使用 Eclipse 的调试示例 请检查目标板是否已经准备好，并加载了 [get-started/blink](#) 示例代码，然后按照[使用 Eclipse 调试](#)中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止。

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

图 50: Eclipse 中的 Debug 视图

浏览代码，查看堆栈和线程 当目标暂停时，调试器会在“Debug”窗口中显示线程的列表，程序暂停的代码行在下面的另一个窗口中被高亮显示，如下图所示。此时板子上的 LED 停止了闪烁。

图 51: 调试时目标停止

暂停的程序所在线程也会被展开，显示函数调用的堆栈，它表示直到目标暂停所在代码行（下图高亮处）为止的相关函数的调用关系。1 号线程下函数调用堆栈的第一行包含了最后一个调用的函数 `app_main()`，根据下一行显示，它又是在函数 `main_task()` 中被调用的。堆栈的每一行还包含调用函数的文件名和行号。通过单击每个堆栈的条目，在下面的窗口中，你将看到此文件的内容。

通过展开线程，你可以浏览整个应用程序。展开 5 号线程，它包含了更长的函数调用堆栈，你可以看到函数调用旁边的数字，比如 `0x4000000c`，它们代表未以源码形式提供的二进制代码所在的内存地址。

无论项目是以源代码还是仅以二进制形式提供，在右边一个窗口中，都可以看到反汇编后的机器代码。

回到 1 号线程中的 `app_main()` 函数所在的 `blink.c` 源码文件，下面的示例将会以该文件为例介绍调试的常用功能。调试器可以轻松浏览整个应用程序的代码，这给单步调试代码和设置断点带来了很大的便利，下面将一一展开讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。按住键盘上的“Control”键，双击 `blink.c` 文件中的行号 33，并在弹出的对话框中点击“OK”按钮进行确定。如果你不想看到此对话框，双击行号即可。执行同样操作，在第 36 行设置另外一个断点。

断点的数量和位置信息会显示在右上角的“断点”窗口中。单击“Show Breakpoints Supported by Selected Target”图标可以刷新此列表。除了刚才设置的两个断点外，列表中可能还包含在调试器启动时设置在 `app_main()` 函数处的临时断点。由于最多只允许设置两个断点（详细信息请参阅[可用的断点和观察点](#)），你需要将其删除，否则调试会失败。

图 52: 浏览函数调用堆栈

图 53: 设置断点

图 54: 设置了三个断点 / 最多允许两个断点

单击“Resume”（如果“Resume”按钮是灰色的，请先单击 8 号线程的 `blink_task()` 函数）后处理器将开始继续运行，并在断点处停止。再一次单击“Resume”按钮，使程序再次运行，然后停在第二个断点处，依次类推。

每次单击“Resume”按钮恢复程序运行后，都会看到 LED 切换状态。

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

手动暂停目标 在调试时，你可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。后者，如果想要返回调试模式，可以通过单击“Suspend”按钮来手动中断程序的运行。

在此之前，请删除所有的断点，然后单击“Resume”按钮。接着单击“Suspend”按钮，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器将展开线程并高亮显示停止的代码行。

图 55: 手动暂停目标

在上图所示的情况下，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在你可以通过单击“Resume”按钮再次将其恢复运行或者进行下面要介绍的调试工作。

单步执行代码 我们还可以使用“Step Into (F5)”和“Step Over (F6)”命令单步执行代码，这两者之间的区别是执行“Step Into (F5)”命令会进入调用的子程序，而执行“Step Over (F6)”命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请参照上文所述确保目前只在 `blink.c` 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下“Step Over (F6)”按钮，观察调试器是如何单步执行一行代码的。

如果你改用“Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

图 56: 使用“Step Over (F6)”单步执行代码

图 57: 使用“Step Into (F5)”单步执行代码

请参阅“[next](#)”命令无法跳过子程序的原因文档以了解 next 命令的潜在局限。

查看并设置内存 要显示或者设置内存的内容，请使用“调试”视图中位于底部的“Memory”选项卡。

在“Memory”选项卡下，我们将在内存地址 0x3FF44004 处读取和写入内容。该地址也是 GPIO_OUT_REG 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 *ESP32-H2 技术参考手册 > IO MUX 和 GPIO Matrix (GPIO, IO_MUX)* [PDF] 章节。

同样在 blink.c 项目文件中，在两个 gpio_set_level 语句的后面各设置一个断点，单击“Memory”选项卡，然后单击“Add Memory Monitor”按钮，在弹出的对话框中输入 0x3FF44004。

按下 F8 按键恢复程序运行，并观察“Monitor”选项卡。

图 58: 观察内存地址 0x3FF44004 处的某个比特被置高

每按一下 F8，你就会看到在内存 0x3FF44004 地址处的一个比特位被翻转（并且 LED 会改变状态）。

图 59: 观察内存地址 0x3FF44004 处的某个比特被置低

要修改内存的数值，请在“Monitor”选项卡中找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将立即看到 LED 的状态发生了改变。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-H2 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，在代码 `i++` 处添加一个断点。

下一步，在“Breakpoints”所在的窗口中，选择“Expressions”选项卡。如果该选项卡不存在，请在顶部菜单栏的 `Window > Show View > Expressions` 中添加这一选项卡。然后在该选项卡中单击“Add new expression”，并输入 `i`。

按下 F8 继续运行程序，每次程序停止时，都会看到变量 `i` 的值在递增。

图 60: 观察程序变量“i”

如想更改 `i` 的值，可以在“Value”一栏中输入新的数值。按下“Resume (F8)”后，程序将从新输入的数字开始递增 `i`。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择“Breakpoint Properties”，将“Type:”改选为“Hardware”然后在“Condition:”一栏中输入条件表达式，例如 `i == 2`。

如果当前 `i` 的值小于 2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处。

使用命令行的调试示例 请检查你的目标板是否已经准备好，并加载了 `get-started/blink` 示例代码，然后按照 [使用命令行调试](#) 中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43     xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5,
↳ NULL);
(gdb)
```

图 61: 设置条件断点

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点
8. 调试 *FreeRTOS* 对象

浏览代码，查看堆栈和线程 当看到 (gdb) 提示符的时候，应用程序已停止运行，LED 也停止闪烁。

要找到代码暂停的位置，输入 `l` 或者 `list` 命令，调试器会打印出暂停点 (`blink.c` 代码文件的第 43 行) 附近的几行代码

```
(gdb) l
38     }
39   }
40
41   void app_main()
42   {
43       xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5,
↳NULL);
44   }
(gdb)
```

也可以通过输入 `l 30, 40` 等命令来查看特定行号范围内的代码。

使用 `bt` 或者 `backtrace` 来查看哪些函数最终导致了此代码被调用:

```
(gdb) bt
#0  app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↳esp32h2/./cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 `app_main ()`。`app_main ()` 又被位于 `cpu_start.c` 文件第 339 行的 `main_task` 函数调用。

想查看 `cpu_start.c` 文件中 `main_task` 函数的上下文，需要输入 `frame N`，其中 `N=1`，因为根据前面的输出，`main_task` 位于 #1 下:

```
(gdb) frame 1
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↳esp32h2/./cpu_start.c:339
339   app_main();
(gdb)
```

输入 `l` 将显示一段名为 `app_main ()` 的代码 (在第 339 行) :

```
(gdb) l
334     ;
335   }
336 #endif
337   //Enable allocation in region where the startup stacks were located.
338   heap_caps_enable_nonos_stack_heaps();
339   app_main();
340   vTaskDelete(NULL);
341 }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 `main_task` 函数：

```
(gdb) l 326, 341
326 static void main_task(void* args)
327 {
328     // Now that the application is about to start, disable boot watchdogs
329     REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
330     REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331 #if !CONFIG_FREERTOS_UNICORE
332     // Wait for FreeRTOS initialization to finish on APP CPU, before replacing
↳ its startup stack
333     while (port_xSchedulerRunning[1] == 0) {
334         ;
335     }
336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
(gdb)
```

如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表：

```
(gdb) i threads
  Id  Target Id      Frame
   8  Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
↳ <optimized out>)
   at /home/user-name/esp/esp-idf/components/esp32h2/./dport_access.c:170
   7  Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
↳ pvBuffer=0x0, xTicksToWait=1644638200,
   xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.
↳ c:1452
   6  Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
   at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
   5  Thread 1073410208 (ipc1 : Running) 0x4000bfef in ?? ()
   4  Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
   at /home/user-name/esp/esp-idf/components/esp32h2/./dport_access.c:150
   3  Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
   at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
   2  Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
   at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
*  1  Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
↳ main/./blink.c:43
(gdb)
```

线程列表显示了每个线程最后一个被调用的函数以及所在的 C 源文件名（如果存在的话）。

你可以通过输入 `thread N` 进入特定的线程，其中 `N` 是线程 ID。我们进入 5 号线程来看一下它是如何工作的：

```
(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0  0x4000bfef in ?? ()
(gdb)
```

然后查看回溯：

```
(gdb) bt
#0  0x4000bfef in ?? ()
#1  0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
↳ esp/esp-idf/components/freertos/./port.c:415
#2  0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
↳ freertos/./tasks.c:2846
```

(下页继续)

```
#3 0x4008532b in _frxt_dispatch ()
#4 0x4008395c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
↳freertos/./port.c:222
#5 0x4000000c in ?? ()
#6 0x4000000c in ?? ()
#7 0x4000000c in ?? ()
#8 0x4000000c in ?? ()
(gdb)
```

如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 ?? 替代，这表示该函数是以二进制格式提供的。像 0x4000bfea 这样的值是被调用函数所在的内存地址。

使用诸如 `bt`, `i threads`, `thread N` 和 `list` 命令可以浏览整个应用程序的代码。这给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 `break M` 设置断点，其中 `M` 是具体的代码行：

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

输入命令 `c`，处理器将运行并在断点处停止。再次输入 `c` 将使其再次运行，并在第二个断点处停止，依此类推：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active) APP_CPU: PC=0x400D10D8

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:33
33      gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active) APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active) APP_CPU: PC=0x400D10D8

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36      gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

只有在输入命令 `c` 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 `info break`：

```
(gdb) info break
Num      Type          Disp Enb Address      What
2        breakpoint    keep y  0x400db6f6 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:33
         breakpoint already hit 1 time
3        breakpoint    keep y  0x400db704 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
         breakpoint already hit 1 time
(gdb)
```

请注意，断点序号（在 Num 栏列出）从 2 开始，这是因为在调试器启动时执行 `thb app_main` 命令已经在 `app_main()` 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。

要删除一个断点，请输入 `delete N` 命令（或者简写成 `d N`），其中 `N` 代表断点序号：

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

暂停和恢复应用程序的运行 在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过输入 `Ctrl+C` 手动中断程序的运行。

在此之前，请删除所有的断点，然后输入 `c` 恢复程序运行。接着输入 `Ctrl+C`，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器会打印如下信息：

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00          APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
↳components/esp32h2/./freertos_hooks.c:52
52          asm("waiti 0");
(gdb)
```

在上图所示的情况下，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在你可以通过输入 `c` 再次将其恢复运行或者进行如下所述的一些调试工作。

单步执行代码 我们还可以使用 `step` 和 `next` 命令（可以简写成 `s` 和 `n`）单步执行代码，这两者之间的区别是执行“`step`”命令会进入调用的子程序内部，而执行“`next`”命令则会直接将子程序看成单个源代码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 `break` 和 `delete` 命令，确保目前只在 `blink.c` 文件的第 36 行设置了一个断点：

```
(gdb) info break
Num      Type           Disp Enb Address      What
3        breakpoint      keep y   0x400db704 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
          breakpoint already hit 1 time
(gdb)
```

输入 `c` 恢复程序运行然后等它在断点处停止运行：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active)  APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36          gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

然后输入 `n` 多次，观察调试器是如何单步执行一行代码的：

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active) APP_CPU: PC=0x400D1128
33         gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

如果你输入 `s`，那么调试器将进入子程序：

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
↳components/esp_driver_gpio/src/gpio.c:183
183     GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
↳", ESP_ERR_INVALID_ARG);
(gdb)
```

上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅 [“next”命令无法跳过子程序的原因](#) 文档以了解 `next` 命令的潜在局限。

查看并设置内存 使用命令 `x` 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 `help x` 可以查看更多相关细节。与 `x` 命令配合使用的命令是 `set`，它允许你将值写入内存。

为了演示 `x` 和 `set` 的使用，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 `GPIO` 的电平。

关于该寄存器的更多详细信息，请参阅 [ESP32-H2 技术参考手册 > IO MUX 和 GPIO Matrix \(GPIO, IO_MUX\) \[PDF\]](#) 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点。输入两次 `c` 命令后停止在断点处，然后输入 `x /1wx 0x3FF44004` 来显示 `GPIO_OUT_REG` 寄存器的值：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active) APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main./
↳blink.c:34
34         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main./
↳blink.c:37
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
```

(下页继续)

(续上页)

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)
```

如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转：

```
0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010
```

现在，当 LED 熄灭时，与之对应地会显示 0x3ff44004: 0x00000000，尝试使用 set 命令向相同的内存地址写入 0x00000010 来将该比特置高：

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

在输入 set {unsigned int}0x3FF44004=0x000010 命令后，你会立即看到 LED 亮起。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了能够演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-H2 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 watch i：

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

这会在所有变量 i 发生改变的代码处插入所谓的“观察点”。现在输入 continue 命令来恢复应用程序的运行并观察它停止：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
->blink.c:33
33      i++;
(gdb)
```

多次恢复程序运行后，变量 i 的值会增加，现在你可以输入 print i（简写 p i）来查看当前 i 的值：

```
(gdb) p i
$1 = 3
(gdb)
```

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出出来查看是否确已修改）：

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)
```

最多可以使用两个观察点，详细信息请参阅[可用的断点和观察点](#)。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令：

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)
```

以上命令在 `blink.c` 文件的 34 处设置了一个条件断点，当 `i == 2` 条件满足时，程序会停止运行。

如果当前 `i` 的值小于 2 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处：

```
(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:34
34         gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

调试 FreeRTOS 对象 该部分内容或许可以帮助你调试 FreeRTOS 任务交互。

需要调试 FreeRTOS 任务交互的用户可使用 GDB 命令 `freertos`。该命令并非 GDB 原生命令，而是来自于 Python 扩展模块 `freertos-gdb`，其包含一系列子命令：

```
(gdb) freertos
"freertos" 后面必须紧随子命令的名称
freertos 子命令如下：

freertos queue -- 打印当前队列信息
freertos semaphore -- 打印当前信号量信息
freertos task -- 打印当前任务及其状态
freertos timer -- 打印当前定时器信息
```

点击 <https://pypi.org/project/freertos-gdb> 链接了解此扩展模块的详细信息。

备注：ESP-IDF 在安装 Python 包时会自动安装 `freertos-gdb` Python 模块，详情请参考 [第三步：设置工具](#)。

如果使用 `idf.py gdb` 命令运行 GDB，FreeRTOS 扩展会自动加载。也可以使用 GDB 内部命令 `python import freertos_gdb` 使能该模块。

请保证使用 Python 3.6 及以上版本，该版本具有 Python 共享库。

获得命令的帮助信息 目前所介绍的都是些非常基础的命令，目的在于让你快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 (gdb) 提示符下输入 `help` 和命令名：

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)
```

只需输入 `help` 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 <https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf>。虽然不是所有命令都适用于嵌入式环境，但还是会有所裨益。

结束调试会话 输入命令 `q` 可以退出调试器：

```
(gdb) q
A debugging session is active.

    Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

4.16 链接器脚本生成机制

4.16.1 概述

ESP32-H2 中有多个用于存放代码和数据的内存区域。代码和只读数据默认存放在 flash 中，可写数据存放在 RAM 中。不过有时，用户必须更改默认存放区域。

例如：

- 将关键代码存放到 RAM 中以提高性能；
- 将可执行代码存放到 IRAM 中，以便在缓存被禁用时运行这些代码；
- 将代码存放到 RTC 存储器中，以便在 wake stub 中使用；

链接器脚本生成机制可以让用户指定代码和数据在 ESP-IDF 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理；生成的存放规则用于链接应用程序。

4.16.2 快速上手

本段将指导如何使用 ESP-IDF 的即用方案，快速将代码和数据放入 RAM 和 RTC 存储器中。

假设用户有：

```
components
├── my_component
│   ├── CMakeLists.txt
│   ├── Kconfig
│   └── src/
│       ├── my_src1.c
│       ├── my_src2.c
│       └── my_src3.c
└── my_linker_fragment_file.lf
```

- 名为 `my_component` 的组件，在构建过程中存储为 `libmy_component.a` 库文件
- 库文件包含的三个源文件：`my_src1.c`、`my_src2.c` 和 `my_src3.c`，编译后分别为 `my_src1.o`、`my_src2.o` 和 `my_src3.o`
- 在 `my_src1.o` 中定义 `my_function1` 功能；在 `my_src2.o` 中定义 `my_function2` 功能
- 在 `my_component` 下 `Kconfig` 中存在布尔类型配置 `PERFORMANCE_MODE (y/n)` 和整数类型配置 `PERFORMANCE_LEVEL (范围是 0-3)`

创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 `.lf` 的文本文件，想要存放的位置信息会写入该文件内。文件创建成功后，需要将其呈现在构建系统中。`ESP-IDF` 支持的构建系统指南如下：

在组件目录的 `CMakeLists.txt` 文件中，指定 `idf_component_register` 调用引数 `LDFRAGMENTS` 的值。`LDFRAGMENTS` 可以为绝对路径，也可为组件目录的相对路径，指向已创建的链接器片段文件。

```
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register(...
    LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
↳another_linker_fragment_file.lf"
    ...
)
```

指定存放区域

可以按照下列粒度指定存放区域：

- 目标文件（`.obj` 或 `.o` 文件）
- 符号（函数/变量）
- 库（`.a` 文件）

存放目标文件 假设整个 `my_src1.o` 目标文件对性能至关重要，所以最好把该文件放在 `RAM` 中。另外，`my_src2.o` 目标文件包含从深度睡眠唤醒所需的符号，因此需要将其存放到 `RTC` 存储器中。

在链接器片段文件中可以写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)      # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
    my_src2 (rtc)         # 将所有 my_src2 代码、数据和只读数据存放到 RTC 快速 RAM_
↳和 RTC 慢速 RAM 中
```

那么 `my_src3.o` 放在哪里呢？由于未指定存放区域，`my_src3.o` 会存放到默认区域。更多关于默认存放区域的信息，请查看[这里](#)。

存放符号 继续上文的例子，假设 `object1.o` 目标文件定义的功能中，只有 `my_function1` 影响到性能；`object2.o` 目标文件中只有 `my_function2` 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1:my_function1 (noflash)
    my_src2:my_function2 (rtc)
```

`my_src1.o` 和 `my_src2.o` 中的其他函数以及整个 `object3.o` 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如：

```
my_src1:my_variable (noflash)
```

注意：按照符号粒度存放代码和数据有一定的局限。为确保存放区域合适，您也可以将相关代码和数据集中在源文件中，参考[使用目标文件的存放规则](#)。

存放整个库 在这个例子中，假设整个组件库都需存放到 RAM 中，可以写入以下内容存放整个库：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (rtc)
```

根据具体配置存放 假设只有在某个条件为真时，比如 `CONFIG_PERFORMANCE_MODE == y` 时，整个组件库才有特定存放区域，可以写入以下内容实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE = y:
        * (noflash)
    else:
        * (default)
```

来看一种更复杂的情况。假设 `CONFIG_PERFORMANCE_LEVEL == 1` 时，只有 `object1.o` 存放到 RAM 中；`CONFIG_PERFORMANCE_LEVEL == 2` 时，`object1.o` 和 `object2.o` 会存放到 RAM 中；`CONFIG_PERFORMANCE_LEVEL == 3` 时，库中的所有目标文件都会存放到 RAM 中。以上三个条件为假时，整个库会存放到 RTC 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL = 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL = 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL = 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
```

(下页继续)

```

object1 (noflash)
  if PERFORMANCE_LEVEL >= 2:
    object2 (noflash)
    if PERFORMANCE_LEVEL >= 3:
      object2 (noflash)
else:
  * (rtc)

```

默认存放区域

到目前为止，“默认存放区域”在未指定 `rtc` 和 `noflash` 存放规则时才会作为备选方案使用。需要注意的是，`noflash` 或者 `rtc` 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是[协议](#)。

与 `rtc` 和 `noflash` 类似，还有一个默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通常存放的区域，即代码和常量存放在 `flash` 中，变量存放在 `RAM` 中。更多关于默认协议的信息，请见[这里](#)。

备注： 使用链接器脚本生成机制的 IDF 组件示例，请参阅 [freertos/CMakeLists.txt](#)。为了提高性能，`freertos` 使用链接器脚本生成机制，将其目标文件存放到 `RAM` 中。

快速入门指南到此结束，下文将详述这个机制的内核，有助于创建自定义存放区域或修改默认方式。

4.16.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换成可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的[链接器片段文件](#)和 (2) [链接器脚本模板](#) 动态生成。

备注： 执行链接器脚本生成机制的工具存放在 `tools/ldgen` 之下。

链接器片段文件

如快速入门指南所述，片段文件是拓展名为 `.lf` 的简单文本文件，内含想要存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是[段](#)、[协议](#)和[映射](#)。

语法 三种片段类型使用同一种语法：

```

[type:name]
key: value
key:
  value
  value
  value
  ...

```

- 类型：片段类型，可以为段、协议或映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。
 - 在[段](#)和[协议](#)中，仅支持 `entries` 键。
 - 在[映射](#)中，支持 `archive` 和 `entries` 键。

备注： 多个片段的类型和名称相同时会引发异常。

备注： 片段名称和键值只能使用字母、数字和下划线。

条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 `kconfiglib` 脚本的 `eval_string`，遵循该脚本要求的语法和局限性，支持：

- **比较**
 - 小于 <
 - 小于等于 <=
 - 大于 >
 - 大于等于 >=
 - 等于 =
 - 不等于 !=
- **逻辑**
 - 或 ||
 - 和 &&
 - 取反 !
- **分组**
 - 圆括号 ()

条件检查和其他语言中的 `if...elseif/elif...else` 块作用一样。键值和完整片段都可以进行条件检查。以下两个示例效果相同：

```
# 键值取决于配置
[type:name]
key_1:
    if CONDITION = y:
        value_1
    else:
        value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b
```

```
# 完整片段的定义取决于配置
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_a
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

注释

链接器片段文件中的注释以 # 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

类型 段

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 `.text`、`.data`），也可以是用户通过 `__attribute__` 关键字定义的段。

'+' 表示段列表开始，且当前段为列表中的第一个段。这种表达方式更加推荐。

```
[sections:name]
entries:
    .section+
    .section
    ...
```

示例：

```
# 不推荐的方式
[sections:text]
entries:
    .text
    .text.*
    .literal
    .literal.*

# 推荐的方式，效果与上面等同
[sections:text]
entries:
    .text+           # 即 .text 和 .text.*
    .literal+       # 即 .literal 和 .literal.*
```

协议

协议定义了每个段对应的目标。

```
[scheme:name]
entries:
    sections -> target
    sections -> target
    ...
```

示例：

```
[scheme:noflash]
entries:
    text -> iram0_text           # text 段下的所有条目均归入 iram0_text
    rodata -> dram0_data       # rodata 段下的所有条目均归入 dram0_data
```

默认协议

注意，有一个默认的协议很特殊，特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着，如果该协议有一条条目是 `text -> flash_text`，则将为目标 `flash_text` 生成如下的存放规则：

```
*(.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定映射规则的情况。

默认协议在 `esp_system/app.lf` 文件中定义。快速上手指南中提到的内置 `noflash` 协议和 `rtc` 协议也在该文件中定义。

映射

映射定义了可映射实体（即目标文件、函数名、变量名和库）对应的协议。

```
[mapping]
archive: archive           # 构建后输出的库文件名称（即 libxxx.a）
entries:
    object:symbol (scheme) # 符号
```

(下页继续)

```
object (scheme)          # 目标
* (scheme)              # 库
```

有三种存放粒度：

- 符号：指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标：只指定目标文件名称。
- 库：指定 *，即某个库下面所有目标文件的简化表达法。

为了更好地理解条目的含义，请看一个按目标存放的例子。

```
object (scheme)
```

根据条目定义，将这个协议展开：

```
object (sections -> target,
        sections -> target,
        ...)
```

再根据条目定义，将这个段展开：

```
object (.section,
        .section,
        ... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置

        .section,
        .section,
        ... -> target, # 同样的方法指定其他段

        ...)          # 直至所有段均已展开
```

示例：

```
[mapping:map]
archive: libfreertos.a
entries:
    * (noflash)
```

除了实体和协议，条目中也支持指定如下标志：（注：<> = 参数名称，[] = 可选参数）

1. ALIGN(<alignment>[, pre, post])

根据 alignment 中指定的数字对齐存放区域，根据是否指定 pre 和 post，或两者都指定，在输入段描述（生成于映射条目）的前面和/或后面生成：

2. SORT([<sort_by_first>, <sort_by_second>])

在输入段描述中输出 SORT_BY_NAME, SORT_BY_ALIGNMENT, SORT_BY_INIT_PRIORITY 或 SORT。

sort_by_first 和 sort_by_second 的值可以是：name、alignment、init_priority。

如果既没指定 sort_by_first 也没指定 sort_by_second，则输入段会按照名称排序，如果两者都指定了，那么嵌套排序会遵循 <https://sourceware.org/binutils/docs/ld/Input-Section-Wildcards.html> 中的规则。

3. KEEP()

用 KEEP 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 <https://sourceware.org/binutils/docs/ld/Input-Section-Keep.html>

4. SURROUND(<name>)

在存放区域的前面和后面生成符号，生成的符号遵循 _<name>_start 和 _<name>_end 的命名方式，例如，如果 name == sym1

在添加标志时，协议中需要指定具体的 section -> target。对于多个 section -> target，使用逗号作为分隔符，例如：

```
# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 条目中定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
    section1 -> target1 KEEP() ALIGN(4, pre, post),
    section2 -> target2 SURROUND(sym) ALIGN(4, post) SORT()
```

合并后，如下的映射：

```
[mapping:name]
archive: lib1.a
entries:
    obj1 (noflash);
        rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出：

```
. = ALIGN(8)
_my_sym_start = ABSOLUTE(.)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

注意，正如在 **flag** 描述中提到的，ALIGN 和 SURROUND 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成：

```
_my_sym_start = ABSOLUTE(.)
. = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

按符号存放 按符号存放可通过编译器标志 `-ffunction-sections` 和 `-ffdata-sections` 实现。ESP-IDF 默认用这些标志编译。用户若选择移除标志，便不能按符号存放。另外，即便有标志，也会有其他限制，具体取决于编译器输出的段。

比如，使用 `-ffunction-sections`，针对每个功能会输出单独的段。段的名称可以预测，即 `.text.{func_name}` 和 `.literal.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `-ffdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`；因此类型 I 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

链接器脚本模板

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法：

```
mapping[target]
```

示例：

以下示例是某个链接器脚本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `iram0_text` 的标记。

```
.iram0.text :
{
    /* 标记 IRAM 空间不足 */
```

(下页继续)

```

_iram_text_start = ABSOLUTE(.);

/* 引用 iram0_text */
mapping[iram0_text]

_iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

假设链接器脚本生成器收集到了以下片段定义：

```

[sections:text]
.text+
.literal+

[sections:iram]
.iram1+

[scheme:default]
entries:
text -> flash_text
iram -> iram0_text

[scheme:noflash]
entries:
text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
* (noflash)

```

然后生成的链接器脚本的相应摘录如下：

```

.iram0.text :
{
/* 标记 IRAM 空间不足 */
_iram_text_start = ABSOLUTE(.);

/* 处理片段生成的存放规则，存放在模板标记的位置处 */
*(.iram1 .iram1.*)
*libfreertos.a:(.literal .text .literal.* .text.*)

_iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

```
*libfreertos.a:(.literal .text .literal.* .text.*)
```

这是根据 `freertos` 映射的 `* (noflash)` 条目生成的规则。`libfreertos.a` 库下所有目标文件的所有 `text` 段会收集到 `iram0_text` 目标下（按照 `noflash` 协议），并放在模板中被 `iram0_text` 标记的地方。

```
*(.iram1 .iram1.*)
```

这是根据默认协议条目 `iram -> iram0_text` 生成的规则。默认协议指定了 `iram -> iram0_text` 条目，因此生成的规则同样也放在被 `iram0_text` 标记的地方。由于该规则是根据默认协议生成的，因此在同一目标下收集的所有规则下排在第一位。

目前使用的链接器脚本模板是 [esp_system/ld/esp32h2/sections.ld.in](#)，生成的脚本存放在构建目录下。

4.17 lwIP

ESP-IDF 使用开源的 [lwIP 轻量级 TCP/IP 协议栈](#)，该版 lwIP ([esp-lwip](#)) 相对上游项目做了修改和增补。

4.17.1 支持的 API

ESP-IDF 支持以下 lwIP TCP/IP 协议栈功能：

- [BSD 套接字 API](#)
- [Netconn API](#) 已启用，但暂无对 ESP-IDF 应用程序的官方支持

适配的 API

警告： 在使用除 [BSD 套接字 API](#) 外的任意 lwIP API 时，请确保所用 API 为线程安全。请启用 [CONFIG_LWIP_CHECK_THREAD_SAFETY](#) 配置选项并运行应用程序，检查所用 API 是否线程安全。此时，lwIP 断言 TCP/IP 核心功能可以正确访问。如果未能从正确的 [lwIP FreeRTOS 任务](#) 访问，或没有正确锁定，则执行中止。建议使用 [ESP-NETIF](#) 组件与 lwIP 交互。

ESP-IDF 间接支持以下常见的 lwIP 应用程序 API：

- 动态主机设置协议 (DHCP) 服务器和客户端，由 [ESP-NETIF](#) 功能间接支持。
- 域名系统 (DNS)；获取 DHCP 地址时，可以自动分配 DNS 服务器，也可以通过 [ESP-NETIF](#) API 手动配置。

备注： lwIP 中的 DNS 服务器配置为全局配置，而非针对特定接口的配置。如需同时使用不同 DNS 服务器的多个网络接口，在从一个接口获取 DHCP 租约时，请注意避免意外覆盖另一个接口的 DNS 设置。

- 简单网络时间协议 (SNTP)，由 [ESP-NETIF](#) 功能间接支持，或通过 [lwip/include/apps/esp_sntp.h](#) 中的函数直接支持。该函数还为 [lwip/lwip/src/include/lwip/apps/sntp.h](#) 函数提供了线程安全的 API，请参阅 [SNTP 时间同步](#)。
- ICMP Ping，由 lwIP ping API 的变体支持，请参阅 [ICMP 回显](#)。
- ICMPv6 Ping，由 lwIP 的 ICMPv6 Echo API 支持，用于测试 IPv6 网络连接情况。有关详细信息，请参阅 [protocols/sockets/icmpv6_ping](#)。
- NetBIOS 查找，由标准的 lwIP API 支持，[protocols/http_server/restful_server](#) 示例中提供了使用 NetBIOS 在局域网中查找主机的选项。
- mDNS 与 lwIP 的默认 mDNS 使用不同实现方式，请参阅 [mDNS 服务](#)。但启用 [CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES](#) 设置项后，lwIP 可以使用 `gethostbyname()` 等标准 API 和 `hostname.local` 约定查找 mDNS 主机。
- lwIP 中的 PPP 实现可用于在 ESP-IDF 中创建 PPPoS (串行 PPP) 接口。请参阅 [ESP-NETIF](#) 组件文档，使用 [esp_netif/include/esp_netif_defaults.h](#) 中定义的 `ESP_NETIF_DEFAULT_PPP()` 宏创建并配置 PPP 网络接口。[esp_netif/include/esp_netif_ppp.h](#) 中提供了其他的运行时设置。PPPoS 接口通常用于与 NB-IoT/GSM/LTE 调制解调器交互。[esp_modem](#) 仓库还支持更多应用层友好的 API，该仓库内部使用了上述 PPP lwIP 模块。

4.17.2 BSD 套接字 API

BSD 套接字 API 是一种常见的跨平台 TCP/IP 套接字 API，最初源于 UNIX 操作系统的伯克利标准发行版，现已标准化为 POSIX 规范的一部分。BSD 套接字有时也称 POSIX 套接字，或伯克利套接字。

在 ESP-IDF 中，lwIP 支持 BSD 套接字 API 的所有常见用法。

参考

BSD 套接字的相关参考资料十分丰富，包括但不限于：

- [单一 UNIX 规范 - BSD 套接字](#)
- [伯克利套接字 - 维基百科](#)

示例

以下为 ESP-IDF 中使用 BSD 套接字 API 的部分示例：

- [protocols/sockets/tcp_server](#)
- [protocols/sockets/tcp_client](#)
- [protocols/sockets/udp_server](#)
- [protocols/sockets/udp_client](#)
- [protocols/sockets/udp_multicast](#)
- [protocols/http_request](#)：此简化示例使用 TCP 套接字发送 HTTP 请求，但更推荐使用 [ESP HTTP 客户端](#) 发送 HTTP 请求

支持的函数

在 ESP-IDF 中，lwIP 支持以下 BSD 套接字 API 函数，详情请参阅 [lwip/lwip/src/include/lwip/sockets.h](#)。

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`
- `getsockopt()` 和 `setsockopt()`：请参阅[套接字选项](#)
- `close()`：通过[虚拟文件系统组件](#)调用
- `read()`、`readv()`、`write()`、`writenv()`：通过[虚拟文件系统组件](#)调用
- `recv()`、`recvmsg()`、`recvfrom()`
- `send()`、`sendmsg()`、`sendto()`
- `select()`：通过[虚拟文件系统组件](#)调用
- `poll()`：ESP-IDF 通过在内部调用 `select()` 实现 `poll()`，因此，建议直接调用 `select()`
- `fcntl()`：请参阅[fcntl\(\)](#)

非标准函数：

- `ioctl()`：请参阅[ioctl\(\)](#)

备注：部分 lwIP 应用程序示例代码使用了带前缀的 BSD API，如 `lwip_socket()`，而非标准 `socket()`。ESP-IDF 支持使用以上两种形式，但更建议使用标准名称。

套接字错误处理

要使套接字应用程序保持稳定，BSD 套接字错误处理代码至关重要。套接字错误处理通常涉及以下几个方面：

- 错误检测
- 获取错误原因代码
- 根据错误原因代码处理错误

在 lwIP 中，处理套接字错误分以下两种情况：

- 套接字 API 返回错误，请参阅[套接字 API 错误](#)。

- `select(int maxfdp1, fd_set *readset, fd_set *writerset, fd_set *exceptset, struct timeval *timeout)` 包含异常描述符，表示套接字出现错误，详情请参阅[select\(\) 错误](#)。

套接字 API 错误 错误检测

- 根据返回值判断套接字 API 是否出错。

获取错误原因代码

- 套接字 API 出错时，其返回值不包含失败原因，可以通过应用程序访问 `errno` 获取错误原因代码。不同返回值具有不同含义，详情请参阅[套接字错误原因代码](#)。

示例：

```
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // 从 errno 获取错误代码
    err = errno;
    return err;
}
```

select() 错误 错误检测

- `select()` 包含异常描述符时的套接字错误。

获取错误原因代码

- 如果 `select()` 报告套接字错误，访问 `errno` 无法获取错误原因代码，此时，应调用 `getsockopt()`。因为当 `select()` 包含异常描述符时，错误代码不会直接赋值给 `errno`。

备注： `getsockopt()` 函数具有以下原型：`int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`。原型可以获取任意类型、任意状态套接字选项的当前值，并将结果存储在 `optval` 中。例如，要在套接字上获取错误代码，可以通过 `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)` 实现。

示例：

```
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // 使用 getsockopt() 获取 select() 异常集
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

套接字错误原因代码 以下是常见错误代码列表。有关标准 POSIX/C 错误代码的详细列表，请参阅 [newlib errno.h](#) 和特定平台扩展 [newlib/platform_include/errno.h](#)。

错误代码	描述
ECONNREFUSED	拒绝连接
EADDRINUSE	地址已在使用中
ECONNABORTED	软件导致连接中断
ENETUNREACH	网络不可达
ENETDOWN	未配置网络接口
ETIMEDOUT	连接超时
EHOSTDOWN	主机已关闭
EHOSTUNREACH	主机不可达
EINPROGRESS	连接已在进行中
EALREADY	套接字已连接
EDESTADDRREQ	需要目标地址
EPROTONOSUPPORT	未知协议

套接字选项

`getsockopt()` 支持获取套接字选项，`setsockopt()` 支持设置套接字选项。

在 ESP-IDF 中，lwIP 并不支持所有标准套接字选项。以下套接字选项受 lwIP 支持：

常见选项 与级别参数 `SOL_SOCKET` 一起使用。

- `SO_REUSEADDR`：如果 `CONFIG_LWIP_SO_REUSE` 已启用，则该选项可用，可以设置 `CONFIG_LWIP_SO_REUSE_RXTOALL` 自定义其行为
- `SO_KEEPAALIVE`
- `SO_BROADCAST`
- `SO_ACCEPTCONN`
- `SO_RCVBUF`：如果 `CONFIG_LWIP_SO_RCVBUF` 已启用，则该选项可用
- `SO_SNDTIMEO / SO_RCVTIMEO`
- `SO_ERROR`：此选项仅支持与 `select()` 一起使用，请参阅[套接字错误处理](#)
- `SO_TYPE`
- `SO_NO_CHECK`：仅适用于 UDP 套接字

IP 选项 与级别参数 `IPPROTO_IP` 一起使用。

- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO`：如果 `CONFIG_LWIP_NETBUF_RECVINFO` 已启用，则该选项可用

对于组播 UDP 套接字：

- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

TCP 选项 只适用于 TCP 套接字，与级别参数 `IPPROTO_TCP` 一起使用。

- `TCP_NODELAY`

与 TCP 保活探测相关的选项：

- `TCP_KEEPAALIVE`：整数值，以毫秒为单位，设置 TCP 保活探测周期
- `TCP_KEEPIDLE`：整数值，以秒为单位，与 `TCP_KEEPAALIVE` 相同
- `TCP_KEEPINTVL`：整数值，以秒为单位，设置保活探测间隔
- `TCP_KEEPCNT`：整数值，设置超时前进行的保活探测次数

IPv6 选项 只适用于 IPv6 套接字，与级别参数 `IPPROTO_IPV6` 一起使用。

- `IPV6_CHECKSUM`
- `IPV6_V6ONLY`

对于组播 IPv6 UDP 套接字：

- `IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP`
- `IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP`
- `IPV6_MULTICAST_IF`
- `IPV6_MULTICAST_HOPS`
- `IPV6_MULTICAST_LOOP`

`fcntl()`

`fcntl()` 函数是设置与文件描述符相关选项的标准 API。在 ESP-IDF 中，使用[虚拟文件系统组件](#)层实现该函数。

当文件描述符为套接字时，仅支持以下 `fcntl()` 值：

- `O_NONBLOCK` 用于置位或清除非阻塞 I/O 模式。`O_NDELAY` 也受支持，与前者功能相同。
- `O_RDONLY`、`O_WRONLY`、`O_RDWR` 标志用于不同的读或写模式，只能用 `F_GETFL` 读取，且无法用 `F_SETFL` 设置。根据连接状况，即两端开启或任一端关闭，TCP 套接字会返回不同模式，而 UDP 套接字始终返回 `O_RDWR`。

`ioctl()`

`ioctl()` 函数以半标准的方式访问 TCP/IP 协议栈的部分内部功能。ESP-IDF 通过[虚拟文件系统组件](#)层实现此函数。

当文件描述符为套接字时，仅支持以下 `ioctl()` 值：

- `FIONREAD` 返回套接字网络 buffer 中接收的待处理字节数。
- `FIONBIO` 和 `fcntl(fd, F_SETFL, O_NONBLOCK, ...)` 相同，也可置位或清除套接字非阻塞 I/O 状态。

4.17.3 Netconn API

lwIP 支持两种较低级别的 API 和 BSD 套接字 API，即 Netconn API 和 Raw API。

lwIP Raw API 适用于单线程设备，无法在 ESP-IDF 中使用。

Netconn API 用于在 lwIP 内部使用 BSD 套接字 API，支持直接从 ESP-IDF 的应用程序调用。相较于 BSD 套接字 API，该 API 占用资源更少。无需提前将数据复制到内部 lwIP buffer，即可使用 Netconn API 发送和接收数据。

重要：乐鑫尚未在 ESP-IDF 中测试 Netconn API，因此**此功能已启用，但尚无官方支持**。对于某些功能，可能只有在从 BSD 套接字 API 中使用时才能正常运作。

有关 Netconn API 的更多信息，请参阅 [lwip/lwip/src/include/lwip/api.h](#) 和 [lwIP 应用程序 **非官方** 开发手册的一部分](#)。

4.17.4 lwIP FreeRTOS 任务

lwIP 创建了专用的 TCP/IP FreeRTOS 任务，处理来自其他任务的套接字 API 请求。

以下配置项可用于修改任务，并调整向 TCP/IP 任务发送数据和从 TCP/IP 任务接收数据的队列（邮箱）：

- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`

- [CONFIG_LWIP_TCPIP_TASK_STACK_SIZE](#)
- [CONFIG_LWIP_TCPIP_TASK_AFFINITY](#)

4.17.5 IPv6 支持

系统支持 IPv4 和 IPv6 的双栈功能，并默认启用这两种协议。如无需要，可将其禁用，请参阅[最小内存使用](#)。

在 ESP-IDF 中，IPv6 支持仅限 **无状态自动配置**，不支持 **有状态配置**，上游的 lwIP 也不支持 **有状态配置**。IPv6 地址配置通过以下协议或服务定义：

- 支持 **SLAAC IPv6** 无状态地址配置 (RFC-2462)
- 支持 **DHCPv6 IPv6** 动态主机配置协议 (RFC-8415)

以上两种地址配置默认处于禁用状态，设备仅使用链路本地地址或静态定义的地址。

无状态自动配置流程

要通过路由器通告协议启用地址自动配置，请启用此配置选项：

- [CONFIG_LWIP_IPV6_AUTOCONFIG](#)

该配置选项启用了所有网络接口的 IPv6 自动配置。而在上游 lwIP 中，需要设置 `netif->ip6_autoconfig_enabled=1`，针对每个 netif 明确启用自动配置。

DHCPv6

lwIP 中的 DHCPv6 非常简单，仅支持无状态配置，可通过以下配置选项启用：

- [CONFIG_LWIP_IPV6_DHCP6](#)

由于 DHCPv6 仅在无状态配置下工作，因此还需要通过[CONFIG_LWIP_IPV6_AUTOCONFIG](#) 启用**无状态自动配置流程**。

此外，还需要使用以下语句，在应用程序代码中明确启用 DHCPv6：

```
dhcp6_enable_stateless(netif);
```

IPv6 自动配置中的 DNS 服务器

要自动配置 DNS 服务器，尤其是在仅使用 IPv6 的网络中配置，可使用以下两种选项：

- 递归域名系统 (DNS)，属于邻居发现协议 (NDP) 的一部分，可使用[无状态自动配置流程](#)。DNS 服务器的数量必须设置为[CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS](#)，该选项默认禁用，即置位为 0。
- DHCPv6 无状态配置，使用[DHCPv6](#) 配置 DNS 服务器。注意，此配置假设 IPv6 路由通告标志 (RFC-5175) 进行了如下设置
 - 管理地址配置标志 (Managed Address Configuration Flag) = 0
 - 其他配置标志 (Other Configuration Flag) = 1

4.17.6 ESP-lwIP 自定义修改

补充内容

以下代码均为新增代码，尚未包含至上游 lwIP 版本：

线程安全的套接字 调用 `close()` 可以从不同于创建套接字的线程中关闭该套接字。该调用持续阻塞，直至其他任务中使用该套接字的函数调用返回。

然而，任务处于主动等待 `select()` 或 `poll()` API 的状态时，无法删除该任务。销毁任务前，这些 API 必须先退出，否则可能会破坏内部数据结构，并导致后续 lwIP 崩溃。这些 API 在栈上分配了全局引用的回调指针，因此，在未完全卸载栈的情况下删除任务时，lwIP 仍可以持有指向已删除栈的指针。

按需定时器 lwIP 中的 IGMP 和 MLD6 功能都会初始化一个定时器，以便在特定时间触发超时事件。

即便没有活动的超时事件，lwIP 也会默认始终启用这些定时器，增加自动 Light-sleep 模式下的 CPU 使用率和功耗。ESP-LWIP 则默认将各定时器设置为按需使用，即只有在有待处理事件时启用。

如果要返回默认 lwIP 设置，即始终启用定时器，请禁用 `CONFIG_LWIP_TIMERS_ONDEMAND`。

lwIP 定时器 API 不使用 Wi-Fi 时，可以通过 API 关闭 lwIP 定时器，减少功耗。

以下 API 函数均受支持，详情请参阅 `lwip/lwip/src/include/lwip/timeouts.h`。

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`

附加套接字选项

- 目前已实现部分标准 IPv4 和 IPv6 组播套接字选项，详情请参阅 [套接字选项](#)。
- 使用 `IPV6_V6ONLY` 套接字选项，可以设置仅使用 IPv6 的 UDP 和 TCP 套接字，而 lwIP 一般只支持 TCP 套接字。

IP 层特性

- IPv4 源地址基础路由实现不同
- 支持 IPv4 映射 IPv6 地址

NAPT 和端口转发 支持 IPv4 网络地址端口转换 (NAPT) 和端口转发。然而，仅限于单个接口启用 NAPT。

- 要在两个接口之间使用 NAPT 转发数据包，必须在连接到目标网络的接口上启用 NAPT。例如，为了通过 Wi-Fi 接口为以太网流量启用互联网访问，必须在以太网接口上启用 NAPT。
- NAPT 的使用示例可参考 [network/vlan_support](#)。

自定义 lwIP 钩子 原始 lwIP 支持通过 `LWIP_HOOK_FILENAME` 实现自定义的编译时修改。ESP-IDF 端口层已使用该文件，但仍支持通过由宏 `ESP_IDF_LWIP_HOOK_FILENAME` 定义的头文件，在 ESP-IDF 中包含并实现自定义添加。以下示例展示了向构建过程添加自定义钩子文件的过程，其中钩子文件名为 `my_hook.h`，位于项目的主文件夹中：

```
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_options(${lwip} PRIVATE "-I${PROJECT_DIR}/main")
target_compile_definitions(${lwip} PRIVATE "-DESP_IDF_LWIP_HOOK_FILENAME=\"my_hook.h\"")
```

使用 ESP-IDF 构建系统自定义 lwIP 选项 组件配置菜单可以配置常见的 lwIP 选项，但是一些自定义选项需要通过命令行添加。CMake 函数 `target_compile_definitions()` 可以用于定义宏，示例如下：

```
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_definitions(${lwip} PRIVATE "-DETHARP_SUPPORT_VLAN=1")
```

使用这种方法可能无法定义函数式宏。虽然 GCC 支持此类定义，但是未必所有编译器都会接受。为了解决这一限制，可以使用 `add_definitions()` 函数为整个项目定义宏，例如 `add_definitions("-DFALLBACK_DNS_SERVER_ADDRESS(addr)=\"IP_ADDR4((addr), 8, 8, 8, 8)\")`。

另一种方法是在头文件中定义函数式宏，该头文件将预先包含在 lwIP 钩子文件中，请参考[自定义 lwIP 钩子](#)。

限制

如[适配的 API](#)所述，ESP-IDF 中的 lwIP 扩展功能仍然受到全局 DNS 限制的影响。为了在应用程序代码中解决这一限制，可以使用 `FALLBACK_DNS_SERVER_ADDRESS()` 宏定义所有接口能够访问的全局 DNS 备用服务器，或者单独维护每个接口的 DNS 服务器，并在默认接口更改时重新配置。

在 UDP 套接字上重复调用 `send()` 或 `sendto()` 最终可能会导致错误。此时 `errno` 报错为 `ENOMEM`，错误原因是底层网络接口驱动程序中的 `buffer` 大小有限。当所有驱动程序的传输 `buffer` 已满时，UDP 传输事务失败。如果应用程序需要发送大量 UDP 数据报，且不希望发送方丢弃数据报，建议检查错误代码，采用短延迟的重传机制。

4.17.7 性能优化

影响 TCP/IP 性能因素较多，可以从多方面进行优化。经调整，ESP-IDF 的默认设置已在 TCP/IP 的吞吐量、响应时间和内存使用间达到平衡。

最大吞吐量

乐鑫使用 `iperf` 测试应用程序 <https://iperf.fr/> 测试了 ESP-IDF 的 TCP/IP 吞吐量。关于实际测试和优化配置的更多信息，请参考[提高网络速度](#)。

重要： 建议逐步应用更改，并在每次更改后，通过特定应用程序的工作负载检查性能。

- 如果系统中有许多任务抢占 CPU 时间，可以考虑调整 lwIP 任务的 CPU 亲和性 (`CONFIG_LWIP_TCPIP_TASK_AFFINITY`)，并以固定优先级 (18, `ESP_TASK_TCPIP_PRIO`) 运行。为优化 CPU 使用，可以考虑将竞争任务分配给不同核心，或将其优先级调整至较低值。有关内置任务优先级的更多详情，请参阅[内置任务优先级](#)。
- 如果使用仅带有套接字参数的 `select()` 函数，禁用 `CONFIG_VFS_SUPPORT_SELECT` 可以更快地调用 `select()`。
- 如果有足够的空闲 IRAM，可以选择 `CONFIG_LWIP_IRAM_OPTIMIZATION` 和 `CONFIG_LWIP_EXTRA_IRAM_OPTIMIZATION`，提高 TX/RX 吞吐量。

最低延迟

除增加 `buffer` 大小外，大多数增加吞吐量的设置会减少 lwIP 函数占用 CPU 的时间，进而降低延迟，缩短响应时间。

- 对于 TCP 套接字，lwIP 支持设置标准的 `TCP_NODELAY` 标记以禁用 Nagle 算法。

最小内存使用

由于 RAM 按需从堆中分配，多数 lwIP 的 RAM 使用也按需分配。因此，更改 lwIP 设置减少 RAM 使用时，或许不会改变空闲时的 RAM 使用量，但可以改变高峰期的 RAM 使用量。

- 减少 `CONFIG_LWIP_MAX_SOCKETS` 可以减少系统中的最大套接字数量。更改此设置，会让处于 `WAIT_CLOSE` 状态的 TCP 套接字在需要打开新套接字时更快地关闭和复用，进一步降低峰值 RAM 使用量。

- 减少 `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`、`CONFIG_LWIP_TCP_RECVMBOX_SIZE` 和 `CONFIG_LWIP_UDP_RECVMBOX_SIZE` 可以减少 RAM 使用量，但会影响吞吐量，具体取决于使用情况。
- 减少 `CONFIG_LWIP_TCP_ACCEPTMBOX_SIZE` 可以通过限制同时接受的连接数来减少 RAM 使用量。
- 减少 `CONFIG_LWIP_TCP_MSL` 和 `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT` 可以减少系统中的最大分段寿命，同时会使处于 `TIME_WAIT` 和 `FIN_WAIT_2` 状态的 TCP 套接字能更快地关闭和复用。
- 禁用 `CONFIG_LWIP_IPV6` 可以在系统启动时节省大约 39 KB 的固件大小和 2 KB 的 RAM，并在运行 TCP/IP 栈时节省 7 KB 的 RAM。如果无需支持 IPv6，可以禁用 IPv6，减少 flash 和 RAM 占用。
- 禁用 `CONFIG_LWIP_IPV4` 可以在系统启动时节省大约 26 KB 的固件大小和 600 B 的 RAM，并在运行 TCP/IP 栈时节省 6 KB 的 RAM。如果本地网络仅支持 IPv6 配置，可以禁用 IPv4，减少 flash 和 RAM 占用。

最大 buffer 使用 lwIP 消耗的最大堆内存即 lwIP 驱动程序 **理论上可能消耗的最大内存**，通常取决于以下因素：

- 创建 UDP 连接所需的内存： `lwip_udp_conn`
- 创建 TCP 连接所需的内存： `lwip_tcp_conn`
- 应用程序拥有的 UDP 连接数量： `lwip_udp_con_num`
- 应用程序拥有的 TCP 连接数量： `lwip_tcp_con_num`
- TCP 的 TX 窗口大小： `lwip_tcp_tx_win_size`
- TCP 的 RX 窗口大小： `lwip_tcp_rx_win_size`

因此，lwIP 消耗的最大堆内存可以用以下公式计算：
$$\text{lwip_dynamic_peek_memory} = (\text{lwip_udp_con_num} * \text{lwip_udp_conn}) + (\text{lwip_tcp_con_num} * (\text{lwip_tcp_tx_win_size} + \text{lwip_tcp_rx_win_size} + \text{lwip_tcp_conn}))$$

某些基于 TCP 的应用程序只需要一个 TCP 连接。然而，当出现错误（如发送失败）时，应用程序可能会关闭此 TCP 连接，并创建一个新的连接。根据 TCP 状态机和 RFC793，关闭 TCP 连接可能需要很长时间，这可能导致系统中同时存在多个 TCP 连接。

4.18 存储器类型

ESP32-H2 芯片具有不同类型的存储器和灵活的存储器映射特性，本小节将介绍 ESP-IDF 默认如何使用这些功能。

ESP-IDF 区分了指令总线 (IRAM、IROM、RTC FAST memory) 和数据总线 (DRAM、DROM)。指令存储器是可执行的，只能通过 4 字节对齐字读取或写入。数据存储器不可执行，可以通过单独的字节操作访问。有关总线的更多信息，请参阅 [ESP32-H2 技术参考手册 > 系统和存储器 \[PDF\]](#)。

4.18.1 DRAM (数据 RAM)

非常量静态数据 (.data 段) 和零初始化数据 (.bss 段) 由链接器放入内部 SRAM 作为数据存储。此区域中的剩余空间可在程序运行时用作堆。

备注：静态分配的 DRAM 的最大值也会因编译应用程序的 *IRAM (指令 RAM)* 大小而减小。运行时可用的堆内存会因应用程序的总静态 IROM 和 DRAM 使用而减少。

常量数据也可能被放入 DRAM，例如当它被用于 non-flash-safe ISR 时（具体请参考 [如何将代码放入 IROM](#)）。

”noinit” DRAM

可以将 `__NOINIT_ATTR` 宏用作属性，从而将数据放入 .noinit 部分。放入该部分的值在启动时不会被初始化，在软件重启后也会保持值不变。

示例:

```
__NOINIT_ATTR uint32_t noinit_data;
```

4.18.2 IRAM (指令 RAM)

备注: 内部 SRAM 中不用于指令 RAM 的部分都会作为 **DRAM (数据 RAM)** 供静态数据和动态分配 (堆) 使用。

何时需要将代码放入 IRAM

以下情况时应将部分应用程序放入 IRAM:

- 如果在注册中断处理程序时使用了 `ESP_INTR_FLAG_IRAM`, 则中断处理程序必须要放入 IRAM。更多信息可参考 [IRAM 安全中断处理程序](#)。
- 可将一些时序关键代码放入 IRAM, 以减少从 flash 中加载代码造成的相关损失。ESP32-H2 通过 MMU 缓存从 flash 中读取代码和数据。在某些情况下, 将函数放入 IRAM 可以减少由缓存未命中造成的延迟, 从而显著提高函数的性能。

如何将代码放入 IRAM

借助链接器脚本, 一些代码会被自动放入 IRAM 区域中。

如果要将某些特定的应用程序代码放入 IRAM, 可以使用 [链接器脚本生成机制](#) 功能并在组件中添加链接器脚本片段文件, 在该片段文件中, 可以给整个目标源文件或其中的个别函数打上 `noflash` 标签。更多信息可参考 [链接器脚本生成机制](#)。

或者, 也可以通过使用 `IRAM_ATTR` 宏在源代码中指定需要放入 IRAM 的代码:

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

放入 IRAM 后可能会导致 IRAM 安全中断处理程序出现问题:

- `IRAM_ATTR` 函数中的字符串或常量可能没有自动放入 RAM 中, 这时可以使用 `DRAM_ATTR` 属性进行标记, 或者也可以使用链接器脚本方法将它们自动放入 RAM 中。

```
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

注意, 具体哪些数据需要被标记为 `DRAM_ATTR` 可能很难确定。如果没有被标记为 `DRAM_ATTR`, 某些变量或表达式有时会被编译器别为常量 (即使它们没有被标记为 `const`) 并将其放入 flash 中。

- GCC 的优化会自动生成跳转表或 `switch/case` 查找表, 并将这些表放在 flash 中。IDF 默认在编译所有文件时使用 `-fno-jump-tables -fno-tree-switch-conversion` 标志来避免这种情况。

可以为不需要放置在 IRAM 中的单个源文件重新启用跳转表优化。关于如何在编译单个源文件时添加 `-fno-jump-tables -fno-tree-switch-conversion` 选项, 请参考 [组件编译控制](#)。

4.18.3 IROM (代码从 flash 中运行)

如果一个函数没有被显式地声明放在 IRAM 或者 RTC 存储器中，则它会放在 flash 中。由于 IRAM 空间有限，应用程序的大部分二进制代码都需要放入 IROM 中。

在启动过程中，从 IRAM 中运行的引导加载程序配置 MMU flash 缓存，将应用程序的指令代码区域映射到指令空间。通过 MMU 访问的 flash 使用一些内部 SRAM 进行缓存，访问缓存的 flash 数据与访问其他类型的内部存储器一样快。

4.18.4 DROM (数据存储在 flash 中)

默认情况下，链接器将常量数据放入一个映射到 MMU flash 缓存的区域中。这与 IROM (代码从 flash 中运行) 部分相同，但此处用于只读数据而不是可执行代码。

唯一没有默认放入 DROM 的常量数据是被编译器嵌入到应用程序代码中的字面常量。这些被放置在周围函数的可执行指令中。

DRAM_ATTR 属性可以用来强制将常量从 DROM 放入 DRAM (数据 RAM) 部分 (见上文)。

4.18.5 RTC FAST memory (RTC 快速存储器)

备注：对于 ESP32-H2，RTC 存储器已被重新命名为 LP (低功耗) 存储器。在与 ESP32-H2 相关的 IDF 代码、文档以及技术参考手册中，可能会出现这两个术语混用的情况。

RTC FAST memory 的同一区域既可以作为指令存储器也可以作为数据存储器进行访问。从深度睡眠模式唤醒后必须要运行的代码要放在 RTC 存储器中，更多信息请查阅文档[深度睡眠](#)。

除非禁用 `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` 选项，否则剩余的 RTC FAST memory 会被添加到堆中。该部分内存可以和 DRAM (数据 RAM) 互换使用，但是访问速度稍慢一点。

4.18.6 具备 DMA 功能

大多数的 DMA 控制器 (比如 SPI、sdmmc 等) 都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量而不是堆栈中。使用 DMA_ATTR 宏可以声明该全局/本地的静态变量具备 DMA 功能，例如：

```
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

或者：

```
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
```

(下页继续)

```
.length = 8 * sizeof(buffer),
};
spi_device_transmit(spi, &temp);
// 其它程序
}
```

也可以通过使用 `MALLOC_CAP_DMA` 标志来动态分配具备 DMA 能力的内存缓冲区。

4.18.7 在堆栈中放置 DMA 缓冲区

可以在堆栈中放置 DMA 缓冲区，但建议尽量避免。如果实在有需要的话，请注意以下几点：

- 在函数中使用 `WORD_ALIGNED_ATTR` 宏来修饰变量，将其放在适当的位置上，比如：

```
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something"; //否则 ↪
    ↪buffer 会被存储在 stuff 变量后面
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

4.19 OpenThread

OpenThread 是在 802.15.4 MAC 层上运行的 IP 协议栈，支持 mesh 网络，具有低功耗特性。

4.19.1 OpenThread 协议栈运行模式

在乐鑫的芯片上，OpenThread 可按以下模式运行：

独立节点模式

在此模式下，完整的 OpenThread 协议栈及其应用层在同一芯片上运行，适用于支持 15.4 无线通信协议的芯片，如 ESP32-H2, ESP32-C6。

无线协处理器 (RCP) 模式

在此模式下，芯片通过连接到运行 OpenThread IP 协议栈的另一个主机，代表主机发送和接收 15.4 数据包。该模式适用于支持 15.4 无线通信协议的芯片，如 ESP32-H2, ESP32-C6。对于芯片和主机之间的通信方式，目前 ESP-IDF 支持 SPI 或 UART。考虑到传输延迟，建议使用 SPI。

OpenThread 主机模式

在此模式下，不支持 15.4 无线通信协议的芯片可以连接到 RCP，并在主机模式下运行 OpenThread。这种模式支持在 Wi-Fi 芯片上（如 ESP32、ESP32-S2、ESP32-S3 和 ESP32-C3 等）运行 OpenThread。下图展示了设备在不同模式下的工作方式：

图 62: OpenThread 设备模式

4.19.2 编写 OpenThread 应用程序

要学习编写 OpenThread 应用程序，可以从 OpenThread 应用示例 [openthread/ot_cli](#) 开始。该示例中展示了简单的 OpenThread 网络组网流程，以及在 OpenThread 网络上，如何实现基于套接字的服务器和客户端之间的简单通信。

初始化 OpenThread 协议栈所需的准备

- s1.1: 主任务调用 `esp_vfs_eventfd_register()`，初始化 eventfd 虚拟文件系统。eventfd 文件系统用于实现 OpenThread 协议栈中的任务通知。
- s1.2: 主任务调用 `nvs_flash_init()` 初始化 NVS，即 Thread 网络数据的存储位置。
- s1.3: **可选**。主任务调用 `esp_netif_init()`，为 Thread 创建网络接口。
- s1.4: 主任务调用 `esp_event_loop_create()` 创建系统事件任务，并初始化应用程序事件的回调函数。

OpenThread 协议栈初始化

- s2.1: 调用 `esp_openthread_init()` 初始化 OpenThread 协议栈。

OpenThread 网络接口初始化

以下为 **可选**步骤，仅在应用程序需为 Thread 创建网络接口时使用。

- s3.1: 使用 `ESP_NETIF_DEFAULT_OPENTHREAD` 调用 `esp_netif_new()`，创建网络接口。
- s3.2: 调用 `esp_openthread_netif_glue_init()`，创建 OpenThread 网络接口处理程序。
- s3.3: 调用 `esp_netif_attach()` 将处理程序附加到网络接口。

OpenThread 主循环

- s4.3: 调用 `esp_openthread_launch_mainloop()` 启动 OpenThread 主循环。注意，OpenThread 主循环属于忙等循环，仅在 OpenThread 协议栈终止后返回。

调用 OpenThread API

OpenThread API 非线程安全。当从其他任务中调用 OpenThread API 时，请确保以 `esp_openthread_lock_acquire()` 获取锁，并在之后以 `esp_openthread_lock_release()` 释放锁。

卸载 OpenThread 协议栈

要在应用程序中卸载 OpenThread 协议栈，请遵循以下步骤：

- 如果创建了 OpenThread 网络接口，请调用 `esp_netif_destroy()` 和 `esp_openthread_netif_glue_deinit()` 卸载 OpenThread 协议栈。
- 调用 `esp_openthread_deinit()` 卸载 OpenThread 协议栈。

4.19.3 OpenThread 边界路由器

OpenThread 边界路由器连接了 Thread 网络和其他 IP 网络，提供 IPv6 连通性、服务注册和委托功能。

要在 ESP 芯片上启用 OpenThread 边界路由器，需要将 RCP 连接到具备 Wi-Fi 功能的芯片上，如 ESP32。

在初始化过程中，调用 `esp_openthread_border_router_init()` 会启用所有边界路由功能。

要了解更多有关边界路由器的详细信息，请参阅 [openthread/ot_br](#) 示例和其中的 README 文件。

4.20 分区表

4.20.1 概述

每片 ESP32-H2 的 flash 可以包含多个应用程序，以及多种不同类型的数据（例如校准数据、文件系统数据、参数存储数据等）。因此，我们在 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0xC00 字节，最多可以保存 95 条分区表条目。MD5 校验和附加在分区表之后，用于在运行时验证分区表的完整性。分区表占据了整个 flash 扇区，大小为 0x1000 (4 KB)。因此，它后面的任何分区至少需要位于 (默认偏移地址) + 0x1000 处。

分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app、data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单 (`idf.py menuconfig`)，并在 `CONFIG_PARTITION_TABLE_TYPE` 下选择一个预定义的分区表：

- "Single factory app, no OTA"
- "Factory app, two OTA definitions"

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 `idf.py partition-table`，即可以打印当前使用分区表的信息摘要。

4.20.2 内置分区表

以下是“Single factory app, no OTA”选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为“factory”的二进制应用程序，且启动加载器将默认加载这个应用程序。
- 分区表中还定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是“Factory app, two OTA definitions”选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为“app”，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序 (factory)，其余两个为 OTA 应用程序 (ota_0, ota_1)。
- 新增了一个名为“otadata”的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果“otadata”分区为空，则会执行出厂程序。

4.20.3 创建自定义分区表

如果在 menuconfig 中选择了“Custom partition table CSV”，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是在 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件：

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000
otadata, data, ota, 0xd000, 0x2000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
ota_0, app, ota_0, , 1M
ota_1, app, ota_1, , 1M
nvs_key, data, nvs_keys, , 0x1000
```

- 字段之间的空格会被忽略，任何以 # 开头的行（注释）也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 Offset 字段可以为空，gen_esp32part.py 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字节，其中包括一个空字节（之后的内容将被截断）。该字段对 ESP32-H2 并不是特别重要。

Type 字段

Type 字段可以指定为 `app` (0x00) 或者 `data` (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE）。注意，0x00-0x3F 不得使用（预留给 `esp-idf` 的核心功能）。

如果你的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考 `esp_partition_type_t` 关于 `app` 和 `data` 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分区类型，需要在 `esp_partition_type_t` 中使用整数，从而与分区 API 一起使用。例如：

```
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t) 0x40;
```

注意，启动加载器将忽略 `app` (0x00) 和 `data` (0x01) 以外的其他分区类型。

SubType 字段

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，`esp-idf` 仅仅规定了“`app`”和“`data`”两种分区类型的子类型含义。

参考 `esp_partition_subtype_t`，以了解 ESP-IDF 定义的全部子类型列表，包括：

- 当 Type 定义为 `app` 时，SubType 字段可以指定为 `factory` (0x00)、`ota_0` (0x10) … `ota_15` (0x1F) 或者 `test` (0x20)。
 - `factory` (0x00) 是默认的 `app` 分区。启动加载器将默认加载该应用程序。但如果存在类型为 `data/ota` 分区，则启动加载器将加载 `data/ota` 分区中的数据，进而判断启动哪个 OTA 镜像文件。
 - * OTA 升级永远都不会更新 `factory` 分区中的内容。
 - * 如果你希望在 OTA 项目中预留更多 flash，可以删除 `factory` 分区，转而使用 `ota_0` 分区。
 - `ota_0` (0x10) … `ota_15` (0x1F) 为 OTA 应用程序分区，启动加载器将根据 OTA 数据分区中的数据来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序应至少拥有 2 个 OTA 应用程序分区 (`ota_0` 和 `ota_1`)。更多详细信息，请参考 [OTA 文档](#)。
 - `test` (0x20) 为预留的子类型，用于工厂测试流程。如果没有其他有效 `app` 分区，`test` 将作为备选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。详细信息请查阅 [从测试固件启动](#)。
- 当 Type 定义为 `data` 时，SubType 字段可以指定为 `ota` (0x00)、`phy` (0x01)、`nvs` (0x02)、`nvs_keys` (0x04) 或者其他组件特定的子类型（请参考 [子类型枚举](#)）。
 - `ota` (0) 即 [OTA 数据分区](#)，用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000。更多详细信息，请参考 [OTA 文档](#)。
 - `phy` (1) 分区用于存放 PHY 初始化数据，从而保证可以为每个设备单独配置 PHY，而非必须采用固件中的统一 PHY 初始化数据。
 - * 默认配置下，`phy` 分区并不启用，而是直接将 `phy` 初始化数据编译至应用程序中，从而节省分区表空间（直接将此分区删掉）。
 - * 如果需从此分区加载 `phy` 初始化数据，请打开项目配置菜单 (`idf.py menuconfig`)，并且使能 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION` 选项。此时，还需要手动将 `phy` 初始化数据烧至设备 flash (`esp-idf` 编译系统并不会自动完成该操作)。
 - `nvs` (2) 是专门给 [非易失性存储 \(NVS\) API](#) 使用的分区。
 - * 用于存储每台设备的 PHY 校准数据（注意，并不是 PHY 初始化数据）。
 - * NVS API 还可以用于其他应用程序数据。
 - * 强烈建议为 NVS 分区分配至少 0x3000 字节空间。
 - * 如果使用 NVS API 存储大量数据，请增加 NVS 分区的大小（默认是 0x6000 字节）。
 - `nvs_keys` (4) 是 NVS 秘钥分区。详细信息，请参考 [非易失性存储 \(NVS\) API](#) 文档。
 - * 用于存储加密密钥（如果启用了 NVS 加密功能）。
 - * 此分区应至少设定为 4096 字节。
 - ESP-IDF 还支持其他用于数据存储的预定义子类型，包括：
 - * `coredump` (0x03) 用于在使用自定义分区表 CSV 文件时存储核心转储，详情请参阅 [核心转储](#)。
 - * `efuse` (0x05) 使用 [虚拟 eFuse](#) 模拟 eFuse 位。

- * `undefined (0x06)` 隐式用于未指定子类型（即子类型为空）的数据分区，但也可显式将其标记为未定义。
 - * `fat (0x81)` 用于 *FAT* 文件系统。
 - * `spiffs (0x82)` 用于 *SPIFFS* 文件系统。
 - * `littlefs (0x83)` 用于 *LittleFS* 文件系统，详情可参阅 [storage/littlefs](#) 示例。
- 如果分区类型是由应用程序定义的任意值 (0x40-0xFE)，那么 `subtype` 字段可以是由应用程序选择的任何值 (0x00-0xFE)。请注意，如果用 C++ 编写，应用程序定义的子类型值需要转换为 `esp_partition_type_t`，从而与分区 API 一起使用。

额外分区 SubType 字段

组件可以通过设置 `EXTRA_PARTITION_SUBTYPES` 属性来定义额外的分区子类型。`EXTRA_PARTITION_SUBTYPES` 是一个 CMake 列表，其中的每个条目由字符串组成，以逗号为分隔，格式为 `<type>, <subtype>, <value>`。构建系统通过该属性会自动添加额外的子类型，并在 `esp_partition_subtype_t` 中插入名为 `ESP_PARTITION_SUBTYPE_<type>_<subtype>` 的字段。项目可以使用这个子类型来定义分区表 CSV 文件中的分区，并使用 `esp_partition_subtype_t` 中的新字段。

偏移地址 (Offset) 和大小 (Size) 字段

- 偏移地址表示 SPI flash 中的分区地址，扇区大小为 0x1000 (4 KB)。因此，偏移地址必须是 4 KB 的倍数。
- 若 CSV 文件中的分区偏移地址为空，则该分区会接在前一个分区之后；若为首个分区，则将接在分区表之后。
- app 分区的偏移地址必须与 0x10000 (64 KB) 对齐。如果偏移字段留空，则 `gen_esp32part.py` 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64 KB) 对齐，则该工具会报错。
- app 分区的大小必须与 flash 扇区大小对齐。为 app 分区指定未对齐的大小将返回错误。
- app 分区的大小和偏移地址可以采用十进制数或是以 0x 为前缀的十六进制数，且支持 K 或 M 的倍数单位 (K 和 M 分别代表 1024 和 1024*1024 字节)。

如果你希望允许分区表中的分区采用任意起始偏移量 (`CONFIG_PARTITION_TABLE_OFFSET`)，请将分区表 (CSV 文件) 中所有分区的偏移字段都留空。注意，此时，如果你更改了分区表中任意分区的偏移地址，则其他分区的偏移地址也会跟着改变。这种情况下，如果你之前还曾设定某个分区采用固定偏移地址，则可能造成分区表冲突，从而导致报错。

Flags 字段

目前支持 `encrypted` 和 `readonly` 标记：

- 如果 Flags 字段设置为 `encrypted`，且已启用 *flash 加密* 功能，则该分区将会被加密。

备注： 无论是否设置 Flags 字段，app 分区都将保持加密。

- 如果 Flags 字段设置为 `readonly`，则该分区为只读分区。`readonly` 标记仅支持除 `ota` 和 `coredump` 子类型外的 `data` 分区。使用该标记，防止意外写入如出厂数据分区等包含关键设备特定配置数据的分区。

备注： 在任何写入模式下 (`w`, `w+`, `a`, `a+`, `r+`)，尝试通过 C 文件 I/O API 打开文件 (`fopen`) 的操作都将失败并返回 `NULL`。除 `O_RDONLY` 外，`open` 与任何标志一同使用都将失败并返回 `-1`，全局变量 `errno` 也将设置为 `EROFS`。上述情况同样适用于通过其他 POSIX 系统调用函数执行写入或擦除的操作。在只读分区上，以读写模式打开 NVS 的句柄将失败并返

回 `ESP_ERR_NOT_ALLOWED` 错误代码，使用 `esp_partition` 或 `spi_flash` 等较低级别的 API 进行写入操作也将返回 `ESP_ERR_NOT_ALLOWED` 错误代码。

可以使用冒号连接不同的标记，来同时指定多个标记，如 `encrypted:readonly`。

4.20.4 生成二进制分区表

烧写到 ESP32-H2 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，`partition_table/gen_esp32part.py` 工具可以实现 CSV 和二进制文件之间的转换。

如果你在项目配置菜单 (`idf.py menuconfig`) 中设置了分区表 CSV 文件的名称，然后构建项目或执行 `idf.py partition-table`。这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件：

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件：

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

在标准输出 (stdout) 上，打印二进制分区表的内容（运行 `idf.py partition-table` 时展示的信息摘要也是这样生成的）：

```
python gen_esp32part.py binary_partitions.bin
```

4.20.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查：

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考[引导加载程序大小](#)。
- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

备注：即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

MD5 校验和

二进制格式的分区表中含有一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 `gen_esp32part.py` 的 `--disable-md5sum` 选项或者 `CONFIG_PARTITION_TABLE_MD5` 选项关闭 MD5 校验。

4.20.6 烧写分区表

- `idf.py partition-table-flash`：使用 `esptool.py` 工具烧写分区表。
- `idf.py flash`：会烧写所有内容，包括分区表。

在执行 `idf.py partition-table` 命令时，手动烧写分区表的命令也将打印在终端上。

备注：分区表的更新并不会擦除根据旧分区表存储的数据。此时，可以使用 `idf.py erase-flash` 命令或者 `esptool.py erase_flash` 命令来擦除 `flash` 中的所有内容。

4.20.7 分区工具 (`parttool.py`)

`partition_table` 组件中有分区工具 `parttool.py`，可以在目标设备上完成分区相关操作。该工具有如下用途：

- 读取分区，将内容存储到文件中 (`read_partition`)
- 将文件中的内容写至分区 (`write_partition`)
- 擦除分区 (`erase_partition`)
- 检索特定分区的名称、偏移、大小和 `flag`（“加密”）标志等信息 (`get_partition_info`)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API

首先请确保已导入 `parttool` 模块。

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table") # parttool.
↳py 位于 $IDF_PATH/components/partition_table 下

sys.path.append(parttool_dir) # 使能 Python 寻找 parttool 模块
from parttool import * # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 `ParttoolTarget`：

```
# 创建 parttool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 `ParttoolTarget` 在目标设备上完成操作：

```
# 擦除名为 'storage' 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存至文件 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 'factory.bin' 文件的内容写至 'factory' 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 `PartitionName`、`PartitionType` 或 `PARTITION_BOOT_DEFAULT` 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。

命令行界面

`parttool.py` 的命令行界面具有如下结构：

```
parttool.py [command-args] [subcommand] [subcommand-args]
```

- `command-args` - 执行主命令 (`parttool.py`) 所需的实际参数，多与目标设备有关
- `subcommand` - 要执行的操作
- `subcommand-args` - 所选操作的实际参数

```
# 擦除名为 'storage' 的分区
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存到 'spiffs.bin' 文件
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
↳subtype=spiffs --output "spiffs.bin"

# 将 'factory.bin' 文件中的内容写入到 'factory' 分区
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
↳"factory.bin"

# 打印默认启动分区的大小
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --
↳info size
```

更多信息可用 `--help` 指令查看：

```
# 显示可用的子命令和主命令描述
parttool.py --help

# 显示子命令的描述
parttool.py [subcommand] --help
```

4.21 性能

ESP-IDF 预设了默认设置，旨在性能、资源使用和可用功能之间进行权衡。

本指南详述了如何优化固件应用程序，以提高特定方面的性能。这一过程通常涉及到性能之间的权衡，例如限制部分可用功能，或者牺牲某性能以满足另一性能的要求，例如通过使用更多内存换取更快的运行速度。

4.21.1 如何优化性能

1. 确定应用程序的关键性能要求，例如控制某个网络操作的响应时间、控制启动时间、或在某个外设中实现特定的数据吞吐量。
2. 确定衡量该性能的方法（下文指南中概述了一些方法）。
3. 修改代码和项目配置，比较新旧测量结果。
4. 重复第三步，直到性能达到第一步中设定的要求为止。

4.21.2 指南

速度优化

概述 提高代码执行速度是提升软件性能的关键要素，该优化也可能带来其他积极影响，比如降低总体功耗。然而，提高代码执行速度可能会牺牲其他性能，如[最小化二进制文件大小](#)。

决定优化目标 如果应用程序固件中的某个函数仅每周在后台执行一次，其执行时间是 10 ms 还是 100 ms 对整体性能的影响或可忽略不计。但如果某个函数以 10 Hz 的频率持续执行，其执行时间是 10 ms 还是 100 ms 就会对系统性能产生显著影响。

大多数应用程序固件中，只有一小部分函数需要优化性能，例如频繁执行的函数，或者必须满足应用程序对延迟或吞吐量的要求的函数。应针对这些特定函数优化其执行速度。

测量性能 想要提升某方面性能，首先要对其进行测量。

基本性能测量方法 可以直接测量与外部交互的性能，例如，测量一般网络性能可以参考 [wifi/ipperf](#) 和 [ethernet/ipperf](#)，或者使用示波器或逻辑分析仪来测量与设备外设的交互时间。

此外，另一种测量性能的方法是在代码中添加计时测量：

```
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();

    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // 需要测量的代码
    }

    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %llu milliseconds (%llu microseconds per_
↪invocation)\n",
           MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

通过多次执行目标代码可以降低其他因素的影响，例如实时操作系统 (RTOS) 的上下文切换、测量的开销等。

- 使用 `esp_timer_get_time()` 可以生成微秒级精度的“墙钟”时间戳，但每次调用计时函数都会产生适量开销。
- 也可以使用标准 Unix 函数 `gettimeofday()` 和 `utime()` 来进行计时测量，尽管其开销略高一些。
- 此外，代码中包含 `hal/cpu_hal.h` 头文件，并调用 HAL 函数 `cpu_hal_get_cycle_count()` 可以返回已执行的 CPU 循环数。该函数开销较低，适用于高精度测量执行时间极短的代码。
- 在执行“微基准测试”时（即仅对运行时间不到 1-2 ms 的小代码段进行基准测试），二进制文件会影响 flash 缓存的性能，进而可能会导致计时测量出现较大差异。这是因为二进制布局可能会导致在特定的执行顺序中产生不同模式的缓存缺失。执行较大测试代码通常可以抵消这种影响。在基准测试时多次执行一个小函数可以减少 flash 缓存缺失的影响。另外，将该代码移到 IRAM 中（参见[针对性优化](#)）也可以解决这个问题。

外部跟踪 [应用层跟踪库](#) 可以在几乎不影响代码执行的情况下测量其执行速度。

任务 如果启用了选项 `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`，则可以使用 FreeRTOS API `vTaskGetRunTimeStats()` 来获取各个 FreeRTOS 任务运行时占用处理器的时间。

[SEGGER SystemView](#) 是一款出色的工具，可将任务执行情况可视化，也可用于排查系统整体的性能问题或改进方向。

提高整体速度 以下优化措施将提高几乎所有代码的执行效果，包括启动时间、吞吐量、延迟等：

- 设置 `CONFIG_ESPTOOLPY_FLASHMODE` 为 QIO 或 QOUT 模式（四线 I/O 模式）。相较于默认的 DIO 模式，在这两种模式下，从 flash 加载或执行代码的速度几乎翻倍。如果两种模式都支持，QIO 会稍微快于 QOUT。请注意，flash 芯片以及 ESP32-H2 与 flash 芯片之间的电气连接都必须支持四线 I/O 模式，否则 SoC 将无法正常工作。
- 设置 `CONFIG_COMPILER_OPTIMIZATION` 为 Optimize for performance (-O2)。相较于默认设置，这可能会略微增加二进制文件大小，但几乎必然会提高某些代码的性能。请注意，如果代码包含 C 或 C++ 的未定义行为，提高编译器优化级别可能会暴露出原本未发现的错误。
- 禁用 `CONFIG_ESP_SYSTEM_HW_STACK_GUARD` 可能会小幅提高代码性能，尤其是在设备上出现大量中断的情况下。
- 避免使用浮点运算 float。ESP32-H2 通过软件模拟进行浮点运算，因此速度非常慢。可以考虑使用不同的整数表示方法进行运算，如定点表示法，或者将部分计算用整数运算后再切换为浮点运算。
- 避免使用双精度浮点运算 double。ESP32-H2 通过软件模拟进行双精度浮点运算，因此速度非常慢。可以考虑使用基于整数的表示方法或单精度浮点数。

减少日志开销 尽管标准输出会先存储在缓冲区中，但缓冲区缺少可用空间时，应用程序将数据输出到日志的速度可能会受限。这点在程序启动并输出大量日志时尤为明显，但也可能随时发生。为解决这一问题，可以采取以下几种方法：

- 通过调低应用日志默认等级 `CONFIG_LOG_DEFAULT_LEVEL`（引导加载程序日志等级的相应配置为 `CONFIG_BOOTLOADER_LOG_LEVEL`）来减少日志输出量。这样做不仅可以减小二进制文件大小，还可以节省一些 CPU 用于格式化字符串的时间。
- 增加 `CONFIG_ESP_CONSOLE_UART_BAUDRATE`，可以提高日志输出速度。

不建议的选项 以下选项也可以提高执行速度，但不建议使用，因为它们会降低固件应用程序的可调试性，并可能导致出现更严重的 bug。

- 禁用 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`。这也会略微减小固件二进制文件大小。然而，它可能导致出现更严重的 bug，甚至出现安全性 bug。如果为了优化特定函数而必须禁用该选项，可以考虑在该源文件的顶部单独添加 `#define NDEBUG`。

针对性优化 以下更改将提高固件应用程序特定部分的速度：

- 将频繁执行的代码移至 IRAM。应用程序中的所有代码都默认从 flash 中执行。这意味着缓存缺失时，CPU 需要等待从 flash 加载后续指令。如果将函数复制到 IRAM 中，则仅需要在启动时加载一次，然后始终以全速执行。IRAM 资源有限，使用更多的 IRAM 可能会减少可用的 DRAM。因此，将代码移动到 IRAM 需要有所取舍。更多信息参见 [IRAM（指令 RAM）](#)。
- 针对不需要放置在 IRAM 中的单个源文件，可以重新启用跳转表优化。这将提高大型 switch cases 代码中的热路径性能。关于如何在编译单个源文件时添加 `-fjump-tables -ftree-switch-conversion` 选项，参见 [组件编译控制](#)。

减少启动时间 除了上述提高整体性能的方法外，还可以微调以下选项来专门减少启动时间：

- 最小化 `CONFIG_LOG_DEFAULT_LEVEL` 和 `CONFIG_BOOTLOADER_LOG_LEVEL` 可以大幅减少启动时间。如要在应用程序启动后获取更多日志，可以设置 `CONFIG_LOG_MAXIMUM_LEVEL`，然后调用 `esp_log_level_set()` 来恢复更高级别的日志输出。示例 `system/startup_time` 的主函数展示了如何实现这一点。

- 如果使用 Deep-sleep 模式，启用 `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` 可以加快从睡眠中唤醒的速度。请注意，启用该选项后在唤醒时将不会执行安全启动验证，需要考量安全风险。
- 设置 `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON` 可以在每次上电复位启动时跳过二进制文件验证，节省的时间取决于二进制文件大小和 flash 设置。请注意，如果 flash 意外损坏，此设置将有一定风险。更多关于使用该选项的解释和建议，参见 [项目配置](#)。
- 禁用 RTC 慢速时钟校准可以节省一小部分启动时间。设置 `CONFIG_RTC_CLK_CAL_CYCLES` 为 0 可以实现该操作。设置后，以 RTC 慢速时钟为时钟源的固件部分精确度将降低。

示例项目 `system/startup_time` 预配了优化启动时间的设置，文件 `system/startup_time/sdkconfig.defaults` 包含了所有相关设置。可以将这些设置追加到项目中 `sdkconfig` 文件的末尾并合并，但请事先阅读每个设置的相关说明。

任务优先级 ESP-IDF FreeRTOS 是实时操作系统，因此需确保高吞吐量或低延迟的任务获得更高优先级，以便立即运行。调用 `xTaskCreate()` 或 `xTaskCreatePinnedToCore()` 会设定优先级，并且可以在运行时调用 `vTaskPrioritySet()` 进行更改。

此外，还需确保任务适时释放 CPU（通过调用 `vTaskDelay()` 或 `sleep()`，或在信号量、队列、任务通知等方面进行阻塞），以避免低优先级任务饥饿并造成系统性问题。[任务看门狗定时器 \(TWDT\)](#) 提供任务饥饿自动检测机制，但请注意，正确的固件操作有时需要长时间运算，因此任务看门狗定时器超时并不总意味着存在问题。在这些情况下，可能需要微调超时时限，甚至禁用任务看门狗定时器。

内置任务优先级 ESP-IDF 启动的系统任务预设了固定优先级。启动时，一些任务会自动启动，而另一些仅在应用程序固件初始化特定功能时启动。为优化性能，请合理设置应用程序任务优先级，以确保它们不会被系统任务阻塞，同时需确保系统任务不会饥饿进而影响其他系统功能。

为此，可能需要分解特定任务。例如，可以在高优先级任务或中断处理程序中执行实时操作，并在较低优先级任务中处理非实时操作。

头文件 `components/esp_system/include/esp_task.h` 包含了用于设置 ESP-IDF 内置任务系统优先级的宏定义。更多系统任务详情，参见 [后台任务](#)。

常见优先级包括：

- [运行主任务](#) 中执行 `app_main` 函数的主任务优先级最低 (1)。
- 系统任务 [ESP 定时器](#) 用于管理定时器事件并执行回调函数，优先级较高 (22, `ESP_TASK_TIMER_PRIO`)。
- FreeRTOS 初始化调度器时会创建定时器任务，用于处理 FreeRTOS 定时器的回调函数，优先级最低 (1, [可配置](#))。
- 系统任务 [事件循环库](#) 用于管理默认的系统事件循环并执行回调函数，优先级较高 (20, `ESP_TASK_EVENT_PRIO`)。仅在应用程序调用 `esp_event_loop_create_default()` 时使用此配置。可以调用 `esp_event_loop_create()` 添加自定义任务配置。
- [lwIP TCP/IP](#) 任务优先级较高 (18, `ESP_TASK_TCP_IP_PRIO`)。
- [Controller & VHCI](#) 任务优先级较高 (23, `ESP_TASK_BT_CONTROLLER_PRIO`)。蓝牙控制器需要以低延迟响应请求，因此其任务应始终为系统最高优先级的任务之一。
- [NimBLE-based Host APIs](#) 任务优先级较高 (21)。
- 以太网驱动程序会创建一个 `MAC` 任务，用于接收以太网帧。如果使用默认配置 `ETH_MAC_DEFAULT_CONFIG`，则该任务为中高优先级 (15)。可以在以太网 `MAC` 初始化时输入自定义 `eth_mac_config_t` 结构体来更改此设置。
- 如果使用 [ESP-MQTT](#) 组件，它会创建优先级默认为 5 的任务 ([可配置](#))，可通过 `CONFIG_MQTT_USE_CUSTOM_CONFIG` 调整，也可以在运行时通过 `esp_mqtt_client_config_t` 结构体中的 `task_prio` 字段调整。
- 关于 mDNS 服务的任务优先级，参见 [性能优化](#)。

设定应用程序任务优先级 一般情况下，不建议将任务优先级设置得比内置的蓝牙/802.15.4, esp32c5= 操作更高，因为这样可能会使 CPU 被长时间占用，导致系统不稳定。

对于非常短、对时序要求严格且不涉及网络的操作，可以使用中断服务程序或是限制运行时间的最高优先级 (24) 任务。

将特定任务优先级设为 19，则较低层级的蓝牙/802.15.4, esp32c5= 功能可以无延迟运行，且仍然会抢占 lwIP TCP/IP 堆栈以及其他非实时内部功能，这对于不执行网络操作的实时任务而言是最佳选项。

lwIP TCP/IP 任务优先级 (18) 应高于所有执行 TCP/IP 网络操作的任务，从而避免优先级反转的问题。

默认配置下，除了个别例外，尤其是 lwIP TCP/IP 任务，大多数内置任务都固定在核 0 上执行。因此，应用程序可以方便地将高优先级任务放置在核 1 上执行。优先级大于等于 19 的应用程序任务在核 1 上运行时可以确保不会被任何内置任务抢占。为了进一步隔离各个 CPU 上运行的任务，配置 [lwIP 任务](#)，可以使 lwIP 任务仅在核 0 上运行，而非其他内核，这可能会根据其他任务的运行情况减少总 TCP/IP 吞吐量。

一般情况下，不建议将核 0 上的任务优先级设置得比内置的蓝牙/802.15.4, esp32c5= 操作更高，因为这样可能会使 CPU 被长时间占用，导致系统不稳定。选择优先级为 19 并在核 0 上运行可以使底层蓝牙/802.15.4, esp32c5= 功能运行无延迟，但仍会抢占 lwIP TCP/IP 栈和其他不太关键的内部功能。这对于无需执行网络操作且时序要求高的任务来说是一个选择。执行 TCP/IP 网络操作的任何任务都应该以低于 lwIP TCP/IP 任务 (18) 的优先级运行，以避免优先级反转问题。

备注： 如果要让特定任务始终先于 ESP-IDF 内置任务运行，并不需要将其固定在核 1 上。将该任务优先级设置为小于等于 17，则无需与内核绑定，那么核 0 上没有执行较高优先级的内置任务时，该任务也可以选择在内核 0 上执行。使用未固定的任务可以提高整体 CPU 利用率，但这会增加任务调度的复杂性。

备注： 对内置 SPI flash 芯片进行写入操作时，任务会完全暂停执行。只有 [IRAM 安全中断处理程序](#) 会继续执行。

提高中断性能 ESP-IDF 支持动态 [中断分配](#) 和中断抢占。系统中每个中断都有相应优先级，较高优先级的中断将优先执行。

只要其他任务不在临界区内，中断处理程序将优先于所有其他任务执行。因此，尽量减少中断处理程序的执行时间十分重要。

要以最佳性能执行特定中断处理程序，可以考虑：

- 调用 `esp_intr_alloc()` 时使用 `ESP_INTR_FLAG_LEVEL2` 或 `ESP_INTR_FLAG_LEVEL3` 等标志，可以为更重要的中断设定更高优先级。
- 如果确定整个中断处理程序可以在 IRAM 中运行（参见 [IRAM 安全中断处理程序](#)），那么在调用 `esp_intr_alloc()` 分配中断时，请设置 `ESP_INTR_FLAG_IRAM` 标志，这样可以防止在应用程序固件写入内置 SPI flash 时临时禁用中断。
- 即使是非 IRAM 安全的中断处理程序，如果需要频繁执行，可以考虑将处理程序的函数移到 IRAM 中，从而尽可能规避执行中断代码时发生 flash 缓存缺失的可能性（参见 [针对性优化](#)）。如果可以确保只有部分处理程序位于 IRAM 中，则无需添加 `ESP_INTR_FLAG_IRAM` 标志将程序标记为 IRAM 安全。

提高网络速度

- 关于提高 lwIP TCP/IP 网速，参见 [性能优化](#)。

提高 I/O 性能 使用标准 C 库函数，如 `fread` 和 `fwrite` 时，相较于使用平台特定的不带缓冲系统调用，I/O 性能可能更慢，如 `read` 和 `write`。标准 C 库函数是为可移植性而设计的，它们会在执行时会引入一定开销和缓冲延迟，因此并不适用需要较高执行速度的场景。

[FAT 文件系统](#) 具体信息和提示如下：

- 读取/写入请求的最大大小等于 FatFS 簇大小（分配单元大小）。

- 使用 `read` 和 `write` 而非 `fread` 和 `fwrite` 可以提高性能。
- 要提高诸如 `fread` 和 `fgets` 等缓冲读取函数的执行速度，可以增加文件缓冲区的大小（Newlib 的默认值为 128 字节），例如 4096、8192 或 16384 字节。为此，可以在特定文件的指针上使用 `setvbuf` 函数进行局部更改，或者修改 `CONFIG_FATFS_VFS_FSTAT_BLKSIZE` 实现全局应用。

备注： 增加缓冲区的大小会增加堆内存的使用量。

最小化二进制文件大小

ESP-IDF 构建系统会编译项目和 ESP-IDF 中所有源文件，但只有程序实际引用的函数和变量才会链接到最终的二进制文件中。在某些情况下，需要减小固件二进制文件的总大小，例如，为使固件适配 flash 分区大小。

要减小固件二进制文件总大小，首先要找到导致其大小增加的原因。

测量静态数据大小 为了优化固件二进制文件大小和内存使用，需要测量项目中静态分配的 RAM (`data`, `bss`)，代码 (`text`) 和只读数据 (`rodata`)。

使用 `idf.py` 的子命令 `size`，`size-components` 和 `size-files` 可以输出项目使用内存概况：

数据大小概况 `idf.py size`

```
$ idf.py size
[...]
Total sizes:
Used stat D/IRAM:  53743 bytes ( 122385 remain, 30.5% used)
  .data size:     6504 bytes
  .bss size:      1984 bytes
  .text size:     44228 bytes
  .vectors size:  1027 bytes
Used Flash size : 118879 bytes
  .text:          83467 bytes
  .rodata:        35156 bytes
Total image size: 170638 bytes (.bin may be padded larger)
```

该输出结果细分了固件二进制文件中所有静态内存区域的大小：

```
$ idf.py size
[...]
Total sizes:
Used stat D/IRAM:  53743 bytes ( 122385 remain, 30.5% used)
  .data size:     6504 bytes
  .bss size:      1984 bytes
  .text size:     44228 bytes
  .vectors size:  1027 bytes
Used Flash size : 118879 bytes
  .text:          83467 bytes
  .rodata:        35156 bytes
Total image size: 170638 bytes (.bin may be padded larger)
```

- `Used stat D/IRAM`: 编译时使用的 D/IRAM 大小。`remain` 表示在运行时可用作堆内存的 D/IRAM 余量。请注意，由于元数据开销、实现限制和启动时的堆分配，实际的 DRAM 堆会更小。
 - `.data size`: 编译时为 `.data`（即所有初始化为非零值的静态变量）分配的 D/IRAM 大小。`.data` 还在二进制映像中占用空间来存储非零初始化值。
 - `.bss size`: 编译时为 `.bss`（即所有初始化为零的静态变量）分配的 D/IRAM 大小。`.bss` 不会在 `flash` 中占用额外空间。

- .text size: 用于 .text 的 D/IRAM 大小 (即所有从内部 RAM 执行的代码)。由于代码最初存储在 .text 中, 在启动时才会复制到 D/IRAM, 因此 .text 在二进制映像中也会占用空间。
- Used Flash size: 使用的 flash 总大小 (不包括 D/IRAM 的使用量)。
 - .text: 用于 .text (即通过 flash 缓存执行的所有代码, 请参阅 *IRAM*) 的 flash 大小。
 - .rodata: 用于 .rodata (即通过 flash 缓存加载的只读数据, 参阅 *DROM*) 的 flash 大小。
- Total image size is the estimated total size of the binary file.

组件使用概况 idf.py size-components idf.py size 的输出结果不够详细, 无法找出导致二进制文件过大的主要原因。要进行更详细的分析, 请使用 idf.py size-components。

```
$ idf.py size-components
[...]

		libmesh.a	0	0	0	0	0	0	↵
↵	0	0							

idf.py size-components 输出的前几行与 idf.py size 相同，此外还会输出 Per-archive contributions to ELF file 表格，显示每个静态库对最终二进制文件大小的贡献程度。

通常，每个组件都会构建一个静态库归档文件，尽管部分是由特定组件包含的二进制库，例如，esp_wifi 组件包含了 libnet80211.a。此外，这里还列出了一些工具链库，例如 libc.a 和 libgcc.a，用于提供 C/C++ 标准库和工具链内置功能。

对于只有一个 main 组件的简单项目，可在 libmain.a 目录下找到所有项目代码。若项目包含其特有组件（参阅构建系统），则每个组件将单独在一行中显示。

该表格按静态库归档文件对最终二进制文件大小的贡献程度降序排序。

各列含义如下：

- DRAM .data & .bss & other-.data 和 .bss 分别与上方显示的总数相同。两者都是静态变量，且都会减少运行时的可用 RAM，但 .bss 不会增加二进制文件大小。other 列指任何会增加 RAM 大小的自定义数据段，该值通常为 0。
- IRAM - 与上方显示的总数相同，表示链接到从 IRAM 执行的代码，这些代码占用二进制文件空间，并且会减少运行时可用作堆内存的 DRAM 空间。
- Flash code & rodata - 这些值与上方显示总数相同，指通过 flash 缓存访问的 IROM 和 DROM 空间，对二进制文件大小的贡献。

源文件使用概况 idf.py size-files 要了解更多详情，请运行 idf.py size-files，获取每个目标文件对最终二进制文件大小的贡献概况。每个目标文件对应一个单独的源文件。

```

[... additional lines removed ...]									

文件总大小概况下方会显示 Per-file contributions to ELF file 表格。

该表格的列与上文运行 `idf.py size-components` 显示的列相同，但该表格的粒度更细，展示了每个目标文件对二进制文件大小的贡献。

例如，文件 `x509_crt_bundle.S.o` 对总固件大小贡献了 64,212 字节，全都存储在 flash 中的 `.rodata` 区域。由此可以推知，该应用程序正在使用 [ESP x509 证书包](#) 功能。如果不使用该功能，固件大小至少可以减少 64,212 字节。

某些目标文件从二进制库中链接至此，因此无法找到对应源文件。要确定一个源文件属于哪个组件，通常可以在 [ESP-IDF 源代码树](#) 中搜索，或者在 [链接器映射文件](#) 中查找完整路径。

比较两个二进制文件 如果某些改动影响了二进制文件大小，可以使用 ESP-IDF 工具来详细分析文件大小的确切差异。

该操作不是通过运行 `idf.py` 进行的，而是需要直接运行 Python 工具 `esp_idf_size`。

执行该操作，首先需要在构建目录中找到链接器映射文件 PROJECTNAME.map。esp_idf_size 工具会基于链接器映射文件的输出结果分析文件大小差异。

要与另一个二进制文件进行比较，还需要保存该文件对应的 .map 文件，该文件位于构建目录中。

例如，要比较两个构建文件，其中一个使用默认的 `CONFIG_COMPILER_OPTIMIZATION` Debug (-Og) 配置，而另一个使用 Optimize for size (-Os) 配置：

```
$ python -m esp_idf_size --diff build_Og/https_request.map build_Os/https_request.
↪map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means
↪that <CURRENT> is larger.
Total sizes of <CURRENT>:
↪<REFERENCE>      Difference
DRAM .data size:  14516 bytes
↪14956            -440
DRAM .bss size:   15792 bytes
↪15808           -16
Used static DRAM: 30308 bytes ( 150428 available, 16.8% used)
↪30764           -456 ( +456 available, +0 total)
Used static IRAM: 78498 bytes ( 52574 available, 59.9% used)
↪83918          -5420 ( +5420 available, +0 total)
      Flash code: 509183 bytes
↪559943         -50760
      Flash rodata: 170592 bytes
↪176736         -6144
Total image size:~ 772789 bytes (.bin may be padded larger)
↪835553         -62764
```

从 Difference 列可以看出，改变该设置导致整个二进制文件减小了 60 KB 以上，并且可用的 RAM 增加了 5 KB 以上。

还可以使用 diff 模式来输出表格，显示组件级（静态库）的差异：

备注： 运行 esp_idf_size 时可以使用 --format 选项输出 JSON 或 CSV 格式的结果。

```
python -m esp_idf_size --archives --diff build_Og/https_request.map build_Oshttps_
↪request.map
```

同样适用于比较单个源文件级的差异：

```
python -m esp_idf_size --files --diff build_Og/https_request.map build_Oshttps_
↪request.map
```

了解将输出写入文件等其他选项，可以输入 --help 查看完整列表。

链接器失败时显示文件大小 如果被分配的静态内存大小超越上限，链接器会失败并显示错误信息，例如 DRAM segment data does not fit 和 region `iram0_0_seg' overflowed by 44 bytes 等。

在这些情况下，idf.py size 也无法成功执行。然而，通过手动运行 esp_idf_size，可以查看 **部分静态内存使用情况**。内存使用情况将不包含无法链接的变量，因此仍然会显示有部分可用空间。

映射文件参数为构建目录下的 <projectname>.map 文件。

```
python -m esp_idf_size build/project_name.map
```

还可以查看类似于 size-components 或 size-files 输出的内容：

```
python -m esp_idf_size --archives build/project_name.map
python -m esp_idf_size --files build/project_name.map
```

链接器映射文件

备注：这是一种非常有用的进阶分析方法。可以先跳转到[减小总体文件大小](#)，以后再详阅这一部分。

分析工具 `idf.py size` 通过解析 GNU binutils 的“链接器映射文件”来输出结果，该文件囊括了链接器在创建（即链接到）最终固件二进制文件时的所有操作。

链接器映射文件本身是纯文本文件，因此可以进行读取并准确了解链接器的操作，但这些文件非常复杂冗长，通常有 100,000 行甚至更多。

映射文件分为多个部分，每个部分各有标题，包括：

- Archive member included to satisfy reference by file (symbol)
 - 该列表显示了链接器链接各个目标文件时所搜寻的特定符号（函数或变量）。
 - 要了解二进制文件包含特定目标文件的原因，可以查看该列表以及文件末尾的 Cross Reference Table。

备注：请注意，并非每个显示在该列表中的目标文件最后都会出现在最终二进制文件中，有些目标文件可能会列在 Discarded input sections 中。

- Allocating common symbols
 - 该列表显示了部分全局变量及其大小。常见符号在 ELF 二进制文件中具有特定含义，但 ESP-IDF 并未广泛使用这些符号。
- Discarded input sections
 - 在链接器读取目标文件时，会将一些输入段作为文件的一部分读取并准备链接到最终的二进制文件中，但由于没有其他部分引用这些输入段，这些段最终会被丢弃。
 - 对于 ESP-IDF 项目来说，这个列表可能会非常长，因为我们将每个函数和静态变量都编译到一个独立的段中，以最小化最终二进制文件的大小。具体而言，ESP-IDF 将使用编译器选项 `-ffunction-sections -fdata-sections` 和链接器选项 `--gc-sections`。
 - 在这个列表中出现的条目 **不会**对最终的二进制文件大小产生影响。
- Memory Configuration 和 Linker script and memory map
 - 这两部分相互关联。输出结果的一部分来自由[构建系统](#)提供的链接器命令行和链接脚本，部分链接脚本由 ESP-IDF 项目通过[链接器脚本生成机制](#)功能生成。
 - 在 `map` 文件的 Linker script and memory map 输出中，会显示链接到最终二进制文件中的每个符号（函数或静态变量）及其地址（以 16 位十六进制数字表示）和长度（也以十六进制表示），还有链接的库和目标文件（可以用于确定组件和源文件）。
 - 在所有占用最终 `.bin` 文件的输出段之后，memory map 还会显示一些 ELF 文件中用于调试的段，如 `.debug_*` 等。这些段不会对最终的二进制文件大小产生影响，且这些符号的地址数值很小，从 `0x0000000000000000` 开始递增。
- Cross Reference Table
 - 该表格显示了引用了各个符号（函数或静态变量）的目标文件。了解二进制文件包含某个特定符号的原因，可参考该表格以确定引用特定符号的目标文件。

备注：Cross Reference Table 不仅包含最终二进制文件中的符号，还包含已丢弃的段内符号。因此，某个符号出现在该表中并不意味着最终二进制文件包含这一符号，需要单独检查。

备注：链接器映射文件由 GNU binutils 的链接器 `ld` 而非由 ESP-IDF 生成。本快速概览专从 ESP-IDF 构建系统的角度编写而成，建议自行搜索更多关于链接器映射文件格式的信息。

减小总体文件大小 可以通过以下配置选项减小几乎所有 ESP-IDF 项目最终二进制文件的大小：

- 将 `CONFIG_COMPILER_OPTIMIZATION` 设置为 `Optimize for size (-Os)`。在某些情况下，相较于默认设置，`Optimize for size (-Os)` 也可以减小二进制文件的大小。请注意，若代码包含 C 或 C++ 的未定义行为，提高编译器优化级别可能会暴露出原本不存在的错误。
- 通过降低应用程序的 `CONFIG_LOG_DEFAULT_LEVEL`，可以减少编译时的日志输出。如果改变 `CONFIG_LOG_MAXIMUM_LEVEL` 的默认选项，则可以控制二进制文件的大小。减少编译时的日志输出可以减少二进制文件中的字符串数量，并减小调用日志函数的代码大小。
- 将 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 设置为 `Silent`，可以避免为所有可能失败的断言编译专门的断言字符串和源文件名。尽管如此，仍可以通过查看断言失败时的内存地址以在代码中找到失败断言。
- 除 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 外，还可以通过设置 `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` 单独禁用或静默 HAL 组件的断言。请注意，即使将 `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` 设置为 `full-assertion` 级别，ESP-IDF 在引导加载程序中也会把 HAL 断言级别降为 `silent`，以减小引导加载程序的大小。
- 设置 `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` 会移除针对 ESP-IDF 内部错误检查宏的特定错误消息。错误消息移除后，通过阅读日志输出来调试某些错误条件可能变得更加困难。
- 不要启用 `CONFIG_COMPILER_CXX_EXCEPTIONS` 或 `CONFIG_COMPILER_CXX_RTTI`，也不要将 `CONFIG_COMPILER_STACK_CHECK_MODE` 设置为 `Overall`。这些选项已默认禁用，启用这些选项会大幅增加二进制文件的大小。
- 禁用 `CONFIG_ESP_ERR_TO_NAME_LOOKUP` 将会移除查找表，该表用于将错误日志中的错误值转换成用户友好名称（参阅[错误处理](#)）。这样做可以减小二进制文件的大小，但错误值将只以整数形式输出。
- 将 `CONFIG_ESP_SYSTEM_PANIC` 设置为 `Silent reboot` 可以减小一小部分二进制文件的大小，但此操作 **仅**建议在没有任何开发者使用 UART 输出来调试设备时进行。
- 设置 `CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS` 以库调用替代内联的入口/出口代码，可以减小二进制文件的大小。
- 如果应用程序的二进制文件只使用 `protocomm` 组件的某个安全版本，取消对其他版本的支持可以减小部分代码大小。请通过 `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`、`CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1` 或者 `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2` 方式，取消对应版本的支持。

备注：除了上述众多配置项之外，还有一些配置选项在更改为非默认设置时会增加二进制文件的大小，这些选项未在此列出。配置项的帮助文本中通常会阐明显著增加二进制文件大小的设置。

针对性优化 以下二进制文件大小优化适用于特定的组件或函数：

Bluetooth NimBLE 如果使用 *NimBLE-based Host APIs*，要减小二进制文件的大小，可以执行以下操作：

- 如果只需要连接一个 Bluetooth LE，则将 `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` 设置为 1。
- 如果不需要 `CONFIG_BT_NIMBLE_ROLE_CENTRAL` 和 `CONFIG_BT_NIMBLE_ROLE_OBSERVER`，可以选择禁用其一。
- 降低 `CONFIG_BT_NIMBLE_LOG_LEVEL` 可以减小二进制文件的大小。请注意，如果在上述减小总体文件大小中已经降低了整体日志级别，那么也会降低 NimBLE 的日志级别。

lwIP IPv6

- 将 `CONFIG_LWIP_IPV6` 设置为 `false` 可以减小 lwIP TCP/IP 堆栈的大小，但将仅支持 IPv4。

备注：如果禁用 IPv6，*ASIO* 端口等组件将无法使用。

lwIP IPv4

- 如果不需要 IPv4 连接功能，将 `CONFIG_LWIP_IPV4` 设置为 `false` 可以减小 lwIP 的大小，使其成为仅支持 IPv6 的 TCP/IP 堆栈。

备注：在禁用 IPv4 支持之前，请注意，仅支持 IPv6 的网络环境尚未普及，必须在本地网络中提供支持，例如，由互联网服务提供商提供支持，或使用受限制的本地网络设置。

Newlib Nano 格式化 ESP-IDF 的 I/O 函数 (`printf()` 和 `scanf()` 等) 默认使用 Newlib 的“完整”格式化功能。

启用配置选项 `CONFIG_NEWLIB_NANO_FORMAT` 将使 Newlib 切换到 Nano 格式化模式。这种模式的代码量更小，并且大部分内容被编译到了 ESP32-H2 的 ROM 中，因此不需要将其添加至二进制文件中。

具体的二进制文件大小差异取决于固件使用的功能，但通常为 25 KB 到 50 KB。

启用 Nano 格式化会减少调用 `printf()` 或其他字符串格式化函数的堆栈使用量，参阅 [栈内存大小优化](#)。

“Nano” 格式化不支持 64 位整数或 C99 格式化功能。请在 [Newlib README 文件](#) 中搜索 `--enable-newlib-nano-formatted-io` 来获取完整的限制列表。

MbedTLS 功能 在 **Component Config > mbedTLS** 下有多个默认启用的 mbedTLS 功能，如果不需要，可以禁用相应功能以减小代码大小。

这些功能包括：

- `CONFIG_MBEDTLS_HAVE_TIME`
- `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
- `CONFIG_MBEDTLS_SHA512_C`
- `CONFIG_MBEDTLS_SHA3_C`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION`
- `CONFIG_MBEDTLS_SSL_ALPN`
- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_GCM_C`
- `CONFIG_MBEDTLS_ECP_C` (或者：启用此选项，但在子菜单中禁用部分椭圆曲线)
- `CONFIG_MBEDTLS_ECP_NIST_OPTIM`
- `CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM`
- 如果不需要 mbedTLS 的服务器和客户端功能，可以修改 `CONFIG_MBEDTLS_TLS_MODE`
- 可以考虑禁用在 TLS Key Exchange Methods 子菜单中列出的一些密码套件 (例如 `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`)，以减小代码大小。

每个选项的帮助文本中都有更多信息可供参考。

重要：强烈建议不要禁用所有 mbedTLS 选项。 仅在理解功能用途，并确定在应用程序中不需要此功能时，方可禁用相应选项。请特别注意以下两点：

- 确保设备连接的任何 TLS 服务器仍然可用。如果服务器由第三方或云服务控制，建议确保固件至少支持两种 TLS 密码套件，以防未来某次更新禁用了其中一种。
- 确保连接设备的任何 TLS 客户端仍然可以使用支持/推荐的密码套件进行连接。请注意，未来版本的客户端操作系统可能会移除对某些功能的支持，因此建议启用多个支持的密码套件或算法以实现冗余。

如果依赖于第三方客户端或服务器，请密切关注其有关支持的 TLS 功能的公告和变更。否则，当所支持功能变更时，ESP32-H2 设备可能无法访问。

备注：ESP-IDF 并未测试所有 mbedTLS 编译配置组合。如果发现某个组合无法编译或无法按预期执行，请在 [GitHub](#) 上报告详细信息。

虚拟文件系统 (VFS) 在 ESP-IDF 中, [虚拟文件系统组件](#) 功能允许使用标准的 I/O 函数 (如 `open`、`read`、`write` 等) 和 C 库函数 (如 `fopen`、`fread`、`fwrite` 等) 来访问多个文件系统驱动程序和类似文件的外设驱动程序。当应用程序中不需要文件系统或类似文件的外设驱动功能时, 可以部分或完全禁用该功能。VFS 组件提供以下配置选项:

- [CONFIG_VFS_SUPPORT_TERMIOS](#) — 如果应用程序不使用 `termios` 函数族, 可以禁用此选项。目前, 这些函数仅在 UART VFS 驱动程序中实现, 大多数应用程序可以禁用此选项。禁用后可以减小约 1.8 KB 代码大小。
- [CONFIG_VFS_SUPPORT_SELECT](#) — 如果应用程序不使用 `select` 函数处理文件描述符, 可以禁用此选项。目前, 只有 UART 和 `eventfd` VFS 驱动程序支持 `select` 函数。请注意, 当禁用该选项时, 仍然可以使用 `select` 处理套接字文件描述符。禁用此选项将减小约 2.7 KB 代码大小。
- [CONFIG_VFS_SUPPORT_DIR](#) — 如果应用程序不使用与目录相关的函数, 例如 `readdir` (参阅此选项的描述以获取完整列表), 可以禁用此选项。如果应用程序只需打开、读取和写入特定文件, 而不需要枚举或创建目录, 可以禁用此选项, 从而减少超过 0.5 KB 代码大小, 具体减小多少取决于使用的文件系统驱动程序。
- [CONFIG_VFS_SUPPORT_IO](#) — 如果应用程序不使用文件系统或类似文件的外设驱动程序, 可以禁用此选项, 这将禁用所有 VFS 功能, 包括上述三个选项。当禁用此选项时, 无法使用 [控制台终端](#)。请注意, 当禁用此选项时, 应用程序仍然可以使用标准 I/O 函数处理套接字文件描述符。相较于默认配置, 禁用此选项可以减小约 9.4 KB 代码大小。

HAL

- 启用 [CONFIG_HAL_SYSTIMER_USE_ROM_IMPL](#) 可以通过链接 ROM 实现的 `systimer` HAL 驱动程序来减少 IRAM 使用和二进制文件大小。
- 启用 [CONFIG_HAL_WDT_USE_ROM_IMPL](#) 可以通过链接 ROM 实现的看门狗 HAL 驱动程序来减少 IRAM 使用和二进制文件大小。

堆

- 启用 [CONFIG_HEAP_TLSF_USE_ROM_IMPL](#) 可以将整个堆功能放置在 flash 中, 从而减少 IRAM 使用和二进制文件大小。
- 启用 [CONFIG_HEAP_TLSF_USE_ROM_IMPL](#) 可以通过链接 ROM 实现的 TLSF 库来减少 IRAM 使用和二进制文件大小。

引导加载程序大小 本文档仅涉及 ESP-IDF 应用程序的二进制文件大小, 而不涉及 ESP-IDF [二级引导程序](#)。

关于 ESP-IDF 引导加载程序二进制文件大小的讨论, 参阅 [引导加载程序大小](#)。

IRAM 二进制文件大小 如果二进制文件的 IRAM 部分过大, 可以通过减少 IRAM 使用来解决这个问题, 参阅 [IRAM 优化](#)。

内存优化

固件应用程序的可用 RAM 在某些情况下可能处于低水平, 甚至完全耗尽。为此, 应调整这些情况下固件应用程序的内存使用情况。

固件应用程序通常需要为内部 RAM 保留备用空间, 用于应对非常规情况, 或在后续版本的更新中, 适应 RAM 使用需求的变化。

背景 在进行 ESP-IDF 的内存优化前, 应了解有关 ESP32-H2 内存类型的基础知识、C 语言中静态和动态内存使用的区别、以及 ESP-IDF 中栈和堆的使用方式。以上信息均可参阅 [堆内存分配](#)。

测量静态内存使用情况 `idf.py` 工具可用于生成应用程序静态内存的使用情况报告，请参阅[测量静态数据大小](#)。

测量动态内存使用情况 ESP-IDF 包含一系列堆 API，可以在运行时测量空闲堆内存，请参阅[堆内存调试](#)。

备注：在嵌入式系统中，除 RAM 使用总量外，也应重点关注堆碎片化问题。堆测量 API 提供了一些方法，可以测量最大空闲内存块。通过监测最大空闲内存块和总空闲字节数，可以快速了解是否存在堆碎片化问题。

静态内存优化

- 降低应用程序的静态内存使用，会增加运行时堆的可用 RAM 空间，反之亦然。
- 优化静态内存使用通常需要监测 `.data` 和 `.bss` 的大小，有关工具请参阅[测量静态数据大小](#)。
- 在 C 语言中，ESP-IDF 内部函数不会占用大量静态 RAM。在多数情况下（例如蓝牙控制器，IEEE 802.15.4 库），静态缓冲区仍从堆中分配。然而，这些分配只在功能初始化阶段进行一次，并在功能去初始化时释放，从而在应用程序生命周期中，优化不同阶段的可用内存。

要实现静态内存优化，请执行以下操作：

- 由于常量数据可以存储在 flash 中，不占用 RAM，建议尽量将结构体、缓冲区或其他变量声明为 `const`。为此，可能需要修改固件参数，使其接收 `const *` 参数而非可变指针参数。以上更改还可以减少某些函数的栈内存使用。
- 若使用 Bluedroid，请设置 `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY` 选项，Bluedroid 将在初始化时分配内存，并在去初始化时释放内存。这并不一定会降低内存使用峰值，但可以将使用静态内存改为运行时使用动态内存。
- 若使用 OpenThread，请设置 `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT` 选项，OpenThread 将从外部 PSRAM 中分配消息池缓冲区，从而减少对内部静态内存的使用。

栈内存大小优化 在 FreeRTOS 操作系统中，任务栈通常从堆中分配。每个任务的栈大小固定，且会作为参数传递给 `xTaskCreate()`。每个任务可用的栈内存不得超过为其分配的栈内存大小，否则将导致栈内存溢出或堆内存损坏，使原本可用的程序崩溃。

因此，确定每个任务栈内存的最佳大小、最小化每个任务栈内存大小、以及最小化任务栈内存的整体数量，都可以大幅减少 RAM 的使用。

要确定特定任务栈内存的最佳大小，请执行以下操作：

- 程序运行时，如你认为某任务有未使用的栈内存，可通过其任务句柄调用 `uxTaskGetStackHighWaterMark()`。该函数将以字节为单位，返回任务中生命周期最短的空闲栈内存。
 - 从任务本身内部调用 `uxTaskGetStackHighWaterMark()` 是调用该函数最容易的方式：在任务达到其栈内存使用峰值后，调用 `uxTaskGetStackHighWaterMark(NULL)` 获取当前任务的高水位标记，换言之，如果有主循环，请多次执行主循环来覆盖各种状态，随后调用 `uxTaskGetStackHighWaterMark()`。
 - 通常可以用任务的栈内存总大小减去调用 `uxTaskGetStackHighWaterMark()` 的返回值，计算任务实际使用的栈内存大小，但应留出一定的安全余量，应对运行时栈内存使用量的小幅意外增长。
- 程序运行时，调用 `uxTaskGetSystemState()` 获取系统中所有任务的摘要，包括各栈内存的高水位标记值。
- 在未使用调试器的监视点时，可以设置 `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 选项。启用此选项时，系统会使用一个观察点，监视每个任务栈的最后一个字节。如果有新的数据覆盖了该字节（例如发生栈溢出），将立即触发 `panic`。相比默认 `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` 选项的 `Check using canary bytes`，这种方式更可靠，因其能够立即触发 `panic`，而不是在下次 RTOS 上下文切换时触发。然而，两种选项都存在缺点，有时栈指针可能会跳过监视点或 `canary` 字节，损坏 RAM 的其他区域。

要减少特定任务栈内存大小，请执行以下操作：

- 避免占用过多栈内存的函数。字符串格式化函数（如 `printf()`）会使用大量栈内存，如果任务不调用这类函数，通常可以减小其占用的栈内存。
 - 启用 *Newlib Nano 格式化*，可以在任务调用 `printf()` 或其他 C 语言字符串格式化函数时，减少这类任务的栈内存使用量。
- 避免在栈上分配大型变量。在 C 语言声明的默认作用域中，任何分配为自动变量大型结构体或数组都会占用栈内存。要优化这些变量占用的栈内存大小，可以使用静态分配，或仅在需要从堆中动态分配。
- 避免调用深度递归函数。尽管调用单个递归函数并不一定会占用大量栈内存，但若每个函数都包含大量基于栈的变量，那么调用这些函数的开销将会很高。

要减少任务的整体数量，请执行以下操作：

- 合并任务。如果从未创建某个特定任务，就不会分配该任务的栈内存，从而极大减少 RAM 使用。如果某些任务可以与另一个任务合并，通常可以将不必要的任务删除。在应用程序中，如果满足以下条件，通常可以合并或删除任务：
 - 任务所执行的内容可以按顺序分解为多个函数调用。
 - 任务所执行的内容可以分解为较小的工作，这些工作可以通过 FreeRTOS 队列或类似机制串行化，并由工作任务执行。

内部任务栈内存大小 为进行系统维护，或操作系统功能，ESP-IDF 分配了许多内部任务，一部分在启动过程中创建，一部分在初始化特定功能时创建。

为了确保支持所有常见的使用模式，这些任务栈内存的默认设置值较大。ESP-IDF 支持配置栈内存大小，因此可以减小任务栈内存，匹配其实际运行时的栈内存使用情况。

重要：如果内部任务的栈内存设置得过小，可能会导致 ESP-IDF 发生无法预测的崩溃。即使任务栈内存溢出是导致崩溃的根本原因，在调试过程中也很难确定具体原因。因此，建议特别关注任务在负载高时的高水位标记，在必要情况下，谨慎减小内部任务的栈内存大小。如果在减小内部任务堆内存大小后，仍遇到问题，请在报告中提供以下信息，以及正在使用的具体配置。

- 运行主任务的栈内存大小为 `CONFIG_ESP_MAIN_TASK_STACK_SIZE`。
- 系统任务 *ESP 定时器* 用于执行回调函数，其栈内存大小为 `CONFIG_ESP_TIMER_TASK_STACK_SIZE`。
- 部分 FreeRTOS 定时器任务用于处理 FreeRTOS 定时器回调，其栈内存大小为 `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`。
- 系统任务 *事件循环库* 用于执行默认系统事件循环回调，其栈内存大小为 `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`。
- TCP/IP 任务 *lwIP* 的栈内存大小为 `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`。
- 蓝牙 API 的栈内存大小为 `CONFIG_BT_BTC_TASK_STACK_SIZE`，`CONFIG_BT_BTU_TASK_STACK_SIZE`。
- *NimBLE-based Host APIs* 的栈内存大小为 `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`。
- 以太网驱动程序会创建任务，用于使 MAC 接收以太网帧，在默认配置 `ETH_MAC_DEFAULT_CONFIG` 下，任务栈内存大小为 4 KB。在初始化以太网 MAC 时，传递自定义 `eth_mac_config_t` 结构体可以更改此设置。
- FreeRTOS 空闲任务栈内存大小由 `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE` 配置。
- 使用 *ESP-MQTT* 组件时会创建一个任务，其栈内存大小由 `CONFIG_MQTT_TASK_STACK_SIZE` 配置。MQTT 栈内存大小也可以使用 `esp_mqtt_client_config_t` 结构体中的 `task_stack` 字段配置。
- 有关使用 mDNS 时内存优化的详细信息，请参阅 [优化内存使用](#)。

备注：除 ESP 定时器等内置系统功能外，若固件应用程序没有初始化 ESP-IDF 中特定功能，则不会创建相关任务。此时，相关任务的栈内存使用量为零，而这些功能没有与之关联的任务，因此无需考虑其栈内存大小配置。

堆内存优化 有关分析运行时堆内存使用的函数，请参阅[堆内存调试](#)。

通常，堆内存优化包含以下几个方面：分析堆内存使用情况、撤回未使用的 `malloc()` 调用、缩小相应的内存使用大小、或提早释放先前分配的缓冲区。

以下是一些 ESP-IDF 配置选项，有助于在运行时实现堆内存优化：

- lwIP 文档中的有关章节介绍了如何配置[最小内存使用](#)。
- 部分 Mbed TLS 配置选项也可用于堆内存优化，详情请参阅[减少内存使用](#)的 Mbed TLS 部分。

备注： 如果将某些配置选项更改为非默认值，也会增加运行时的堆内存使用。这类选项未在上文中列出，但配置选项的帮助文档中给出了相应说明。

IRAM 优化 程序运行时，由于使用了静态 IRAM，用于堆内存使用的 DRAM 会相应减少。反之，可以通过减少 IRAM 使用，增加可用 DRAM。

如果应用程序分配的静态 IRAM 超过可用上限，应用程序将无法构建，并出现链接器错误，如 `section '.iram0.text' will not fit in region 'iram0_0_seg'`、`IRAM0 segment data does not fit` 以及 `region 'iram0_0_seg' overflowed by 84-bytes`。如果发生这种情况，应找到减少静态 IRAM 使用的方法，链接应用程序。

要分析固件应用程序二进制文件中的 IRAM 使用情况，请使用[测量静态数据大小](#)。如果固件应用程序链接失败，请参阅[链接器失败时显示文件大小](#)中的步骤，分析失败原因。

要对某些 ESP-IDF 功能进行 IRAM 优化，请使用以下选项：

- 启用 `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`。只要没有从 ISR 中错误地调用这些函数，就可以在所有配置中安全启用此选项。
- 启用 `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`。只要没有从 ISR 中错误地调用这些函数，就可以在所有配置中安全启用此选项。
- 启用 `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`。如果从 IRAM 中的中断上下文中使用 ISR ringbuf 函数，例如启用了 `CONFIG_UART_ISR_IN_IRAM`，则无法安全使用此选项。在此情况下，安装 ESP-IDF 相关驱动程序时，将在运行时报错。
- 启用 `CONFIG_SPI_FLASH_ROM_IMPL` 选项可以释放一些 IRAM，但此时 `esp_flash` 错误修复程序及新的 flash 芯片支持将失效，详情请参阅 [SPI Flash API ESP-IDF Version vs Chip-ROM Version](#)。
- 禁用 `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR` 可以防止从 [IRAM 安全中断处理程序](#) 中发布 `esp_event` 事件，节省 IRAM 空间。
- 禁用 `CONFIG_SPI_MASTER_ISR_IN_IRAM` 可以防止在写入 flash 时发生 `spi_master` 中断，节省 IRAM 空间，但可能影响 `spi_master` 的性能。
- 禁用 `CONFIG_SPI_SLAVE_ISR_IN_IRAM` 可以防止在写入 flash 时发生 `spi_slave` 中断，节省 IRAM 空间。
- 设置 `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` 为禁用 HAL 组件的断言，可以节省 IRAM 空间，对于经常调用 `HAL_ASSERT` 且位于 IRAM 中的 HAL 代码尤为如此。
- 要禁用不需要的 flash 驱动程序，节省 IRAM 空间，请参阅 `sdkconfig` 菜单中的 Auto-detect Flash chips 选项。
- 启用 `CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH`。只要未启用 `CONFIG_SPI_MASTER_ISR_IN_IRAM` 选项，且没有从 ISR 中错误地调用堆函数，就可以在所有配置中安全启用此选项。

备注： 将常用函数从 IRAM 移动到 flash，可能会增加函数的执行时间。

备注： 部分配置选项可以将一些功能移动到 IRAM 中，从而提高性能，但这类选项默认不进行配置，因此未在此列出。了解启用上述选项对 IRAM 大小造成的影响，请参阅配置项的帮助文本。

4.22 Reproducible Builds

4.22.1 Introduction

ESP-IDF build system has support for [reproducible builds](#).

When reproducible builds are enabled, the application built with ESP-IDF does not depend on the build environment. Both the .elf file and .bin files of the application remains exactly the same, even if the following variables change:

- Directory where the project is located
- Directory where ESP-IDF is located (`IDF_PATH`)
- Build time

4.22.2 Reasons for Non-Reproducible Builds

There are several reasons why an application may depend on the build environment, even when the same source code and tools versions are used.

- In C code, `__FILE__` preprocessor macro is expanded to the full path of the source file.
- `__DATE__` and `__TIME__` preprocessor macros are expanded to compilation date and time.
- When the compiler generates object files, it adds sections with debug information. These sections help debuggers, like GDB, to locate the source code which corresponds to a particular location in the machine code. These sections typically contain paths of relevant source files. These paths may be absolute, and will include the path to ESP-IDF or to the project.

There are also other possible reasons, such as unstable order of inputs and non-determinism in the build system.

4.22.3 Enabling Reproducible Builds in ESP-IDF

Reproducible builds can be enabled in ESP-IDF using `CONFIG_APP_REPRODUCIBLE_BUILD` option.

This option is disabled by default. It can be enabled in `menuconfig`.

The option may also be added into `sdkconfig.defaults`. If adding the option into `sdkconfig.defaults`, delete the `sdkconfig` file and run the build again. See [自定义 `sdkconfig` 的默认值](#) for more information.

4.22.4 How Reproducible Builds Are Achieved

ESP-IDF achieves reproducible builds using the following measures:

- In ESP-IDF source code, `__DATE__` and `__TIME__` macros are not used when reproducible builds are enabled. Note, if the application source code uses these macros, the build will not be reproducible.
- ESP-IDF build system passes a set of `-fmacro-prefix-map` and `-fdebug-prefix-map` flags to replace base paths with placeholders:
 - Path to ESP-IDF is replaced with `/IDF`
 - Path to the project is replaced with `/IDF_PROJECT`
 - Path to the build directory is replaced with `/IDF_BUILD`
 - Paths to components are replaced with `/COMPONENT_NAME_DIR` (where `NAME` is the name of the component)
- Build date and time are not included into the *application metadata structure* and *bootloader metadata structure* if `CONFIG_APP_REPRODUCIBLE_BUILD` is enabled.
- ESP-IDF build system ensures that source file lists, component lists and other sequences are sorted before passing them to CMake. Various other parts of the build system, such as the linker script generator also perform sorting to ensure that same output is produced regardless of the environment.

4.22.5 Reproducible Builds and Debugging

When reproducible builds are enabled, file names included in debug information sections are altered as shown in the previous section. Due to this fact, the debugger (GDB) is not able to locate the source files for the given code location.

This issue can be solved using GDB `set substitute-path` command. For example, by adding the following command to GDB init script, the altered paths can be reverted to the original ones:

```
set substitute-path /COMPONENT_FREERTOS_DIR /home/user/esp/esp-idf/components/
↳freertos
```

ESP-IDF build system generates a file with the list of such `set substitute-path` commands automatically during the build process. The file is called `prefix_map_gdbinit` and is located in the project build directory.

When `idf.py gdb` is used to start debugging, this additional `gdbinit` file is automatically passed to GDB. When launching GDB manually or from an IDE, please pass this additional `gdbinit` script to GDB using `-x build/prefix_map_gdbinit` argument.

4.22.6 Factors Which Still Affect Reproducible Builds

Note that the built application still depends on:

- ESP-IDF version
- Versions of the build tools (CMake, Ninja) and the cross-compiler

[IDF Docker 镜像](#) can be used to ensure that these factors do not affect the build.

4.23 RF 校准

ESP32-H2 在 RF 初始化过程中支持以下三种 RF 校准：

1. 部分校准
2. 全面校准
3. 不校准

4.23.1 部分校准

在 RF 初始化期间，默认使用部分校准，该方法基于存储在 NVS 中的完全校准数据实现。要使用此校准方法，请前往 `menuconfig` 并启用 `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`。

4.23.2 全面校准

在以下几种情况下，使用全面校准：

1. NVS 不存在。
2. 存储校准数据的 NVS 分区已擦除。
3. 硬件 MAC 地址变更。
4. PHY 库版本变更。
5. 从 NVS 分区加载的 RF 校准数据损坏。

全面校准耗时比部分校准长约 100 ms。当启动时长的重要性不高时，建议使用全面校准。要切换到全面校准，请前往 `menuconfig` 并禁用 `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`。如果使用了默认的部分校准，作为最后补救措施，可以使用以下两种方法添加函数，触发全面校准：

1. 如果不介意擦除 NVS 分区中的所有数据，那么擦除 NVS 分区是最简单的方法。

2. 在初始化 Wi-Fi 和 Bluetooth®/Bluetooth Low Energy 前，根据某些条件（例如，在某些诊断模式下提供的选项）调用 API `esp_phy_erase_cal_data_in_nvs()`，此时仅会擦除 NVS 分区的 PHY 命名空间。

4.23.3 不校准

设备从 Deep-sleep 模式中唤醒时，可以不校准。

4.23.4 PHY 初始化数据

PHY 初始化数据用于 RF 校准，通过以下两种方法，可以获取 PHY 初始化数据。

一是使用默认初始化数据，该数据位于头文件 `components/esp_phy/esp32h2/include/phy_init_data.h` 中。默认初始化数据会在编译后嵌入到应用程序的二进制文件，然后存储在只读存储器 (DROM) 中。要使用默认的初始化数据，请前往 `menuconfig` 并禁用 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`。

二是将初始化数据存储于 PHY 数据分区中。默认的分区分区表中已经包含了 PHY 数据分区，但是使用自定义分区表时，请确保在自定义分区表中包含一个 PHY 数据分区（类型：data，子类型：phy）。无论使用自定义分区表还是默认分区表，只要初始化数据存储于分区中，就需要将其烧录到相应的分区中，否则运行时可能会出现错误。如果想要使用存储在分区中的初始化数据，请前往 `menuconfig` 并启用选项 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`。

4.23.5 API 参考

Header File

- `components/esp_phy/include/esp_phy_init.h`
- This header file can be included with:

```
#include "esp_phy_init.h"
```

- This header file is a part of the API provided by the `esp_phy` component. To declare that your component depends on `esp_phy`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_phy
```

or

```
PRIV_REQUIRES esp_phy
```

Functions

```
const esp_phy_init_data_t* esp_phy_get_init_data(void)
```

Get PHY init data.

If "Use a partition to store PHY init data" option is set in `menuconfig`, This function will load PHY init data from a partition. Otherwise, PHY init data will be compiled into the application itself, and this function will return a pointer to PHY init data located in read-only memory (DROM).

If "Use a partition to store PHY init data" option is enabled, this function may return NULL if the data loaded from flash is not valid.

备注: Call `esp_phy_release_init_data` to release the pointer obtained using this function after the call to `esp_wifi_init`.

返回 pointer to PHY init data structure

void **esp_phy_release_init_data** (const *esp_phy_init_data_t* *data)

Release PHY init data.

参数 data -- pointer to PHY init data structure obtained from esp_phy_get_init_data function

esp_err_t **esp_phy_load_cal_data_from_nvs** (*esp_phy_calibration_data_t* *out_cal_data)

Function called by esp_phy_load_cal_and_init to load PHY calibration data.

This is a convenience function which can be used to load PHY calibration data from NVS. Data can be stored to NVS using esp_phy_store_cal_data_to_nvs function.

If calibration data is not present in the NVS, or data is not valid (was obtained for a chip with a different MAC address, or obtained for a different version of software), this function will return an error.

参数 out_cal_data -- pointer to calibration data structure to be filled with loaded data.

返回 ESP_OK on success

esp_err_t **esp_phy_store_cal_data_to_nvs** (const *esp_phy_calibration_data_t* *cal_data)

Function called by esp_phy_load_cal_and_init to store PHY calibration data.

This is a convenience function which can be used to store PHY calibration data to the NVS. Calibration data is returned by esp_phy_load_cal_and_init function. Data saved using this function to the NVS can later be loaded using esp_phy_store_cal_data_to_nvs function.

参数 cal_data -- pointer to calibration data which has to be saved.

返回 ESP_OK on success

esp_err_t **esp_phy_erase_cal_data_in_nvs** (void)

Erase PHY calibration data which is stored in the NVS.

This is a function which can be used to trigger full calibration as a last-resort remedy if partial calibration is used. It can be called in the application based on some conditions (e.g. an option provided in some diagnostic mode).

返回 ESP_OK on success

返回 others on fail. Please refer to NVS API return value error number.

void **esp_phy_enable** (*esp_phy_modem_t* modem)

Enable PHY and RF module.

PHY and RF module should be enabled in order to use WiFi or BT. Now PHY and RF enabling job is done automatically when start WiFi or BT. Users should not call this API in their application.

参数 modem -- the modem to call the phy enable.

void **esp_phy_disable** (*esp_phy_modem_t* modem)

Disable PHY and RF module.

PHY module should be disabled in order to shutdown WiFi or BT. Now PHY and RF disabling job is done automatically when stop WiFi or BT. Users should not call this API in their application.

参数 modem -- the modem to call the phy disable.

void **esp_btbb_enable** (void)

Enable BTBB module.

BTBB module should be enabled in order to use IEEE802154 or BT. Now BTBB enabling job is done automatically when start IEEE802154 or BT. Users should not call this API in their application.

void **esp_btbb_disable** (void)

Disable BTBB module.

Disable BTBB module, used by IEEE802154 or Bluetooth. Users should not call this API in their application.

void **esp_phy_load_cal_and_init** (void)

Load calibration data from NVS and initialize PHY and RF module.

void **esp_phy_modem_init** (void)

Initialize backup memory for Phy power up/down.

void **esp_phy_modem_deinit** (void)

Deinitialize backup memory for Phy power up/down Set phy_init_flag if all modems deinit on ESP32C3.

void **esp_phy_common_clock_enable** (void)

Enable WiFi/BT common clock.

void **esp_phy_common_clock_disable** (void)

Disable WiFi/BT common clock.

int64_t **esp_phy_rf_get_on_ts** (void)

Get the time stamp when PHY/RF was switched on.

返回 return 0 if PHY/RF is never switched on. Otherwise return time in microsecond since boot when phy/rf was last switched on

esp_err_t **esp_phy_update_country_info** (const char *country)

Update the corresponding PHY init type according to the country code of Wi-Fi.

参数 **country** -- country code

返回 ESP_OK on success.

返回 esp_err_t code describing the error on fail

char ***get_phy_version_str** (void)

Get PHY lib version.

返回 PHY lib version.

void **phy_init_param_set** (uint8_t param)

Set PHY init parameters.

参数 **param** -- is 1 means combo module

void **phy_wifi_enable_set** (uint8_t enable)

Wi-Fi RX enable.

参数 **enable** -- True for enable wifi receiving mode as default, false for closing wifi receiving mode as default.

Structures

struct **esp_phy_init_data_t**

Structure holding PHY init parameters.

Public Members

uint8_t **params**[128]

opaque PHY initialization parameters

struct **esp_phy_calibration_data_t**

Opaque PHY calibration data.

Public Members

uint8_t **version**[4]

PHY version

uint8_t **mac**[6]

The MAC address of the station

uint8_t **opaque**[1894]

calibration data

Enumerations

enum **esp_phy_modem_t**

PHY enable or disable modem.

Values:

enumerator **PHY_MODEM_WIFI**

PHY modem WIFI

enumerator **PHY_MODEM_BT**

PHY modem BT

enumerator **PHY_MODEM_IEEE802154**

PHY modem IEEE802154

enum **esp_phy_calibration_mode_t**

PHY calibration mode.

Values:

enumerator **PHY_RF_CAL_PARTIAL**

Do part of RF calibration. This should be used after power-on reset.

enumerator **PHY_RF_CAL_NONE**

Don't do any RF calibration. This mode is only suggested to be used after deep sleep reset.

enumerator **PHY_RF_CAL_FULL**

Do full RF calibration. Produces best results, but also consumes a lot of time and current. Suggested to be used once.

Header File

- [components/esp_phy/include/esp_phy_cert_test.h](#)
- This header file can be included with:

```
#include "esp_phy_cert_test.h"
```

- This header file is a part of the API provided by the `esp_phy` component. To declare that your component depends on `esp_phy`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_phy
```

or

```
PRIV_REQUIRES esp_phy
```

Functions

void **esp_wifi_power_domain_on** (void)

Wifi power domain power on.

void **esp_wifi_power_domain_off** (void)

Wifi power domain power off.

void **esp_phy_rftest_config** (uint8_t conf)

Environment variable configuration.

参数 conf -- Set to 1 to enter RF test mode.

void **esp_phy_rftest_init** (void)

RF initialization configuration.

void **esp_phy_tx_contin_en** (bool contin_en)

TX Continuous mode.

参数 contin_en -- Set to true for continuous packet sending, which can be used for certification testing; Set to false to cancel continuous mode, which is the default mode and can be used for WLAN tester.

void **esp_phy_cbw40m_en** (bool en)

HT40/HT20 mode selection.

参数 en -- Set to false to enter 11n HT20 mode; Set to true to enter 11n HT40 mode;

void **esp_phy_wifi_tx** (uint32_t chan, *esp_phy_wifi_rate_t* rate, int8_t backoff, uint32_t length_byte, uint32_t packet_delay, uint32_t packet_num)

Wi-Fi TX command.

参数

- **chan** -- channel setting, 1~14;
- **rate** -- rate setting;
- **backoff** -- Transmit power attenuation, unit is 0.25dB. For example, 4 means that the power is attenuated by 1dB;
- **length_byte** -- TX packet length configuration, indicating PSDU Length, unit is byte;
- **packet_delay** -- TX packet interval configuration, unit is us;
- **packet_num** -- The number of packets sent, 0 means sending packets continuously, other values represent the number of packets to send.

void **esp_phy_test_start_stop** (uint8_t value)

Test start/stop command, used to stop transmitting or receiving state.

参数 value -- Value should be set to 3 before TX/RX. Set value to 0 to end TX/RX state.

void **esp_phy_wifi_rx** (uint32_t chan, *esp_phy_wifi_rate_t* rate)

Wi-Fi RX command.

参数

- **chan** -- channel setting, 1~14;
- **rate** -- rate setting;

void **esp_phy_wifi_tx_tone** (uint32_t start, uint32_t chan, uint32_t backoff)

Wi-Fi Carrier Wave(CW) TX command.

参数

- **start** -- enable CW, 1 means transmit, 0 means stop transmitting;
- **chan** -- CW channel setting, 1~14;
- **backoff** -- CW power attenuation parameter, unit is 0.25dB. 4 indicates the power is attenuated by 1dB.

void **esp_phy_ble_tx** (uint32_t txpwr, uint32_t chan, uint32_t len, *esp_phy_ble_type_t* data_type, uint32_t syncw, *esp_phy_ble_rate_t* rate, uint32_t tx_num_in)

BLE TX command.

参数

- **txpwr** -- Transmit power level. Tx power is about (level-8)*3 dBm, step is 3dB. Level 8 is around 0 dBm;
- **chan** -- channel setting, range is 0~39, corresponding frequency = 2402+chan*2;
- **len** -- Payload length setting, range is 0-255, unit is byte, 37 bytes is employed generally;
- **data_type** -- Data type setting;
- **syncw** -- Packet identification (need to be provided by the packet generator or instrument manufacturer), 0x71764129 is employed generally;
- **rate** -- rate setting;
- **tx_num_in** -- The number of packets sent, 0 means sending packets continuously, other values represent the number of packets to send.

void **esp_phy_ble_rx** (uint32_t chan, uint32_t syncw, *esp_phy_ble_rate_t* rate)

BLE RX command.

参数

- **chan** -- channel selection, range is 0-39; Channels 0, 1, 2~10 correspond to 2404MHz, 2406MHz, 2408MHz~2424MHz respectively; Channels 11, 12, 13~36 correspond to 2428MHz, 2430MHz, 2432MHz~2478MHz respectively; Channel 37: 2402MHz, Channel 38: 2426MHz, Channel 39: 2480MHz;
- **syncw** -- Packet identification (need to be provided by the packet generator or instrument manufacturer), 0x71764129 is employed generally;
- **rate** -- rate setting;

void **esp_phy_bt_tx_tone** (uint32_t start, uint32_t chan, uint32_t power)

BLE Carrier Wave(CW) TX command.

参数

- **start** -- enable CW, 1 means transmit, 0 means stop transmitting;
- **chan** -- Single carrier transmission channel selection, range is 0~39, corresponding frequency freq = 2402+chan*2;
- **power** -- CW power attenuation parameter, unit is 0.25dB. 4 indicates the power is attenuated by 1dB.

void **esp_phy_get_rx_result** (*esp_phy_rx_result_t* *rx_result)

Get some RX information.

参数 **rx_result** -- This struct for storing RX information;

Structures

struct **esp_phy_rx_result_t**

Structure holding PHY RX result.

Public Members

uint32_t **phy_rx_correct_count**

The number of desired packets received

int **phy_rx_rssi**

Average RSSI of desired packets

uint32_t **phy_rx_total_count**

The number of total packets received

uint32_t **phy_rx_result_flag**

0 means no RX info; 1 means the latest Wi-Fi RX info; 2 means the latest BLE RX info.

Enumerations

enum **esp_phy_wifi_rate_t**

Values:

enumerator **PHY_RATE_1M**

enumerator **PHY_RATE_2M**

enumerator **PHY_RATE_5M5**

enumerator **PHY_RATE_11M**

enumerator **PHY_RATE_6M**

enumerator **PHY_RATE_9M**

enumerator **PHY_RATE_12M**

enumerator **PHY_RATE_18M**

enumerator **PHY_RATE_24M**

enumerator **PHY_RATE_36M**

enumerator **PHY_RATE_48M**

enumerator **PHY_RATE_54M**

enumerator **PHY_RATE_MCS0**

enumerator **PHY_RATE_MCS1**

enumerator **PHY_RATE_MCS2**

enumerator **PHY_RATE_MCS3**

enumerator **PHY_RATE_MCS4**

enumerator **PHY_RATE_MCS5**

enumerator **PHY_RATE_MCS6**

enumerator **PHY_RATE_MCS7**

enumerator **PHY_WIFI_RATE_MAX**

enum **esp_phy_ble_rate_t**

Values:

enumerator **PHY_BLE_RATE_1M**

enumerator **PHY_BLE_RATE_2M**

enumerator **PHY_BLE_RATE_125K**

enumerator **PHY_BLE_RATE_500k**

enumerator **PHY_BLE_RATE_MAX**

enum **esp_phy_ble_type_t**

Values:

enumerator **PHY_BLE_TYPE_1010**

enumerator **PHY_BLE_TYPE_00001111**

enumerator **PHY_BLE_TYPE_prbs9**

enumerator **PHY_BLE_TYPE_00111100**

enumerator **PHY_BLE_TYPE_MAX**

4.24 线程局部存储

4.24.1 概述

线程局部存储 (TLS) 机制可以分配变量，使每个现有的线程都有相应变量实例。ESP-IDF 提供了以下三种方法，支持使用此类变量：

- *FreeRTOS 原生 API*：ESP-IDF FreeRTOS 原生 API。
- *Pthread API*：ESP-IDF pthread API。
- *C11 标准*：C11 标准引入了特殊关键字，将变量声明为线程局部变量。

4.24.2 FreeRTOS 原生 API

ESP-IDF FreeRTOS 提供以下 API，用于管理线程局部变量：

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

此时，可以分配的最大变量数量受 `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` 限制。变量保存在任务控制块 (TCB) 中，并由其索引访问。注意，索引 0 保留，供 ESP-IDF 内部使用。

通过使用上述 API，你可以分配任意大小的线程局部变量，并将其分配给任意数量的任务。不同任务可以拥有不同的 TLS 变量集。

如果变量大小超过 4 个字节，你需要负责为其分配/释放内存。在任务删除时，FreeRTOS 会释放变量，但必须提供回调函数来适当清理。

4.24.3 Pthread API

ESP-IDF 提供以下 *POSIX Thread*，用于管理线程局部变量：

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

Pthread API 具备 FreeRTOS 原生 API 的所有优点，并突破了 FreeRTOS 原生 API 的部分限制，如变量数量仅受堆上可用内存大小的限制。然而由于 Pthread API 具备动态性质，与原生 API 相比，这个 API 引入了额外的性能开销。

4.24.4 C11 标准

ESP-IDF FreeRTOS 支持基于 C11 标准的线程局部变量，使用 `__thread` 关键字指定。要了解 GCC 功能详情，请参阅 [GCC 文档](#)。

这类变量的存储空间分配在任务栈上。请注意，即使任务根本不使用这些变量，程序中所有这类变量的存储区域都会在系统中每个任务的栈上分配。例如，ESP-IDF 系统任务（如 `ipc`、`timer` 任务等）也有额外的栈空间分配。因此，使用这个特性时，需要谨慎考虑。

在使用 C11 线程局部变量时，可以针对以下特点进行权衡：在编程中使用 C11 线程局部变量非常方便，使用最少的 CPU 指令即可访问，但这一优势的代价是系统中所有任务都会额外使用栈。由于变量分配的静态性质，系统中的所有任务具有一组相同的 C11 线程局部变量。

4.25 工具

4.25.1 IDF 前端工具 - `idf.py`

idf.py 命令行工具提供了一个前端界面，管理工程构建、工程部署及工程调试等操作。该前端界面使用多项工具，如：

- **CMake** 用于配置要构建的工程。
- **Ninja** 用于构建工程。
- **esptool.py** 用于烧录目标芯片。

第五步：开始使用 ESP-IDF 吧 简要介绍了设置 idf.py 以配置、构建及烧录工程的操作流程。

重要： idf.py 应在 ESP-IDF 工程目录下运行，即包含 CMakeLists.txt 文件的目录。旧版本工程，即包含 Makefile 的目录，与 idf.py 不兼容。

常用命令

创建新工程：create-project

```
idf.py create-project <project name>
```

此命令将创建一个新的 ESP-IDF 工程。此外，使用 --path 选项可指定工程创建路径。

创建新组件：create-component

```
idf.py create-component <component name>
```

此命令将创建一个新的组件，包含构建所需的最基本文件集。使用 -C 选项可指定组件创建目录。有关组件的更多信息，请参阅[组件 CMakeLists 文件](#)。

选择目标芯片：set-target ESP-IDF 支持多个目标芯片，运行 idf.py --list-targets 查看当前 ESP-IDF 版本支持的所有目标芯片。

```
idf.py set-target <target>
```

此命令将设置当前工程的目标芯片。

重要： idf.py set-target 将清除构建目录，并重新生成 sdkconfig 文件，原来的 sdkconfig 文件保存为 sdkconfig.old。

备注： idf.py set-target 命令与以下操作效果相同：

1. 清除构建目录 (idf.py fullclean)
 2. 删除 sdkconfig 文件 (mv sdkconfig sdkconfig.old)
 3. 使用新的目标芯片重新配置工程 (idf.py -DIDF_TARGET=esp32 reconfigure)
-

所需的 IDF_TARGET 还可以作为环境变量（如 export IDF_TARGET=esp32s2）或 CMake 变量（如将 -DIDF_TARGET=esp32s2 作为 CMake 或 idf.py 的参数）传递。在经常使用同类芯片的情况下，设置环境变量将使操作更加便利。

要给指定工程设定 IDF_TARGET 的默认值，请将 CONFIG_IDF_TARGET 选项添加到该工程的 sdkconfig.defaults 文件（如 CONFIG_IDF_TARGET="esp32s2"）。若未通过使用环境变量、CMake 变量或 idf.py set-target 命令等方法指定 IDF_TARGET，则默认使用该选项的值。

若未通过以上任一方法设置目标芯片，构建系统将默认使用 esp32。

启动图形配置工具：menuconfig

```
idf.py menuconfig
```

构建工程: **build**

```
idf.py build
```

此命令将构建当前目录下的工程，具体步骤如下：

- 若有需要，创建构建子目录 `build` 保存构建输出文件，使用 `-B` 选项可改变子目录的路径。
- 必要时运行 **CMake** 配置工程，并为主要构建工具生成构建文件。
- 运行主要构建工具 (**Ninja** 或 **GNU Make**)。默认情况下，构建工具会完成自动检测，也可通过将 `-G` 选项传递给 `idf.py` 来显式设置构建工具。

构建是增量行为，因此若上次构建结束后，源文件或配置并未发生更改，则不会执行任何操作。

此外，使用 `app`、`bootloader` 或 `partition-table` 参数运行此命令，可选择仅构建应用程序、引导加载程序或分区表。

清除构建输出: **clean**

```
idf.py clean
```

此命令可清除构建目录中的构建输出文件，下次构建时，工程将完全重新构建。注意，使用此选项不会删除构建文件夹内的 **CMake** 配置输出。

删除所有构建内容: **fullclean**

```
idf.py fullclean
```

此命令将删除所有 `build` 子目录内容，包括 **CMake** 配置输出。下次构建时，**CMake** 将重新配置其输出。注意，此命令将递归删除构建目录下的所有文件（工程配置将保留），请谨慎使用。

烧录工程: **flash**

```
idf.py flash
```

此命令将在需要时自动构建工程，随后将其烧录到目标芯片。使用 `-p` 和 `-b` 选项可分别设置串口名称和烧录程序的波特率。

备注：环境变量 `ESPPORT` 和 `ESPBAUD` 可分别设置 `-p` 和 `-b` 选项的默认值，在命令行上设置这些选项的参数可覆盖默认值。

与 `build` 命令类似，使用 `app`、`bootloader` 或 `partition-table` 参数运行此命令，可选择仅烧录应用程序、引导加载程序或分区表。

错误处理提示

`idf.py` 使用存储在 tools/idf_py_actions/hints.yml 中的提示数据库，当找到与给定错误相匹配的提示时，`idf.py` 会打印该提示以尝试提供解决方案。目前，错误处理提示不支持 `menuconfig` 对象。

若无需该功能，可以通过 `idf.py` 的 `--no-hints` 参数关闭提示。

重要提示

多个 `idf.py` 命令可以在同一行命令中组合使用。例如，`idf.py -p COM4 clean flash monitor` 可以清除源代码树、编译工程、并将其烧录到目标芯片，随后运行串行监视器。

在同一调用中，多个 `idf.py` 命令的顺序并不重要，它们将自动以正确的程序执行，以使全部操作生效（例如先构建后烧录、先擦除后烧录）。

`idf.py` 会尝试将未知命令作为构建系统目标执行。

命令 `idf.py` 支持 `bash`、`zsh` 和 `fish shell` 的 **shell 自动补全**。

调用命令 `export` 为 `idf.py` 启用自动补全（[第四步：设置环境变量](#)），按 `TAB` 键启动自动补全。输入 `idf.py -` 并按 `TAB` 键以自动补全选项。

预计未来版本将支持 `PowerShell` 自动补全。

高级命令

打开文档: `docs`

```
idf.py docs
```

此命令将在浏览器中打开工程目标芯片和 ESP-IDF 版本对应的文档。

显示大小: `Size`

```
idf.py size
```

此命令将显示应用程序大小，包括占用的 `RAM` 和 `flash` 及各部分（如 `.bss`）的大小。

```
idf.py size-components
```

此命令将显示工程中各个组件的应用程序大小。

```
idf.py size-files
```

该命令将显示工程中每个源文件的大小。

选项

- `--format` 指定输出格式，可输出 `text`、`csv`、`json` 格式，默认格式为 `text`。
- `--output-file` 可选参数，可以指定命令输出文件的文件名，而非标准输出。

重新配置工程: `reconfigure`

```
idf.py reconfigure
```

此命令将重新运行 `CMake`。正常情况下并不会用到该命令，因为一般无需重新运行 `CMake`，但如果从源代码树中添加或删除了文件，或需要修改 `CMake` 缓存变量时，将有必要使用该命令。例如，`idf.py -DNAME='VALUE' reconfigure` 可将变量 `NAME` 在 `CMake` 缓存中设置为值 `VALUE`。

清除 Python 字节码: `python-clean`

```
idf.py python-clean
```

此命令将从 `ESP-IDF` 目录中删除生成的 `Python` 字节码。字节码在切换 `ESP-IDF` 和 `Python` 版本时可能会引起问题，建议在切换 `Python` 版本后运行此命令。

生成 UF2 二进制文件: `uf2`

```
idf.py uf2
```

此命令将在构建目录中生成一个 UF2 (USB 烧录格式) 二进制文件 `uf2.bin`，该文件包含所有烧录目标芯片所必需的二进制文件，即引导加载程序、应用程序和分区表。

在 ESP 芯片上运行 [ESP USB Bridge](#) 项目将创建一个 USB 大容量存储设备，用户可以将生成的 UF2 文件复制到该 USB 设备中，桥接 MCU 将使用该文件来烧录目标 MCU。这一操作十分简单，只需将文件复制（或“拖放”）到文件资源管理器访问的公开磁盘中即可。

如需仅为应用程序生成 UF2 二进制文件，即不包含加载引导程序和分区表，请使用 `uf2-app` 命令。

```
idf.py uf2-app
```

读取 Otadata 分区: `read-otadata`

```
idf.py read-otadata
```

此命令将打印 `otadata` 分区的内容，该分区存储当前所选 OTA 应用程序分区的信息。有关 `otadata` 分区的更多信息，请参阅[空中升级 \(OTA\)](#)。

全局选项

运行 `idf.py --help` 列出所有可用的根级别选项。要列出特定子命令的选项，请运行 `idf.py <command> --help`，如 `idf.py monitor --help`。部分常用选项如下：

- `-C <dir>` 支持从默认当前工作目录覆盖工程目录。
- `-B <dir>` 支持从工程目录的默认 `build` 子目录覆盖构建目录。
- `--ccache` 可以在安装了 [CCache](#) 工具的前提下，在构建源文件时启用 [CCache](#)，减少部分构建耗时。

重要： 注意，某些旧版本 [CCache](#) 在某些平台上存在 bug，因此如果文件没有按预期重新构建，可禁用 [CCache](#) 并重新构建。可以通过将环境变量 `IDF_CCACHE_ENABLE` 设置为非零值来默认启用 [CCache](#)。

- `-v` 会使 `idf.py` 和构建系统生成详细的构建输出，有助于调试构建错误。
- `--cmake-warn-uninitialized` (或 `-w`) 将使 [CMake](#) 只显示在工程目录中发现的变量未初始化的警告，该选项仅控制 [CMake](#) 内部的 [CMake](#) 变量警告，不控制其他类型的构建警告。将环境变量 `IDF_CMAKE_WARN_UNINITIALIZED` 设置为非零值，可永久启用该选项。
- `--no-hints` 用于禁用有关错误处理的提示并禁用捕获输出。

通过 @file 传递参数 可以通过文件向 `idf.py` 传递多个参数。该文件或文件路径须在开头使用 `@` 进行标注。文件中的参数支持通过换行或空格分隔，并按其在 `idf.py` 命令行中的顺序扩展。

例如，当前有文件 `custom_flash.txt`：

```
flash --baud 115200
```

运行命令：`idf.py @custom_flash.txt monitor`

文件中的参数可以与额外的命令行参数结合使用，也支持同时使用带有 `@` 标注的多个文件。例如，另有一个文件 `another_config.txt`，此时，可以通过指定 `idf.py @custom_flash.txt @another_config.txt monitor` 同时使用两个文件。

关于参数文件的更多示例，如通过 `@filename` 创建配置文件概要，请参阅 [多个构建配置示例](#)。

4.25.2 IDF 监视器

IDF 监视器是一个串行终端程序，使用了 [esp-idf-monitor](#) 包，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 ESP-IDF 的其他特性。

在 ESP-IDF 中调用 `idf.py monitor` 可以启用此监视器。

操作快捷键

为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。这些快捷键可以自定义，请查看[配置文件](#)章节了解详情。

快捷键	操作	描述
Ctrl +]	退出监视器程序	
Ctrl + T	菜单退出键	按下如下给出的任意键之一，并按指示操作。
• Ctrl + T	将菜单字符发送至远程	
• Ctrl +]	将 exit 字符发送至远程	
• Ctrl + P	重置目标设备，进入引导加载程序，通过 RTS 和 DTR 线暂停应用程序	重置目标设备，通过 RTS 和 DTR 线（如已连接）进入引导加载程序。这会阻止开发板运行任何程序，在等待其他设备启动时可以使用此操作。更多详细信息，请参考 复位目标到引导加载程序 。
• Ctrl + R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl + F	编译并烧录此项目	暂停 <code>idf_monitor</code> ，运行 <code>flash</code> 目标，然后恢复 <code>idf_monitor</code> 。任何改动的源文件都会被重新编译，然后重新烧录。如果 <code>idf_monitor</code> 是以参数 <code>-E</code> 启动的，则会运行目标 <code>encrypted-flash</code> 。
• Ctrl + A (或者 A)	仅编译及烧录应用程序	暂停 <code>idf_monitor</code> ，运行 <code>app-flash</code> 目标，然后恢复 <code>idf_monitor</code> 。这与 <code>flash</code> 类似，但只有主应用程序被编译并被重新烧录。如果 <code>idf_monitor</code> 是以参数 <code>-E</code> 启动的，则会运行目标 <code>encrypted-flash</code> 。
• Ctrl + Y	停止/恢复在屏幕上打印日志输出	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl + L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）。
• Ctrl + I (或者 I)	停止/恢复打印时间标记	IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 <code>--timestamp-format</code> 命令行参数来改变。
• Ctrl + H (或者 H)	显示所有快捷键	
• Ctrl + X (或者 X)	退出监视器程序	
Ctrl + C	中断正在运行的应用程序	暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启用 <code>ref: CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME</code> 选项。

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

兼具 ESP-IDF 特性

自动解码地址 每当芯片输出指向可执行代码的十六进制地址时，IDF 监视器将查找该地址在源代码中的位置（文件名和行号），并在下一行用黄色打印出该位置。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```

abort() was called at PC 0x42067cd5 on core 0

IDF 监视器在后台运行以下命令，解码各地址：

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

如果在应用程序源代码中找不到匹配的地址，IDF 监视器还会检查 ROM 代码。此时不会打印源文件名和行号，只显示函数名 in ROM:

```

abort() was called at PC 0x400481c1 on core 0
0x400481c1: ets_rsa_pss_verify in ROM

Stack dump detected

ROM ELF 文件会根据 `IDF_PATH` 和 `ESP_ROM_ELF_DIR` 环境变量的路径自动加载。如需覆盖此行为, 可以通过调用 `esp_idf_monitor` 并指定特定的 ROM ELF 文件路径: `python -m esp_idf_monitor --rom-elf-file [ROM ELF 文件的路径]`。

备注: 将环境变量 `ESP_MONITOR_DECODE` 设置为 0 或者调用 `esp_idf_monitor` 的特定命令行选项 `python -m esp_idf_monitor --disable-address-decoding` 来禁止地址解码。

连接时复位目标芯片 默认情况下, IDF 监视器会在目标芯片连接时通过 DTR 和 RTS 串行线自动复位芯片。要防止 IDF 监视器在连接时自动复位, 请在调用 IDF 监视器时加上选项 `--no-reset`, 如 `idf.py monitor --no-reset`, 或者将环境变量 `ESP_IDF_MONITOR_NO_RESET` 设置成 1。

备注: `--no-reset` 选项在 IDF 监视器连接到特定端口时可以实现同样的效果, 如 `idf.py monitor --no-reset -p [PORT]`。

复位目标到引导加载程序 IDF 监视器可以通过预定义的复位序列将芯片复位到引导加载程序, 该序列已经经过调整, 可以在大多数环境中正常工作。此外, 用户可以设置自定义复位序列。通过对复位序列进行微调, 使其适应各种情况。

使用预定义的复位序列 IDF 监视器的默认复位序列可在大多数环境中使用。使用默认序列复位芯片到引导加载程序中, 无需进行额外配置。

自定义复位序列 对于高级用户或特定用例, IDF 监视器支持使用配置文件配置自定义复位序列。这在默认序列可能不足的极端情况下特别有用。

复位序列可通过以下格式的字符串定义:

- 各个命令由 | 分隔 (例如 `R0|D1|W0.5`)。
- 命令 (例如 `R0`) 由代码 (R) 和参数 (0) 定义。

代码	操作	参数
D	设置 DTR 控制线	1/0
R	设置 RTS 控制线	1/0
U	同时设置 DTR 和 RTS 控制线 (仅适用于类 Unix 系统)	0, 0/0, 1/1, 0/1, 1
W	等待 N 秒 (其中 N 为浮点数)	N

示例:

```
[esp-idf-monitor]
custom_reset_sequence = U0,1|W0.1|D1|R0|W0.5|D0
```

有关更多详细信息，请参阅 Esptool 文档中 [custom reset sequence](#) 章节。请注意，IDF 监视器只使用了 Esptool 配置中的 `custom_reset_sequence` 值，其他值会被 IDF 监视器忽略。

IDF 监视器和 Esptool 之间共享配置 自定义复位序列的配置可以在 IDF 监视器和 Esptool 之间的共享配置文件中指定。在这种情况下，为了使两个工具都能识别配置文件，其名称应为 `setup.cfg` 或 `tox.ini`。

共享配置文件的示例：

```
[esp-idf-monitor]
menu_key = T
skip_menu_key = True

[esptool]
custom_reset_sequence = U0,1|W0.1|D1|R0|W0.5|D0
```

备注： 当在 `[esp-idf-monitor]` 部分和 `[esptool]` 部分都使用 `custom_reset_sequence` 参数时，IDF 监视器会优先使用 `[esp-idf-monitor]` 部分的配置。`[esptool]` 部分中任何与之冲突的配置都将被忽略。

当配置分散在多个文件中时，此优先规则也适用。全局 `esp-idf-monitor` 配置将优先于本地 `esptool` 配置。

配置 GDBStub 以启用 GDB GDBStub 支持在运行时进行调试。GDBStub 在目标上运行，并通过串口连接到主机从而接收调试命令。GDBStub 支持读取内存和变量、检查调用堆栈帧等命令。虽然没有 JTAG 调试通用，但由于 GDBStub 完全通过串行端口完成通信，故不需要使用特殊硬件（如 JTAG/USB 桥接器）。

通过设置 `CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME`，可以将目标配置为在后台运行 GDBStub。GDBStub 将保持在后台运行，直到通过串行端口发送 `Ctrl+C` 导致应用程序中断（即停止程序执行），从而让 GDBStub 处理调试命令。

此外，还可以通过设置 `CONFIG_ESP_SYSTEM_PANIC` 为 GDBStub on panic 来配置 panic 处理程序，使其在发生 crash 事件时运行 GDBStub。当 crash 发生时，GDBStub 将通过串口输出特殊的字符串模式，表示 GDBStub 正在运行。

无论是通过发送 `Ctrl+C` 还是收到特殊字符串模式，IDF 监视器都会自动启动 GDB，从而让用户发送调试命令。GDB 退出后，通过 RTS 串口线复位目标。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

备注： IDF 监视器在后台运行如下命令启用 GDB：

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↳ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

输出筛选 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，即打印所有内容。支持使用环境变量 `ESP_IDF_MONITOR_PRINT_FILTER` 调整筛选设置。

备注： 同时使用环境变量 `ESP_IDF_MONITOR_PRINT_FILTER` 和参数 `--print-filter` 时，通过命令行输入的 CLI 参数 `--print-filter` 优先级更高。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 {N, E, W, I, D, V, *} 集合中的一个字母，指的是日志级别。

例如，`--print_filter="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

备注：编译时，可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 `*`、冒号 `:`，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- `*` 可用于匹配任何类型标签。但 `--print_filter="*:I tag1:E"` 打印关于 `tag1` 的输出时会报错，这是因为 `tag1` 规则比 `*` 规则的优先级高。
- 默认规则（空）等价于 `*:V`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `*:N` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 详细度级别或更低级别打印 `tag1`，在 Warning 详细度级别或更低级别打印 `tag2`。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 `tag3:N` 指定 `tag3` 不打印。
- `tag3:N` 在规则 `"tag1:I tag2:W tag3:N *:V"` 中更有意义，这是因为如果没有 `tag3:N`，`tag3` 信息就可能打印出来了；`tag1` 和 `tag2` 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

高级筛选规则示例 如下日志是在没有设置任何筛选选项的情况下获得的：

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

`--print_filter="wifi esp_image:E light_driver:I"` 筛选选项捕获的输出如下所示：

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

`--print_filter="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` 选项的输出如下：

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

配置文件

esp-idf-monitor 使用 **C0 控制字符** 与控制台进行交互。配置文件中的字符会被转换为对应的 C0 控制代码。可用字符包括英文字母 (A-Z) 和特殊符号: [、]、\、^、和 _。

警告: 注意, 一些字符可能无法在所有平台通用, 或被保留作为其他用途的快捷键。请谨慎使用此功能。

文件位置 配置文件的默认名称为 esp-idf-monitor.cfg。首先, 在 esp-idf-monitor 路径中检测配置文件并运行。

如果此目录中没有检测到配置文件, 则检查当前用户操作系统的配置目录:

- Linux: /home/<user>/.config/esp-idf-monitor/
- MacOS /Users/<user>/.config/esp-idf-monitor/
- Windows: c:\Users\<user>\AppData\Local\esp-idf-monitor\

如仍未检测到配置文件, 会最后再检查主目录:

- Linux: /home/<user>/
- MacOS /Users/<user>/
- Windows: c:\Users\<user>\

在 Windows 中, 可以使用 HOME 或 USERPROFILE 环境变量设置主目录, 因此, Windows 配置目录的位置也取决于这些变量。

还可以使用 ESP_IDF_MONITOR_CFGFILE 环境变量为配置文件指定一个不同的位置, 例如 ESP_IDF_MONITOR_CFGFILE = ~/custom_config.cfg。这一设置的检测优先级高于上述所有位置检测的优先级。

如果没有使用其他配置文件, esp-idf-monitor 会从其他常用的配置文件中读取设置。如果存在 setup.cfg 或 tox.ini 文件, esp-idf-monitor 会自动从这些文件中读取设置。

配置选项 下表列出了可用的配置选项:

选项名称	描述	默认值
menu_key	访问主菜单	T
exit_key	退出监视器]
chip_reset_key	初始化芯片重置	R
recompile_upload_key	重新编译并上传	F
recompile_upload_app_key	仅重新编译并上传应用程序	A
toggle_output_key	切换输出显示	Y
toggle_log_key	切换日志功能	L
toggle_timestamp_key	切换时间戳显示	I
chip_reset_bootloader_key	将芯片重置为引导加载模式	P
exit_menu_key	从菜单中退出监视器	X
skip_menu_key	设置使用菜单命令时无需按下主菜单键	False
custom_reset_sequence	复位目标到引导加载程序的自定义复位序列	无默认值

语法 配置文件为.ini 文件格式，必须以 [esp-idf-monitor] 标头引入才能被识别为有效文件。以下语法以“配置名称 = 配置值”形式列出。以 # 或 ; 开头的行是注释，将被忽略。

```
# esp-idf-monitor.cfg file to configure internal settings of esp-idf-monitor
[esp-idf-monitor]
menu_key = T
exit_key = ]
chip_reset_key = R
recompile_upload_key = F
recompile_upload_app_key = A
toggle_output_key = Y
toggle_log_key = L
toggle_timestamp_key = I
chip_reset_bootloader_key = P
exit_menu_key = X
skip_menu_key = False
```

IDF 监视器已知问题

如果在使用 IDF 监视器过程中遇到任何问题，请查看我们的 [GitHub 仓库](#) 以获取已知问题列表及其当前状态。如果遇到的问题没有相关记录，请创建一个新的问题报告。

4.25.3 IDF Docker 镜像

IDF Docker 镜像 (espressif/idf) 为使用特定版本的 ESP-IDF 自动化构建应用程序和库而设计。

该镜像包含以下内容：

- 常见的实用工具，如 git、wget、curl 和 zip。
- Python 3.8 或更高版本。
- 特定版本 ESP-IDF 的副本。有关版本信息，请参阅下文。该副本中设置了 IDF_PATH 环境变量，并指向容器中 ESP-IDF 的位置。
- 构建特定版本 ESP-IDF 所需工具：CMake、Ninja、交叉编译器工具链等。
- ESP-IDF 需要的所有 Python 软件包。这些软件包均已安装在虚拟环境中。

镜像 ENTRYPOINT 会设置 PATH 环境变量，指向正确版本的工具，并激活 Python 虚拟环境。此时，环境已经准备好，可以使用 ESP-IDF 构建系统。

如需使用其他工具，可用该镜像作为基础自定义镜像。

标签

该镜像维护了以下多个标签：

- latest：跟踪 ESP-IDF 的 master 分支
- vX.Y：对应 ESP-IDF 的版本 vX.Y
- release-vX.Y：跟踪 ESP-IDF 的 release/vX.Y 分支

备注：在引入镜像功能前发布的 ESP-IDF 版本没有对应的 Docker 镜像版本。要查找最新可用标签列表，请参阅 <https://hub.docker.com/r/espressif/idf/tags>。

使用 Docker

设置 Docker 在本地使用 espressif/idf Docker 镜像前，请确保已安装 Docker。如果本地未安装 Docker，请按 <https://docs.docker.com/install/> 提供的说明完成安装。

如果在 CI 环境中使用该镜像，请参阅 CI 服务说明文档，了解如何指定用于构建的镜像。

使用 CMake 构建项目 在项目目录下，运行以下命令：

```
docker run --rm -v $PWD:/project -w /project -u $UID -e HOME=/tmp espressif/idf_
→idf.py build
```

该命令具体内容如下：

- `docker run`：运行 Docker 镜像。此为 `docker container run` 命令的缩写形式。
- `--rm`：构建完成后删除相应容器。
- `-v $PWD:/project`：将主机当前目录 (`$PWD`) 挂载为容器中的 `/project` 目录。
- `-w /project`：使 `/project` 成为当前命令的工作目录。
- `-u $UID`：以当前用户的 ID 运行命令，使文件以当前用户而非 `root` 用户的身份创建。
- `-e HOME=/tmp`：为用户提供一个主目录，用于将 `idf.py` 创建的临时文件保存在 `~/.cache` 中。
- `espressif/idf`：使用标签为 `latest` 的 Docker 镜像 `espressif/idf`。未指定标签时，Docker 会隐式添加 `latest` 标签。
- `idf.py build`：在容器内运行此命令。

备注： 如果挂载目录 `/project` 包含的 `git` 仓库的用户 (UID) 不同于运行 Docker 容器的用户，在 `/project` 中执行 `git` 命令可能会失败，并显示错误信息 `fatal: detected dubious ownership in repository at '/project'`。如需解决此问题，可以在启动 Docker 容器时设置 `IDF_GIT_SAFE_DIR` 环境变量，将 `/project` 目录指定为安全目录。例如，可以将 `-e IDF_GIT_SAFE_DIR='/project'` 作为参数包含，还可以使用分隔符：指定多个目录，或使用 `*` 完全禁用此项 `git` 安全检查。

要以特定 Docker 镜像标签进行构建，请将其指定为 `espressif/idf:TAG`，示例如下：

```
docker run --rm -v $PWD:/project -w /project -u $UID -e HOME=/tmp espressif/
→idf:release-v4.4 idf.py build
```

要查看最新可用标签列表，请参阅 <https://hub.docker.com/r/espressif/idf/tags>。

交互使用镜像 Docker 也支持以交互方式进行构建，以调试构建问题或测试自动构建脚本。请使用 `-i -t` 标志启动容器，示例如下：

```
docker run --rm -v $PWD:/project -w /project -u $UID -e HOME=/tmp -it espressif/idf
```

接着在容器内部照常使用 `idf.py`：

```
idf.py menuconfig
idf.py build
```

备注： 若未将串行接口传递到容器中，则 `idf.py flash` 和 `idf.py monitor` 等与开发板通信的命令在容器中无法正常工作。对于 Linux 系统，可以使用 [设备选项](#) 将串行接口传递到容器中。然而，目前 Windows 系统 (<https://github.com/docker/for-win/issues/1018>) 和 Mac 系统 (<https://github.com/docker/for-mac/issues/900>) 中 Docker 不支持此功能。可以使用 [远程串行接口](#) 克服此限制。有关如何执行此操作，请参阅 [以下使用远程串行接口](#) 章节。

备注： 对于 Linux 系统，如果使用 `--device` 或 `--privileged` 等选项将主机的串行接口设备添加到容器，并使用 `-u $UID` 以特定用户启动容器时，请确保此用户对设备具有读/写访问权限。使用 `--group-add` 选项可以将容器用户添加到分配给主机设备的组 ID 中。例如，如果主机设备被分配到 `dialout` 组，你可以使用 `--group-add $(getent group dialout | cut -d':' -f3)` 将容器用户添加到主机的 `dialout` 组。

使用远程串行接口 RFC2217 (Telnet) 协议可用于远程连接到串行接口，详情请参阅 ESP 工具项目的 [远程串行接口](#) 文档。如果无法直接访问 Docker 容器内的串行接口，也可使用该协议进行访问。以下示例展示了如何从 Docker 容器内部使用烧写命令。

在主机上安装并启动 `esp_rfc2217_server`：

- 在 Windows 系统中，该软件包以一个文件的形式提供，这个文件是由 `pyinstaller` 创建的可执行文件，可以从 [ESP 工具版本](#) 页面以 ZIP 压缩文件的形式与其他 ESP 工具一起下载：

```
esp_rfc2217_server -v -p 4000 COM3
```

- 在 Linux 或 macOS 系统中，该软件包是 `esptool` 的组成部分，可以在 ESP-IDF 环境中找到，或使用以下 `pip` 命令安装：

```
pip install esptool
```

随后执行以下命令启动服务器：

```
esp_rfc2217_server.py -v -p 4000 /dev/ttyUSB0
```

此时，便可使用以下命令，从 Docker 容器内部烧写连接到主机的设备：

```
docker run --rm -v <host_path>:<container_path> -w /<container_path> espressif/
↳idf idf.py --port 'rfc2217://host.docker.internal:4000?ign_set_control' flash
```

请确保将 `<host_path>` 正确设置为主机上的项目路径，并使用 `-w` 选项将 `<container_path>` 设置为容器内的工作目录。`host.docker.internal` 为特殊的 Docker DNS 名称，用于访问主机。如有需要，可以将其替换为主机的 IP 地址。

构建自定义镜像

ESP-IDF 库中的 Docker 文件提供了以下构建参数，可用于构建自定义 Docker 镜像：

- `IDF_CLONE_URL`：克隆 ESP-IDF 存储库的 URL。在使用 ESP-IDF 分支时，可以将该参数设置为自定义 URL，默认值为 `https://github.com/espressif/esp-idf.git`。
- `IDF_CLONE_BRANCH_OR_TAG`：克隆 ESP-IDF 时使用的 git 分支或标签的名称。该参数将作为 `git clone` 命令的 `--branch` 参数传递，默认值为 `master`。
- `IDF_CHECKOUT_REF`：如果将此参数设置为非空值，在克隆之后会执行 `git checkout $IDF_CHECKOUT_REF` 命令。可以将此参数设置为特定 commit 的 SHA 值，以便切换到所需的版本分支或 commit。例如，在希望使用特定版本分支上的某个 commit 时，就可以将此参数设置为该 commit 的 SHA 值。
- `IDF_CLONE_SHALLOW`：如果将此参数设置为非空值，则会在执行 `git clone` 时使用 `--depth=1 --shallow-submodules` 参数。浅克隆的深度可以使用 `IDF_CLONE_SHALLOW_DEPTH` 设置。浅克隆可以极大减少下载的数据量及生成的 Docker 镜像大小。然而，如果需要切换到此类“浅层”存储库中的其他分支，必须先执行额外的 `git fetch origin <branch>` 命令。
- `IDF_CLONE_SHALLOW_DEPTH`：此参数指定进行浅克隆时要使用的深度值。如未设置，将使用 `--depth=1`。此参数仅在使用 `IDF_CLONE_SHALLOW` 时有效。如果要为分支构建 Docker 镜像，并且该镜像必须包含该分支上的最新标签，则需使用此参数。要确定所需的深度，请在特定的分支运行 `git describe` 命令，并注意偏移值。将偏移值加 1 后即可将其用作 `IDF_CLONE_SHALLOW_DEPTH` 参数的值。此过程将确保生成的镜像包含分支上的最新标签，且 Docker 镜像内部的 `git describe` 命令也会按预期工作。
- `IDF_INSTALL_TARGETS`：以逗号分隔的 ESP-IDF 目标列表，用于安装工具链，或者使用 `all` 安装所有目标的工具链。选择特定目标可以减少下载的数据量和生成的 Docker 镜像的大小。该参数默认值为 `all`。

要使用以上参数，请通过 `--build-arg` 命令行选项传递。例如，以下命令使用 ESP-IDF v4.4.1 的浅克隆以及仅适用于 ESP32-C3 的工具链构建了 Docker 镜像：

```
docker build -t idf-custom:v4.4.1-esp32c3 \
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
```

(下一页继续)

```
--build-arg IDF_CLONE_SHALLOW=1 \
--build-arg IDF_INSTALL_TARGETS=esp32c3 \
tools/docker
```

4.25.4 IDF Windows 安装程序

命令行参数

IDF Windows 安装程序 `esp-idf-tools-setup` 提供以下命令行参数：

- `/CONFIG=[PATH]` - 指定 ini 配置文件的路径，覆盖安装程序的默认配置。默认值：`config.ini`。
- `/GITCLEAN=[yes|no]` - 在以离线模式安装时，执行 `git clean` 命令，并删除未跟踪的目录。默认值：`yes`。
- `/GITRECURSIVE=[yes|no]` - 递归克隆所有 Git 仓库子模块。默认值：`yes`。
- `/GITREPO=[URL|PATH]` - 指定克隆 ESP-IDF 仓库的 URL。默认值：`https://github.com/espressif/esp-idf.git`。
- `/GITRESET=[yes|no]` - 在安装过程中，启用或禁用对仓库的 `git reset` 操作。默认值：`yes`。
- `/HELP` - 显示 Inno Setup 安装程序提供的命令行选项。
- `/IDFDIR=[PATH]` - 指定安装目录的路径。默认值：`{userdesktop}\esp-idf`。
- `/IDFVERSION=[v4.3|v4.1|master]` - 使用指定的 ESP-IDF 版本，如 `v4.1`、`v4.2`、`master`。默认值：`empty`，选取列表中的第一个版本。
- `/IDFVERSIONSURL=[URL]` - 使用 URL 下载 ESP-IDF 版本列表。默认值：`https://dl.espressif.com/dl/esp-idf/idf_versions.txt`。
- `/LOG=[PATH]` - 在指定目录中存储安装日志文件。默认值：`empty`。
- `/OFFLINE=[yes|no]` - 在离线模式下，使用 `pip` 执行。通过设置环境变量 `PIP_NO_INDEX`，也可在离线模式下安装 Python 软件包。默认值：`no`。
- `/USEEMBEDDEDPYTHON=[yes|no]` - 使用嵌入式 Python 版本完成安装。将此参数设置为 `no`，可以在安装程序中选择 Python 版本。默认值：`yes`。
- `/PYTHONNOUSERSITE=[yes|no]` - 在启动任意 Python 命令前，设置 `PYTHONNOUSERSITE` 变量，避免从 `AppDataRoaming` 加载 Python 软件包。默认值：`yes`。
- `/PYTHONWHEELSURL=[URL]` - 指定 PyPi 存储库的 URL，以解析二进制 Python Wheel 依赖关系。设置环境变量 `PIP_EXTRA_INDEX_URL` 可以实现相同效果。默认值：`https://dl.espressif.com/pypi`。
- `/SKIPSYSTEMCHECK=[yes|no]` - 跳过系统检查页面。默认值：`no`。
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - 执行静默安装。

静默安装

通过设置以下命令行参数，可以静默安装 ESP-IDF：

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

在命令行中运行安装程序时，它会在后台启动一个独立的进程执行安装操作，而不会阻塞命令行的使用。通过以下 PowerShell 脚本可以等待安装程序完成：

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

自定义 Python 版本及 Python Wheel 位置

IDF 安装程序默认使用嵌入的 Python 版本，并参考预定义的 Python Wheel 镜像获取所需软件包。

以下参数支持自定义 Python 版本及 Python Wheel 位置:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↳org/simple/
```

4.25.5 IDF 组件管理器

IDF 组件管理器工具用于下载 ESP-IDF CMake 项目的依赖项，该下载在 CMake 运行期间自动完成。IDF 组件管理器可以从 [组件注册表](#) 或 Git 仓库获取组件。

要获取组件列表，请参阅 <https://components.espressif.com/>。

有关 IDF 组件管理器的详细信息，请参阅 [IDF 组件管理器及 ESP 组件注册表文档](#)。

在项目中使用 IDF 组件管理器

项目中各组件的依赖项定义在单独的清单文件中，命名为 `idf_component.yml`，位于组件根目录。运行 `idf.py create-manifest` 可以为组件创建清单文件模板。默认情况下将为 `main` 组件创建清单文件。使用 `--path` 选项，可以显式指定创建清单文件的目录路径。使用 `--component=my_component` 选项可以指定组件名称，这样系统将会在 `components` 文件夹下为该组件创建清单文件。`create-manifest` 命令支持以下运行方式：

- `idf.py create-manifest` 为 `main` 组件创建清单文件
- `idf.py create-manifest --component=my_component` 在 `components` 目录下，为组件 `my_component` 创建清单文件
- `idf.py create-manifest --path="../../my_component"` 在 `my_component` 目录下，为组件 `my_component` 创建清单文件

在向项目的某个组件添加新的清单时，必须先运行 `idf.py reconfigure`，手动重新配置项目。随后，构建过程将跟踪 `idf_component.yml` 清单的变更，并在必要时自动触发 CMake。

要为 ESP-IDF 项目中的组件（如 `my_component`）添加依赖项，可以运行命令 `idf.py add-dependency DEPENDENCY`。DEPENDENCY 参数代表一个由 IDF 组件管理器管理的额外组件，而 `my_component` 也依赖于这个组件。DEPENDENCY 参数的格式为 `namespace/name=1.0.0`，`namespace/name` 代表组件名称，`=1.0.0` 是组件的版本范围，详情请参阅 [版本文档](#)。默认情况下，依赖项会添加到 `main` 组件。通过使用 `--path` 选项，可以显式指定包含清单的目录，也可以使用 `--component=my_component`，在 `components` 文件夹中指定组件。`add-dependency` 命令支持以下运行方式：

- `idf.py add-dependency example/cmp` 为 `main` 组件添加依赖项，依赖项为 `example/cmp` 的最新版本
- `idf.py add-dependency --component=my_component example/cmp<=3.3.3` 将依赖项添加到位于 `components` 目录下名为 `my_component` 的组件中，依赖项为版本号 `<=3.3.3` 的 `example/cmp`
- `idf.py add-dependency --path="../../my_component" example/cmp^3.3.3` 将依赖项添加到位于目录 `my_component` 下名为 `my_component` 的组件中，依赖项为版本号 `^3.3.3` 的 `example/cmp`

备注： `add-dependency` 命令会从 [乐鑫组件注册表](#) 将依赖项显式添加到你的项目中。

要更新 ESP-IDF 项目的依赖项，请运行命令 `idf.py update-dependencies`。你也可以使用 `--project-dir PATH` 选项，指定项目目录的路径。

应用程序示例 [build_system/cmake/component_manager](#) 使用了由组件管理器安装的组件。

对于不需要受管理依赖项的组件，则无需提供清单文件。

在 CMake 配置项目（如 `idf.py reconfigure`）时，组件管理器会执行以下操作：

- 处理项目中每个组件的 `idf_component.yml` 清单，并递归解析依赖项。
- 在项目根目录中创建 `dependencies.lock` 文件，包含完整的依赖项列表。
- 将所有依赖项下载至 `managed_components` 目录。

请勿更改 `dependencies.lock` 锁文件和 `managed_components` 目录的内容。组件管理器运行时，会始终确保这些文件处于最新状态。如果意外修改了这些文件，可以通过使用 `idf.py reconfigure` 触发 CMake，重新运行组件管理器。

设置构建属性 `DEPENDENCIES_LOCK` 可以指定顶层 `CMakeLists.txt` 文件中的锁文件路径。例如，在 `project(PROJECT_NAME)` 前添加 `idf_build_set_property(DEPENDENCIES_LOCK dependencies.lock.${IDF_TARGET})`，可以为不同目标生成不同锁文件。

从示例创建项目

组件注册表中，部分组件包含示例项目。要从示例创建一个新项目，可以运行命令 `idf.py create-project-from-example EXAMPLE`。EXAMPLE 参数格式为 `namespace/name=1.0.0:example`，`namespace/name` 代表组件名称，`=1.0.0` 是组件的版本范围（详情请参阅 [版本文档](#)），而 `example` 代表示例名称。在 [乐鑫组件注册表](#) 中，可以找到各组件的示例列表，以及启动组件示例的相应命令。

在清单文件中定义依赖项

通过在文本编辑器直接编辑，你可以轻松定义清单文件 `idf_component.yml` 中的依赖项。以下是有关定义依赖项的简单示例：

你可以通过指定组件名称和版本范围，定义来自注册表的依赖项：

```
dependencies:
  # 定义来自注册表 (https://components.espressif.com/component/example/cmp)
  ↳ 的依赖项
  example/cmp: ">=1.0.0"
```

要从 Git 仓库定义依赖关系，请提供组件在仓库中的路径和仓库的 URL：

```
dependencies:
  # 从 Git 仓库定义依赖项
  test_component:
    path: test_component
    git: ssh://git@gitlab.com/user/components.git
```

在开发组件时，可以通过指定相对或绝对路径，使用本地目录中的组件：

```
dependencies:
  # 通过相对路径定义本地依赖项
  some_local_component:
    path: ../../projects/component
```

有关清单文件格式的详细信息，请参阅 [清单文件格式文档](#)。

禁用组件管理器

将环境变量 `IDF_COMPONENT_MANAGER` 设置为 0，可以显式禁用组件管理器。

4.25.6 IDF clang-tidy

IDF clang-tidy 是使用 [clang-tidy](#) 对当前应用程序进行静态分析的工具。

警告： IDF clang-tidy 的功能及其依赖的工具链尚在开发中，最终版本发布前可能有重大变更。

目前仅支持基于 clang 的工具链。在配置项目前，必须在环境变量或 CMake 缓存中设置 `IDF_TOOLCHAIN=clang` 进行激活。

警告： 当前工具尚不支持基于 RISC-V 的芯片。目前，乐鑫尚未针对 RISC-V 提供基于 clang 的工具链。

准备工作

初次运行此工具时，请按照以下步骤准备该工具：

1. 运行 `idf_tools.py install esp-clang` 安装 clang-tidy 所需的二进制文件。

备注： 该工具链尚在开发中，最终版本发布后，将无需手动安装工具链。

2. 再次运行导出脚本（如 `export.sh`、`export.bat` 等），刷新环境变量。

其他命令

clang-check 运行 `idf.py clang-check` 可以重新生成编译数据库，并在当前项目文件夹下运行 clang-tidy，所得输出写入 `<project_dir>/warnings.txt`。

运行 `idf.py clang-check --help` 查看完整文档。

clang-html-report

1. 运行 `pip install codereport` 安装附加依赖关系。
2. 运行 `idf.py clang-html-report` 会根据 `warnings.txt` 在 `<project_dir>/html_report` 文件夹内生成 HTML 报告。请在浏览器中打开 `<project_dir>/html_report/index.html` 查看报告。

错误报告

此工具托管在 [espressif/clang-tidy-runner](https://github.com/espressif/clang-tidy-runner)。如遇到任何错误，或有任何功能请求，请通过 [Github issues](https://github.com/espressif/clang-tidy-runner/issues) 提交报告。

4.25.7 可下载的 ESP-IDF 工具

构建过程中，ESP-IDF 依赖许多工具，如交叉编译工具链、CMake 构建系统等。

如[快速入门](#)所述，若所需工具版本可用，首选使用当前操作系统的软件包管理器（如 `apt`、`yum`、`brew` 等）安装相关工具。例如，在 Linux 和 macOS 系统中，建议用 Linux 和 macOS 系统的软件包管理器安装 CMake。

但部分 ESP-IDF 的特定工具在操作系统软件包存储库中不可用，且不同版本的 ESP-IDF 需相应使用不同版本的工具运行。为解决以上两个问题，ESP-IDF 提供了一组脚本，可以下载和安装正确的工具版本，并设置相应运行环境。

下文中，这类可下载的工具简称为“工具”。除此类工具外，ESP-IDF 还使用以下工具：

- ESP-IDF 捆绑的 Python 脚本，如 `idf.py`
- 从 PyPI 安装的 Python 软件包

以下各小节介绍了可下载工具的安装方法，并提供了在不同平台上安装的工具列表。

备注： 本文档面向需要自定义其安装过程的高级用户、希望了解安装过程的用户以及 ESP-IDF 开发人员。要了解如何安装 ESP-IDF 工具，请参阅[快速入门](#)。

工具元数据文件

各平台所需工具及工具版本列表存放在 `tools/tools.json` 文件中，`tools/tools_schema.json` 定义了该文件的模式。

在安装工具或设置环境变量时，`tools/idf_tools.py` 脚本将使用上述文件。

工具安装目录

IDF_TOOLS_PATH 环境变量指定下载及安装工具的位置。若未设置该变量，Linux 和 macOS 系统的默认下载安装位置为 `HOME/.espressif`，Windows 系统的默认下载安装位置为 `%USER_PROFILE%\espressif`。

在 IDF_TOOLS_PATH 目录下，工具安装脚本会创建以下子目录和文件：

- `dist` — 工具存档下载位置。
- `tools` — 工具解压缩位置。工具会解压缩到子目录 `tools/TOOL_NAME/VERSION/` 中，该操作支持同时安装不同版本的工具。
- `idf-env.json` — “目标 (target)” 和 “功能 (feature)” 等用户安装选项均存储在此文件中。“目标”为选择需要安装和保持更新的工具的芯片目标；“功能”则决定应安装哪些 Python 软件包。有关用户安装选项的详情，请参阅下文。
- `python_env` — 与工具无关；虚拟 Python 环境安装在其子目录中。注意，设置 `IDF_PYTHON_ENV_PATH` 环境变量可以将 Python 环境目录放置到其他位置。
- `espidf.constraints.*.txt` — 每个 ESP-IDF 版本都有的约束文件，包含 Python 包版本要求。

GitHub 资源镜像

工具下载器下载的工具大多属于 GitHub 发布的资源，即在 GitHub 上伴随软件发布的文件。

如果无法访问 GitHub 下载或访问速度较慢，可以配置一个 GitHub 资源镜像。

要使用乐鑫下载服务器，请将环境变量 `IDF_GITHUB_ASSETS` 设置为 `dl.espressif.com/github_assets`，在国内下载时，也可设置为 `dl.espressif.cn/github_assets` 加快下载速度。安装过程中，当从 `github.com` 下载工具时，URL 将重写为使用乐鑫下载服务器。

只要 URL 与 `github.com` 的下载 URL 格式匹配，任何镜像服务器均可使用，安装过程中下载的 GitHub 资源 URL 将把 `https://github.com` 替换为 `https://{IDF_GITHUB_ASSETS}`。

备注： 目前，乐鑫下载服务器不会镜像 GitHub 上的所有内容，只镜像部分发布版本的附件资源文件及源文件。

idf_tools.py 脚本

ESP-IDF 随附的 `tools/idf_tools.py` 脚本具备以下功能：

- `install`：将工具下载到 `${IDF_TOOLS_PATH}/dist` 目录，并解压缩到 `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`。
`install` 命令接收 `TOOL_NAME` 或 `TOOL_NAME@VERSION` 格式的安装工具列表。如果给定参数 `all`，则会安装列表上的所有工具，包括必须项和可选项。如果没有给定参数，或给定参数为 `required`，则只安装必须项。

- `download`: 与 `install` 类似, 但不会解压缩工具。使用可选项 `--platform` 可下载特定平台的工具。
- `export`: 列出使用已安装工具前应设置的环境变量。对多数工具而言, 只需要设置环境变量 `PATH`, 但也有些工具需要设置额外的环境变量。

环境变量可以以 `shell` 或 `key-value` 格式列出, 使用 `--format` 参数设置该选项。

- `export` 可选参数:

- * `--unset`: 该参数可用于创建语句, 取消特定全局变量设置, 使环境恢复到调用 `export` 前状态。
- * `--add_paths_extras`: 该参数将 `$PATH` 中与 `ESP-IDF` 相关的额外路径添加到 `${IDF_TOOLS_PATH}/esp-idf.json` 中, 以保证在退出当前 `ESP-IDF` 环境时删除全局变量。例如, 在运行 `export.{sh/fish}` 脚本时, 如果在全局变量 `$PATH` 中添加了新的路径, 在命令中添加该参数可以将这些新路径保存到 `${IDF_TOOLS_PATH}/esp-idf.json` 文件中。

- `shell`: 生成适合在 `shell` 中执行的输出, 例如, 在 `Linux` 和 `macOS` 上生成以下输出

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

在 `Windows` 上生成以下输出

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

备注: 当前不支持以 `Powershell` 格式导出环境变量, 可以用 `key-value` 格式代替。

如果 `shell` 支持, 则该命令的输出可用于更新环境变量。例如

```
eval $(${IDF_PATH}/tools/idf_tools.py export)
```

- `key-value`: 以 `VARIABLE=VALUE` 格式生成输出, 以便其他脚本解析

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

注意, 用于处理此输出的脚本必须对输出中的 `$VAR` 或 `%VAR%` 模式进行扩展, 即解析成对应变量。

- `list`: 列出已知的工具版本, 并指示哪些版本已安装。
 - 以下选项可用于自定义输出。
 - `--outdated`: 仅列出安装在 `IDF_TOOLS_PATH` 中的过时版本工具。
- `check`: 检查每个工具是否在系统路径和 `IDF_TOOLS_PATH` 中可用。
- `install-python-env`: 在 `${IDF_TOOLS_PATH}/python_env` 目录或直接在 `IDF_PYTHON_ENV_PATH` 环境变量设置的目录中创建 `Python` 虚拟环境, 并在其中安装所需的 `Python` 软件包。
 - 参数 `--features` 为可选项, 用于指定要添加或删除的功能列表, 功能之间用逗号分隔。
 1. 该参数将删除以 `-` 开头的功能, 添加以 `+` 开头或无符号标记的功能。例如, 要删除功能 `XY`, 示例语法为 `--features=-XY`; 要添加功能 `XY`, 示例语法为 `--features=+XY` 或 `--features=XY`。如果为同一功能同时提供了删除和添加选项, 则不执行任何操作。
 2. 每个功能都必须有依赖文件。例如, 只有当 `${IDF_PATH}/tools/requirements/requirements.XY.txt` 文件已存在, 并包含要安装的 `Python` 包列表时, 功能 `XY` 才有效。
 3. `core` 功能为必须项, 确保 `ESP-IDF` 的核心功能, 如控制台中的构建、烧录、监视器、调试等。
 4. 用户可选择任意数量的可选功能, 已选功能列表存储在 `idf-env.json` 中。
 5. 依赖文件中存储了需要安装的 `Python` 包以及 `espidf.constraints.*.txt` 文件, 该约束文件从 <https://dl.espressif.com> 下载, 并存储在 `${IDF_TOOLS_PATH}` 目录, 包含了针对特定 `ESP-IDF` 版本的安装包版本要求。

备注: 可以通过使用 `--no-constraints` 参数或将环境变量 `IDF_PYTHON_CHECK_CONSTRAINTS` 设置为 `no`, 禁用约束文件的下载和使用, 但 **不建议此做法**。

- `check-python-dependencies`: 检查所有必需的 `Python` 包是否均已安装。该命令会对比检查由 `idf-env.json` 功能列表从 `${IDF_PATH}/tools/requirements/requirements.*`

txt 所选择的软件包与 `espidf.constraints.*.txt` 文件指定的软件包版本是否一致。

备注： 约束文件可通过 `install-python-env` 命令下载。与 `install-python-env` 命令类似，可以通过使用 `--no-constraints` 参数或将环境变量 `IDF_PYTHON_CHECK_CONSTRAINTS` 设置为 `no`，禁止使用约束文件。

- `uninstall`: 打印并删除当前 ESP-IDF 版本未使用的工具。
 - `--dry-run` 打印已安装但未使用的工具。
 - `--remove-archives` 删除过去下载的所有旧版本软件安装包。

安装脚本

ESP-IDF 的根目录中提供了针对不同 shell 的用户安装脚本，包括：

- `install.bat` 适用于 Windows 命令提示符
- `install.ps1` 适用于 Powershell
- `install.sh` 适用于 Bash
- `install.fish` 适用于 Fish

这些脚本除了下载和安装 `IDF_TOOLS_PATH` 中的工具外，还会准备一个 Python 虚拟环境，并在此虚拟环境中安装所需软件包。

为启用相应功能，这些脚本可以选择性地接受一组以逗号分隔的芯片目标列表及 `--enable-*` 参数，这类参数会传递给 `idf_tools.py` 脚本，并由该脚本将这类参数存储在 `idf-env.json` 中，从而逐步启用芯片目标及功能。

要为所有芯片目标安装工具，请在不使用任何可选参数的情况下，运行 `idf_tools.py install --targets=all`。要安装具备 ESP-IDF 核心功能的 Python 软件包，请运行 `idf_tools.py install-python-env --features=core`。

也可为特定芯片安装工具，例如，运行 `install.sh esp32` 可以只为 ESP32 安装工具。更多相关示例，请参阅 [第三步：设置工具](#)。

运行 `idf_tools.py install-python-env --features=core,XY, install.sh --enable-XY` 可以启用 XY 功能。

导出脚本

由于安装好的工具并非永久添加到用户或系统的 `PATH` 环境变量中，因此，要在命令行中使用这些工具，还需要额外步骤。以下脚本会修改当前 shell 的环境变量，从而使用正确版本的工具：

- `export.bat` 适用于 Windows 命令提示符
- `export.ps1` 适用于 Powershell
- `export.sh` 适用于 Bash
- `export.fish` 适用于 Fish

备注： 在 Bash 中修改 shell 环境时，必须使用 `./export.sh` 命令加载 `export.sh`，注意添加前面的点和空格。

`export.sh` 可以在除了 Bash 外的其他 shell（如 zsh）中使用。但在这种情况下，必须在运行脚本前设置 `IDF_PATH` 环境变量。在 Bash 中使用时，脚本会从当前目录猜测 `IDF_PATH` 的值。

除了调用 `idf_tools.py`，这些脚本还会列出已经添加到 `PATH` 的目录。

其他安装方法

为适用于不同环境，ESP-IDF 提供了更多用户友好的 `idf_tools.py` 包装工具：

- [ESP-IDF 工具安装器](#) 支持下载和安装工具，其内部使用 `idf_tools.py` 实现功能。

- **ESP-IDF Eclipse 插件** 包括了一个用于设置工具的菜单项，该插件内部调用 `idf_tools.py`。
- **VSCode ESP-IDF 扩展** 提供了设置工具的入门流程。尽管此扩展包不依赖 `idf_tools.py`，但安装方法相同。

自定义安装

推荐用户使用上述方法安装 ESP-IDF 工具，但也可以选择其他方式来构建 ESP-IDF 应用程序。自定义安装时，用户需将所有必要的工具都安装在某个位置，并在 `PATH` 中定义，以保证 ESP-IDF 构建系统可用。

卸载 ESP-IDF

卸载 ESP-IDF 需要删除安装过程中配置的工具和环境变量。

- 使用 **Windows ESP-IDF 工具安装器** 的 Windows 用户可以直接运行卸载向导卸载 ESP-IDF。
- **工具安装目录** 下包含了已下载及安装的工具，删除该目录即可删除此前通过运行 **安装脚本** 安装的内容。通过 **导出脚本** 设置的环境变量不具备永久性，新环境中不会存在此类环境变量。
- 如在安装过程中进行了自定义设置，除删除上述工具外，可能还涉及手动恢复此前为适用 ESP-IDF 工具而修改的环境变量及系统路径，例如 `IDF_PYTHON_ENV_PATH` 或 `IDF_TOOLS_PATH`。如存在通过手动复制安装的工具，则也需手动追踪并删除相关文件。
- 如安装了 **ESP-IDF Eclipse** 或 **VSCode ESP-IDF 扩展程序** 等插件，则需按照对应插件文档中的特定卸载说明进行操作。

备注： 卸载 ESP-IDF 工具不会删除任何项目文件或用户代码。为防止意外丢失其他文件，请在删除文件时谨慎操作。如果对某个步骤的操作有所疑问，请参考前述安装说明。

上述卸载指南默认需卸载的工具是按本文档中的步骤进行安装的。如果使用了自定义安装，可能需要进行相应调整。

4.26 ESP32-H2 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是基于目标的测试，该测试使用运行在 esp32h2 上的中央单元测试应用程序。这些测试使用的是基于 [Unity](#) 的单元测试框架。通过把测试用例放在组件的 test 子目录，可以将其集成到 ESP-IDF 组件中。本文档主要介绍这种基于目标的测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，暂且只有一小部分 ESP-IDF 组件支持 Mock，具体请参考[基于 Linux 主机的单元测试](#)。

4.26.1 添加常规测试用例

单元测试被添加在相应组件的 test 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以“test”开头。

测试文件需要包含 unity.h 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]")
{
    // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数是用方括号括起来的标识符。标识符用来对相关测试或具有特定属性的测试进行分组。

备注： 没有必要在每个测试用例中使用 UNITY_BEGIN() 和 UNITY_END() 来声明主函数的区域，unity_platform.c 会自动调用 UNITY_BEGIN()，然后运行测试用例，最后调用 UNITY_END()。

test 子目录应包含组件 *CMakeLists.txt*，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 Unity 测试框架，位于 unity 组件里。因此，每个测试组件都需要通过 REQUIRES 参数将 unity 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 SRC_DIRS 用于 idf_component_register。

总的来说，test 子目录下最小的 CMakeLists.txt 文件可能如下所示：

```
idf_component_register(SRC_DIRS "."
                      INCLUDE_DIRS "."
                      REQUIRES unity)
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 <http://www.throwtheswitch.org/unity>。

4.26.2 添加多设备测试用例

常规测试用例会在一个在试设备 (Device Under Test, DUT) 上执行。但是，由于要求互相通信的组件（比如 GPIO、SPI）需要与其他设备进行通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 运行测试。

以下是一个多设备测试用例：

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

宏 TEST_CASE_MULTIPLE_DEVICES 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例需要相互之间进行同步。可以通过 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数使用 UART 进行同步操作。上例的场景中，slave 应该在 master 设置好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1 (master) 终端：

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) 终端：

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号，你需要在 DUT1 的终端按回车键，然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞，并开始更改 GPIO 的电平。

4.26.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码。例如，在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，可以通过定义多阶段测试用例来将这些测试函数组合在一起：

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32h2]", trigger_
↪deepsleep, check_deepsleep_reset_reason);
```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

4.26.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）不支持在所有的芯片上执行。请参照本节，让你的单元测试只在其中一部分芯片上执行。

1. 使用宏 `!(TEMPORARY_)DISABLED_FOR_TARGETS()` 包装你的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例：

```
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[ ]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

如果要将其中某个测试在特定芯片上编译，只需要修改禁止的芯片列表。推荐使用一些能在 `soc_caps.h` 中被清楚描述的通用概念来禁止某些单元测试。如果已经进行上述操作，但一些测试在芯片中的调试暂未通过，请同时使用上述两种方法，当调试完成后再移除 `(TEMPORARY_)DISABLED_FOR_TARGETS()`。例：

```
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. 对于某些你确定不会支持的测试（例如，芯片根本没有该外设），使用 `DISABLED_FOR_TARGETS` 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 `runner` 资源等），使用 `TEMPORARY_DISABLED_FOR_TARGETS` 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 `test/target` 目录下并用 `CMakeLists.txt` 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果你将一些代码放在 `test/esp32` 目录下避免 `esp32s2` 芯片执行它，一旦你需要在新的芯片（比如 `esp32s3`）中启用该测试，这种结构很难保持代码整洁。

- 请勿继续使用 `CONFIG_IDF_TARGET_XXX` 宏来禁用测试。这种方法会让被禁用的测试项目难以追踪和重新打开。并且，相比于白名单式的 `#if CONFIG_IDF_TARGET_XXX`，黑名单式的 `#if !disabled` 不会导致在新芯片引入时这些测试被自动禁用。但对于测试实现，仍可使用 `#if CONFIG_IDF_TARGET_XXX` 给不同芯片版本选择实现代码。测试项目和测试实现区分如下：
 - 测试项目：那些会在一些芯片上执行，而在另外一些上跳过的项目，例如：
 - 有三个测试项目 `SD 1-bit`、`SD 4-bit` 和 `SDSPI`。对于不支持 `SD Host` 外设的 `ESP32-S2` 芯片，只有 `SDSPI` 一个项目需要被执行。
 - 测试实现：一些始终会发生的代码，但采取的实现方式不同。例如：
 - `ESP8266` 芯片没有 `SDIO_PKT_LEN` 寄存器。如果在测试过程中需要从 `slave` 设备的数据长度，你可以用不同方式读取的 `#if CONFIG_IDF_TARGET_` 宏来保护不同的实现代码。但请注意避免使用 `#else` 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

4.26.5 编译单元测试程序

按照 `esp-idf` 顶层目录的 `README` 文件中的说明进行操作，请确保 `IDF_PATH` 环境变量已经被设置指向了 `esp-idf` 的顶层目录。

切换到 `tools/unit-test-app` 目录下进行配置和编译：

- `idf.py menuconfig` - 配置单元测试程序。
- `idf.py -T all build` - 编译单元测试程序，测试每个组件 `test` 子目录下的用例。
- `idf.py -T "xxx yyy" build` - 编译单元测试程序，对以空格分隔的特定组件进行测试（如 `idf.py -T heap build` - 仅对 `heap` 组件目录下的单元测试程序进行编译）。
- `idf.py -T all -E "xxx yyy" build` - 编译单元测试程序，测试除指定组件之外的所有组件（例如 `idf.py -T all -E "ulp mbedtls" build` - 编译所有的单元测试，不包括 `ulp` 和 `mbedtls` 组件。）。

备注：由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：`idf.py -T xxx -T yyy build` 或者在 `PowerShell` 中使用 `idf.py -T \"xxx yyy\" build`，在 Windows 命令提示符中使用 `idf.py -T \"^\"ssd1306 hts221\"^\" build`。

当编译完成时，它会打印出烧写芯片的指令。你只需要运行 `idf.py flash` 即可烧写所有编译输出的文件。

你还可以运行 `idf.py -T all flash` 或者 `idf.py -T xxx flash` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。更多信息，见 <tools/unit-test-app/README.md>。

4.26.6 运行单元测试

备注：我们还提供基于 `pytest` 的框架 `pytest-embedded`，以便更方便、高效地运行单元测试。如需在 `CI` 中运行测试或连续运行多个测试，不妨尝试这一框架。了解更多信息，请查看 [pytest-embedded 文档](#) 和 [ESP-IDF pytest 指南](#)。

烧写完成后重启 `ESP32-H2`，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

```
Here is the test menu, pick your combo:
(1)  "esp_ota_begin() verifies arguments" [ota]
(2)  "esp_ota_get_next_update_partition logic" [ota]
(3)  "Verify bootloader image in flash" [bootloader_support]
(4)  "Verify unit test app image" [bootloader_support]
(5)  "can use new and delete" [cxx]
```

(下页继续)

```

(6)    "can call virtual functions" [cxx]
(7)    "can use static initializers for non-POD types" [cxx]
(8)    "can use std::vector" [cxx]
(9)    "static initialization guards work as expected" [cxx]
(10)   "global initializers run in the correct order" [cxx]
(11)   "before scheduler has started, static initializers work correctly" [cxx]
(12)   "adc2 work with wifi" [adc]
(13)   "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"
(14)   "SPI Master clockdiv calculation routines" [spi]
(15)   "SPI Master test" [spi][ignore]
(16)   "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)   "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)" ↪
↪[spi]
(18)   "SPI Master DMA test, TX and RX in different regions" [spi]
(19)   "SPI Master DMA test: length, start, not aligned" [spi]
(20)   "reset reason check for deepsleep" [esp32h2][test_env=UT_T2_1][multi_stage]
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"

```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi_device] 和 [multi_stage] 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 TEST_CASE_MULTIPLE_STAGES 和 TEST_CASE_MULTIPLE_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```

Running gpio master/slave test example...
gpio master/slave test example
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"

```

你需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```

Running reset reason check for deepsleep...
reset reason check for deepsleep
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"

```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

4.26.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部存储器中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞，从而导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即最大限度地减少缓存缺失）。理论上，这会影响执行速度，但这些因素通常无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行时间和构建时的测量时间可能会有所差异，减少差异的方法之一是将代码和数据分别放在指令或数据 RAM (IRAM/DRAM) 中。CPU 可以直接访问 IRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是上述方法的替代方法，该计时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 `ccomp_timer_start`，使调度器进入睡眠状态，唤醒并在另一个内核上重新调度，那么对应的 `ccomp_timer_stop` 将无效。

4.26.8 Mocks

备注：目前，只有一些特定的组件在 Linux 主机上运行时才能 Mock。未来我们计划，无论是在 Linux 主机上运行还是在目标芯片 ESP32-H2 上运行，ESP-IDF 所有重要的组件都可以实现 Mock。

嵌入式系统中单元测试的最大问题之一是对硬件依赖性极强。直接在 ESP32-H2 上运行单元测试对于上层组件来说存在极大的困难，原因如下：

- 受下层组件和/或硬件设置的影响，测试可靠性降低。
- 由于下层组件和/或硬件设置的限制，测试边缘案例的难度提高。
- 由于数量庞大的依赖关系影响了行为，识别根本难度的提高。

当测试一个特定的组件（即被测组件）时，通过软件进行 Mock 能让所有被测组件的依赖在软件中被完全替换（即 Mock）。为了实现该功能，ESP-IDF 集成了 CMock 的 Mock 框架作为组件。通过在 ESP-IDF 的构建系统中添加一些 CMake 函数，可以方便地 Mock 整个（或部分）ESP-IDF 组件。

理想情况下，被测组件所依赖的所有组件都应该被 Mock，从而让测试环境完全控制与被测组件之间的所有交互。然而，如果 Mock 所有的组件过于复杂或冗长（例如需要模拟过多的函数调用），以下做法可能会有帮助：

- 在测试代码中包含更多“真正”（非模拟）代码。这样做可能有效，但同时也会增加对“真正”代码行为的依赖。此外，一旦测试失败，很难判断失败原因是因为实际测试代码还是“真正”的 ESP-IDF 代码。
- 重新评估被测代码的设计，尝试将被测代码划分为更易于管理的组件来减少其依赖性。这可能看起来很麻烦，但众所周知，单元测试经常暴露软件设计的弱点。修复设计上的弱点不仅在短期内有助于进行单元测试，而且还有助于长期的代码维护。

请参考 [cmock/CMock/docs/CMock_Summary.md](#) 了解 CMock 工作原理以及如何创建和使用 Mock。

要求

目前 Mock 只支持基于 Linux 主机的单元测试。生成 Mock 需要满足如下要求：

- 已安装 ESP-IDF 及使用 ESP-IDF 的所有依赖项
- 满足系统软件包需求 (libbsd、libbsd-dev)
- Linux 或 macOS 和 GCC 编译器已更新至足够新的版本
- 应用程序所依赖的所有组件必须受 Linux 目标 (Linux/POSIX 模拟器) 支持，或可进行模拟

对于在 Linux 目标上运行的应用程序，需要在应用程序根目录的 CMakeLists.txt 文件中，设置 COMPONENTS 变量为 main，具体操作如下：

```
set(COMPONENTS main)
```

为方便起见，应用程序会在构建过程中，自动包含 ESP-IDF 的所有组件，执行上述代码则可以防止此类情况。

对组件进行 Mock

如果 ESP-IDF 中已对组件进行 Mock（也称为 组件模拟），那么只要满足要求，该版本即可立即投入使用。已进行 Mock 的组件列表，可参考[组件 Linux/Mock 支持情况概述](#)。具体组件模拟的使用方法，请参考[修改单元测试文件](#)。

如果 ESP-IDF 尚未提供任何组件模拟，则需要创建组件的 Mock 版本，以特定方式覆盖组件。覆盖组件时，需要创建一个与原始组件名称完全相同的组件，让构建系统先发现原始组件，再发现这个具有相同名称的新组件。具体可参考[同名组件](#)。

在组件模拟中需要指定如下部分：

- 头文件，头文件中提供了需要生成模拟的函数
- 上述头文件的路径
- 模拟组件的依赖（如果头文件中包含了其他组件的文件，那么这点非常必要）

以上这些部分都需要使用 ESP-IDF 构建系统函数 `idf_component_mock` 指定。你可以使用 ESP-IDF 构建系统函数 `idf_component_get_property`，并加上标签 `COMPONENT_OVERRIDEN_DIR` 来访问原始组件的组件目录，然后使用 `idf_component_mock` 注册模拟组件。

```
idf_component_get_property(original_component_dir <original-component-name>_
↳COMPONENT_OVERRIDEN_DIR)
...
idf_component_mock(INCLUDE_DIRS "${original_component_dir}/include"
  REQUIRES freertos
  MOCK_HEADER_FILES ${original_component_dir}/include/header_containing_
↳functions_to_mock.h)
```

组件模拟还需要一个单独的 mock 目录，里面包含一个 `mock_config.yaml` 文件用于配置 CMock。以下是一份简单的 `mock_config.yaml` 文件：

```
:cmock:
:plugins:
- expect
- expect_any_args
```

更多关于 CMock yaml 类型配置文件的详细信息，请查看 [cmock/CMock/docs/CMock_Summary.md](#)。

请注意，组件模拟不一定要对原始组件进行整体模拟。只要组件模拟满足测试项目的依赖以及其他代码对原始组件的依赖，部分模拟就足够了。事实上，ESP-IDF 中 `tools/mocks` 中的大多数组件模拟都只是部分地模拟了原始组件。

可在 ESP-IDF 目录的 `tools/mocks` 下找到组件模拟的示例。有关如何覆盖 ESP-IDF 组件，可查看[同名组件](#)。

- [NVS 页面类的单元测试](#)。
- [esp_event 的单元测试](#)。
- [mqtt 的单元测试](#)。

修改单元测试文件

单元测试需要通知 `cmake` 构建系统对依赖的组件进行模拟（即用模拟组件来覆盖原始组件）。这可以通过将组件模拟放到项目的 `components` 目录，或者在项目的根目录 `CMakeLists.txt` 文件中使用以下代码来添加模拟组件的目录来实现：

```
list(APPEND EXTRA_COMPONENT_DIRS "<mock_component_dir>")
```

这两种方法都会让组件模拟覆盖 ESP-IDF 中的现有组件。如果你使用的是 ESP-IDF 提供的组件模拟，则第二个方法更加方便。

可参考 `esp_event` 基于主机的单元测试及其 `esp_event/host_test/esp_event_unit_test/CMakeLists.txt` 作为组件模拟的示例。

4.27 在主机上运行 ESP-IDF 应用程序

备注：在主机上运行 ESP-IDF 应用程序的功能仍处于试验阶段，无法保证 API 的稳定性。欢迎用户通过 [ESP-IDF GitHub 仓库](#) 或 [ESP32 论坛](#) 提供反馈意见，助力未来 ESP-IDF 基于主机的应用程序设计。

本文档概述了在 Linux 上运行 ESP-IDF 应用程序的方法，并介绍了可以在 Linux 上运行的常见 ESP-IDF 应用程序类型。

4.27.1 介绍

ESP-IDF 应用程序通常在主机上进行构建（交叉编译），然后上传（即烧录）到 ESP 芯片上运行，并由主机通过 UART/USB 端口监控。然而，在 ESP 芯片上运行 ESP-IDF 应用程序在各种开发/使用/测试场景下可能存在限制。

因此，ESP-IDF 支持在同一台 Linux 主机上构建和运行其应用程序。在主机上运行 ESP-IDF 应用程序具有以下几个优点：

- 无需上传到目标芯片。
- 应用程序在主机上的运行速度比在 ESP 芯片上快。
- 除主机本身外，无特定硬件要求。
- 更易进行软件测试的自动化和设置。
- 提供大量用于代码和运行分析的工具，如 `Valgrind`。

许多 ESP-IDF 组件依赖支持特定芯片的硬件，因此在主机上运行应用程序时，必须对这些硬件依赖文件进行模拟或仿真。目前，ESP-IDF 支持以下模拟和仿真方法：

1. 使用 [FreeRTOS POSIX/Linux 模拟器](#) 可以模拟 FreeRTOS 调度。在此模拟的基础上，在主机上运行应用程序时也会模拟或使用其他 API。
2. 使用 [CMock](#) 可以模拟所有依赖文件，并在完全独立的情况下运行代码。

原则上，这两种方法（POSIX/Linux 模拟器和使用 CMock 模拟）可以混用，但此功能在 ESP-IDF 中尚未实现。注意，尽管名称中包含 POSIX/Linux，但目前的 FreeRTOS POSIX/Linux 模拟器也支持在 macOS 系统中运行。在主机上运行 ESP-IDF 应用程序通常用于测试，但模拟环境和模拟依赖文件并不能完全代表目标设备。因此，仍然需要在目标设备上测试，此时测试的侧重点通常在集成和系统测试上。

备注：在主机上运行应用程序的另一方法是使用 QEMU 模拟器，但 ESP-IDF 的 QEMU 模拟器仍在开发中，尚未发布相关文档。

基于 CMock 的模拟

该方法使用 CMock 框架解决缺少硬件和软件依赖文件的问题。在主机上运行基于 CMock 的应用程序具备一大优势：在主机上运行的应用程序通常只编译必要代码，即模拟了最主要代码的依赖文件，而非编译整个系统。有关 Mocks 的总体介绍及其在 ESP-IDF 的配置和使用，请参阅 [Mocks](#)。

POSIX/Linux 模拟器的模拟

ESP-IDF 已支持使用 [FreeRTOS POSIX/Linux 模拟器](#) 预览应用程序在目标芯片上的运行效果。使用该模拟器可以在主机上运行 ESP-IDF 组件，并使这类组件可用于在主机上运行的 ESP-IDF 应用程序。目前，只有一部分组件可以在 Linux 上构建。此外，各组件移植到 Linux 上后，其功能可能也会受到限制，或与在芯片目标上构建该组件的功能有所不同。有关所需组件在 Linux 上是否受支持的更多信息，请参阅 [组件 Linux/Mock 支持情况概述](#)。

备注：FreeRTOS POSIX/Linux 模拟器支持配置 [Amazon SMP FreeRTOS](#) 版本，但模拟仍在单核模式下运行。支持 Amazon SMP FreeRTOS 主要是为给 Amazon SMP FreeRTOS 编写的 ESP-IDF 应用程序提供 API 兼容性。

4.27.2 使用模拟器的前提

- 已安装 ESP-IDF 及使用 ESP-IDF 的所有依赖项
- 满足系统软件包需求 (libbsd、libbsd-dev)
- Linux 或 macOS 和 GCC 编译器已更新至足够新的版本
- 应用程序所依赖的所有组件必须受 Linux 目标 (Linux/POSIX 模拟器) 支持，或可进行模拟

对于在 Linux 目标上运行的应用程序，需要在应用程序根目录的 CMakeLists.txt 文件中，设置 COMPONENTS 变量为 main，具体操作如下：

```
set(COMPONENTS main)
```

为方便起见，应用程序会在构建过程中，自动包含 ESP-IDF 的所有组件，执行上述代码则可以防止此类情况。

如果使用了任意模拟器，则应设置变量 Ruby。

4.27.3 构建和运行

要在 Linux 上构建并运行应用程序，需要将目标芯片设置为 linux：

```
idf.py --preview set-target linux
idf.py build
idf.py monitor
```

4.27.4 组件 Linux/Mock 支持情况概述

注意，下表中的“是”并不代表完全实现或模拟，它也可以表示功能的部分实现或模拟。实现或模拟通常只进行到可以提供足够功能、可以构建和运行测试应用程序的程度。

组件	模拟	仿真

4.28 USB 串行/JTAG 控制器控制台

ESP 芯片通常使用 UART 实现串口，并可以通过外部 USB-UART 桥接芯片，连接到主机/PC 上的串口控制台仿真器。然而，在具有 USB 串行/JTAG 控制器的 ESP 芯片上，控制器的 CDC-ACM 部分即可实现串口，该串口直接连接到主机/PC，不需要外部 USB-UART 桥接芯片。

拥有 USB 串行/JTAG 控制器时，ESP32-H2 支持以下功能：

- 双向串行控制台，可与 *IDF 监视器* 或其他串行监视器一起使用。
- 使用 `esptool.py` 和 `idf.py flash` 烧录。
- 使用 OpenOCD 等工具进行 JTAG 调试，同时进行串行操作。

备注：USB 串行/JTAG 控制器是一个 USB 设备，其功能固定，完全由硬件实现。也就是说，即便重新配置，它也只能执行串口和 JTAG 调试功能。这不同于某些 ESP 芯片中的 USB OTG 控制器，后者经配置，可以执行多种 USB 设备功能。

4.28.1 硬件要求

将 ESP32-H2 连接到 USB 端口，连接方式如下：

GPIO	USB
27	D+ (绿)
26	D- (白)
GND	GND (黑)
5V (或由外部提供)	+5V (红)

部分开发板可能会为 USB 串行/JTAG 控制器提供 USB 连接器，此时无需额外连接。

4.28.2 软件配置

在 `CONFIG_ESP_CONSOLE_UART` 选项中选择 `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG`，可以将 USB 串行/JTAG 控制器用作串口。选择该选项后，即可正常构建和烧录项目。

另外，也可以通过 `usb_serial_jtag` 端口访问输出，但请确保在 `CONFIG_ESP_CONSOLE_SECONDARY` 选项选择了 `CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG`。

警告： 除输出外，如果还想用控制台输入或使用交互式解释器 (REPL)，请选择 `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG` 选项。

4.28.3 上传应用程序

USB 串行/JTAG 控制器可以自动将 ESP32-H2 置于下载模式。用户只需正常烧录芯片，但需要在系统上指定 USB 串行/JTAG 控制器端口：`idf.py flash -p PORT`，PORT 是正确的端口名称。

备注： USB 串行/JTAG 控制器的串行端口通常：

- 在 Linux 系统上显示为 `/dev/ttyACM*`
- 在 MAC 系统上显示为 `/dev/cu*`
- 在 Windows 设备管理器上显示为 COM* 端口

4.28.4 限制

USB 串行/JTAG 控制台功能存在一些限制，这些限制的影响程度各不相同，具体取决于开发中的应用程序类型，以及开发的工作流程。

重新配置 USB 管脚

如果在意外情况下，应用程序重新配置了 USB 外设管脚，或禁用了 USB 串行/JTAG 控制器，设备会从系统消失。应用程序中的问题修复后，需要将未更新！拉低，并重置芯片，手动将 ESP32-H2 置于下载模式。

如果应用程序进入 Deep-sleep 模式，USB 串行/JTAG 设备会从系统中消失。

数据缓冲

对于从 ESP32-H2 发送到 PC 终端的数据（例如 stdout、日志），ESP32-H2 会先写入一个小型内部缓冲区。如果该缓冲区达到最大容量（例如没有连接 PC 终端），ESP32-H2 会进行一次等待，时长约 50 ms。在此期间，PC 终端可以请求数据，但可能会导致应用程序出现非常短暂的暂停。

对于从 PC 终端发送到 ESP32-H2 的数据（如控制台命令），许多 PC 终端会等待 ESP32-H2 接收字节后，再允许发送更多数据。这与使用 USB 转串口 (URAT) 桥接芯片不同，URAT 桥接芯片始终接收字节，并将其发送到（可能未在监听）的 ESP32-H2。

备注：在极少数情况下，从 ESP32-H2 发送到主机的数据可能会“阻塞”在主机内存中。继续发送数据即可“取消阻塞”，但如果应用程序未继续发送数据，则需要手动将这些数据刷新到主机。能否继续发送数据取决于驱动程序，默认配置的非阻塞驱动程序和 VFS 实现会在换行后自动刷新，而基于中断的阻塞驱动程序会在发送缓冲区变空时自动刷新。

睡眠模式考虑因素

USB 串行/JTAG 控制器及其关联的 USB PHY 均由特定时钟控制（如 APB 和 USB PHY 时钟），并属于特定的电源域（如数字电源域）。因此，对 USB 串行/JTAG 控制器关联的时钟和电源域进行任何更改，如进入另一睡眠模式，都可能影响控制器操作。

Deep-sleep 进入 Deep-sleep 模式时，USB 串行/JTAG 控制器及 USB PHY 关闭，导致 USB PHY 的 D+ 线不再变成高电平。因此：

- 进入 Deep-sleep 模式时，USB 串行/JTAG 设备会对主机/PC 显示为断开连接。即使 USB 电缆在物理层面上处于连接状态，仍会显示为断开连接。
- 退出 Deep-sleep 模式时，USB 串行/JTAG 设备会重新连接到主机/PC。

Light-sleep 进入 Light-sleep 模式时，APB 和 USB PHY 时钟关闭。因此，USB 串行/JTAG 控制器将无法接收或响应任何来自相连主机的 USB 事务，包括周期性的 CDC Data IN 事务。因此：

- 进入 Light-sleep 模式时，USB 串行/JTAG 设备无法响应主机/PC 的 USB CDC 驱动程序。主机/PC 可能会报告 USB 串行/JTAG 设备已断开连接，或连接出错。即使 USB 电缆在物理层面上处于连接状态，仍会显示为断开连接。
- 退出 Light-sleep 模式时，由于 USB PHY 的 D+ 线在 Light-sleep 期间始终处于高电平，可能导致主机/PC 不会重新枚举（即重新连接）USB 串行/JTAG 设备。用户可能需要在物理层面上断开 USB 电缆，并重新连接。

自动与手动进入睡眠模式 如果通过 `esp_light_sleep_start()` 或 `esp_deep_sleep_start()` 手动进入睡眠模式，需注意，USB 串行/JTAG 控制器在睡眠期间不工作。ESP-IDF 没有添加任何拒绝进入睡眠的安全检查，即使 USB 串行/JTAG 控制器已连接，也会进入睡眠模式。如果在连接了 USB 串行/JTAG 控制器的情况下进入睡眠，可以通过拔出并重新插入 USB 电缆来重新建立连接。

如果通过 `esp_pm_configure()` 自动进入睡眠模式，请启用 `CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION` 选项，该选项支持 ESP32-H2 自动检测 USB 串行/JTAG 控制器与主机的连接情况，并在连接持续时，阻止程序自动进入睡眠模式。注意，此选项会增加功耗。

4.29 低功耗模式使用指南

对于物联网应用场景，终端的待机性能表现十分重要，本文档旨在介绍 ESP32-H2 低功耗的基本原理，同时介绍 ESP32-H2 支持的低功耗模式，需注意本文档主要针对 `station mode`。文档还会具体给出每种模式的配置步骤、推荐配置和功耗表现，以帮助用户根据实际需求快速配置适合的低功耗模式。

4.29.1 系统低功耗模式介绍

低功耗模式不仅涉及到系统相关问题，还涉及到芯片具体的工作场景，如处在 Wi-Fi 工作场景就会与处在蓝牙工作场景时产生不同。为此本节将首先介绍纯系统角度，即不涉及具体场景的低功耗模式，主要

有 DFS、Light-sleep、Deep-sleep。纯系统下的低功耗模式主要思想就是在休眠时关闭或门控一些功能模块来降低功耗。

DFS

DFS (Dynamic frequency scaling) 即动态频率切换，是 ESP-IDF 中集成的电源管理机制的基础功能。DFS 可以根据应用程序持有电源锁的情况，调整外围总线 (APB) 频率和 CPU 频率。持有高性能锁就使用高频，空闲状态不持有电源锁时则使用低频来降低功耗，以此来尽可能减少运行应用程序的功耗。

DFS 的调频机制即根据持有电源锁的最大频率需求来调整频率，同时，freertos tick rates 的数值也会对 DFS 调频产生影响。系统任务调度的灵敏度越大，则意味着系统能更及时的根据需求调整频率。有关调频机制的详细信息，请参见[电源管理](#)。

下图为 DFS 调频机制运行的理想电流情况。

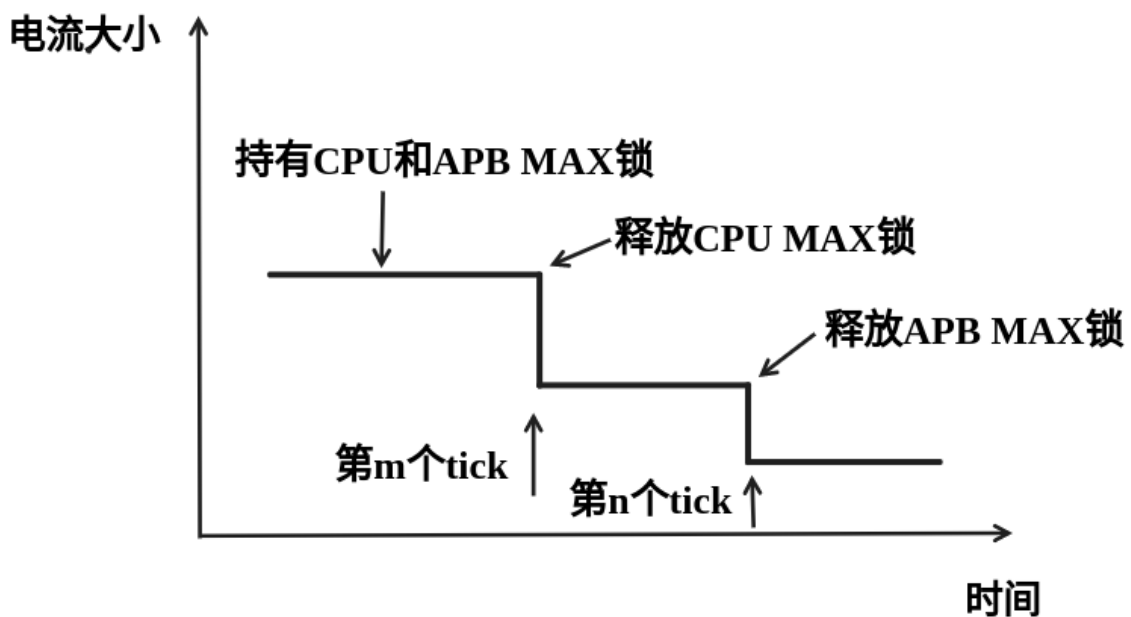

图 63: 理想 DFS 机制调频电流图

DFS 适用于 CPU 必须处于工作状态但是对低功耗有需求的场景，因此 DFS 经常与其他低功耗模式共同开启，下文会详细介绍。

Light-sleep

Light-sleep 模式是 ESP32-H2 预设的一种低功耗模式，其核心思想就是在休眠时关闭或门控一些功能模块来降低功耗。从纯系统方面来说，Light-sleep 模式有两种进入方式，一种是通过 API 调用进入休眠，一种是自动进入的 auto 模式。两种模式都需要配置唤醒源进行唤醒，同时在进入休眠后会门控或关闭一些模块。这里主要介绍 Auto Light-sleep 模式。

Auto Light-sleep 模式是 ESP-IDF 电源管理机制和 Light-sleep 模式的结合。开启电源管理机制是其前置条件，auto 体现在系统进入空闲状态 (IDLE) 超过设定时间后，自动进入 Light-sleep。空闲状态下，应用程序释放所有电源锁，此时，DFS 将降频以减小功耗。

Auto Light-sleep 依赖于电源管理机制，系统经过提前判断，发现空闲时间超过设定时间时，则直接进入休眠。该过程为自动进行。休眠时会自动关闭 RF、8 MHz 振荡器、40 MHz 高速晶振、PLL、门控数字内核时钟，暂停 CPU 工作。

Auto Light-sleep 模式需配置唤醒源。该模式拥有多种唤醒源，支持相互组合，此时任何一个唤醒源都可以触发唤醒。唤醒后，会从进入休眠的位置继续执行程序。若不配置唤醒源，进入 Light-sleep 休眠后，芯片将一直处在睡眠状态，直到外部复位。具体唤醒源有 RTC 定时器、触摸传感器、外部唤醒 (ext0)、外部唤醒 (ext1)、ULP 协处理器、SDIO、GPIO、UART、Wi-Fi、BT 唤醒等。

Auto Light-sleep 模式工作流程相对复杂，但是进入休眠状态是自动进行，同时需注意在进入前配置好唤醒源，防止芯片一直处在休眠状态。

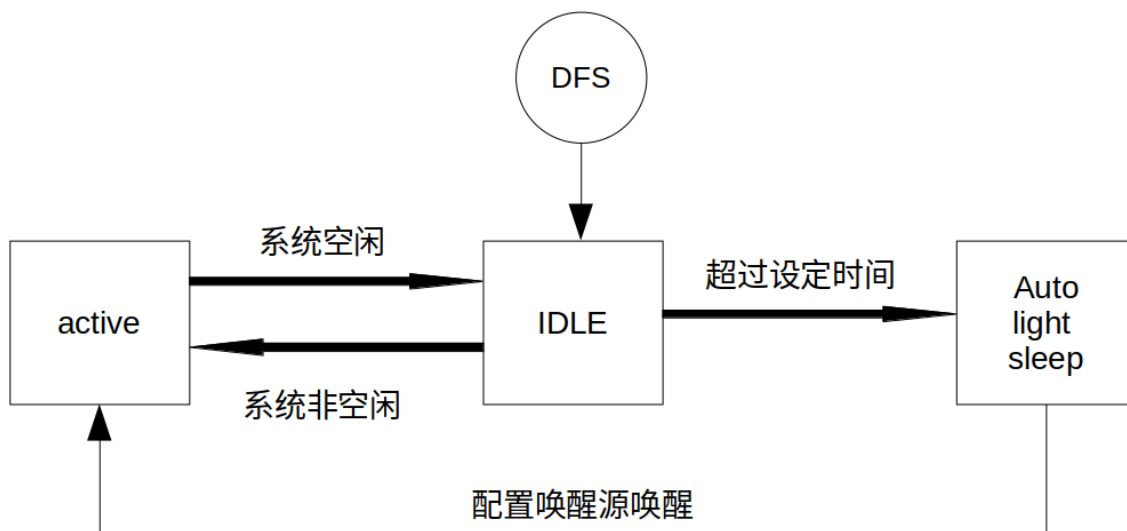

图 64: Auto Light-sleep 模式工作流程图

根据 Auto Light-sleep 的工作流程可得其理想电流图，关键节点均在图上标出。

图 65: Auto Light-sleep 模式理想电流图

备注：为更加清晰地展现出 Auto Light-sleep 的主要变化，图中省略了 DFS 降频过程。

Auto Light-sleep 模式适用于不需要实时响应外界需求的场景。

Deep-sleep

Deep-sleep 模式是为了追求更好的功耗表现所设计，休眠时仅保留 RTC 控制器、RTC 外设（可配置）、ULP 协处理器、RTC 高速内存、RTC 低速内存，其余模块全部关闭。与 Light-sleep 类似，Deep-sleep 同样通过 API 进入，且需要配置唤醒源进行唤醒。

Deep-sleep 通过调用 API 进入，休眠时会关闭除 RTC 控制器、RTC 外设、ULP 协处理器、RTC 高速内存、RTC 低速内存外的所有模块。

Deep-sleep 模式需配置唤醒源，其拥有多种唤醒源，这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。若不配置唤醒源进入 Deep-sleep 模式，芯片将一直处在睡眠状态，直到外部复位。具体唤醒源有 RTC 定时器、触摸传感器、外部唤醒 (ext0)、外部唤醒 (ext1)、ULP 协处理器、GPIO 唤醒等。

Deep-sleep 模式工作流程如下图所示：

图 66: Deep-sleep 模式工作流程图

Deep-sleep 模式主要应用场景决定了系统很长时间才会苏醒一次，完成工作后又会继续进入 Deep-sleep，所以其理想电流图如下。

Deep-sleep 可以用于低功耗的传感器应用，或是大部分时间都不需要进行数据传输的情况，也就是通常所说的待机模式。设备可以每隔一段时间从 Deep-sleep 状态醒来测量数据并上传，之后重新进入 Deep-sleep；也可以将多个数据存储于 RTC memory，然后一次性发送出去。

如何配置纯系统下低功耗模式

介绍完纯系统下的低功耗模式后，本节将介绍公共配置选项、每种模式独有的配置选项，以及相应低功耗模式 API 的使用说明，同时给出相应模式推荐的配置。

公共配置选项

DFS 配置

DFS 有如下可配置选项：

- **max_freq_mhz** 该参数表示最大 CPU 频率 (MHz)，即 CPU 最高性能工作时候的频率，一般设置为芯片参数的最大值。

图 67: Deep-sleep 模式理想电流图

- **min_freq_mhz** 该参数表示最小 CPU 频率 (MHz)，即系统处在空闲状态时 CPU 的工作频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值除以整数。
- **light_sleep_enable** 使能该选项，系统将在空闲状态下自动进入 Light-sleep 状态，即 Auto Light-sleep 使能，上文已经具体介绍。

具体配置方法如下：

1. 使能 CONFIG_PM_ENABLE
2. 配置 max_freq_mhz 和 min_freq_mhz，方式如下：

```
esp_pm_config_t pm_config = {
    .max_freq_mhz = CONFIG_EXAMPLE_MAX_CPU_FREQ_MHZ,
    .min_freq_mhz = CONFIG_EXAMPLE_MIN_CPU_FREQ_MHZ,
    .light_sleep_enable = false
};
ESP_ERROR_CHECK(esp_pm_configure(&pm_config));
```

推荐配置：

配置名称	设置情况
CONFIG_PM_ENABLE	ON
RTOS Tick rate (Hz)	1000
max_freq_mhz	160
min_freq_mhz	40
light_sleep_enable	false

备注：上表中不涉及的配置均是默认。

Light-sleep 配置

本节介绍 Auto Light-sleep 的推荐配置和配置步骤。

Auto Light-sleep 有如下可配置选项：

- **Minimum step to enter sleep mode** 该参数表示系统自动进入休眠的阈值。该参数单位为 RTOS Tick，故其表示的时间与 RTOS Tick rate 相关，例该参数值为 3，RTOS Tick rate 配置为 1000 Hz 时，即当系统空闲时间大于等于 3 ms 时进入休眠。
- **Put light sleep related codes in internal RAM** 如果使能该选项，一些 light-sleep 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加 1.8 kB。
- **Put RTOS IDLE related codes in internal RAM** 如果使能该选项，一些 RTOS IDLE 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加 260 B。
- **RTC slow clock source** 该参数表示 RTC 慢速时钟源。系统休眠时计时器模块的时钟被门控，此时使用 RTC Timer 进行计时，唤醒后使用 RTC Timer 的计数值对系统时间进行补偿。

时钟源	精度	频偏
Internal 150 kHz OSC	约 6.7 us/cycle	大
External 32 kHz XTAL	约 30.5 us/cycle	小

- **Disable all GPIO when chip at sleep** 如果使能该选项，系统将在休眠过程中禁用所有 GPIO 管脚，消除 GPIO 漏电，降低功耗，但是休眠过程中 GPIO 无法进行信号输入和输出。

唤醒源：

- RTC Timer Wakeup
- GPIO Wakeup
- UART Wakeup
- Touchpad Wakeup
- External Wakeup (ext0)
- External Wakeup (ext1)
- ULP Coprocessor Wakeup

备注： 以上仅列出可配置唤醒源，详细介绍请参考[睡眠模式](#)。

配置方法：

1. 配置唤醒源
2. 使能 CONFIG_PM_ENABLE
3. 使能 CONFIG_FREERTOS_USE_TICKLESS_IDLE
4. 配置 DFS 参数
5. light_sleep_enable = true，具体如下：

```
esp_pm_config_t pm_config = {
    .max_freq_mhz = CONFIG_EXAMPLE_MAX_CPU_FREQ_MHZ,
    .min_freq_mhz = CONFIG_EXAMPLE_MIN_CPU_FREQ_MHZ,
    #if CONFIG_FREERTOS_USE_TICKLESS_IDLE
    .light_sleep_enable = true
    #endif
};
ESP_ERROR_CHECK(esp_pm_configure(&pm_config));
```

6. 配置介绍的其余相关参数

推荐配置：

Deep-sleep 配置

对 Deep-sleep 模式来说，除了唤醒源相关配置，其余配置意义已经不大。

Deep-sleep 有如下可配置选项：

- RTC Timer wakeup
- EXT0/1 wakeup
- Touchpad wakeup
- ULP wakeup

备注： 以上仅列出可配置唤醒源，详细介绍请参考[睡眠模式](#)。

配置步骤：

- 配置唤醒源
- 调用 API，具体如下：

```
/* Enter deep sleep */
esp_deep_sleep_start();
```

用户可以通过下列配置选项，让一些特定模块在休眠时保持开启状态：

- **Power up External 40 MHz XTAL** 在一些特殊应用中，部分模块对休眠时的时钟精度及稳定度有很高要求（例如 BT）。这种情况下，可以考虑在休眠过程中打开 External 40 MHz XTAL。打开和关闭代码如下：

```
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_XTAL, ESP_PD_OPTION_ON));
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_XTAL, ESP_PD_OPTION_
↪OFF));
```

- **Power up Internal 8 MHz OSC** 在一些特殊应用中，部分模块（例如 LEDC）将 Internal 8 MHz OSC 作为时钟源，并且希望在 Light-sleep 休眠过程中也可以正常使用。这种情况下，可以考虑在休眠过程中打开 Internal 8 MHz OSC。打开和关闭代码如下：

```
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_RTC8M, ESP_PD_OPTION_
↪ON));
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_RTC8M, ESP_PD_OPTION_
↪OFF));
```

4.30 Wi-Fi Expansion

ESP32-H2 does not support Wi-Fi functionality natively, but it is possible to use the same Wi-Fi API and features using Wi-Fi expansion.

The principle of Wi-Fi Expansion operation is to add another ESP32 series, Wi-Fi capable, target connected to the ESP32-H2 in a pre-defined way. Your project could then include the [esp_wifi_remote](#) component using:

```
idf.py add-dependency esp_wifi_remote
```

Please follow the instructions described in the [esp_wifi_remote documentation](#).

To explore the Wi-Fi Expansion functionality on ESP32-H2, you can get started with this example: [examples/protocols/mqtt/tcp/README.md](#) and choose Wi-Fi connection in the project configuration menu.

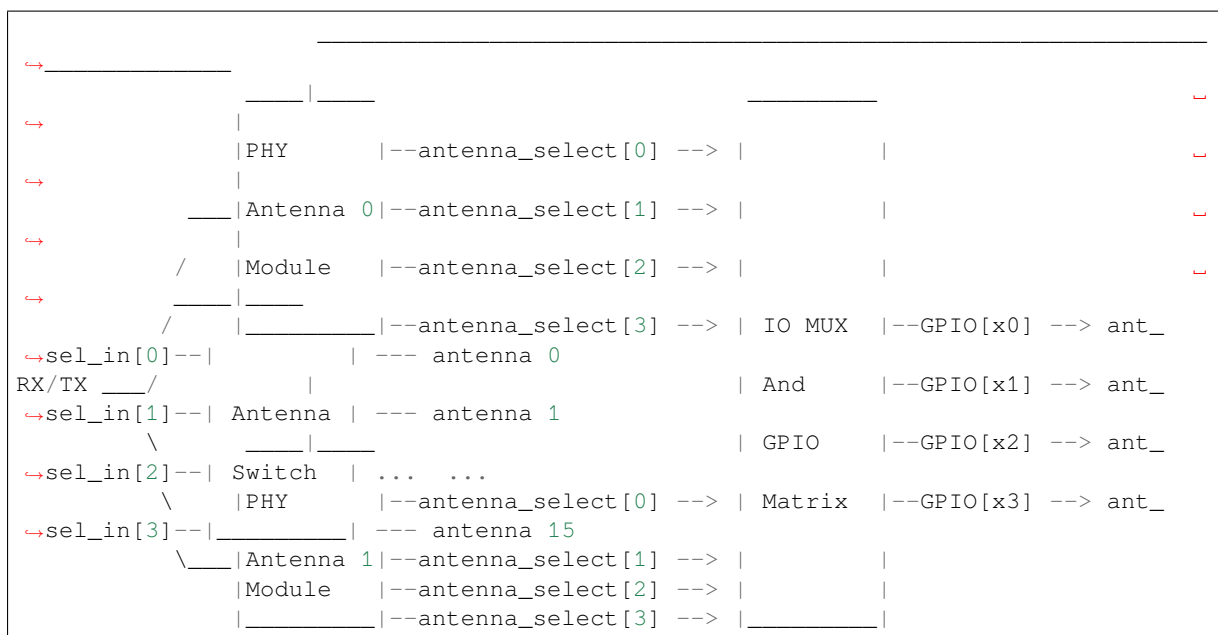

4.31 PHY

4.31.1 多根天线

多根天线功能原理和组成

多根天线功能主要通过将内部天线模块工作信号输出到具体 IO 引脚上，通过 IO 引脚控制外部天线切换器选择指定天线，最多支持 16 根天线。

下图描述多根天线功能组成:

ESP32-H2 多根天线功能主要包含 3 个部分：芯片内部的 PHY 天线模块、IO MUX 和 GPIO Matrix、以及外部的天线切换器。

1. 芯片内部的天线选择模块 PHY Antenna Module：- 两个天线模块均支持工作于发送 (TX) 或接收 (RX) 模式，可以通过软件配置发送和接收选用某个模块。- 每个天线模块最多支持输出 4 个天线选择信号 antenna_select[3:0]，该信号值可由软件配置并且可以一一映射到任意 IO 引脚。- 当某个天线模块处于工作状态时，IO 引脚的高低电平值为软件配置的信号值。

2. IO MUX 和 GPIO Matrix：- 将内部 4 路天线信号输出到具体的 IO 引脚上。

3. 外部的天线切换器：- 一般为多路选择器，通过 ant_sel_in[x] 引脚的电平，选择工作的天线，例如 ant_sel_in[3:0] 为“0b1011”，表示选中天线 11。

多根天线使用步骤

1. 根据硬件电路设计及外部天线切换器确定用于控制天线切换的 IO 引脚。

2. 配置天线选择信号输出到指定 IO 引脚 - API esp_phy_set_ant_gpio() 用于配置 antenna_selects[3:0] 信号连接 GPIO[x3:x0]。如果 GPIO[x0] 连接到 antenna_select[0]，gpio_config->gpio_cfg[x0].gpio_select 应设置为 1，且 gpio_config->gpio_cfg[x0].gpio_num 的值为 GPIO[x0]。

3. 配置内部天线工作模式及输出信号 - API esp_phy_set_ant() 用于配置发送或接收时使用内部天线模块 0 或 1，并配置当天线模块 0 或 1 工作时的输出信号值。- 对于 ESP_PHY_ANT_MODE_AUTO 模式目前不推荐使用。

多根天线配置参考例子

通常，可以执行以下步骤来配置多根天线：

- 配置 antenna_selects 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 antenna_select[0]/antenna_select[1]，配置如下所示：

```

esp_phy_ant_gpio_config_t ant_gpio_config = {
    .gpio_cfg[0] = { .gpio_select = 1, .gpio_num = 20 },
    .gpio_cfg[1] = { .gpio_select = 1, .gpio_num = 21 }
};
  
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据始终选择天线 3。配置如下所示：

```
esp_phy_ant_config_t config = {  
    .rx_ant_mode = ESP_PHY_ANT_MODE_AUTO,  
    .rx_ant_default = ESP_PHY_ANT_ANT0,  
    .tx_ant_mode = ESP_PHY_ANT_MODE_ANT1,  
    .enabled_ant0 = 1,  
    .enabled_ant1 = 3  
};
```

注意事项

1. 不同天线切换器，`ant_sel_in[3:0]` 的输入值中可能存在非法值，即 ESP32-H2 通过外部天线开关支持的天线数可能小于 16 根。例如，ESP32-WROOM-DA 使用 RTC6603SP 作为天线切换器，仅支持 2 根天线。两个天线选择输入管脚为高电平有效，连接到两个 GPIO。'0b01' 表示选中天线 0，'0b10' 表示选中天线 1。输入值'0b00' 和'0b11' 为非法值。

2. 尽管最多支持 16 根天线，发送和接收数据时，最多仅能同时使能两根天线。

3. 对于 **ESP_PHY_ANT_MODE_AUTO** 模式目前不推荐使用，主要有以下限制情况需要考虑：

- 因为发送数据天线基于 **ESP_PHY_ANT_MODE_AUTO** 类型的接收数据天线选择算法，只有接收数据的天线模式为 **ESP_PHY_ANT_MODE_AUTO** 时，发送数据天线才能设置为 **ESP_PHY_ANT_MODE_AUTO**。
- 接收或者发送天线模式配置为 **ESP_PHY_ANT_MODE_AUTO** 时，只要存在 RF 信号的恶化，很容易触发天线切换。如果射频信号不稳定，天线会频繁切换，使得总的射频性能无法达到预期效果。

推荐在以下场景中使用多根天线

1. 应用程序可以始终选择指定的天线，也可以执行自身天线选择算法，如根据应用程序收集的信息来选择天线模式等。请参考 IDF 示例 [examples/phy/antenna/README.md](#) 来设计天线选择算法。

2. 接收/发送数据的天线模式均配置为 **ESP_PHY_ANT_MODE_ANT0** 或 **ESP_PHY_ANT_MODE_ANT1**。

Chapter 5

迁移指南

5.1 迁移到 ESP-IDF 5.x

5.1.1 从 4.4 迁移到 5.0

低功耗蓝牙

Bluetooth

以下 Bluetooth 宏、类型和函数已被重命名：

- `bt/host/bluetooth/api/include/api/esp_gap_ble_api.h`
 - `esp_gap_ble_cb_event_t` 中：
 - * `ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT` 改名为 `ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT`
 - * `ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT` 改名为 `ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT`
 - * `ESP_GAP_BLE_CHANNEL_SELETE_ALGORITHM_EVT` 改名为 `ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT`
 - `esp_ble_wl_opration_t` 改名为 `esp_ble_wl_operation_t`
 - `esp_ble_gap_cb_param_t.pkt_data_lenth_cmpl` 改名为 `pkt_data_length_cmpl`
 - `esp_ble_gap_cb_param_t.update_whitelist_cmpl.wl_opration` 改名为 `wl_operation`
 - `esp_ble_gap_set_prefered_default_phy` 改名为 `esp_ble_gap_set_preferred_default_phy()`
 - `esp_ble_gap_set_prefered_phy` 改名为 `esp_ble_gap_set_preferred_phy()`
- `bt/host/bluetooth/api/include/api/esp_gatt_defs.h`
 - `esp_gatt_status_t` 中：
 - * `ESP_GATT_ENCRYPED_MITM` 改名为 `ESP_GATT_ENCRYPTED_MITM`
 - * `ESP_GATT_ENCRYPED_NO_MITM` 改名为 `ESP_GATT_ENCRYPTED_NO_MITM`

Nimble

以下 Nimble API 已被移除：

- [bt/host/nimble/esp-hci/include/esp_nimble_hci.h](#)
 - 移除 `esp_err_t esp_nimble_hci_and_controller_init(void)`
 - * 控制器初始化、使能以及 HCI 初始化的调用已经被移到 `nimble_port_init` 中。可直接删除该函数。
 - 移除 `esp_err_t esp_nimble_hci_and_controller_deinit(void)`
 - * 控制器去初始化、禁用以及 HCI 去初始化的调用已经被移到 `nimble_port_deinit` 中。可直接删除该函数。

ESP-BLE-MESH

以下 ESP-BLE-MESH 宏已被重命名：

- [bt/esp_ble_mesh/api/esp_ble_mesh_defs.h](#)
 - `esp_ble_mesh_prov_cb_event_t` 中：
 - * `ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT` 改名为 `ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT`

迁移构建系统至 ESP-IDF v5.0

从 GNU Make 构建系统迁移至 ESP-IDF v5.0 ESP-IDF v5.0 已不再支持基于 Make 的工程，请参考从 [ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统](#) 进行迁移。

更新片段文件语法 ESP-IDF v5.0 中将不再支持 ESP-IDF v3.x 中链接器脚本片段文件的旧式语法。在迁移的过程中需注意以下几点：

- 必须缩进，缩进不当的文件会产生解析异常；旧版本不强制缩进，但之前的文档和示例均遵循了正确的缩进语法。
- 条件改用 `if...elif...else` 结构，可以参照[之前的章节](#)。
- 映射片段和其他片段类型一样，需有名称。

明确指定组件依赖 在之前的 ESP-IDF 版本中，除了[通用组件依赖项](#)，还有一些组件总是作为公共依赖项，在构建时添加至每个组件中，如：

- driver
- efuse
- esp_timer
- lwip
- vfs
- esp_wifi
- esp_event
- esp_netif
- esp_eth
- esp_phy

这意味着可以直接包含这些组件的头文件，而无需在 `idf_component_register` 中将它们指定为依赖。此行为是由各种常见组件的传递依赖关系引起的。

在 ESP-IDF v5.0 中，此行为已修复，这些组件不再默认作为公共依赖项添加。

如果组件所依赖的某个组件不属于通用组件依赖项，则必须显式地声明此依赖关系。可以通过在组件的 `CMakeLists.txt` 中的 `idf_component_register` 调用中添加 `REQUIRES <component_name>` 或 `PRIV_REQUIRES <component_name>` 来完成。有关指定组件依赖的更多信息，请参阅[组件依赖](#)。

设置 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量 为了实现构建项目时的路径能够包含空格，ESP-IDF v5.0 做了一系列改进，其中包括改进了 CMakeLists.txt 文件中的 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量。

ESP-IDF v5.0 版本中，不再支持添加不存在的目录到变量 COMPONENT_DIRS 或 EXTRA_COMPONENT_DIRS 中，否则会出现报错。

同时，ESP-IDF v5.0 中也不再支持使用字符串拼接的方式定义 COMPONENT_DIRS 或 EXTRA_COMPONENT_DIRS 变量。这些变量应该定义为 CMake 列表。例如：

```
set(EXTRA_COMPONENT_DIRS path1 path2)
list(APPEND EXTRA_COMPONENT_DIRS path3)
```

不支持：

```
set(EXTRA_COMPONENT_DIRS "path1 path2")
set(EXTRA_COMPONENT_DIRS "${EXTRA_COMPONENT_DIRS} path3")
```

将这些变量定义为 CMake 列表的方式兼容之前的 ESP-IDF 版本。

更新 target_link_libraries 用法 ESP-IDF v5.0 修复了组件的 CMake 变量传播问题。此问题导致本应该只应用于某一组件的编译器标志和定义应用到了项目中的每个组件。

该修复也带来一定的副作用，从 ESP-IDF v5.0 开始，用户项目在使用 target_link_libraries 时必须明确指定 project_elf，同时自定义 CMake 项目必须指定 PRIVATE、PUBLIC 或 INTERFACE 参数。这是一项重大变更，不兼容以前的 ESP-IDF 版本。

例如：

```
target_link_libraries(${project_elf} PRIVATE "-Wl,--wrap=esp_panic_handler")
```

不支持：

```
target_link_libraries(${project_elf} "-Wl,--wrap=esp_panic_handler")
```

更新 CMake 版本 在 ESP-IDF v5.0 中，最低 CMake 版本已更新到 3.16，并且不再支持低于 3.16 的版本。如果你的操作系统没有安装 CMake，请运行 tools/idf_tools.py install cmake 来安装合适的版本。

该变更会影响到使用系统提供的 CMake 以及自定义 CMake 的 ESP-IDF 用户。

重新定义特定目标配置文件的应用顺序 ESP-IDF v5.0 重新安排了特定目标配置文件和 SDKCONFIG_DEFAULTS 中所有其他文件的应用顺序。现在，特定目标的配置文件将在引入它的文件之后、在 SDKCONFIG_DEFAULTS 中后续的其他文件之前应用。

例如：

```
如果 ``SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1
↳ ``，且同一文件夹内有 ``sdkconfig.defaults.esp32``
↳ 文件，那么文件的应用顺序为：(1) sdkconfig.defaults (2) sdkconfig.defaults.esp32
↳ (3) sdkconfig_devkit1
```

如果某个键在不同的特定目标配置文件中有不同的值，那么后者的值会覆盖前者。例如在以上案例中，如果某个键在 sdkconfig.defaults.esp32 和 sdkconfig_devkit1 中的值不同，则在 sdkconfig_devkit1 中的值会覆盖在 sdkconfig.defaults.esp32 中的值。

如果确实需要设置特定目标的配置值，请将其放到后应用的特定目标文件中，如 sdkconfig_devkit1.esp32。

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 8.4.0，现已针对所有芯片目标升级至 GCC 11.2.0。若需要将代码从 GCC 8.4.0 迁移到 GCC 11.2.0，请参考以下官方 GCC 迁移指南。

- [迁移至 GCC 9](#)
- [迁移至 GCC 10](#)
- [迁移至 GCC 11](#)

警告 升级至 GCC 11.2.0 后会触发新警告，或是导致原有警告内容发生变化。所有 GCC 警告的详细内容，请参考 [GCC 警告选项](#)。建议用户仔细检查代码，并设法解决这些警告。但由于某些警告的特殊性及用户代码的复杂性，有些警告可能为误报，需要进行关键修复。在这种情况下，用户可以采取多种方式来抑制这些警告。本节介绍了用户可能遇到的常见警告及如何抑制这些警告。

注意： 建议用户在抑制警告之前仔细确认该警告是否确实为误报。

-Wstringop-overflow、-Wstringop-overread、-Wstringop-truncation 和 -Warray-bounds 如果编译器不能准确判断内存或字符串的大小，使用 memory/string copy/compare 函数的用户会遇到某种 -Wstringop 警告。下文展示了触发这些警告的代码，并介绍了如何抑制这些警告。

```
#pragma GCC diagnostic push
#pragma GCC diagnostic ignored "-Wstringop-overflow"
#pragma GCC diagnostic ignored "-Warray-bounds"
    memset(RTC_SLOW_MEM, 0, CONFIG_ULP_COPROC_RESERVE_MEM); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

```
#pragma GCC diagnostic push
#if __GNUC__ >= 11
#pragma GCC diagnostic ignored "-Wstringop-overread" // <<-- 此键从 GCC 11 开始引入
#endif
#pragma GCC diagnostic ignored "-Warray-bounds" (-Warray-bounds) 。
    memcpy(backup_write_data, (void *)EFUSE_PGM_DATA0_REG, sizeof(backup_
↳write_data)); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

-Waddress-of-packed-member 当访问打包 struct 中的某个未对齐成员时，由于非对齐内存访问会对性能产生影响，GCC 会触发 -Waddress-of-packed-member 警告。然而，所有基于 Xtensa 或 RISC-V 架构的 ESP 芯片都允许非对齐内存访问，并且不会产生额外的性能影响。因此，在大多数情况下，可以忽略此问题。

```
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c: In function
↳'btc_to_bta_gatt_id':
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c:105:21: warning:↳
↳taking address of packed member of 'struct <anonymous>' may result in an↳
↳unaligned pointer value [-Waddress-of-packed-member]
   105 |         btc_to_bta_uuid(&p_dest->uuid, &p_src->uuid);
       |         |
       |         ^~~~~~
```

如果该警告在多个源文件中多次出现，可以在 CMake 级别抑制该警告，如下所示。

```
set_source_files_properties(
    "host/bluedroid/bta/gatt/bta_gattc_act.c"
    "host/bluedroid/bta/gatt/bta_gattc_cache.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatts.c"
    PROPERTIES COMPILE_FLAGS -Wno-address-of-packed-member)
```

但如果只有一或两处警告，可以直接在源代码中进行抑制，如下所示。

```
#pragma GCC diagnostic push
#if __GNUC__ >= 9
#pragma GCC diagnostic ignored "-Waddress-of-packed-member" <<-- 此键从 GCC 11_
↪开始引入
#endif
uint32_t* reg_ptr = (uint32_t*)src;
#pragma GCC diagnostic pop
```

llabs () 用于 64 位整数 `stdlib.h` 中的函数 `abs ()` 需要使用 `int` 参数。请在计划为 64 位的类型中使用 `llabs ()`，尤其是 `time_t`。

乐鑫工具链更新

Xtensa 编译器中的 `int32_t` 和 `uint32_t` 在 Xtensa 编译器中，`int32_t` 和 `uint32_t` 类型已分别从 `int` 和 `unsigned int` 更新为 `long` 和 `unsigned long`。此更新现与上游 GCC 相匹配，上游 GCC 在 Xtensa、RISC-V 和其他架构上使用 `long` 整数来表示 `int32_t` 和 `uint32_t`。

	2021r2 及以上版本, GCC 8	2022r1, GCC 11
Xtensa	(unsigned) int	(unsigned) long
riscv32	(unsigned) long	(unsigned) long

若代码中使用了 `<inttypes.h>` 提供的类型来格式化字符串，则这些代码会受到上述变化的影响。使用这些宽度固定的类型（例如 `uint32_t`）时，请使用 `PRIi32`、`PRIx32` 来分别替换 `%i`、`%x` 等占位符。只有在 `<inttypes.h>` 中定义的类型（例如 `int`）需要这种特殊格式。

在其他情况下，请注意枚举支持 `int` 类型。

通常，`int32_t` 和 `int` 为不同的类型。同样，`uint32_t` 和 `unsigned int` 也为不同的类型。

如果用户在其应用中没有对格式化字符串进行上述更新，程序会报错，如下所示：

```
/Users/name/esp/esp-rainmaker/components/esp-insights/components/esp_diagnostics/
↪include/esp_diagnostics.h:238:29: error: format '%u' expects argument of type
↪'unsigned int', but argument 3 has type 'uint32_t' {aka 'long unsigned int'} [-
↪Werror=format=]
238 |     esp_diag_log_event(tag, "EV (%u) %s: " format, esp_log_timestamp(), tag,
↪##__VA_ARGS__); \
    |                                     ^~~~~~                               ~~~~~~
    |                                     |
    |                                     uint32_t {aka long_
↪unsigned int}                               uint32_t {aka long unsigned int}
```

移除构建选项 `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS` 原有的 `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS` 选项用于构建使用现已僵化的 GCC 5 工具链编写的陈旧代码。但由于已经过去较长时间，现在可以对警告进行修复，因此该选项已移除。

目前，在 GCC 11 中，建议用户仔细检查代码，尽量解决编译器警告。

网络

Wi-Fi

回调函数类型 `esp_now_recv_cb_t` 此前 `esp_now_recv_cb_t` 的第一个参数的类型是 `const uint8_t *mac_addr`，该参数只包含对端 ESP-NOW 设备的地址。

现在该函数有所更新。第一个参数的类型变更为 `esp_now_recv_info_t`，它包含三个成员变量 `src_addr`，`des_addr` 和 `rx_ctrl`。因此，需要进行如下更新：

- 重新定义的 ESP-NOW 收包回调函数。
- `src_addr` 可以等价替换原来的 `mac_addr`。
- `des_addr` 是 ESP-NOW 包的目的地 MAC 地址，可以是单播或广播地址。使用 `des_addr` 可以区分单播或广播的 ESP-NOW 包，其中，即使是在加密的 ESP-NOW 配置中，广播的 ESP-NOW 包也可以是非加密的。
- `rx_ctrl` 是 ESP-NOW 包的 Rx control info，它包含此包的更多有用信息。

请参考 ESP-NOW 样例：[wifi/espnow/main/espnow_example_main.c](#)

以太网

`esp_eth_ioctl()` API 此前，`esp_eth_ioctl()` API 存在以下问题：

- 在某些情况下，第三个参数（数据类型为 `void /*`）可以接受 `int/bool` 类型实参（而非指针）作为输入。然而，文档中未描述这些情况。
- 为了将 `int/bool` 类型实参作为第三个参数传递，实参将强制转换为 `void *` 类型，以防出现如下所示的编译器警告。此等转换可能引起 `esp_eth_ioctl()` 函数的滥用。

```
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, (void *)true);
```

因此，我们统一了 `esp_eth_ioctl()` 的用法。现在，该结构体的第三个参数在传递时必须作为指向特定数据类型的指针，表示 `esp_eth_ioctl()` 读取/存储数据的位置。`esp_eth_ioctl()` 的用法如下列代码所示。

设置以太网配置的用例如下：

```
eth_duplex_t new_duplex_mode = ETH_DUPLEX_HALF;
esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```

获取以太网配置的用例如下：

```
eth_duplex_t duplex_mode;
esp_eth_ioctl(eth_handle, ETH_CMD_G_DUPLEX_MODE, &duplex_mode);
```

KSZ8041/81 和 LAN8720 驱动更新 KSZ8041/81 和 LAN8720 驱动现已更新，以支持相关产品系列中的更多设备（如新一代设备）。上述驱动能够识别特定芯片编号及驱动提供的潜在支持。

更新之后，通用函数将替代特定“芯片编号”函数得以调用：

- 删除 `esp_eth_phy_new_ksz8041()` 以及 `esp_eth_phy_new_ksz8081()`，转而使用 `esp_eth_phy_new_ksz80xx()`
- 删除 `esp_eth_phy_new_lan8720()`，转而使用 `esp_eth_phy_new_lan87xx()`

ESP NETIF Glue 时间处理程序 `esp_eth_set_default_handlers()` 和 `esp_eth_clear_default_handlers()` 函数现已删除。现在可以自动处理以太网默认 IP 层处理程序的注册。如果在注册以太网/IP 事件处理程序之前，你已经按照建议，完全初始化以太网驱动和网络接口，则无需执行任何操作（除了删除受影响的函数）。否则，在注册用户事件处理程序后，应随即启动以太网驱动。

PHY 地址自动检测 以太网 PHY 地址自动检测函数 `esp_eth_detect_phy_addr()` 已重命名为 `esp_eth_phy_802_3_detect_phy_addr()`，其声明移至 `esp_eth/include/esp_eth_phy_802_3.h`。

SPI 以太网模块初始化 SPI 以太网模块的初始化过程已经简化。此前，你需要在实例化 SPI 以太网 MAC 之前，使用 `spi_bus_add_device()` 手动分配 SPI 设备。

现在，SPI 设备已在内部分配，因此无需再调用 `spi_bus_add_device()`。`eth_dm9051_config_t`、`eth_w5500_config_t` 和 `eth_ksz8851snl_config_t` 配置结构体现已包含 SPI 设备配置成员（例如，可以微调可能依赖 PCB 设计的 SPI 时序）。`ETH_DM9051_DEFAULT_CONFIG`、`ETH_W5500_DEFAULT_CONFIG` 和 `ETH_KSZ8851SNL_DEFAULT_CONFIG` 配置初始化宏也已接受新的参数输入。了解 SPI 以太网模块初始化示例，请查看[以太网 API 参考指南](#)。

Ethernet 驱动 用于创建 MAC 实例的 API (`esp_eth_mac_new_*`) 的输入参数由一个配置参数改为两个，这两个参数用于

- 供应商特定的 MAC 配置
- Ethernet 驱动 MAC 配置

该更新不仅适用于内部 Ethernet MAC `esp_eth_mac_new_esp32()` 也适用于外部 MAC 设备，如 `esp_eth_mac_new_ksz8851snl()`、`esp_eth_mac_new_dm9051()` 和 `esp_eth_mac_new_w5500()`。

TCP/IP 适配器 TCP/IP 适配器是在 ESP-IDF v4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` API 迁移至 *ESP-NETIF* 的过程。

更新网络连接代码

网络软件栈初始化

- 你只需用 `esp_netif_init()` 替换 `tcpip_adapter_init()`，注意 `esp_netif_init()` 函数现将返回标准错误代码。了解详细信息，请参考[ESP-NETIF](#)。
- `esp_netif_deinit()` 函数用于反初始化网络软件栈。
- 你还需用 `#include "esp_netif.h"` 替换 `#include "tcpip_adapter.h"`。

创建网络接口 更新之前，TCP/IP 适配器静态定义了以下三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

接口定义现已更新。网络接口的设计应严格参考[ESP-NETIF](#)，使其能够连接至 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`；或 `esp_netif_create_default_wifi_ap()`；。

请参考上述三个接口的初始化代码示例：

- Wi-Fi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- Wi-Fi AP: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- 以太网: [ethernet/basic/main/ethernet_example_main.c](#)

其他 tcpip_adapter API 更换 所有 tcpip_adapter 函数都有对应的 esp-netif。请参考以下章节中的 esp_netif.h 部分，了解更多信息：

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

TCP/IP 适配器 API tcpip_adapter_get_sta_list() 用于获取与软件接入点 (softAP) 相关联的 Wi-Fi 站点列表，现已移到 Wi-Fi 组件，并更名为 esp_wifi_ap_get_sta_list_with_ip()，它是 ESP-NETIF API *esp_netif_dhcps_get_clients_by_mac()* 一个特例。无论服务器在哪个网络接口上运行，该 API 都可更方便地提供连接到 DHCP 服务器的客户端列表。

默认事件处理程序 事件处理程序已从 tcpip_adapter 移至相应驱动程序代码。从应用程序的角度来看，这一变更不会产生任何影响，所有事件仍将以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 esp-netif 结构体而非 LwIP 结构体的形式接收 IP 地址。两种结构体均兼容二进制格式。

打印地址的首选方式如下所示：

```
ESP_LOGI(TAG, "got ip:" IPSTR, IP2STR(&event->ip_info.ip));
```

不建议使用下述方式：

```
ESP_LOGI(TAG, "got ip:%s", ip4addr_ntoa(&event->ip_info.ip));
```

ip4addr_ntoa() 为 LwIP API，因此 esp-netif 还提供了替代函数 esp_ip4addr_ntoa()，然而总得来说仍推荐使用 IP2STR() 这一方法。

IP 地址 推荐使用 esp-netif 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。

- [esp-netif IP address definitions](#)

外设

外设时钟门控 与更新之前相同，外设的时钟仍由驱动处理，用户无需对外设模块的时钟门控进行设置。但是，如果用户想基于组件 hal 和 soc 开发自己的驱动，请注意时钟门控的头文件引用路径已由 driver/periph_ctrl.h 更新为 esp_private/periph_ctrl.h。

RTC 子系统控制 RTC 控制 API 已经从 driver/rtc_ctrl.h 移动到了 esp_private/rtc_ctrl.h。

ADC

ADC 单次模式及连续模式驱动 ADC 单次模式的驱动已更新。

- 新的驱动位于组件 esp_adc 中，头文件引用路径为 esp_adc/adc_oneshot.h。
- 旧版驱动仍然可用，其头文件引用路径为 driver/adc.h。

对于 ADC 连续模式驱动，其位置已由组件 driver 更新为 esp_adc。

- 头文件引用路径由 driver/adc.h 更新为 esp_adc/adc_continuous.h。

但是，引用两种模式的旧版路径 `driver/adc.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_ADC_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy adc driver is deprecated, please migrate to use esp_adc/adc_oneshot.h and
↳ esp_adc/adc_continuous.h for oneshot mode and continuous mode drivers
↳ respectively
```

ADC 校准驱动 ADC 校准驱动已更新。

- 新的驱动位于组件 `esp_adc` 中，头文件引用路径为 `esp_adc/adc_cali.h` 和 `esp_adc/adc_cali_scheme.h`。

旧版驱动仍然可用，其头文件引用路径为 `esp_adc_cal.h`。如果用户要使用旧版路径，需要将组件 `esp_adc` 添加到文件 `CMakeLists.txt` 的组件需求表中。

默认情况下，引用路径 `esp_adc_cal.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_ADC_CALI_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy adc calibration driver is deprecated, please migrate to use esp_adc/adc_
↳ cali.h and esp_adc/adc_cali_scheme.h
```

API 更新

- ADC 电源管理 API `adc_power_acquire` 和 `adc_power_release` 已被移至 `esp_private/adc_share_hw_ctrl.h`，用于内部功能。
 - 更新前，由于硬件勘误表的工作原理，这两个 API 可以被用户调用。
 - 更新后，ADC 电源管理完全由驱动在内部实现。
 - 如果用户仍需调用这个 API，可以通过引用路径 `esp_private/adc_share_hw_ctrl.h` 来调用它。
- 更新后，`driver/adc2_wifi_private.h` 已被移至 `esp_private/adc_share_hw_ctrl.h`。
- `adc_unit_t` 中的枚举 `ADC_UNIT_BOTH`，`ADC_UNIT_ALTER` 及 `ADC_UNIT_MAX` 已被删除。
- 由于只有部分芯片支持下列枚举的某些取值，因此将下列枚举删除。如果用户使用了不支持的取值，会造成驱动运行错误。
 - 枚举 `ADC_CHANNEL_MAX`
 - 枚举 `ADC_ATTEN_MAX`
 - 枚举 `ADC_CONV_UNIT_MAX`
- ESP32 中的 API `hall_sensor_read` 已被删除，因此 ESP32 不再支持霍尔传感器。
- API `adc_set_i2s_data_source` 和 `adc_i2s_mode_init` 已被弃用，相关的枚举 `adc_i2s_source_t` 也已被弃用，请使用 `esp_adc/adc_continuous.h` 进行迁移。
- API `adc_digi_filter_reset`，`adc_digi_filter_set_config`，`adc_digi_filter_get_config` 和 `adc_digi_filter_enable` 已被移除。这些接口的行为不被保证。枚举 `adc_digi_filter_idx_t`，`adc_digi_filter_mode_t` 和结构体 `adc_digi_iir_filter_t` 已被移除。
- API `esp_adc_cal_characterize` 已被弃用，请迁移到 `adc_cali_create_scheme_curve_fitting` 或 `adc_cali_create_scheme_line_fitting`。
- API `esp_adc_cal_raw_to_voltage` 已被弃用，请迁移到 `adc_cali_raw_to_voltage`。
- API `esp_adc_cal_get_voltage` 已被弃用，请迁移到 `adc_oneshot_get_calibrated_result`。

GPIO

- 之前的 `Kconfig` 选项 `RTCIO_SUPPORT_RTC_GPIO_DESC` 已被删除，因此数组 `rtc_gpio_desc` 已不可用，请使用替代数组 `rtc_io_desc`。
- 更新后，用户回调函数无法再通过读取 GPIO 中断的状态寄存器来获取用于触发中断的 GPIO 管脚的编号。但是，用户可以通过使用回调函数变量来确定该管脚编号。
 - 更新前，GPIO 中断发生时，GPIO 中断状态寄存器调用用户回调函数之后，会被清空。因此，用户可以在回调函数中读取 GPIO 中断状态寄存器，以便确定触发中断的 GPIO 管脚。
 - 但是，在调用回调函数后清空中断状态寄存器可能会导致边沿触发的中断丢失。例如，在调用用户回调函数时，如果某个边沿触发的中断 (re) 被触发，该中断会被清除，并且其注册的用户回调函数还未被处理。

- 更新后，GPIO 的中断状态寄存器在调用用户回调函数 **之前** 被清空。因此，用户无法读取 GPIO 中断状态寄存器来确定哪个管脚触发了中断。但是，用户可以通过回调函数变量来传递被触发的管脚编号。

Sigma-Delta 调制器 Sigma-Delta 调制器的驱动现已更新为 *SDM*。

- 新驱动中实现了工厂模式，SDM 通道都位于内部通道池中，因此用户无需手动将 SDM 通道配置到 GPIO 管脚。
- SDM 通道会被自动分配。

尽管我们推荐用户使用新的驱动 API，旧版驱动仍然可用，位于头文件引用路径 `driver/sigmadelat.h` 中。但是，引用 `driver/sigmadelat.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_SDM_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
The legacy sigma-delta driver is deprecated, please use driver/sdm.h
```

概念与使用方法上的主要更新如下所示：

主要概念更新

- SDM 通道名称已由 `sigmadelta_channel_t` 更新为 `sdm_channel_handle_t`，后者为一个不透明指针。
- SDM 通道配置原来存放于 `sigmadelta_config_t`，现存放于 `sdm_config_t`。
- 旧版驱动中，用户无需为 SDM 通道设置时钟源。但是在新驱动中，用户需要在 `sdm_config_t::clk_src` 为 SDM 通道设置合适的时钟源，`soc_periph_sdm_clk_src_t` 中列出了可用的时钟源。
- 旧版驱动中，用户需要为通道设置 `prescale`，该参数会影响调制器输出脉冲的频率。在新的驱动中，用户需要使用 `sdm_config_t::sample_rate_hz` 实现该功能。
- 旧版驱动中，用户通过设置 `duty` 来改变输出的模拟量，现在换成了一个更贴切的名字 `density`

主要使用方法更新

- 更新前，通道配置由通道分配在 `sdm_new_channel()` 完成。在新驱动中，只有 `density` 可在运行时由 `sdm_channel_set_pulse_density()` 更新。其他参数如 `gpio number`、`prescale` 只能在通道分配时进行设置。
- 在进行下一步通道操作前，用户应通过调用 `sdm_channel_enable()` 提前 **使能** 该通道。该函数有助于管理一些系统级服务，如 **电源管理**。

定时器组驱动 为统一和简化通用定时器的使用，定时器组驱动已更新为 *GPTimer*。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，其头文件引用路径为 `driver/timer.h`。但是，引用 `driver/timer.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_GPTIMER_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy timer group driver is deprecated, please migrate to driver/gptimer.h
```

概念和使用方法上的主要更新如下所示：

主要概念更新

- 用于识别定时器的 `timer_group_t` 和 `timer_idx_t` 已被删除。在新驱动中，定时器用参数 `gptimer_handle_t` 表示。
- 更新后，定时器的时钟源由 `gptimer_clock_source_t` 定义，之前的时钟源参数 `timer_src_clk_t` 不再使用。
- 更新后，定时器计数方向由 `gptimer_count_direction_t` 定义，之前的计数方向参数 `timer_count_dir_t` 不再使用。
- 更新后，仅支持电平触发的中断，`timer_intr_t` 和 `timer_intr_mode_t` 不再使用。

- 更新后，通过设置标志位 `gptimer_alarm_config_t::auto_reload_on_alarm`，可以使能自动加载。`timer_autoreload_t` 不再使用。

主要使用方法更新

- 更新后，通过从 `gptimer_new_timer()` 创建定时器示例可以初始化定时器。用户可以在 `gptimer_config_t` 进行一些基本设置，如时钟源，分辨率和计数方向。请注意，无需在驱动安装阶段进行报警事件的特殊设置。
- 更新后，报警事件在 `gptimer_set_alarm_action()` 中进行设置，参数在 `gptimer_alarm_config_t` 中进行设置。
- 更新后，通过 `gptimer_get_raw_count()` 设置计数数值，通过 `gptimer_set_raw_count()` 获取计数数值。驱动不会自动将原始数据同步到 UTC 时间戳。由于定时器的分辨率已知，用户可以自行转换数据。
- 更新后，如果 `gptimer_event_callbacks_t::on_alarm` 被设置为有效的回调函数，驱动程序也会安装中断服务。在回调函数中，用户无需配置底层寄存器，如用于“清除中断状态”，“重新使能事件”的寄存器等。因此，`timer_group_get_intr_status_in_isr` 与 `timer_group_get_auto_reload_in_isr` 这些函数不再使用。
- 更新后，当报警事件发生时，为更新报警配置，用户可以在中断回调中调用 `gptimer_set_alarm_action()`，这样报警事件会被重新使能。
- 更新后，如果用户将 `gptimer_alarm_config_t::auto_reload_on_alarm` 设置为 `true`，报警事件将会一直被驱动程序使能。

UART

删除/弃用项目	替代	备注
<code>uart_isr_register()</code>	无	更新后，UART 中断由驱动处理。
<code>uart_isr_free()</code>	无	更新后，UART 中断由驱动处理。
<code>uart_config_t</code> 中的 <code>use_ref_tick</code>	<code>uart_config_t::source_clk</code>	选择时钟源。
<code>uart_enable_pattern_detect</code>	<code>uart_enable_pattern_detect_baud</code>	使能模式检测中断。

I2C

删除/弃用项目	替代	备注
<code>i2c_isr_register()</code>	无	更新后，I2C 中断由驱动处理。
<code>i2c_isr_register()</code>	无	更新后，I2C 中断由驱动处理。
<code>i2c_opmode_t</code>	无	更新后，该项不再在 <code>esp-idf</code> 中使用。

SPI

删除/弃用项目	替代	备注
<code>spi_cal_clock()</code>	<code>spi_get_actual_clock()</code>	获取 SPI 真实的工作频率。

- 内部头文件 `spi_common_internal.h` 已被移至 `esp_private/spi_common_internal.h`。

LEDC

删除/弃用项目	替代	备注
<code>ledc_timer_config_t</code> 中的 <code>bit_num</code>	<code>ledc_timer_config_t::duty_resolution</code>	设置占空比分辨率。

脉冲计数器 (PCNT) 驱动 为统一和简化 PCNT 外设，PCNT 驱动已更新，详见 [PCNT](#)。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，保留在头文件引用路径 `driver/pcnt.h` 中。但是，引用路径 `driver/pcnt.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_PCNT_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy pcnt driver is deprecated, please migrate to use driver/pulse_cnt.h
```

主要概念和使用方法上的更新如下所示：

主要概念更新

- 更新后，`pcnt_port_t`、`pcnt_unit_t` 和 `pcnt_channel_t` 这些用于识别 PCNT 单元和通道的参数已被删除。在新的驱动中，PCNT 单元由参数 `pcnt_unit_handle_t` 表示，PCNT 通道由参数 `pcnt_channel_handle_t` 表示，这两个参数都是不透明指针。
- 更新后，不再使用 `pcnt_evt_type_t`，它们由统一的 **观察点事件** 表示。在事件回调函数 `pcnt_watch_cb_t` 中，通过 `pcnt_watch_event_data_t` 可以分辨不同观察点。
- `pcnt_count_mode_t` 更新为 `cpp:type:pcnt_channel_edge_action_t`，`pcnt_ctrl_mode_t` 更新为 `pcnt_channel_level_action_t`。

主要使用方法更新

- 更新前，PCNT 的单元配置和通道配置都通过函数 `pcnt_unit_config` 实现。更新后，PCNT 的单元配置通过工厂 API `pcnt_new_unit()` 完成，通道配置通过工厂 API `pcnt_new_channel()` 完成。
 - 只需配置计数范围即可初始化一个 PCNT 单元。更新后，GPIO 管脚分配通过 `pcnt_new_channel()` 完成。
 - 高/低电平控制模式和上升沿/下降沿计数模式分别通过函数 `pcnt_channel_set_edge_action()` 和 `pcnt_channel_set_level_action()` 进行设置。
- `pcnt_get_counter_value` 更新为 `pcnt_unit_get_count()`。
- `pcnt_counter_pause` 更新为 `pcnt_unit_stop()`。
- `pcnt_counter_resume` 更新为 `pcnt_unit_start()`。
- `pcnt_counter_clear` 更新为 `pcnt_unit_clear_count()`。
- 更新后，`pcnt_intr_enable` 与 `pcnt_intr_disable` 已被删除。新的驱动中，通过注册时间回调函数 `pcnt_unit_register_event_callbacks()` 来使能中断。
- 更新后，`pcnt_event_enable` 与 `pcnt_event_disable` 已被删除。新的驱动中，可通过 `pcnt_unit_add_watch_point()` 和 `pcnt_unit_remove_watch_point()` 来增加/删除观察点，以使能/停用 PCNT 事件。
- 更新后，`pcnt_set_event_value` 已被删除。新的驱动中，通过 `pcnt_unit_add_watch_point()` 增加观察点时，也同时设置了事件的数值。
- 更新后，`pcnt_get_event_value` 与 `pcnt_get_event_status` 已被删除。在新的驱动中，这些信息存储在 `pcnt_watch_event_data_t` 的回调函数 `pcnt_watch_cb_t` 中。
- 更新后，`pcnt_isr_register` 与 `pcnt_isr_unregister` 已被删除，不允许注册 ISR 句柄。用户可以通过调用 `cpp:func:pcnt_unit_register_event_callbacks` 来注册事件回调函数。
- 更新后，`pcnt_set_pin` 已被删除，新的驱动不再允许在运行时切换 GPIO 管脚。如果用户想切换为其他 GPIO 管脚，可通过 `cpp:func:pcnt_del_channel` 删除当前的 PCNT 通道，然后通过 `cpp:func:pcnt_new_channel` 安装新的 GPIO 管脚。
- `pcnt_filter_enable`、`pcnt_filter_disable` 与 `pcnt_set_filter_value` 更新为 `pcnt_unit_set_glitch_filter()`。同时，`pcnt_get_filter_value` 已被删除。
- `pcnt_set_mode` 更新为 `pcnt_channel_set_edge_action()` 与 `pcnt_channel_set_level_action()`。
- `pcnt_isr_service_install`、`pcnt_isr_service_uninstall`、`pcnt_isr_handler_add` 与 `pcnt_isr_handler_remove` 更新为 `pcnt_unit_register_event_callbacks()`。默认的 ISR 句柄已安装在新的驱动中。

温度传感器驱动 温度传感器的驱动已更新，推荐用户使用新驱动。旧版驱动仍然可用，但是无法与新驱动同时使用。

新驱动的头文件引用路径为 `driver/temperature_sensor.h`。旧版驱动仍然可用，保留在引用路径 `driver/temp_sensor.h` 中。但是，引用路径 `driver/temp_sensor.h` 会默认触发如下编译警告，可通过设置 Kconfig 选项 `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy temperature sensor driver is deprecated, please migrate to driver/
↳temperature_sensor.h
```

配置内容已更新。更新前，用户需要设置 `clk_div` 与 `dac_offset`。更新后，用户仅需设置 `tsens_range`。

温度传感器的使用过程也已更新。更新前，用户可通过 `config->start->read_celsius` 获取数据。更新后，用户需要通过 `temperature_sensor_install` 先安装温度传感器的驱动，测量完成后需卸载驱动，详情请参考 [Temperature Sensor](#)。

RMT 驱动 为统一和扩展 RMT 外设的使用，RMT 驱动已更新，详见 [RMT transceiver](#)。

尽管我们建议使用新的驱动 API，旧版驱动仍然可用，保留在头文件引用路径 `driver/rmt.h` 中。但是，引用路径 `driver/rmt.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_RMT_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
The legacy RMT driver is deprecated, please use driver/rmt_tx.h and/or driver/rmt_
↳rx.h
```

主要概念和使用方法更新如下所示：

主要概念更新

- 更新后，用于识别硬件通道的 `rmt_channel_t` 已删除。在新的驱动中，RMT 通道用参数 `rmt_channel_handle_t` 表示，该通道由驱动程序动态分配，而不是由用户指定。
- `rmt_item32_t` 更新为 `rmt_symbol_word_t`，以避免在结构体中出现嵌套的共用体。
- 更新后，`rmt_mem_t` 已被删除，因为我们不允许用户直接访问 RMT 内存块（即 RMTMEM）。直接访问 RMTMEM 没有意义，反而会引发错误，特别是当 RMT 通道与 DMA 通道相连时。
- 更新后，由于 `rmt_mem_owner_t` 由驱动控制，而不是用户，因此 `rmt_mem_owner_t` 已被删除。
- `rmt_source_clk_t` 更新为 `rmt_clock_source_t`，后者不支持二进制兼容。
- 更新后，`rmt_data_mode_t` 已被删除，RMT 内存访问模式配置为始终使用 Non-FIFO 和 DMA 模式。
- 更新后，由于驱动有独立的发送和接收通道安装函数，因此 `rmt_mode_t` 已被删除。
- 更新后，`rmt_idle_level_t` 已被删除，在 `rmt_transmit_config_t::eot_level` 中可为发送通道设置空闲状态电平。
- 更新后，`rmt_carrier_level_t` 已被删除，可在 `rmt_carrier_config_t::polarity_active_low` 设置载流子极性。
- 更新后，`rmt_channel_status_t` 与 `rmt_channel_status_result_t` 已被删除，不再使用。
- 通过 RMT 通道发送并不需要用户提供 RMT 符号，但是用户需要提供一个 RMT 编码器用来告诉驱动如何将用户数据转换成 RMT 符号。

主要使用方法更新

- 更新后，分别通过 `rmt_new_tx_channel()` 和 `rmt_new_rx_channel()` 安装发送通道和接收通道。
- 更新后，`rmt_set_clk_div` 和 `rmt_get_clk_div` 已被删除。通道时钟配置只能在通道安装时完成。
- 更新后，`rmt_set_rx_idle_thresh` 和 `rmt_get_rx_idle_thresh` 已被删除。新驱动中，接收通道的空闲状态阈值定义为 `rmt_receive_config_t::signal_range_max_ns`。
- 更新后，`rmt_set_mem_block_num` 和 `rmt_get_mem_block_num` 已被删除。新驱动中，内存块的数量由 `rmt_tx_channel_config_t::mem_block_symbols` 与 `rmt_rx_channel_config_t::mem_block_symbols` 决定。
- 更新后，`rmt_set_tx_carrier` 已被删除。新驱动使用 `rmt_apply_carrier()` 来设置载波动作。
- 更新后，`rmt_set_mem_pd` 和 `rmt_get_mem_pd` 已被删除，驱动程序自动调整内存的功率。

- 更新后, `rmt_memory_rw_rst`, `rmt_tx_memory_reset` 和 `rmt_rx_memory_reset` 已被删除, 驱动程序自动进行内存重置。
- 更新后, `rmt_tx_start` 和 `rmt_rx_start` 被合并为函数 `rmt_enable()`, 该函数同时适用于发射通道和接收通道。
- 更新后, `rmt_tx_stop` 和 `rmt_rx_stop` 被合并为函数 `rmt_disable()`, 该函数同时适用于发射通道和接收通道。
- 更新后, `rmt_set_memory_owner` 和 `rmt_get_memory_owner` 已被删除, 驱动程序自动添加 RMT 内存保护。
- 更新后, `rmt_set_tx_loop_mode` 和 `rmt_get_tx_loop_mode` 已被删除。新驱动中, 在 `rmt_transmit_config_t::loop_count` 中设置循环模式。
- 更新后, `rmt_set_source_clk` 和 `rmt_get_source_clk` 已被删除。仅能在通道安装时通过 `rmt_tx_channel_config_t::clk_src` 和 `rmt_rx_channel_config_t::clk_src` 设置时钟源。
- 更新后, `rmt_set_rx_filter` 已被删除。新驱动中, 过滤阈值定义为 `rmt_receive_config_t::signal_range_min_ns`。
- 更新后, `rmt_set_idle_level` 和 `rmt_get_idle_level` 已被删除, 可在 `rmt_transmit_config_t::eot_level` 中设置发射通道的空闲状态电平。
- 更新后, `rmt_set_rx_intr_en`, `rmt_set_err_intr_en`, `rmt_set_tx_intr_en`, `rmt_set_tx_thr_intr_en` 和 `rmt_set_rx_thr_intr_en` 已被删除。新驱动不允许用户在用户端开启/关闭中断, 而是提供了回调函数。
- 更新后, `rmt_set_gpio` 和 `rmt_set_pin` 已被删除。新驱动不支持运行时动态切换 GPIO 管脚。
- 更新后, `rmt_config` 已被删除。新驱动中, 基础配置在通道安装阶段完成。
- 更新后, `rmt_isr_register` 和 `rmt_isr_deregister` 已被删除, 驱动程序负责分配中断。
- `rmt_driver_install` 更新为 `rmt_new_tx_channel()` 与 `rmt_new_rx_channel()`。
- `rmt_driver_uninstall` 更新为 `rmt_del_channel()`。
- 更新后, `rmt_fill_tx_items`, `rmt_write_items` 和 `rmt_write_sample` 已被删除。新驱动中, 用户需要提供一个编码器用来将用户数据“翻译”为 RMT 符号。
- 更新后, 由于用户可以通过 `rmt_tx_channel_config_t::resolution_hz` 配置通道的时钟分辨率, `rmt_get_counter_clock` 已被删除。
- `rmt_wait_tx_done` 更新为 `rmt_tx_wait_all_done()`。
- 更新后, `rmt_translator_init`, `rmt_translator_set_context` 和 `rmt_translator_get_context` 已被删除。新驱动中, 翻译器更新为 RMT 译码器。
- 更新后, `rmt_get_ringbuf_handle` 已被删除。新驱动程序不再使用 Ringbuffer 来保存 RMT 符号。输入数据会直接保存到用户提供的缓冲区中, 这些缓冲区甚至可以直接被挂载到 DMA 链接内部。
- `rmt_register_tx_end_callback` 更新为 `rmt_tx_register_event_callbacks()`, 用户可以在这个参数里面注册事件回调函数 `rmt_tx_event_callbacks_t::on_trans_done`。
- 更新后, `rmt_set_intr_enable_mask` 和 `rmt_clr_intr_enable_mask` 已被删除。由于驱动程序负责处理中断, 因此用户无需进行处理。
- `rmt_add_channel_to_group` 和 `rmt_remove_channel_from_group` 更新为 RMT 同步管理器, 详见 `rmt_new_sync_manager()`。
- 更新后, `rmt_set_tx_loop_count` 已被删除。新驱动中, 循环计数在 `rmt_transmit_config_t::loop_count` 进行配置。
- 更新后, `rmt_enable_tx_loop_autostop` 已被删除。新驱动中, 发射循环自动终止一直使能, 用户无法进行配置。

LCD

- LCD 面板的初始化流程也有一些更新。更新后, `esp_lcd_panel_init()` 不再会自动打开显示器。用户需要调用 `esp_lcd_panel_disp_on_off()` 来手动打开显示器。请注意, 打开显示器与打开背光是不同的。更新后, 打开屏幕前, 用户可以烧录一个预定义的图案, 这可以避免开机复位后屏幕上的随机噪音。
- 更新后, `esp_lcd_panel_disp_off()` 已被弃用, 请使用 `esp_lcd_panel_disp_on_off()` 作为替代。
- 更新后, `dc_as_cmd_phase` 已被删除, SPI LCD 驱动不再支持 9-bit 的 SPI LCD。请使用专用的 GPIO 管脚来控制 LCD D/C 线。
- 更新后, 用于注册 RGB 面板的事件回调函数已从 `esp_lcd_rgb_panel_config_t` 更新为单独的 API `esp_lcd_rgb_panel_register_event_callbacks()`。但是, 事件回调签名仍保持

不变。

- 更新后, `esp_lcd_rgb_panel_config_t` 中的标志位 `relax_on_idle` 被重命名为 `esp_lcd_rgb_panel_config_t::refresh_on_demand`, 后者虽表达了同样的含义, 但是其命名更有意义。
- 更新后, 如果创建 RGB LCD 时, 标志位 `refresh_on_demand` 使能, 驱动不会在 `esp_lcd_panel_draw_bitmap()` 中进行刷新, 用户需要调用 `esp_lcd_rgb_panel_refresh()` 来刷新屏幕。
- 更新后, `esp_lcd_color_space_t` 已被弃用, 请使用 `lcd_color_space_t` 来描述色彩空间, 使用 `lcd_rgb_element_order_t` 来描述 RGB 颜色的排列顺序。

MCPWM MCPWM 驱动已更新 (详见 [MCPWM](#))。同时, 旧版驱动已被弃用。

新驱动中, 每个 MCPWM 子模块相互独立, 用户可以自由进行资源连接。

尽管我们推荐使用新的驱动 API, 旧版驱动仍然可用, 其引用路径为 `driver/mcpwm.h`。但是, 使用旧版驱动会默认触发如下编译警告, 可以通过配置 `Kconfig` 选项 `CONFIG_MCPWM_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy MCPWM driver is deprecated, please migrate to the new driver (include_
↳driver/mcpwm_prelude.h)
```

主要概念和使用方法上的更新如下所示:

主要概念更新 更新后, MCPWM 驱动是面向对象的, 大多数 MCPWM 子模块都有一个与之相关的驱动对象。驱动对象是由工厂函数创建的, 如 `mcpwm_new_timer()`。IO 控制函数总是需要对象句柄。

旧版驱动有一个不恰当的假设, 即 MCPWM 运算器应连接到不同的 MCPWM 定时器上。但是, 硬件上并没有这样的限制。新驱动中, 同一个 MCPWM 定时器可以连接多个运算器, 这样运算器可以获得最佳的同步性能。

更新前, 驱动将生成 PWM 波形的方法预设为所谓的 `mcpwm_duty_type_t`, 但是, 列出的占空比模式远远不够。类似的, 旧版驱动有一些预设的 `mcpwm_deadtime_type_t` 也没有包含所有的使用场景。更重要的是, 用户通常会被占空比模式和死区时间模式的名称所迷惑。更新后, 驱动没有这些限制, 但是用户必须从头开始构建发生器的行为。

在旧版驱动中, 通过 GPIO 管脚, 软件和其他定时器模块同步 MCPWM 定时器的方法并不统一。这增加了用户的学习成本, 因此新驱动统一了同步 API。

旧版驱动混淆了“故障检测器”和“故障处理器”的概念。这让用户对 API 感到非常困惑。新驱动中, 故障对象只代表一个故障源, 而且我们引入了一个新概念, **制动器**, 来表示故障处理器。而且, 新驱动支持软件故障。

旧版驱动只为获取子模块提供了回调函数, 而新驱动为 MCPWM 子模块提供多种回调函数, 如停止定时器, 比较匹配, 故障进入, 紧急停止等。

- 更新后, 不再使用 `mcpwm_io_signals_t` 和 `mcpwm_pin_config_t`, GPIO 管脚配置被移至子模块的配置结构中。
- 更新后, 不再使用 `mcpwm_timer_t` 和 `mcpwm_generator_t`, 定时器和发生器分别用 `mcpwm_timer_handle_t` 和 `cpp:type:mcpwm_gen_handle_t` 表示。
- 更新后, 不再使用 `mcpwm_fault_signal_t` 和 `mcpwm_sync_signal_t`, 故障和同步源分别用 `mcpwm_fault_handle_t` 和 `cpp:type:mcpwm_sync_handle_t` 表示。
- 更新后, 不再使用 `mcpwm_capture_signal_t`, 获取通道用 `mcpwm_cap_channel_handle_t` 表示。

主要使用方法更新

- `mcpwm_gpio_init` 和 `mcpwm_set_pin`: GPIO 管脚配置在子模块配置中完成, 例如在 `mcpwm_generator_config_t::gen_gpio_num` 中设置 PWM GPIO 管脚。
- `mcpwm_init`: 为得到预期的 PWM 波形, 用户需要至少分配一个 MCPWM 定时器和 MCPWM 运算器, 然后通过调用 `mcpwm_operator_connect_timer()` 将二

- 者连接起来。然后，用户需要调用如：`cpp:func:mcpwm_generator_set_actions_on_timer_event`，`mcpwm_generator_set_actions_on_compare_event()` 来设置发生器对不同事件的动作。
- `mcpwm_group_set_resolution`: 新驱动中，群组分辨率固定为最大值，通常为 80 MHz。
 - `mcpwm_timer_set_resolution`: MCPWM 定时器的分辨率在 `mcpwm_timer_config_t::resolution_hz` 中进行设置。
 - `mcpwm_set_frequency`: PWM 频率由 `mcpwm_timer_config_t::resolution_hz`，`mcpwm_timer_config_t::count_mode` 和 `cpp:member:mcpwm_timer_config_t::period_ticks` 决定。
 - `mcpwm_set_duty`: 为设置 PWM 占空比，用户应调用 `mcpwm_comparator_set_compare_value()` 来改变比较器的阈值。
 - `mcpwm_set_duty_type`: 新驱动中没有预设的占空比模式，通过设置不同的发生器行为，如 `mcpwm_generator_set_actions_on_timer_event()`，来配置占空比模式。
 - `mcpwm_set_signal_high` 和 `mcpwm_set_signal_low` 更新为 `mcpwm_generator_set_force_level()`。新驱动中，这是通过为发生器设置力作用来实现的，而不是在后台将占空比改为 0% 或 100%。
 - `mcpwm_start` 和 `mcpwm_stop` 更新为 `mcpwm_timer_start_stop()`。用户可以用更多的模式来启动和停止 MCPWM 定时器，详见 `mcpwm_timer_start_stop_cmd_t`。
 - `mcpwm_carrier_init` 更新为 `mcpwm_operator_apply_carrier()`。
 - `mcpwm_carrier_enable` 与 `mcpwm_carrier_disable`: 通过检查载波设置结构 `mcpwm_carrier_config_t` 是否为空集来自动使能和停用载波子模块。
 - `mcpwm_carrier_set_period` 更新为 `mcpwm_carrier_config_t::frequency_hz`。
 - `mcpwm_carrier_set_duty_cycle` 更新为 `mcpwm_carrier_config_t::duty_cycle`。
 - `mcpwm_carrier_one_shot_mode_enable` 更新为 `mcpwm_carrier_config_t::first_pulse_duration`。
 - 更新后，`mcpwm_carrier_one_shot_mode_disable` 被删除。硬件不支持停用第一个载波脉冲（即一次性脉冲）。
 - `mcpwm_carrier_output_invert` 更新为 `mcpwm_carrier_config_t::invert_before_modulate` 和 `mcpwm_carrier_config_t::invert_after_modulate`。
 - `mcpwm_deadtime_enable` 与 `mcpwm_deadtime_disable` 更新为 `mcpwm_generator_set_dead_time()`。
 - `mcpwm_fault_init` 更新为 `mcpwm_new_gpio_fault()`。
 - `mcpwm_fault_set_one_shot_mode` 与 `mcpwm_fault_set_cyc_mode` 更新为 `mcpwm_operator_set_brake_on_fault()` 与 `mcpwm_generator_set_actions_on_brake_event()`。
 - 由于 `mcpwm_capture_enable` 与 `mcpwm_capture_enable_channel()` 重复，因此在更新后被删除。
 - 由于 `mcpwm_capture_disable` 与 `mcpwm_capture_disable_channel()` 重复，因此在更新后被删除。
 - `mcpwm_capture_enable_channel` 与 `mcpwm_capture_disable_channel` 更新为 `mcpwm_capture_channel_enable()` 与 `mcpwm_capture_channel_disable()`。
 - `mcpwm_capture_signal_get_value` 与 `mcpwm_capture_signal_get_edge`: 通过 `mcpwm_capture_event_data_t`，获取事件回调函数中提供了计时器的数值和边缘电平。只有获取事件发生时，获取数据才有意义，提供单一的 API 来获取捕获数据是没有意义的。
 - 由于 `mcpwm_sync_enable` 与 `mcpwm_sync_configure()` 重复，因此更新后被删除。
 - `mcpwm_sync_configure` 更新为 `mcpwm_timer_set_phase_on_sync()`。
 - `mcpwm_sync_disable` 相当于将 `mcpwm_timer_sync_phase_config_t::sync_src` 设置为 NULL。
 - `mcpwm_set_timer_sync_output` 更新为 `mcpwm_new_timer_sync_src()`。
 - `mcpwm_timer_trigger_soft_sync` 更新为 `mcpwm_soft_sync_activate()`。
 - `mcpwm_sync_invert_gpio_synchro` 与设置 `mcpwm_gpio_sync_src_config_t::active_neg` 功能相同。
 - 更新后，`mcpwm_isr_register` 已被删除。用户可以注册不同的事件回调函数来替代其功能，例如，可以使用 `mcpwm_capture_channel_register_event_callbacks()` 注册获取事件注册函数。

专用的 GPIO 驱动

- 更新后，所有与专用 GPIO 管脚相关的底层 (LL) 函数从 `cpu_ll.h` 中被移至 `dedic_gpio_cpu_ll.h`，并重新命名。

I2S 驱动 旧版 I2S 驱动在支持 ESP32-C3 和 ESP32-S3 新功能时暴露了很多缺点，为解决这些缺点，I2S 驱动已更新（请参考：[doc:I2S Driver <../../api-reference/peripherals/i2s>](#)）。用户可以通过引用不同 I2S 模式对应的头文件来使用新版驱动的 API，如 `esp_driver_i2s/include/driver/i2s_std.h`、`esp_driver_i2s/include/driver/i2s_pdm.h` 以及 `esp_driver_i2s/include/driver/i2s_tdm.h`。

为保证前向兼容，旧版驱动的 API 仍然在 `driver/deprecated/driver/i2s.h` 中可用。但使用旧版 API 会触发编译警告，该警告可通过配置 Kconfig 选项 `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` 来关闭。

以下是更新后的 I2S 文件概况。

主要概念更新

独立的发送通道和接收通道 更新后，I2S 驱动的最小控制单元是发送/接收通道，而不是整个 I2S 控制器（控制器包括多个通道）。

- 用户可以分别控制同一个 I2S 控制器的发送通道和接收通道，即可以通过配置实现分别开启和关闭发送通道和接收通道。
- `i2s_chan_handle_t` 句柄类型用于唯一地识别 I2S 通道。所有的 API 都需要该通道句柄，用户需要对这些通道句柄进行维护。
- 对于 ESP32-C3 和 ESP32-S3，同一个控制器中的发送通道和接收通道可以配置为不同的时钟或不同的模式。
- 但是对于 ESP32 和 ESP32-S2，同一个控制器中的发送通道和接收通道共享某些硬件资源。因此，配置可能会造成一个通道影响同一个控制器中的另一个通道。
- 通过将 `i2s_port_t::I2S_NUM_AUTO` 设置为 I2S 端口 ID，驱动会搜索可用的发送/接收通道，之后通道会被自动注册到可用的 I2S 控制器上。但是，驱动仍然支持将通道注册到一个特定的端口上。
- 为区分发送/接收通道和声道，在更新后的驱动中，“通道 (channel)” 一词仅代表发送/接收通道，用“声道 (slot)” 来表示声道。

I2S 模式分类 I2S 通信模式包括以下三种模式，请注意：

- **标准模式**：标准模式通常包括两个声道，支持 Philips, MSB 和 PCM（短帧同步）格式，详见 `esp_driver_i2s/include/driver/i2s_std.h`。
- **PDM 模式**：PDM 模式仅支持两个声道，16 bit 数据位宽，但是 PDM TX 和 PDM RX 的配置略有不同。对于 PDM TX，采样率可通过 `i2s_pdm_tx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于上采样的配置。对于 PDM RX，采样率可通过 `i2s_pdm_rx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于下采样的配置，详见 `esp_driver_i2s/include/driver/i2s_pdm.h`。

- **TDM 模式**: TDM 模式可支持高达 16 声道, 该模式可工作在 Philips, MSB, PCM (短帧同步) 和 PCM (长帧同步) 格式下, 详见 `esp_driver_i2s/include/driver/i2s_tdm.h`。

在某个模式下分配新通道时, 必须通过相应的函数初始化这个通道。我们强烈建议使用辅助宏来生成默认配置, 以避免默认值被改动。

独立的声道配置和时钟配置 可以单独进行声道配置和时钟配置。

- 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `cpp:func:i2s_channel_init_tdm_mode` 初始化声道/时钟/GPIO 管脚配置。
- 通过调用 `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_pdm_rx_slot()`, `i2s_channel_reconfig_pdm_tx_slot()` 或 `i2s_channel_reconfig_tdm_slot()` 可以在初始化之后改变声道配置。
- 通过调用 `i2s_channel_reconfig_std_clock()`, `i2s_channel_reconfig_pdm_rx_clock()`, `i2s_channel_reconfig_pdm_tx_clock()` 或 `i2s_channel_reconfig_tdm_clock()` 可以在初始化之后改变时钟配置。
- 通过调用 `i2s_channel_reconfig_std_gpio()`, `i2s_channel_reconfig_pdm_rx_gpio()`, `i2s_channel_reconfig_pdm_tx_gpio()` 或 `i2s_channel_reconfig_tdm_gpio()` 可以在初始化之后改变 GPIO 管脚配置。

Misc

- 更新后, I2S 驱动利用状态和状态机避免在错误状态下调用 API。
- 更新后, ADC 和 DAC 模式已被删除, 只有它们各自专用的驱动及 I2S 旧版驱动还支持这两种模式。

主要使用方法更新 请参考以下步骤使用更新后的 I2S 驱动:

1. 通过调用 `i2s_new_channel()` 来获取通道句柄。我们应该在此步骤中指定外设为主机还是从机以及 I2S 端口。此外, 驱动负责生成发送通道或接收通道的句柄。不需要同时输入发送通道和接收通道句柄, 但需要输入至少一个句柄。输入两个句柄时, 驱动会工作在双工模式。在同一端口上, 发送通道和接收通道同时可用, 并且共享 MCLK, BCLK 和 WS 信号。如果只输入了发送通道句柄或接收通道句柄, 该通道只能工作在单工模式。
2. 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()` 将通道初始化为指定模式。进行相应的声道、时钟和 GPIO 管脚配置。
3. (可选) 通过调用 `i2s_channel_register_event_callback()` 注册 ISR 事件回调函数。I2S 事件由回调函数同步接收, 而不是从事件队列中异步接收。
4. 通过调用 `i2s_channel_enable()` 来开启 I2S 通道的硬件资源。在更新后的驱动中, I2S 在安装后不会再自动开启, 用户需要确定通道是否已经开启。
5. 分别通过 `i2s_channel_read()` 和 `i2s_channel_write()` 来读取和写入数据。当然, 在 `i2s_channel_read()` 中只能输入接收通道句柄, 在 `i2s_channel_write()` 中只能输入发送通道句柄。
6. (可选) 通过相应的'reconfig'函数可以更改声道、时钟和 GPIO 管脚配置, 但是更改配置前必须调用 `i2s_channel_disable()`。
7. 通过调用 `i2s_channel_disable()` 可以停止使用 I2S 通道的硬件资源。
8. 不再使用某通道时, 通过调用 `i2s_del_channel()` 可以删除和释放该通道资源, 但是删除之前必须先停用该通道。

TWAI 驱动程序 CAN 外设驱动程序已弃用并被删除, 请使用 TWAI 驱动程序代替 (即在应用程序中包含 `driver/twai.h`)。

用于访问寄存器的宏 更新前, 所有用于访问寄存器的宏都可以作为表达式来使用, 所以以下命令是允许的:

```
uint32_t val = REG_SET_BITS(reg, bits, mask);
```

在 ESP-IDF v5.0 中, 用于写入或读取-修改-写入寄存器的宏不能再作为表达式使用, 而只能作为语句使用, 这适用于以下宏: `REG_WRITE`, `REG_SET_BIT`, `REG_CLR_BIT`, `REG_SET_BITS`, `REG_SET_FIELD`, `WRITE_PERI_REG`, `CLEAR_PERI_REG_MASK`, `SET_PERI_REG_MASK`, `SET_PERI_REG_BITS`。

为存储要写入寄存器的值, 请按以下步骤完成操作:

```
uint32_t new_val = REG_READ(reg) | mask;
REG_WRITE(reg, new_val);
```

要获得修改后的寄存器的值 (该值可能与写入的值不同), 要增加一个显示的读取命令:

```
REG_SET_BITS(reg, bits, mask);
uint32_t new_val = REG_READ(reg);
```

协议

Mbed TLS 在 ESP-IDF v5.0 版本中, [Mbed TLS](#) 已从 v2.x 版本更新到 v3.1.0 版本。

更多有关 Mbed TLS 从 v2.x 版本迁移到 v3.0 或更高版本的详细信息, 请参考 [官方指南](#)。

重大更新 (概述)

增加私有结构体字段数量

- 不再支持直接访问公共头文件中声明的结构体 (`struct` 类型) 字段。
- 当前版本下, 访问公共头文件中声明的结构体字段需要使用特定的访问函数 (`getter/setter`)。另外, 也可以用 `MBEDTLS_PRIVATE` 宏暂时代替, 但不建议使用此种方法。
- 更多详细信息, 请参考 [官方指南](#)。

SSL

- 不再支持 TLS 1.0、TLS 1.1 和 DTLS 1.0
- 不再支持 SSL 3.0

移除密码模块中的废弃函数

- 更新了与 MD、SHA、RIPEMD、RNG、HMAC 模块相关的函数 `MBEDTLS_*_ret()` 的返回值, 并将其重新命名, 以取代未附加 `_ret` 的相应函数。
- 更多详细信息, 请参考 [官方指南](#)。

废弃配置选项 下列为在此次更新中废弃的重要配置选项。与以下配置有关或是依赖于下列配置的相关配置也已相应废弃。

- `MBEDTLS_SSL_PROTO_SSL3`: 原用于支持 SSL 3.0
- `MBEDTLS_SSL_PROTO_TLS1`: 原用于支持 TLS 1.0
- `MBEDTLS_SSL_PROTO_TLS1_1`: 原用于支持 TLS 1.1
- `MBEDTLS_SSL_PROTO_DTLS`: 原用于支持 DTLS 1.1 (当前版本仅支持 DTLS 1.2)
- `MBEDTLS_DES_C`: 原用于支持 3DES 密码套件
- `MBEDTLS_RC4_MODE`: 原用于支持基于 RC4 的密码套件

备注: 上述仅列出了可通过 `idf.py menuconfig` 配置的主要选项。更多有关废弃选项的信息, 请参考 [官方指南](#)。

其他更新

禁用 Diffie-Hellman 密码交换模式 为避免 [安全风险](#)，当前版本已默认禁用 Diffie-Hellman 密码交换模式。以下为相应的禁用配置项：

- `MBEDTLS_DHM_C`：原用于支持 Diffie-Hellman-Merkle 模块
- `MBEDTLS_KEY_EXCHANGE_DHE_PSK`：原用于支持 Diffie-Hellman 预共享密钥 (PSK) TLS 认证模式
- `MBEDTLS_KEY_EXCHANGE_DHE_RSA`：原用于支持带有前缀的密码套件 `TLS-DHE-RSA-WITH-`

备注：在信号交换的初始步骤（即 `client_hello`）中，服务器会在客户端提供的列表选择一个密码。由于 `DHE_PSK/DHE_RSA` 密码已在本次更新中禁用，服务器将退回到一个替代密码。在极个别情况中，服务器不支持任何其他的代码，此时，初始步骤将失败。若要检索服务器所支持的密码列表，需要首先在客户端使用特定的密码连接服务器，可以使用 `ssllscan` 等工具完成连接。

从 X509 库中移除 `certs` 模块

- `mbdtdls 3.1` 不再支持 `mbdtdls/certs.h` 头文件。大多数应用程序支持从包含列表中安全删除该头文件。

对 `esp_cert_bundle_set` API 的重大更新

- 更新后，调用 `esp_cert_bundle_set()` API 需要一个额外的参数 `bundle_size`。该 API 的返回类型也从 `void` 变为了 `esp_err_t`。

对 `esp_ds_rsa_sign` API 的重大更新

- 更新后，调用 `esp_ds_rsa_sign()` API 无需再使用参数 `mode`。

HTTPS 服务器

重大更新（概述） 更新 `httpd_ssl_config_t` 结构体中持有不同证书的变量名。

- `httpd_ssl_config::servercert`：原 `cacert_pem`
- `httpd_ssl_config::servercert_len`：原 `cacert_len`
- `httpd_ssl_config::cacert_pem`：原 `client_verify_cert_pem`
- `httpd_ssl_config::cacert_len`：原 `client_verify_cert_len`

`httpd_ssl_stop()` API 的返回类型从 `void` 变为了 `esp_err_t`。

ESP HTTPS OTA

重大更新（概述）

- 函数 `esp_https_ota()` 现需以指向 `esp_https_ota_config_t` 的指针作为参数，而非之前的指向 `esp_http_client_config_t` 的指针。

ESP-TLS

重大更新（概述）

私有化 `esp_tls_t` 结构体 更新后, `esp_tls_t` 已完全私有化, 用户无法直接访问其内部结构。之前需要通过 ESP-TLS 句柄获得的必要数据, 现在可由对应的 getter/setter 函数获取。如需特定功能的 getter/setter 函数, 请在 ESP-IDF 的 [Issue 板块](#) 提出。

下列为新增的 getter/setter 函数:

- `esp_tls_get_ssl_context()`: 从 ESP-TLS 句柄获取底层 ssl 栈的 ssl 上下文。

废弃函数及推荐的替代函数 下表总结了在 ESP-IDF v5.0 中废弃的函数以及相应的替代函数。

废弃函数	替代函数
<code>esp_tls_conn_new()</code>	<code>esp_tls_conn_new_sync()</code>
<code>esp_tls_conn_delete()</code>	<code>esp_tls_conn_destroy()</code>

- 函数 `esp_tls_conn_http_new()` 现已废弃。请使用替代函数 `esp_tls_conn_http_new_sync()` (或其异步函数 `esp_tls_conn_http_new_async()`)。请注意, 使用替代函数时, 需要额外的参数 `esp_tls_t`, 此参数必须首先通过 `esp_tls_init()` 函数进行初始化。

HTTP 服务器

重大更新 (概述)

- `esp_http_server` 现不再支持 `http_server.h` 头文件。请使用 `esp_http_server.h`。

ESP HTTP 客户端

重大更新 (概述)

- 函数 `esp_http_client_read()` 和 `esp_http_client_fetch_headers()` 现在会返回额外的返回值 `-ESP_ERR_HTTP_EAGAIN` 用于处理超时错误, 即数据准备好前就已调用超时的情况。

TCP 传输

重大更新 (概述)

- 更新后, 出现连接超时的情况时, 函数 `esp_transport_read()` 将返回 0, 对其他错误则返回 `< 0`。请参考 `esp_tcp_transport_err_t`, 查看所有可能的返回值。

MQTT 客户端

重大更新 (概述)

- `esp_mqtt_client_config_t` 的所有字段都分组存放在子结构体中。

以下为较为常用的配置选项:

- 通过 `esp_mqtt_client_config_t::broker::address::uri` 配置 MQTT Broker
- 通过 `esp_mqtt_client_config_t::broker::verification` 配置 MQTT Broker 身份验证的相关安全问题
- 通过 `esp_mqtt_client_config_t::credentials::username` 配置客户端用户名
- `esp_mqtt_client_config_t` 不再支持 `user_context` 字段。之后注册事件处理程序, 请使用 `esp_mqtt_client_register_event()`; 最后一个参数 `event_handler_arg` 可用于将用户上下文传递给处理程序。

ESP-Modbus

重大更新 (概述) 本次更新从 ESP-IDF 中移除了组件 `freemodbus`，该组件已作为一个独立组件受到支持。可前往如下的独立仓库，查看更多有关 ESP-Modbus 的信息：

- [GitHub 中的 ESP-Modbus 组件](#)

在新版应用程序中，main 组件文件夹应包括组件管理器清单文件 `idf_component.yml`，如下所示：

```
dependencies:
  espressif/esp-modbus:
    version: "^1.0"
```

可以前往 [组件管理器注册表](#) 找到 ESP-Modbus 组件。更多有关如何设置组件管理器的信息，请参考 [组件管理器文档](#)。

对于使用 ESP-IDF v4.x 及以后版本的应用程序，需要通过添加组件管理器清单文件 `idf_component.yml` 拉取新版 ESP-Modbus 组件。同时，在编译时，应去掉已过时的 `freemodbus` 组件。此项操作可通过项目 `CMakeLists.txt` 中的以下语句实现：

```
set(EXCLUDE_COMPONENTS freemodbus)
```

配置

Protocomm `protocomm_set_security()` API 中的 `pop` 字段现已弃用。请使用 `sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，`sec_params` 参数应包含指向 `protocomm_security2_params_t` 类型结构的指针。

Wi-Fi 配置

- `wifi_prov_mgr_start_provisioning()` API 中的 `pop` 字段现已弃用。为了向后兼容，在使用安全版本 1 时，`pop` 仍可以作为字符串传递。但在使用安全版本 2 时，请使用 `wifi_prov_sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。例如，当使用安全版本 2 时，`wifi_prov_sec_params` 参数应包含指向 `wifi_prov_security2_params_t` 结构体类型的指针。对于安全版本 1，该 API 的行为和使用方式保持不变。
- `wifi_prov_mgr_is_provisioned()` API 不再返回 `ESP_ERR_INVALID_STATE` 错误。此 API 现在可以在不依赖配置管理器初始化状态的情况下工作。

ESP 本地控制 `esp_local_ctrl_proto_sec_cfg_t` API 中的 `pop` 字段现已弃用。请使用 `sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，`sec_params` 字段应包含指向 `esp_local_ctrl_security2_params_t` 类型结构的指针。

从 ESP-IDF 中移出或弃用的组件

移至 ESP-IDF Component Registry 的组件 以下组件已经从 ESP-IDF 中迁出至 [ESP-IDF Component Registry](#)：

- [libsodium](#)
- [cbor](#)
- [jsmn](#)
- [esp_modem](#)
- [nghttp](#)
- [mdns](#)
- [esp_websocket_client](#)
- [asio](#)
- [freemodbus](#)
- [sh2lib](#)
- [expat](#)
- [coap](#)
- [esp-cryptoauthlib](#)
- [qrcode](#)
- [tjpgd](#)
- [esp_serial_slave_link](#)
- [tinyusb](#)

备注： 请注意，[http](#) 解析功能以前属于 [nghttp](#) 组件一部分，但现在属于 [http_parser](#) 组件。

可使用 `idf.py add-dependency` 命令安装以上组件。

例如，要安装 X.Y 版本的 [libsodium](#) 组件，请运行：`idf.py add-dependency libsodium==X.Y`。

根据 [semver](#) 规则安装与 X.Y 兼容的最新版本 [libsodium](#) 组件，请运行 `idf.py add-dependency libsodium~X.Y`。

可前往 <https://components.espressif.com> 查询每个组件有哪些版本，按名称搜索该组件，组件页面上会列出所有版本。

弃用的组件 ESP-IDF v4.x 版本中已不再使用以下组件，这些组件已弃用：

- `tcpip_adapter`。可使用 [ESP-NETIF](#) 组件代替，具体可参考 [TCP/IP 适配器](#)。

备注： 不再支持 [OpenSSL-API](#) 组件。ESP-IDF Component Registry 中也没有该组件。请直接使用 [ESP-TLS](#) 或 [mbedtls](#) API。

备注： 不再支持 `esp_adc_cal` 组件。新的 `adc` 校准驱动在 `esp_adc` 组件中。旧版 `adc` 校准驱动已被迁移进 `esp_adc` 组件中。要使用旧版 `esp_adc_cal` 驱动接口，你应该在 `CMakeLists.txt` 文件的组件依赖列表中增加 `esp_adc`。更多细节请查看 [Peripherals Migration Guide](#)。

版本更新后无需目标组件，因此以下目标组件也已经从 ESP-IDF 中删除：

- `esp32`
- `esp32s2`
- `esp32s3`
- `esp32c2`
- `esp32c3`
- `esp32h2`

存储

分区 API 的新组件 非兼容性更新：所有的分区 API 代码都已迁移到新组件 `esp_partition` 中。如需查看所有受影响的函数及数据类型，请参见头文件 `esp_partition.h`。

在以前，这些 API 函数和数据类型属于 `spi_flash` 组件。因此，在现有的应用程序中或将依赖 `spi_flash`，这也意味着在直接使用 `esp_partition_*` API/数据类型时，可能会导致构建过程失败（比如，在出现 `#include "esp_partition.h"` 的行中报错 `fatal error: esp_partition.h: No such file or directory`）。如果遇到类似问题，请按以下步骤更新项目中的 `CMakeLists.txt` 文件：

原有的依赖性设置：

```
idf_component_register(...
    REQUIRES spi_flash)
```

更新后的依赖性设置：

```
idf_component_register(...
    REQUIRES spi_flash esp_partition)
```

备注：请根据项目的实际情况，更新相应的 `REQUIRES` 或是 `PRIV_REQUIRES` 部分。上述代码片段仅为范例。

如果问题仍未解决，请联系我们，我们将协助你进行代码迁移。

SDMMC/SDSPI 用户现可通过 `sdmmc_host_t.max_freq_khz` 将 SDMMC/SDSPI 接口上的 SD 卡频率配置为特定值，不再局限于之前的 `SDMMC_FREQ_PROBING (400 kHz)`、`SDMMC_FREQ_DEFAULT (20 MHz)` 或是 `SDMMC_FREQ_HIGHSPEED (40 MHz)`。此前，如果用户配置了上述三个给定频率之外的值，用户所选频率将自动调整为与其最为接近的给定值。

更新后，底层驱动将计算与用户配置的特定值最为接近的合适频率。相对于枚举项选择，该频率现由可用的分频器提供。不过，如果尚未更新现有的应用代码，可能会导致与 SD 卡的通信过程出现问题。如发现上述问题，请继续尝试配置与期望值接近的不同频率，直到找到合适的频率。如需查看底层驱动的计算结果以及实际应用的频率，请使用 `void sdmmc_card_print_info(FILE* stream, const sdmmc_card_t* card)` 函数。

FatFs FatFs 已更新至 v0.14，`f_mkfs()` 函数签名也已变更。新签名为 `FRESULT f_mkfs (const TCHAR* path, const MKFS_PARM* opt, void* work, UINT len);`，使用 `MKFS_PARM` 结构体作为第二个实参。

分区表 分区表生成器不再支持未对齐的分区。生成分区表时，ESP-IDF 将只接受偏移量与 4 KB 对齐的分区。此变更仅影响新生成的分区表，不影响读写现有分区。

VFS `esp_vfs_semihost_register()` 函数签名有所更改：

- 新签名为 `esp_err_t esp_vfs_semihost_register(const char* base_path);`
- 旧签名的 `host_path` 参数不再存在，请使用 `OpenOCD` 命令 `ESP_SEMIHOST_BASEDIR` 设置主机上的完整路径。

函数签名更改 以下函数现将返回 `esp_err_t`，而非 `void` 或 `nvs_iterator_t`。此前，当参数无效或内部出现问题时，这些函数将 `assert()` 或返回 `nullptr`。通过返回 `esp_err_t`，你将获得更加实用的错误报告。

- `nvs_entry_find()`
- `nvs_entry_next()`
- `nvs_entry_info()`

由于 `esp_err_t` 返回类型的更改，`nvs_entry_find()` 和 `nvs_entry_next()` 的使用模式也发生了变化。上述函数现均通过参数修改迭代器，而非返回一个迭代器。

迭代 NVS 分区的旧编程模式如下所示：

```
nvs_iterator_t it = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↳ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d'", info.key, info.type);
};
```

现在，迭代 NVS 分区的编程模式已更新为：

```
nvs_iterator_t it = nullptr;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &
↳it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are_
↳guaranteed to be non-NULL
    printf("key '%s', type '%d'", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

迭代器有效性 请注意，由于函数签名的改动，如果存在参数错误，则可能从 `nvs_entry_find()` 获得无效迭代器。因此，请务必在使用 `nvs_entry_find()` 之前将迭代器初始化为 `NULL`，以免在调用 `nvs_release_iterator()` 之前进行复杂的错误检查。上述编程模式便是一个很好的例子。

删除 SDSPI 弃用的 API 结构体 `sdspi_slot_config_t` 和函数 `sdspi_host_init_slot()` 现已删除，并由结构体 `sdspi_device_config_t` 和函数 `sdspi_host_init_device()` 替代。

ROM SPI flash 在 v5.0 之前的版本中，ROM SPI flash 函数一般通过 `esp32**/rom/spi_flash.h` 得以体现。因此，为支持不同 ESP 芯片而编写的代码可能会填充不同目标的 ROM 头文件。此外，并非所有 API 都可以在全部的 ESP 芯片上使用。

现在，常用 API 已提取至 `esp_rom_spiflash.h`。尽管这不能算作重大变更，我们强烈建议仅使用此头文件中的函数（即以 `esp_rom_spiflash` 为前缀并包含在 `esp_rom_spiflash.h` 中），以获得不同 ESP 芯片之间更佳的交叉兼容性。

为了提高 ROM SPI flash API 的可读性，以下函数也进行了重命名：

- `esp_rom_spiflash_lock()` 更名为 `esp_rom_spiflash_set_bp()`
- `esp_rom_spiflash_unlock()` 更名为 `esp_rom_spiflash_clear_bp()`

SPI flash 驱动 `esp_flash_speed_t` enum 类型现已弃用。现在，可以直接将实际时钟频率值传递给 flash 配置结构。下为配置 80 MHz flash 频率的示例：

```
esp_flash_spi_device_config_t dev_cfg = {
    // Other members
    .freq_mhz = 80,
    // Other members
};
```

旧版 SPI flash 驱动 为了使 SPI flash 驱动更为稳定，v5.0 已经删除旧版 SPI flash 驱动。旧版 SPI flash 驱动程序是指自 v3.0 以来的默认 SPI flash 驱动程序，以及自 v4.0 以来启用配置选项 CONFIG_SPI_FLASH_USE_LEGACY_IMPL 的 SPI flash 驱动。从 v5.0 开始，我们将不再支持旧版 SPI flash 驱动程序。因此，旧版驱动 API 和 CONFIG_SPI_FLASH_USE_LEGACY_IMPL 配置选项均已删除，请改用新 SPI flash 驱动的 API。

删除项目	替代项目
spi_flash_erase_sector()	esp_flash_erase_region()
spi_flash_erase_range()	esp_flash_erase_region()
spi_flash_write()	esp_flash_write()
spi_flash_read()	esp_flash_read()
spi_flash_write_encrypted()	esp_flash_write_encrypted()
spi_flash_read_encrypted()	esp_flash_read_encrypted()

备注：带有前缀 esp_flash 的新函数接受额外的 esp_flash_t* 参数。你可以直接将其设置为 NULL，从而使函数运行主 flash (esp_flash_default_chip)。

由于系统函数不再是公共函数，esp_spi_flash.h 头文件已停止使用。若要使用 flash 映射 API，请使用 spi_flash_mmap.h。

系统

跨核执行 跨核执行 (Inter-Processor Call, IPC) 不再是一个独立组件，现已包含至 esp_system。

因此，若项目的 CMakeLists.txt 文件中出现 PRIV_REQUIRES esp_ipc 或 REQUIRES esp_ipc，应删除这些选项，因为项目中已默认包含 esp_system 组件。

ESP 时钟 ESP 时钟 API (即以 esp_clk 为前缀的函数、类型或宏) 已更新为私有 API。因此，原先的包含路径 #include "ESP32-H2/clk.h" 和 #include "esp_clk.h" 已移除。如仍需使用 ESP 时钟 API (并不推荐)，请使用 #include "esp_private/esp_clk.h" 来包含。

注意：私有 API 不属于稳定的 API，不会遵循 ESP-IDF 的版本演进规则，因此不推荐用户在应用中使用。

缓存错误中断 缓存错误中断 API (即以 esp_cache_err 为前缀的函数、类型或宏) 已更新为私有 API。因此，原先的包含路径 #include "ESP32-H2/cache_err_int.h" 已移除。如仍需使用缓存错误中断 API (并不推荐)，请使用 #include "esp_private/cache_err_int.h" 来包含。

bootloader_support

- 函数 bootloader_common_get_reset_reason() 已移除。请使用 ROM 组件中的函数 esp_rom_get_reset_reason()。
- 函数 esp_secure_boot_verify_sbv2_signature_block() 和 esp_secure_boot_verify_rsa_signature_block() 已移除，无新的替换函数。不推荐用户直接使用以上函数。如确需要，请在 [GitHub](#) 上对该功能提交请求，并解释需要此函数的原因。

断电 断电 API (即以 esp_brownout 为前缀的函数、类型或宏) 已更新为私有 API。因此，原先的包含路径 #include "brownout.h" 已移除。如仍需使用断电 API (并不推荐)，请使用 #include "esp_private/brownout.h" 来包含。

Trax Trax API (即以 `trax_` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "trax.h"` 已移除。如仍需使用 Trax API (并不推荐), 请使用 `#include "esp_private/trax.h"` 来包含。

ROM `components/esp32/rom/` 路径下存放的已弃用的 ROM 相关头文件已移除 (原包含路径为 `rom/*.h`)。请使用新的特定目标的路径 `components/esp_rom/include/ESP32-H2/` (新的包含路径为 `ESP32-H2/rom/*.h`)。

esp_hw_support

- 头文件 `soc/cpu.h` 及弃用的 CPU util 函数都已移除。请包含 `esp_cpu.h` 来代替相同功能的函数。
- 头文件 `hal/cpu_ll.h`, `hal/cpu_hal.h`, `hal/soc_ll.h`, `hal/soc_hal.h` 和 `interrupt_controller_hal.h` 的 CPU API 函数已弃用。请包含 `esp_cpu.h` 来代替相同功能的函数。
- 头文件 `compare_set.h` 已移除。请使用 `esp_cpu.h` 中提供的 `esp_cpu_compare_and_set()` 函数来代替。
- `esp_cpu_get_ccount()`, `esp_cpu_set_ccount()` 和 `esp_cpu_in_ocd_debug_mode()` 已从 `esp_cpu.h` 中移除。请分别使用 `esp_cpu_get_cycle_count()`, `esp_cpu_set_cycle_count()` 和 `esp_cpu_dbgr_is_attached()` 代替。
- 头文件 `esp_intr.h` 已移除。请包含 `esp_intr_alloc.h` 以分配和操作中断。
- Panic API (即以 `esp_panic` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "esp_panic.h"` 已移除。如仍需使用 Panic API (并不推荐), 请使用 `#include "esp_private/panic_reason.h"` 来包含。此外, 请包含 `esp_debug_helpers.h` 以使用与调试有关的任意辅助函数, 如打印回溯。
- 头文件 `soc_log.h` 现更名为 `esp_hw_log.h`, 并已更新为私有。建议用户使用 `esp_log.h` 头文件下的日志 API。
- 包含头文件 `spinlock.h`, `clk_ctrl_os.h` 和 `rtc_wdt.h` 时不应当使用 `soc` 前缀, 如 `#include "spinlock.h"`。
- `esp_chip_info()` 命令返回芯片版本, 格式为 `= 100 * 主要 eFuse 版本 + 次要 eFuse 版本`。因此, 为适应新格式, `esp_chip_info_t` 结构体中的 `revision` 扩展为 `uint16_t`。

PSRAM

- 针对特定目标的头文件 `spiram.h` 及头文件 `esp_spiram.h` 已移除, 创建新组件 `esp_psram`。对于与 PSRAM 或 SPIRAM 相关的函数, 请包含 `esp_psram.h`, 并在 `CMakeLists.txt` 项目文件中将 `esp_psram` 设置为必需组件。
- `esp_spiram_get_chip_size` 和 `esp_spiram_get_size` 已移除, 请使用 `esp_psram_get_size`。

eFuse

- 函数 `esp_secure_boot_read_key_digests()` 的参数类型从 `ets_secure_boot_key_digests_t*` 更新为 `esp_secure_boot_key_digests_t*`。新类型与旧类型相同, 仅移除了 `allow_key_revoke` 标志。在当前代码中, 后者总是设置为 `true`, 并未提供额外信息。
- 针对 eFuse 晶圆增加主要修订版本和次要修订版本。API `esp_efuse_get_chip_ver()` 与新修订不兼容, 因此已移除。请使用 API `efuse_hal_get_major_chip_version()`, `efuse_hal_get_minor_chip_version()` 或 `efuse_hal_chip_revision()` 来代替原有 API。

esp_common `EXT_RAM_ATTR` 已弃用。请使用新的宏 `EXT_RAM_BSS_ATTR` 以将 `.bss` 放在 PSRAM 上。

esp_system

- 头文件 `esp_random.h`、`esp_mac.h` 和 `esp_chip_info.h` 以往都是通过头文件 `esp_system.h` 间接包含，更新后必须直接包含。已移除从 `esp_system.h` 中的间接包含功能。
- 回溯解析器 API（即以 `esp_eh_frame_` 为前缀的函数、类型或宏）已更新为私有 API。因此，原先的包含路径 `#include "eh_frame_parser.h"` 已移除。如仍需使用回溯解析器 API（并不推荐），请使用 `#include "esp_private/eh_frame_parser.h"` 来包含。
- 中断看门狗定时器 API（即以 `esp_int_wdt_` 为前缀的函数、类型或宏）已更新为私有 API。因此，原先的包含路径 `#include "esp_int_wdt.h"` 已移除。如仍需使用中断看门狗定时器 API（并不推荐），请使用 `#include "esp_private/esp_int_wdt.h"` 来包含。

SOC 依赖性

- Doxyfiles 中列出的公共 API 头文件中不会显示不稳定和非必要的 SOC 头文件，如 `soc/soc.h` 和 `soc/rtc.h`。这意味着，如果用户仍然需要这些“缺失”的头文件，就必须在代码中明确包含这些文件。
- Kconfig 选项 `LEGACY_INCLUDE_COMMON_HEADERS` 也已移除。
- 头文件 `soc/soc_memory_types.h` 已弃用。请使用 `esp_memory_utils.h`。包含 `soc/soc_memory_types.h` 将触发构建警告，如 `soc_memory_types.h is deprecated, please migrate to esp_memory_utils.h`。

应用跟踪 其中一个时间戳源已从定时器组驱动改为新的 *GPTimer*。Kconfig 选项已重新命名，例如 `APPTRACE_SV_TS_SOURCE_TIMER00` 已更改为 `APPTRACE_SV_TS_SOURCE_GPTIMER`。用户已无需选择组和定时器 ID。

esp_timer 基于 FRC2 的 `esp_timer` 过去可用于 ESP32，现在已移除，更新后仅可使用更简单有效的 LAC 定时器。

ESP 镜像 ESP 镜像中关于 SPI 速度的枚举成员已重新更名：

- `ESP_IMAGE_SPI_SPEED_80M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_1`。
- `ESP_IMAGE_SPI_SPEED_40M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_2`。
- `ESP_IMAGE_SPI_SPEED_26M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_3`。
- `ESP_IMAGE_SPI_SPEED_20M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_4`。

任务看门狗定时器

- API `esp_task_wdt_init()` 更新后有如下变化：
 - 以结构体的形式传递配置。
 - 可将该函数配置为订阅空闲任务。
- 原先的配置选项 `CONFIG_ESP_TASK_WDT` 重新命名为 `CONFIG_ESP_TASK_WDT_INIT` 并引入了一个新选项 `CONFIG_ESP_TASK_WDT_EN`。

FreeRTOS

遗留 API 及数据类型 在以往版本中，ESP-IDF 默认设置 `configENABLE_BACKWARD_COMPATIBILITY` 选项，因此可使用 FreeRTOS v8.0.0 之前的函数名称和数据类型。该选项现在已默认禁用，因此默认情况下不再支持以往的 FreeRTOS 名称或类型。用户可以选择以下一种解决方式：

- 更新代码，删除以往的 FreeRTOS 名称或类型。
- 启用 `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` 以显式调用这些名称或类型。

任务快照 头文件 `task_snapshot.h` 已从 `freertos/task.h` 中移除。如需使用任务快照 API，请包含 `freertos/task_snapshot.h`。

函数 `vTaskGetSnapshot()` 现返回 `BaseType_t`，成功时返回值为 `pdTRUE`，失败则返回 `pdFALSE`。

FreeRTOS 断言 在以往版本中，FreeRTOS 断言通过 `FREERTOS_ASSERT` `kconfig` 选项独立配置，不同于系统的其他部分。该选项已移除，现在需要通过 `COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 来完成配置。

FreeRTOS 移植相关的宏 已移除用以保证弃用 API 向后兼容性的 `portmacro_deprecated.h` 文件。建议使用下列函数来代替弃用 API。

- `portENTER_CRITICAL_NESTED()` 已移除，请使用 `portSET_INTERRUPT_MASK_FROM_ISR()` 宏。
- `portEXIT_CRITICAL_NESTED()` 已移除，请使用 `portCLEAR_INTERRUPT_MASK_FROM_ISR()` 宏。
- `vPortCPUInitializeMutex()` 已移除，请使用 `spinlock_initialize()` 函数。
- `vPortCPUAcquireMutex()` 已移除，请使用 `spinlock_acquire()` 函数。
- `vPortCPUAcquireMutexTimeout()` 已移除，请使用 `spinlock_acquire()` 函数。
- `vPortCPUReleaseMutex()` 已移除，请使用 `spinlock_release()` 函数。

应用程序更新

- 函数 `esp_ota_get_app_description()` 和 `esp_ota_get_app_elf_sha256()` 已弃用，请分别使用 `esp_app_get_description()` 和 `esp_app_get_elf_sha256()` 函数来代替。这些函数已移至新组件 `esp_app_format`。请参考头文件 `esp_app_desc.h`。

引导加载程序支持

- `esp_app_desc_t` 结构体此前在 `esp_app_format.h` 中声明，现在在 `esp_app_desc.h` 中声明。
- 函数 `bootloader_common_get_partition_description()` 已更新为私有函数，请使用代替函数 `esp_ota_get_partition_description()`。注意，此函数的第一个参数为 `esp_partition_t`，而非 `esp_partition_pos_t`。

芯片版本 在应用程序开始加载时，引导加载程序会检查芯片版本。只有当版本为 \geq `CONFIG_ESP32H2_REV_MIN` 和 $<$ `CONFIG_ESP32H2_REV_MAX_FULL` 时，应用程序才能成功加载。

在 OTA 升级时，会检查应用程序头部中的版本需求和芯片版本是否符合条件。只有当版本为 \geq `CONFIG_ESP32H2_REV_MIN` 和 $<$ `CONFIG_ESP32H2_REV_MAX_FULL` 时，应用程序才能成功更新。

工具

ESP-IDF 监视器 ESP-IDF 监视器在波特率方面的改动如下：

- 目前，ESP-IDF 监视器默认遵循自定义的控制台波特率 (`CONFIG_ESP_CONSOLE_UART_BAUDRATE`)，而非 115200。
- ESP-IDF v5.0 不再支持通过 `menuconfig` 自定义波特率。
- 支持通过设置环境变量或在命令行中使用 `idf.py monitor -b <baud>` 命令自定义波特率。
- 注意，为了与全局波特率 `idf.py -b <baud>` 保持一致，波特率参数已从 `-B` 改名为 `-b`。请运行 `idf.py monitor --help` 获取更多信息。

废弃指令 ESP-IDF v5.0 已将 `idf.py` 子命令和 `cmake` 目标名中的下划线 (`_`) 统一为连字符 (`-`)。使用废弃的子命令及目标名将会触发警告，建议使用更新后的版本。具体改动如下：

表 1: 废弃子命令及目标名

废弃名	现用名
efuse_common_table	efuse-common-table
efuse_custom_table	efuse-custom-table
erase_flash	erase-flash
partition_table	partition-table
partition_table-flash	partition-table-flash
post_debug	post-debug
show_efuse_table	show-efuse-table
erase_otadata	erase-otadata
read_otadata	read-otadata

Esptool `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT` 选项已重命名为 `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`，且默认禁用。迁移到 ESP-IDF v5.0 的新项目和现有项目必须设置 `CONFIG_ESPTOOLPY_FLASHSIZE`。若因编译时 flash 大小未知而无法设置，可启用 `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`。但需要注意的是，启用该项后，为在烧录期间使用 flash 大小更新二进制头时不会导致摘要无效，映像后将不再附加 SHA256 摘要。

Windows 环境 基于 MSYS/MinGW 的 Windows 环境支持已在 ESP-IDF v4.0 中弃用，v5.0 则完全移除了该项服务。请使用 [ESP-IDF 工具安装器](#) 设置 Windows 兼容环境。目前支持 Windows 命令行、Power Shell 和基于 Eclipse IDE 的图形用户界面等选项。此外，还可以使用 [支持的插件](#)，设置基于 VSCode 的环境。

5.1.2 从 5.0 迁移到 5.1

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 11.2.0，现已针对所有芯片目标升级至 GCC 12.2.0。若需要将代码从 GCC 11.2.0 迁移到 GCC 12.2.0，请参考以下 GCC 官方迁移指南。

- [迁移至 GCC 12](#)

警告 升级至 GCC 12.2.0 后会触发新警告，或是导致原有警告内容发生变化。了解所有 GCC 警告的详细内容，请参考 [GCC 警告选项](#)。建议用户仔细检查代码，并尽量解决这些警告。但由于某些警告的特殊性及用户代码的复杂性，有些警告可能为误报，需要进行关键修复。在这种情况下，用户可以采取多种方式来抑制警告。本节介绍了用户可能遇到的常见警告及如何修复这些警告。

-Wuse-after-free 一般而言，此警告不会针对发布版本的代码产生误报，但是这种情况可能出现在测试用例中。以下示例为如何在 ESP-IDF 的 `test_realloc.c` 中修复该警告。

```
void *x = malloc(64);
void *y = realloc(x, 48);
TEST_ASSERT_EQUAL_PTR(x, y);
```

将指针转换为 `int` 可以避免出现 `-Wuse-after-free` 警告。

```
int x = (int) malloc(64);
int y = (int) realloc((void *) x, 48);
TEST_ASSERT_EQUAL_UINT32((uint32_t) x, (uint32_t) y);
```

-Waddress GCC 12.2.0 引入了增强版 `-Waddress` 警告选项，该选项对 `if` 语句中的数组指针检查更加敏感。

以下代码将触发警告：

```
char array[8];
...
if (array)
    memset(array, 0xff, sizeof(array));
```

删去不必要的检查可以消除警告。

```
char array[8];
...
memset(array, 0xff, sizeof(array));
```

在 ESP-IDF 框架之外构建 RISC-V RISC-V 的 `zicsr` 和 `zifencei` 扩展现已独立于 I 扩展，这一变化在 GCC 12 中也有所体现。因此，在 ESP-IDF 框架之外构建 RISC-V ESP32 芯片时，请在构建系统中指定 `-march` 选项时添加 `_zicsr_zifencei` 后缀。示例如下。

原为：

```
riscv32-esp-elf-gcc main.c -march=rv32imac
```

现为：

```
riscv32-esp-elf-gcc main.c -march=rv32imac_zicsr_zifencei
```

IEEE 802.15.4

Receive Handle Done

备注：这个功能仅包括在 IDF v5.1.3 以及之后的发布中。

当收到的数据帧被处理后，用户需要调用函数 `esp_ieee802154_receive_handle_done()` 通知 802.15.4 驱动层，否则这个数据空间将不会被释放。

外设

GPSPI 不再支持以下函数。从 ESP-IDF v5.1 版本起，GPSPI 时钟源可配置。

- `spi_get_actual_clock` 已废弃，更新为 `spi_device_get_actual_freq()`。

LEDC

- `soc_periph_ledc_clk_src_legacy_t::LEDC_USE_RTC8M_CLK` 已废弃，更新为 `LEDC_USE_RC_FAST_CLK`。

存储

FatFs `esp_vfs_fat_sdmmc_unmount()` 已弃用，可以使用 `esp_vfs_fat_sdcard_unmount()` 代替。此接口在更早的 ESP-IDF 版本中已弃用，但是尚未添加弃用警告。自 ESP-IDF v5.1 起，调用 `esp_vfs_fat_sdmmc_unmount()` 接口将会产生弃用警告。

SPI_FLASH

- `spi_flash_get_counters()` 已弃用，请使用 `esp_flash_get_counters()` 代替。
- `spi_flash_dump_counters()` 已弃用，请使用 `esp_flash_dump_counters()` 代替。
- `spi_flash_reset_counters()` 已弃用，请使用 `esp_flash_reset_counters()` 代替。

网络

SNTP SNTP 模块现在提供线程安全的 API 用于访问 lwIP 功能。建议使用 `ESP_NETIF` API。了解更多信息，请参考章节 [SNTP API](#)。

系统

FreeRTOS

电源管理

- `esp_pm_config_esp32xx_t` 已弃用，应使用 `esp_pm_config_t` 替代。
- `esp32xx/pm.h` 已弃用，应使用 `esp_pm.h` 替代。

5.1.3 从 5.1 迁移到 5.2

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 12.2.0，现已针对所有芯片目标升级至 GCC 13.2.0。若需将代码从 GCC 12.2.0 迁移到 GCC 13.2.0，请参考以下 GCC 官方迁移指南。

- [迁移至 GCC 13](#)

常见迁移问题和解决方法

stdio.h 不再包含 `sys/types.h`

问题描述 使用旧工具链的代码可能会出现编译错误，例如：

```
#include <stdio.h>
clock_t var; // error: expected specifier-qualifier-list before 'clock_t'
```

解决方法 使用正确的头文件可以解决这一问题。请按照以下方式重构代码：

```
#include <time.h>
clock_t var;
```

IEEE 802.15.4

Receive Handle Done 当收到的数据帧被处理后，用户需要调用函数 `esp_ieee802154_receive_handle_done()` 通知 802.15.4 驱动层，否则这个数据空间将不会被释放。

外设

UART

- `UART_FIFO_LEN` 已弃用，更新为 `UART_HW_FIFO_LEN`。

I2C I2C 驱动已经被重新设计在 `I2C`，以统一接口并扩展 I2C 外设的使用。尽管我们推荐使用新驱动层的接口，但用户仍然可以通过包含路径 `driver/i2c.h` 来使用老驱动。

主要的概念上和用法上的改变如下所示：

主要概念更新

- 用于初始化整个 I2C 总线的结构体 `i2c_config_t` 已经被移除。在新驱动中，从机和主机是分开的。用户可以独立调用 `i2c_master_bus_config_t` 和 `i2c_slave_config_t`。
- `i2c_mode_t` 用来判断 I2C 控制器是工作在从模式还是主模式。该枚举器已被弃用。在新驱动程序中，用户无需自行设置，驱动程序会妥善处理。
- `i2c_rw_t` 用来判断 I2C 主控制器是在进行“写”还是“读”。现在，它已被弃用。
- `i2c_addr_mode_t` 被重命名为 `i2c_addr_bit_len_t`。
- 在老驱动中，你需要将 I2C 命令通过 `I2C_LINK_RECOMMENDED_SIZE`，`i2c_cmd_link_create_static`，等链接成链表。在新驱动中，你不需要这么做，你只需要调用相关的接口函数即可。
- 在老驱动中，选择时钟通过例如 `I2C_SCLK_SRC_FLAG_FOR_NOMAL` 的时钟标志位。在新驱动中，你可以直接选择时钟源。

主要用法更新

- I2C 总线初始化通过两部分完成。第一步通过 `i2c_new_master_bus()` 初始化 I2C 总线，然后初始化 I2C 设备通过 `i2c_master_bus_add_device()`。
- `i2c_reset_tx_fifo` 和 `i2c_reset_rx_fifo` 已被删除，因为用户不太需要重置 fifo。但可以通过 `i2c_master_bus_reset` 重置整个总线。
- 删除了 `i2c_cmd_link_xxx` 函数，用户不需要自己使用 `link` 来链接命令。
- `i2c_master_write_to_device` 更名为 `i2c_master_transmit`。
- `i2c_master_read_from_device` 已更名为 `i2c_master_receive`。
- `i2c_master_write_read_device` 已更名为 `i2c_master_transmit_receive`。
- `i2c_slave_write_buffer` 重命名为 `i2c_slave_transmit`。
- `i2c_slave_read_buffer` 已更名为 `i2c_slave_receive`。

协议

CoAP CoAP 相关示例已迁移至 `idf-extra-components` 仓库。

HTTP2 `http2_request` 相关示例已迁移至 `idf-extra-components` 仓库。

存储

NVS 加密

- 在集成 HMAC 外设 (`SOC_HMAC_SUPPORTED`) 的 SoC 上, 启用 *flash* 加密时将不再自动启用 NVS 加密。
- 因此需显式启用 NVS 加密, 并按照需要选择基于 flash 加密或基于 HMAC 外设的方案。即使未启用 flash 加密, 也可选择基于 HMAC 外设的方案 (`CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME`)。
- 启用 flash 加密后, 未集成 HMAC 外设的 SoC 仍会自动启用 NVS 加密。

系统

FreeRTOS

升级 IDF FreeRTOS IDF FreeRTOS 内核 (通过 FreeRTOS 实现的双核 SMP) 已升级, 现基于 Vanilla FreeRTOS v10.5.1。伴随升级, IDF FreeRTOS 的设计和实现也发生了重大变化。因此, 用户应注意以下关于内核行为和 API 的变化:

- 通过 `CONFIG_FREERTOS_UNICORE` 选项启用单核模式时, 内核行为将与 Vanilla FreeRTOS 完全相同 (详见 [单核模式](#))。
- 对于由 IDF FreeRTOS 添加的与 SMP 相关的 API, `xCoreID` 参数的检查将更加严格。为 `xCoreID` 参数提供超出范围的值现在将触发断言。
- 为了保证命名一致性, 以下与 SMP 相关的 API 现已被弃用并已重新更名:
 - 弃用 `xTaskGetAffinity()`, 更名为 `xTaskGetCoreID()`。
 - 弃用 `xTaskGetIdleTaskHandleForCPU()`, 更名为 `xTaskGetIdleTaskHandleForCore()`。
 - 弃用 `xTaskGetCurrentTaskHandleForCPU()`, 更名为 `xTaskGetCurrentTaskHandleForCore()`。

任务快照 由于缺乏从用户代码中使用该 API 的实际方法 (必须先暂停调度器才能调用该 API), 任务快照 API 已被设置为私有。

紧急处理程序行为 在配置选项 `CONFIG_ESP_SYSTEM_PANIC` 中, 是否可选择 `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` 取决于是否在构建中包含了 `esp_gdbstub` 组件。使用 `set (COMPONENTS main)` 来缩减这类构建的组件列表时, 必须将 `esp_gdbstub` 组件添加到这个组件列表中, 以使 `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` 选项可用。

5.1.4 从 5.2 迁移到 5.3

经典蓝牙

Bluedroid

以下 Bluedroid API 已被废弃：

- `/bt/host/bluedroid/api/include/esp_bt_device.h`
 - 废弃 `esp_err_t esp_bt_dev_set_device_name(const char *name)`
 - * 设置设备名 API 已被替换为 `esp_err_t esp_bt_gap_set_device_name(const char *name)` 或 `esp_err_t esp_ble_gap_set_device_name(const char *name)`。原来的函数已经被废弃。
 - 废弃 `esp_err_t esp_bt_dev_get_device_name(void)`
 - * 获取设备名 API 已被替换为 `esp_err_t esp_bt_gap_get_device_name(void)` 或 `esp_err_t esp_ble_gap_get_device_name(void)`。原来的函数已经被废弃。

GCC

常见的移植问题及解决方法

`sys/dirent.h` 不再包含一些函数原型

问题 使用旧工具链的代码可能会出现编译错误。例如：

```
#include <sys/dirent.h>
/* .... */
DIR* dir = opendir("test_dir");
/* .... */
/**
 * Compile error:
 * test.c: In function 'test_opendir':
 * test.c:100:16: error: implicit declaration of function 'opendir' [-
↳Werror=implicit-function-declaration]
 *   100 |     DIR* dir = opendir(path);
 *       |                ^~~~~~
 */
```

解决方法 包含正确的头文件即可解决此问题。请将代码重构如下：

```
#include <dirent.h>
/* .... */
DIR* dir = opendir("test_dir");
```

外设

驱动程序 为了细粒度地控制其他组件对外设驱动的依赖，原先位于 `driver` 组件下的驱动程序被拆分到了各自独立的组件中。这些组件包括：

- `esp_driver_gptimer` - 通用定时器驱动
- `esp_driver_pcmt` - 脉冲计数器驱动
- `esp_driver_gpio` - GPIO 驱动
- `esp_driver_spi` - 通用 SPI 驱动
- `esp_driver_mcpwm` - 电机控制 PWM 驱动
- `esp_driver_sdmmc` - SDMMC 驱动
- `esp_driver_sdspi` - SDSPI 驱动
- `esp_driver_sdio` - SDIO 驱动
- `esp_driver_ana_cmpr` - 模拟比较器驱动
- `esp_driver_i2s` - I2S 驱动
- `esp_driver_dac` - DAC 驱动
- `esp_driver_rmt` - RMT 驱动
- `esp_driver_tsens` - 温度传感器驱动
- `esp_driver_sdm` - Sigma-Delta 调制器驱动
- `esp_driver_i2c` - I2C 驱动
- `esp_driver_uart` - UART 驱动
- `esp_driver_ledc` - LEDC 驱动
- `esp_driver_parlio` - 并行 IO 驱动
- `esp_driver_usb_serial_jtag` - USB_SERIAL_JTAG 驱动

为了兼容性，原来的 `driver` 组件仍然存在，并作为一个“all-in-one”的组件，将以上这些 `esp_driver_xyz` 组件注册成自己的公共依赖。换句话说，你无需修改既有项目的 CMake 文件，但是你现在多了一个途径去指定你项目依赖的具体的外设驱动。

原来你可能使用 `linker.lf` 指定了一些驱动函数在内存空间的链接位置，但是现在，因为驱动文件的位置发生了挪动，就需要你对 `linker.lf` 文件做出相应的改动的。假如，你的 `linker.lf` 文件里面有以下的条目：

```
[mapping:my_mapping_scheme]
archive: libdriver.a
entries:
  gpio (noflash)
```

现在需要修改成：

```
[mapping:my_mapping_scheme]
archive: libesp_driver_gpio.a
entries:
  gpio (noflash)
```

安全元素 ATECC608A 安全元素接口示例现已移至 GitHub 上的 [esp-cryptoauthlib](#) 仓库中。

该示例也是组件管理器注册表中 [esp-cryptoauthlib](#) 的一部分。

I2S 回调事件 `i2s_event_data_t` 中指向 DMA 数组的二级指针 `data` 因使用过于繁琐已被弃用，请使用新增的指向 DMA 数组的一级指针 `dma_buf` 字段代替。

Protocols

ESP HTTPS OTA

Breaking Changes (Summary)

- If the image length is found in the HTTP header and `esp_https_ota_config_t::bulk_flash_erase` is set to true, then instead of erasing the entire flash, the erase operation will be performed to accommodate the size of the image length.

安全性

平台安全特性 当启用 flash 加密时，仅加密 app 分区中存在的应用程序镜像，而不是加密整个分区。这可以帮助优化在首次启动期间所需的加密时间。

这可以通过配置 `CONFIG_SECURE_FLASH_ENCRYPT_ONLY_IMAGE_LEN_IN_APP_PART` 来实现，默认情况下从 ESP-IDF v5.3 开始启用，而在所有早期版本中均禁用，以避免任何破坏性行为。

存储

VFS VFS 操作符的 UART 具体实现函数从 `vfs` 组件挪到了 `esp_driver_uart` 组件中。

所有以 `esp_vfs_dev_uart_` 前缀开头的 API 已被弃用，更新成在 `uart_vfs.h` 文件中定义的以 `uart_vfs_dev_` 为前缀的一组 API。具体来说，`esp_vfs_dev_uart_register` 更名为 `uart_vfs_dev_register` - `esp_vfs_dev_uart_port_set_rx_line_endings` 更名为 `uart_vfs_dev_port_set_rx_line_endings` - `esp_vfs_dev_uart_port_set_tx_line_endings` 更名为 `uart_vfs_dev_port_set_tx_line_endings` - `esp_vfs_dev_uart_use_nonblocking` 更名为 `uart_vfs_dev_use_nonblocking` - `esp_vfs_dev_uart_use_driver` 更名为 `uart_vfs_dev_use_driver`

为了兼容性，`vfs` 组件依旧将 `esp_driver_uart` 注册成了其私有依赖。换句话说，你无需修改既有项目的 CMake 文件。

SPI flash 驱动 XMC-C 系列闪存 `suspend` 功能的支持已被移除。根据闪存制造商的反馈，在某些情况下，XMC-C 闪存需要在 `resume` 和下一条命令之间间隔 1 毫秒。这对于软件请求来说时间太长。基于上述原因，为了安全使用 `suspend` 功能，我们决定取消对 XMC-C 系列闪存挂起的支持。但是你依旧可以通过打开 `CONFIG_SPI_FLASH_FORCE_ENABLE_XMC_C_SUSPEND` 来强行使能这个功能。如果您有任何疑问，请联系 espressif 商务支持。

System

Power Management

- `esp_sleep_enable_ext1_wakeup_with_level_mask` is deprecated, use `esp_sleep_enable_ext1_wakeup_io()` and `esp_sleep_disable_ext1_wakeup_io()` instead.

Unit Testing In the past versions of Unity framework, it was possible to omit a semicolon at the end of a `TEST_ASSERT_*` macro statement. This is no longer the case in the newer version of Unity, used in IDF v5.3.

For example, the following code:

```
TEST_ASSERT(some_func() == ESP_OK)
```

will now result in a compilation error. To fix this, add a semicolon at the end of the statement:

```
TEST_ASSERT(some_func() == ESP_OK);
```

Partition Table Partition Table generation tool has been fixed to ensure that the size of partition of type `app` is having flash sector (minimum erase size) aligned size (please see [偏移地址 \(Offset\)](#) 和 [大小 \(Size\)](#) 字段). If the partition does not have aligned size, partition table generator tool will raise an error. This fix ensures that OTA updates for a case where the file size is close or equal to the size of partition works correctly (erase operation does not go beyond the partition size).

In case you have the `app` partition size which is not a multiple of the 4 KB then please note that while migrating to ESP-IDF 5.3, you must align this size to its lower 4 KB boundary for the build to succeed. This does not impact the partition table for existing devices as such but ensures that generated firmware size remains within the OTA update capability limit.

Chapter 6

安全指南

6.1 概述

6.1.1 安全

本指南概述了乐鑫解决方案中可用的整体安全功能。从 **安全** 角度考虑，强烈建议在使用乐鑫平台和 ESP-IDF 软件栈设计产品时参考本指南。

目标

高级安全目标包括：

1. 防止执行不受信任的代码
2. 保护存储在外部 flash 中代码的可信度和完整性
3. 保护设备身份
4. 安全存储机密数据
5. 设备身份验证与加密通信

平台安全

安全启动 安全启动功能可以确保设备仅执行通过身份认证的软件。安全启动时，会验证 **应用程序的启动流程** 中所涉及的所有 **可变** 软件实体，形成信任链。设备启动以及 OTA 更新过程中都会进行签名认证。

关于安全启动功能的更多详情，请参阅 [Secure Boot V2](#)。

重要： 强烈建议在所有生产设备上启用安全启动功能。

安全启动最佳实践

- 在具备高质量熵源的系统中生成签名密钥。
- 签名密钥始终保密；签名密钥泄露会危及安全启动系统。
- 禁止第三方使用 `espsecure.py` 观察密钥生成或签名过程的相关细节，这两个过程都容易受到时序攻击或其他侧信道攻击的影响。
- 确保正确烧录所有安全性 eFuse，包括禁用调试接口以及非必需的启动介质（例如 UART 下载模式）等。

flash 加密 flash 加密功能可以加密外部 flash 中的内容，从而保护存储在 flash 中软件或数据的 **机密性**。关于该功能的更多详情，请参阅[flash 加密](#)。

flash 加密最佳实践

- 建议在生产环境中使用 flash 加密的发布模式。
- 建议为每个设备生成唯一的 flash 加密密钥。
- 启用[安全启动](#)作为额外保护层，防止 flash 在启动前遭受恶意攻击。

设备身份 在 ESP32-H2 中，数字签名外设借助硬件加速，通过 HMAC 算法生成 RSA 数字签名。RSA 私钥仅限设备硬件访问，软件无法获取，保证了设备上存储密钥的安全性。

ESP32-H2 还支持 ECDSA 外设，用于生成硬件加速的 ECDSA 数字签名。ECDSA 私钥支持直接编程到 eFuse 块中，并在软件中标记为读保护。

DS 或 ECDSA 外设可以建立与远程终端之间的 **安全设备身份**，如基于 RSA 或 ECDSA 加密算法的 TLS 双向认证。

详情请参阅[椭圆曲线数字签名算法 \(ECDSA\)](#) 及[数字签名 \(DS\)](#)。

内存保护 ESP32-H2 可以通过架构或 PMS 等特定外设实现 **内存保护**，强制执行和监控内存以及某些外设的权限属性。使用相应外设，ESP-IDF 应用程序启动代码可以配置数据内存的读取/写入权限以及指令内存的读取/执行权限。如有任何操作尝试违反这些权限属性，如写入指令内存区域，将触发违规中断，导致系统 panic。

使用该功能需启用配置选项 `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`，该选项默认启用。请注意，该功能的 API 是 **私有的**，仅供 ESP-IDF 代码使用。

备注：内存保护功能可以防止因软件漏洞导致的远程代码注入。

差分功耗分析 (DPA) 保护 ESP32-H2 支持针对 DPA 相关安全攻击的保护机制。DPA 保护通过动态调整加密外设的时钟频率，在其运行期间模糊了功耗消耗记录。时钟变化范围会根据配置的 DPA 安全级别改变。更多详情请参阅[技术参考手册](#)。

通过 `CONFIG_ESP_CRYPTDPA_PROTECTION_LEVEL` 可以调整 DPA 级别。级别越高安全性越强，但也可能会影响性能。默认启用最低级别 DPA 保护，可以根据安全需求修改。

备注：请注意，为确保 DPA 保护正常工作，必须启用硬件 `RNG`。

调试接口

JTAG

- 如果启用了任一安全功能，则 JTAG 接口将保持禁用。更多详情请参阅[JTAG 与 flash 加密和安全引导](#)。
- 如果不启用其他安全功能，也可以使用 `eFuse API` 禁用 JTAG 接口。
- ESP32-H2 支持软禁用 JTAG 接口，并且可以通过 HMAC 烧录密钥重新启用，请参阅[HMAC 启用 JTAG 接口](#)。

UART 下载模式 ESP32-H2 中，如果启用了任一安全功能，则会激活安全 UART 下载模式。

- 要启用安全 UART 下载模式，也可以调用 `esp_efuse_enable_rom_secure_download_mode()`。
- 该模式下，禁止执行通过 UART 下载模式下载的任何代码。
- 该模式将限制部分涉及更新 SPI 配置的命令，如更改波特率、基本的 flash 写入以及通过 `get_security_info` 返回当前启用的安全功能摘要。
- 要完全禁用安全 UART 下载模式，可以将 `CONFIG_SECURE_UART_ROM_DL_MODE` 设置为建议选项 `Permanently disable ROM Download Mode`，或者在运行时调用 `esp_efuse_disable_rom_download_mode()`。

重要：安全 UART 下载模式下，仅支持使用 `--no-stub` 参数调用 `esptool.py`。

产品安全

安全 OTA 更新

- OTA 更新必须通过安全传输进行，如 HTTPS。
- ESP-IDF 为此提供了一个简化的抽象层，即 [ESP HTTPS OTA 升级](#)。
- 如果启用了 [安全启动](#)，则服务器应托管已签名的应用程序镜像。
- 如果启用了 [flash 加密](#)，则服务器端不需要额外操作，在 flash 写入时，设备将自动加密。
- OTA 更新的 [回滚过程](#) 可以在验证完应用程序的功能后，再将应用程序切换为 `active` 状态。

防回滚保护 防回滚保护功能确保设备仅执行特定版本的应用程序，即应满足设备 eFuse 存储的安全版本条件。因此，即使已由合法密钥信任和签名，应用程序可能包含已撤销的安全功能或凭据，因此设备必须拒绝执行此类应用程序。

ESP-IDF 仅支持在应用程序使用该功能，并通过二级引导加载程序管理。安全版本存储在设备 eFuse 中，并在启动时和 OTA 更新期间与应用程序镜像头进行比较。

关于启用此功能的更多详情，请参阅 [防回滚](#)。

加密固件分发 OTA 更新期间，使用加密的固件分发，可以确保在从服务器传输到设备的过程中，应用程序保持加密。OTA 更新期间，这可以作为在 TLS 通信之上的额外保护层，保护应用程序身份。

关于加密固件分发的工作示例，请参阅 [使用预加密固件进行 OTA 升级](#)。

安全存储 安全存储指在设备上以安全方式存储应用程序的特定数据，即将数据存储在外部 flash 中。外部 flash 通常是可读写的 flash 分区，用于存储设备特定的配置数据，如 Wi-Fi 凭据。

ESP-IDF 提供了 **NVS（非易失性存储）** 管理组件，允许加密数据分区。该功能与上文提到的 [flash 加密](#) 平台功能相关。

关于该功能的工作原理和启用说明，请参阅 [NVS 加密](#)。

重要：ESP-IDF 组件会默认将 Wi-Fi 证书等设备特定数据写入 NVS 默认分区，建议使用 **NVS 加密功能** 来保护这些数据。

安全设备控制 ESP-IDF 提供了 ESP 本地控制组件，可以通过 Wi-Fi/Ethernet + HTTP 或 BLE 安全地控制 ESP 设备。

关于该功能的更多详情，请参阅 [ESP 本地控制](#)。

安全策略

ESP-IDF GitHub 代码库内含 [安全政策介绍](#)。

公告

- 乐鑫会发布重要 [安全公告](#)，包括硬件和软件相关公告。
- ESP-IDF 软件组件的相关安全公告会发布在 [GitHub 仓库](#)。

软件更新 ESP-IDF 会及时处理针对组件和第三方库的相关报告，并修复关键安全问题。修复内容会逐步同步到 ESP-IDF 的所有适用版本分支中。

ESP-IDF 的发布说明将涵盖各 ESP-IDF 组件和第三方库的相应安全问题和 CVE 编号。

重要： 为获取所有关键安全修复，建议定期更新到 ESP-IDF 的最新 Bugfix 版本。

6.2 功能

6.2.1 flash 加密

本文档旨在引导用户快速了解 ESP32-H2 的 flash 加密功能，通过应用程序代码示例向用户演示如何在开发及生产过程中测试及验证 flash 加密的相关操作。

概述

flash 加密功能用于加密与 ESP32-H2 搭载使用的片外 flash 中的内容。启用 flash 加密功能后，固件会以明文形式烧录，然后在首次启动时将数据进行加密。因此，物理读取 flash 将无法恢复大部分 flash 内容。

重要： 对于生产用途，flash 加密仅应在“发布”模式下启用。

重要： 启用 flash 加密将限制后续 ESP32-H2 更新。在使用 flash 加密功能前，请务必阅读本文档了解其影响。

加密分区

启用 flash 加密后，会默认加密以下类型的数据：

- [二级引导程序](#)（固件引导加载程序）
- 分区表
- [NVS 密钥分区](#)
- Otadata
- 所有 app 类型的分区

其他类型的数据将视情况进行加密：

- 分区表中标有 encrypted 标志的分区。如需了解详情，请参考[加密分区标志](#)。
- 如果启用了安全启动，则会对安全启动引导程序摘要进行加密（见下文）。

相关 eFuses

flash 加密操作由 ESP32-H2 上的多个 eFuse 控制。以下是这些 eFuse 列表及其描述，下表中的各 eFuse 名称也在 espfuse.py 工具中使用，为了能在 eFuse API 中使用，请在名称前加上 ESP_EFUSE_，如：`esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT)`。

表 1: flash 加密过程中使用的 eFuses

eFuse	描述	位深
BLOCK_KEYN	AES 密钥存储, N 在 0-5 之间。	256 位密钥块
KEY_PURPOSE_N	控制 eFuse 块 BLOCK_KEYN 的目的, 其中 N 在 0 到 5 之间。对于 flash 加密, 唯一的有效值是 4, 代表 XTS_AES_128_KEY。	4
DIS_DOWNLOAD_MANUAL_ENCRYPT	设置后, 则在下载引导模式时禁用 flash 加密。	1
SPI_BOOT_CRYPT_CNT	设置 SPI 启动模式后, 可启用加密和解密。如果在 eFuse 中设置 1 或 3 个比特位, 则启用该功能, 否则将禁用。	3

备注:

- 上表中列出的所有 eFuse 位都提供读/写访问控制。
- 这些位的默认值是 0。

对上述 eFuse 位的读写访问由 WR_DIS 和 RD_DIS 寄存器中的相应字段控制。有关 ESP32-H2 eFuse 的详细信息, 请参考 [eFuse 管理器](#)。要使用 esefuse.py 更改 eFuse 字段的保护位, 请使用以下两个命令: read_protect_efuse 和 write_protect_efuse。例如 esefuse.py write_protect_efuse DISABLE_DL_ENCRYPT。

flash 的加密过程

假设 eFuse 值处于默认状态, 且固件的引导加载程序编译为支持 flash 加密, 则 flash 加密的具体过程如下:

1. 第一次开机复位时, flash 中的所有数据都是未加密的 (明文)。ROM 引导加载程序加载固件引导加载程序。
2. 固件的引导加载程序将读取 SPI_BOOT_CRYPT_CNT eFuse 值 (0b000)。因为该值为 0 (偶数位), 固件引导加载程序将配置并启用 flash 加密块。关于 flash 加密块的更多信息, 请参考 [ESP32-H2 技术参考手册](#)。
3. 固件的引导加载程序使用 RNG (随机数发生器) 模块生成 256 位密钥, 然后将其写入 BLOCK_KEYN eFuse。软件也为存储密钥的块更新了 KEY_PURPOSE_N。由于 BLOCK_KEYN eFuse 已设置了读保护和写保护位, 因此无法通过软件访问密钥。KEY_PURPOSE_N 字段也受写保护。flash 加密操作完全在硬件中完成, 无法通过软件访问密钥。如果 eFuse 中已经存在有效密钥 (例如用 esefuse 工具烧写的密钥), 则会跳过密钥生成, 并将该密钥用于 flash 加密过程。
4. flash 加密块将加密 flash 的内容 (固件的引导加载程序、应用程序、以及标有“加密”标志的分区)。就地加密可能会耗些时间 (对于大分区最多需要一分钟)。
5. 固件引导加载程序将在 SPI_BOOT_CRYPT_CNT (0b001) 中设置第一个可用位来对已加密的 flash 内容进行标记。设置奇数位。
6. 对于 [开发模式](#), 固件引导加载程序允许 UART 引导加载程序重新烧录加密后的二进制文件。同时, SPI_BOOT_CRYPT_CNT eFuse 位不受写入保护。此外, 默认情况下, 固件引导加载程序设置 DIS_DOWNLOAD_ICACHE、DIS_PAD_JTAG、DIS_USB_JTAG 和 DIS_LEGACY_SPI_BOOT eFuse 位。
7. 对于 [发布模式](#), 固件引导加载程序设置所有在开发模式下设置的 eFuse 位以及 DIS_DOWNLOAD_MANUAL_ENCRYPT。它还写保护 SPI_BOOT_CRYPT_CNT eFuse 位。要修改此行为, 请参阅 [启用 UART 引导加载程序加密/解密](#)。
8. 重新启动设备以开始执行加密镜像。固件引导加载程序调用 flash 解密块来解密 flash 内容, 然后将解密的内容加载到 IRAM 中。

在开发阶段常需编写不同的明文 flash 镜像并测试 flash 的加密过程。这要求固件下载模式能够根据需求不断加载新的明文镜像。但是, 在制造和生产过程中, 出于安全考虑, 固件下载模式不应有权限访问 flash 内容。

因此需要有两种不同的 flash 加密配置: 一种用于开发, 另一种用于生产。详情请参考 [flash 加密设置](#) 小节。

flash 加密设置

提供以下 flash 加密模式：

- **开发模式** - 建议仅在开发过程中使用。因为在这种模式下，仍然可以将新的明文固件烧录到设备，并且引导加载程序将使用存储在硬件中的密钥对该固件进行透明加密。此操作间接允许从 flash 中读出固件明文。
- **发布模式** - 推荐用于制造和生产。因为在这种模式下，如果不知道加密密钥，则不可能将明文固件烧录到设备。

本节将详细介绍上述 flash 加密模式，并且逐步说明如何使用它们。

开发模式 在开发过程中，可使用 ESP32-H2 内部生成的密钥或外部主机生成的密钥进行 flash 加密。

使用 ESP32-H2 生成的密钥 开发模式允许用户使用固件下载模式下下载多个明文镜像。

测试 flash 加密过程需完成以下步骤：

1. 确保你的 ESP32-H2 设备有相关 *eFuses* 中所示的 flash 加密 eFuse 的默认设置。
请参考如何检查 *ESP32-H2 flash 加密状态*。
2. 在 **项目配置菜单**，执行以下操作：
 - 启动时使能 *flash 加密*。
 - 选择加密模式（默认是 **开发模式**）。
 - 选择 *UART ROM 下载模式*（默认是 **启用**）。
 - 选择适当详细程度的 *引导加载程序日志*。
 - 保存配置并退出。

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考 *引导加载程序大小*。

3. 运行以下命令来构建和烧录完整的镜像。

```
idf.py flash monitor
```

备注： 这个命令不包括任何应该写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-H2 将复位。在下次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为“加密”的分区，然后复位。就地加密可能需要时间，对于大分区最多需要一分钟。之后，应用程序在运行时解密并执行命令。

下面是启用 flash 加密后 ESP32-H2 首次启动时的样例输出：

TO BE UPDATED

启用 flash 加密后，在下次启动时输出将显示已启用 flash 加密，样例输出如下：

TO BE UPDATED

在此阶段，如果用户需要更新或重新烧录二进制文件，请参考 *重新烧录更新后的分区*。

使用主机生成的密钥 可在主机中预生成 flash 加密密钥，并将其烧录到 eFuse 密钥块中。这样，无需明文 flash 更新便可以在主机上预加密数据并将其烧录。该功能可在 **开发模式** 和 **发布模式** 两模式下使用。如果没有预生成的密钥，数据将以明文形式烧录，然后 ESP32-H2 对数据进行就地加密。

备注： 不建议在生产中使用该方法，除非为每个设备都单独生成一个密钥。

使用主机生成的密钥需完成以下步骤：

1. 确保你的 ESP32-H2 设备有[相关 eFuses](#) 中所示的 flash 加密 eFuse 的默认设置。
请参考[如何检查 ESP32-H2 flash 加密状态](#)。

2. 通过运行以下命令生成一个随机密钥：

```
espssecure.py generate_flash_encryption_key my_flash_encryption_key.bin
```

3. **在第一次加密启动前**，使用以下命令将该密钥烧录到设备上，这个操作只能执行一次。

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
→AES_128_KEY
```

其中 BLOCK 是 BLOCK_KEY0 和 BLOCK_KEY5 之间的一个空闲密钥区。

如果未烧录密钥并在启用 flash 加密后启动设备，ESP32-H2 将生成一个软件无法访问或修改的随机密钥。

4. 在[项目配置菜单](#)中进行如下设置：
 - [启动时启用 flash 加密功能](#)
 - [选择加密模式](#)（默认为[开发模式](#)）
 - [选择适当详细程度的引导加载程序日志](#)
 - [保存配置并退出](#)

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考[引导加载程序大小](#)。

5. 运行以下命令来构建并烧录完整的镜像：

```
idf.py flash monitor
```

备注：这个命令不包括任何应该被写入 flash 上的分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-H2 将复位。在下次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

如果使用开发模式，那么更新和重新烧录二进制文件最简单的方法是[重新烧录更新后的分区](#)。

如果使用发布模式，那么可以在主机上预先加密二进制文件，然后将其作为密文烧录。具体请参考[手动加密文件](#)。

重新烧录更新后的分区 如果用户以明文方式更新了应用程序代码并需要重新烧录，则需要在烧录前对其进行加密。请运行以下命令一次完成应用程序的加密与烧录：

```
idf.py encrypted-app-flash monitor
```

如果所有分区都需要以加密形式更新，请运行：

```
idf.py encrypted-flash monitor
```

发布模式 在发布模式下，UART 引导加载程序无法执行 flash 加密操作，**只能**使用 OTA 方案下载新的明文镜像，该方案将在写入 flash 前加密明文镜像。

使用该模式需要执行以下步骤：

1. 确保你的 ESP32-H2 设备有[相关 eFuses](#) 中所示的 flash 加密 eFuse 的默认设置。
请参考[如何检查 ESP32-H2 flash 加密状态](#)。

2. 在**项目配置菜单**，执行以下操作：

- 启动时使能 *flash* 加密
- 选择发布模式（注意一旦选择了发布模式，EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT eFuse 位将被编程为在 ROM 下载模式下禁用 flash 加密硬件。）
- 选择 *UART ROM* 下载（推荐永久性的切换到安全模式）。这是默认且推荐使用的选项。如果不需要该模式，也可以改变此配置设置永久地禁用 UART ROM 下载模式。
- 选择适当详细程度的引导加载程序日志
- 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考[引导加载程序大小](#)。

3. 运行以下命令来构建并烧录完整的镜像：

```
idf.py flash monitor
```

备注： 这个命令不包括任何应该被写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-H2 将复位。在下次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

一旦在发布模式下启用 flash 加密，引导加载程序将写保护 SPI_BOOT_CRYPT_CNT eFuse。

请使用 [OTA 方案](#) 对字段中的明文进行后续更新。

备注： 如果用户已经预先生成了 flash 加密密钥并存储了一个副本，并且 UART 下载模式没有通过 [CONFIG_SECURE_UART_ROM_DL_MODE](#) 永久禁用，那么可以通过使用 `espsecure.py encrypt_flash_data --aes_xts` 预加密文件，从而在本地更新 flash，然后烧录密文。请参考[手动加密文件](#)。

最佳实践 在生产中使用 flash 加密时：

- 不要在多个设备之间重复使用同一个 flash 加密密钥，这样攻击者就无法从一台设备上复制加密数据后再将其转移到第二台设备上。
- 如果不需要 UART ROM 下载模式，则应完全禁用该模式，或者永久设置为“安全下载模式”。安全下载模式永久性地将可用的命令限制在更新 SPI 配置、更改波特率、基本的 flash 写入和使用 `get_security_info` 命令返回当前启用的安全功能摘要。默认在发布模式下第一次启动时设置为安全下载模式。要完全禁用下载模式，请选择 [CONFIG_SECURE_UART_ROM_DL_MODE](#) 为“永久禁用 ROM 下载模式（推荐）”或在运行时调用 `esp_efuse_disable_rom_download_mode()`。
- 启用 [安全启动](#) 作为额外的保护层，防止攻击者在启动前有选择地破坏 flash 中某部分。

外部启用 flash 加密

在上述过程中，对与 flash 加密相关的 eFuse 是通过固件引导加载程序烧写的，或者，也可以借助 `espefuse` 工具烧写 eFuse。如需了解详情，请参考[Enable Flash Encryption Externally](#)。

可能出现的错误

一旦启用 flash 加密，SPI_BOOT_CRYPT_CNT 的 eFuse 值将设置为奇数位。这意味着所有标有加密标志的分区都会包含加密的密本。如果 ESP32-H2 错误地加载了明文数据，则会出现以下三种典型的错误情

况:

1. 如果通过 **明文固件引导加载程序镜像** 重新烧录了引导加载程序分区，则 ROM 加载器将无法加载固件引导加载程序，并会显示以下错误类型：

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
```

备注：不同应用程序中无效头文件的值不同。

备注：如果 flash 内容被擦除或损坏，也会出现这个错误。

2. 如果固件的引导加载程序已加密，但通过 **明文分区表镜像** 重新烧录了分区表，引导加载程序将无法读取分区表，从而出现以下错误：

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00

```

ESP32-H2 flash 加密状态

1. 确保你的 ESP32-H2 设备有相关 *eFuses* 中所示的 flash 加密 eFuse 的默认设置。

要检查你的 ESP32-H2 设备上是否启用了 flash 加密，请执行以下操作之一：

- 将应用示例 [security/flash_encryption](#) 烧录到你的设备上。此应用程序会打印 SPI_BOOT_CRYPT_CNT eFuse 值，以及是否启用了 flash 加密。
- 查询设备所连接的串口名称，在以下命令中将 PORT 替换为串口名称后运行：

```
espefuse.py -p PORT summary
```

在加密的 flash 中读写数据

ESP32-H2 应用程序代码可以通过调用函数 `esp_flash_encryption_enabled()` 来检查当前是否启用了 flash 加密。此外，设备可以通过调用函数 `esp_get_flash_encryption_mode()` 来识别 flash 加密模式。

一旦启用 flash 加密，使用代码访问 flash 内容时要更加小心。

flash 加密范围 当 SPI_BOOT_CRYPT_CNT eFuse 设置为奇数位的值，所有通过 MMU 的 flash 缓存访问的 flash 内容都将被透明解密。包括：

- flash 中可执行的应用程序代码 (IROM)。
- 所有存储于 flash 中的只读数据 (DROM)。
- 通过函数 `spi_flash_mmap()` 访问的任意数据。
- ROM 引导加载程序读取的固件引导加载程序镜像。

重要： MMU flash 缓存将无条件解密所有数据。flash 中未加密存储的数据将通过 flash 缓存“被透明解密”，并在软件中存储为随机垃圾数据。

读取加密的 flash 如果需要在不使用 flash 缓存 MMU 映射的情况下读取数据，推荐使用分区读取函数 `esp_partition_read()`。该函数只会解密从加密分区读取的数据。从未加密分区读取的数据不会被解密。这样，软件便能以相同的方式访问加密和未加密的 flash。

也可以使用以下 SPI flash API 函数：

- 通过函数 `esp_flash_read()` 读取不会被解密的原（加密）数据。
- 通过函数 `esp_flash_read_encrypted()` 读取和解密数据。

使用非易失性存储器 (NVS) API 存储的数据始终从 flash 加密的角度进行存储和读取解密。如有需要，则由库提供加密功能。详情可参考 [NVS 加密](#)。

写入加密的 flash 推荐使用分区写入函数 `esp_partition_write()`。此函数只会在将数据写入加密分区时加密数据，而写入未加密分区的数据不会被加密。通过这种方式，软件可以以相同的方式访问加密和非加密 flash。

也可以使用函数 `esp_flash_write_encrypted()` 预加密和写入数据。

此外，esp-idf 应用程序中存在但不支持以下 ROM 函数：

- `esp_rom_spiflash_write_encrypted` 预加密并将数据写入 flash
- `SPIWrite` 将未加密的数据写入 flash

由于数据是按块加密的，加密数据最小的写入大小为 16 字节，对齐也是 16 字节。

更新加密的 flash

OTA 更新 如果使用函数 `esp_partition_write()`，对加密分区的 OTA 更新将自动以加密形式写入。

在为已加密设备的 OTA 更新构建应用程序镜像之前，启用项目配置菜单中的 **启动时使能 flash 加密** 选项。请参考 [OTA](#) 获取更多关于 ESP-IDF OTA 更新的信息。

通过串口更新加密 flash 通过串行引导加载程序烧录加密设备，需要串行引导加载程序下载接口没有通过 eFuse 被永久禁用。

在开发模式下，推荐的方法是 [重新烧录更新后的分区](#)。

在发布模式下，如果主机上有存储在 eFuse 中的相同密钥的副本，那么就可以在主机上对文件进行预加密，然后进行烧录，具体请参考 [手动加密文件](#)。

关闭 flash 加密

如果意外启用了 flash 加密，则明文数据的 flash 会使 ESP32-H2 无法正常启动。设备将不断重启，并报错 `flash read err, 1000` 或 `invalid header: 0xxxxxxx`。

对于开发模式下的 flash 加密，可以通过烧录 `SPI_BOOT_CRYPT_CNT` efuse 来关闭加密。每个芯片仅有 1 次机会，请执行以下步骤：

1. 在 **项目配置菜单** 中，禁用 **启动时使能 flash 加密** 选项，然后保存并退出。
2. 再次打开项目配置菜单，再次检查你是否已经禁用了该选项，如果这个选项仍被启用，引导加载程序在启动时将立即重新启用加密功能。
3. 在禁用 flash 加密后，通过运行 `idf.py flash` 来构建和烧录新的引导加载程序 and 应用程序。
4. 使用 `espefuse.py`（在 `components/esptool_py/esptool` 中）以关闭 `SPI_BOOT_CRYPT_CNT`，运行：

```
espefuse.py burn_efuse SPI_BOOT_CRYPT_CNT
```

重置 ESP32-H2，flash 加密应处于关闭状态，引导加载程序将正常启动。

flash 加密的要点

- 通过 ESP32-H2 的 flash 缓存映射功能，flash 可支持透明访问——任何映射到地址空间的 flash 区域在读取时都将被透明地解密。
为便于访问，某些数据分区最好保持未加密状态，或者也可使用对已加密数据无效的 flash 友好型更新算法。由于 NVS 库无法与 flash 加密直接兼容，因此无法加密非易失性存储器的 NVS 分区。详情可参见 [NVS 加密](#)。
- 如果以后可能需要启用 flash 加密，则编程人员在编写 [使用加密 flash](#) 代码时需小心谨慎。
- 如果已启用安全启动，重新烧录加密设备的引导加载程序则需要“可重新烧录”的安全启动摘要（可参考 [flash 加密与安全启动](#)）。

启用 flash 加密将增大引导加载程序，因此可能需更新分区表偏移量。请参考[引导加载程序大小](#)。

重要：在首次启动加密过程中，请勿切断 ESP32-H2 的电源。如果电源被切断，flash 的内容将受到破坏，并需要重新烧录未加密数据。而这类重新烧录将不计入烧录限制次数。

flash 加密的局限性

flash 加密可以保护固件，防止未经授权的读取与修改。了解 flash 加密系统的局限之处亦十分重要：

- flash 加密功能与密钥同样稳固。因而，推荐在首次启动设备时，在设备上生成密钥（默认行为）。如果在设备外生成密钥，请确保遵循正确的后续步骤，不要在所有生产设备之间使用相同的密钥。
- 并非所有数据都是加密存储。因而在 flash 上存储数据时，请检查你使用的存储方式（库、API 等）是否支持 flash 加密。
- flash 加密无法防止攻击者获取 flash 的高层次布局信息。这是因为每对相邻的 16 字节 AES 块都使用相邻的 AES 密钥。当这些相邻的 16 字节块中包含相同内容时（如空白或填充区域），这些字节块将加密以产生匹配的加密块对。这让攻击者可在加密设备间进行高层次对比（例如，确认两设备是否可能运行相同的固件版本）。
- 单独使用 flash 加密可能无法防止攻击者修改本设备的固件。为防止设备上运行未经授权的固件，可搭配 flash 加密使用[安全启动](#)。

flash 加密与安全启动

推荐 flash 加密与安全启动搭配使用。但是，如果已启用安全启动，则重新烧录设备时会受到其他限制：

- 如果新的应用程序已使用安全启动签名密钥正确签名，则[OTA 更新](#)不受限制。

flash 加密的高级功能

以下部分介绍了 flash 加密的高级功能。

加密分区标志 部分分区默认为已加密。通过在分区的标志字段中添加“encrypted”标志，可在分区表描述中将其他分区标记为需要加密。在这些标记分区中的数据会和应用程序分区一样视为加密数据。

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
secret_data, 0x40, 0x01, 0x20000, 256K, encrypted
```

请参考[分区表](#)获取更多关于分区表描述的具体信息。

关于分区加密，还需了解以下信息：

- 默认分区表都不包含任何加密数据分区。
- 启用 flash 加密后，“app”分区一般都视为加密分区，因此无需标记。
- 如果未启用 flash 加密，则“encrypted”标记无效。
- 将可选 phy 分区标记为“encrypted”，可以防止物理访问读取或修改 phy_init 数据。
- nvs 分区无法标记为“encrypted”因为 NVS 库与 flash 加密不直接兼容。

启用 UART 引导加载程序加密/解密 在第一次启动时，flash 加密过程默认会烧录以下 eFuse：

- DIS_DOWNLOAD_MANUAL_ENCRYPT 在 UART 引导加载程序启动模式下运行时，禁止 flash 加密操作。

- `DIS_DIRECT_BOOT`` (即之前的 ``DIS_LEGACY_SPI_BOOT`) 禁用传统的 SPI 启动模式。

为了能启用这些功能，可在首次启动前仅烧录部分 eFuse，并用未设置值 0 写保护其他部分。例如：

```
espfuse.py --port PORT burn_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
espfuse.py --port PORT write_protect_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
```

备注： 请注意在写保护前设置所有适当的位！

一个位可以控制三个 eFuse 的写保护，这意味着写保护一个 eFuse 位将写保护所有未设置的 eFuse 位。

由于 `esptool.py` 目前不支持读取加密 flash，所以对这些 eFuse 进行写保护从而使其保持未设置目前来说并不是很有用。

JTAG 调试 默认情况下，当启用 flash 加密（开发或发布模式）时，将通过 eFuse 禁用 JTAG 调试。引导加载程序在首次启动时执行此操作，同时启用 flash 加密。

请参考 [JTAG 与 flash 加密和安全引导](#) 了解更多关于使用 JTAG 调试与 flash 加密的信息。

手动加密文件 手动加密或解密文件需要在 eFuse 中预烧录 flash 加密密钥（请参阅 [使用主机生成的密钥](#)）并在主机上保留一份副本。如果 flash 加密配置在开发模式下，那么则不需要保留密钥的副本或遵循这些步骤，可以使用更简单的 [重新烧录更新后的分区](#) 步骤。

密钥文件应该是单个原始二进制文件（例如：`key.bin`）。

例如，以下是将文件 `build/my-app.bin` 进行加密、烧录到偏移量 `0x10000` 的步骤。运行 `espsecure.py`，如下所示：

```
espsecure.py encrypt_flash_data --aes_xts --keyfile /path/to/key.bin --address_
↳0x10000 --output my-app-ciphertext.bin build/my-app.bin
```

然后可以使用 `esptool.py` 将文件 `my-app-ciphertext.bin` 写入偏移量 `0x10000`。关于为 `esptool.py` 推荐的所有命令行选项，请查看 `idf.py build` 成功时打印的输出。

备注：

如果 ESP32-H2 在启动时无法识别烧录进去的密文文件，请检查密钥是否匹配以及命令行参数是否完全匹配，包括偏移量是否正确。

`espsecure.py decrypt_flash_data` 命令可以使用同样的选项（和不同的输入/输出文件）来解密 flash 密文或之前加密的文件。

技术细节

以下章节将提供 flash 加密操作的相关信息。

- 有关在 Python 中实现的完整 flash 加密算法，可参见 `espsecure.py` 源代码中的函数 `_flash_encryption_operation()`。

flash 加密算法

- ESP32-H2 使用 XTS-AES 块密码模式进行 flash 加密，密钥大小为 256 位。
- XTS-AES 是一种专门为光盘加密设计的块密码模式，它解决了其它潜在模式如 AES-CTR 在此使用情景下的不足。有关 XTS-AES 算法的详细描述，请参考 [IEEE Std 1619-2007](#)。
- flash 加密的密钥存储于一个 `BLOCK_KEYN` eFuse 中，默认受保护防止进一步写入或软件读取。
- 有关在 Python 中实现的完整 flash 加密算法，可参见 `espsecure.py` 源代码中的函数 `_flash_encryption_operation()`。

6.2.2 Secure Boot V2

重要: This document is about Secure Boot V2, supported on ESP32-H2

Secure Boot V2 uses RSA-PSS or ECDSA based app and bootloader (二级引导程序) verification. This document can also be used as a reference for signing apps using the RSA-PSS or ECDSA scheme without signing the bootloader.

Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32-H2, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

ESP32-H2 has provision to choose between a RSA-PSS or ECDSA based secure boot verification scheme.

The Secure Boot process on the ESP32-H2 involves the following steps:

1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader's RSA-PSS or ECDSA signature is verified. If the verification is successful, the second stage bootloader is executed.
2. When the second stage bootloader loads a particular application image, the application's RSA-PSS or ECDSA signature is verified. If the verification is successful, the application image is executed.

Advantages

- The RSA-PSS or ECDSA public key is stored on the device. The corresponding RSA-PSS or ECDSA private key is kept at a secret place and is never accessed by the device.
- Up to three public keys can be generated and stored in the chip during manufacturing.
- ESP32-H2 provides the facility to permanently revoke individual public keys. This can be configured conservatively or aggressively.
- Conservatively - The old key is revoked after the bootloader and application have successfully migrated to a new key. Aggressively - The key is revoked as soon as verification with this key fails.
- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section [How To Enable Secure Boot V2](#).

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*. Each image has a separately generated signature block which is appended to the end of the image.

Up to 3 signature blocks can be appended to the bootloader or application image in ESP32-H2.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072, ECDSA-256, or ECDSA-192 public key. For more details about the format, refer to [Signature Block Format](#). A digest of the RSA-3072, ECDSA-256, or ECDSA-192 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.

2. The ROM code verifies the bootloader's signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image's signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

Signature Block Format

The signature block starts on a 4 KB aligned boundary and has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes (*Secure Padding*).

备注: ESP32-H2 has a provision to choose between RSA scheme and ECDSA scheme. Only one scheme can be used per device.

ECDSA provides similar security strength, compared to RSA, with shorter key lengths. Current estimates are that ECDSA with curve P-256 has an approximate equivalent strength to RSA with 3072-bit keys. However, ECDSA signature verification takes considerably more amount of time as compared to RSA signature verification.

RSA is recommended for use cases where fast bootup time is required whereas ECDSA is recommended for use cases where shorter key length is required.

表 2: Comparison between signature verification time

Verification scheme	Time	CPU Frequency
RSA-3072	~4.5 ms	96 MHz
ECDSA-P256	~36 ms	96 MHz

The above table compares the time taken to verify a signature in a particular scheme. It does not indicate the bootup time.

The content of each signature block is shown in the following table:

表 3: Content of a RSA Signature Block

Offset	Size (bytes)	Description
0	1	Magic byte
1	1	Version number byte (currently 0x02), 0x01 is for Secure Boot V1.
2	2	Padding bytes, Reserved. Should be zero.
4	32	SHA-256 hash of only the image content, not including the signature block.
36	384	RSA Public Modulus used for signature verification. (value 'n' in RFC8017).
420	4	RSA Public Exponent used for signature verification (value 'e' in RFC8017).
424	384	Pre-calculated R, derived from 'n'.
808	4	Pre-calculated M', derived from 'n'
812	384	RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MGF1 function, salt length 32 bytes, default trailer field (0xBC).
1196	4	CRC32 of the preceding 1196 bytes.
1200	16	Zero padding to length 1216 bytes.

备注: R and M' are used for hardware-assisted Montgomery Multiplication.

表 4: Content of a ECDSA Signature Block

Offset	Size (bytes)	Description
0	1	Magic byte.
1	1	Version number byte (currently 0x03).
2	2	Padding bytes, Reserved. Should be zero.
4	32	SHA-256 hash of only the image content, not including the signature block.
36	1	Curve ID (1 for NIST192p curve. 2 for NIST256p curve).
37	64	ECDSA Public key: 32 byte X coordinate followed by 32 byte Y coordinate.
101	64	ECDSA Signature result (section 5.3.2 of RFC6090) of the image content: 32 byte R component followed by 32 byte S component.
165	1031	Reserved.
1196	4	CRC32 of the preceding 1196 bytes.
1200	16	Zero padding to length 1216 bytes.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

Secure Padding

In Secure Boot V2 scheme, the application image is padded to the flash MMU page size boundary to ensure that only verified contents are mapped in the internal address space. This is known as secure padding. Signature of the image is calculated after padding and then signature block (4KB) gets appended to the image.

- Default flash MMU page size is 64KB
- ESP32-H2 supports configurable flash MMU page size, it (`CONFIG_MMU_PAGE_SIZE`) gets set based on the [CONFIG_ESPTOOLPY_FLASHSIZE](#)
- Secure padding is applied through the option `--secure-pad-v2` in the `elf2image` conversion using `esptool.py`

Following table explains the Secure Boot V2 signed image with secure padding and signature block appended:

表 5: Contents of a signed application

Offset	Size (KB)	Description
0	580	Unsigned application size (as an example)
580	60	Secure padding (aligned to next 64KB boundary)
640	4	Signature block

备注: Please note that the application image always starts on the next flash MMU page size boundary (default 64KB) and hence the space left over after the signature block shown above can be utilized to store any other data partitions (e.g., `nvs`).

Verifying a Signature Block

A signature block is "valid" if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it is invalid.

Verifying an Image

An image is "verified" if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader's signature block with the digest(s) saved in the eFuses. If public key's hash does not match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests do not match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using either RSA-PSS (section 8.1.2 of RFC8017) or ECDSA signature verification (section 5.3.3 of RFC6090) with the image digest calculated in step (2) for comparison.

Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [引导加载程序大小](#).

In the case when `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` is disabled, the bootloader is sector padded (4KB) using the `--pad-to-size` option in `elf2image` command of `esptool`.

eFuse Usage

- `SECURE_BOOT_EN` - Enables Secure Boot protection on boot.
- `KEY_PURPOSE_X` - Set the purpose of the key block on ESP32-H2 by programming `SECURE_BOOT_DIGESTX` ($X = 0, 1, 2$) into `KEY_PURPOSE_X` ($X = 0, 1, 2, 3, 4, 5$). Example: If `KEY_PURPOSE_2` is set to `SECURE_BOOT_DIGEST1`, then `BLOCK_KEY2` will have the Secure Boot V2 public key digest. The write-protection bit must be set (this field does not have a read-protection bit).
- `BLOCK_KEYX` - The block contains the data corresponding to its purpose programmed in `KEY_PURPOSE_X`. Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M' values (represented as 776 bytes -offsets 36 to 812 - as per the [Signature Block Format](#)) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.
- `KEY_REVOKEX` - The revocation bits corresponding to each of the 3 key block. Ex. Setting `KEY_REVOKE2` revokes the key block whose key purpose is `SECURE_BOOT_DIGEST2`.
- `SECURE_BOOT_AGGRESSIVE_REVOKE` - Enables aggressive revocation of keys. The key is revoked as soon as verification with this key fails.

To ensure no trusted keys can be added later by an attacker, each unused key digest slot should be revoked (`KEY_REVOKEX`). It will be checked during app startup in `esp_secure_boot_init_checks()` and fixed unless `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS` is enabled.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

How To Enable Secure Boot V2

1. Open the [项目配置菜单](#), in "Security features" set "Enable hardware Secure Boot in bootloader" to enable Secure Boot.
2. The "Secure Boot V2" option will be selected and the "App Signing Scheme" would be set to RSA by default. RSA is recommended because of faster verification time. You can choose between RSA and ECDSA scheme from the menu.
3. Specify the path to Secure Boot signing key, relative to the project directory.

4. Select the desired UART ROM download mode in "UART ROM download mode". By default, it is set to "Permanently switch to Secure mode" which is generally recommended. For production devices, the most secure option is to set it to "Permanently disabled".
5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.
6. The first time you run `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

重要: A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

重要: For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

7. Run `idf.py bootloader` to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you are ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 6.

备注: `idf.py flash` does not flash the bootloader if Secure Boot is enabled.

10. Reset the ESP32-H2 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32-H2 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

备注: Secure boot will not be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

备注: If the ESP32-H2 is reset or powered down during the first boot, it will start the process again on the next boot.

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

Restrictions After Secure Boot Is Enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If `flash 加密` is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.
- Please note that enabling Secure Boot or flash encryption disables the USB-OTG USB stack in the ROM, disallowing updates via the serial emulation or Device Firmware Update (DFU) on that port.

Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`.

The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2. Additionally `--scheme rsa3072` can be passed as well to generate RSA 3072 private key

Select the ECDSA scheme by passing `--version 2 --scheme ecdsa256` or `--version 2 --scheme ecdsa192` to generate corresponding ECDSA private key

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA-PSS or ECDSA key generation utilities.

For example, to generate a signing key using the `openssl` command line:

For RSA 3072

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

For ECC NIST192p curve

```
` openssl ecparam -name prime192v1 -genkey -noout -out my_secure_boot_signing_key.pem `
```

For ECC NIST256p curve

```
` openssl ecparam -name prime256v1 -genkey -noout -out my_secure_boot_signing_key.pem `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

Remote Signing of Images

Signing Using `espsecure.py` For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` Secure Boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` and build the firmware. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data BINARY_FILE --version 2 --keyfile PRIVATE_SIGNING_KEY
```

The above command appends the image signature to the existing binary. You can use the `--output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_
↳BINARY_FILE BINARY_FILE
```

Signing Using Pre-calculated Signatures If you have valid pre-calculated signatures generated for an image and their corresponding public keys, you can use these signatures to generate a signature sector and append it to the image. Note that the pre-calculated signature should be calculated over all bytes in the image including the secure-padding bytes.

In such cases, the firmware image should be built by disabling the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`. This image will be secure-padded and to generate a signed binary use the following command:

```
espsecure.py sign_data --version 2 --pub-key PUBLIC_SIGNING_KEY --signature_
↳SIGNATURE_FILE --output SIGNED_BINARY_FILE BINARY_FILE
```

The above command verifies the signature, generates a signature block (refer to *Signature Block Format*) and appends it to the binary file.

Signing Using an External Hardware Security Module (HSM) For security reasons, you might also use an external Hardware Security Module (HSM) to store your private signing key, which cannot be accessed directly but has an interface to generate the signature of a binary file and its corresponding public key.

In such cases, disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` and build the firmware. This secure-padded image then can be used to supply the external HSM for generating a signature. Refer to [Signing using an External HSM](#) to generate a signed image.

备注: For all the above three remote signing workflows, the signed binary is written to the filename provided to the `--output` argument and the option `--append_signatures` allows us to append multiple signatures (up to 3) the image.

Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espssecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with *flash 加密* to prevent local readout of the flash contents.

Key Management

- Between 1 and 3 RSA-3072, ECDSA-256, or ECDSA-192 public key pairs (Keys #0, #1, #2) should be computed independently and stored separately.
- The KEY_DIGEST eFuses should be write protected after being programmed.
- The unused KEY_DIGEST slots must have their corresponding KEY_REVOKE eFuse burned to permanently disable them. This must happen before the device leaves the factory.
- The eFuses can either be written by the software bootloader during first boot after enabling "Secure Boot V2" from menuconfig or can be done using `espefuse.py` which communicates with the serial bootloader program in ROM.
- The KEY_DIGESTs should be numbered sequentially beginning at key digest #0. (i.e., if key digest #1 is used, key digest #0 should be used. If key digest #2 is used, key digest #0 & #1 must be used.)
- The software bootloader (non OTA upgradeable) is signed using at least one, possibly all three, private keys and flashed in the factory.
- Apps should only be signed with a single private key (the others being stored securely elsewhere), however they may be signed with multiple private keys if some are being revoked (see Key Revocation, below).

Multiple Keys

- The bootloader should be signed with all the private key(s) that are needed for the life of the device, before it is flashed.
- The build system can sign with at most one private key, user has to run manual commands to append more signatures if necessary.
- **You can use the append functionality of `espssecure.py`, this command would also printed at the end of the Secure B**
`espssecure.py sign_data -k secure_boot_signing_key2.pem -v 2 --append_signatures -o signed_bootloader.bin build/bootloader/bootloader.bin`
- While signing with multiple private keys, it is recommended that the private keys be signed independently, if possible on different servers and stored separately.
- **You can check the signatures attached to a binary using -** `espssecure.py signature_info_v2 datafile.bin`

Key Revocation

- Keys are processed in a linear order. (key #0, key #1, key #2).
- Applications should be signed with only one key at a time, to minimize the exposure of unused private keys.
- The bootloader can be signed with multiple keys from the factory.

备注: Note that enabling the config `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS` only makes sure that the **app** does not revoke the unused digest slots. But if you plan to enable secure boot during the first boot up, the bootloader will intentionally revoke the unused digest slots while enabling secure boot, even if the above config is enabled because keeping the unused key slots un-revoked would be a security hazard. In case for any development workflow if you need to avoid this revocation, you should enable secure boot externally (*Enable Secure Boot V2 Externally*) rather than enabling it during the boot up, so that the bootloader would not need to enable secure boot and thus you could avoid its revocation strategy.

Conservative Approach: Assuming a trusted private key (N-1) has been compromised, to update to new key pair (N).

1. Server sends an OTA update with an application signed with the new private key (#N).
 2. The new OTA update is written to an unused OTA app partition.
 3. The new application's signature block is validated. The public keys are checked against the digests programmed in the eFuse & the application is verified using the verified public key.
 4. The active partition is set to the new OTA application's partition.
 5. Device resets, loads the bootloader (verified with key #N-1 and #N) which then boots new app (verified with key #N).
 6. The new app verifies bootloader and application with key #N (as a final check) and then runs code to revoke key #N-1 (sets KEY_REVOKE eFuse bit).
 7. The API `esp_ota_revoke_secure_boot_public_key()` can be used to revoke the key #N-1.
- A similar approach can also be used to physically re-flash with a new key. For physical re-flashing, the bootloader content can also be changed at the same time.

Aggressive Approach: ROM code has an additional feature of revoking a public key digest if the signature verification fails.

To enable this feature, you need to burn `SECURE_BOOT_AGGRESSIVE_REVOKE` efuse or enable `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`

Key revocation is not applicable unless secure boot is successfully enabled. Also, a key is not revoked in case of invalid signature block or invalid image digest, it is only revoked in case the signature verification fails, i.e., revoke key only if failure in step 3 of *Verifying an Image*

Once a key is revoked, it can never be used for verifying a signature of an image. This feature provides strong resistance against physical attacks on the device. However, this could also brick the device permanently if all the keys are revoked because of signature verification failure.

Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

Manual Commands Secure boot is integrated into the esp-idf build system, so `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
↳signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072, ECDSA-256, or ECDSA-192 private signing key.

Secure Boot & Flash Encryption

If Secure Boot is used without *flash* 加密, it is possible to launch "time-of-check to time-of-use" attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app is not verified during the update process, it is assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it is essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app is not verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

Although multiple trusted keys are supported when using hardware Secure Boot, only the first public key in the signature block is used to verify updates if signature checking without Secure Boot is configured. If multiple trusted public keys are required, it is necessary to enable the full Secure Boot feature instead.

备注: In general, it is recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

How To Enable Signed App Verification

1. Open 项目配置菜单 -> Security features
2. Choose *App Signing Scheme*. Either *RSA* or *ECDSA (V2)*
3. Enable *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*
4. By default, "Sign binaries during build" will be enabled on selecting "Require signed app images" option, which will sign binary files as a part of build process. The file named in "Secure boot private signing key" will be used to sign the image.
5. If you disable "Sign binaries during build" option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

警告: It is very important that all apps flashed have been signed, either during the build or after the build.

Advanced Features

JTAG Debugging By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See [JTAG 与 flash 加密和安全引导](#) for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

6.3 流程

6.3.1 Host-Based Security Workflows

Introduction

It is recommended to have an uninterrupted power supply while enabling security features on ESP32 SoCs. Power failures during the secure manufacturing process could cause issues that are hard to debug and, in some cases, may cause permanent boot-up failures.

This guide highlights an approach where security features are enabled with the assistance of an external host machine. Security workflows are broken down into various stages and key material is generated on the host machine; thus, allowing greater recovery chances in case of power or other failures. It also offers better timings for secure manufacturing, e.g., in the case of encryption of firmware on the host machine vs. on the device.

Goals

1. Simplify the traditional workflow with stepwise instructions.
2. Design a more flexible workflow as compared to the traditional firmware-based workflow.
3. Improve reliability by dividing the workflow into small operations.
4. Eliminate dependency on [二级引导程序](#) (firmware bootloader).

Pre-requisite

- `esptool`: Please make sure the `esptool` has been installed. It can be installed by running:

```
pip install esptool
```

Scope

- [Enable Flash Encryption and Secure Boot V2 Externally](#)
- [Enable Flash Encryption Externally](#)
- [Enable Secure Boot V2 Externally](#)
- [Enable NVS Encryption Externally](#)

Security Workflows

Enable Flash Encryption and Secure Boot V2 Externally

重要: It is recommended to enable both Flash Encryption and Secure Boot V2 for a production use case.

When enabling the Flash Encryption and Secure Boot V2 together we need to enable them in the following order:

1. Enable the Flash Encryption feature by following the steps listed in [Enable Flash Encryption Externally](#).
2. Enable the Secure Boot V2 feature by following the steps listed in [Enable Secure Boot V2 Externally](#).

The reason for this order is as follows:

备注: To enable the Secure Boot (SB) V2, it is necessary to keep the SB V2 key readable. To protect the key's readability, the write protection for RD_DIS (ESP_EFUSE_WR_DIS_RD_DIS) is applied. However, this action poses a challenge when attempting to enable Flash Encryption, as the Flash Encryption (FE) key needs to remain unreadable. This conflict arises because the RD_DIS is already write-protected, making it impossible to read protect the FE key.

Enable Flash Encryption Externally In this case, all the eFuses related to Flash Encryption are written with help of the `espefuse` tool. More details about flash encryption can be found in the [Flash Encryption Guide](#)

1. Check device status

Ensure that you have an ESP32-H2 device with default Flash Encryption eFuse settings as shown in [相关 eFuses](#).

See how to check [ESP32-H2 flash 加密状态](#).

At this point, the Flash Encryption must not be already enabled on the chip. Additionally, the flash on the chip needs to be erased, which can be done by running:

```
esptool.py --port PORT erase_flash
```

2. Generate a Flash Encryption key

A random Flash Encryption key can be generated by running:

```
espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
```

3. Burn the Flash Encryption key into eFuse

This action **cannot be reverted**. It can be done by running:

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↪AES_128_KEY
```

where BLOCK is a free keyblock between BLOCK_KEY0 and BLOCK_KEY5.

警告: For the ESP32-H2 BLOCK9 (BLOCK_KEY5) can not be used by XTS_AES keys.

4. Burn the SPI_BOOT_CRYPT_CNT eFuse

If you only want to enable Flash Encryption in **Development** mode and want to keep the ability to disable it in the future, Update the SPI_BOOT_CRYPT_CNT value in the below command from 7 to 0x1 (not recommended for production).

```
espefuse.py --port PORT --chip esp32h2 burn_efuse SPI_BOOT_CRYPT_CNT 7
```

5. Burn Flash Encryption-related security eFuses as listed below

A) Burn security eFuses

重要: For production use cases, it is highly recommended to burn all the eFuses listed below.

- DIS_DIRECT_BOOT: Disable direct boot (legacy SPI boot mode)
- DIS_USB_JTAG: Disable USB switch to JTAG
- DIS_PAD_JTAG: Disable JTAG permanently

- `DIS_DOWNLOAD_MANUAL_ENCRYPT`: Disable UART bootloader encryption access

The respective eFuses can be burned by running:

```
espefuse.py burn_efuse --port PORT EFUSE_NAME 0x1
```

备注: Please update the `EFUSE_NAME` with the eFuse that you need to burn. Multiple eFuses can be burned at the same time by appending them to the above command (e.g., `EFUSE_NAME VAL EFUSE_NAME2 VAL2`). More documentation about `espefuse.py` can be found [here](#).

B) Write protect security eFuses

After burning the respective eFuses we need to write_protect the security configurations. It can be done by burning following eFuse

```
espefuse.py --port PORT write_protect_efuse DIS_ICACHE
```

备注: The write protection of above eFuse also write protects multiple other eFuses, Please refer to the ESP32-H2 eFuse table for more details.

6. Configure the project

The bootloader and the application binaries for the project must be built with Flash Encryption Release mode with default configurations.

Flash encryption Release mode can be set in the menuconfig as follows:

- *Enable Flash Encryption on boot*
- *Select Release mode* (Note that once Release mode is selected, the `EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT` eFuse bit will be burned to disable Flash Encryption hardware in ROM Download Mode)
- *Select UART ROM download mode (Permanently switch to Secure mode (recommended))*. This is the default option and is recommended. It is also possible to change this configuration setting to permanently disable UART ROM download mode, if this mode is not needed
- *Select the appropriate bootloader log verbosity*
- Save the configuration and exit

7. Build, Encrypt and Flash the binaries

The binaries can be encrypted on the host machine by running:

```
espsecure.py encrypt_flash_data --aes_xts --keyfile my_flash_encryption_
↪key.bin --address 0x1000 --output bootloader-enc.bin build/bootloader/
↪bootloader.bin

espsecure.py encrypt_flash_data --aes_xts --keyfile my_flash_encryption_
↪key.bin --address 0x8000 --output partition-table-enc.bin build/
↪partition_table/partition-table.bin

espsecure.py encrypt_flash_data --aes_xts --keyfile my_flash_encryption_
↪key.bin --address 0x10000 --output my-app-enc.bin build/my-app.bin
```

In the above command the offsets are used for a sample firmware, the actual offset for your firmware can be obtained by checking the partition table entry or by running `idf.py partition-table`. Please note that not all the binaries need to be encrypted, the encryption applies only to those generated from the partitions which are marked as `encrypted` in the partition table definition file. Other binaries are flashed unencrypted, i.e., as a plain output of the build process.

The above files can then be flashed to their respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, see the output printed when `idf.py build` succeeds.

When the application contains the following partition: `otadata`, `nvs_encryption_keys` they need to be encrypted as well. Please refer to [加密分区](#) for more details about encrypted partitions.

备注: If the flashed ciphertext file is not recognized by the ESP32-H2 when it boots, check that the keys match and that the command line arguments match exactly, including the correct offset. It is important to provide the correct offset as the ciphertext changes when the offset changes.

The command `espsecure.py decrypt_flash_data` can be used with the same options (and different input/output files), to decrypt ciphertext flash contents or a previously encrypted file.

8. Secure the ROM Download mode

警告: Please perform the following step at the very end. After this eFuse is burned, the `espefuse` tool can no longer be used to burn additional eFuses.

Disable UART ROM DL mode:

- `UART_DOWNLOAD_DIS` : Disable the UART ROM Download mode

The eFuse can be burned by running:

```
espefuse.py --port PORT burn_efuse UART_DOWNLOAD_DIS
```

Enable Security Download mode:

- `ENABLE_SECURITY_DOWNLOAD`: Enable Secure ROM download mode

The eFuse can be burned by running:

```
espefuse.py --port PORT burn_efuse ENABLE_SECURITY_DOWNLOAD
```

重要:

9. Delete Flash Encryption key on host

Once the Flash Encryption has been enabled for the device, the key **must be deleted immediately**.

This ensures that the host cannot produce encrypted binaries for the same device going forward.

This step is important to reduce the vulnerability of the flash encryption key.

Flash Encryption Guidelines

- It is recommended to generate a unique Flash Encryption key for each device for production use-cases.
- It is recommended to ensure that the RNG used by host machine to generate the Flash Encryption key has good entropy.
- See [flash 加密的局限性](#) for more details.

Enable Secure Boot V2 Externally In this workflow, we shall use `espsecure` tool to generate signing keys and use the `espefuse` tool to burn the relevant eFuses. The details about the Secure Boot V2 process can be found at [Secure Boot V2 Guide](#)

1. Generate Secure Boot V2 Signing Private Key

The Secure Boot V2 signing key for the RSA3072 scheme can be generated by running:

```
espsecure.py generate_signing_key --version 2 --scheme rsa3072 secure_
↳boot_signing_key.pem
```

The Secure Boot V2 signing key for ECDSA scheme can be generated by running:

```
espsecure.py generate_signing_key --version 2 --scheme ecdsa256 secure_
↳boot_signing_key.pem
```

The scheme in the above command can be changed to `ecdsa192` to generate `ecdsa192` private key.

A total of 3 keys can be used for Secure Boot V2 at once. These should be computed independently and stored separately. The same command with different key file names can be used to generate multiple Secure Boot V2 signing keys. It is recommended to use multiple keys in order to reduce dependency on a single key.

2. Generate Public Key Digest

The public key digest for the private key generated in the previous step can be generated by running:

```
espsecure.py digest_sbv2_public_key --keyfile secure_boot_signing_key.pem
↳--output digest.bin
```

In case of multiple digests, each digest should be kept in a separate file.

3. Burn the key digest in eFuse

The public key digest can be burned in the eFuse by running:

```
espefuse.py --port PORT --chip esp32h2 burn_key BLOCK digest.bin SECURE_
↳BOOT_DIGEST0
```

where `BLOCK` is a free keyblock between `BLOCK_KEY0` and `BLOCK_KEY5`.

In case of multiple digests, the other digests can be burned sequentially by changing the key purpose to `SECURE_BOOT_DIGEST1` and `SECURE_BOOT_DIGEST2` respectively.

4. Enable Secure Boot V2

Secure Boot V2 eFuse can be enabled by running:

```
espefuse.py --port PORT --chip esp32h2 burn_efuse SECURE_BOOT_EN
```

5. Burn relevant eFuses

A) Burn security eFuses

重要: For production use cases, it is highly recommended to burn all the eFuses listed below.

- `SOFT_DIS_JTAG`: Disable software access to JTAG peripheral
- `DIS_DIRECT_BOOT`: Disable direct boot (legacy SPI boot mode)
- `DIS_USB_JTAG`: Disable USB switch to JTAG
- `DIS_PAD_JTAG`: Disable JTAG permanently
- `SECURE_BOOT_AGGRESSIVE_REVOKE`: Aggressive revocation of key digests, see [Aggressive Approach](#): for more details.

The respective eFuses can be burned by running:

```
espefuse.py burn_efuse --port PORT EFUSE_NAME 0x1
```

备注: Please update the `EFUSE_NAME` with the eFuse that you need to burn. Multiple eFuses can be burned at the same time by appending them to the above command (e.g., `EFUSE_NAME VAL EFUSE_NAME2 VAL2`). More documentation about `espefuse.py` can be found [here](#)

B) Secure Boot V2-related eFuses

i) Disable the read-protection option:

The Secure Boot digest burned in the eFuse must be kept readable otherwise the Secure Boot operation would result in a failure. To prevent the accidental enabling of read protection for this key block, the following eFuse needs to be burned:

重要: After burning above-mentioned eFuse, the read protection cannot be enabled for any key. E.g., if Flash Encryption which requires read protection for its key is not enabled at this point, then it cannot be enabled afterwards. Please ensure that no eFuse keys are going to need read protection after completing this step.

```
espefuse.py -p $ESPPORT write_protect_efuse RD_DIS
```

ii) Revoke key digests:

The unused digest slots need to be revoked when we are burning the Secure Boot key. The respective slots can be revoked by running

```
espefuse.py --port PORT --chip esp32h2 burn_efuse EFUSE_REVOKE_BIT
```

The `EFUSE_REVOKE_BIT` in the above command can be `SECURE_BOOT_KEY_REVOKE0` or `SECURE_BOOT_KEY_REVOKE1` or `SECURE_BOOT_KEY_REVOKE2`. Please note that only the unused key digests must be revoked. Once revoked, the respective digest cannot be used again.

6. Configure the project

By default, the ROM bootloader would only verify the [二级引导程序](#) (firmware bootloader). The firmware bootloader would verify the app partition only when the `CONFIG_SECURE_BOOT` option is enabled (and `CONFIG_SECURE_BOOT_VERSION` is set to `SECURE_BOOT_V2_ENABLED`) while building the bootloader.

- a) Open the [项目配置菜单](#), in "Security features" set "Enable hardware Secure Boot in bootloader" to enable Secure Boot.

The "Secure Boot V2" option will be selected and the "App Signing Scheme" will be set to RSA by default.

- b) Disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` for the project in the [项目配置菜单](#). This shall make sure that all the generated binaries are secure padded and unsigned. This step is done to avoid generating signed binaries as we are going to manually sign the binaries using `espssecure` tool.

7. Build, Sign and Flash the binaries

After the above configurations, the bootloader and application binaries can be built with `idf.py build` command.

The Secure Boot V2 workflow only verifies the `bootloader` and `application` binaries, hence only those binaries need to be signed. The other binaries (e.g., `partition-table.bin`) can be flashed as they are generated in the build stage.

The `bootloader.bin` and `app.bin` binaries can be signed by running:

```

espsecure.py sign_data --version 2 --keyfile secure_boot_signing_key.pem -
↳--output bootloader-signed.bin build/bootloader/bootloader.bin

espsecure.py sign_data --version 2 --keyfile secure_boot_signing_key.pem -
↳--output my-app-signed.bin build/my-app.bin

```

If multiple keys Secure Boot keys are to be used then the same signed binary can be appended with a signature block signed with the new key as follows:

```

espsecure.py sign_data --keyfile secure_boot_signing_key2.pem --version 2
↳--append_signatures -o bootloader-signed2.bin bootloader-signed.bin

espsecure.py sign_data --keyfile secure_boot_signing_key2.pem --version 2
↳--append_signatures -o my-app-signed2.bin my-app-signed.bin

```

The same process can be repeated for the third key. Note that the names of the input and output files must not be the same.

The signatures attached to a binary can be checked by running:

```

espsecure.py signature_info_v2 bootloader-signed.bin

```

The above files along with other binaries (e.g., partition table) can then be flashed to their respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, see the output printed when `idf.py build` succeeds. The flash offset for your firmware can be obtained by checking the partition table entry or by running `idf.py partition-table`.

8. Secure the ROM Download mode:

警告: Please perform the following step at the very end. After this eFuse is burned, the `espefuse` tool can no longer be used to burn additional eFuses.

Disable UART ROM DL mode:

- `UART_DOWNLOAD_DIS`: Disable the UART ROM Download mode

The eFuse can be burned by running:

```

espefuse.py --port PORT burn_efuse UART_DOWNLOAD_DIS

```

Enable Security Download mode:

- `ENABLE_SECURITY_DOWNLOAD`: Enable Secure ROM download mode

The eFuse can be burned by running:

```

espefuse.py --port PORT burn_efuse ENABLE_SECURITY_DOWNLOAD

```

Secure Boot V2 Guidelines

- It is recommended to store the Secure Boot key in a highly secure place. A physical or a cloud HSM may be used for secure storage of the Secure Boot private key. Please take a look at [Remote Signing of Images](#) for more details.
- It is recommended to use all the available digest slots to reduce dependency on a single private key.

Enable NVS Encryption Externally The details about NVS Encryption and related schemes can be found at [NVS Encryption](#).

Enable NVS Encryption based on HMAC

1. Generate the HMAC key and NVS Encryption key

In the HMAC based NVS scheme, there are two keys:

- HMAC key - this is a 256 bit HMAC key that shall be stored in the eFuse
- NVS Encryption key - This is the NVS Encryption key that is used to encrypt the NVS partition. This key is derived at run-time using the HMAC key.

The above keys can be generated with the `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` script with help of the following command:

```
python3 nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_
↪keygen --kp_hmac_keyfile hmac_key.bin --keyfile nvs_encr_key.bin
```

This shall generate the respective keys in the `keys` folder.

2. Burn the HMAC key in the eFuse

The NVS key can be burned in the eFuse of ESP32-H2 with help of following command:

```
espefuse.py --port PORT burn_key BLOCK hmac_key.bin HMAC_UP
```

where `BLOCK` is a free keyblock between `BLOCK_KEY0` and `BLOCK_KEY5`.

3. Generate the encrypted NVS partition

We shall generate the actual encrypted NVS partition on host. More details about generating the encryption NVS partition can be found at [生成 NVS 加密分区](#). For this purpose, the contents of the NVS file shall be available in a CSV file. Please check out [CSV 文件格式](#) for more details.

The encrypted NVS partition can be generated with following command:

```
python3 nvs_partition_gen.py encrypt sample_singlepage_blob.csv nvs_encr_
↪partition.bin 0x3000 --inputkey keys/nvs_encr_key.bin
```

Some command arguments are explained below:

- CSV file name - In this case `sample_singlepage_blob.csv` is the CSV file which contains the NVS data, Replace this with the file you wish to choose.
- NVS partition offset - This is the offset at which that NVS partition shall be stored in the flash of ESP32-H2. The offset of your `nvs-partition` can be found by executing `idf.py partition-table` in the project directory. Please update the sample value of `0x3000` in the above-provided command to the correct offset.

4. Configure the project

- Enable *NVS Encryption* by enabling `CONFIG_NVS_ENCRYPTION`.
- Enable the HMAC based NVS Encryption by setting `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` to `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`
- Set the HMAC efuse key id at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` to the one in which the eFuse key was burned in Step 2.

5. Flash NVS partition

The NVS partition (`nvs_encr_partition.bin`) generated in Step 3 can then be flashed to its respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, check the output printed when `idf.py build` succeeds. If Flash encryption is enabled for the chip then please encrypt the partition first before flashing. You may refer the flashing related steps of [Flash Encryption workflow](#).

Enable NVS Encryption based on Flash Encryption In this case we generate NVS Encryption keys on a host. This key is then flashed on the chip and protected with help of the *Flash Encryption* feature.

1. Generate the NVS Encryption key

For generation of respective keys, we shall use *NVS partition generator utility*. We shall generate the encryption key on host and this key shall be stored on the flash of ESP32-H2 in encrypted state.

The key can be generated with the `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` script with help of the following command:

```
python3 nvs_partition_gen.py generate-key --keyfile nvs_encr_key.bin
```

This shall generate the respective key in the `keys` folder.

2. Generate the encrypted NVS partition

We shall generate the actual encrypted NVS partition on host. More details about generating the encryption NVS partition can be found at [生成 NVS 加密分区](#). For this, the contents of the NVS file shall be available in a CSV file. Please refer [CSV 文件格式](#) for more details.

The encrypted NVS partition can be generated with following command:

```
python3 nvs_partition_gen.py encrypt sample_singlepage_blob.csv nvs_encr_
↪partition.bin 0x3000 --inputkey keys/nvs_encr_key.bin
```

Some command arguments are explained below:

- CSV file name - In this case `sample_singlepage_blob.csv` is the CSV file which contains the NVS data, Replace this with the file you wish to choose.
- NVS partition offset - This is the offset at which that NVS partition shall be stored in the flash of ESP32-H2. The offset of your nvs-partition can be found by executing `idf.py partition-table` in the project directory. Please update the sample value of `0x3000` in the above-provided command to the correct offset.

3. Configure the project

- Enable *NVS Encryption* by enabling `CONFIG_NVS_ENCRYPTION`.
- Set NVS to use Flash Encryption based scheme by setting `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` to `CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC`.

4. Flash NVS partition and NVS Encryption keys

The NVS partition (`nvs_encr_partition.bin`) and NVS Encryption key (`nvs_encr_key.bin`) can then be flashed to their respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, check the output printed when `idf.py build` succeeds. If Flash encryption is enabled for the chip then please encrypt the partition first before flashing. You may refer the flashing related steps of *Flash Encryption workflow*.

Chapter 7

库与框架

7.1 云框架

ESP32-H2 可以使用构建在 ESP-IDF 之上的代理来支持多个云框架。以下是各种支持的云框架代理和示例：

7.1.1 ESP RainMaker

ESP RainMaker 是用于加速 AIoT 开发的完整解决方案。更多信息见 [ESP RainMaker GitHub 仓库](#)。

7.1.2 AWS IoT

<https://github.com/espressif/esp-aws-iot> 是 ESP32-H2 的开源仓库，基于亚马逊 Web 服务的 `aws-iot-device-sdk-embedded-C`。

7.1.3 Azure IoT

<https://github.com/espressif/esp-azure> 是 ESP32-H2 的开源存储库，基于微软 Azure 的 `azure-iot-sdk-c` SDK。

7.1.4 Google IoT Core

<https://github.com/espressif/esp-google-iot> 是 ESP32-H2 的开源存储库，基于谷歌的 `iot-device-sdk-embedded-c` SDK。

7.1.5 阿里云 IoT

<https://github.com/espressif/esp-aliyun> 是 ESP32-H2 的开源存储库，基于阿里云的 `iotkit-embedded` SDK。

7.1.6 Joylink IoT

<https://github.com/espressif/esp-joylink> 是 ESP32-H2 的开源存储库，基于 Joylink 的 `joylink_dev_sdk` SDK。

7.1.7 腾讯 IoT

<https://github.com/espressif/esp-welink> 是 ESP32-H2 的开源存储库，基于腾讯的 [welink SDK](#)。

7.1.8 腾讯云 IoT

<https://github.com/espressif/esp-qcloud> 是 ESP32-H2 的开源存储库，基于腾讯云的 [qcloud-iot-sdk-embedded-c SDK](#)。

7.1.9 百度 IoT

<https://github.com/espressif/esp-baidu-iot> 是 ESP32-H2 的开源存储库，基于百度的 [iot-sdk-c SDK](#)。

7.2 其他库和开发框架

本文展示了一系列乐鑫官方发布的库和框架。

7.2.1 ESP-ADF

ESP-ADF 是一个全方位的音频应用程序框架，该框架支持：

- CODEC 的 HAL
- 音乐播放器和录音机
- 音频处理
- 蓝牙扬声器
- 互联网收音机
- 免提设备
- 语音识别

该框架对应的 GitHub 仓库为 [ESP-ADF](#)。

7.2.2 ESP-CSI

ESP-CSI 是一个具有实验性的框架，它利用 Wi-Fi 信道状态信息来检测人体存在。

该框架对应的 GitHub 仓库为 [ESP-CSI](#)。

7.2.3 ESP-DSP

ESP-DSP 提供了针对数字信号处理应用优化的算法，该库支持：

- 矩阵乘法
- 点积
- 快速傅立叶变换 (FFT)
- 无限脉冲响应 (IIR)
- 有限脉冲响应 (FIR)
- 向量数学运算

该库对应的 GitHub 仓库为 [ESP-DSP 库](#)。

7.2.4 ESP-WIFI-MESH

ESP-WIFI-MESH 基于 ESP-WIFI-MESH 协议搭建，该框架支持：

- 快速网络配置
- 稳定升级
- 高效调试
- LAN 控制
- 多种应用示例

该框架对应的 GitHub 仓库为 [ESP-MDF](#)。

7.2.5 ESP-WHO

ESP-WHO 框架利用 ESP32 及摄像头实现人脸检测及识别。

该框架对应的 GitHub 仓库为 [ESP-WHO](#)。

7.2.6 ESP RainMaker

[ESP RainMaker](#) 提供了一个快速 AIoT 开发的完整解决方案。使用 ESP RainMaker，用户可以创建多种 AIoT 设备，包括固件 AIoT 以及集成了语音助手、手机应用程序和云后端的 AIoT 等。

该解决方案对应的 GitHub 仓库为 [GitHub 上的 ESP RainMaker](#)。

7.2.7 ESP-IoT-Solution

[ESP-IoT-Solution](#) 涵盖了开发 IoT 系统时常用的设备驱动程序及代码框架。在 ESP-IoT-Solution 中，设备驱动程序和代码框架以独立组件存在，可以轻松地集成到 ESP-IDF 项目中。

ESP-IoT-Solution 支持：

- 传感器、显示器、音频、GUI、输入、执行器等设备驱动程序
- 低功耗、安全、存储等框架和文档
- 从实际应用角度指导乐鑫开源解决方案

该解决方案对应的 GitHub 仓库为 [GitHub 上的 ESP-IoT-Solution](#)。

7.2.8 ESP-Protocols

[ESP-Protocols](#) 库包含 ESP-IDF 的协议组件集。ESP-Protocols 中的代码以独立组件存在，可以轻松地集成到 ESP-IDF 项目中。此外，每个组件都可以在 [ESP-IDF 组件注册表](#) 中找到。

ESP-Protocols 组件：

- [esp_modem](#) 使用 AT 命令或 PPP 协议与 GSM/LTE 调制解调器连接，详情请参阅 [esp_modem 文档](#)。
- [mdns](#) (mDNS) 是一种组播 UDP 服务，用于提供本地网络服务与主机发现，详情请参阅 [mdns 文档](#)。
- [esp_websocket_client](#) 是 ESP-IDF 的托管组件，可在 ESP32 上实现 WebSocket 协议客户端，详情请参阅 [esp_websocket_client 文档](#)。有关 WebSocket 协议客户端，请参阅 [WebSocket_protocol_client](#)。
- [asio](#) 是一个跨平台的 C++ 库，请参阅 <https://think-async.com/Asio/>。该库基于现代 C++ 提供一致的异步模型，请参阅 [asio 文档](#)。
- [esp_wifi_remote](#) 是一个 Wi-Fi 通信库，提供标准的 Wi-Fi API，并且能够借助指定的传输接口，帮助目标设备通过外部 ESP32 芯片实现 Wi-Fi 通信。详情请参阅 [Wi-Fi Expansion](#)。

7.2.9 ESP-BSP

ESP-BSP 库包含了各种乐鑫和第三方开发板的板级支持包 (**BSP**)，可以帮助快速上手特定的开发板。它们通常包含管脚定义和辅助函数，这些函数可用于初始化特定开发板的外设。此外，**BSP** 还提供了一些驱动程序，可用于开发版上的外部芯片，如传感器、显示屏、音频编解码器等。

7.2.10 ESP-IDF-CXX

ESP-IDF-CXX 包含了 ESP-IDF 的部分 C++ 封装，重点在实现易用性、安全性、自动资源管理，以及将错误检查转移到编译过程中，以避免运行时失败。它还提供了 ESP 定时器、I2C、SPI、GPIO 等外设或 ESP-IDF 其他功能的 C++ 类。ESP-IDF-CXX 作为组件可以从 [组件注册表](#) 中获取。详情请参阅 [README.md](#)。

Chapter 8

贡献指南

欢迎为 ESP-IDF 项目贡献内容！

8.1 如何贡献

欢迎为 ESP-IDF 贡献内容，如修复问题、新增功能、添加文档等。你可通过 [Github Pull Requests](#) 提交你的贡献内容。

8.2 准备工作

在提交 Pull Request 前，请检查以下要点：

- 贡献内容是否完全是自己的成果，或已获得与 Apache License 2.0 兼容的开源许可？如果不是，我们不能接受该内容。了解更多信息，请见 [版权标头指南](#)。
- 要提交的代码是否符合 ESP-IDF [Espressif IoT Development Framework Style Guide](#)？
- 是否安装了 ESP-IDF [pre-commit 钩子](#)？
- 代码文档是否符合 [编写文档](#) 的要求？
- 代码是否注释充分，便于读者理解其结构？
- 是否为贡献的代码提供文档或示例？要写出好的示例，请参考 [examples readme](#)。
- 注释或文档是否以英语书写并表达清晰，不存在拼写或语法错误？
- 欢迎贡献新的代码示例。了解更多信息，请参考 [创建示例项目](#)。
- 如果需提交多个内容，是否将所有内容按照改动的类型（每个 pull request 对应一个主要改动）进行分组？是否有命名类似“fixed typo”的提交 [压缩到了此前的提交中](#)？
- 如不能确定上述任意内容，请提交 Pull Request，并向我们寻求反馈。

8.3 Pull Request 提交流程

创建 Pull Request 后，PR 评论区中可能有一些关于该请求的讨论。

Pull Request 准备好待合并时，首先会合并到我们的内部 git 系统中进行内部自动化测试。

测试流程通过后，你贡献的内容将合并到公共 GitHub 库。

8.4 法律规范

在提交贡献内容前，你需签署 [贡献者协议](#)。该协议将在 Pull Request 过程中自动推送。

8.5 相关文档

8.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

Indentation Use 4 spaces for each indentation level. Do not use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space Place one empty line between functions. Do not begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
}
// INCORRECT, do not place empty line here
// place empty line here
void function2()
{
    // INCORRECT, do not use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

The maximum line length is 120 characters as long as it does not seriously affect the readability.

Horizontal Space Always add single space after conditional and loop keywords:

```
if (condition) {    // correct
    // ...
}

switch (n) {        // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);        // also okay

int y_cur = -y;                                          // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);                // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF,  I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK,  I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g., `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{
}

// NOT like this:
void function(int arg) {
}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```

if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}

```

Comments Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Do not use single comments to disable some functionality:

```

void init_something()
{
    setup_dma();
    // load_resources();           // WHY is this thing commented, asks_
    ↪the reader?
    start_timer();
}

```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```

void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated_
    ↪yet.
    // load_resources();
    start_timer();
}

```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Do not use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.
- Do not add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g., this comment adds clutter to the code without adding any useful information:

```

void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}

```

Line Endings Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option* <github-line-endings>.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```

git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs_
↪dos2unix && git commit -a --amend --no-edit --allow-empty' master

```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it is possible to run `dos2unix FILENAME` and then run `git commit --amend`

Formatting Your Code ESP-IDF uses Astyle to format source code. The configuration is stored in [tools/ci/astyle-rules.yml](#) file.

Initially, all components are excluded from formatting checks. You can enable formatting checks for the component by removing it from `components_not_formatted_temporary` list. Then run:

```
pre-commit run --files <path_to_files> astyle_py
```

Alternatively, you can run `astyle_py` manually. You can install it with `pip install astyle_py==VERSION`. Make sure you have the same version installed as the one specified in [.pre-commit-config.yml](#) file. With `astyle_py` installed, run:

```
astyle_py --rules=$IDF_PATH/tools/ci/astyle-rules.yml <path-to-file>
```

Type Definitions Should be snake_case, ending with `_t` suffix:

```
typedef int signed_32_bit_t;
```

Enum Enums should be defined through the *typedef* and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

Assertions The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or `0` will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it is not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

备注: When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK` 宏 instead of an `assert()`.

It is possible to configure ESP-IDF projects with assertions disabled (see [CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL](#)). Therefore, functions called in an `assert()` statement should not have side-effects.

It is also necessary to use particular techniques to avoid "variable set but not used" warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

Header File Guards

All public facing header files should have preprocessor guards. A pragma is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

Include Statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`).
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

Naming

- **Class and struct** names shall be written in `CamelCase` with a capital letter as beginning. Member variables and methods shall be in `snake_case`. An exception from `CamelCase` is if the readability is severely decreased, e.g., in `GPIOOutput`, then an underscore `_` is allowed to make it more readable: `GPIO_Output`.
- **Namespaces** shall be in lower `snake_case`.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

Spacing

- Do not indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

Simple Example

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only_
↪initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
```

(下页继续)

```
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Do not put anything in the optional parentheses after `endforeach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the [cmake-lint](#) project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see [EditorConfig Website](#).

Third Party Component Code Styles

ESP-IDF integrates a number of third party components where these components may have differing code styles.

FreeRTOS The code style adopted by FreeRTOS is described in the [FreeRTOS style guide](#). Formatting of FreeRTOS source code is automated using [Uncrustify](#), thus a copy of the FreeRTOS code style's Uncrustify configuration (`uncrustify.cfg`) is stored within ESP-IDF FreeRTOS component.

If a FreeRTOS source file is modified, the updated file can be formatted again by following the steps below:

1. Ensure that Uncrustify (v0.69.0) is installed on your system
2. Run the following command on the update FreeRTOS source file (where `source.c` is the path to the source file that requires formatting).

```
uncrustify -c $IDF_PATH/components/freertos/FreeRTOS-Kernel/uncrustify.cfg --
↪replace source.c --no-backup
```

Documenting Code

Please see the guide here: [编写文档](#).

Structure

To be written.

Language Features

To be written.

8.5.2 为 ESP-IDF 安装 pre-commit 钩子

环境依赖

我们向 IDF 开发人员推荐 Python 3.8.* 及以上版本。

如果你已安装了不兼容的 Python 版本，应在安装 pre-commit 工具前进行更新。

安装 pre-commit 工具

运行 `pip install pre-commit`。

安装 pre-commit 钩子

1. 切换到 IDF 项目路径。
2. 运行 `pre-commit install --allow-missing-config -t pre-commit -t commit-msg` 命令。使用这种方式安装钩子后，即使在没有 `.pre-commit-config.yaml` 的分支中也能成功提交。
3. 在运行 `git commit` 命令时，pre-commit 钩子会自动运行。

卸载 pre-commit 钩子

运行 `pre-commit uninstall`。

更多

更多详细使用方法，请参考 [pre-commit](#) 文档。

Windows 用户常见问题

```
/usr/bin/env: python: Permission denied.
```

如果使用 Git Bash，请运行 `which python` 检查 Python 的可执行位置。

如果该可执行文件位于 `~/AppData/Local/Microsoft/WindowsApps/`，这其实是一个到 Windows 应用商店的链接，而不是真正的可执行文件。

请手动安装 Python，并在 PATH 环境变量中进行更新。

你的 USERPROFILE 中包含非 ASCII 字符

如果 pre-commit 的缓存路径包含非 ASCII 字符，用 pre-commit 为特定钩子初始化环境时可能会失败。解决方案是，将 `PRE_COMMIT_HOME` 设置为一个仅包含标准字符的路径，然后再运行 pre-commit。

- **CMD:** `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- **PowerShell:** `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- **git bash:** `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

8.5.3 编写文档

本文档简要总结了 `espressif/esp-idf` 库中的文档风格，并介绍了如何添加新文档。

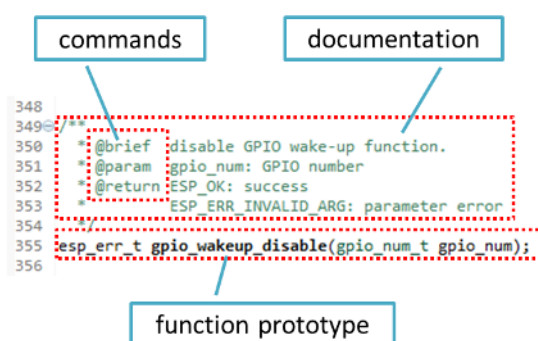

概述

为本仓库代码编写文档时，请遵循 [Doxygen style](#)，即在标准注释块中插入特殊命令，如 `@param`：

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen 能够解析代码，提取此类特殊命令及其后续文本，并基于提取的信息构建文档。

下图为一个包含函数文档的典型注释块：

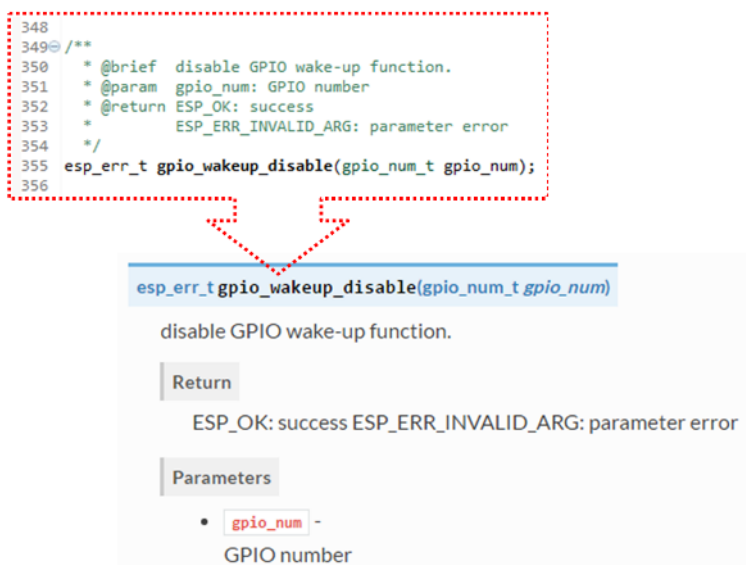

Doxygen 支持多种格式，并支持文档内部的多个详情级别，具有很强的灵活性。要了解更多可用功能，请参考 [Doxygen Manual](#)。

为什么要用 Doxygen?

我们的最终目的是保证代码文档的一致性。因此，我们可以使用 [Sphinx](#) 和 [Breathe](#) 等工具，在代码变更时自动更新 API 文档。

借助这些工具，以上代码的渲染效果如下：

试一试!

为 ESP-IDF 库添加代码时，请遵循以下标准：

1. 为代码的所有构件提供文档说明，包括函数、结构体、类型定义、枚举、宏等。对其目的、功能和局限性进行充分介绍，提供符合读者预期的良好体验。
2. 函数文档应说明该函数的作用。如果函数接受输入参数并返回值，也需要对输入参数和返回值进行解释。
3. 请勿在参数前添加数据类型或除空格外的任何字符。所有空格和换行符都会压缩为一个空格。如需换行，请换行两次。

```

41 //
42 * @brief Set log level for given tag
43 *
44 * If logging for given component has already been enabled, changes previous setting.
45 *
46 * @param tag Tag of the log entries to enable. Must be a non-NULL zero terminated string.
47 *           Value "" resets log level for all tags to the given value.
48 *
49 * @param level Selects log level to enable.
50 *             Only logs at this and lower levels will be shown.
51 */
52 void esp_log_level_set(const char* tag, esp_log_level_t level);

```

do not add data type

white spaces are compressed

a line break that will render

this line break will not render

```

void esp_log_level_set(const char*tag, esp_log_level_t level)

```

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Parameters

- **tag** - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "" resets log level for all tags to the given value.
- **level** - Selects log level to enable. Only logs at this and lower levels will be shown.

4. 在函数输入为空或不返回值时，无需插入 @param 或 @return 命令。

```

26 //
27 * @brief Initialize BT controller
28 *
29 * This function should be called only once,
30 * before any other BT functions are called.
31 */
32 void bt_controller_init(void);

```

```

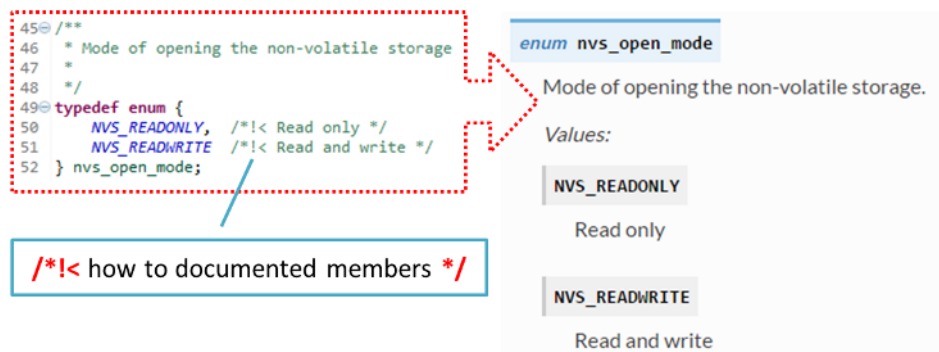

void bt_controller_init(void)

```

Initialize BT controller.

This function should be called only once, before any other BT functions are called.

5. 为 define struct 或 enum 的成员撰写文档时，需遵循以下格式在每个成员后添加注释。

6. 要渲染出整齐的列表，可在命令后换行（如以下代码示例中的 @return 命令）。

```

*
* @return
* - ESP_OK if erase operation was successful
* - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
* - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
* - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
* - other error codes from the underlying storage driver

```

7. 头文件或一组文件库的功能概述需在同一路径下单独的 README.rst 文档中进行描述。如该路径下还有其他 API 的头文件，则应将此头文件对应的 README 文件命名为 apiname-readme.rst。

进阶用法

也可以使用以下进阶技巧，产出更加优质使用的文档。

在编写代码时，请遵循以下标准：

1. 使用 @code{c} 和 @endcode 命令添加代码示例片段，阐述实现过程。

```

*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*

```

该代码片段应添加在其所说明的函数的注释区中。

2. 要高亮重点信息，可使用 @attention 或 @note 命令。

```

*
* @attention
* 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
* 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to
* ↪disconnect.
*

```

以上示例也展示了有序列表的用法。

3. 要描述一组具有相似功能的函数，可使用 /**@{*/ 和 /**@}*/ 标记命令。

```

/**@{*/
/**
* @brief common description of similar functions
*
* /

```

(下页继续)

```
void first_similar_function (void);
void second_similar_function (void);
/**@}*/
```

如需更多应用示例，请参考 [nvs_flash/include/nvs.h](#)。

- 如需进一步跳过重复定义或枚举等代码，可使用 `/** @cond */` 和 `/** @endcond */` 命令附上该代码。相关应用实例，请参考 [esp_driver_gpio/include/driver/gpio.h](#)。
- 使用 `markdown` 添加标题、链接和表格等，增强文档的可读性。

```
*
* [ESP32-H2 Technical Reference Manual] (https://www.espressif.com/sites/
* ↪default/files/documentation/esp32-h2_technical_reference_manual_en.pdf)
*
```

备注：如果没有将代码片段、说明或链接等内容包含在一个文档对象相关联的注释块中，则文档中不会出现相关内容。

- 为一个或多个完整代码示例提供说明。将说明写入单独的 `README.md` 文件中并放在 `examples` 路径下对应文件夹。

文档格式标准化

撰写代码文档文本时，请遵循以下标准，提供格式良好的 Markdown (.md) 或 reST (.rst) 文档。

- 确保将一个段落写在同一行。通过换行加强可读性仅适用于代码，请勿在文本中以下图形式换行。为方便阅读，建议在段落之间空一行。

图 1: 一个段落写在同一行 (点击放大)

图 2: 同一段落中请勿换行 (点击放大)

- 中英文文档行号需对齐，如下所示。这样做的好处是为作者和译者节省时间。非双语作者更新文档时，仅需更新对应中文或英文文档的同一行。对译者来说，如果英文文档出现更新，可快速定位对应中文文档需更新的位置。另外，通过比较英文和中文文档的总行数，可以快速检查文档的中文版是否落后于英文版本。

图 3: 对齐中英文文档行号 (点击放大)

构建文档

文档由基于 [Sphinx](#) 的 Python 包 `esp-docs` 进行构建。

安装命令:

```
pip install esp-docs
```

安装成功后, 使用如下命令在 `docs` 文件夹中构建文档:

```
build-docs build
```

或使用以下命令指定目标芯片和语言:

```
build-docs -t esp32 -l en build
```

如需深入了解 `esp-docs` 的功能, 请参考 [esp-docs](#)。

小结

出色的代码可以实现令人赞叹的功能, 精心编写的文档则让开发者们如虎添翼。

期待你的贡献!

相关文章

- [API 文档模板](#)

8.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目, 其他人可以将示例复制至本地, 并根据实际情况进行一定修改。请注意, 示例项目主要是为了展示 ESP-IDF 的功能。

示例项目结构

- `main` 目录需要包含一个名为 `(something)_example_main.c` 的源文件, 里面包含示例项目的主要功能。

- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 main 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。
- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 components 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 components 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)，并根据项目实际情况进行修改。
- 示例项目需要包含一个 example_test.py 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 [Pull Request](#) 的相关内容。

一般准则

示例代码需要遵循《[乐鑫物联网开发框架风格指南](#)》。

检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)。
- 示例项目中的函数和变量的命令要遵循[命名规范](#)中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 example 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或常量。
- 配置项可见 KConfig.projbuild 文件，该文件中包含一个名为“Example Configuration”的菜单。具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 in the public domain CC0）和免责声明。或者，源代码也可以应用 Apache License 2.0 许可条款。请查看现有示例项目的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 Apache License 2.0 协议。

8.5.5 API 文档模板

备注：说明

1. 使用此文件 ([docs/zh_CN/api-reference/template.rst](#)) 作为 API 参考文档模板。
 2. API 参考文档需和 API 的头文件名称保持一致。
 3. 使用 `..include::` 从 API 文件夹中添加相应的说明文件。
 - README.rst
 - example.rst
 - ...
 4. 可选择在此文件中直接提供描述。
 5. 完成后，删除所有的说明信息（类似本说明）和多余的头部信息。
-

概述

备注：撰写说明

1. 提供概述，简要说明 API 的用途和使用方法。
2. 必要时提供代码片段，以说明特定函数的功能。
3. 用此 [文档](#) 中介绍的方式区分不同的章节标题：
 - # 用于设置各部分，标题上下同时标记
 - * 用于设置章标题，标题上下同时标记
 - = 用于设置节标题
 - - 用于设置小节标题
 - ^ 用于设置小小节标题
 - " 用于设置段落标题

应用示例

备注：撰写说明

1. 准备一个或多个实际示例，展示此 API 的功能。
2. 每个示例应遵循 esp-idf/examples/ 文件夹中项目的模式。
3. 将示例放在此文件夹中，添加 README.md 文件。
4. 在 README.md 中对展示的功能进行概述。
5. 良好的概述让读者能够充分理解示例，而无需参考源代码。
6. 按照示例的复杂程度，将代码描述分解成几个部分，并对每部分的功能进行概述。
7. 必要时，添加流程图和应用程序的输出截图。
8. 最后为本章节的每个示例添加对应链接，示例文件夹应位于 esp-idf/examples/ 中。

API 参考

备注：撰写说明

1. ESP-IDF 仓库通过用 [Doxygen](#) 从头文件中检索代码标记的方式自动更新 API 参考文档。
2. 通过调用 Sphinx 扩展工具 esp_extensions/run_doxygen.py，对 [docs/doxygen/Doxyfile](#) 中 INPUT 语句列出的所有头文件进行更新。
3. INPUT 语句的每一行（以 ## 开头的注释除外）都包含一个到头文件 *.h 的路径，用于生成相应的 *.inc 文件：

```
##
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

4. 头文件被展开时，sdkconfig.h 中默认定义的宏以及在 SOC 特定 include/soc/*_caps.h 头文件中定义的宏都会被展开。这样，头文件就可以根据 IDF_TARGET 的值来添加或排除相关内容。
5. *.inc 文件中包含每次文档构建时自动生成的 API 成员格式化参考。所有 *.inc 文件都位于 Sphinx 的 _build 路径下。如需查看生成指令，以 esp_wifi.h 为例，运行 python gen-dxd.py esp32/include/esp_wifi.h。
6. 用以下语句在文档中显示 *.inc 文件的内容：

```
.. include-build-file:: inc/esp_wifi.inc
```

参考示例：[docs/en/api-reference/network/esp_wifi.rst](#)

7. 你也可以不用 *.inc 文件，而使用自己的方式描述 API。参考示例：[docs/en/api-reference/storage/fatfs.rst](#)。

以下为常见的 .. doxygen...:: 指令：

- 函数 - .. doxygenfunction:: name_of_function
- 联合体 - .. doxygenunion:: name_of_union
- 结构体 - .. doxygenstruct:: name_of_structure 和 :members:

- 宏 -... doxygendifine:: name_of_define
- 类定义 -... doxygentypedef:: name_of_type
- 枚举 -... doxygenenum:: name_of_enumeration

如需更多信息，请参考 [Breathe 文档](#)。

使用 `link custom role` 指令添加指向头文件的链接，如下所示：

```
* :component_file:`path_to/header_file.h`
```

8. 在任何情况下，要生成 API 参考文档，应该更新文件 `docs/doxygen/Doxyfile` 并将其中的路径更新为正在添加文档的 *.h 头文件的路径。
9. 更改提交并构建文档后，可以查看文档的渲染效果。如有需要，为相应的头文件 [纠正注释](#)。

8.5.6 贡献者协议

个人贡献者非独占性许可协议（包含传统专利许可选项）

感谢您以贡献者身份为托管在 GitHub 上的乐鑫项目（以下简称“乐鑫”）做出贡献。

本贡献者协议（以下简称“协议”）旨在将贡献者授予乐鑫的权利明确写入文档。要有效利用这份文档，请遵循 [贡献指南](#)。

1. 定义 **贡献者**是指向乐鑫提交贡献的个人版权所有人，本文中称“贡献者”或“您”。如果您以雇员身份提交贡献，且该贡献属于您的部分工作内容，您的雇主须已批准此协议，或作为实体签署此协议。

贡献是指您向乐鑫提交的、您拥有版权的原创作品（软件/文档），包括对既有工作进行的任何修改或补充。如果您没有该原创作品的完整版权，请在 GitHub 上向乐鑫提交评论。

版权是指在原创作品的整个存续期内（包括许可的延期），保护您所拥有或控制的原创作品的所有权利，包括版权、精神权、邻接权等，视具体情况而定。

材料是指乐鑫向第三方提供的软件或文档。当本协议涉及多个软件项目时，材料指您的贡献内容所提交到的软件或文档。在您提交贡献后，此贡献可能被包含在材料中。

提交是指向乐鑫发送的任何形式的实体、电子、或书面交流信息，包括但不限于由乐鑫管理或代表乐鑫管理的电子邮件列表、源代码控制系统和问题跟踪系统，但不包括您以显著方式标记或以其他书面形式指定为“非贡献”的交流内容。

提交日期是指您向乐鑫提交贡献的日期。

文档是指贡献中任何非软件的部分。

2. 版权许可 2.1 向乐鑫授予版权许可

根据本协议的条款和条件，对包含您贡献的版权，您在此授予乐鑫全球范围内免版权授权费、非独占、永久且不可撤销的版权许可，允许乐鑫无限次转让非独占性版权许可或向第三方转许可，以任何方式使用您的贡献，使用方式包括但不限于：

- 公开发布您的贡献
- 修改您的贡献内容，制作基于或包含贡献内容的衍生作品，以及将贡献内容并入其他软件代码中
- 复制原始或修改后的贡献内容
- 分发、公开、展示和公开演示您的原始贡献或修改后贡献

2.2 精神权在其受到承认的范围内不受影响，不受适用法免除。尽管如此，您仍可在贡献的源代码文件中添加自己的姓名。在使用您的贡献时，乐鑫尊重这一归属。

3. 专利许可 3.1 向乐鑫授予专利许可

根据本协议的条款和条件，您在此授予乐鑫全球范围内免专利授权费、非独占、永久且不可撤销（3.2 节所述情况除外）的专利许可，允许乐鑫无限次转让非独占性专利许可或向第三方转许可，从而制作、委托制作、使用、出售、许诺出售、进口、以其他方式转让贡献以及并入材料的贡献（或此结合产物的一部分）。本许可适用于您现在或此后拥有或控制的所有专利，如未经您的许可而制作、委托制作、使用、出售、许诺出售、进口、或以其他方式转让贡献本身或并入材料中的贡献，都将构成侵权。

3.2 撤回专利许可

如果乐鑫对您的贡献提出任何不出于防卫目的的侵权索赔，您保留撤回专利许可（如 3.1 条所述）的权利。如果某实体已向乐鑫或乐鑫的任何被许可人提出、维持或威胁进行专利侵权诉讼，或已自愿参与专利侵权诉讼，则乐鑫在此情况下向该实体提出的索赔应被视为出于“防卫目的”。

4. 免责声明 贡献以“原样”提供。具体地，所有明示和默示的保证条款，包括但不限于任何默示适销性保证、特定用途适用性和非侵权性保证条款，均由您对乐鑫和乐鑫对您双方互相明确表示免责。在任何此类保证不能被免责的情况下，此类保证的适用期限为法律允许的最短期限。

5. 间接损害豁免 在所适用的法律允许的最大范围内，对于本协议引起的任何利润损失、预期存款损失、数据丢失以及间接性、特殊性、偶然性、后果性和惩戒性损害，无论索赔所依据的法律或衡平法理论（合同、侵权或其他）如何，乐鑫或您在任何情况下均不承担责任。

6. 近似免责声明和损害豁免 如果第 4 节和第 5 节中提及的免责声明和间接损害豁免声明在当地适用法律下不具有法律效力，则复审法院应采用最接近于绝对免除所有与该贡献相关的民事责任的当地法律。

7. 协议期限 7.1 本协议在您接受条款和条件后生效。

7.2 如果本协议终止，第 4、5、6、7、8 条在本协议终止后仍然完全有效。为避免疑义，在本协议终止日前获得自由开源许可的贡献，在本协议终止后仍然完全有效。

8. 其他条款 8.1 本协议以及由本协议引起、或以任何方式与本协议有关的所有争议、索赔、法律行动、诉讼或其他程序，均应受中华人民共和国法律管辖，但不包括其国际私法条款。

8.2 本协议规定了您与乐鑫之间、关于您向乐鑫提供的贡献内容的完整协议，并且此协议的优先级高于其他所有正式或非正式协议。

8.3 如果本协议的任何条款被认定为无效或不可执行条款，该条款将尽量由最接近原始条款含义且可执行的条款取代。即使在本协议的基本目的或有限的补救措施失效的情况下，本协议中规定的条款和条件应仍在法律允许的最大范围内适用。

8.4 如果您了解到任何事实或情况可能影响本协议在某方面的准确性，您都同意将此事实或情况告知乐鑫。

8.5.7 版权标头指南

ESP-IDF 基于 [the Apache License 2.0](#)，并包含一些不同许可证下的第三方版权代码。要了解更多信息，请参考 [Copyrights and Licenses](#)。

本页面介绍了如何在源代码中正确标注版权标头。ESP-IDF 使用 [Software Package Data Exchange \(SPDX\)](#) 格式，简短易读，能够方便自动化工具处理及进行版权检查。

如何检查版权标头

请确保你已安装了包含版权标头检查器的 [pre-commit hooks](#)。若该检查器无法检测到格式正确的 [SPDX](#) 标头，则会提供标头建议。

检查器的建议不正确怎么办

再好的自动化检查工具都无法取代人工检查。因此，开发者有责任修改检查器提供的标头，使其符合源代码的法律规范和许可证要求。某些许可证可能并不兼容，请参考后文示例。

检查器由 `tools/ci/check_copyright_config.yaml` 进行配置。请检查该配置文件提供的选项，并根据实际情况进行更新，以正确匹配标头。

常见版权标头示例

最简单的情况是，你的代码不基于任何此前已获得许可的代码，例如你完全独立完成的代码。此类代码可以使用如下版权标头，并放在 [ESP-IDF](#) 许可证下：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Apache-2.0
 */
```

ESP-IDF 限制性较小的部分 ESP-IDF 的某些部分特意采用了限制性较小的许可证，方便在商业闭源代码项目中重复使用。例如公有域下或免费知识共享 (CC0) 许可下的 [ESP-IDF examples](#)。此类源文件可使用如下标头：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Unlicense OR CC0-1.0
 */
```

如允许使用多个许可证，可采用关键字 `OR` 连接，如上例所示。这可以通过在 `tools/ci/check_copyright_config.yaml` 配置文件中定义多个许可实现。但是，请谨慎使用该方法，并仅在 [ESP-IDF](#) 项目限制性较小的部分中选择性使用。

第三方许可证 受到不同许可证许可，经乐鑫修改，并包含在 ESP-IDF 中的代码不能使用 Apache License 2.0 进行许可，即便检查器可能提出此类建议。建议保留原有版权标头，并在前面添加 SPDX 标识。

例如，对于一个由“GNU General Public License v2.0 及以上”许可证许可、John Doe 持有、且由 Espressif Systems 做出额外修改的代码文件，请按照如下示例提供标头：

```
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 *
 * SPDX-License-Identifier: GPL-2.0-or-later
 *
 * SPDX-FileContributor: 2019-2023 Espressif Systems (Shanghai) CO LTD
 */
```

这些许可证能够得到识别，并且可以在官方 [SPDX license list](#) 中找到 SPDX 标识符。其他常见许可证还包括 GPL-2.0-only, BSD-3-Clause 和 BSD-2-Clause。

特殊情况下，如果一个许可证没有包含在 [SPDX license list](#) 中，可使用 `LicenseRef-[idString]` 自定义许可证标识符，如以下示例中的 `LicenseRef-Special-License`。另外，必须把完整的许可文本添加到 `Special-License` 文件夹下的 `LICENSES` 路径中：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: LicenseRef-Special-License
 */
```

如果自定义许可证直接包含在源文件中，可使用专门的自定义许可证标识符 `LicenseRef-Included` 进行说明：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: LicenseRef-Included
 *
 * <Full custom license text>
 */
```

`tools/ci/check_copyright_config.yaml` 中的配置为第三方许可证提供了许多有用的功能：

- 对第三方程序库的文件部分，可以定义一个不同的许可证。
- 可以永久禁用对选定文件集的检查。请谨慎使用该选项，并且仅在其他选项都不适用时，才可使用该选项。

8.5.8 ESP-IDF pytest 指南

ESP-IDF 有多种类型的测试需在 ESP 芯片上执行（即 **目标测试**）。目标测试通常作为 IDF 测试项目（即 **测试应用程序**）的一部分进行编译，在这个过程中，测试应用程序和其他标准 IDF 项目遵循同样的构建、烧写和监控流程。

通常，目标测试需要连接一台主机（如个人电脑），负责触发特定的测试用例、提供测试数据、检查测试结果。

ESP-IDF 在主机端使用 `pytest` 框架（以及一些 `pytest` 插件）来自动进行目标测试。本文档介绍 ESP-IDF 中的 `pytest`，并介绍以下内容：

1. ESP-IDF 中不同类型的测试应用程序。
2. 将 `pytest` 框架应用于 Python 测试脚本，进行自动化目标测试。
3. ESP-IDF CI (Continuous Integration) 板载测试流程。
4. 使用 `pytest` 在本地执行目标测试。
5. `pytest` 的使用技巧。

备注: ESP-IDF 默认使用以下插件:

- [pytest-embedded](#) 和默认服务 `esp,idf`
- [pytest-rerunfailures](#)

本文档介绍的所有概念和用法都基于 ESP-IDF 的默认配置, 并非都适用于原生 `pytest`。

安装

所有依赖项都可以通过执行安装脚本的 `--enable-pytest` 进行安装:

```
$ install.sh --enable-pytest
```

安装过程常见问题

No Package 'dbus-1' Found

```
configure: error: Package requirements (dbus-1 >= 1.8) were not met:
No package 'dbus-1' found
Consider adjusting the PKG_CONFIG_PATH environment variable if you
installed software in a non-standard prefix.
```

如果遇到上述错误信息, 可能需要安装一些缺失的软件包。

如果使用 Ubuntu 系统, 可能需要执行:

```
sudo apt-get install libdbus-glib-1-dev
```

或

```
sudo apt-get install libdbus-1-dev
```

如使用 Linux 其他发行版本, 请在搜索引擎中查询上述错误信息, 并查找对应发行版需安装哪些缺失的软件包。

Invalid command 'bdist_wheel'

```
error: invalid command 'bdist_wheel'
```

如果遇到上述错误信息, 可能需要安装一些缺失的 Python 包, 例如:

```
python -m pip install -U pip
```

或

```
python -m pip install wheel
```

备注: 执行 `pip` 命令前, 请确保使用的环境为 IDF Python 虚拟环境。

测试应用程序

ESP-IDF 包含不同类型的测试应用程序, 可用 `pytest` 自动完成。

组件测试 ESP-IDF 组件通常包含针对特定组件的测试应用程序，执行针对特定组件的单元测试。推荐通过组件测试应用程序来测试组件。所有测试应用程序都应位于 `${IDF_PATH}/components/<COMPONENT_NAME>/test_apps` 下，例如：

```

components/
├── my_component/
│   ├── include/
│   │   └── ...
│   ├── test_apps/
│   │   ├── test_app_1
│   │   │   ├── main/
│   │   │   │   └── ...
│   │   │   ├── CMakeLists.txt
│   │   │   └── pytest_my_component_app_1.py
│   │   ├── test_app_2
│   │   │   ├── ...
│   │   │   └── pytest_my_component_app_2.py
│   │   └── parent_folder
│   │       ├── test_app_3
│   │       │   ├── ...
│   │       │   └── pytest_my_component_app_3.py
│   │       └── ...
│   ├── my_component.c
│   └── CMakeLists.txt

```

例程测试 例程测试是为了向用户展示 ESP-IDF 的部分功能（要了解更多信息，请参考 [Examples Readme](#)）。

但是，要确保这些例程正确运行，可将例程看作测试应用，并用 `pytest` 自动执行。所有例程都应和已测试的例程，包括 Python 测试脚本一起放在 `${IDF_PATH}/examples` 路径下，例如：

```

examples/
├── parent_folder/
│   └── example_1/
│       ├── main/
│       │   └── ...
│       ├── CMakeLists.txt
│       └── pytest_example_1.py

```

自定义测试 自定义测试是为了测试 ESP-IDF 的一些任意功能，这些测试不是为了向用户展示 ESP-IDF 的功能。

所有自定义测试应用都位于 `${IDF_PATH}/tools/test_apps` 路径下。要了解更多信息，请参考 [Custom Test Readme](#)。

在 ESP-IDF 中使用 `pytest`

pytest 执行步骤

1. 引导阶段

创建会话缓存：

- 端口目标缓存
- 端口应用缓存

2. 数据获取阶段

- A. 获取所有前缀为 `pytest_` 的 Python 文件。
- B. 获取所有前缀为 `test_` 的测试函数。
- C. 应用 `params`，并复制测试函数。
- D. 利用 CLI 选项筛选测试用例。详细用法请参考 [筛选测试用例](#)。

3. 运行阶段

- A. 创建 `fixture`。在 ESP-IDF 中，常见 `fixture` 的初始化顺序如下：
 - a. `pexpect_proc`: `pexpect` 实例
 - b. `app`: `IdfApp` 实例
此阶段会解析测试应用程序的相关信息，如 `sdkconfig`、`flash_files`、`partition_table` 等。
 - c. `serial`: `IdfSerial` 实例
此阶段会自动检测目标芯片所连接的主机端口。考虑到主机可能连接了多个目标芯片，应用程序会解析测试目标芯片的类型。测试程序的二进制文件会自动烧写到测试目标芯片上。
 - d. `dut`: `IdfDut` 实例
- B. 运行测试函数。
- C. 析构 `fixture`。析构顺序如下：
 - a. `dut`
 - i. 关闭 `serial` 端口。
 - ii. (仅适用于使用了 `Unity` 测试框架 的应用程序) 生成 `Unity` 测试用例的 JUnit 报告。
 - b. `serial`
 - c. `app`
 - d. `pexpect_proc`: 关闭文件描述符
- D. (仅适用于使用了 `Unity` 测试框架 的应用程序)
如果调用了 `dut.expect_from_unity_output()`，那么检测到 `Unity` 测试失败时会触发 `AssertionError`。

4. 报告阶段

- A. 为测试函数生成 Junit 报告。
 - B. 将 JUnit 报告中的测试用例名修改为 ESP-IDF 测试用例 ID 格式: `<target>.<config>.<test function name>`。
5. 完成阶段 (仅适用于使用了 `Unity` 测试框架 的应用程序)
如果生成了 `Unity` 测试用例的 JUnit 报告，这些报告会被合并。

入门示例 以下 Python 测试脚本示例来自 `pytest_console_basic.py`。

```
@pytest.mark.esp32
@pytest.mark.esp32c3
@pytest.mark.generic
@pytest.mark.parametrize('config', [
    'history',
    'nohistory',
], indirect=True)
def test_console_advanced(config: str, dut: IdfDut) -> None:
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

下面的小节对这个简单的测试脚本进行了逐行讲解，以说明 `pytest` 在 ESP-IDF 测试脚本中的典型使用方法。

目标芯片 marker 使用 `Pytest marker` 可以指出某个特定测试用例应在哪个目标芯片 (即 ESP 芯片) 上运行。例如:

```
@pytest.mark.esp32      # <-- support esp32
@pytest.mark.esp32c3   # <-- support esp32c3
@pytest.mark.generic    # <-- test env "generic"
```

上例表明，某一测试用例可以在 ESP32 和 ESP32-C3 上运行。此外，目标芯片的类型应为 `generic`。要了解有关 `generic` 类型，运行 `pytest --markers` 以获取所有 `marker` 的详细信息。

备注：如果测试用例可以在 ESP-IDF 官方支持的所有目标芯片上运行(调用 `idf.py --list-targets` 了解详情)，则可以使用特殊 `marker supported_targets` 指定所有目标芯片。

参数化 marker 可使用 `pytest.mark.parametrize` 和 `config` 参数对包含不同 `sdkconfig` 文件的不同应用程序进行相同的测试。如需了解关于 `sdkconfig.ci.xxx` 文件的更多信息，请参考 `readme` 下的 `Configuration Files` 章节。

```
@pytest.mark.parametrize('config', [
    'history',      # <-- run with app built by sdkconfig.ci.history
    'nohistory',   # <-- run with app built by sdkconfig.ci.nohistory
], indirect=True) # <-- `indirect=True` is required
```

总体而言，这一测试函数会复制为 4 个测试用例：

- `esp32.history.test_console_advanced`
- `esp32.nohistory.test_console_advanced`
- `esp32c3.history.test_console_advanced`
- `esp32c3.nohistory.test_console_advanced`

测试串行输出 为确保测试在目标芯片上顺利执行，测试脚本可使用 `dut.expect()` 函数来测试目标芯片上的串行输出：

```
def test_console_advanced(config: str, dut: IdfDut) -> None: # The value of _
    ←argument `config` is assigned by the parameterization.
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

在执行 `dut.expect(...)` 时，首先会将预期字符串编译成正则表达式用于搜索串行输出结果，直到找到与该编译后的正则表达式匹配的结果或运行超时。

如果预期字符串中包含正则表达式关键字（如括号或方括号），则需格外注意。或者，也可以使用 `dut.expect_exact(...)`，它会尝试直接匹配字符串，而不将其转换为正则表达式。

如需了解关于 `expect` 函数类型的更多信息，请参考 [pytest-embedded Expecting documentation](#)。

进阶示例

用同一应用程序进行多个 DUT 测试 有时，一个测试可能涉及多个运行同一测试程序的目标芯片。在这种情况下，可以使用 `parameterize` 将多个 DUT 实例化，例如：

```
@pytest.mark.esp32s2
@pytest.mark.esp32s3
@pytest.mark.usb_host
@pytest.mark.parametrize('count', [
    2,
], indirect=True)
def test_usb_host(dut: Tuple[IdfDut, IdfDut]) -> None:
    device = dut[0] # <-- assume the first dut is the device
    host = dut[1]  # <-- and the second dut is the host
    ...
```

将参数 `count` 设置为 2 后，所有 `fixture` 都会改为元组。

用不同应用程序进行多个 DUT 测试 有时（特别是协议测试），一个测试可能涉及多个运行不同测试程序的目标芯片（例如不同目标芯片作为主机和从机）。在这种情况下，可以使用 `parameterize` 将针对不同测试应用程序的多个 DUT 实例化。

以下代码示例来自 `pytest_wifi_getting_started.py`。

```
@pytest.mark.esp32
@pytest.mark.multi_dut_generic
@pytest.mark.parametrize(
    'count, app_path', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}'),
        ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

以上示例中，第一个 DUT 用 `softAP` 应用程序烧录，第二个 DUT 用 `station` 应用程序烧录。

备注： 这里的 `app_path` 应设置为绝对路径。Python 中的 `__file__` 宏会返回测试脚本自身的绝对路径。

用不同应用程序和目标芯片进行多目标测试 以下代码示例来自 `pytest_wifi_getting_started.py`。如注释所述，该代码目前尚未在 ESP-IDF CI 中运行。

```
@pytest.mark.parametrize(
    'count, app_path, target', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}|',
         'esp32|esp32s2'),
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}|',
         'esp32s2|esp32'),
        ],
        indirect=True,
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

总体而言，此测试函数会被复制为 2 个测试用例：

- 在 ESP32 上烧录 `softAP`，在 ESP32-S2 上烧录 `station`
- 在 ESP32-S2 上烧录 `softAP`，在 ESP32 上烧录 `station`

支持对不同 `sdkconfig` 文件及目标芯片的组合测试 以下进阶代码示例来自 `pytest_panic.py`。

```
CONFIGS = [
    pytest.param('coredump_flash_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_flash_elf_sha', marks=[pytest.mark.esp32]), # sha256_
↪only supported on esp32
    pytest.param('coredump_uart_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
```

(下页继续)

```

    pytest.param('coredump_uart_elf_crc', marks=[pytest.mark.esp32, pytest.mark.
↳ esp32s2]),
    pytest.param('gdbstub', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('panic', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
]

@pytest.mark.parametrize('config', CONFIGS, indirect=True)
...

```

自定义类 通常，可能会在下列情况下编写自定义类：

1. 向一定数量的 DUT 添加更多可复用功能。
2. 为不同阶段添加自定义的前置和后置函数，请参考章节 [pytest 执行步骤](#)。

以下代码示例来自 [panic/confstest.py](#)。

```

class PanicTestDut (IdfDut):
    ...

@pytest.fixture(scope='module')
def monkeypatch_module(request: FixtureRequest) -> MonkeyPatch:
    mp = MonkeyPatch()
    request.addfinalizer(mp.undo)
    return mp

@pytest.fixture(scope='module', autouse=True)
def replace_dut_class(monkeypatch_module: MonkeyPatch) -> None:
    monkeypatch_module.setattr('pytest_embedded_idf.dut.IdfDut', PanicTestDut)

```

`monkeypatch_module` 提供了一个 [基于模块](#) 的 `monkeypatch` fixture。

`replace_dut_class` 是一个 [基于模块](#) 的 [自动执行](#) fixture。该函数会用你的自定义类替换 `IdfDut` 类。

标记不稳定测试 某些测试用例基于以太网或 Wi-Fi。然而由于网络问题，测试可能会不稳定。此时，可以将某个测试用例标记为不稳定的测试用例。

以下代码示例来自 [pytest_esp_eth.py](#)。

```

@pytest.mark.flaky(reruns=3, reruns_delay=5)
def test_esp_eth_ip101(dut: IdfDut) -> None:
    ...

```

这一 `marker` 表示，如果该测试函数失败，其测试用例会每隔 5 秒钟再运行一次，最多运行三次。

标记已知失败 有时，测试会因以下原因而持续失败：

- 测试的功能（或测试本身）存在错误。
- 测试环境不稳定（例如网络问题），导致失败率较高。

可使用 `xfail` `marker` 来标记此测试用例，并写出原因。

以下代码来自 [pytest_panic.py](#)。

```

@pytest.mark.xfail('config.getvalue("target") == "esp32s2"', reason='raised_
↳ IllegalInstruction instead')
def test_cache_error(dut: PanicTestDut, config: str, test_func_name: str) -> None:

```

这一 `marker` 表示该测试在 ESP32-S2 上是一个已知失败。

标记夜间运行的测试用例 在缺少 runner 时，一些测试用例仅在夜间运行的管道中触发。

```
@pytest.mark.nightly_run
```

这一 marker 表示，此测试用例仅在环境变量为 NIGHTLY_RUN 或 INCLUDE_NIGHTLY_RUN 时运行。

标记在 CI 中暂时禁用的测试用例 在缺少 runner 时，可以在 CI 中禁用一些本地能够通过测试的测试用例。

```
@pytest.mark.temp_skip_ci(targets=['esp32', 'esp32s2'], reason='lack of runners')
```

这一 marker 表明，此测试用例仍可以在本地用 `pytest --target esp32` 执行，但不会在 CI 中执行。

运行 Unity 测试用例 对基于组件的单元测试应用程序，以下代码即可执行所有的单板测试用例，包括普通测试用例和多阶段测试用例：

```
def test_component_ut(dut: IdfDut):
    dut.run_all_single_board_cases()
```

此代码还会跳过所有 tag 为 [ignore] 的测试用例。

如需按组执行测试用例，可运行：

```
def test_component_ut(dut: IdfDut):
    dut.run_all_single_board_cases(group='psram')
```

此代码会触发模块包含 [psram] tag 的所有测试用例。

你可能还会看到一些包含以下语句的测试脚本，这些脚本已被弃用。请使用上述建议的方法。

```
def test_component_ut(dut: IdfDut):
    dut.expect_exact('Press ENTER to see the list of tests')
    dut.write('*')
    dut.expect_unity_test_output()
```

如需了解关于 ESP-IDF 单元测试的更多内容，请参考 [ESP32-H2 中的单元测试](#)。

在 CI 中执行测试

CI 的工作流程很简单，即编译任务 -> 板载测试任务。

编译任务

编译任务命名

- 基于组件的单元测试: `build_pytest_components_<target>`
- 例程测试: `build_pytest_examples_<target>`
- 自定义测试: `build_pytest_test_apps_<target>`

编译任务命令 CI 用于创建所有相关测试的命令为: `python $IDF_PATH/tools/ci/ci_build_apps.py <parent_dir> --target <target> -vv --pytest-apps`

所有支持指定目标芯片的应用程序都使用 `build_<target>_<config>` 下支持的 `sdkconfig` 文件创建。

例如，如果运行 `python $IDF_PATH/tools/ci/ci_build_apps.py $IDF_PATH/examples/system/console/basic --target esp32 --pytest-apps` 指令，文件夹结构将如下所示：

```

basic
├── build_esp32_history/
│   └── ...
├── build_esp32_nohistory/
│   └── ...
├── main/
├── CMakeLists.txt
├── pytest_console_basic.py
└── ...

```

所有编译文件的文件夹都会上传到同一路径。

板载测试任务

板载测试任务命名

- 基于部件的单元测试: `component_ut_pytest_<target>_<test_env>`
- 例程测试: `example_test_pytest_<target>_<test_env>`
- 自定义测试: `test_app_test_pytest_<target>_<test_env>`

板载测试任务命令 CI 用于执行所有相关测试的命令为: `pytest <parent_dir> --target <target> -m <test_env_marker>`

这一命令将执行父文件夹下所有具有指定目标芯片 `marker` 和测试环境 `marker` 的测试用例。

板载测试任务中的二进制文件是从编译任务中下载的，相应文件会放在同一路径下。

本地测试

首先，你需为 ESP-IDF 安装 Python 依赖：

```

$ cd $IDF_PATH
$ bash install.sh --enable-pytest
$ ./export.sh

```

默认情况下，`pytest` 脚本会按照以下顺序查找编译目录：

- `build_<target>_<sdkconfig>`
- `build_<target>`
- `build_<sdkconfig>`
- `build`

因此，运行 `pytest` 最简单的方式是调用 `idf.py build`。

例如，如果你要执行 `$IDF_PATH/examples/get-started/hello_world` 文件夹下的所有 ESP32 测试，你可执行：

```

$ cd examples/get-started/hello_world
$ idf.py build
$ pytest --target esp32

```

如果你的测试应用程序中有多个 `sdkconfig` 文件，例如那些 `sdkconfig.ci.*` 文件，仅使用 `idf.py build` 命令并不能调用这些额外的 `sdkconfig` 文件。下文以 `$IDF_PATH/examples/system/console/basic` 为例进行说明。

如果要用 `history` 配置测试此应用程序，并用 `idf.py build` 进行编译，你需运行：

```

$ cd examples/system/console/basic
$ idf.py -DSDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig.ci.history" build
$ pytest --target esp32 --sdkconfig history

```

如果你想同时编译测试所有 `sdkconfig` 文件，则需运行我们的 CI 脚本 (`ci_build_apps.py`) 作为辅助脚本：

```
$ cd examples/system/console/basic
$ python $IDF_PATH/tools/ci/ci_build_apps.py . --target esp32 -vv --pytest-apps
$ pytest --target esp32
```

包含 `sdkconfig.ci.history` 配置的应用程序会编译到 `build_esp32_history` 中，而包含 `sdkconfig.ci.nohistory` 配置的应用程序会编译到 `build_esp32_nohistory` 中。`pytest --target esp32` 命令会在这两个应用程序上运行测试。

使用技巧

筛选测试用例

- 根据目标芯片筛选：`pytest --target <target>`
`pytest` 会执行所有支持指定目标芯片的测试用例。
- 根据 `sdkconfig` 文件筛选：`pytest --sdkconfig <sdkconfig>`
如果 `<sdkconfig>` 为 `default`，`pytest` 会执行所有 `sdkconfig` 文件包含 `sdkconfig.defaults` 的测试用例。
如果是其他情况，`pytest` 会执行所有 `sdkconfig` 文件包含 `sdkconfig.ci.<sdkconfig>` 的测试用例。
- 使用 `pytest -k <test-case name>` 按测试用例名称筛选，可以运行单个测试用例，例如 `pytest -k test_int_wdt_cache_disabled`。

添加新 marker 我们目前使用两种自定义 `marker`。`target marker` 是指测试用例支持此目标芯片，`env marker` 是指测试用例应分配到 CI 中具有相应 `tag` 的 `runner` 上。

你可以在 `/${IDF_PATH}/conftest.py` 文件后添加一行新的 `marker`。如果该 `marker` 是 `target marker`，应将其添加到 `TARGET_MARKERS` 中。如果该 `marker` 指定了一类测试环境，应将其添加到 `ENV_MARKERS` 中。自定义 `marker` 格式：`<marker_name>: <marker_description>`。

生成 JUnit 报告 你可调用 `pytest` 执行 `--junitxml <filepath>` 生成 JUnit 报告。在 ESP-IDF 中，测试用例命名会统一为 `<target>.<config>.<function_name>`。

跳过自动烧录二进制文件 调试测试脚本时最好跳过自动烧录二进制文件。

调用 `pytest` 执行 `--skip-autoflash y` 即可实现。

记录数据 在执行测试时，你有时需要记录一些数据，例如性能测试数据。

在测试脚本中使用 `record_xml_attribute` fixture，数据就会记录在 JUnit 报告的属性中。

日志系统 在执行测试用例时，你有时可能需要添加一些额外的日志行。

这可通过使用 [Python 日志模块](#) 实现。

其他日志函数（作为 fixture）

`log_performance`

```
def test_hello_world(
    dut: IdfDut,
    log_performance: Callable[[str, object], None],
) -> None:
    log_performance('test', 1)
```

以上示例可实现用预定义格式 [performance][test]: 1 记录性能数据，并在指定 --junitxml <filepath> 的情况下将其记录在 JUnit 报告的 properties tag 下。相应的 JUnit 测试用例节点如下所示：

```
<testcase classname="examples.get-started.hello_world.pytest_hello_world" file=
↳"examples/get-started/hello_world/pytest_hello_world.py" line="13" name="esp32.
↳default.test_hello_world" time="8.389">
  <properties>
    <property name="test" value="1"/>
  </properties>
</testcase>
```

check_performance 我们提供了 TEST_PERFORMANCE_LESS_THAN 和 TEST_PERFORMANCE_GREATER_THAN 宏来记录性能项，并检测性能项的数值是否在有效范围内。有时 C 宏无法检测一些性能项的值，为此，我们提供了 Python 函数实现相同的目的。注意，由于该 Python 函数不能很好地识别不同的 ifdef 块下同一性能项的阈值，请尽量使用 C 宏。

```
def test_hello_world(
    dut: IdfDut,
    check_performance: Callable[[str, float, str], None],
) -> None:
    check_performance('RSA_2048KEY_PUBLIC_OP', 123, 'esp32')
    check_performance('RSA_2048KEY_PUBLIC_OP', 19001, 'esp32')
```

以上示例会首先从 [components/idf_test/include/idf_performance.h](#) 和指定目标芯片的 [components/idf_test/include/esp32/idf_performance_target.h](#) 头文件中获取性能项 RSA_2048KEY_PUBLIC_OP 的阈值，然后检查该值是否达到了最小值或超过了最大值。

例如，假设 IDF_PERFORMANCE_MAX_RSA_2048KEY_PUBLIC_OP 的值为 19000，则上例中第一行 check_performance 会通过测试，第二行会失败并警告：[Performance] RSA_2048KEY_PUBLIC_OP value is 19001, doesn't meet pass standard 19000. 0。

Chapter 9

ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 master 分支。
如有量产需求，请使用稳定版本。

9.1 发布版本

通过以下链接，可以访问各个版本的配套文档：

- 最新稳定版 ESP-IDF：https://docs.espressif.com/projects/esp-idf/zh_CN/stable/
- 最新版 ESP-IDF（即 master 分支）：https://docs.espressif.com/projects/esp-idf/zh_CN/latest/

ESP-IDF 在 GitHub 平台上的完整发布历史请见 [发布说明页面](#)。该页面支持查看各个版本的发布说明、配套文档及相应获取方式。

9.2 我该选择哪个版本？

- 如有量产需求，请使用 [最新稳定版本](#)。稳定版本已通过人工测试，后续更新仅修复 bug，主要特性不受影响（更多详情，请见 [版本管理](#)）。请访问 [发布说明页面](#) 界面查看每一个稳定发布版本。另外，为确保使用的 ESP-IDF 版本与需生产的芯片版本兼容，可参考 [ESP-IDF 版本与乐鑫芯片版本兼容性](#)。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 [最新版本（在 master 分支上）](#)。最新版本包含 ESP-IDF 的所有最新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 master 分支更新的影响，可以按照需求选择一个最适合的稳定版本，将其 [更新至一个预发布版本](#) 或 [更新至一个发布分支](#)。
- 如需使用其他基于 ESP-IDF 的项目，请先查看该项目的文档，以确定其兼容的 ESP-IDF 版本。

有关如何更新 ESP-IDF 本地副本的内容，请参考 [更新 ESP-IDF](#) 章节。

9.3 版本管理

ESP-IDF 采用了 [语义版本管理方法](#)，你可以从字面含义理解每个版本的差异。其中

- 主要版本（例 v3.0）代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。升级至一个新的主要版本（例 v2.1 升级至 v3.0）意味着你可能需要更新工程代码，并重新测试工程，具体可参考 [发布说明页面](#) 的重大变更 (Breaking Change) 部分。
- 次要版本（例 v3.1）代表有新增特性和 bug 修复，但现有特性不受影响，公开 API 的使用也不受影响。

升级至一个新的次要版本（例 v3.0 升级至 v3.1）意味着你可能不需要更新工程代码，但需重新测试工程，特别是 [发布说明页面](#) 中专门提到的部分。

- **Bugfix** 版本（例 v3.0.1）仅修复 bug，并不增加任何新特性。

升级至一个新的 **Bugfix** 版本（例 v3.0 升级至 v3.0.1）意味着你不需要更新工程代码，仅需测试与本次发布修复 bug（列表见 [发布说明页面](#)）直接相关的特性。

9.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

[支持期限政策](#) 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

[发布说明页面](#) 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如果你刚开始一个新项目，建议使用最新稳定版本。
- 如果你有 GitHub 账号，请点击 [发布说明页面](#) 界面右上角的“Watch”按钮，并选中“Releases only”选项。GitHub 将会在新版本发布的时候发送通知。当你所使用的版本有 **Bugfix** 版本发布时，请做好升级至该 **Bugfix** 版本的规划。
- 如可能，请定期（如每年一次）将项目的 IDF 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保你所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日期起。

在支持期限内意味着 ESP-IDF 团队将继续在 GitHub 的发布分支上进行 bug 修复、安全修复等，并根据需要定期发布新的 **Bugfix** 版本。

支持期限分为“服务期”和“维护期”：

周期	时长	是否推荐新工程使用
服务期	12 个月	是
维护期	18 个月	否

在服务期内，**Bugfix** 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 bug 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在所用版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 bug 修复。

支持期限不包括预发布版本（betas、预览版、-rc 和 -dev 版等），有时会将某个特性在发布版中标记为“预览版”，这意味着该特性也不在支持期限内。

关于 [不同版本的 ESP-IDF](#)（主要版本、次要版本、**Bugfix** 版本等）的更多信息，请参考 ESP-IDF 编程指南。

9.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 `idf.py` 命令：

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此你也可以使用宏 `IDF_VER` 查看 ESP-IDF 的版本（以字符串的格式）。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 *compile-time macros* 检查版本。

几个 ESP-IDF 版本的例子：

版本字符串	含义
v3.2-dev-306-gbeb3611ca	<p>master 分支上的预发布版本。</p> <ul style="list-style-type: none"> - v3.2-dev: 为 v3.2 进行的开发。 - 306: v3.2 开发启动后的 commit 数量。 - beb3611ca: commit 标识符。
v3.0.2	稳定版本，标签为 v3.0.2。
v3.1-beta1-75-g346d6b0ea	<p>v3.1 的 beta 测试版本（可参考更新至一个发布分支）。</p> <ul style="list-style-type: none"> - v3.1-beta1 - 预发布标签。 - 75: 添加预发布 beta 标签后的 commit 数量。 - 346d6b0ea: commit 标识符。
v3.0.1-dirty	<p>稳定版本，标签为 v3.0.1。</p> <ul style="list-style-type: none"> - dirty 代表 ESP-IDF 的本地副本有修改。

9.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 `master` 分支（最新版本）上进行。`master` 分支上的 ESP-IDF 版本总带有 `-dev` 标签，表示“正在开发中”，例 `v3.1-dev`。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 `master` 分支上进行）并达到进入 `beta` 测试的标准，则将该版本切换至一个新分支（例 `release/v3.1`）。此外，该分支还打上预发布标签（例 `v3.1-beta1`）。你可以在 GitHub 平台上查看 ESP-IDF 的完整 [分支列表](#) 和 [标签列表](#)。`Beta` 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 `beta` 版本的不断测试，`bug` 修复将同时增加至该发布分支和 `master` 分支。而且，`master` 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 `rc` 标签，代表候选发布（Release Candidate），例 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 `bug`，则该预发布版本将最终增加“主要版本”（例 `v4.0`）或“次要版本”标记（例 `v3.1`），成为正式发布版本，并体现在 [发布说明页面](#)。
- 后续，发布版本中发现的 `bug` 都将在该发布分支上进行修复。
- 发布分支上会定期进行 `bug` 修复，人工测试完成后，该分支将增加一个 `Bugfix` 版本标签（例 `v3.1.1`），并体现在 [发布说明页面](#)。

9.7 更新 ESP-IDF

请根据实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考[更新至一个稳定发布版本](#)。
- 如需测试/研发/尝试最新特性，建议参考[更新至 `master` 分支](#)。
- 两者折衷建议参考[更新至一个发布分支](#)。

备注： 在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考[入门指南](#) 中的介绍。

9.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 [发布说明页面](#)，了解最新发布情况。
- 如有新发布的 `Bugfix` 版本（例 `v3.0.1` 或 `v3.0.2`）时，请将新的 `Bugfix` 版本更新至你的 ESP-IDF 目录。
- 在 Linux 或 macOS 系统中，请运行如下命令将分支更新至 `vX.Y.Z`：

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在 Windows 系统中，需要将 `cd $IDF_PATH` 替换为 `cd %IDF_PATH%`。
- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级版本。具体命令与上方描述一致。

备注： 如果你在安装 ESP-IDF 时使用的是 `zip` 文件包，而非通过 `Git` 命令，则将无法使用 `Git` 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 `zip` 文件包，并替换掉之前 `IDF_PATH` 下的全部内容。

9.7.2 更新至一个预发布版本

你也可以将你的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考[更新至一个稳定发布版本](#) 中的描述。

预发布版本通常不体现在 [发布说明页面](#)。更多详情，请查看完整 [标签列表](#)。使用预发布版本的注意事项，请参考[更新至一个发布分支](#) 中的描述。

9.7.3 更新至 master 分支

备注：ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在“流血的边缘试探”，存在一定风险。

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 在 Linux 或 macOS 系统中，使用如下命令在本地切换至 master 分支：

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 在 Windows 系统中，需要将 `cd $IDF_PATH` 替换为 `cd %IDF_PATH%`。
- 此外，你还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，你可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

重要：强烈建议定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本得到及时更新。旧的 master 分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考[更新至一个发布分支](#)。

9.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但也同时保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 GitHub 查看完整 [标签列表](#)。

例如，在 Linux 或 macOS 系统中，可以运行以下命令更新至 ESP-IDF v3.1，随时关注该分支上的 Bugfix 版本发布（如 v3.1.1 等）：

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

在 Windows 系统中，需要将 `cd $IDF_PATH` 替换为 `cd %IDF_PATH%`。

每次在该分支上使用 `git pull` 时，都相当于把最新的 Bugfix 版本发布更新至你的本地副本中。

备注：发布分支并不会会有专门的配套文档，建议使用与本分支最接近版本的文档。

Chapter 10

资源

10.1 PlatformIO

- [什么是 PlatformIO ?](#)
- [安装](#)
- [配置](#)
- [教程](#)
- [项目示例](#)
- [更多内容](#)

10.1.1 什么是 PlatformIO ?

PlatformIO 是一个跨平台的嵌入式开发环境，能直接支持 ESP-IDF。

由于 PlatformIO 对 ESP-IDF 的支持并非由 Espressif 团队维护，如果遇到 PlatformIO 相关的问题，请通过 [官方 PlatformIO 库](#) 联系其开发人员。

要了解关于 PlatformIO 生态系统及其理念的详细概述，请参考 [官方 PlatformIO 文档](#)。

10.1.2 安装

- [PlatformIO IDE](#) 是一个可在 Windows, macOS 和 Linux 平台上使用的嵌入式 C/C++ 开发工具集。
- [PlatformIO Core \(CLI\)](#) 是一个命令行工具，包含多平台编译系统，平台和库管理器以及其他集成组件。它可以与各种代码开发环境一起使用，还可以集成云平台和网络服务。

10.1.3 配置

请参阅 [PlatformIO 官方](#) 的 ESP-IDF 配置指南。

10.1.4 教程

- [ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis](#)

10.1.5 项目示例

请参阅 [PlatformIO 官方文档](#) 中 ESP-IDF 相关内容。

10.1.6 更多内容

访问以下链接探索 PlatformIO 生态系统：

- 了解更多 [与其他 IDE 或文本编辑器集成](#) 的信息。
- 从 [PlatformIO 社区](#) 获取帮助。

10.2 CLion

10.2.1 CLion 是什么？

CLion 是用于 C 和 C++ 编程的跨平台集成开发环境 (IDE)。CLion 还提供了专门支持 ESP-IDF 的功能，使开发人员能够无缝使用 ESP-IDF 框架。

10.2.2 安装

安装 CLion，请参考 [CLion 安装指南](#)，可根据操作系统（Windows, macOS, or Linux）选择适用的版本。

10.2.3 配置

要在 CLion 中配置一个 ESP-IDF 项目，请参考 [在 CLion 中配置 ESP CMake 项目](#)。本指南将带您逐步完成配置项目的必要步骤。

10.2.4 资源

有关 CLion 和 ESP-IDF 集成的更多信息，请参考以下资源：

- [CLion 文档](#)：CLion 官方文档提供了有关 IDE 各方面内容的详细信息，包括 ESP-IDF 集成。

10.3 VisualGDB

10.3.1 VisualGDB 是什么?

VisualGDB 是 Microsoft Visual Studio 的一个强大扩展，为嵌入式系统提供包括支持 ESP-IDF 框架在内的一系列先进的开发工具和功能。通过 VisualGDB，能够在 ESP-IDF 项目中利用熟悉且功能丰富的 Visual Studio 环境，从而实现高效的编码、调试与部署。

10.3.2 安装

请参照 [下载和安装 VisualGDB](#)，下载和安装 VisualGDB。

10.3.3 配置

请参照 [使用 ESP-IDF 在 VisualGDB 中创建高级 ESP32 项目](#)，在 VisualGDB 中配置 ESP-IDF 项目。

也可以参考 [高级 ESP-IDF 项目结构](#)，了解更多关于使用 VisualGDB 开发 ESP-IDF 项目的信息。

10.3.4 资源

有关 VisualGDB 和 ESP-IDF 集成的更多信息，请参阅以下资源：

- [VisualGDB 文档](#): VisualGDB 的官方文档提供了关于使用 VisualGDB 与 ESP-IDF 的全面指南和教程。

有关这些第三方工具的问题，请寻求该工具的支持渠道或用户社区的帮助。

10.4 有用的链接

- 请在 [ESP32 论坛](#) 中提出问题，访问社区资源。
- 请通过 GitHub 的 [Issues](#) 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 [Issues](#)。
- 请在 [ESP IoT Solution](#) 库中找到基于 ESP-IDF 的 [解决方案](#)、[应用实例](#)、[组件和驱动](#) 等内容。多数文档均提供中英文版本。
- 通过 Arduino 平台开发应用，请参考 [ESP32](#)、[ESP32-S2](#) 和 [ESP32-C3](#) 芯片的 [Arduino 内核](#)。
- 关于 ESP32 的书籍列表，请查看 [乐鑫](#) 网站。
- 如果你有兴趣参与到 ESP-IDF 的开发，请查阅 [贡献指南](#)。
- 关于 ESP32-H2 的其它信息，请查看官网 [文档](#) 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 [下载](#)。

11.5 TjpgDec License

TjpgDec - Tiny JPEG Decompressor R0.01 (C) ChaN, 2011 The TjpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TjpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

Chapter 12

关于本指南

本指南为 ESP32-H2 官方应用开发框架 [ESP-IDF](#) 的配套文档。

ESP32-H2 是一款支持 802.15.4 Thread/Zigbee 和低功耗蓝牙的芯片，搭载 RISC-V RV32IMAC 32 位单核处理器。

图 1: 乐鑫物联网综合开发框架

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32-H2 应用程序提供工具链、API、组件和工作流程的支持。

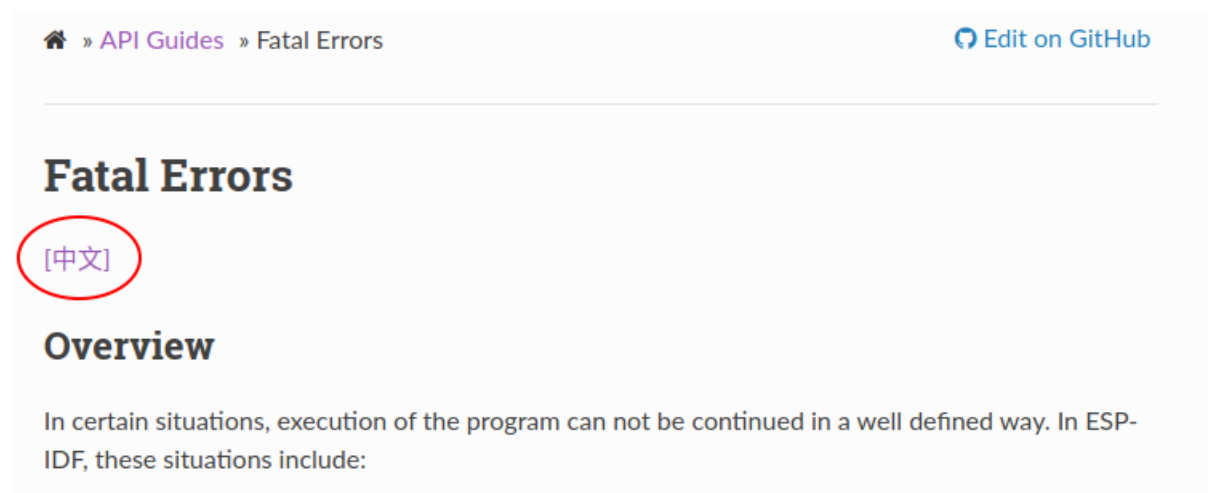

Chapter 13

切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入，请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，可以通过点击文档上方的语言链接，轻松进行语言切换。

 xQueueReceive (C++ function), 1842
 xQueueReceiveFromISR (C++ function), 1845
 xQueueRemoveFromSet (C++ function), 1848
 xQueueReset (C macro), 1858
 xQueueSelectFromSet (C++ function), 1848
 xQueueSelectFromSetFromISR (C++ function), 1848
 xQueueSend (C macro), 1853
 xQueueSendFromISR (C macro), 1858
 xQueueSendToBack (C macro), 1852
 xQueueSendToBackFromISR (C macro), 1856
 xQueueSendToFront (C macro), 1851
 xQueueSendToFrontFromISR (C macro), 1855
 xRingbufferAddToQueueSetRead (C++ function), 1934
 xRingbufferCanRead (C++ function), 1934
 xRingbufferCreate (C++ function), 1927
 xRingbufferCreateNoSplit (C++ function), 1928
 xRingbufferCreateStatic (C++ function), 1928
 xRingbufferCreateWithCaps (C++ function), 1935
 xRingbufferGetCurFreeSize (C++ function), 1934
 xRingbufferGetMaxItemSize (C++ function), 1933
 xRingbufferGetStaticBuffer (C++ function), 1935
 xRingbufferPrintInfo (C++ function), 1935
 xRingbufferReceive (C++ function), 1930
 xRingbufferReceiveFromISR (C++ function), 1930
 xRingbufferReceiveSplit (C++ function), 1931
 xRingbufferReceiveSplitFromISR (C++ function), 1931
 xRingbufferReceiveUpTo (C++ function), 1932
 xRingbufferReceiveUpToFromISR (C++ function), 1932
 xRingbufferRemoveFromQueueSetRead (C++ function), 1934
 xRingbufferSend (C++ function), 1928
 xRingbufferSendAcquire (C++ function), 1929
 xRingbufferSendComplete (C++ function), 1929
 xRingbufferSendFromISR (C++ function), 1928
 xSemaphoreCreateBinary (C macro), 1860
 xSemaphoreCreateBinaryStatic (C macro), 1860
 xSemaphoreCreateBinaryWithCaps (C++ function), 1942
 xSemaphoreCreateCounting (C macro), 1870
 xSemaphoreCreateCountingStatic (C macro), 1871
 xSemaphoreCreateCountingWithCaps (C++ function), 1942
 xSemaphoreCreateMutex (C macro), 1867
 xSemaphoreCreateMutexStatic (C macro), 1868
 xSemaphoreCreateMutexWithCaps (C++ function), 1942
 xSemaphoreCreateRecursiveMutex (C macro), 1869
 xSemaphoreCreateRecursiveMutexStatic (C macro), 1869
 xSemaphoreCreateRecursiveMutexWithCaps (C++ function), 1942
 xSemaphoreGetMutexHolder (C macro), 1872
 xSemaphoreGetMutexHolderFromISR (C macro), 1872
 xSemaphoreGetStaticBuffer (C macro), 1873
 xSemaphoreGive (C macro), 1863
 xSemaphoreGiveFromISR (C macro), 1865
 xSemaphoreGiveRecursive (C macro), 1864
 xSemaphoreTake (C macro), 1861
 xSemaphoreTakeFromISR (C macro), 1867
 xSemaphoreTakeRecursive (C macro), 1862
 xSTATIC_RINGBUFFER (C++ struct), 1935
 xStreamBufferBytesAvailable (C++ function), 1905
 xStreamBufferCreateStaticWithCallback (C macro), 1907
 xStreamBufferCreateWithCallback (C macro), 1906
 xStreamBufferCreateWithCaps (C++ function), 1943
 xStreamBufferGetStaticBuffers (C++ function), 1900
 xStreamBufferIsEmpty (C++ function), 1904
 xStreamBufferIsFull (C++ function), 1904
 xStreamBufferReceive (C++ function), 1902
 xStreamBufferReceiveCompletedFromISR (C++ function), 1906
 xStreamBufferReceiveFromISR (C++ function), 1903
 xStreamBufferReset (C++ function), 1905
 xStreamBufferSend (C++ function), 1900
 xStreamBufferSendCompletedFromISR (C++ function), 1905
 xStreamBufferSendFromISR (C++ function), 1901
 xStreamBufferSetTriggerLevel (C++ function), 1905
 xStreamBufferSpacesAvailable (C++ function), 1905
 xTASK_STATUS (C++ struct), 1831

- `xTASK_STATUS::eCurrentState` (C++ member), 1832
- `xTASK_STATUS::pcTaskName` (C++ member), 1832
- `xTASK_STATUS::pxStackBase` (C++ member), 1832
- `xTASK_STATUS::ulRunTimeCounter` (C++ member), 1832
- `xTASK_STATUS::usStackHighWaterMark` (C++ member), 1832
- `xTASK_STATUS::uxBasePriority` (C++ member), 1832
- `xTASK_STATUS::uxCurrentPriority` (C++ member), 1832
- `xTASK_STATUS::xCoreID` (C++ member), 1832
- `xTASK_STATUS::xHandle` (C++ member), 1832
- `xTASK_STATUS::xTaskNumber` (C++ member), 1832
- `xTaskAbortDelay` (C++ function), 1816
- `xTaskCallApplicationTaskHook` (C++ function), 1823
- `xTaskCatchUpTicks` (C++ function), 1831
- `xTaskCheckForTimeOut` (C++ function), 1830
- `xTaskCreate` (C++ function), 1810
- `xTaskCreatePinnedToCore` (C++ function), 1938
- `xTaskCreatePinnedToCoreWithCaps` (C++ function), 1940
- `xTaskCreateStatic` (C++ function), 1812
- `xTaskCreateStaticPinnedToCore` (C++ function), 1939
- `xTaskCreateWithCaps` (C++ function), 1941
- `xTaskDelayUntil` (C++ function), 1815
- `xTaskGenericNotifyStateClear` (C++ function), 1829
- `xTaskGenericNotifyWait` (C++ function), 1827
- `xTaskGetApplicationTaskTag` (C++ function), 1823
- `xTaskGetApplicationTaskTagFromISR` (C++ function), 1823
- `xTaskGetCoreID` (C++ function), 1939
- `xTaskGetCurrentTaskHandleForCore` (C++ function), 1940
- `xTaskGetHandle` (C++ function), 1822
- `xTaskGetIdleTaskHandle` (C++ function), 1823
- `xTaskGetStaticBuffers` (C++ function), 1822
- `xTaskGetTickCount` (C++ function), 1821
- `xTaskGetTickCountFromISR` (C++ function), 1821
- `xTaskNotifyAndQueryIndexed` (C macro), 1834
- `xTaskNotifyAndQueryIndexedFromISR` (C macro), 1836
- `xTaskNotifyGiveIndexed` (C macro), 1836
- `xTaskNotifyIndexed` (C macro), 1833
- `xTaskNotifyIndexedFromISR` (C macro), 1834
- `xTaskNotifyStateClear` (C macro), 1838
- `xTaskNotifyStateClearIndexed` (C macro), 1838
- `xTaskNotifyWait` (C macro), 1836
- `xTaskNotifyWaitIndexed` (C macro), 1836
- `xTaskResumeAll` (C++ function), 1821
- `xTaskResumeFromISR` (C++ function), 1820
- `xTimerChangePeriod` (C macro), 1882
- `xTimerChangePeriodFromISR` (C macro), 1888
- `xTimerCreate` (C++ function), 1873
- `xTimerCreateStatic` (C++ function), 1875
- `xTimerDelete` (C macro), 1883
- `xTimerGetExpiryTime` (C++ function), 1881
- `xTimerGetPeriod` (C++ function), 1881
- `xTimerGetReloadMode` (C++ function), 1880
- `xTimerGetStaticBuffer` (C++ function), 1881
- `xTimerGetTimerDaemonTaskHandle` (C++ function), 1878
- `xTimerIsTimerActive` (C++ function), 1878
- `xTimerPendFunctionCall` (C++ function), 1880
- `xTimerPendFunctionCallFromISR` (C++ function), 1878
- `xTimerReset` (C macro), 1884
- `xTimerResetFromISR` (C macro), 1889
- `xTimerStart` (C macro), 1881
- `xTimerStartFromISR` (C macro), 1886
- `xTimerStop` (C macro), 1882
- `xTimerStopFromISR` (C macro), 1887
