，得益于其广泛的部署、高效的网络连接、高数据率以及范围不限的可扩展性，几乎所有的有线通信都可以通过以太网进行。

符合 IEEE 802.3 标准的正常以太网帧的长度在 64 至 1518 字节之间，由五个或六个不同的字段组成：目的地 MAC 地址 (DA)、源 MAC 地址 (SA)、类型/长度字段、数据有效载荷字段、可选的填充字段和帧校验序列字段 (CRC)。此外，在以太网上传输时，以太网数据包的开头需附加 7 字节的前导码和 1 字节的帧起始符 (SOF)。

因此，双绞线上的通信如图所示：

图 4: 以太网数据帧格式

**前导码和帧起始符** 前导码包含 7 字节的 55H，作用是使接收器在实际帧到达之前锁定数据流。帧前界定符 (SFD) 为二进制序列 10101011（物理介质层可见）。有时它也被视作前导码的一部分。在传输和接收数据时，协议将自动从数据包中生成/移除前导码和帧起始符。

**目的地址 (DA)** 目的地址字段包含一个 6 字节长的设备 MAC 地址，数据包将发送到该地址。如果 MAC 地址第一个字节中的最低有效位是 1，则该地址为组播地址。例如，01-00-00-F0-00 和 33-45-67-89-AB-CD 是组播地址，而 00-00-00-F0-00 和 32-45-67-89-AB-CD 不是。

带有组播地址的数据包将到达选定的一组以太网节点，并发挥重要作用。如果目的地址字段是保留的多播地址，即 FF-FF-FF-FF-FF-FF，则该数据包是一个广播数据包，指向共享网络中的每个对象。如果 MAC 地址的第一个字节中的最低有效位为 0，则该地址为单播地址，仅供寻址节点使用。

通常，EMAC 控制器会集成接收过滤器，用于丢弃或接收带有组播、广播和/或单播目的地址的数据包。传输数据包时，由主机控制器将所需的目标地址写入传输缓冲区。

**源地址 (SA)** 源地址字段包含一个 6 字节长的节点 MAC 地址，以太网数据包通过该节点创建。以太网的用户需为所使用的任意控制器生成唯一的 MAC 地址。MAC 地址由两部分组成：前三个字节称为组织唯一标识符 (OUI)，由 IEEE 分配；后三个字节是地址字节，由购买 OUI 的公司配置。有关 ESP-IDF 中使用的 MAC 地址的详细信息，请参见 [MAC 地址分配](#)。

传输数据包时，由主机控制器将分配的源 MAC 地址写入传输缓冲区。

**类型/长度** 类型/长度字段长度为 2 字节。如果其值  $\leq 1500$  (十进制)，则该字段为长度字段，指定在数据字段后的非填充数据量；如果其值  $\geq 1536$ ，则该字段值表示后续数据包所属的协议。以下为该字段的常见值：

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

使用专有网络的用户可以将此字段配置为长度字段。然而，对于使用互联网协议 (IP) 或地址解析协议 (ARP) 等协议的应用程序，在传输数据包时，应将此字段配置为协议规范定义的适当类型。

**数据有效载荷** 数据有效载荷字段是一个可变长度的字段，长度从 0 到 1500 字节不等。更大的数据包会因违反以太网标准而被大多数以太网节点丢弃。

数据有效载荷字段包含客户端数据，如 IP 数据报。

**填充及帧校验序列 (FCS)** 填充字段是一个可变长度的字段。数据有效载荷较小时，将添加填充字段以满足 IEEE 802.3 规范的要求。

以太网数据包的 DA、SA、类型、数据有效载荷和填充字段共计必须不小于 60 字节。加上所需的 4 字节 FCS 字段，数据包的长度必须不小于 64 字节。如果数据有效载荷字段小于 46 字节，则需要加上一个填充字段。

帧校验序列字段 (FCS) 长度为 4 字节，其中包含一个行业标准的 32 位 CRC，该 CRC 是根据 DA、SA、类型、数据有效载荷和填充字段的数据计算的。鉴于计算 CRC 的复杂性，硬件通常会生成一个有效的 CRC 进行传输。否则，需由主机控制器生成 CRC 并将其写入传输缓冲区。

通常情况下，主机控制器无需关注填充字段和 CRC 字段，因为这两部分可以在传输或接收时由硬件 EMAC 自动生成或验证。然而，当数据包到达时，填充字段和 CRC 字段将被写入接收缓冲区。因此，如果需要的话，主机控制器也可以对它们进行评估。

---

**备注：**除了上述的基本数据帧，在 10/100 Mbps 以太网中还有两种常见的帧类型：控制帧和 VLAN 标记帧。ESP-IDF 不支持这两种帧类型。

---

**配置 MAC 和 PHY** 以太网驱动器由两部分组成：MAC 和 PHY。

MAC 和 PHY 之间的通信可以通过多种方式进行，如：**MII**（媒体独立接口）、**RMII**（简化媒体独立接口）等。

MII 和 RMII 的一个明显区别在于其所需的信号数。MII 通常需要多达 18 个信号，RMII 接口则仅需要 9 个信号。

在 RMII 模式下，接收器和发射器信号的参考时钟为 REF\_CLK。在访问 PHY 和 MAC 时，REF\_CLK 必须保持稳定。一般来说，根据您设计中 PHY 设备的特征，可通过以下三种方式生成 REF\_CLK：

- 一些 PHY 芯片可以从其外部连接的 25 MHz 晶体振荡器中获取 REF\_CLK（如图中的选项 a 所示）。对于此类芯片，请在 [CONFIG\\_ETH\\_RMII\\_CLK\\_MODE](#) 中选择 CONFIG\_ETH\_RMII\_CLK\_INPUT。
- 一些 PHY 芯片使用可以作为 MAC 端 REF\_CLK 的外接 50 MHz 晶体振荡器或其他时钟源（如图中的选项 b 所示）。对于此类芯片，请同样在 [CONFIG\\_ETH\\_RMII\\_CLK\\_MODE](#) 中选择 CONFIG\_ETH\_RMII\_CLK\_INPUT。
- 一些 EMAC 控制器可以使用其内部的高精度 PLL 生成 REF\_CLK（如图中的选项 c 所示）。此种情况下，请在 [CONFIG\\_ETH\\_RMII\\_CLK\\_MODE](#) 中选择 CONFIG\_ETH\_RMII\_CLK\_OUTPUT。

图 5: 以太网 RMIi 接口

**备注:** 如上所述, REF\_CLK 默认通过项目配置进行配置。然而, 通过设置 `eth_esp32_emac_config_t::interface` 和 `eth_esp32_emac_config_t::clock_config`, 也可以实现在用户应用代码中覆盖该时钟。更多细节, 请参见 `emac_rmii_clock_mode_t` 和 `emac_rmii_clock_gpio_t`。

**警告:** 如果配置 RMII 时钟模式为 `CONFIG_ETH_RMII_CLK_OUTPUT`, 那么就可以使用 GPIO0 输出 REF\_CLK 信号。更多细节, 请参见 `CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0`。

值得一提的是, 如果您在设计中并未使用 PSRAM, 则 GPIO16 和 GPIO17 也可以用来输出参考时钟。更多细节, 请参见 `CONFIG_ETH_RMII_CLK_OUT_GPIO`。

如果配置 RMII 时钟模式为 `CONFIG_ETH_RMII_CLK_INPUT`, 那么有且只有 GPIO0 可以用来输入 REF\_CLK 信号。请注意, GPIO0 同时也是 ESP32 上一个重要的 strapping GPIO 管脚。如果 GPIO0 在上电时采样为低电平, ESP32 将进入下载模式, 需进行手动复位重启系统。解决这个问题的方法是, 在硬件中默认禁用 REF\_CLK, 从而避免 strapping 管脚在启动阶段受到其他信号的干扰。随后, 再在以太网驱动安装阶段重新启用 REF\_CLK。

可以通过以下方法禁用 REF\_CLK 信号:

- 禁用或关闭晶体振荡器的电源 (对应图中的选项 *b*)。
- 强制复位 PHY 设备 (对应图中的选项 *a*)。此种方法并不适用于所有 PHY 设备, 即便处于复位状态, 某些 PHY 设备仍会向 GPIO0 输出信号。

无论选择哪种 RMII 时钟模式, 都请确保硬件设计中 REF\_CLK 的信号完整性! 信号线越短越好, 并保持信号线与 RF 设备和电感器元件的距离。

**备注:** ESP-IDF 只支持 RMII 接口 (即在 Kconfig 选项 `CONFIG_ETH_PHY_INTERFACE` 中始终选择 `CONFIG_ETH_PHY_INTERFACE_RMII`)。

**警告:**

如希望以太网与 Wi-Fi 一起工作, 不要选择 ESP32 作为 REF\_CLK 的源, 因为这会导致 REF\_CLK 不稳定。可以选择禁用 Wi-Fi, 或使用 PHY 或外部振荡器作为 REF\_CLK 的源。

在数据平面使用的信号通过 MUX 连接至特定的 GPIO, 这些信号无法配置至其他 GPIO。在控制平面使用的信号则可以通过 Matrix 矩阵路由到任何空闲 GPIO。相关的硬件设计示例, 请参考 `ESP32-Ethernet-Kit`。

根据您的以太网板设计, 需要分别为 MAC 和 PHY 配置必要的参数, 通过两者完成驱动程序的安装。

MAC 的相关配置可以在 `eth_mac_config_t` 中找到, 具体包括:

- `eth_mac_config_t::sw_reset_timeout_ms`: 软件复位超时值, 单位为毫秒。通常, MAC 复位应在 100 ms 内完成。
- `eth_mac_config_t::rx_task_stack_size` 和 `eth_mac_config_t::rx_task_prio`: MAC 驱动会创建一个专门的任务来处理传入的数据包, 这两个参数用于设置该任务的堆栈大小和优先级。
- `eth_mac_config_t::flags`: 指定 MAC 驱动应支持的额外功能, 尤其适用于某些特殊情况。这个字段的值支持与以 `ETH_MAC_FLAG_` 为前缀的宏进行 OR 运算。例如, 如果 MAC 驱动应在禁用缓存后开始工作, 那么则需要用 `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE` 配置这个字段。
- `eth_esp32_emac_config_t::smi_mdc_gpio_num` 和 `eth_esp32_emac_config_t::smi_mdio_gpio_num`: 连接 SMI 信号的 GPIO 编号。
- `eth_esp32_emac_config_t::interface`: 配置到 PHY (MII/RMII) 的 MAC 数据接口。

- `eth_esp32_emac_config_t::clock_config`: 配置 EMAC 接口时钟 (RMII 模式下的 REF\_CLK 模式以及 GPIO 编号)。

MAC 的相关配置可以在 `eth_phy_config_t` 中找到, 具体包括:

- `eth_phy_config_t::phy_addr`: 同一条 SMI 总线上可以存在多个 PHY 设备, 所以有必要为各个 PHY 设备分配唯一地址。通常, 这个地址是在硬件设计期间, 通过拉高/拉低一些 PHY strapping 管脚来配置的。根据不同的以太网开发板, 可配置值为 0 到 15。需注意, 如果 SMI 总线上仅有一个 PHY 设备, 将该值配置为 -1, 即可使驱动程序自动检测 PHY 地址。
- `eth_phy_config_t::reset_timeout_ms`: 复位超时值, 单位为毫秒。通常, PHY 复位应在 100 ms 内完成。
- `eth_phy_config_t::autonego_timeout_ms`: 自动协商超时值, 单位为毫秒。以太网驱动程序会自动与对等的以太网节点进行协商, 以确定双工和速度模式。此值通常取决于您电路板上 PHY 设备的性能。
- `eth_phy_config_t::reset_gpio_num`: 如果您的开发板同时将 PHY 复位管脚连接至了任意 GPIO 管脚, 请使用该字段进行配置。否则, 配置为 -1。

ESP-IDF 在宏 `ETH_MAC_DEFAULT_CONFIG` 和 `ETH_PHY_DEFAULT_CONFIG` 中为 MAC 和 PHY 提供了默认配置。

**创建 MAC 和 PHY 实例** 以太网驱动是以面向对象的方式实现的。对 MAC 和 PHY 的任何操作都应基于实例。

### 内部 EMAC + 外部 PHY

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // 应用默认的通用 MAC 配置
eth_esp32_emac_config_t esp32_emac_config = ETH_ESP32_EMAC_DEFAULT_CONFIG(); // 应用默认的供应商特定 MAC 配置
esp32_emac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // 更改用于 MDC 信号的 GPIO
esp32_emac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // 更改用于 MDIO 信号的 GPIO
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&esp32_emac_config, &mac_config); // 创建 MAC 实例

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // 根据开发板设计更改 PHY 地址
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // 更改用于 PHY 复位的 GPIO
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // 创建 PHY 实例
// ESP-IDF 为数种以太网 PHY 芯片驱动提供官方支持
// esp_eth_phy_t *phy = esp_eth_phy_new_rt18201(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_dp83848(&phy_config);
```

**可选的运行时 MAC 时钟配置** 可以通过用户应用程序代码, 选择性配置 EMAC 中的 REF\_CLK。

```
eth_esp32_emac_config_t esp32_emac_config = ETH_ESP32_EMAC_DEFAULT_CONFIG(); // 应用默认的供应商特定 MAC 配置
// ...
esp32_emac_config.interface = EMAC_DATA_INTERFACE_RMII; // 更改 EMAC 数据接口
esp32_emac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // 配置 EMAC REF_CLK 模式
```

### SPI-Ethernet 模块

eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();           // 应用默认的通用 MAC␣

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();           // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;                // 根据开发板设计更改␣

phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;     // 更改用于 PHY␣
↳复位的 GPIO
// 安装 GPIO 中断服务 (因为 SPI-Ethernet 模块为中断驱动)
gpio_install_isr_service(0);
// 配置 SPI 总线
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// 配置 SPI 从机设备
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

#### 备注:

- 当为 SPI-Ethernet 模块 (例如 DM9051) 创建 MAC 和 PHY 实例时, 由于 PHY 是集成在模块中的, 因此调用的实例创建函数的后缀须保持一致 (例如 `esp_eth_mac_new_dm9051` 和 `esp_eth_phy_new_dm9051` 搭配使用)。
- 针对不同的以太网模块, 或是为了满足特定 PCB 上的 SPI 时序, SPI 从机设备配置 (即 `spi_device_interface_config_t`) 可能略有不同。具体配置请查看模块规格以及 ESP-IDF 中的示例。

**安装驱动程序** 安装以太网驱动程序需要结合 MAC 和 PHY 实例, 并在 `esp_eth_config_t` 中配置一些额外的高级选项 (即不仅限于 MAC 或 PHY 的选项):

- `esp_eth_config_t::mac`: 由 MAC 生成器创建的实例 (例如 `esp_eth_mac_new_esp32()`)。
- `esp_eth_config_t::phy`: 由 PHY 生成器创建的实例 (例如 `esp_eth_phy_new_ip101()`)。
- `esp_eth_config_t::check_link_period_ms`: 以太网驱动程序会启用操作系统定时器来定期检查链接状态。该字段用于设置间隔时间, 单位为毫秒。
- `esp_eth_config_t::stack_input`: 在大多数的以太网物联网应用中, 驱动器接收的以太网帧会被传递到上层 (如 TCP/IP 栈)。经配置, 该字段为负责处理传入帧的函数。您可以在安装驱动

程序后，通过函数 `esp_eth_update_input_path()` 更新该字段。该字段支持在运行过程中进行更新。

- `esp_eth_config_t::on_lowlevel_init_done` 和 `esp_eth_config_t::on_lowlevel_deinit_done`: 这两个字段用于指定钩子函数，当去初始化或初始化低级别硬件时，会调用钩子函数。

ESP-IDF 在宏 `ETH_DEFAULT_CONFIG` 中为安装驱动程序提供了一个默认配置。

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // 应用默认驱动程序配置
esp_eth_handle_t eth_handle = NULL; // 驱动程序安装完毕后，将得到驱动程序的句柄
esp_eth_driver_install(&config, &eth_handle); // 安装驱动程序
```

以太网驱动程序包含事件驱动模型，该模型会向用户空间发送有用及重要的事件。安装以太网驱动程序之前，需要首先初始化事件循环。有关事件驱动编程的更多信息，请参考 [ESP Event](#)。

```
/** 以太网事件的事件处理程序 */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* 可从事件数据中获得以太网驱动句柄 */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
            ↪addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // 创建一个在后台运行的默认事件循环
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↪// 注册以太网事件处理程序（用于在发生 link up/down
↪等事件时，处理特定的用户相关内容）
```

**启动以太网驱动程序** 安装驱动程序后，可以立即启动以太网。

```
esp_eth_start(eth_handle); // 启动以太网驱动程序状态机
```

**连接驱动程序至 TCP/IP 协议栈** 现在，以太网驱动程序已经完成安装。但对应 OSI（开放式系统互连模型）来看，目前阶段仍然属于第二层（即数据链路层）。这意味着可以检测到 link up/down 事件，获得用户空间的 MAC 地址，但无法获得 IP 地址，当然也无法发送 HTTP 请求。ESP-IDF 中使用的 TCP/IP 协议栈是 LwIP，关于 LwIP 的更多信息，请参考 [LwIP](#)。

要将以太网驱动程序连接至 TCP/IP 协议栈，需要以下三步：

1. 为以太网驱动程序创建网络接口

2. 将网络接口连接到以太网驱动程序
3. 注册 IP 事件处理程序

有关网络接口的更多信息，请参考 [Network Interface](#)。

```

/** IP_EVENT_ETH_GOT_IP 的事件处理程序 */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // 初始化 TCP/IP 网络接口 (在应用程序中应仅调用一次)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // 应用以太网的默认网络接口配置
esp_netif_t *eth_netif = esp_netif_new(&cfg); // 为以太网驱动程序创建网络接口

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // 将以太网驱动程序连接至 TCP/IP 协议栈
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // 注册用户定义的 IP 事件处理程序
esp_eth_start(eth_handle); // 启动以太网驱动程序状态机

```

**警告：** 推荐在完成整个以太网驱动和网络接口的初始化后，再注册用户定义的以太网/IP 事件处理程序，也就是把注册事件处理程序作为启动以太网驱动程序的最后一步。这样可以确保以太网驱动程序或网络接口将首先执行以太网/IP 事件，从而保证在执行用户定义的处理程序时，系统处于预期状态。

**以太网驱动程序的杂项控制** 以下功能只支持在安装以太网驱动程序后调用。

- 关闭以太网驱动程序: `esp_eth_stop()`
- 更新以太网数据输入路径: `esp_eth_update_input_path()`
- 获取/设置以太网驱动程序杂项内容: `esp_eth_ioctl()`

```

/* 获取 MAC 地址 */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
          ↪addr[5]);

/* 获取 PHY 地址 */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

```

**数据流量控制** 受 RAM 大小限制，在网络拥堵时，MCU 上的以太网通常仅能处理有限数量的帧。发送站的数据传输速度可能快于对等端的接收能力。以太网数据流量控制机制允许接收节点向发送方发出信号，要求暂停传输，直到接收方跟上。这项功能是通过暂停帧实现的，该帧定义在 IEEE 802.3x 中。

暂停帧是一种特殊的以太网帧，用于携带暂停命令，其 EtherType 字段为 0x8808，控制操作码为 0x0001。只有配置为全双工操作的节点组可以发送暂停帧。当节点组希望暂停链路的另一端时，它会发送一个暂

暂停帧到 48 位的保留组播地址 01-80-C2-00-00-01。暂停帧中也包括请求暂停的时间段，以两字节的整数形式发送，值的范围从 0 到 65535。

安装以太网驱动程序后，数据流量控制功能默认禁用，可以通过以下方式启用此功能：

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

需注意，暂停帧是在自动协商期间由 PHY 向对等端公布的。只有当链路的两边都支持暂停帧时，以太网驱动程序才会发送暂停帧。

### 进阶操作

**自定义 PHY 驱动程序** 目前市面上已有多家 PHY 制造商提供了大量的芯片组合。ESP-IDF 现已支持多种 PHY 芯片，但是由于价格、功能、库存等原因，有时用户还是无法找到一款能满足其实际需求的芯片。

好在 IEEE 802.3 在其 22.2.4 管理功能部分对 EMAC 和 PHY 之间的管理接口进行了标准化。该部分定义了所谓的“MII 管理接口”规范，用于控制 PHY 和收集 PHY 的状态，还定义了一组管理寄存器来控制芯片行为、链接属性、自动协商配置等。在 ESP-IDF 中，这项基本的管理功能是由 [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) 实现的，这也大大降低了创建新的自定义 PHY 芯片驱动的难度。

**备注：**由于一些 PHY 芯片可能不符合 IEEE 802.3 第 22.2.4 节的规定，所以请首先查看 PHY 数据手册。不过，就算芯片不符合规定，您依旧可以创建自定义 PHY 驱动程序，只是由于需要自行定义所有的 PHY 管理功能，这个过程将变得较为复杂。

ESP-IDF 以太网驱动程序所需的大部分 PHY 管理功能都已涵盖在 [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) 中。不过对于以下几项，可能仍需针对不同芯片开发具体的管理功能：

- 链接状态。此项总是由使用的具体芯片决定
- 芯片初始化。即使不存在严格的限制，也应进行自定义，以确保使用的是符合预期的芯片
- 芯片的具体功能配置

### 创建自定义 PHY 驱动程序的步骤：

1. 请根据 PHY 数据手册，定义针对供应商的特定注册表布局。示例请参见 [esp\\_eth/src/esp\\_eth\\_phy\\_ip101.c](#)。
2. 准备衍生的 PHY 管理对象信息结构，该结构：
  - 必须至少包含 IEEE 802.3 [phy\\_802\\_3\\_t](#) 父对象
  - 可选包含支持非 IEEE 802.3 或自定义功能所需的额外变量。示例请参见 [esp\\_eth/src/esp\\_eth\\_phy\\_ksz80xx.c](#)。
3. 定义针对芯片的特定管理回调功能。
4. 初始化 IEEE 802.3 父对象并重新分配针对芯片的特定管理回调功能。

实现新的自定义 PHY 驱动程序后，你可以通过 [IDF 组件管理中心](#) 将驱动分享给其他用户。

The following common IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- `ETH_CMD_S_AUTONEGO` enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- `ETH_CMD_G_AUTONEGO` gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype to which the current configuration is to be stored.

## 2.5.4 IP 网络层协议

### ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

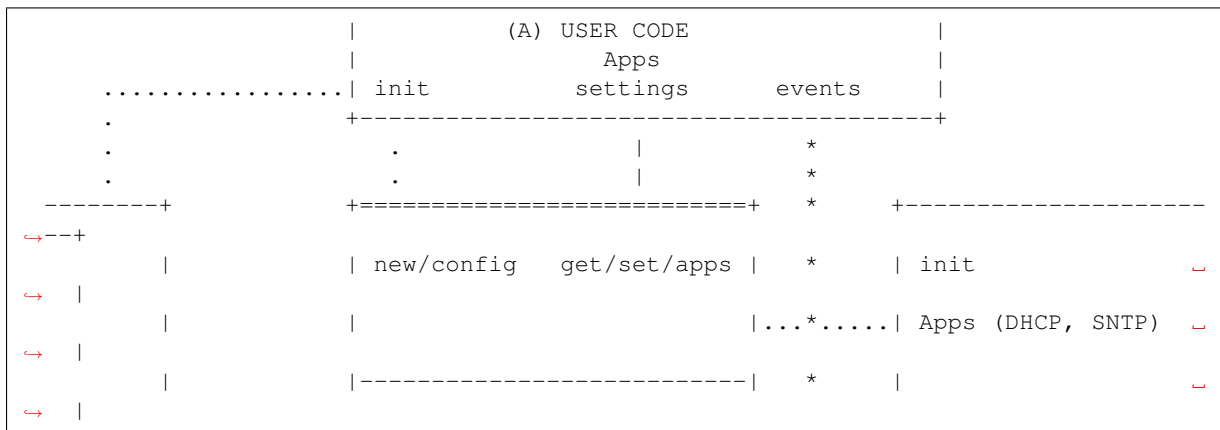

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to [components/esp\\_netif\\_stack/README.md](#).

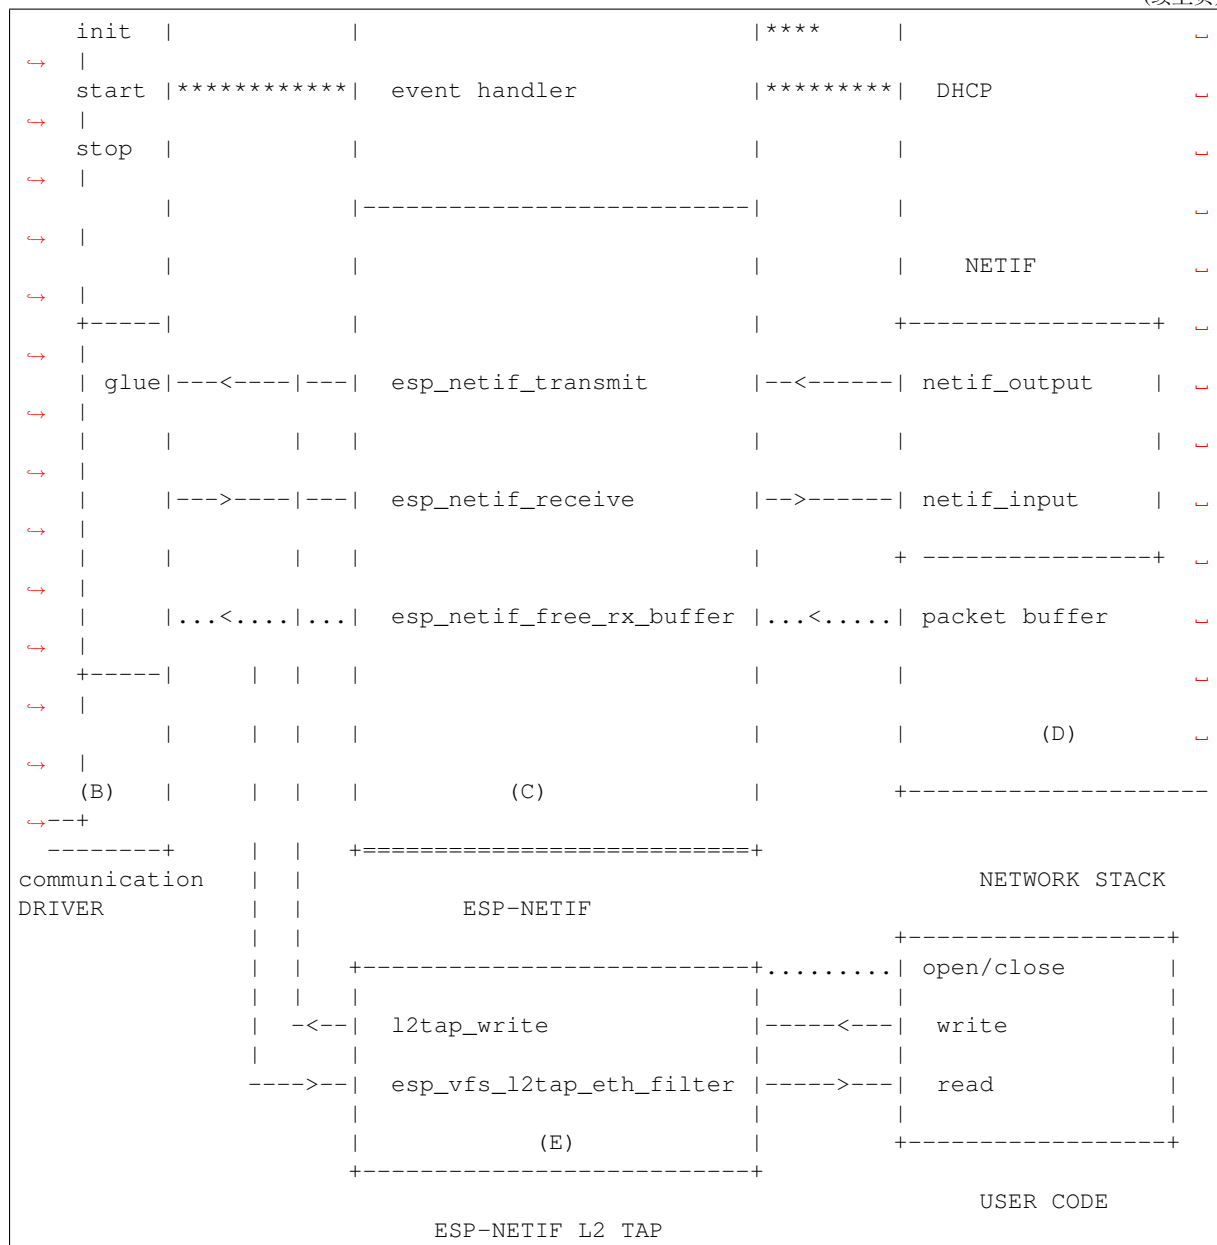

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

### ESP-NETIF architecture

**Data and event flow in the diagram**

- ..... Initialization line from user code to ESP-NETIF and communication driver
- ---<--->-- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

**ESP-NETIF interaction**

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with

- ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
  - 4) Configures event handlers
    - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
    - register handlers for app related events (such as IP lost/acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
  - *SNTP API*
- 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to [虚拟文件系统组件](#) to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user's application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

## ESP-NETIF L2 TAP Interface Usage Manual

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `"/dev/net/tap"`. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp\\_netif/include/esp\\_netif\\_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to `0x05DC`, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval `<0, 0x05DC>` at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user's application. In case the filter value is set greater than `0x05DC`, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

**警告:** The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

---

**备注:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

---

---

**备注:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user's application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

---

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

**close()** Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**select()** Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**SNTP API** You can find a brief introduction to SNTP in general, its initialization code and basic modes in [SNTP 时间同步](#) section in the *System Time Document*.

This section provides more details about specific use cases of SNTP service, with statically configured servers, or using DHCP provided servers, or both. The workflow is usually very simple:

- 1) Initialize and configure the service using `esp_netif_sntp_init()`. This operations can only be called once (unless the SNTP service has been destroyed by `esp_netif_sntp_deinit()`)
- 2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.
- 3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
- 4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

**Basic mode with statically defined server(s)** Initialize the module with the default configuration after connecting to network. Note that it's possible to provide multiple NTP servers in the configuration struct:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
    ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"),
    ↪ );
esp_netif_sntp_init(&config);
```

**备注:** If we want to configure multiple SNTP servers, we have to update lwIP configuration [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#).

**Use DHCP obtained SNTP server(s)** First of all, we have to enable lwIP configuration option [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#). Then we have to initialize the SNTP module with the DHCP option and no NTP server:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // start SNTP service explicitly
config.server_from_dhcp = true; // accept NTP offer from DHCP server
esp_netif_sntp_init(&config);
```

Then, once we're connected, we could start the service using:

```
esp_netif_sntp_start();
```

**备注:** It's also possible to start the service during initialization (default `config.start=true`). This would likely cause the initial SNTP request to fail (since we are not connected yet) and thus some backoff time for subsequent requests.

**Use both static and dynamic servers** Very similar to the scenario above (DHCP provided SNTP server), but in this configuration we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when DHCP provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep DHCP provided server at index 0, and the statically configured server at index 1).

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start SNTP service explicitly
↪ (after connecting)
config.server_from_dhcp = true; // accept NTP offers from DHCP server
config.renew_servers_after_new_IP = true; // let esp-netif update configured
↪ SNTP server(s) after receiving DHCP lease
config.index_of_first_server = 1; // updates from server num 1, leaving
↪ server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // IP event on which we refresh
↪ the configuration
```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF programmer's manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)
- L2 TAP: [protocols/l2tap/main/l2tap\\_main.c](#)

- WiFi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**参数**

- **esp\_netif** -- [in] Handle to esp-netif instance

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**备注:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

#### 参数

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [in] IP information to set on the specified interface

#### 返回

- ESP\_OK

*esp\_err\_t* **esp\_netif\_set\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

#### 参数

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

*esp\_netif\_t* \***esp\_netif\_next** (*esp\_netif\_t* \*esp\_netif)

---

**备注:** This API doesn't lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather than within a single iteration. Therefore it is recommended to iterate over the interfaces inside *esp\_netif\_tcpip\_exec()*

---

Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

Used for bulk search loops within TCPIP context, e.g. using *esp\_netif\_tcpip\_exec()*, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

**参数** **esp\_netif** -- **[in]** Handle to esp-netif instance

## 2.5.5 IP 网络层协议

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as_
↳esp-netif driver */
    driver_impl_t *h;                     /*!< handle of driver_
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

### 2.6.1 模数转换器 (ADC) 单次转换模式驱动

## 简介

模数转换器集成于芯片，支持测量特定模拟 IO 管脚的模拟信号。

ESP32 有两个 ADC 单元，可以在以下场景使用：

- 生成 ADC 单次转换结果
- 生成连续 ADC 转换结果

本指南介绍了 ADC 单次转换模式。

## 功能概述

下文将分节概述安装和运行 ADC 的基本步骤：

- **资源分配** - 介绍获取 ADC 句柄所需设置的参数，以及如何在 ADC 完成工作后回收资源。
- **配置 ADC 单元实例** - 介绍配置 ADC 单元所需设置的参数，用于获取 ADC 转换的原始结果。
- **读取转换结果** - 介绍如何获取 ADC 转换的原始结果。
- **硬件限制** - 介绍与 ADC 相关的硬件限制。
- **电源管理** - 介绍电源管理的相关内容。
- **IRAM 安全** - 介绍在禁用 cache 时，如何读取 ADC 转换的原始结果。
- **线程安全** - 介绍由驱动程序认证为线程安全的 API。
- **Kconfig 选项** - 介绍支持的 Kconfig 选项，不同选项对驱动程序的操作会产生不同影响。

**资源分配** ADC 单次转换模式驱动基于 ESP32 SAR ADC 模块实现，不同的 ESP 芯片可能拥有不同数量的独立 ADC。对于单次转换模式驱动而言，ADC 实例以 `adc_oneshot_unit_handle_t` 表示。

请设置所需的初始配置结构体 `adc_oneshot_unit_init_cfg_t` 安装 ADC 实例，具体如下：

- `adc_oneshot_unit_init_cfg_t::unit_id` 选择 ADC。请参阅 [技术规格书](#)，了解对应 ADC 的专用模拟 IO 管脚。
- `adc_oneshot_unit_init_cfg_t::clk_src` 选择 ADC 的时钟源。设置为 0 时，驱动程序将使用默认时钟源，详情请参阅 `adc_oneshot_clk_src_t`。
- `adc_oneshot_unit_init_cfg_t::ulp_mode` 设置是否支持 ADC 在 ULP 模式下工作。

完成 ADC 初始配置后，使用已设置的初始配置结构体 `adc_oneshot_unit_init_cfg_t` 调用 `adc_oneshot_new_unit()`。如果分配成功，该函数将返回 ADC 单元实例句柄。

该函数可能因参数无效、内存不足等原因返回错误代码。比如，当要分配的 ADC 实例已经注册时，该函数会返回 `ESP_ERR_NOT_FOUND` 错误。可用 ADC 数量可通过 `SOC_ADC_PERIPH_NUM` 查看。

如果不再需要先前创建的 ADC 单元实例，请调用 `adc_oneshot_del_unit()` 回收该实例，相关的硬件和软件资源也会回收。

### 在普通单次转换模式下创建 ADC 单元实例句柄

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

### 回收 ADC 单元实例

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**配置 ADC 单元实例** 创建 ADC 单元实例后，请设置 `adc_oneshot_chan_cfg_t` 配置 ADC IO 以测量模拟信号，具体如下：

- `adc_oneshot_chan_cfg_t::atten`，ADC 衰减。请参阅 [技术参考手册](#) > 片上传感器与模拟信号处理。
- `adc_oneshot_chan_cfg_t::bitwidth`，原始转换结果的位宽。

**备注：** ADC IO 及其对应的 ADC 通道编号，请参阅 [技术规格书](#)。

此外，可以使用 `adc_continuous_io_to_channel()` 和 `adc_continuous_channel_to_io()` 了解 ADC 通道和 ADC IO。

为使以上设置生效，请使用上述配置结构体调用 `adc_oneshot_config_channel()`，并指定要配置的 ADC 通道。函数 `adc_oneshot_config_channel()` 支持多次调用，以配置不同的 ADC 通道。驱动程序将在内部保存每个通道的配置。

### 配置两个 ADC 通道

```
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &
↪ config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &
↪ config));
```

**读取转换结果** 完成上述配置后，ADC 即可测量来自配置好的 ADC 通道的模拟信号。调用 `adc_oneshot_read()` 可以获取 ADC 通道的原始转换结果。

- `adc_oneshot_read()` 可安全使用。ADC 由其他驱动程序/外设共享，请参阅 [硬件限制](#)。函数 `adc_oneshot_read()` 使用互斥锁，避免与其他函数同时使用硬件，因此该函数不应在 ISR 上下文中使用。当 ADC 由其他驱动程序/外设占用时，该函数可能出错，并返回 `ESP_ERR_TIMEOUT` 错误。此时，ADC 原始结果无效。

该函数可能因参数无效而调用失败。

通过该函数获取的 ADC 转换结果为原始数据。可以使用以下公式，根据 ADC 原始结果计算电压：

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

其中：

Vout	数字输出结果，代表电压。
Dout	ADC 原始数字读取结果。
Vmax	可测量的最大模拟输入电压，与 ADC 衰减相关，请参考 <a href="#">技术参考手册</a> > 片上传感器与模拟信号处理。
Dmax	输出 ADC 原始数字读取结果的最大值，即 $2^{\text{位宽}}$ ，位宽即之前配置的 <code>adc_oneshot_chan_cfg_t::bitwidth</code> 。

若需进一步校准，将 ADC 原始结果转换为以 mV 为单位的电压数据，请参考校准文档 [模数转换器 \(ADC\) 校准驱动程序](#)。

### 读取原始结果

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);
```

(下页继续)

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

### 硬件限制

- 随机数生成器 (RNG) 以 ADC 为输入源。使用 ADC 单次转换模式驱动从 RNG 生成随机数时，随机性会减弱。
- 一个 ADC 单元每次只能在一种操作模式下运行，可以是连续模式或单次模式。`adc_oneshot_start()` 提供了保护措施。
- Wi-Fi 也使用 ADC2, `adc_oneshot_read()` 提供了 Wi-Fi 驱动与 ADC 单次转换模式驱动间的保护。
- ESP32-DevKitC: GPIO0 已用于自动烧录功能，不能用于 ADC 单次转换模式。
- ESP-WROVER-KIT: GPIO0、GPIO2、GPIO4 和 GPIO15 已有其他用途，不能用于 ADC 单次转换模式。

**电源管理** 启用电源管理，即启用 `CONFIG_PM_ENABLE` 时，系统在空闲状态下可能会调整系统时钟频率。然而，ADC 单次转换模式驱动以轮询例程运行，`adc_oneshot_read()` 会不断检查 CPU 是否完成读取，直到函数返回。在此期间，ADC 单次转换模式驱动程序所在的任务不会受阻塞。因此，在读取时时钟频率保持稳定。

**IRAM 安全** flash 写入/擦除、OTA 等原因都可能导致 cache 禁用，此时，默认不应运行任何 ADC 单次转换模式驱动 API。如果在禁用 cache 时执行了 ADC 单次转换模式驱动 API，可能会出现类似 `Illegal Instruction` 或 `Load/Store Prohibited` 的错误。

### 线程安全

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

上述函数均为线程安全，使用时，可以直接从不同的 RTOS 任务中调用以上函数，无需额外锁保护。

- `adc_oneshot_del_unit()` 非线程安全。此外，与上文中线程安全的函数一起调用该函数时，可能导致线程安全函数的调用出错。

### Kconfig 选项

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` 决定了放置 ADC 快速读取函数的位置，即 IRAM 或 flash 中，详情请参阅 [IRAM 安全](#)。

## 2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

### Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

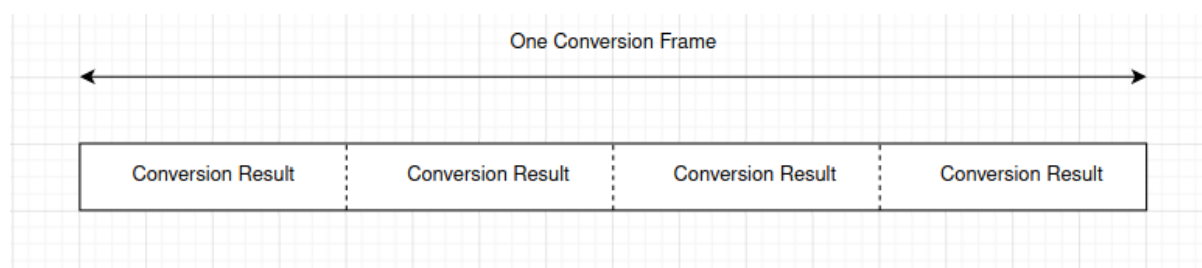

ESP32 has two ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

**Driver Concepts** ADC continuous mode conversion is made up with multiple Conversion Frames.

- **Conversion Frame:** One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes.
- **Conversion Result:** One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

### Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- [Resource Allocation](#) - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- [ADC Configurations](#) - describes how to configure the ADC(s) to make it work under continuous mode.
- [ADC Control](#) - describes ADC control functions.
- [Register Event Callbacks](#) - describes how to hook user specific code to an ADC continuous mode event callback function.
- [Read Conversion Result](#) - covers how to get ADC conversion result.
- [Hardware Limitations](#) - describes the ADC related hardware limitations.
- [Power Management](#) - covers power management related.
- [IRAM Safe](#) - covers the IRAM safe functions.
- [Thread Safety](#) - lists which APIs are guaranteed to be thread safe by the driver.

**Resource Allocation** The ADC continuous mode driver is implemented based on ESP32 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the I2S0 peripheral is in use. See [Hardware Limitations](#) for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

### Initialize the ADC Continuous Mode Driver

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

**ADC Configurations** After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

---

**备注:** For the IO corresponding ADC channel number. Check [datasheet](#) to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

---

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't call this API at this moment.

See ADC continuous mode example [peripherals/adc/continuous\\_read](#) to see configuration codes.

### ADC Control

**Start and Stop** Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

**Register Event Callbacks** By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t` - `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes. - `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren't in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't add callback at this moment.

**Conversion Done Event** The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

---

**备注:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

---

---

**备注:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

---

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won't fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn't reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>:cpp:member::adc_digi_pattern_config_1:bit_width</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [模数转换器 \(ADC\) 校准驱动程序](#).

### Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by the Wi-Fi. `adc_continuous_start()` has provided the protection between Wi-Fi driver and ADC continuous mode driver.
- ADC continuous mode driver uses I2S0 peripheral as hardware DMA fifo. Therefore, if I2S0 is in use already, the `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe** All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety** ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See [Hardware Limitations](#) for more details.

## 2.6.3 模数转换器 (ADC) 校准驱动程序

## 简介

在 ESP32 中，模数转换器 (ADC) 比较输入的模拟电压和参考电压，以确定每一位数字输出结果。ESP32 设计的 ADC 参考电压为 1100 mV。然而，不同芯片的真实参考电压可能会略有变化，范围在 1000 mV 到 1200 mV 之间。本文介绍了 ADC 校准驱动程序，可以降低参考电压不同带来的影响，获取更准确的输出结果。

## 功能概述

下文将分节概述安装和使用 ADC 校准驱动程序的基本步骤：

- **创建校准方案** - 介绍如何创建和删除校准方案句柄。
- **结果转换** - 介绍如何将原始 ADC 结果转换为校准后的结果。
- **线程安全** - 列出由驱动程序认证为线程安全的 API。
- **减少噪声** - 介绍一种常见的降低噪声的方法。
- **Kconfig 选项** - 列出了驱动程序支持的 Kconfig 选项，这些选项会对驱动程序的行为产生不同影响。

**创建校准方案** ADC 校准驱动程序会提供 ADC 校准方案。对于驱动程序来说，每个 ADC 校准方案对应一个 ADC 校准句柄 `adc_cali_handle_t`。

使用 `adc_cali_check_scheme()` 可以查看芯片支持的校准方案。若已了解芯片支持的校准方案，可以跳过该步骤，直接调用对应函数创建校准方案句柄。

使用自定义 ADC 校准方案时，可以选择调整函数 `adc_cali_check_scheme()`，或直接跳过该步骤，调用自定义函数创建校准方案句柄。

**ADC 校准线性拟合方案** ESP32 支持 `ADC_CALI_SCHEME_VER_LINE_FITTING` 方案。要创建此方案，请先根据以下配置选项，设置 `adc_cali_line_fitting_config_t`。

- `adc_cali_line_fitting_config_t::unit_id`，表示 ADC 原始结果来自哪个 ADC 单元。
- `adc_cali_line_fitting_config_t::atten`，表示 ADC 原始结果的衰减程度。
- `adc_cali_line_fitting_config_t::bitwidth`，表示 ADC 原始结果的位宽。

`adc_cali_line_fitting_config_t::default_vref` 通常默认设置为 0，此值不影响线性拟合方案的校准过程。然而，如果线性拟合方案所需使用的 eFuse 位没有烧录到板上，则驱动程序将根据 `adc_cali_line_fitting_config_t::default_vref` 进行校准。

通过 `adc_cali_scheme_line_fitting_check_efuse()` 可以检查 eFuse 位。一般情况下，线性拟合方案的 eFuse 值为 `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP` 或 `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF`。这意味着线性拟合方案在校准时，使用的是烧录在 eFuse 中的校准参数。

当线性拟合方案的 eFuse 值为 `ADC_CALI_LINE_FITTING_EFUSE_VAL_DEFAULT_VREF` 时，请设置 `esp_adc_cali_line_fitting_init::default_vref`。默认 `vref` 为 ADC 参考电压的估计值，在校准时作为参数提供。

设置完上述配置结构体后，请调用 `adc_cali_create_scheme_line_fitting()` 创建线性拟合校准方案句柄。

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

ADC 校准使用完毕后，请调用 `adc_cali_delete_scheme_line_fitting()`，删除线性拟合校准方案句柄。

### 删除线性拟合校准方案句柄

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

**备注:** 要使用自定义校准方案, 可以通过提供创建函数, 创建自己的校准方案句柄。请参阅 `components/esp_adc/interface/adc_cali_interface.h` 中的函数表 `adc_cali_scheme_t`, 了解 ESP ADC 校准接口。

**结果转换** 对驱动程序进行完上述配置和初始化工作后, 可以调用 `adc_cali_raw_to_voltage()`, 将原始 ADC 结果转换为校准结果, 校准结果以 mV 为单位。该函数可能因参数无效而调用失败。如果函数返回 `ESP_ERR_INVALID_STATE`, 说明校准方案尚未创建。因此你需要创建一个校准方案句柄, 通过 `adc_cali_check_scheme()` 可以了解当前芯片支持的校准方案; 你也可以提供自定义校准方案, 创建对应的校准方案句柄。

### 获取电压

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↳voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↳ADC1_CHAN0, voltage[0][0]);
```

**线程安全** 驱动程序会确保工厂函数 `esp_adc_cali_new_scheme()` 的线程安全, 使用时, 可以直接从不同的 RTOS 任务中调用此类函数, 无需额外锁保护。

其他以 `adc_cali_handle_t` 作为第一个位置参数的函数均非线程安全, 在没有设置互斥锁保护的任務中, 应避免从多个任务中调用这类函数。

### Kconfig 选项

- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE` - 如果校准相关的 eFuse 值没有配置为 `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_TP`, 则可以禁用该选项, 减小代码大小。
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE` - 如果校准相关的 eFuse 值没有配置为 `ADC_CALI_LINE_FITTING_EFUSE_VAL_EFUSE_VREF`, 则可以禁用该选项, 减小代码大小。
- `CONFIG_ADC_CAL_LUT_ENABLE` - 如果校准 ADC 原始结果时, 衰减没有设置成 `ADC_ATTEN_DB_12`, 则可以禁用该选项, 减小代码大小。

**减少噪声** ESP32 ADC 对噪声敏感, 可能导致 ADC 读数出现较大偏差。根据不同使用场景, 要减少噪声影响, 你可能需要将旁路电容 (如 100 nF 陶瓷电容) 连接到 ADC 使用的输入管脚。此外, 也可以通过多次采样, 进一步减轻噪声的影响。

## 2.6.4 时钟树

ESP32 的时钟子系统用于从一系列根时钟中提取并分配系统/模块时钟。时钟树驱动程序负责维护系统时钟的基本功能，并管理模块时钟间的复杂关系。

本文档首先介绍了根时钟和模块时钟，随后介绍了可供用户调用的时钟树 API，调用这些 API，可以监测模块时钟的运行状态。

### 简介

本节列出了 ESP32 支持的根时钟和模块时钟的定义，这些定义通常用于驱动程序配置，有助于为外设选择合适的时钟源。

**根时钟** 根时钟会产生可靠的时钟信号，经各种门、复用器、分频器或倍频器传递，这些时钟信号最终成为 CPU 内核、Wi-Fi、蓝牙、RTC 及外设等功能模块的时钟源。

ESP32 的根时钟列在 `soc_root_clk_t` 中：

- 内部 8 MHz RC 振荡器 (`RC_FAST`)
  - 此 RC 振荡器可产生约 8.5 MHz 的时钟信号输出，标识为 `RC_FAST_CLK`。
  - 此约 8.5 MHz 的信号也会传入可配置的分频器，默认情况下，该分频器会将输入的时钟频率分频 256 倍，生成信号 `RC_FAST_D256_CLK`。
  - 在运行时，通过在 `RC_FAST_D256_CLK` 上校准，可以计算 `RC_FAST_CLK` 的实际频率。
- 外部 2 ~ 40 MHz 晶振 (`XTAL`)
- 内部 150 kHz RC 振荡器 (`RC_SLOW`)
  - 此 RC 振荡器产生约 150 kHz 的时钟信号输出，标识为 `RC_SLOW_CLK`。在运行时，通过校准，可以计算该时钟信号的实际频率。
- 外部 32 kHz 晶振 - 可选 (`XTAL32K`)
  - `XTAL32K_CLK` 的时钟源可以是连接到 `32K_XP` 和 `32K_XN` 管脚的 32 kHz 晶振，也可以是外部电路生成的 32 kHz 时钟信号。如果使用外部电路生成的时钟信号，该信号必须连接到 `32K_XN` 管脚，并且在 `32K_XP` 管脚和地之间连接一个 1 nF 的电容。此时，`32K_XP` 管脚不能用作 GPIO 管脚。
  - 通过校准，可以计算 `XTAL32K_CLK` 的实际频率。

与晶振产生的信号相比，从 RC 振荡器电路产生的信号通常精度较低，且容易受环境影响。因此，ESP32 为 `RTC_SLOW_CLK` 提供了几种时钟源选项，可以根据对系统时间精度和对功耗的要求选择。更多详情，请参阅 [RTC 定时器时钟源](#)。

**模块时钟** ESP32 的可用模块时钟在 `soc_module_clk_t` 中列出，每个模块时钟都有其唯一 ID。查阅文档中的枚举值，即可获取各模块时钟的详细信息。

## 使用 API

时钟树驱动程序提供了一个一体化接口，可以获取模块时钟的频率，即 `esp_clk_tree_src_get_freq_hz()`。通过该函数，你可以在任何时刻，通过提供时钟名称 `soc_module_clk_t` 和指定返回频率值的精度级别 `esp_clk_tree_src_freq_precision_t`，获取时钟频率。

## 2.6.5 数模转换器 (DAC)

### 概况

ESP32 有两个 8 位数模转换器 (DAC) 通道，分别连接到 GPIO25 (通道 1) 和 GPIO26 (通道 2)。每个 DAC 通道可以将数字值 0~255 转换成模拟电压 0~Vref (此处的 Vref 为 VDD3P3\_RTC 引脚输入的参考电压，一般来说其输入的电压值应等于电源电压 VDD)。输出电压可按以下方式计算：

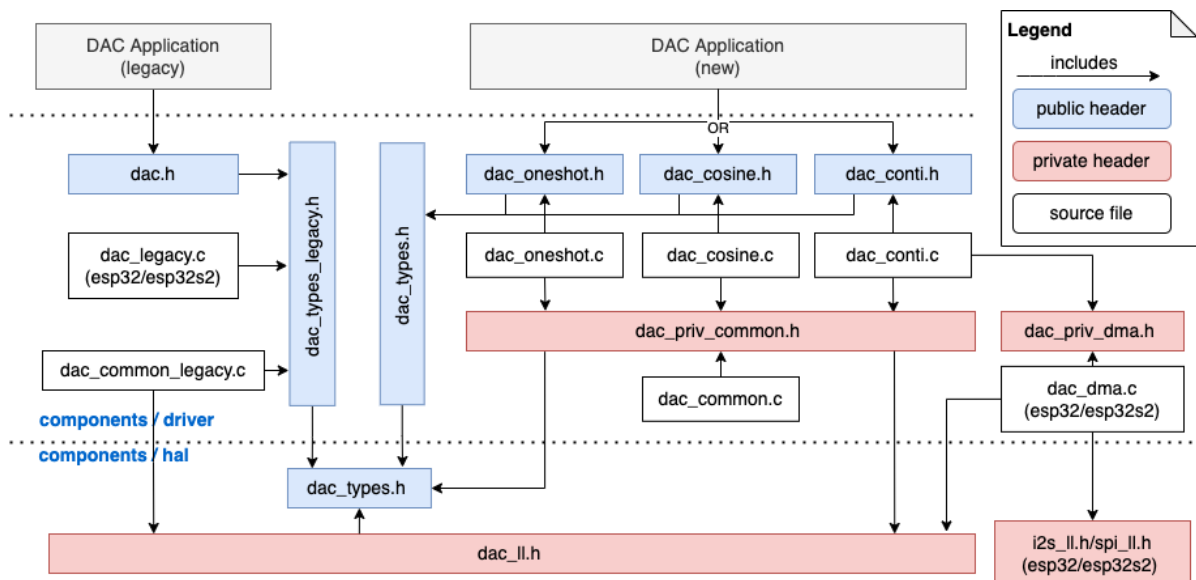

```
out_voltage = Vref * digi_val / 255
```

DAC 外设支持以下列方式输出模拟信号：

1. 直接输出电压。DAC 通道持续输出某一指定电压。
2. 通过 DMA 输出连续模拟信号。DAC 以某一特定频率转换缓冲器中的数据。
3. 通过余弦波发生器输出余弦波。DAC 通道可以输出特定频率和振幅的余弦波。

其他模拟输出选项可参考 [Sigma-Delta 调制](#) 和 [LED PWM 控制器](#)。这两个模块均输出高频的 PWM/PDM 信号，也可借助硬件低通滤波输出较低频率的模拟信号。

### DAC 文件结构

需包含在 DAC 应用程序中的公共头文件包括：

- `dac.h`：原有 DAC 驱动的最上层头文件，只包含在使用原有驱动 API 的应用程序中。
- `dac_oneshot.h`：新 DAC 驱动的最上层头文件，应包含在使用新驱动 API (单次模式) 的应用程序中。

- `dac_cosine.h`: 新 DAC 驱动的最上层头文件, 应包含在使用新驱动 API (余弦模式) 的应用程序中。
- `dac_continuous.h`: 新 DAC 驱动的最上层头文件, 应包含在使用新驱动 API (连续模式) 的应用程序中。

**备注:** 原有驱动程序与新驱动程序无法共存。使用原有驱动需包含 `dac.h`, 使用新驱动需包含 `dac_oneshot.h`, `dac_cosine.h` 和 `dac_continuous.h`。后续更新或将移除原有驱动程序。

## 功能概览

**资源管理** ESP32 有两个 DAC 通道。通道的软件资源互相独立, 用户可以根据具体情况调用 `dac_oneshot_handle_t`、`dac_cosine_handle_t` 或 `dac_continuous_handle_t` 来管理不同通道, 但不支持在同一个通道上注册不同模式。

**电压直接输出 (单次/直接模式)** 在这种模式下, DAC 通道每次调用 `dac_oneshot_output_voltage()` (可在 ISR 中调用) 时都可以将一个 8 位数字转换为模拟值。直至下一次转换开始前, DAC 通道上都将维持该模拟电压。开始转换电压前, 需要首先调用 `dac_oneshot_new_channel()` 来启用该 DAC 通道。

**连续波输出 (连续/DMA 模式)** DAC 通道可以通过 DMA 连续转换数字信号, 这种模式下有三种写入 DAC 数据的方法:

1. 常规写入 (同步): 一次性传输所有数据并在所有数据均已载入 DMA 缓冲区前保持阻塞状态。如果不再继续输入数据, 电压将维持在最后的转换值。该模式通常用于传输音频等长信号。要连续转换数据, 需要调用 `dac_continuous_new_channels()` 来分配连续通道句柄, 调用 `dac_continuous_enable()` 来启用 DMA 转换, 然后调用 `dac_continuous_write()` 来同步写入数据。示例可参考 [peripherals/dac/dac\\_continuous/dac\\_audio](#)。
2. 循环写入: 在数据载入 DMA 缓冲区后, 缓冲区中的数据将以非阻塞的方式被循环转换。但要注意, 输入的缓冲区大小受 DMA 描述符数量和 DMA 缓冲区大小的限制。该模式通常用于传输如正弦波等需要重复的短信号。为了启用循环写入, 需要在启用 DAC 连续模式后调用 `dac_continuous_write_cyclically()`。示例可参考 [peripherals/dac/dac\\_continuous/signal\\_generator](#)。
3. 异步写入。可根据事件回调异步传输数据。需要调用 `dac_event_callbacks_t::on_convert_done` 以启用异步模式。用户在回调中可得到 `dac_event_data_t`, 其中包含 DMA 缓冲区的地址和长度, 即允许用户直接将数据载入 DMA 缓冲区。启用异步写入前需要调用 `dac_continuous_register_event_callback()`、`dac_event_callbacks_t::on_convert_done` 和 `dac_continuous_start_async_writing()`。注意, 异步写入一旦开始, 回调函数将被持续触发。调用 `dac_continuous_write_asynchronously()` 可以在某个单独任务中或直接在回调函数中载入数据。示例可参考 [peripherals/dac/dac\\_continuous/dac\\_audio](#)。

在 ESP32 上, DAC 的数字控制器可以在内部连接到 I2S0, 并借用其 DMA 进行连续转换。虽然 DAC 转换仅需 8 位数据, 但它必须是左移的 8 位 (即 16 位中的高 8 位), 以满足 I2S 通信格式。默认状态下驱动程序将自动扩充数据至 16 位, 如需手动扩充, 请在 `menuconfig` 中禁用 `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN`。

DAC 的数字控制器的时钟也来自 I2S0, 有以下两种时钟源可选:

- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_PLL_D2` 支持 19.6 KHz 到若干 MHz 之间的频率。该时钟源为默认时钟源, 也可通过选择 `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_DEFAULT` 来启用该时钟源。
- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_APLL` 支持 648 Hz 到若干 MHz 之间的频率。该时钟源可能会被其他外设占用而导致频率无法更改, 此时除非 APLL 仍能准确分频得到 DAC DMA 的目标频率, 否则将无法使用该时钟源。

**余弦波输出 (余弦模式)** DAC 外设中包含一个余弦波发生器，可以在通道上产生余弦波。用户可以配置余弦波的频率、振幅和相位。启用该模式需要先调用 `dac_cosine_new_channel()` 将 DAC 转换成余弦模式，然后调用 `dac_cosine_start()` 启动余弦波发生器。

目前，余弦波发生器仅有 `RTC_FAST` 一个时钟源，可通过选择 `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_FAST` 来启用该时钟源。该时钟源为默认时钟源，与 `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_DEFAULT` 相同。

**电源管理** 启用电源管理时（即开启 `CONFIG_PM_ENABLE`），系统会在进入 `Light-sleep` 模式前调整或停止 DAC 时钟源，这可能会影响 DAC 信号，从而导致数据无法正确转换。

在连续模式下使用 DAC 驱动时，可以通过获取电源管理锁来防止系统在 DMA 或余弦波模式下改变或停止时钟源。时钟源为 APB 时，锁的类型将被设置为 `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`。时钟源为 APLL 时（仅在 DMA 模式下），锁的类型将被设置为 `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`。在进行 DAC 转换时（即 DMA 或余弦波发生器运行时），驱动程序会保证在调用 `dac_continuous_enable()` 后获取电源管理锁。同样地，在调用 `dac_continuous_disable()` 时，驱动程序会释放锁。

**IRAM 安全** 默认情况下，由于写入或擦除 flash 等原因导致 cache 被禁用时，DAC 的 DMA 中断将产生延迟，无法及时执行 DMA EOF 中断。

在实时应用中，可通过启用 Kconfig 选项 `CONFIG_DAC_ISR_IRAM_SAFE` 来避免此种情况发生，启用后：

1. 即使在 cache 被禁用的情况下，也可以启用中断服务。
2. 驱动对象会被放入 DRAM（以防其被意外链接到 PSRAM）。

此时在 cache 被禁用时仍可以运行中断，但会增加 IRAM 内存消耗。

**线程安全** 驱动程序可保证所有公共 DAC API 的线程安全，用户可以从不同的 RTOS 任务中调用这些 API，而不需要额外的锁来保护。注意，DAC 驱动使用 `mutex` 锁来保证线程安全，因此不允许在 ISR 中使用除了 `dac_one_shot_output_voltage()` 之外的 API。

### Kconfig 选项

- `CONFIG_DAC_ISR_IRAM_SAFE` 控制默认 ISR 处理程序在 cache 被禁用时能否继续运行。更多信息可参考 `IRAM 安全`。
- `CONFIG_DAC_SUPPRESS_DEPRECATED_WARN` 控制是否在使用原有 DAC 驱动时关闭警告信息。
- `CONFIG_DAC_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用该选项将增加固件的二进制文件大小。
- `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` 会在驱动中自动将 8 位数据扩展为 16 位数据，以满足 I2S DMA 格式。

uint32\_t **desc\_num**

The number of DMA descriptor, at least 2 descriptors are required The number of descriptors is directly proportional to the max data buffer size while converting in cyclic output but only need to ensure it is greater than '1' in acyclic output Typically, suggest to set the number bigger than 5, in case the DMA stopped while sending a short buffer

Each DMA buffer will be attached to a DMA descriptor, i.e. the number of DMA buffer will be equal to the DMA descriptor number The DMA buffer size is not allowed to be greater than 4092 bytes The total DMA buffer size equal to desc\_num \* buf\_size Typically, suggest to set the size to the multiple of 4

GPIO	模拟功能	RTC GPIO	注释
GPIO38	ADC1_CH2	RTC_GPIO2	GPI
GPIO39	ADC1_CH3	RTC_GPIO3	GPI

**备注:**

- Strapping 管脚: GPIO0、GPIO2、GPIO5、GPIO12 (MTDI) 和 GPIO15 (MTDO) 是 Strapping 管脚。更多信息请参考 [ESP32 技术规格书](#)。
- SPI0/1: GPIO6-11 和 GPIO16-17 通常连接到模组内集成的 SPI flash 和 PSRAM，因此不能用于其他用途。
- JTAG: GPIO12-15 通常用于在线调试。
- GPI: GPIO34-39 只能设置为输入模式，不具备软件使能的上拉或下拉功能。
- TXD & RXD 通常用于烧录和调试。
- ADC2: 使用 Wi-Fi 时不能使用 ADC2 管脚。因此，如果您在使用 Wi-Fi 时无法从 ADC2 GPIO 获取值，可以考虑使用 ADC1 GPIO 来解决该问题。更多详情请参考 [ADC 连续转换模式下的硬件限制](#) 以及 [ADC 单次转换模式下的硬件限制](#)。
- 使用 ADC 或睡眠模式下使用 Wi-Fi 和蓝牙时，请不要使用 GPIO36 和 GPIO39 的中断。有关问题的详细描述，请参考 [ESP32 ECO 和 Bug 解决方法](#) > 中的第 3.11 节。

GPIO 驱动提供了一个函数 `gpio_dump_io_configuration()` 用来输出指定管脚的实时配置状态，包括上下拉、输入输出使能、管脚映射等。输出示例如下：

```

=====IO DUMP Start=====
IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigOut ID: 256 (simple GPIO output)
  SleepSelEn: 1

IO[26] **RESERVED** -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 0 (IOMUX)
  SleepSelEn: 1

=====IO DUMP End=====

```

当 IO 管脚是通过 GPIO 交换矩阵连接到内部外设信号，输出信息打印中的外设信号 ID 定义可以在 `soc/gpio_sig_map.h` 文件中查看。`**RESERVED**` 字样则表示此 IO 被用于连接 FLASH 或 PSRAM，因此该引脚不应该被其他任何应用场景所征用并进行重新配置。

当 GPIO 连接到 RTC 低功耗和模拟子系统时，ESP32 芯片还单独支持 RTC GPIO。可在以下情况时使用这些管脚功能：

- 处于 Deep-sleep 模式时
- [超低功耗协处理器 \(ULP\)](#) 运行时

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**参数**

- **fn** -- Interrupt handler function.

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's ETS\_GPIO\_INTR\_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

参数 **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

返回

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service

- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

参数

- **gpio\_num** -- GPIO number
- **isr\_handler** -- ISR handler function for the corresponding GPIO number.
- **args** -- parameter for ISR handler.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

**参数**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**返回**

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

**参数**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the power domain of where GPIO/IOMUX belongs to becomes off. For example, chip or system is reset (e.g. watchdog time-out, deep-sleep events are triggered), or peripheral power-down in light-sleep.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**参数** *gpio\_num* -- GPIO number, only support output-capable GPIOs

**返回**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

*esp\_err\_t* **gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from peripheral power-down sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**参数** `gpio_num` -- GPIO number, only support output-capable GPIOs  
**返回**

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

void `gpio_deep_sleep_hold_en` (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

Disable all digital gpio pads hold function during Deep-sleep.

## 2.6.7 通用定时器

### 简介

通用定时器是 ESP32 定时器组外设的驱动程序。ESP32 硬件定时器分辨率高，具有灵活的报警功能。定时器内部计数器达到特定目标数值的行为被称为定时器报警。定时器报警时将调用用户注册的不同定时器回调函数。

通用定时器通常在以下场景中使用：

- 如同挂钟一般自由运行，随时随地获取高分辨率时间戳；
- 生成周期性警报，定期触发事件；
- 生成一次性警报，在目标时间内响应。

### 功能概述

下文介绍了配置和操作定时器的常规步骤：

- **资源分配** - 获取定时器句柄应设置的参数，以及如何在通用定时器完成工作时回收资源。
- **设置和获取计数值** - 如何强制定时器从起点开始计数，以及如何随时获取计数值。
- **设置警报动作** - 启动警报事件应设置的参数。
- **注册事件回调函数** - 如何将用户的特定代码挂载到警报事件回调函数。
- **使能和禁用定时器** - 如何使能和禁用定时器。
- **启动和停止定时器** - 通过不同报警行为启动定时器的典型使用场景。
- **电源管理** - 选择不同的时钟源将会如何影响功耗。
- **IRAM 安全** - 在 cache 禁用的情况下，如何更好地让定时器处理中断事务以及实现 IO 控制功能。
- **线程安全** - 驱动程序保证哪些 API 线程安全。
- **Kconfig 选项** - 支持的 Kconfig 选项，这些选项会对驱动程序行为产生不同影响。

**资源分配** 不同的 ESP 芯片可能有不同数量的独立定时器组，每组内也可能有若干个独立定时器。<sup>1</sup>

通用定时器实例由 `gptimer_handle_t` 表示。后台驱动会在资源池中管理所有可用的硬件资源，这样您便无需考虑硬件所属的定时器以及定时器组。

要安装一个定时器实例，需要提前提供配置结构体 `gptimer_config_t`：

<sup>1</sup> 不同 ESP 芯片系列的通用定时器实例数量可能不同。了解详细信息，请参考《ESP32 技术参考手册》> 章节定时器组 (TIMG) [PDF]。驱动程序不会禁止您申请更多的定时器，但是当所有可用的硬件资源用完时将会返回错误。在分配资源时，请务必检查返回值（例如 `gptimer_new_timer()`）。

- `gptimer_config_t::clk_src` 选择定时器的时钟源。 `gptimer_clock_source_t` 中列出多个可用时钟，仅可选择其中一个时钟。了解不同时钟源对功耗的影响，请查看章节[电源管理](#)。
- `gptimer_config_t::direction` 设置定时器的计数方向， `gptimer_count_direction_t` 中列出多个支持的方向，仅可选择其中一个方向。
- `gptimer_config_t::resolution_hz` 设置内部计数器的分辨率。计数器每滴答一次相当于  $1 / \text{resolution\_hz}$  秒。
- `gptimer_config::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- 选用 `gptimer_config_t::intr_shared` 设置是否将定时器中断源标记为共享源。了解共享中断的优缺点，请参考[Interrupt Handling](#)。

完成上述结构配置之后，可以将结构传递给 `gptimer_new_timer()`，用以实例化定时器实例并返回定时器句柄。

该函数可能由于内存不足、参数无效等错误而失败。具体来说，当没有更多的空闲定时器（即所有硬件资源已用完）时，将返回 `ESP_ERR_NOT_FOUND`。可用定时器总数由 `SOC_TIMER_GROUP_TOTAL_TIMERS` 表示，不同的 ESP 芯片该数值不同。

如已不再需要之前创建的通用定时器实例，应通过调用 `gptimer_del_timer()` 回收定时器，以便底层硬件定时器用于其他目的。在删除通用定时器句柄之前，请通过 `gptimer_disable()` 禁用定时器，或者通过 `gptimer_enable()` 确认定时器尚未使能。

### 创建分辨率为 1 MHz 的通用定时器句柄

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**设置和获取计数值** 创建通用定时器时，内部计数器将默认重置为零。计数值可以通过 `gptimer_set_raw_count()` 异步更新。最大计数值取决于硬件定时器的位宽，这也会在 SOC 宏 `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH` 中有所反映。当更新活动定时器的原始计数值时，定时器将立即从新值开始计数。

计数值可以随时通过 `gptimer_get_raw_count()` 获取。

**设置警报动作** 对于大多数通用定时器使用场景而言，应在启动定时器之前设置警报动作，但不包括简单的挂钟场景，该场景仅需自由运行的定时器。设置警报动作，需要根据如何使用警报事件来配置 `gptimer_alarm_config_t` 的不同参数：

- `gptimer_alarm_config_t::alarm_count` 设置触发警报事件的目标计数值。设置警报值时还需考虑计数方向。当 `gptimer_alarm_config_t::auto_reload_on_alarm` 为 `true` 时， `gptimer_alarm_config_t::alarm_count` 和 `gptimer_alarm_config_t::reload_count` 不能设置为相同的值，因为警报值和重载值相同时没有意义。请注意，由于中断延迟，不建议将警报周期设置为小于 5 微秒。
- `gptimer_alarm_config_t::reload_count` 代表警报事件发生时要重载的计数值。此配置仅在 `gptimer_alarm_config_t::auto_reload_on_alarm` 设置为 `true` 时生效。
- `gptimer_alarm_config_t::auto_reload_on_alarm` 标志设置是否使能自动重载功能。如果使能，硬件定时器将在警报事件发生时立即将 `gptimer_alarm_config_t::reload_count` 的值重载到计数器中。

要使警报配置生效，需要调用 `gptimer_set_alarm_action()`。特别是当 `gptimer_alarm_config_t` 设置为 `NULL` 时，报警功能将被禁用。

---

**备注：** 如果警报值已设置且定时器超过该值，则会立即触发警报。

---

**注册事件回调函数** 定时器启动后，可动态产生特定事件（如“警报事件”）。如需在事件发生时调用某些函数，请通过 `gptimer_register_event_callbacks()` 将函数挂载到中断服务例程 (ISR)。 `gptimer_event_callbacks_t` 中列出了所有支持的事件回调函数：

- `gptimer_event_callbacks_t::on_alarm` 设置警报事件的回调函数。由于此函数在 ISR 上下文中调用，必须确保该函数不会试图阻塞（例如，确保仅从函数内调用具有 ISR 后缀的 FreeRTOS API）。函数原型在 `gptimer_alarm_cb_t` 中有所声明。

您也可以通过参数 `user_data` 将自己的上下文保存到 `gptimer_register_event_callbacks()` 中。用户数据将直接传递给回调函数。

此功能将为定时器延迟安装中断服务，但不使能中断服务。所以，请在 `gptimer_enable()` 之前调用这一函数，否则将返回 `ESP_ERR_INVALID_STATE` 错误。了解详细信息，请查看章节 [使能和禁用定时器](#)。

**使能和禁用定时器** 在对定时器进行 IO 控制之前，需要先调用 `gptimer_enable()` 使能定时器。此函数功能如下：

- 此函数将把定时器驱动程序的状态从 `init` 切换为 `enable`。
- 如果 `gptimer_register_event_callbacks()` 已经延迟安装中断服务，此函数将使能中断服务。
- 如果选择了特定的时钟源（例如 APB 时钟），此函数将获取适当的电源管理锁。了解更多信息，请查看章节 [电源管理](#)。

调用 `gptimer_disable()` 将进行相反的操作，即将定时器驱动程序恢复到 `init` 状态，禁用中断服务并释放电源管理锁。

**启动和停止定时器** 启动和停止是定时器的基本 IO 操作。调用 `gptimer_start()` 可以使内部计数器开始工作，而 `gptimer_stop()` 可以使计数器停止工作。下文说明了如何在存在或不存在警报事件的情况下启动定时器。调用 `gptimer_start()` 将使驱动程序状态从 `enable` 转换为 `run`，反之亦然。您需要确保 `start` 和 `stop` 函数成对使用，否则，函数可能返回 `ESP_ERR_INVALID_STATE`。

// Retrieve the timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

### 触发周期性事件

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don't introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_

    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
```

(下页继续)

```

    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

### 触发一次性事件

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**警报值动态更新** 通过更改 `gptimer_alarm_event_data_t::alarm_value`, 可以在 ISR 程序回调中动态更新警报值。警报值将在回调函数返回后更新。

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

```

```

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**电源管理** 有些电源管理的策略会在某些时刻关闭时钟源，或者改变时钟源的频率，以求降低功耗。比如在启用 DFS 后，APB 时钟源会降低频率。如果浅睡眠（light sleep）模式也被开启，PLL 和 XTAL 时钟都会被默认关闭，从而导致 GPTimer 的计时不准确。

驱动程序会根据具体的时钟源选择，通过创建不同的电源锁来避免上述情况的发生。驱动会在 `gptimer_enable()` 函数中增加电源锁的引用计数，并在 `gptimer_disable()` 函数中减少电源锁的引用计数，从而保证了在 `gptimer_enable()` 和 `gptimer_disable()` 之间，GPTimer 的时钟源始终处于稳定工作的状态。

**IRAM 安全** 默认情况下，当 cache 因写入或擦除 flash 等原因而被禁用时，通用定时器的中断服务将会延迟，造成警报中断无法及时执行。在实时应用程序中通常需要避免这一情况发生。

调用 Kconfig 选项 `CONFIG_GPTIMER_ISR_IRAM_SAFE` 可实现如下功能：

- 即使禁用 cache 也可使能正在运行的中断
- 将 ISR 使用的所有函数放入 IRAM<sup>2</sup>
- 将驱动程序对象放入 DRAM（以防意外映射到 PSRAM）

这将允许中断在 cache 禁用时运行，但会增加 IRAM 使用量。

调用另一 Kconfig 选项 `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` 也可将常用的 IO 控制功能放入 IRAM，以便这些函数在 cache 禁用时也能执行。常用的 IO 控制功能如下：

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`

<sup>2</sup> `gptimer_event_callbacks_t::on_alarm` 回调函数和这一函数调用的函数也需放在 IRAM 中，请自行处理。

- `gptimer_set_alarm_action()`

**线程安全** 驱动提供的所有 API 都是线程安全的，这意味着您可以从不同的 RTOS 任务中调用这些函数，而无需额外的互斥锁去保护。以下这些函数还被允许在中断上下文中运行。

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

### Kconfig 选项

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` 控制着定时器控制函数的存放位置（IRAM 或 flash）。
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` 控制着定时器中断处理函数的存放位置（IRAM 或 flash）。
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` 控制着中断处理函数是否需要在 cache 关闭的时候被屏蔽掉。更多信息，请参阅 *IRAM 安全*。
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用这一选项将增加固件二进制文件大小。

## 2.6.8 I2C 驱动程序

### 概述

I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线 (SDA) 和串行时钟线 (SCL) 线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32 有 2 个 I2C 控制器（也称为端口），负责处理在 I2C 总线上的通信。每个控制器都可以设置为主机或从机。

### 驱动程序的功能

I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

### 使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. [配置驱动程序](#) - 设置初始化参数（如主机模式或从机模式，SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. [安装驱动程序](#) - 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机

3. 根据是为主机还是从机配置驱动程序，选择合适的项目
  - a) 主机模式下通信 - 发起通信（主机模式）
  - b) 从机模式下通信 - 响应主机消息（从机模式）
4. 中断处理 - 配置 I2C 中断服务
5. 用户自定义配置 - 调整默认的 I2C 通信参数（如时序、位序等）
6. 错误处理 - 如何识别和处理驱动程序配置和通信错误
7. 删除驱动程序 - 在通信结束时释放 I2C 驱动程序所使用的资源

**配置驱动程序** 建立 I2C 通信第一步是配置驱动程序，这需要设置 `i2c_config_t` 结构中的几个参数：

- 设置 I2C 工作模式 - 从 `i2c_mode_t` 中选择主机模式或从机模式
- 设置 通信管脚
  - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
  - 是否启用 ESP32 的内部上拉电阻
- （仅限主机模式）设置 I2C 时钟速度
- （仅限从机模式）设置以下内容：
  - 是否应启用 **10 位寻址模式**
  - 定义 **从机地址**

然后，初始化给定 I2C 端口的配置，请使用端口号和 `i2c_config_t` 作为函数调用参数来调用 `i2c_param_config()` 函数。

配置示例（主机）：

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // 配置 SDA 的 GPIO
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,          // 配置 SCL 的 GPIO
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,  // 为项目选择频率
    .clk_flags = 0,                          // 可选项，可以使用 I2C_SCLK_SRC_FLAG_* 标志来选择
    ↪ I2C 源时钟
};
```

配置示例（从机）：

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // 配置 SDA 的 GPIO
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,          // 配置 SCL 的 GPIO
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,      // 项目从机地址
    .slave.maximum_speed = I2C_SLAVE_MAX_SPEED // 预期的最大时钟速度
    .clk_flags = 0,                          // 可选项，可以使用 I2C_SCLK_SRC_
    ↪ FLAG_* 标志来选择 I2C 源时钟
};
```

在此阶段，`i2c_param_config()` 还将其他 I2C 配置参数设置为 I2C 总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考[用户自定义配置](#)。

**源时钟配置** 增加了 **时钟源分配器**，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如 `i2c_config_t::clk_flags` 中的要求）。

当 `i2c_config_t::clk_flags` 为 0 时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如 APB 之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将 `i2c_config_t::clk_flags` 设置为 0。有关时钟特性，请参见下表。

**备注：**如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位（`clk_flags`）在时钟的功能中均为 0。

表 3: ESP32 时钟源特性

时钟名称	时钟频率	SCL 的最大频率	时钟功能
APB 时钟	80 MHz	4 MHz	/

对 `i2c_config_t::clk_flags` 的解释如下：

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: 当 APB 时钟改变时，时钟的波特率不会改变。
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: 支持轻度睡眠模式，APB 时钟则不支持。
3. ESP32 可能不支持某些标志，请在使用前阅读技术参考手册。

**备注：**在主机模式下，SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。

**备注：**SCL 的时钟频率会被上拉电阻和线上电容（或是从机电容）一起影响。因此，用户需要自己选择合适的上拉电阻去保证 SCL 时钟频率是准确的。尽管 I2C 协议推荐上拉电阻值为 1 K 欧姆到 10 K 欧姆，但是需要根据不同的频率需要选择不同的上拉电阻。

通常来说，所选择的频率越高，需要的上拉电阻越小（但是不要小于 1 K 欧姆）。这是因为高电阻会减小电流，这会延长上升时间从而使频率变慢。通常我们推荐的上拉阻值范围为 2 K 欧姆到 5 K 欧姆，但是用户可能也需要根据他们的实际情况做出一些调整。

**安装驱动程序** 配置好 I2C 驱动程序后，使用以下参数调用函数 `i2c_driver_install()` 安装驱动程序：

- 端口号，从 `i2c_port_t` 中二选一
- 主机或从机模式，从 `i2c_mode_t` 中选择
- （仅限从机模式）分配用于在从机模式下发送和接收数据的缓存区大小。I2C 是一个以主机为中心的总线，数据只能根据主机的请求从从机传输到主机。因此，从机通常有一个发送缓存区，供从应用程序写入数据使用。数据保留在发送缓存区中，由主机自行读取。
- 用于分配中断的标志（请参考 `esp_hw_support/include/esp_intr_alloc.h` 中 `ESP_INTR_FLAG_*` 值）

**主机模式下通信** 安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

ESP32 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信，并发送命令让从机响应，如进行测量并将结果发给主机。

为优化通信流程，驱动程序提供一个名为“命令链接”的容器，该容器应填充一系列命令，然后传递给 I2C 控制器执行。

**主机写入数据** 下面的示例展示如何为 I2C 主机构建命令链接，从而向从机发送  $n$  个字节。

下面介绍如何为“主机写入数据”设置命令链接及其内部内容：

1. 使用 `i2c_cmd_link_create()` 创建一个命令链接。  
然后，将一系列待发送给从机的数据填充命令链接：
  - a) 启动位 - `i2c_master_start()`

图 8: I2C command link - master write example

- b) 从机地址 - `i2c_master_write_byte()`。提供单字节地址作为调用此函数的实参。
- c) 数据 - 一个或多个字节的数据作为 `i2c_master_write()` 的实参。
- d) 停止位 - `i2c_master_stop()`

函数 `i2c_master_write_byte()` 和 `i2c_master_write()` 都有额外的实参，规定主机是否应确认其有无接受到 ACK 位。

2. 通过调用 `i2c_master_cmd_begin()` 来触发 I2C 控制器执行命令链接。一旦开始执行，就不能再修改命令链接。
3. 命令发送后，通过调用 `i2c_cmd_link_delete()` 释放命令链接使用的资源。

**主机读取数据** 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取  $n$  个字节。

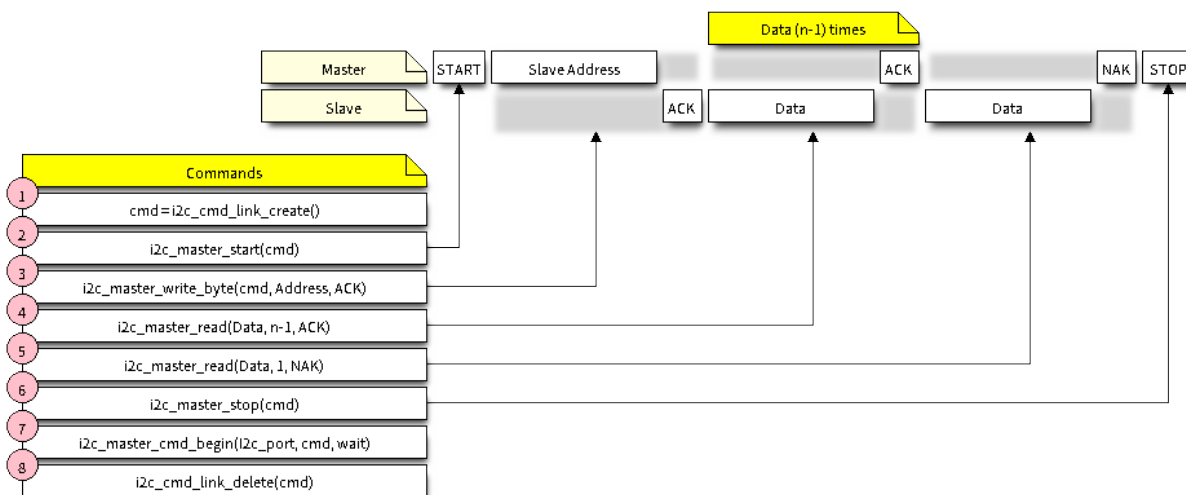

图 9: I2C command link - master read example

在读取数据时，在上图的步骤 4 中，不是用 `i2c_master_write...`，而是用 `i2c_master_read_byte()` 和/或 `i2c_master_read()` 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

**指示写入或读取数据** 发送从机地址后（请参考上图中第 3 步），主机可以写入或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址  $(ESP\_SLAVE\_ADDR \ll 1) | I2C\_MASTER\_WRITE$ ，如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

同理，指示从从机读取数据的命令链接如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**从机模式下通信** 安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

API 为从机提供以下功能：

- `i2c_slave_read_buffer()`  
当主机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数 `i2c_slave_read_buffer()`。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。
- `i2c_slave_write_buffer()`  
发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数 `i2c_slave_write_buffer()` 有一个参数，用于指定发送缓存区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。

在 `peripherals/i2c` 中可找到介绍如何使用这些功能的代码示例。

**中断处理** 安装驱动程序时，默认情况下会安装中断处理程序。

**用户自定义配置** 如本节末尾所述配置驱动程序，函数 `i2c_param_config()` 在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 I2C 总线协议规范规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。

表 4: 其他可配置的 I2C 通信参数

要更改的参数	函数
SCL 脉冲周期的高电平和低电平	<code>i2c_set_period()</code>
在产生 启动信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_start_timing()</code>
在产生 停止信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_stop_timing()</code>
从机采样以及主机切换时，SCL 和 SDA 信号之间的时序关系	<code>i2c_set_data_timing()</code>
I2C 超时	<code>i2c_set_timeout()</code>
优先发送/接收最高有效位 (LSB) 或最低有效位 (MSB) ，可在 <code>i2c_trans_mode_t</code> 定义的模式中选择	<code>i2c_set_data_mode()</code>

上述每个函数都有一个 `_get_` 对应项来检查当前设置的值。例如，调用 `i2c_get_timeout()` 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值，请参考文件 `driver/i2c/i2c.c` 并查找带有后缀 `_DEFAULT` 的定义。

通过函数 `i2c_set_pin()` 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值，请使用函数 `i2c_param_config()`。

**备注：**ESP32 的内部上拉电阻范围为几万欧姆，因此在大多数情况下，它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 I2C 总线协议规范规定范围内的上拉电阻。计算阻值的具体方法，可参考 [TI 应用说明](#)

**错误处理** 大多数 I2C 驱动程序的函数在成功完成时会返回 `ESP_OK`，或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息，其中包含错误说明，例如检查输入配置的正确性。有关详细信息，请参考文件 `driver/i2c/i2c.c` 并用后缀 `_ERR_STR` 查找定义。

使用专用中断来捕获通信故障。例如，如果从机将数据发送回主机耗费太长时间，会触发 `I2C_TIME_OUT_INT` 中断。详细信息请参考 [中断处理](#)。

如果出现通信失败，可以分别为发送和接收缓存区调用 `i2c_reset_tx_fifo()` 和 `i2c_reset_rx_fifo()` 来重置内部硬件缓存区。

**删除驱动程序** 当使用 `i2c_driver_install()` 建立 I2C 通信，一段时间后不再需要 I2C 通信时，可以通过调用 `i2c_driver_delete()` 来移除驱动程序以释放分配的资源。

由于函数 `i2c_driver_delete()` 无法保证线程安全性，请在调用该函数移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create\_static** (uint8\_t \*buffer, uint32\_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

**备注:** It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may

increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

#### 参数

- **buffer** -- Buffer to use for commands allocations
- **size** -- Size in bytes of the buffer

**返回** Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create**(void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

**返回** Handle to the I2C command link or NULL in case of insufficient dynamic memory.

It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

## 2.6.9 I2S

### 简介

I2S (Inter-IC Sound, 集成电路内置音频总线) 是一种同步串行通信协议, 通常用于在两个数字音频设备之间传输音频数据。

ESP32 包含 2 个 I2S 外设。通过配置这些外设, 可以借助 I2S 驱动来输入和输出采样数据。

标准或 TDM 通信模式下的 I2S 总线包含以下几条线路:

- **MCLK**: 主时钟线。该信号线可选, 具体取决于从机, 主要用于向 I2S 从机提供参考时钟。
- **BCLK**: 位时钟线。用于数据线的位时钟。
- **WS**: 字 (声道) 选择线。通常用于识别声道 (除 PDM 模式外)。
- **DIN/DOUT**: 串行数据输入/输出线。如果 DIN 和 DOUT 被配置到相同的 GPIO, 数据将在内部回环。

PDM 通信模式下的 I2S 总线包含以下几条线路:

- **CLK**: PDM 时钟线。
- **DIN/DOUT**: 串行数据输入/输出线。

每个 I2S 控制器都具备以下功能, 可由 I2S 驱动进行配置:

- 可用作系统主机或从机
- 可用作发射器或接收器
- DMA 控制器支持流数据采样, CPU 无需单独复制每个采样数据

每个控制器都支持 RX 或 TX 单工通信。由于 RX 与 TX 通道共用一个时钟, 因此只有在两者拥有相同配置时, 才可以实现全双工通信。

### I2S 文件结构

图 10: I2S 文件结构

需要包含在 I2S 应用中的公共头文件如下所示:

- `i2s.h`: 提供原有 I2S API (用于使用原有驱动的应用)。
- `i2s_std.h`: 提供标准通信模式的 API (用于使用标准模式的新驱动程序的应用)。
- `i2s_pdm.h`: 提供 PDM 通信模式的 API (用于使用 PDM 模式的新驱动程序的应用)。
- `i2s_tdm.h`: 提供 TDM 通信模式的 API (用于使用 TDM 模式的新驱动的应用)。

**备注:** 原有驱动与新驱动无法共存。包含 `i2s.h` 以使用原有驱动, 或包含其他三个头文件以使用新驱动。原有驱动未来可能会被删除。

已包含在上述头文件中的公共头文件如下所示:

- `i2s_types_legacy.h`: 提供只在原有驱动中使用的原有公共类型。
- `i2s_types.h`: 提供公共类型。
- `i2s_common.h`: 提供所有通信模式通用的 API。

## I2S 时钟

### 时钟源

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: 默认 PLL 时钟。
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL 时钟。
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: 音频 PLL 时钟, 在高采样率应用中比 `I2S_CLK_SRC_PLL_160M` 更精确。其频率可根据采样率进行配置, 但如果 APLL 已经被 EMAC 或其他通道占用, 则无法更改 APLL 频率, 驱动程序将尝试在原有 APLL 频率下工作。如果原有 APLL 频率无法满足 I2S 的需求, 时钟配置将失败。

### 时钟术语

- **采样率**: 单声道每秒采样数据数量。
- **SCLK**: 源时钟频率, 即时钟源的频率。
- **MCLK**: 主时钟频率, BCLK 由其产生。MCLK 信号通常作为参考时钟, 用于同步 I2S 主机和从机之间的 BCLK 和 WS。
- **BCLK**: 位时钟频率, 一个 BCLK 时钟周期代表数据管脚上的一个数据位。通过 `i2s_std_slot_config_t::slot_bit_width` 配置的通道位宽即为一个声道中的 BCLK 时钟周期数量, 因此一个声道中可以有 8/16/24/32 个 BCLK 时钟周期。
- **LRCK / WS**: 左/右时钟或字选择时钟。在非 PDM 模式下, 其频率等于采样率。

**备注:** 通常, MCLK 应该同时是采样率和 BCLK 的倍数。字段 `i2s_std_clk_config_t::mclk_multiple` 表示 MCLK 相对于采样率的倍数。在大多数情况下, 将其设置为 `I2S_MCLK_MULTIPLE_256` 即可。但如果 `slot_bit_width` 被设置为 `I2S_SLOT_BIT_WIDTH_24BIT`, 为了保证 MCLK 是 BCLK 的整数倍, 应该将 `i2s_std_clk_config_t::mclk_multiple` 设置为能被 3 整除的倍数, 如 `I2S_MCLK_MULTIPLE_384`, 否则 WS 会不精准。

## I2S 通信模式

### 模式概览

芯片	I2S 标准	PDM TX	PDM RX	TDM	ADC/DAC	LCD/摄像头
ESP32	I2S 0/1	I2S 0	I2S 0	无	I2S 0	I2S 0
ESP32-S2	I2S 0	无	无	无	无	I2S 0
ESP32-C3	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-C6	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	无	无
ESP32-H2	I2S 0	I2S 0	无	I2S 0	无	无

**标准模式** 标准模式中有且仅有左右两个声道，驱动中将声道称为 slot。这些声道可以支持 8/16/24/32 位宽的采样数据，声道的通信格式主要包括以下几种：

- **Philips 格式**：数据信号与 WS 信号相比有一个位的位移。WS 信号的占空比为 50%。

- **MSB 格式**：与 Philips 格式基本相同，但其数据没有位移。

- **PCM 帧同步**：数据有一个位的位移，同时 WS 信号变成脉冲，持续一个 BCLK 周期。

**PDM 模式 (TX)** 在 PDM (Pulse-density Modulation, 脉冲密度调制) 模式下，TX 通道可以将 PCM 数据转换为 PDM 格式，该格式始终有左右两个声道。PDM TX 只在 I2S0 中受支持，且只支持 16 位宽的采样数据。PDM TX 至少需要一个 CLK 管脚用于时钟信号，一个 DOUT 管脚用于数据信号（即下图中的 WS 和 SD 信号。BCK 信号为内部采样时钟，在 PDM 设备之间不需要）。PDM 模式允许用户配置上采样参数 `i2s_pdm_tx_clk_config_t::up_sample_fp` 和 `i2s_pdm_tx_clk_config_t::up_sample_fs`，上采样率可以通过公式 
$$\text{up\_sample\_rate} = \frac{\text{i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fp}}{\text{i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fs}}$$
 来计算。在 PDM TX 中有以下两种上采样模式：

- **固定时钟频率模式**：在这种模式下，上采样率将根据采样率的变化而变化。设置 `fp = 960`、`fs = sample_rate / 100`，则 CLK 管脚上的时钟频率 ( $F_{\text{pdm}}$ ) 将固定为  $128 * 48 \text{ KHz} = 6.144$

MHz。注意此频率不等于采样率 (Fpcm)。

- **固定上采样率模式**：在这种模式下，上采样率固定为 2。设置  $f_p = 960$ 、 $f_s = 480$ ，则 CLK 管脚上的时钟频率 (Fpdm) 将为  $128 * \text{sample\_rate}$ 。

**PDM 模式 (RX)** 在 PDM (Pulse-density Modulation, 脉冲密度调制) 模式下，RX 通道可以接收 PDM 格式的数据并将数据转换成 PCM 格式。PDM RX 只在 I2S0 中受支持，且只支持 16 位宽的采样数据。PDM RX 至少需要一个 CLK 管脚用于时钟信号，一个 DIN 管脚用于数据信号。此模式允许用户配置下采样参数 `i2s_pdm_rx_clk_config_t::dn_sample_mode`。在 PDM RX 中有以下两种下采样模式：

- `i2s_pdm_dsr_t::I2S_PDM_DSR_8S`：在这种模式下，WS 管脚的时钟频率 (Fpdm) 将为  $\text{sample\_rate} (F_{\text{pcm}}) * 64$ 。
- `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`：在这种模式下，WS 管脚的时钟频率 (Fpdm) 将为  $\text{sample\_rate} (F_{\text{pcm}}) * 128$ 。

**LCD/摄像头模式** LCD/摄像头模式只支持在 I2S0 上通过并行总线运行。在 LCD 模式下，I2S0 应当设置为主机 TX 模式；在摄像头模式下，I2S0 应当设置为从机 RX 模式。这两种模式不是由 I2S 驱动实现的，关于 LCD 模式的实现，请参阅 [LCD](#)。更多信息请参考 [ESP32 技术参考手册 > I2S 控制器 \(I2S\) > LCD 模式 \[PDF\]](#)。

**ADC/DAC 模式** 仅 ESP32 支持在 I2S0 上运行 ADC 和 DAC 模式。实际上，ADC 和 DAC 模式是 LCD/摄像头模式的两个子模式。I2S0 可以直接连接到内部模数转换器 (ADC) 和数模转换器 (DAC)，也即 ADC 和 DAC 外设可以通过 I2S0 的 DMA 连续读取或写入数据。由于 ADC 和 DAC 并非通信模式，因此并没有在 I2S 驱动中实现。

## 功能概览

I2S 驱动提供以下服务：

**资源管理** I2S 驱动中的资源可分为三个级别：

- 平台级资源：当前芯片中所有 I2S 控制器的资源。
- 控制器级资源：一个 I2S 控制器的资源。
- 通道级资源：一个 I2S 控制器 TX 或 RX 通道的资源。

公开的 API 都是通道级别的 API，通道句柄 `i2s_chan_handle_t` 可以帮助用户管理特定通道下的资源，而无需考虑其他两个级别的资源。高级别资源为私有资源，由驱动自动管理。用户可以调用 `i2s_new_channel()` 来分配通道句柄，或调用 `i2s_del_channel()` 来删除该句柄。

**电源管理** 电源管理启用（即开启 `CONFIG_PM_ENABLE`）时，系统将在进入 Light-sleep 前调整或停止 I2S 时钟源，这可能会影响 I2S 信号，从而导致传输或接收的数据无效。

I2S 驱动可以获取电源管理锁，从而防止系统设置更改或时钟源被禁用。时钟源为 APB 时，锁的类型将被设置为 `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`。时钟源为 APLL（若支持）时，锁的类型将被设置为 `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`。用户通过 I2S 读写时（即调用 `i2s_channel_read()` 或 `i2s_channel_write()`），驱动程序将获取电源管理锁，并在读写完成后释放锁。

**有限状态机** I2S 通道有三种状态，分别为 registered（已注册）、ready（准备就绪）和 running（运行中），它们的关系如下图所示：

图 11: I2S 有限状态机

图中的 <mode> 可用相应的 I2S 通信模式来代替，如 std 代表标准的双声道模式。更多关于通信模式的信息，请参考 [I2S 通信模式](#) 小节。

**数据传输** I2S 的数据传输（包括数据发送和接收）由 DMA 实现。在传输数据之前，请调用 `i2s_channel_enable()` 来启用特定的通道。发送或接收的数据达到 DMA 缓冲区的大小时，将触发 I2S\_OUT\_EOF 或 I2S\_IN\_SUC\_EOF 中断。注意，DMA 缓冲区的大小不等于 `i2s_chan_config_t::dma_frame_num`，这里的一帧是指一个 WS 周期内的所有采样数据。因此，`dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`。传输数据时，可以调用 `i2s_channel_write()` 来输入数据，并把数据从源缓冲区复制到 DMA TX 缓冲区等待传输完成。此过程将重复进行，直到发送的字节数达到配置的大小。接收数据时，用户可以调用函数 `i2s_channel_read()` 来等待接收包含 DMA 缓冲区地址的消息队列，从而将数据从 DMA RX 缓冲区复制到目标缓冲区。

`i2s_channel_write()` 和 `i2s_channel_read()` 都是阻塞函数，在源缓冲区的数据发送完毕前，或是整个目标缓冲区都被加载数据占用时，它们会一直保持等待状态。在等待时间达到最大阻塞时间时，返回 `ESP_ERR_TIMEOUT` 错误。要实现异步发送或接收数据，可以通过 `i2s_channel_register_event_callback()` 注册回调，随即便可在回调函数中直接访问 DMA 缓冲区，无需通过这两个阻塞函数来发送或接收数据。但请注意，该回调是一个中断回调，不要在该回调中添加复杂的逻辑、进行浮点运算或调用不可重入函数。

**配置** 用户可以通过调用相应函数（即 `i2s_channel_init_std_mode()`、`i2s_channel_init_pdm_rx_mode()`、`i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()`）将通道初始化为特定模式。如果初始化后需要更新配置，

必须先调用 `i2s_channel_disable()` 以确保通道已经停止运行，然后再调用相应的'reconfig'函数，例如 `i2s_channel_reconfig_std_slot()`、`i2s_channel_reconfig_std_clock()` 和 `i2s_channel_reconfig_std_gpio()`。

**IRAM 安全** 默认情况下，由于写入或擦除 flash 等原因导致 cache 被禁用时，I2S 中断将产生延迟，无法及时执行 EOF 中断。

在实时应用中，可通过启用 Kconfig 选项 `CONFIG_I2S_ISR_IRAM_SAFE` 来避免此种情况发生，启用后：

1. 即使在 cache 被禁用的情况下，中断仍可继续运行。
2. 驱动程序将存放在 DRAM 中（以防其意外映射到 PSRAM 中）。

启用该选项可以保证 cache 禁用时的中断运行，但会相应增加 IRAM 占用。

**线程安全** 驱动程序可保证所有公开的 I2S API 的线程安全，使用时，可以直接从不同的 RTOS 任务中调用此类 API，无需额外锁保护。注意，I2S 驱动使用 mutex 锁来保证线程安全，因此不允许在 ISR 中使用这些 API。

### Kconfig 选项

- `CONFIG_I2S_ISR_IRAM_SAFE` 控制默认 ISR 处理程序能否在禁用 cache 的情况下工作。更多信息可参考 **IRAM 安全**。
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` 控制是否在使用原有 I2S 驱动时关闭警告信息。
- `CONFIG_I2S_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用该选项将增加固件的二进制文件大小。

### 应用实例

I2S 驱动例程请参考 [peripherals/i2s](#) 目录。以下为每种模式的简单用法：

**标准 TX/RX 模式的应用** 不同声道的通信格式可通过以下标准模式的辅助宏来生成。如上所述，在标准模式下有三种格式，辅助宏分别为：

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

时钟配置的辅助宏为：

- `I2S_STD_CLK_DEFAULT_CONFIG`。

请参考 **标准模式** 了解 STD API 的相关信息。更多细节请参考 [driver/i2s/include/driver/i2s\\_std.h](#)。

**STD TX 模式** 以 16 位数据位宽为例，如果 `uint16_t` 写缓冲区中的数据如下所示：

数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

下表展示了在不同 `i2s_std_slot_config_t::slot_mode` 和 `i2s_std_slot_config_t::slot_mask` 设置下线路上的真实数据。

数据位宽	声道模式	声道掩码	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平
16 位	单声道	左	0x0002	0x0000	0x0001	0x0000	0x0004	0x0000	0x0003	0x0000
		右	0x0000	0x0002	0x0000	0x0001	0x0000	0x0004	0x0000	0x0003
		左右	0x0002	0x0002	0x0001	0x0001	0x0004	0x0004	0x0003	0x0003
	立体声	左	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007
		右	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		左右	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**备注：**当数据位宽为 32 位时，情况与上表类似，但当位宽为 8 位和 24 位时需要额外注意。数据位宽为 8 位时，写入的缓冲区仍应使用 `uint16_t`（即以 2 字节对齐），并且只有高 8 位有效，低 8 位将被丢弃；数据位宽为 24 位时，缓冲区应该使用 `uint32_t`（即以 4 字节对齐），并且只有高 24 位有效，低 8 位将被丢弃。

另外，在 8 位宽和 16 位宽单声道模式下，线路上的真实数据顺序会被调换。为了获取正确的数据顺序，写入缓冲区时，每两个字节需要调换一次数据顺序。

/* 删除通道之前必须先禁用通道 */
i2s_channel_disable(tx_handle);
/* 如果不再需要句柄，删除该句柄以释放通道资源 */
i2s_del_channel(tx_handle);

```

**STD RX 模式** 例如，当数据位宽为 16 时，如线路上的数据如下所示：

WS 低电 平	WS 高电 平	WS 低电 平	WS 高电 平	WS 低电 平	WS 高电 平	WS 低电 平	WS 高电 平	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

不同 `i2s_std_slot_config_t::slot_mode` 和 `i2s_std_slot_config_t::slot_mask` 配置下缓冲区中收到的数据如下所示。

数据位 宽	声道模 式	声道掩 码	数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7
16 位	单声道	左	0x0001	0x0000	0x0005	0x0003	0x0009	0x0007	0x000d	0x000b
		右	0x0002	0x0000	0x0006	0x0004	0x000a	0x0008	0x000e	0x000c
	立体声	任意	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**备注：**ESP32 上的接收有些复杂。首先，当数据位宽为 8 位或 24 位时，接收的数据仍将以 2 个字节或 4 个字节对齐，这意味着有效数据被放在每两个字节的高 8 位和每四个字节的的高 24 位。例如，当线路上的数据是 8 位宽度的 0x5A 时，接收的数据将是 0x5A00；当数据是 0x00 005A 时，则收到 0x0000 5A00。其次，在 8 位宽和 16 位宽单声道传输中，缓冲区内每两个数据会进行一次数据翻转，因此可能需要手动将顺序回转，以获取正确的数据顺序。

**全双工** 全双工模式可以在 I2S 端口中同时注册 TX 和 RX 通道，同时通道共享 BCLK 和 WS 信号。目前，STD 和 TDM 通信模式支持以下方式的全双工通信，但不支持 PDM 全双工模式，因为 PDM 模式下 TX 和 RX 通道的时钟不同。

请注意，一个句柄只能代表一个通道，因此仍然需要对 TX 和 RX 通道逐个进行声道和时钟配置。

以下示例展示了如何分配两个全双工通道：

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* 分配两个 I2S 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* 同时分配给 TX 和 RX 通道，使其进入全双工模式。 */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* 配置两个通道，因为在全双工模式下，TX 和 RX 通道必须相同。 */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
},
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

```

**单工模式** 在单工模式下分配通道句柄，应该为每个通道调用 `i2s_new_channel()`。在 ESP32 上，TX/RX 通道的时钟和 GPIO 管脚不是相互独立的，因此在单工模式下，TX 和 RX 通道不能共存于同一个 I2S 端口中。

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

```

```

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* 初始化通道 */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* 如果没有找到其他可用的 I2S 设备, RX 通道将被注册在另一个 I2S 上
 * 并返回 ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

## 应用注意事项

**防止数据丢失** 对于需要高频采样率的应用, 数据的巨大吞吐量可能会导致数据丢失。用户可以通过注册 ISR 回调函数来接收事件队列中的数据丢失事件:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t
↳handle, i2s_event_data_t *event, void *user_ctx)
{
    // 处理 RX 队列溢出事件 ...
}

```

(下页继续)

(续上页)

```

    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

请按照以下步骤操作，以防止数据丢失：

1. 确定中断间隔。通常来说，当发生数据丢失时，为减少中断次数，中断间隔应该越久越好。因此，在保证 DMA 缓冲区大小不超过最大值 4092 的前提下，应使 `dma_frame_num` 尽可能大。具体转换关系如下：

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

2. 确定 `dma_desc_num` 的值。`dma_desc_num` 由 `i2s_channel_read` 轮询周期的最大时间决定，所有接收到的数据都应该存储在两个 `i2s_channel_read` 之间。这个周期可以通过计时器或输出 GPIO 信号来计算。具体转换关系如下：

```

dma_desc_num > polling_cycle / interrupt_interval

```

3. 确定接收缓冲区大小。在 `i2s_channel_read` 中提供的接收缓冲区应当能够容纳所有 DMA 缓冲区中的数据，这意味着它应该大于所有 DMA 缓冲区的总大小：

```

recv_buffer_size > dma_desc_num * dma_buffer_size

```

例如，如果某个 I2S 应用的已知值包括：

```

sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms

```

那么可以按照以下公式计算出参数 `dma_frame_num`、`dma_desc_num` 和 `recv_buf_size`：

```

dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↪ 549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↪ = 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

```

**I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG** (rate)

### 参数

- **rate** -- sample rate

**I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM style in 2 slots(TX)

### 参数

- **bits\_per\_sample** -- i2s data bit width, only support 16 bits for PDM mode

**I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG** (rate)

i2s default pdm tx clock configuration

---

**备注:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample\_rate\_hz / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate\_hz If the pdm receiver do not care the pdm serial clock, it's recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be adopted.

### Functions

*esp\_err\_t* **i2s\_new\_channel** (const *i2s\_chan\_config\_t* \*chan\_cfg, *i2s\_chan\_handle\_t* \*ret\_tx\_handle, *i2s\_chan\_handle\_t* \*ret\_rx\_handle)

Allocate new I2S channel(s)

---

**备注:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

---

---

**备注:** When the port id in channel configuration is I2S\_NUM\_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

---

---

**备注:** If both `tx_handle` and `rx_handle` are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

---

**备注:** If `tx_handle` OR `rx_handle` is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

---

#### 参数

- **chan\_cfg** -- [in] I2S controller channel configurations
- **ret\_tx\_handle** -- [out] I2S channel handler used for managing the sending channel(optional)
- **ret\_rx\_handle** -- [out] I2S channel handler used for managing the receiving channel(optional)

*esp\_err\_t* **i2s\_channel\_enable** (*i2s\_chan\_handle\_t* handle)

Enable the i2s channel.

---

**备注:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not

started) the channel will enter RUNNING state once it is enabled successfully.

---

**备注:** Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

---

**参数 handle** -- [in] I2S channel handler

- ESP\_OK Start successfully

---

**备注:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

---

**备注:** Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

---

**参数 handle** -- [in] I2S channel handler

**返回**

- ESP\_OK Stop successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_preload\_data** (*i2s\_chan\_handle\_t* tx\_handle, const void \*src, size\_t size, size\_t \*bytes\_loaded)

Preload the data into TX DMA buffer.

---

**备注:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

---

**备注:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

---

**备注:** This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

---

**备注:** Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

**备注:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

---

---

**备注:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

---

---

**备注:** When `CONFIG_I2S_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

## 2.6.10 LCD

### Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

### Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller's internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the [Espressif Component Registry](#).
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *I80 Interfaced LCD* describes the steps to install the I80 LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

### SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
```

(下页继续)

(续上页)

```

    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
↳transfer 80 lines of pixels (assume pixel is RGB565) at most in one
↳SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
↳AUTO)); // Enable the DMA feature

```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver will use this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver will use this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e. this LCD), you can set the gpio number to -1 to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver will use this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,

// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_

```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```

esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {

## I2C Interfaced LCD

1. Create I2C bus. Please refer to [I2C API doc](#) for more details.

```

i2c_config_t i2c_conf = {
.mode = I2C_MODE_MASTER, // I2C LCD is a master node
.sda_io_num = EXAMPLE_PIN_NUM_SDA,
.scl_io_num = EXAMPLE_PIN_NUM_SCL,
.sda_pullup_en = GPIO_PULLUP_ENABLE,
.scl_pullup_en = GPIO_PULLUP_ENABLE,
.master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0,
↪0));

```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver will use this address to communicate with the LCD controller chip.
- `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
.dev_addr = EXAMPLE_I2C_HW_ADDR,
.control_phase_bytes = 1, // refer to LCD spec
.dc_bit_offset = 6, // refer to LCD spec
.lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
.lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t) I2C_
↪HOST, &io_config, &io_handle));

```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```

esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
.bits_per_pixel = 1,
.reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};

## I80 Interfaced LCD

1. Create I80 bus by `esp_lcd_new_i80_bus()`. You need to set up the following parameters for an Intel 8080 parallel bus:

- `esp_lcd_i80_bus_config_t::clk_src` sets the clock source of the I80 bus. Note, the default clock source may be different between ESP targets.
- `esp_lcd_i80_bus_config_t::wr_gpio_num` sets the GPIO number of the pixel clock (also referred as WR in some LCD spec)
- `esp_lcd_i80_bus_config_t::dc_gpio_num` sets the GPIO number of the data/command select pin (also referred as RS in some LCD spec)
- `esp_lcd_i80_bus_config_t::bus_width` sets the bit width of the data bus (only support 8 or 16)
- `esp_lcd_i80_bus_config_t::data_gpio_nums` is the array of the GPIO number of the data bus. The number of GPIOs should be equal to the `esp_lcd_i80_bus_config_t::bus_width` value.
- `esp_lcd_i80_bus_config_t::max_transfer_bytes` sets the maximum number of bytes that can be transferred in one transaction.

```

esp_lcd_i80_bus_handle_t i80_bus = NULL;
esp_lcd_i80_bus_config_t bus_config = {
    .clk_src = LCD_CLK_SRC_DEFAULT,
    .dc_gpio_num = EXAMPLE_PIN_NUM_DC,
    .wr_gpio_num = EXAMPLE_PIN_NUM_PCLK,
    .data_gpio_nums = {
        EXAMPLE_PIN_NUM_DATA0,
        EXAMPLE_PIN_NUM_DATA1,
        EXAMPLE_PIN_NUM_DATA2,
        EXAMPLE_PIN_NUM_DATA3,
        EXAMPLE_PIN_NUM_DATA4,
        EXAMPLE_PIN_NUM_DATA5,
        EXAMPLE_PIN_NUM_DATA6,
        EXAMPLE_PIN_NUM_DATA7,
    },
    .bus_width = 8,
    .max_transfer_bytes = EXAMPLE_LCD_H_RES * 100 * sizeof(uint16_t), /
↪ / transfer 100 lines of pixels (assume pixel is RGB565) at most in
↪ one transaction
    .psram_trans_align = EXAMPLE_PSRAM_DATA_ALIGNMENT,
    .sram_trans_align = 4,
};
ESP_ERROR_CHECK(esp_lcd_new_i80_bus(&bus_config, &i80_bus));

```

2. Allocate an LCD IO device handle from the I80 bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i80_config_t::cs_gpio_num` sets the GPIO number of the chip select pin.
- `esp_lcd_panel_io_i80_config_t::pclk_hz` sets the pixel clock frequency in Hz. Higher pixel clock frequency will result in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.
- `esp_lcd_panel_io_i80_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i80_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_i80_config_t::trans_queue_depth` sets the maximum number of transactions that can be queued in the LCD IO device. A bigger value means more transactions can be queued up, but it also consumes more memory.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i80_config_t io_config = {
    .cs_gpio_num = EXAMPLE_PIN_NUM_CS,

```

(下页继续)

(续上页)

```

.pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
.trans_queue_depth = 10,
.dc_levels = {
    .dc_idle_level = 0,
    .dc_cmd_level = 0,
    .dc_dummy_level = 0,
    .dc_data_level = 1,
},
.lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
.lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i80(i80_bus, &io_config, &io_
↪handle));

```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I80 IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to `-1`.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the color order the pixel color data.

```

esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_RGB,
    .bits_per_pixel = 16,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));

### Functions

**esp\_err\_t esp\_lcd\_panel\_io\_rx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**备注:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by

`esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

#### 参数

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [out] Buffer for the command data
- **param\_size** -- [in] Size of `param` buffer

#### 返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)`

If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

#### 参数

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command

## 2.6.11 LED PWM 控制器

### 概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 8 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LEDC 通道共有两组，分别为 8 路高速通道和 8 路低速通道。高速通道模式在硬件中实现，可以自动且无干扰地改变 PWM 占空比。低速通道模式下，PWM 占空比需要由软件中的驱动器改变。每组通道都可以使用不同的时钟源。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

## 功能概览

设置 LEDC 通道在**高速模式**或**低速模式**下运行，需要进行如下配置：

1. **定时器配置** 指定 PWM 信号的频率和占空比分辨率。
2. **通道配置** 绑定定时器和输出 PWM 信号的 GPIO。
3. **改变 PWM 信号** 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

另一个可选步骤是在渐变终端设置一个中断。

图 12: LED PWM 控制器 API 的关键配置

**备注：**首次 LEDC 配置时，建议先配置定时器（调用函数 `ledc_timer_config()`），再配置通道（调用函数 `ledc_channel_config()`）。这样可以确保 IO 脚上的 PWM 信号自有输出开始其频率就是正确的。

**定时器配置** 要设置定时器，可调用函数 `ledc_timer_config()`，并将包括如下配置参数的数据结构 `ledc_timer_config_t` 传递给该函数：

- 速度模式 `ledc_mode_t`
- 定时器索引 `ledc_timer_t`
- PWM 信号频率
- PWM 占空比分辨率
- 时钟源 `ledc_clk_cfg_t`

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见 [频率和占空比分辨率支持范围](#) 一节。

时钟源同样可以限制 PWM 频率。选择的时钟源频率越高，可以配置的 PWM 频率上限就越高。

表 5: ESP32 LEDC 时钟源特性

时钟名称	时钟频率	速度模式	时钟功能
APB_CLK	80 MHz	高速 / 低速	/
REF_TICK	1 MHz	高速 / 低速	支持动态调频 (DFS) 功能
RC_FAST_CLK	8 MHz	低速	支持动态调频 (DFS) 功能, 支持 Light-sleep 模式

**备注:**

1. 如果 ESP32 的定时器选用了 RC\_FAST\_CLK 作为其时钟源, 驱动会通过内部校准来得知这个时钟源的实际频率。这样确保了输出 PWM 信号频率的精准性。

**通道配置** 定时器设置好后, 请配置所需的通道 (`ledc_channel_t` 之一)。配置通道需调用函数 `ledc_channel_config()`。

通道的配置与定时器设置类似, 需向通道配置函数传递包括通道配置参数的结构体 `ledc_channel_config_t`。

此时, 通道会按照 `ledc_channel_config_t` 的配置开始运作, 并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中, 可以随时通过调用函数 `ledc_stop()` 将其暂停。

**改变 PWM 信号** 通道开始运行、生成具有恒定占空比和频率的 PWM 信号之后, 有几种方式可以改变该信号。驱动 LED 时, 主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要, PWM 信号的频率也可更改, 详见 [改变 PWM 频率](#) 一节。

**使用软件改变 PWM 占空比** 调用函数 `ledc_set_duty()` 可以设置新的占空比。之后, 调用函数 `ledc_update_duty()` 使新配置生效。要查看当前设置的占空比, 可使用 `_get_` 函数 `ledc_get_duty()`。

另外一种设置占空比和其他通道参数的方式是调用 [通道配置](#) 一节提到的函数 `ledc_channel_config()`。

传递给函数的占空比数值范围取决于选定的 `duty_resolution`, 应为 0 至  $(2 ** \text{duty\_resolution})$ 。例如, 如选定的占空比分辨率为 10, 则占空比的数值范围为 0 至 1024。此时分辨率为 ~0.1%。

**警告:** 在 ESP32 上, 当通道绑定的定时器配置了其最大 PWM 占空比分辨率 (`MAX_DUTY_RES`), 通道的占空比不能被设置到  $(2 ** \text{MAX\_DUTY\_RES})$ 。否则, 硬件内部占空比计数器会溢出, 并导致占空比计算错误。

**使用硬件改变 PWM 占空比** LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能, 需用函数 `ledc_fade_func_install()` 使能渐变, 之后用下列可用渐变函数之一配置:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

最后需要调用 `ledc_fade_start()` 开启渐变。渐变可以在阻塞或非阻塞模式下运行, 具体区别请查看 `ledc_fade_mode_t`。需要特别注意的是, 不管在何种模式下, 下一次渐变或单次占空比配置的指令生效都必须等到前一次渐变结束。由于 ESP32 的硬件限制, 在渐变达到原先预期的占空比前想要中止本次渐变是不被支持的。

此外，在使能渐变后，每个通道都可以额外通过调用 `ledc_cb_register()` 注册一个回调函数用以获得渐变完成的事件通知。回调函数的原型被定义在 `ledc_cb_t`。每个回调函数都应当返回一个布尔值给驱动的中断处理函数，用以表示是否有高优先级任务被其唤醒。此外，值得注意的是，由于驱动的中断处理函数被放在了 IRAM 中，回调函数和其调用的函数也需要被放在 IRAM 中。`ledc_cb_register()` 会检查回调函数及函数上下文的指针地址是否在正确的存储区域。

如不需要渐变和渐变中断，可用函数 `ledc_fade_func_uninstall()` 关闭。

**改变 PWM 频率** LED PWM 控制器 API 有多种方式即时改变 PWM 频率：

- 通过调用函数 `ledc_set_freq()` 设置频率。可用函数 `ledc_get_freq()` 查看当前频率。
- 通过调用函数 `ledc_bind_channel_timer()` 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数 `ledc_channel_config()` 改变通道的定时器。

**控制 PWM 的更多方式** 有一些较独立的定时器特定函数可用于更改 PWM 输出：

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数 `ledc_timer_config()` 在后台运行，在定时器配置后启动。

**使用中断** 配置 LED PWM 控制器通道时，可在 `ledc_channel_config_t` 中选取参数 `ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数 `ledc_isr_register()`。

### LED PWM 控制器高速和低速模式

高速模式的优点是可平稳地改变定时器设置。也就是说，高速模式下如定时器设置改变，此变更会自动应用于定时器的下一次溢出中断。而更新低速定时器时，设置变更应由软件显式触发。LED PWM 驱动的设置将在硬件层面被修改，比如在调用函数 `ledc_timer_config()` 或 `ledc_timer_set()` 时。

更多关于速度模式的详细信息请参阅 [ESP32 技术参考手册 > LED PWM 控制器 \(LEDC\) \[PDF\]](#)。

### 频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比可为 0 至 100% 之间的任意值，分辨率为 ~0.012% ( $2^{13} = 8192$  LED 亮度的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器计时的时钟信号，LED PWM 控制器为通道提供时钟（具体可参考 [定时器配置](#) 和 [ESP32 技术参考手册 > LED PWM 计时器 \(LEDC\) \[PDF\]](#)）。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz、占空比分辨率设置为 3 位时，串行端口监视器上会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用 `ledc_timer_bit_t` 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

## 2.6.12 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g. brushed/brushless DC motor, RC servo motor
- Switch mode based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog value like speed, distance
- Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

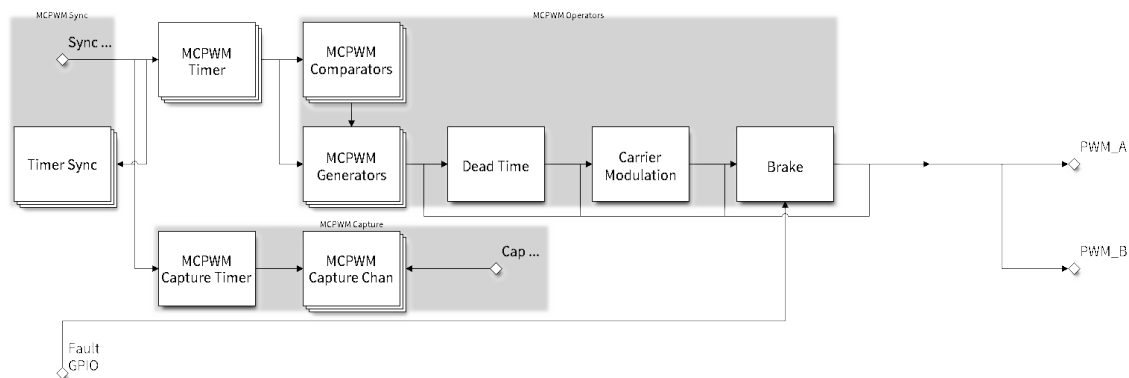

图 13: MCPWM Overview

- **MCPWM Timer:** The time base of the final PWM signal. It also determines the event timing of other submodules.
- **MCPWM Operator:** The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead time, and carrier modulator.
- **MCPWM Comparator:** The compare module takes the time-base count value as input, and continuously compares it to the threshold value configured. When the timer is equal to any of the threshold values, a compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator:** One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered by other submodules like MCPWM Timer and MCPWM Comparator.

- **MCPWM Fault:** The fault module is used to detect the fault condition from outside, mainly via the GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state to protect the system from damage.
- **MCPWM Sync:** The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from the GPIO matrix or from an MCPWM Timer event.
- **Dead Time:** This submodule is used to insert extra delay to the existing PWM edges generated in the previous steps.
- **Carrier Modulation:** The carrier submodule can modulate a high-frequency carrier signal into PWM waveforms by the generator and dead time submodules. This capability is mandatory for controlling the power-switching elements.
- **Brake:** MCPWM operator can set how to brake the generators when a particular fault is detected. You can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depending on how critical the fault is.
- **MCPWM Capture:** This is a standalone submodule that can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels, with each channel connected to the GPIO. A pulse on the GPIO triggers the capture timer to store the time-base count value and then notify you by an interrupt. Using this feature, you can measure a pulse width precisely. What is more, the capture timer can also be synchronized by the MCPWM Sync submodule.

## Functional Overview

Description of the MCPWM functionality is divided into the following sections:

- *Resource Allocation and Initialization* - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
- *Timer Operations and Events* - describes control functions and event callbacks that supported by the MCPWM timer.
- *Comparator Operations and Events* - describes control functions and event callbacks that supported by the MCPWM comparator.
- *Generator Actions on Events* - describes how to set actions for MCPWM generators on particular events that generated by the MCPWM timer and comparators.
- *Classical PWM Waveforms and Generator Configurations* - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
- *Dead Time* - describes how to set dead time for MCPWM generators.
- *Classical PWM Waveforms and Dead Time Configurations* - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
- *Carrier Modulation* - describes how to set modulate a high frequency onto the final PWM waveforms.
- *Faults and Brake Actions* - describes how to set brake actions for MCPWM operators on particular fault event.
- *Generator Force Actions* - describes how to control the generator output level asynchronously in a forceful way.
- *Synchronization* - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
- *Capture* - describes how to use the MCPWM capture module to measure the pulse width of a signal.
- *Power Management* - describes how different source clock will affect power consumption.
- *IRAM Safe* - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization** As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers** You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, timers located in different groups are totally independent.

- `mcpwm_timer_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` set the expected resolution of the timer, the driver internally will set a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.
- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).
- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free timers in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

On the contrary, calling `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators** You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, operators located in different groups are totally independent.
- `mcpwm_operator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
- `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
- `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
- `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to peak.
- `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free operators in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

**MCPWM Comparators** You can allocate a MCPWM comparator object by calling `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_comparator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.

<sup>1</sup> Different ESP chip series might have different number of MCPWM resources (e.g. groups, timers, comparators, operators, generators and so on). Please refer to the [TRM] for details. The driver won't forbid you from applying for more MCPWM resources, but it will return error when there's no hardware resources available. Please always check the return value when doing [Resource Allocation](#).

- `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to peak.
- `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 1160, 1</sup>

On the contrary, calling `mcpwm_del_comparator()` function will free the allocated comparator object.

**MCPWM Generators** You can allocate a MCPWM generator object by calling `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
- `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
- `mcpwm_generator_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.
- `mcpwm_generator_config_t::io_od_mode` configures the PWM GPIO as open-drain output.
- `mcpwm_generator_config_t::pull_up` and `mcpwm_generator_config_t::pull_down` controls whether to enable the internal pull-up and pull-down resistors accordingly.

The `mcpwm_new_generator()` will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 1160, 1</sup>

On the contrary, calling `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software. To allocate a GPIO fault object, you can call `mcpwm_new_gpio_fault()` function, with configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 1160, 1</sup>

Software fault object can be used to trigger a fault by calling a function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code.

Specifically, when there are no memory left for the fault object, this function will return `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, but the returned fault handle is of the same type.

On the contrary, calling `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources** The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There're three types of sync sources: A sync source reflected from the GPIO, a sync source generated by software and a sync source generated by MCPWM timer event.

To allocate a GPIO sync source, you can call `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, GPIO sync source located in different groups are totally independent, i.e. GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edges.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error. Page 1160, 1

To allocate a Timer event sync source, you can call `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e. the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, if a sync source has been allocated from the same timer before, this function will return `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the sync source object, this function will return `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, don't forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling `mcpwm_del_sync_src()` function will free the allocated sync source object, this function works for all types of sync sources.

**MCPWM Capture Timer and Channels** The MCPWM group has a dedicated timer which is used to capture the timestamp when specific event occurred. The capture timer is connected with several independent channels, each channel is assigned with a GPIO.

To allocate a capture timer, you can call `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.

- `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

---

**备注:** In ESP32, `mcpwm_capture_timer_config_t::resolution_hz` parameter is invalid, the capture timer resolution is always equal to the `MCPWM_CAPTURE_CLK_SRC_APB`.

---

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture timer left in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.<sup>Page 1160, 1</sup>

Next, to allocate a capture channel, you can call `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
- `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or falling edge of the input signal.
- `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.
- `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture channel left in the capture timer, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

**MCPWM interrupt priority** MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

---

**备注:** When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group's interrupt priority.

---

## Timer Operations and Events

**Update Period** The timer period is initialized by the `mcpwm_timer_config_t::period_ticks` parameter in `mcpwm_timer_config_t`. You can update the period at runtime by calling `mcpwm_timer_set_period()` function. The new period will take effect based on how you set the `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` parameters in `mcpwm_timer_config_t`. If none of them are set, the timer period will take effect immediately.

**Register Timer Event Callbacks** The MCPWM timer can generate different events at runtime. If you have some function that should be called when particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets callback function for timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets callback function for timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets callback function for timer when it is stopped.

The callback functions above are called within the ISR context, so they should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_timer_register_event_callbacks()` function is used to save user's own context, it will be passed to each callback function directly.

This function will lazy install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also *Enable and Disable timer* for more information.

**Enable and Disable Timer** Before doing IO control to the timer, user needs to enable the timer first, by calling `mcpwm_timer_enable()`. Internally, this function will:

- switch the timer state from **init** to **enable**.
- enable the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g. PLL\_160M clock) is selected. See also *Power management* for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What're more, you can even start the timer for only one round, that means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator** The allocated MCPWM Timer should be connected with a MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Make sure the MCPWM timer and operator are in the same group, otherwise, this function will return `ESP_ERR_INVALID_ARG` error.

## Comparator Operations and Events

**Register Event Callbacks** The MCPWM comparator can inform the user when the timer counter equals to the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets callback function for comparator when the timer counter equals to the compare value.

The callback function will provide event specific data of type `mcpwm_compare_event_data_t` to the user. The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

**Set Compare Value** You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There're a few points to note:

- New compare value might won't take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_tez`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return error code `ESP_ERR_INVALID_STATE`.
- The compare value shouldn't exceed timer's count peak, otherwise, the compare event will never got triggered.

## Generator Actions on Events

**Set Generator Action on Timer Event** One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specific the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There's a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` **must** be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

**Set Generator Action on Compare Event** One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specific the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See [MCPWM Comparators](#) for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There's a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` **must** be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.

**Set Generator Action on Fault Event** One generator can set action on fault based trigger events, by calling `mcpwm_generator_set_action_on_fault_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_fault_event_action_t`:

- `mcpwm_gen_fault_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_fault_event_action_t::fault` specifies the fault used for the trigger. See [MCPWM Faults](#) for how to allocate a fault.
- `mcpwm_gen_fault_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1160, 1

The trigger only support GPIO fault. when the input is not a GPIO fault, this function will return the `ESP_ERR_NOT_SUPPORTED` error.

There's a helper macro `MCPWM_GEN_FAULT_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, fault event does not have variadic function like `mcpwm_generator_set_actions_on_fault_event()`.

**Set Generator Action on Sync Event** One generator can set action on sync based trigger events, by calling `mcpwm_generator_set_action_on_sync_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_sync_event_action_t`:

- `mcpwm_gen_sync_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_sync_event_action_t::sync` specifies the sync source used for the trigger. See [MCPWM Sync Sources](#) for how to allocate a sync source.
- `mcpwm_gen_sync_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1160, 1

The trigger only support one sync action, regardless of the kinds. When set sync actions more than once, this function will return the `ESP_ERR_INVALID_STATE` error.

There's a helper macro `MCPWM_GEN_SYNC_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, sync event does not have variadic function like `mcpwm_generator_set_actions_on_sync_event()`.

**Classical PWM Waveforms and Generator Configurations** This section will demonstrate the classical PWM waveforms that can be generated by the pair of the generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms are determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer's period and count mode.
- The duty cycle of the PWM waveform is determined by the generator's various action combinations.

**Dead Time** In power electronics, the rectifier and inverter are commonly used. This requires the use of rectifier bridge and inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm can't conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, but the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave that generated by setting *Generator Actions on Events*.

The dead time driver works like a **decorator**. This is also reflected in the function parameters of *mcpwm\_generator\_set\_dead\_time()*, where it takes the primary generator handle (*in\_generator*), and returns a new generator (*out\_generator*) after applying the dead time. Please note, if the *out\_generator* and *in\_generator* are the same, it means you are adding the time delay to the PWM waveform in an "in-place" fashion. In turn, if the *out\_generator* and *in\_generator* are different, it means you are deriving a new PWM waveform from the existing *in\_generator*.

Dead-time specific configuration is listed in the *mcpwm\_dead\_time\_config\_t* structure:

- *mcpwm\_dead\_time\_config\_t::posedge\_delay\_ticks* and *mcpwm\_dead\_time\_config\_t::negedge\_delay\_ticks* set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means to bypass the dead-time module. The resolution of the dead-time tick is the same to the timer that is connected with the operator by *mcpwm\_operator\_connect\_timer()*.
- *mcpwm\_dead\_time\_config\_t::invert\_output*: Whether to invert the signal after applying the dead-time, which can be used to control the delay edge polarity.

**警告:** Due to the hardware limitation, one delay module (either *posedge delay* or *negedge delay*) can't be applied to multiple MCPWM generators at the same time. e.g. the following configuration is **invalid**:

```

mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};
// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can't apply the posedge delay to another generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);

```

However, you can apply *posedge delay* to generator A and *negedge delay* to generator B. You can also set both *posedge delay* and *negedge delay* for generator B, while letting generator A bypass the dead time module. Note that if *negedge delay* and *posedge delay* are both set for generator A, generator B will not be available. Where generator A is the first generator requested through the operator handle and generator B is the second generator requested through an operator handle.

**备注:** It is also possible to generate the required dead time by setting *Generator Actions on Events*, especially by

controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead-time submodule should be used.

**Classical PWM Waveforms and Dead Time Configurations** This section will demonstrate the classical PWM waveforms that can be generated by the dead-time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

**Carrier Modulation** The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g. isolated digital power application) by passing the PWM output signals through transformers. Any of PWM output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.
- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver will search for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can't be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

**Faults and Brake Actions** The MCPWM operator is able to sense external signals with information about failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into *MCPWM fault objects*.

You should determine possible failure modes of the motor and what action should be performed on detection of a particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. Because of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

**Set Operator Brake Mode on Fault** The way that MCPWM operator reacts to the fault is called **Brake**. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Brake specific configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` set which fault that the operator should react to.
- `mcpwm_brake_config_t::brake_mode` set the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator will recover itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can't recover even though the fault disappears. User has to call `mcpwm_operator_recover_from_fault()` to manually recover it.

**Set Generator Action on Brake Event** One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There's a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` **must** be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks** The MCPWM fault detector can inform the user when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform the user when it going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets callback function that will be called when the operator is going to take a *CBC* action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets callback function that will be called when the operator is going to take an *OST* action.

The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_operator_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g. `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator's output level will be controlled by the event actions again.
- Set the `hold_on` to true, the force output level will keep alive, until it's removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, any upcoming event can override it.

**Synchronization** When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined **phase**, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the MCPWM capture timer *MCPWM Capture Timer* can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

**Capture** The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, you can use the capture submodule to sense the rotor position from the Hall sensor.

The capture timer is usually connected with several capture channels, please refer to [MCPWM Capture Timer and Channels](#) for resource allocation.

**Register Event Callbacks** The MCPWM capture channel can inform the user when there's a valid edge detected on the signal. You have to register a callback function to get the timer count value of the capture moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets callback function for the capture channel when a valid edge is detected.

The callback function will provide event specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with ISR suffix is called within the function).

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, user needs to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function will:

- switch the capture timer state from **init** to **enable**.
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also *Power management* for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to **init** state, and release the power management lock.

**Start and Stop Capture Timer** The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

**Trigger a Software Capture Event** Sometime, the software also wants to trigger a "fake" capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it's a "fake" capture event, it can still cause an interrupt, thus your capture event callback function will get invoked as well.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the PLL, APB frequency before going into light sleep, thus potentially changing the period of a MCPWM timers' counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from going into Light-sleep by acquiring a power management lock of type `ESP_PM_NO_LIGHT_SLEEP`. Whenever the driver creates an MCPWM timer instance that has selected PLL as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_timer_enable()`. On the contrary, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, whenever the driver creates an MCPWM capture timer instance, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_capture_timer_enable()`. And releases the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe** By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM<sup>2</sup>
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

**Thread Safety** The factory functions like `mcpwm_new_timer()` are guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, as the driver uses a critical section to prevent them being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

---

<sup>2</sup> Callback function and the sub-functions invoked by itself should also be placed in IRAM, users need to take care of this by themselves.

Other functions that are not related to *Resource Allocation*, are not thread safe. Thus, you should avoid calling them in different tasks without mutex protection.

### Kconfig Options

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see *IRAM Safe* for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.
