Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_DYNAMIC_BUFFER](#)

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

Default value:

- No (disabled) if [CONFIG_MBEDTLS_DYNAMIC_BUFFER](#)

CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT

Free SSL CA certificate after its usage

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_DYNAMIC_BUFFER](#) > [CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA](#)

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA](#)

CONFIG_MBEDTLS_DEBUG

Enable mbedtls debugging

Found in: [Component config](#) > [mbedtls](#)

Enable mbedtls debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp_debug.h" and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedtls debug output via the ESP log mechanism.

Default value:

- No (disabled)

CONFIG_MBEDTLS_DEBUG_LEVEL

Set mbedTLS debugging level

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_DEBUG](#)

Set mbedTLS debugging level

Available options:

- Warning (CONFIG_MBEDTLS_DEBUG_LEVEL_WARN)
- Info (CONFIG_MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (CONFIG_MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (CONFIG_MBEDTLS_DEBUG_LEVEL_VERBOSE)

mbedtls v3.x related Contains:

- [DTLS-based configurations](#)
- [CONFIG_MBEDTLS_PKCS7_C](#)
- [CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION](#)
- [CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK](#)
- [CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE](#)
- [CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY](#)
- [CONFIG_MBEDTLS_SSL_PROTO_TLS1_3](#)
- [CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT](#)
- [CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH](#)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Support TLS 1.3 protocol

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

TLS 1.3 related configurations Contains:

- [CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL](#)
- [CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE](#)
- [CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL](#)
- [CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK](#)

CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE

TLS 1.3 middlebox compatibility mode

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG_MBEDTLS_SSL_PROTO_TLS1_3](#) > [TLS 1.3 related configurations](#)

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_SSL_PROTO_TLS1_3](#)

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

TLS 1.3 PSK key exchange mode

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG_MBEDTLS_SSL_PROTO_TLS1_3](#) > [TLS 1.3 related configurations](#)

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_SSL_PROTO_TLS1_3](#)

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL

TLS 1.3 PSK ephemeral key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

Variable SSL buffer length

Found in: Component config > mbedTLS > mbedTLS v3.x related

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT

Use a backward compatible ECDH context (Experimental)

Found in: Component config > mbedTLS > mbedTLS v3.x related

Use the legacy ECDH context format. Define this option only if you enable `MBEDTLS_ECP_RESTARTABLE` or if you want to access ECDH context fields directly.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK

Enable trusted certificate callbacks

Found in: Component config > mbedTLS > mbedTLS v3.x related

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedTLS documentation for required API and more details.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION

Enable serialization of the TLS context structures

Found in: Component config > mbedTLS > mbedTLS v3.x related

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE

Keep peer certificate after handshake completion

Found in: Component config > mbedTLS > mbedTLS v3.x related

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_PKCS7_C

Enable PKCS #7

Found in: Component config > mbedTLS > mbedTLS v3.x related

Enable PKCS #7 core for using PKCS #7-formatted signatures.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY

Record plaintext padding

Found in: Component config > mbedTLS > mbedTLS v3.x related

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

Notes: A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

Range:

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

Default value:

- 16 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

DTLS-based configurations Contains:

- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Support for the DTLS Connection ID extension

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX

Maximum length of CIDs used for incoming DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for incoming DTLS messages

Range:

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

Default value:

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

Range:

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

Default value:

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the `use_srtp` extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

Certificate Bundle Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

Found in: Component config > mbedTLS > Certificate Bundle

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Available options:

- Use the full default certificate bundle (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Add custom certificates to the default bundle

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Default value:

- No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#) > [CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST

Add deprecated root certificates

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Include the deprecated list of root certificates in the bundle. This list gets updated when a certificate is removed from the Mozilla's NSS root certificate store. This config can be enabled if you would like to ensure that none of the certificates that were deployed in the product are affected because of the update to bundle. In turn, enabling this config keeps expired, retracted certificates in the bundle and it may pose a security risk.

- Deprecated cert list may grow based based on sync with upstream bundle
- Deprecated certs would be removed in ESP-IDF (next) major release

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS

Maximum no of certificates allowed in certificate bundle

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Default value:

- 200

CONFIG_MBEDTLS_ECP_RESTARTABLE

Enable mbedtls ecp restartable

Found in: [Component config](#) > [mbedtls](#)

Enable "non-blocking" ECC operations that can return early and be resumed.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CMAC_C

Enable CMAC mode for block ciphers

Found in: [Component config](#) > [mbedtls](#)

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

Default value:

- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES

Enable hardware AES acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

CONFIG_MBEDTLS_AES_USE_INTERRUPT

Use interrupt for long AES operations

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_AES](#)

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_AES_INTERRUPT_LEVEL

AES hardware interrupt level

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_AES](#) > [CONFIG_MBEDTLS_AES_USE_INTERRUPT](#)

This config helps to set the interrupt priority level for the AES peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

Range:

- from 0 to 3

Default value:

- 0

CONFIG_MBEDTLS_HARDWARE_GCM

Enable partially hardware accelerated GCM

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_AES](#)

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedtls will still use the hardware accelerated AES block operation, but on a single block at a time.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_GCM_SUPPORT_NON_AES_CIPHER

Enable support for non-AES ciphers in GCM operation

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_AES](#)

Enable this config to support fallback to software definitions for a non-AES cipher GCM operation as we support hardware acceleration only for AES cipher. Some of the non-AES ciphers used in a GCM operation are DES, ARIA, CAMELLIA, CHACHA20, BLOWFISH.

If this config is disabled, performing a non-AES cipher GCM operation with the config MBEDTLS_HARDWARE_AES enabled will result in calculation of an AES-GCM operation instead for the given input values and thus could lead to failure in certificate validation which would ultimately lead to a SSL handshake failure.

This config being by-default enabled leads to an increase in binary size footprint of ~2.5KB. In case you are sure that your use case (for example, client and server configurations in case of a TLS handshake) would not involve any GCM operations using a non-AES cipher, you can safely disable this config, leading to reduction in binary size footprint.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_HARDWARE_MPI

Enable hardware MPI (bignum) acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_MPI](#)

Fallback to software implementation for RSA key lengths larger than `SOC_RSA_MAX_BIT_LEN`. If this is not active then the ESP will be unable to process keys greater than `SOC_RSA_MAX_BIT_LEN`.

Default value:

- No (disabled)

CONFIG_MBEDTLS_MPI_USE_INTERRUPT

Use interrupt for MPI exp-mod operations

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_MPI](#)

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_MPI_INTERRUPT_LEVEL

MPI hardware interrupt level

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_MPI](#) > [CONFIG_MBEDTLS_MPI_USE_INTERRUPT](#)

This config helps to set the interrupt priority level for the MPI peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

Range:

- from 0 to 3

Default value:

- 0

CONFIG_MBEDTLS_HARDWARE_SHA

Enable hardware SHA acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

CONFIG_MBEDTLS_HARDWARE_ECC

Enable hardware ECC acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedtls

Default value:

- Yes (enabled) if `SOC_ECC_SUPPORTED`

CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK

Fallback to software implementation for curves not supported in hardware

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_ECC](#)

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_HARDWARE_ECC](#)

CONFIG_MBEDTLS_ROM_MD5

Use MD5 implementation in ROM

Found in: [Component config](#) > [mbedtls](#)

Use ROM MD5 in mbedtls.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_HARDWARE_ECDSA_SIGN

Enable ECDSA signing using on-chip ECDSA peripheral

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedtls.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA_KEY. If no key is burnt, it will report an error

The key should be burnt in little endian format. `espefuse.py` utility handles it internally but care needs to be taken while burning using `esp_efuse` APIs

Default value:

- No (disabled) if `SOC_ECDSA_SUPPORTED`

CONFIG_MBEDTLS_HARDWARE_ECDSA_VERIFY

Enable ECDSA signature verification using on-chip ECDSA peripheral

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedtls.

Default value:

- Yes (enabled) if `SOC_ECDSA_SUPPORTED`

CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

Found in: [Component config](#) > [mbedtls](#)

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

Found in: [Component config](#) > [mbedtls](#)

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip.

Default value:

- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME

Enable mbedtls time support

Found in: [Component config](#) > [mbedtls](#)

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_PLATFORM_TIME_ALT

Enable mbedtls time support: platform-specific

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HAVE_TIME](#)

Enabling this config will provide users with a function "mbedtls_platform_set_time()" that allows to set an alternative time function pointer.

Default value:

- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE

Enable mbedtls certificate expiry check

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HAVE_TIME](#)

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDSA_DETERMINISTIC

Enable deterministic ECDSA

Found in: [Component config](#) > [mbedtls](#)

Standard ECDSA is "fragile" in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SHA512_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

Found in: [Component config](#) > [mbedtls](#)

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_TLS_MODE

TLS Protocol Role

Found in: [Component config](#) > [mbedtls](#)

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (CONFIG_MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (CONFIG_MBEDTLS_TLS_SERVER_ONLY)
- Client (CONFIG_MBEDTLS_TLS_CLIENT_ONLY)
- None (CONFIG_MBEDTLS_TLS_DISABLED)

TLS Key Exchange Methods Contains:

- [CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA](#)
- [CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE](#)
- [CONFIG_MBEDTLS_PSK_MODES](#)
- [CONFIG_MBEDTLS_KEY_EXCHANGE_RSA](#)
- [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

CONFIG_MBEDTLS_PSK_MODES

Enable pre-shared-key ciphersuites

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

Default value:

- No (disabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

Default value:

- No (disabled) if [CONFIG_MBEDTLS_PSK_MODES](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK

Enable DHE-PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_PSK_MODES](#) && [CONFIG_MBEDTLS_DHM_C](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK

Enable ECDHE-PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_PSK_MODES](#) && [CONFIG_MBEDTLS_ECDH_C](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK

Enable RSA-PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_PSK_MODES](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

Default value:

- Yes (enabled) if `CONFIG_MBEDTLS_DHM_C`

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Support Elliptic Curve based ciphersuites

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA

Enable ECDHE-RSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA

Enable ECDH-RSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE

Enable ECJPAKE based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

Default value:

- No (disabled) if `CONFIG_MBEDTLS_ECJPAKE_C` && `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`

CONFIG_MBEDTLS_SSL_RENEGOTIATION

Support TLS renegotiation

Found in: [Component config](#) > [mbedtls](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2

Support TLS 1.2 protocol

Found in: [Component config](#) > [mbedtls](#)

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1

Support GM/T SSL 1.1 protocol

Found in: [Component config](#) > [mbedtls](#)

Provisions for GM/T SSL 1.1 support

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS

Support DTLS protocol (all versions)

Found in: [Component config](#) > [mbedtls](#)

Requires TLS 1.2 to be enabled for DTLS 1.2

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN

Support ALPN (Application Layer Protocol Negotiation)

Found in: [Component config](#) > [mbedtls](#)

Disabling this option will save some code size if it is not needed.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

Found in: *Component config > mbedTLS*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

Found in: *Component config > mbedTLS*

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:

- Yes (enabled)

Symmetric Ciphers Contains:

- *CONFIG_MBEDTLS_AES_C*
- *CONFIG_MBEDTLS_BLOWFISH_C*
- *CONFIG_MBEDTLS_CAMELLIA_C*
- *CONFIG_MBEDTLS_CCM_C*
- *CONFIG_MBEDTLS_DES_C*
- *CONFIG_MBEDTLS_GCM_C*
- *CONFIG_MBEDTLS_NIST_KW_C*
- *CONFIG_MBEDTLS_XTEA_C*

CONFIG_MBEDTLS_AES_C

AES block cipher

Found in: *Component config > mbedTLS > Symmetric Ciphers*

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

Found in: *Component config > mbedTLS > Symmetric Ciphers*

Default value:

- No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

Found in: *Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

Default value:

- No (disabled)

CONFIG_MBEDTLS_BLOWFISH_C

Blowfish block cipher (read help)

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

Default value:

- No (disabled)

CONFIG_MBEDTLS_XTEA_C

XTEA block cipher

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enables the XTEA block cipher.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CCM_C

CCM (Counter with CBC-MAC) block cipher modes

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_GCM_C

GCM (Galois/Counter) block cipher modes

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C

NIST key wrapping (KW) and KW padding (KWP)

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enable NIST key wrapping and key wrapping padding.

Default value:

- No (disabled)

CONFIG_MBEDTLS_RIPEMD160_C

Enable RIPEMD-160 hash algorithm

Found in: [Component config > mbedTLS](#)

Enable the RIPEMD-160 hash algorithm.

Default value:

- No (disabled)

Certificates Contains:

- [CONFIG_MBEDTLS_PEM_PARSE_C](#)
- [CONFIG_MBEDTLS_PEM_WRITE_C](#)
- [CONFIG_MBEDTLS_X509_CRL_PARSE_C](#)
- [CONFIG_MBEDTLS_X509_CSR_PARSE_C](#)

CONFIG_MBEDTLS_PEM_PARSE_C

Read & Parse PEM formatted certificates

Found in: [Component config > mbedTLS > Certificates](#)

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C

Write PEM formatted certificates

Found in: [Component config > mbedTLS > Certificates](#)

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C

X.509 CRL parsing

Found in: [Component config > mbedTLS > Certificates](#)

Support for parsing X.509 Certificate Revocation Lists.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C

X.509 CSR parsing

Found in: [Component config > mbedTLS > Certificates](#)

Support for parsing X.509 Certificate Signing Requests

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_C

Elliptic Curve Ciphers

Found in: *Component config* > *mbedTLS*

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_DHM_C

Diffie-Hellman-Merkle key exchange (DHM)

Found in: *Component config* > *mbedTLS*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDH_C

Elliptic Curve Diffie-Hellman (ECDH)

Found in: *Component config* > *mbedTLS*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C

Elliptic Curve DSA

Found in: *Component config* > *mbedTLS* > *CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C

Elliptic curve J-PAKE

Found in: *Component config* > *mbedTLS*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED

Enable SECP192R1 curve

Found in: *Component config* > *mbedTLS*

Enable support for SECP192R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP224R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

Enable SECP256R1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP256R1 Elliptic Curve.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED

Enable SECP384R1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP384R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED

Enable SECP521R1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP521R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED

Enable SECP192K1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP192K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED

Enable SECP224K1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP224K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED

Enable SECP256K1 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for SECP256K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED

Enable BP256R1 curve

Found in: [Component config](#) > [mbedtls](#)

support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED

Enable BP384R1 curve

Found in: [Component config](#) > [mbedtls](#)

support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED

Enable BP512R1 curve

Found in: [Component config](#) > [mbedtls](#)

support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED

Enable CURVE25519 curve

Found in: [Component config](#) > [mbedtls](#)

Enable support for CURVE25519 Elliptic Curve.

CONFIG_MBEDTLS_ECP_NIST_OPTIM

NIST 'modulo p' optimisations

Found in: [Component config](#) > [mbedtls](#)

NIST 'modulo p' optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM

Enable fixed-point multiplication optimisations

Found in: [Component config](#) > [mbedtls](#)

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curve selected) in the application binary.

end of Elliptic Curve options

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C

Poly1305 MAC algorithm

Found in: [Component config](#) > [mbedtls](#)

Enable support for Poly1305 MAC algorithm.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CHACHA20_C

Chacha20 stream cipher

Found in: [Component config > mbedTLS](#)

Enable support for Chacha20 stream cipher.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C

ChaCha20-Poly1305 AEAD algorithm

Found in: [Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C](#)

Enable support for ChaCha20-Poly1305 AEAD algorithm.

Default value:

- No (disabled) if [CONFIG_MBEDTLS_CHACHA20_C](#) && [CONFIG_MBEDTLS_POLY1305_C](#)

CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

Found in: [Component config > mbedTLS](#)

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

Default value:

- No (disabled)

CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

Found in: [Component config > mbedTLS](#)

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

Default value:

- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

Found in: [Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C](#)

Enable threading alt to allow your own alternate threading implementation.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_THREADING_C](#)

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

Found in: [Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C](#)

Enable the pthread wrapper layer for the threading layer.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_THREADING_C`

CONFIG_MBEDTLS_ERROR_STRINGS

Enable error code to error string conversion

Found in: [Component config](#) > [mbedtls](#)

Enables `mbedtls_strerror()` for converting error codes to error strings. Disabling this config can save some code/rodata size as the error string conversion implementation is replaced with an empty stub.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_USE_CRYPTOROM_IMPL

Use ROM implementation of the crypto algorithm

Found in: [Component config](#) > [mbedtls](#)

Enable this flag to use `mbedtls` crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of `mbedtls` crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the `mbedtls` revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future `mbedtls` revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

Default value:

- No (disabled) if `ESP_ROM_HAS_MBEDTLS_CRYPTOLIB` && `CONFIG_IDF_EXPERIMENTAL_FEATURES`

ESP-MQTT Configurations

 Contains:

- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_PROTOCOL_5`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

CONFIG_MQTT_PROTOCOL_311

Enable MQTT protocol 3.1.1

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

If not, this library will use MQTT protocol 3.1

Default value:

- Yes (enabled)

CONFIG_MQTT_PROTOCOL_5

Enable MQTT protocol 5.0

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

If not, this library will not support MQTT 5.0

Default value:

- No (disabled)

CONFIG_MQTT_TRANSPORT_SSL

Enable MQTT over SSL

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Enable MQTT transport over SSL with mbedtls

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET

Enable MQTT over Websocket

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Enable MQTT transport over Websocket.

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

Enable MQTT over Websocket Secure

Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE](#)

Enable MQTT transport over Websocket Secure.

Default value:

- Yes (enabled)

CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

Default value:

- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The

MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

Default value:

- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

Found in: Component config > ESP-MQTT Configurations

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

Default value:

- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

Found in: Component config > ESP-MQTT Configurations

Custom MQTT configurations.

Default value:

- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over TCP port

Default value:

- 1883 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_SSL_DEFAULT_PORT

Default MQTT over SSL port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over SSL port

Default value:

- 8883 if *CONFIG_MQTT_USE_CUSTOM_CONFIG* && *CONFIG_MQTT_TRANSPORT_SSL*

CONFIG_MQTT_WS_DEFAULT_PORT

Default MQTT over Websocket port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket port

Default value:

- 80 if *CONFIG_MQTT_USE_CUSTOM_CONFIG* && *CONFIG_MQTT_TRANSPORT_WEBSOCKET*

CONFIG_MQTT_WSS_DEFAULT_PORT

Default MQTT over Websocket Secure port

Found in: *Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

Default value:

- 443 if *CONFIG_MQTT_USE_CUSTOM_CONFIG* && *CONFIG_MQTT_TRANSPORT_WEBSOCKET* && *CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE*

CONFIG_MQTT_BUFFER_SIZE

Default MQTT Buffer Size

Found in: *Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

Default value:

- 1024 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_TASK_STACK_SIZE

MQTT task stack size

Found in: *Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

Default value:

- 6144 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_DISABLE_API_LOCKS

Disable API locks

Found in: *Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

Default value:

- No (disabled) if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_TASK_PRIORITY

MQTT task priority

Found in: *Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

Default value:

- 5 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_POLL_READ_TIMEOUT_MS

MQTT transport poll read timeout

Found in: *Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Timeout when polling underlying transport for read.

Default value:

- 1000 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_EVENT_QUEUE_SIZE

Number of queued events.

Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)

A value higher than 1 enables multiple queued events.

Default value:

- 1 if [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

This will enable core selection

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use ?

Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED](#)

Available options:

- Core 0 ([CONFIG_MQTT_USE_CORE_0](#))
- Core 1 ([CONFIG_MQTT_USE_CORE_1](#))

CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY

Use external memory for outbox data

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set to true to use external memory for outbox data.

Default value:

- No (disabled) if [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: `idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)`

Default value:

- No (disabled)

CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS

Outbox message expired timeout[ms]

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Messages which stays in the outbox longer than this value before being published will be discarded.

Default value:

- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

Newlib Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`

CONFIG_NEWLIB_STDOUT_LINE_ENDING

Line ending for UART output

Found in: [Component config](#) > [Newlib](#)

This option allows configuring the desired line endings sent to UART when a newline ('n', LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_LF`)
- CR (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CR`)

CONFIG_NEWLIB_STDIN_LINE_ENDING

Line ending for UART input

Found in: [Component config](#) > [Newlib](#)

This option allows configuring which input sequence on UART produces a newline ('n', LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF (`CONFIG_NEWLIB_STDIN_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDIN_LINE_ENDING_LF`)
- CR (`CONFIG_NEWLIB_STDIN_LINE_ENDING_CR`)

CONFIG_NEWLIB_NANO_FORMAT

Enable 'nano' formatting options for printf/scanf family

Found in: [Component config](#) > [Newlib](#)

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for '--enable-newlib-nano-formatted-io': https://sourceware.org/git/?p=newlib-cygwin.git;a=blob_plain;f=newlib/README;hb=HEAD

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP_ROM_HAS_NEWLIB_NANO_FORMAT and ESP_ROM_HAS_NEWLIB_NORMAL_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

CONFIG_NEWLIB_TIME_SYSCALL

Timers used for gettimeofday function

Found in: [Component config > Newlib](#)

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used,** timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS; they are defined as weak, so they could be overridden. If you want to customize gettimeofday() and other time functions, please choose this option and refer to the 'time.c' source file for the exact prototypes of these functions.
- **When RTC is used for timekeeping, two RTC_STORE registers are** used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG_NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (CONFIG_NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (CONFIG_NEWLIB_TIME_SYSCALL_USE_HRT)
- None (CONFIG_NEWLIB_TIME_SYSCALL_USE_NONE)

NVS Contains:

- [CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY](#)
- [CONFIG_NVS_ENCRYPTION](#)
- [CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG](#)
- [CONFIG_NVS_ASSERT_ERROR_CHECK](#)

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

Found in: *Component config > NVS*

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

Default value:

- Yes (enabled) if *CONFIG_SECURE_FLASH_ENC_ENABLED*

CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

Found in: *Component config > NVS*

Enabling this will ignore "encrypted" flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have "encrypted" flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

CONFIG_NVS_ASSERT_ERROR_CHECK

Use assertions for error checking

Found in: *Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

Default value:

- No (disabled)

CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY

Enable legacy nvs_set function behavior when same key is reused with different data types

Found in: *Component config > NVS*

Enabling this option will switch the nvs_set() family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding nvs_get() call for the key given. Use this option only when your application relies on such NVS API behaviour.

Default value:

- No (disabled)

NVS Security Provider

 Contains:

- *CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID*
- *CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME*

CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME

NVS Encryption: Key Protection Scheme

Found in: *Component config > NVS Security Provider*

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

Available options:

- Using Flash Encryption (`CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC`)
Protect the NVS Encryption Keys using Flash Encryption Requires a separate 'nvs_keys' partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`)
Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block (`NVS_SEC_HMAC_EFUSE_KEY_ID` or the v2 API argument) to be empty or pre-written with a key with the purpose `ESP_EFUSE_KEY_PURPOSE_HMAC_UP`

CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID

eFuse key ID storing the HMAC key

Found in: Component config > NVS Security Provider

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

Note: The eFuse block key ID required by the HMAC scheme (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`) is set using this config when the default NVS partition is initialized with `nvs_flash_init()`. The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

Range:

- from 0 to 6 if `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`

Default value:

- 6 if `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`

OpenThread Contains:

- `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT`
- `CONFIG_OPENTHREAD_DEVICE_TYPE`
- `CONFIG_OPENTHREAD_RADIO_TYPE`
- `CONFIG_OPENTHREAD_BORDER_ROUTER`
- `CONFIG_OPENTHREAD_COMMISSIONER`
- `CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE`
- `CONFIG_OPENTHREAD_CSL_ENABLE`
- `CONFIG_OPENTHREAD_DIAG`
- `CONFIG_OPENTHREAD_DNS_CLIENT`
- `CONFIG_OPENTHREAD_DUA_ENABLE`
- `CONFIG_OPENTHREAD_JOINER`
- `CONFIG_OPENTHREAD_LINK_METRICS`
- `CONFIG_OPENTHREAD_MACFILTER_ENABLE`
- `CONFIG_OPENTHREAD_CLI`
- `CONFIG_OPENTHREAD_SPINEL_ONLY`
- `CONFIG_OPENTHREAD_RX_ON_WHEN_IDLE`
- `CONFIG_OPENTHREAD_RADIO_STATS_ENABLE`
- `CONFIG_OPENTHREAD_SRP_CLIENT`
- `CONFIG_OPENTHREAD_TIME_SYNC`
- `CONFIG_OPENTHREAD_NCP_VENDOR_HOOK`
- `CONFIG_OPENTHREAD_MAC_MAX_CSMA_BACKOFFS_DIRECT`
- `CONFIG_OPENTHREAD_ENABLED`
- *OpenThread version message*
- `CONFIG_OPENTHREAD_XTAL_ACCURACY`
- `CONFIG_OPENTHREAD_CSL_UNCERTAIN`
- `CONFIG_OPENTHREAD_CSL_ACCURACY`
- `CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS`
- `CONFIG_OPENTHREAD_RCP_TRANSPORT`

- `CONFIG_OPENTHREAD_MLE_MAX_CHILDREN`
- `CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES`
- `CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE`
- `CONFIG_OPENTHREAD_UART_BUFFER_SIZE`
- *Thread Address Query Config*
- *Thread Operational Dataset*
- `CONFIG_OPENTHREAD_DNS64_CLIENT`

CONFIG_OPENTHREAD_ENABLED

OpenThread

Found in: Component config > OpenThread

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

Default value:

- No (disabled)

CONFIG_OPENTHREAD_LOG_LEVEL_DYNAMIC

Enable dynamic log level control

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable dynamic log level control for OpenThread

Default value:

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_CONSOLE_TYPE

OpenThread console type

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select OpenThread console type

Available options:

- OpenThread console type UART (`CONFIG_OPENTHREAD_CONSOLE_TYPE_UART`)
- OpenThread console type USB Serial/JTAG Controller (`CONFIG_OPENTHREAD_CONSOLE_TYPE_USB_SERIAL_JTAG`)

CONFIG_OPENTHREAD_LOG_LEVEL

OpenThread log verbosity

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select OpenThread log level.

Available options:

- No logs (`CONFIG_OPENTHREAD_LOG_LEVEL_NONE`)
- Error logs (`CONFIG_OPENTHREAD_LOG_LEVEL_CRIT`)
- Warning logs (`CONFIG_OPENTHREAD_LOG_LEVEL_WARN`)
- Notice logs (`CONFIG_OPENTHREAD_LOG_LEVEL_NOTE`)
- Info logs (`CONFIG_OPENTHREAD_LOG_LEVEL_INFO`)
- Debug logs (`CONFIG_OPENTHREAD_LOG_LEVEL_DBG`)

Thread Operational Dataset Contains:

- `CONFIG_OPENTHREAD_NETWORK_EXTPANID`
- `CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX`
- `CONFIG_OPENTHREAD_NETWORK_CHANNEL`
- `CONFIG_OPENTHREAD_NETWORK_MASTERKEY`
- `CONFIG_OPENTHREAD_NETWORK_NAME`
- `CONFIG_OPENTHREAD_NETWORK_PANID`
- `CONFIG_OPENTHREAD_NETWORK_PSKC`

CONFIG_OPENTHREAD_NETWORK_NAME

OpenThread network name

Found in: Component config > OpenThread > Thread Operational Dataset

Default value:

- "OpenThread-ESP"

CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX

OpenThread mesh local prefix, format <address>/<plen>

Found in: Component config > OpenThread > Thread Operational Dataset

A string in the format "<address>/<plen>", where <address> is an IPv6 address and <plen> is a prefix length. For example "fd00:db8:a0:0::/64"

Default value:

- "fd00:db8:a0:0::/64"

CONFIG_OPENTHREAD_NETWORK_CHANNEL

OpenThread network channel

Found in: Component config > OpenThread > Thread Operational Dataset

Range:

- from 11 to 26

Default value:

- 15

CONFIG_OPENTHREAD_NETWORK_PANID

OpenThread network pan id

Found in: Component config > OpenThread > Thread Operational Dataset

Range:

- from 0 to 0xFFFFE

Default value:

- "0x1234"

CONFIG_OPENTHREAD_NETWORK_EXTPANID

OpenThread extended pan id

Found in: Component config > OpenThread > Thread Operational Dataset

The OpenThread network extended pan id in hex string format

Default value:

- dead00beef00cafe

CONFIG_OPENTHREAD_NETWORK_MASTERKEY

OpenThread network key

Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)

The OpenThread network network key in hex string format

Default value:

- 00112233445566778899aabbccddeeff

CONFIG_OPENTHREAD_NETWORK_PSKC

OpenThread pre-shared commissioner key

Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)

The OpenThread pre-shared commissioner key in hex string format

Default value:

- 104810e2315100afd6bc9215a6bfac53

CONFIG_OPENTHREAD_RADIO_TYPE

Config the Thread radio type

Found in: [Component config](#) > [OpenThread](#)

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (CONFIG_OPENTHREAD_RADIO_NATIVE)
Select this to use the native 15.4 radio.
- Connect via UART (CONFIG_OPENTHREAD_RADIO_SPINEL_UART)
Select this to connect to a Radio Co-Processor via UART.
- Connect via SPI (CONFIG_OPENTHREAD_RADIO_SPINEL_SPI)
Select this to connect to a Radio Co-Processor via SPI.

CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

Found in: [Component config](#) > [OpenThread](#)

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG_OPENTHREAD_FTD)
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (CONFIG_OPENTHREAD_MTD)
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (CONFIG_OPENTHREAD_RADIO)
Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_RCP_TRANSPORT

The RCP transport type

Found in: Component config > OpenThread

Available options:

- UART RCP (CONFIG_OPENTHREAD_RCP_UART)
Select this to enable UART connection to host.
- SPI RCP (CONFIG_OPENTHREAD_RCP_SPI)
Select this to enable SPI connection to host.

OpenThread version message Contains:

- *CONFIG_OPENTHREAD_PACKAGE_NAME*
- *CONFIG_OPENTHREAD_PLATFORM_INFO*

CONFIG_OPENTHREAD_PACKAGE_NAME

OpenThread package name

Found in: Component config > OpenThread > OpenThread version message

The OpenThread package name.

Default value:

- "openthread-esp32" if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_PLATFORM_INFO

platform information

Found in: Component config > OpenThread > OpenThread version message

The OpenThread platform information.

Default value:

- "esp32s2" if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_NCP_VENDOR_HOOK

Enable vendor command for RCP

Found in: Component config > OpenThread

Select this to enable OpenThread NCP vendor commands.

Default value:

- Yes (enabled) if *CONFIG_OPENTHREAD_RADIO*

CONFIG_OPENTHREAD_CLI

Enable Openthread Command-Line Interface

Found in: Component config > OpenThread

Select this option to enable Command-Line Interface in OpenThread.

Default value:

- Yes (enabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_DIAG

Enable diag

Found in: Component config > OpenThread

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

Default value:

- Yes (enabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_COMMISSIONER

Enable Commissioner

Found in: Component config > OpenThread

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_COMM_MAX_JOINER_ENTRIES

The size of max commissioning joiner entries

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_COMMISSIONER

Default value:

- 2 if *CONFIG_OPENTHREAD_COMMISSIONER*

CONFIG_OPENTHREAD_JOINER

Enable Joiner

Found in: Component config > OpenThread

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_SRP_CLIENT

Enable SRP Client

Found in: Component config > OpenThread

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

Default value:

- Yes (enabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_SRP_CLIENT_MAX_SERVICES

Specifies number of service entries in the SRP client service pool

Found in: *Component config > OpenThread > CONFIG_OPENTHREAD_SRP_CLIENT*

Set the max buffer size of service entries in the SRP client service pool.

Default value:

- 5 if *CONFIG_OPENTHREAD_SRP_CLIENT*

CONFIG_OPENTHREAD_DNS_CLIENT

Enable DNS Client

Found in: *Component config > OpenThread*

Select this option to enable DNS Client in OpenThread.

Default value:

- Yes (enabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_BORDER_ROUTER

Enable Border Router

Found in: *Component config > OpenThread*

Select this option to enable border router features in OpenThread.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT

Allocate message pool buffer from PSRAM

Found in: *Component config > OpenThread*

If enabled, the message pool is managed by platform defined logic.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED* && (*CONFIG_SPIRAM_USE_CAPS_ALLOC* || *CONFIG_SPIRAM_USE_MALLOC*)

CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS

The number of openthread message buffers

Found in: *Component config > OpenThread*

Default value:

- 65 if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE

The size of openthread spinel rx frame buffer

Found in: *Component config > OpenThread*

Default value:

- 1024 if (*CONFIG_OPENTHREAD_MTD* || *CONFIG_OPENTHREAD_RADIO*) && (*CONFIG_OPENTHREAD_ENABLED* || *CONFIG_OPENTHREAD_SPINEL_ONLY*)
- 2048 if (*CONFIG_OPENTHREAD_FTD* || *CONFIG_OPENTHREAD_SPINEL_ONLY*) && (*CONFIG_OPENTHREAD_ENABLED* || *CONFIG_OPENTHREAD_SPINEL_ONLY*)

CONFIG_OPENTHREAD_MAC_MAX_CSMA_BACKOFFS_DIRECT

Maximum backoffs times before declaring a channel access failure.

Found in: Component config > OpenThread

The maximum number of backoffs the CSMA-CA algorithm will attempt before declaring a channel access failure.

Default value:

- 4 if *CONFIG_OPENTHREAD_ENABLED* || *CONFIG_OPENTHREAD_SPINEL_ONLY*

CONFIG_OPENTHREAD_MLE_MAX_CHILDREN

The size of max MLE children entries

Found in: Component config > OpenThread

Default value:

- 10 if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES

The size of max TMF address cache entries

Found in: Component config > OpenThread

Default value:

- 20 if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_DNS64_CLIENT

Use dns64 client

Found in: Component config > OpenThread

Select this option to acquire NAT64 address from dns servers.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED* && *CONFIG_LWIP_IPV4*

CONFIG_OPENTHREAD_DNS_SERVER_ADDR

DNS server address (IPv4)

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_DNS64_CLIENT

Set the DNS server IPv4 address.

Default value:

- "8.8.8.8" if *CONFIG_OPENTHREAD_DNS64_CLIENT*

CONFIG_OPENTHREAD_UART_BUFFER_SIZE

The uart received buffer size of openthread

Found in: Component config > OpenThread

Set the OpenThread UART buffer size.

Default value:

- 2048 if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_LINK_METRICS

Enable link metrics feature

Found in: Component config > OpenThread

Select this option to enable link metrics feature

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_MACFILTER_ENABLE

Enable mac filter feature

Found in: Component config > OpenThread

Select this option to enable mac filter feature

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_CSL_ENABLE

Enable CSL feature

Found in: Component config > OpenThread

Select this option to enable CSL feature

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_XTAL_ACCURACY

The accuracy of the XTAL

Found in: Component config > OpenThread

The device's XTAL accuracy, in ppm.

Default value:

- 130

CONFIG_OPENTHREAD_CSL_ACCURACY

The current CSL rx/tx scheduling drift, in units of \pm ppm

Found in: Component config > OpenThread

The current accuracy of the clock used for scheduling CSL operations

Default value:

- 1 if *CONFIG_OPENTHREAD_CSL_ENABLE*

CONFIG_OPENTHREAD_CSL_UNCERTAIN

The CSL Uncertainty in units of 10 us.

Found in: Component config > OpenThread

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

Default value:

- 1 if *CONFIG_OPENTHREAD_CSL_ENABLE*

CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE

Enable CSL debug

Found in: [Component config > OpenThread](#)

Select this option to set rx on when sleep in CSL feature, only for debug

Default value:

- No (disabled) if [CONFIG_OPENTHREAD_CSL_ENABLE](#)

CONFIG_OPENTHREAD_DUA_ENABLE

Enable Domain Unicast Address feature

Found in: [Component config > OpenThread](#)

Only used for Thread1.2 certification

Default value:

- No (disabled) if [CONFIG_OPENTHREAD_ENABLED](#)

CONFIG_OPENTHREAD_TIME_SYNC

Enable the time synchronization service feature

Found in: [Component config > OpenThread](#)

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

Default value:

- No (disabled) if [CONFIG_OPENTHREAD_ENABLED](#)

CONFIG_OPENTHREAD_RADIO_STATS_ENABLE

Enable Radio Statistics feature

Found in: [Component config > OpenThread](#)

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics information.

Default value:

- No (disabled) if [CONFIG_OPENTHREAD_FTD](#) || [CONFIG_OPENTHREAD_MTD](#)

CONFIG_OPENTHREAD_SPINEL_ONLY

Enable OpenThread External Radio Spinel feature

Found in: [Component config > OpenThread](#)

Select this option to enable the OpenThread Radio Spinel for external protocol stack, such as Zigbee.

Default value:

- No (disabled)

CONFIG_OPENTHREAD_RX_ON_WHEN_IDLE

Enable OpenThread radio capability rx on when idle

Found in: [Component config > OpenThread](#)

Select this option to enable OpenThread radio capability rx on when idle. Do not support this feature when SW coexistence is enabled.

Default value:

- No (disabled) if `CONFIG_ESP_COEX_SW_COEXIST_ENABLE`

Thread Address Query Config Contains:

- `CONFIG_OPENTHREAD_ADDRESS_QUERY_RETRY_DELAY`
- `CONFIG_OPENTHREAD_ADDRESS_QUERY_MAX_RETRY_DELAY`
- `CONFIG_OPENTHREAD_ADDRESS_QUERY_TIMEOUT`

CONFIG_OPENTHREAD_ADDRESS_QUERY_TIMEOUT

Timeout value (in seconds) for a address notification response after sending an address query.

Found in: Component config > OpenThread > Thread Address Query Config

Default value:

- 3 if `CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_MTD`

CONFIG_OPENTHREAD_ADDRESS_QUERY_RETRY_DELAY

Initial retry delay for address query (in seconds).

Found in: Component config > OpenThread > Thread Address Query Config

Default value:

- 15 if `CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_MTD`

CONFIG_OPENTHREAD_ADDRESS_QUERY_MAX_RETRY_DELAY

Maximum retry delay for address query (in seconds).

Found in: Component config > OpenThread > Thread Address Query Config

Default value:

- 120 if `CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_MTD`

Protocomm Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0

Support protocomm security version 0 (no security)

Found in: Component config > Protocomm

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:

- Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:

- Yes (enabled)

CONFIG_ESP_PROTocomm_SUPPORT_SECURITY_VERSION_2

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

Found in: [Component config](#) > [Protocomm](#)

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:

- Yes (enabled)

PThreads Contains:

- [CONFIG_PTHREAD_TASK_NAME_DEFAULT](#)
- [CONFIG_PTHREAD_TASK_CORE_DEFAULT](#)
- [CONFIG_PTHREAD_TASK_PRIO_DEFAULT](#)
- [CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT](#)
- [CONFIG_PTHREAD_STACK_MIN](#)

CONFIG_PTHREAD_TASK_PRIO_DEFAULT

Default task priority

Found in: [Component config](#) > [PThreads](#)

Priority used to create new tasks with default pthread parameters.

Range:

- from 0 to 255

Default value:

- 5

CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT

Default task stack size

Found in: [Component config](#) > [PThreads](#)

Stack size used to create new tasks with default pthread parameters.

Default value:

- 3072

CONFIG_PTHREAD_STACK_MIN

Minimum allowed pthread stack size

Found in: [Component config](#) > [PThreads](#)

Minimum allowed pthread stack size set in attributes passed to pthread_create

Default value:

- 768

CONFIG_PTHREAD_TASK_CORE_DEFAULT

Default pthread core affinity

Found in: *Component config > PThreads*

The default core to which pthreads are pinned.

Available options:

- No affinity (CONFIG_PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (CONFIG_PTHREAD_DEFAULT_CORE_0)
- Core 1 (CONFIG_PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

Found in: *Component config > PThreads*

The default name of pthreads.

Default value:

- "pthread"

SoC Settings Contains:

- *MMU Config*

MMU Config

Main Flash configuration Contains:

- *Optional and Experimental Features (READ DOCS FIRST)*
- *SPI Flash behavior when brownout*

SPI Flash behavior when brownout Contains:

- *CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC*

CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC

Enable sending reset when brownout for XMC flash chips

Found in: *Component config > Main Flash configuration > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

Optional and Experimental Features (READ DOCS FIRST) Contains:

- *CONFIG_SPI_FLASH_AUTO_SUSPEND*
- *CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US*
- *CONFIG_SPI_FLASH_HPM_DC*

CONFIG_SPI_FLASH_HPM_DC

Support HPM using DC (READ DOCS FIRST)

Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)

This feature needs your bootloader to be compiled DC-aware (BOOT-LOADER_FLASH_DC_AWARE=y). Otherwise the chip will not be able to boot after a reset.

Available options:

- Auto (Enable when bootloader support enabled (BOOT-LOADER_FLASH_DC_AWARE)) (CONFIG_SPI_FLASH_HPM_DC_AUTO)
- Disable (READ DOCS FIRST) (CONFIG_SPI_FLASH_HPM_DC_DISABLE)

CONFIG_SPI_FLASH_AUTO_SUSPEND

Auto suspend long erase/write operations (READ DOCS FIRST)

Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)

This option is disabled by default because it is supported only for specific flash chips and for specific Espressif chips. To evaluate if you can use this feature refer to *Optional Features for Flash > Auto Suspend & Resume* of the *ESP-IDF Programming Guide*.

CAUTION: If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

If you are using an official Espressif module, please contact Espressif Business support to check if the module has the flash that support this feature installed. Also refer to *Concurrency Constraints for Flash on SPI1 > Flash Auto Suspend Feature* before enabling this option.

CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US

SPI flash tSUS value (refer to chapter AC CHARACTERISTICS)

Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)

This config is used for setting Tsus parameter. Tsus means CS# high to next command after suspend. You can refer to the chapter of AC CHARACTERISTICS of flash datasheet.

SPI Flash driver Contains:

- *Auto-detect flash chips*
- *CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE*
- *CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE*
- *CONFIG_SPI_FLASH_ENABLE_COUNTERS*
- *CONFIG_SPI_FLASH_ROM_DRIVER_PATCH*
- *CONFIG_SPI_FLASH_YIELD_DURING_ERASE*
- *CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED*
- *CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE*
- *CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST*
- *CONFIG_SPI_FLASH_SIZE_OVERRIDE*
- *CONFIG_SPI_FLASH_ROM_IMPL*
- *CONFIG_SPI_FLASH_VERIFY_WRITE*
- *CONFIG_SPI_FLASH_DANGEROUS_WRITE*

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

Found in: [Component config](#) > [SPI Flash driver](#)

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG_SPI_FLASH_VERIFY_WRITE](#)

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG_SPI_FLASH_VERIFY_WRITE](#)

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

Found in: [Component config](#) > [SPI Flash driver](#)

This option enables the following APIs:

- `esp_flash_reset_counters`
- `esp_flash_dump_counters`
- `esp_flash_get_counters`

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

Found in: [Component config](#) > [SPI Flash driver](#)

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

CONFIG_SPI_FLASH_ROM_IMPL

Use esp_flash implementation in ROM

Found in: [Component config](#) > [SPI Flash driver](#)

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as "y" in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI_FLASH_AUTO_SUSPEND (C3, S3)

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

Found in: [Component config](#) > [SPI Flash driver](#)

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature **does not** check calls to the esp_rom_XXX SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (CONFIG_SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (CONFIG_SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (CONFIG_SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

Found in: [Component config](#) > [SPI Flash driver](#)

Some flash chips can have very high "max" erase times, especially for block erase (32KB or 64KB). This option allows to bypass "block erase" and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Enables yield operation during flash erase

Found in: [Component config](#) > [SPI Flash driver](#)

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI_FLASH_ERASE_YIELD_DURATION_MS and SPI_FLASH_ERASE_YIELD_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documentation under section *OS Function*.

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS

Duration of erasing to yield CPUs (ms)

Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG_SPI_FLASH_YIELD_DURING_ERASE](#)

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS

CPU release time (tick) for an erase operation

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Defines how many ticks will be before returning to continue a erasing.

CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

Found in: Component config > SPI Flash driver

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

CONFIG_SPI_FLASH_SIZE_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

Found in: Component config > SPI Flash driver

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED

Flash timeout checkout disabled

Found in: Component config > SPI Flash driver

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

Found in: Component config > SPI Flash driver

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default_registered_chips* structure must be provided by the user.

See example: `custom_chip_driver` under `examples/storage` for more details.

Auto-detect flash chips Contains:

- `CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_TH_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP`

CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

Found in: Component config > SPI Flash driver

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG_SPIFFS_USE_MAGIC*
- *CONFIG_SPIFFS_GC_STATS*
- *CONFIG_SPIFFS_PAGE_CHECK*
- *CONFIG_SPIFFS_FOLLOW_SYMLINKS*
- *CONFIG_SPIFFS_MAX_PARTITIONS*
- *CONFIG_SPIFFS_USE_MTIME*
- *CONFIG_SPIFFS_GC_MAX_RUNS*
- *CONFIG_SPIFFS_OBJ_NAME_LEN*
- *CONFIG_SPIFFS_META_LENGTH*
- *SPIFFS Cache Configuration*
- *CONFIG_SPIFFS_PAGE_SIZE*
- *CONFIG_SPIFFS_MTIME_WIDE_64_BITS*

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

Found in: Component config > SPIFFS Configuration

Define maximum number of partitions that can be mounted.

Range:

- from 1 to 10

Default value:

- 3

SPIFFS Cache Configuration Contains:

- *CONFIG_SPIFFS_CACHE*

CONFIG_SPIFFS_CACHE

Enable SPIFFS Cache

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration

Enables/disable memory read caching of nucleus file system operations.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_CACHE_WR

Enable SPIFFS Write Caching

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enables memory write caching for file descriptors in hydrogen.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS

Enable SPIFFS Cache Statistics

Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG_SPIFFS_CACHE](#)

Enable/disable statistics on caching. Debug/test purpose only.

Default value:

- No (disabled)

CONFIG_SPIFFS_PAGE_CHECK

Enable SPIFFS Page Check

Found in: [Component config](#) > [SPIFFS Configuration](#)

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS

Set Maximum GC Runs

Found in: [Component config](#) > [SPIFFS Configuration](#)

Define maximum number of GC runs to perform to reach desired free pages.

Range:

- from 1 to 10000

Default value:

- 10

CONFIG_SPIFFS_GC_STATS

Enable SPIFFS GC Statistics

Found in: [Component config](#) > [SPIFFS Configuration](#)

Enable/disable statistics on gc. Debug/test purpose only.

Default value:

- No (disabled)

CONFIG_SPIFFS_PAGE_SIZE

SPIFFS logical page size

Found in: [Component config](#) > [SPIFFS Configuration](#)

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

Range:

- from 256 to 1024

Default value:

- 256

CONFIG_SPIFFS_OBJ_NAME_LEN

Set SPIFFS Maximum Name Length

Found in: [Component config](#) > [SPIFFS Configuration](#)

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Range:

- from 1 to 256

Default value:

- 32

CONFIG_SPIFFS_FOLLOW_SYMLINKS

Enable symbolic links for image creation

Found in: [Component config](#) > [SPIFFS Configuration](#)

If this option is enabled, symbolic links are taken into account during partition image creation.

Default value:

- No (disabled)

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

Found in: [Component config](#) > [SPIFFS Configuration](#)

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG_SPIFFS_USE_MAGIC](#)

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_META_LENGTH

Size of per-file metadata field

Found in: [Component config](#) > [SPIFFS Configuration](#)

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Default value:

- 4

CONFIG_SPIFFS_USE_MTIME

Save file modification time

Found in: Component config > SPIFFS Configuration

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_MTIME_WIDE_64_BITS

The time field occupies 64 bits in the image instead of 32 bits

Found in: Component config > SPIFFS Configuration

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

Default value:

- No (disabled) if *CONFIG_SPIFFS_META_LENGTH* >= 8

Debug Configuration Contains:

- *CONFIG_SPIFFS_DBG*
- *CONFIG_SPIFFS_API_DBG*
- *CONFIG_SPIFFS_CACHE_DBG*
- *CONFIG_SPIFFS_CHECK_DBG*
- *CONFIG_SPIFFS_TEST_VISUALISATION*
- *CONFIG_SPIFFS_GC_DBG*

CONFIG_SPIFFS_DBG

Enable general SPIFFS debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print general debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_API_DBG

Enable SPIFFS API debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print API debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_GC_DBG

Enable SPIFFS Garbage Cleaner debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print GC debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_CACHE_DBG

Enable SPIFFS Cache debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print cache debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_CHECK_DBG

Enable SPIFFS Filesystem Check debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print Filesystem Check debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION

Enable SPIFFS Filesystem Visualization

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enable this option to enable SPIFFS_vis function in the API.

Default value:

- No (disabled)

TCP Transport Contains:

- [Websocket](#)

Websocket Contains:

- [CONFIG_WS_TRANSPORT](#)

CONFIG_WS_TRANSPORT

Enable Websocket Transport

Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#)

Enable support for creating websocket transport.

Default value:

- Yes (enabled)

CONFIG_WS_BUFFER_SIZE

WebSocket transport buffer size

Found in: [Component config](#) > [TCP Transport](#) > [WebSocket](#) > [CONFIG_WS_TRANSPORT](#)

Size of the buffer used for constructing the HTTP Upgrade request during connect

Default value:

- 1024

CONFIG_WS_DYNAMIC_BUFFER

Using dynamic websocket transport buffer

Found in: [Component config](#) > [TCP Transport](#) > [WebSocket](#) > [CONFIG_WS_TRANSPORT](#)

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

Default value:

- No (disabled)

Ultra Low Power (ULP) Co-processor Contains:

- [CONFIG_ULP_ROM_PRINT_ENABLE](#)
- [CONFIG_ULP_COPROC_ENABLED](#)
- [ULP Debugging Options](#)
- [ULP RISC-V Settings](#)

CONFIG_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Co-processor

Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#)

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

Default value:

- No (disabled)

CONFIG_ULP_COPROC_TYPE

ULP Co-processor type

Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG_ULP_COPROC_ENABLED](#)

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

Available options:

- ULP FSM (Finite State Machine) ([CONFIG_ULP_COPROC_TYPE_FSM](#))
- ULP RISC-V ([CONFIG_ULP_COPROC_TYPE_RISCV](#))
- LP core RISC-V ([CONFIG_ULP_COPROC_TYPE_LP_CORE](#))

CONFIG_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG_ULP_COPROC_ENABLED](#)

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

Range:

- from 32 to 8176 if [CONFIG_ULP_COPROC_ENABLED](#)

Default value:

- 4096 if [CONFIG_ULP_COPROC_ENABLED](#)

ULP RISC-V Settings

 Contains:

- [CONFIG_ULP_RISCV_UART_BAUDRATE](#)
- [CONFIG_ULP_RISCV_INTERRUPT_ENABLE](#)
- [CONFIG_ULP_RISCV_I2C_RW_TIMEOUT](#)

CONFIG_ULP_RISCV_INTERRUPT_ENABLE

Enable ULP RISC-V interrupts

Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

Turn on this setting to enable interrupts on the ULP RISC-V core.

Default value:

- No (disabled) if [CONFIG_ULP_COPROC_TYPE_RISCV](#)

CONFIG_ULP_RISCV_UART_BAUDRATE

Baudrate used by the bitbanged ULP RISC-V UART driver

Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

The accuracy of the bitbanged UART driver is limited, it is not recommended to increase the value above 19200.

Default value:

- 9600 if [CONFIG_ULP_COPROC_TYPE_RISCV](#)

CONFIG_ULP_RISCV_I2C_RW_TIMEOUT

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

Range:

- from -1 to 4294967295 if [CONFIG_ULP_COPROC_TYPE_RISCV](#)

Default value:

- 500 if [CONFIG_ULP_COPROC_TYPE_RISCV](#)

CONFIG_ULP_ROM_PRINT_ENABLE

Enable print utilities from LP ROM

Found in: Component config > Ultra Low Power (ULP) Co-processor

Set this option to enable printf functionality from LP ROM. This option can help reduce the LP core binary size by not linking printf functionality from RAM code. Note: For LP ROM prints to work properly, make sure that the LP core boots from the LP ROM.

Default value:

- Yes (enabled) if `CONFIG_ULP_COPROC_TYPE_LP_CORE` &&
`ESP_ROM_HAS_LP_ROM`

ULP Debugging Options Contains:

- `CONFIG_ULP_PANIC_OUTPUT_ENABLE`
- `CONFIG_ULP_HP_UART_CONSOLE_PRINT`

CONFIG_ULP_PANIC_OUTPUT_ENABLE

Enable panic handler which outputs over LP UART

Found in: Component config > Ultra Low Power (ULP) Co-processor > ULP Debugging Options

Set this option to enable panic handler functionality. If this option is enabled then the LP Core will output a panic dump over LP UART, similar to what the main core does. Output depends on LP UART already being initialized and configured. Disabling this option will reduce the LP core binary size by not linking in panic handler functionality.

CONFIG_ULP_HP_UART_CONSOLE_PRINT

Route lp_core_printf to the console HP-UART

Found in: Component config > Ultra Low Power (ULP) Co-processor > ULP Debugging Options

Set this option to route lp_core_printf to the console HP-UART. This allows you to easily view print outputs from the LP core, without having to connect to the LP-UART. This option comes with the following limitations:

1. There is no mutual exclusion between the HP-Core and the LP-Core accessing the HP-UART, which means that if both cores are logging heavily the output strings might get mangled together.
2. The HP-UART can only work while the HP-Core is running, which means that if the HP-Core is in deep sleep, the LP-Core will not be able to print to the console HP-UART.

Due to these limitations it is only recommended to use this option for easy debugging. For more serious use-cases you should use the LP-UART.

Unity unit testing library Contains:

- `CONFIG_UNITY_ENABLE_COLOR`
- `CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER`
- `CONFIG_UNITY_ENABLE_FIXTURE`
- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG_UNITY_ENABLE_64BIT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_FLOAT`

CONFIG_UNITY_ENABLE_FLOAT

Support for float type

Found in: [Component config](#) > [Unity unit testing library](#)

If not set, assertions on float arguments will not be available.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_DOUBLE

Support for double type

Found in: [Component config](#) > [Unity unit testing library](#)

If not set, assertions on double arguments will not be available.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_64BIT

Support for 64-bit integer types

Found in: [Component config](#) > [Unity unit testing library](#)

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_COLOR

Colorize test output

Found in: [Component config](#) > [Unity unit testing library](#)

If set, Unity will colorize test results using console escape sequences.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

Found in: [Component config](#) > [Unity unit testing library](#)

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

Found in: [Component config](#) > [Unity unit testing library](#)

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

Found in: [Component config](#) > [Unity unit testing library](#)

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

Default value:

- No (disabled)

USB-OTG Contains:

- [CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK](#)
- [CONFIG_USB_HOST_HW_BUFFER_BIAS](#)
- [CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE](#)
- [Root Hub configuration](#)
- [CONFIG_USB_HOST_EXT_HUB_SUPPORT](#)

CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE

Largest size (in bytes) of transfers to/from default endpoints

Found in: [Component config](#) > [USB-OTG](#)

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device's control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device's with configuration descriptors larger than this limit cannot be supported

Default value:

- 256

CONFIG_USB_HOST_HW_BUFFER_BIAS

Hardware FIFO size biasing

Found in: [Component config](#) > [USB-OTG](#)

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:

- Balanced (CONFIG_USB_HOST_HW_BUFFER_BIAS_BALANCED)
- Bias IN (CONFIG_USB_HOST_HW_BUFFER_BIAS_IN)
- Periodic OUT (CONFIG_USB_HOST_HW_BUFFER_BIAS_PERIODIC_OUT)

Root Hub configuration Contains:

- [CONFIG_USB_HOST_DEBOUNCE_DELAY_MS](#)
- [CONFIG_USB_HOST_RESET_HOLD_MS](#)
- [CONFIG_USB_HOST_RESET_RECOVERY_MS](#)
- [CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS](#)

CONFIG_USB_HOST_DEBOUNCE_DELAY_MS

Debounce delay in ms

Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)

On connection of a USB device, the USB 2.0 specification requires a "debounce interval with a minimum duration of 100ms" to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

Default value:

- 250

CONFIG_USB_HOST_RESET_HOLD_MS

Reset hold in ms

Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that "the reset signaling must be driven for a minimum of 10ms" (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

Default value:

- 30

CONFIG_USB_HOST_RESET_RECOVERY_MS

Reset recovery delay in ms

Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)

After a port stops driving the reset signal, the USB 2.0 specification requires that the "USB System Software guarantees a minimum of 10 ms for reset recovery" before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

Default value:

- 30

CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS

SetAddress() recovery time in ms

Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)

”After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same).” See USB 2.0 chapter 9.2.6.3 for more details.

The default value is set to 10 ms to be safe.

Default value:

- 10

CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK

Enable enumeration filter callback

Found in: [Component config](#) > [USB-OTG](#)

The enumeration filter callback is called before enumeration of each newly attached device. This callback allows users to control whether a device should be enumerated, and what configuration number to use when enumerating a device.

If enabled, the enumeration filter callback can be set via 'usb_host_config_t' when calling 'usb_host_install()'.

Default value:

- No (disabled)

CONFIG_USB_HOST_EXT_HUB_SUPPORT

Support USB HUB (Experimental)

Found in: [Component config](#) > [USB-OTG](#)

Feature is under development.

Default value:

- No (disabled) if [CONFIG_IDF_EXPERIMENTAL_FEATURES](#)

Virtual file system Contains:

- [CONFIG_VFS_SUPPORT_IO](#)

CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

Found in: [Component config](#) > [Virtual file system](#)

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_SELECT

Provide select function

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for "select" on UART file descriptors is not required.

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

Default value:

- Yes (enabled)

CONFIG_VFS_SELECT_IN_RAM

Make VFS driver select() callbacks IRAM-safe

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT

If enabled, VFS driver select() callback function will be placed in IRAM.

Default value:

- No (disabled)

CONFIG_VFS_SUPPORT_TERMIOS

Provide `termios.h` functions

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#)

Disabling this option can save memory when the support for `termios.h` is not required.

Default value:

- Yes (enabled)

CONFIG_VFS_MAX_COUNT

Maximum Number of Virtual Filesystems

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#)

Define maximum number of virtual filesystems that can be registered.

Range:

- from 1 to 20

Default value:

- 8

Host File System I/O (Semihosting) Contains:

- [CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS](#)

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#) > [Host File System I/O \(Semihosting\)](#)

Define maximum number of host filesystem mount points.

Default value:

- 1

Wear Levelling Contains:

- [CONFIG_WL_SECTOR_MODE](#)
- [CONFIG_WL_SECTOR_SIZE](#)

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

Found in: [Component config](#) > [Wear Levelling](#)

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (CONFIG_WL_SECTOR_SIZE_512)
- 4096 (CONFIG_WL_SECTOR_SIZE_4096)

CONFIG_WL_SECTOR_MODE

Sector store mode

Found in: [Component config](#) > [Wear Levelling](#)

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:

- Performance (CONFIG_WL_SECTOR_MODE_PERF)
- Safety (CONFIG_WL_SECTOR_MODE_SAFE)

Wi-Fi Provisioning Manager Contains:

- [CONFIG_WIFI_PROV_BLE_BONDING](#)
- [CONFIG_WIFI_PROV_BLE_SEC_CONN](#)
- [CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION](#)
- [CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV](#)
- [CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES](#)
- [CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT](#)
- [CONFIG_WIFI_PROV_STA_SCAN_METHOD](#)

CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES

Max Wi-Fi Scan Result Entries

Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

Range:

- from 1 to 255

Default value:

- 16

CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT

Provisioning auto-stop timeout

Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

Range:

- from 5 to 600

Default value:

- 30

CONFIG_WIFI_PROV_BLE_BONDING

Enable BLE bonding

Found in: Component config > Wi-Fi Provisioning Manager

This option is applicable only when provisioning transport is BLE.

CONFIG_WIFI_PROV_BLE_SEC_CONN

Enable BLE Secure connection flag

Found in: Component config > Wi-Fi Provisioning Manager

Used to enable Secure connection support when provisioning transport is BLE.

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION

Force Link Encryption during characteristic Read / Write

Found in: Component config > Wi-Fi Provisioning Manager

Used to enforce link encryption when attempting to read / write characteristic

CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Keep BT on after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager

CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Default value:

- Yes (enabled) if `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`

CONFIG_WIFI_PROV_STA_SCAN_METHOD

Wifi Provisioning Scan Method

Found in: Component config > Wi-Fi Provisioning Manager

Available options:

- All Channel Scan (`CONFIG_WIFI_PROV_STA_ALL_CHANNEL_SCAN`)
Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (`CONFIG_WIFI_PROV_STA_FAST_SCAN`)
Scan will end after an AP matching with the SSID has been detected.

CONFIG_IDF_EXPERIMENTAL_FEATURES

Make experimental features visible

Found in:

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

Current experimental feature list:

- CONFIG_ESPTOOLPY_FLASHFREQ_120M && CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR
- CONFIG_SPIRAM_SPEED_120M && CONFIG_SPIRAM_MODE_OCT
- CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH
- CONFIG_MBEDTLS_USE_CRYPTOROM_IMPL
- CONFIG_ESP_WIFI_EAP_TLS1_3
- CONFIG_ESP_WIFI_ENABLE_ROAMING_APP

Default value:

- No (disabled)

2.7 配网 API

2.7.1 协议通信

概述

协议通信 (protocomm) 组件用于管理安全会话并为多种传输提供框架。应用程序还可以直接使用 `protocomm` 层来增加特定扩展，用于配网或非配网使用场景。

以下功能可用于配网：

- 应用程序层面的通信安全
 - `protocomm_security0` (无安全功能)
 - `protocomm_security1` (Curve25519 密钥交换 + AES-CTR 加密/解密)
 - `protocomm_security2` (基于 SRP6a 的密钥交换 + AES-GCM 加密/解密)
- 所有权验证 (Proof-of-possession) (仅 `protocomm_security1` 支持该功能)
- 盐值和验证器 (Salt and Verifier) (仅 `protocomm_security2` 支持该功能)

在 `protocomm` 内部，`protobuf` (协议缓冲区) 用于建立安全会话。用户可以自行选择 (即使在不使用 `Protobuf` 的情况下) 实现安全性，也可以在没有任何安全层的情况下使用协议。

`Protocomm` 为以下各种传输提供框架：

- Wi-Fi (SoftAP + HTTPD)
- 控制台：使用该传输方案时，设备端会自动调用处理程序。相关代码片段，请参见下文传输示例。

请注意，对于 `protocomm_security1` 和 `protocomm_security2`，客户端仍需要执行双向握手来建立会话。

关于安全握手逻辑的详情，请参阅[统一配网](#)。

启用 `protocomm` 安全版本

关于启用/禁用相应的安全版本，请参阅 `protocomm` 组件的项目配置菜单。相应配置选项如下：

- 支持 `protocomm_security0`, 该版本无安全功能: [CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0](#), 该选项默认启用。
- 支持 `protocomm_security1`, 使用 Curve25519 密钥交换和 AES-CTR 加密/解密: [CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1](#), 该选项默认启用。
- 支持 `protocomm_security2`, 使用基于 SRP6a 的密钥交换和 AES-GCM 加密/解密: [CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2](#)。

备注: 启用多个安全版本后可以动态控制安全版本, 但也会增加固件大小。

使用 Security 2 的 SoftAP + HTTP 传输方案示例

示例用法请参阅 `wifi_provisioning/src/scheme_softap.c`。

```

/* 此为将通过 protocomm 注册的端点处理程序, 会直接回显接收到的数据 */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID 可以用于持久化 */
    printf("Session ID : %d", session_id);

    /* 回显接收到的数据 */
    *outlen = inlen;          /* 输出更新后的数据长度 */
    *outbuf = malloc(inlen); /* 将在外部释放 */
    memcpy(*outbuf, inbuf, inlen);

    /* 端点创建时传递的私有数据 */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;

static uint32_t priv_data = 1234;

/* 为 protocomm_
↪实例添加一个新端点，该端点由唯一名称标识，再注册一个处理函数，在执行函数时传递私有数据。只要端点_
↪
protocomm_add_endpoint(pc, "echo_req_endpoint",
                       echo_req_handler, (void *) &priv_data);
return pc;
}

/* 停止 protocomm 实例的示例函数 */
void stop_pc(protocomm_t *pc)
{
    /* 移除由其唯一名称标识的端点 */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* 移除由其名称标识的安全端点 */
    protocomm_unset_security(pc, "security_endpoint");

    /* 停止 HTTP 服务器 */
    protocomm_httpd_stop(pc);

    /* 删除（即释放）protocomm 实例 */
    protocomm_delete(pc);
}

```

API 参考

Header File

- `components/protocomm/include/common/protocomm.h`
- This header file can be included with:

```
#include "protocomm.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

PRIV_REQUIRES protocomm

Functions

protocomm_t ***protocomm_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the *protocomm_t* structure initialized to NULL.

返回

- *protocomm_t** : On success
- NULL : No memory for allocating new instance

void **protocomm_delete** (*protocomm_t* *pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

参数 *pc* -- [in] Pointer to the protocomm instance to be deleted

esp_err_t **protocomm_add_endpoint** (*protocomm_t* *pc, const char *ep_name, *protocomm_req_handler_t* h, void *priv_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the *protocomm_t* instance structure.
-

参数

- *pc* -- [in] Pointer to the protocomm instance
- *ep_name* -- [in] Endpoint identifier(name) string
- *h* -- [in] Endpoint handler function
- *priv_data* -- [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

返回

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocomm_remove_endpoint** (*protocomm_t* *pc, const char *ep_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

备注:

- This function internally calls the registered `remove_endpoint()` function which is a member of the *protocomm_t* instance structure.
-

参数

- *pc* -- [in] Pointer to the protocomm instance
- *ep_name* -- [in] Endpoint identifier(name) string

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_open_session** (*protocomm_t* *pc, uint32_t session_id)

Allocates internal resources for new transport session.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
-

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **session_id** -- **[in]** Unique ID for a communication session

返回

- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_close_session** (*protocomm_t* *pc, uint32_t session_id)

Frees internal resources used by a transport session.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
-

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **session_id** -- **[in]** Unique ID for a communication session

返回

- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_req_handle** (*protocomm_t* *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - Resulting output buffer must be deallocated by the caller.
-

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **session_id** -- **[in]** Unique ID for a communication session
- **inbuf** -- **[in]** Input buffer contains input request data which is to be processed by the registered handler
- **inlen** -- **[in]** Length of the input buffer
- **outbuf** -- **[out]** Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** -- **[out]** Buffer length of the allocated output buffer

返回

- `ESP_OK` : Request handled successfully
- `ESP_FAIL` : Internal error in execution of registered handler
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

esp_err_t **protocomm_set_security** (*protocomm_t* *pc, const char *ep_name, const *protocomm_security_t* *sec, const void *sec_params)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.
-

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **sec** -- **[in]** Pointer to endpoint security instance
- **sec_params** -- **[in]** Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 `sec_params` should contain pointer to struct of type `protocomm_security1_params_t` and `protocomm_security2_params_t` respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

返回

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

esp_err_t **protocomm_unset_security** (*protocomm_t* *pc, const char *ep_name)

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string

返回

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

esp_err_t **protocomm_set_version** (*protocomm_t* *pc, const char *ep_name, const char *version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **version** -- **[in]** Version identifier(name) string

返回

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

`esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name)`

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

参数

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Type Definitions

typedef `esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Function prototype for protocomm endpoint handler.

typedef struct protocomm **protocomm_t**

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

备注: Structure of the protocomm object is kept private

Header File

- `components/protocomm/include/security/protocomm_security.h`
- This header file can be included with:

```
#include "protocomm_security.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

Structures

struct **protocomm_security1_params**

Protocomm Security 1 parameters: Proof Of Possession.

Public Members

const uint8_t ***data**

Pointer to buffer containing the proof of possession data

uint16_t **len**

Length (in bytes) of the proof of possession data

struct **protocomm_security2_params**

Protocomm Security 2 parameters: Salt and Verifier.

Public Members

const char ***salt**

Pointer to the buffer containing the salt

uint16_t **salt_len**

Length (in bytes) of the salt

const char ***verifier**

Pointer to the buffer containing the verifier

uint16_t **verifier_len**

Length (in bytes) of the verifier

struct **protocomm_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

备注: This structure should not have any dynamic members to allow re-entrancy

Public Members

int **ver**

Unique version number of security implementation

esp_err_t (***init**)(*protocomm_security_handle_t* *handle)

Function for initializing/allocating security infrastructure

esp_err_t (***cleanup**)(*protocomm_security_handle_t* handle)

Function for deallocating security infrastructure

esp_err_t (***new_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t (***close_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t (***security_req_handler**)(*protocomm_security_handle_t* handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (***encrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (***decrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct *protocomm_security1_params* **protocomm_security1_params_t**

Protocomm Security 1 parameters: Proof Of Possession.

typedef *protocomm_security1_params_t* **protocomm_security_pop_t**

typedef struct *protocomm_security2_params* **protocomm_security2_params_t**

Protocomm Security 2 parameters: Salt and Verifier.

typedef void ***protocomm_security_handle_t**

typedef struct *protocomm_security* **protocomm_security_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

备注: This structure should not have any dynamic members to allow re-entrancy

Enumerations

enum **protocomm_security_session_event_t**

Events generated by the protocomm security layer.

These events are generated while establishing secured session.

Values:

enumerator **PROTOCOLM_SECURITY_SESSION_SETUP_OK**

Secured session established successfully

enumerator **PROTOCOLM_SECURITY_SESSION_INVALID_SECURITY_PARAMS**

Received invalid (NULL) security parameters (username / client public-key)

enumerator **PROTOCOLM_SECURITY_SESSION_CREDENTIALS_MISMATCH**

Received incorrect credentials (username / PoP)

```
PRIV_REQUIRES protocomm
```

Functions

esp_srp_handle_t ***esp_srp_init** (*esp_ng_type_t* ng)

Initialize srp context for given NG type.

备注: the handle gets freed with *esp_srp_free*

参数 **ng** -- NG type given by *esp_ng_type_t*

返回 *esp_srp_handle_t** srp handle

void **esp_srp_free** (*esp_srp_handle_t* *hd)

free *esp_srp_context*

参数 **hd** -- handle to be free

esp_err_t **esp_srp_srv_pubkey** (*esp_srp_handle_t* *hd, const char *username, int username_len, const char *pass, int pass_len, int salt_len, char **bytes_B, int *len_B, char **bytes_salt)

Returns B (pub key) and salt. [Step2.b].

备注: *bytes_B MUST NOT BE FREED BY THE CALLER

备注: *bytes_salt MUST NOT BE FREE BY THE CALLER

参数

- **hd** -- *esp_srp* handle
- **username** -- Username not expected NULL terminated
- **username_len** -- Username length
- **pass** -- Password not expected to be NULL terminated
- **pass_len** -- Password length
- **salt_len** -- Salt length
- **bytes_B** -- Public Key returned
- **len_B** -- Length of the public key
- **bytes_salt** -- Salt bytes generated

返回 *esp_err_t* ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_gen_salt_verifier** (const char *username, int username_len, const char *pass, int pass_len, char **bytes_salt, int salt_len, char **verifier, int *verifier_len)

Generate salt-verifier pair, given username, password and salt length.

备注: if API has returned ESP_OK, salt and verifier generated need to be freed by caller

备注: Usually, username and password are not saved on the device. Rather salt and verifier are generated outside the device and are embedded. this convenience API can be used to generate salt and verifier on the fly for development use case. OR for devices which intentionally want to generate different password each time and can send it to the client securely. e.g., a device has a display and it shows the pin

参数

- **username** -- **[in]** username
- **username_len** -- **[in]** length of the username
- **pass** -- **[in]** password

- **pass_len** -- [in] length of the password
- **bytes_salt** -- [out] generated salt on successful generation, or NULL
- **salt_len** -- [in] salt length
- **verifier** -- [out] generated verifier on successful generation, or NULL
- **verifier_len** -- [out] length of the generated verifier

返回 esp_err_t ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_set_salt_verifier** (*esp_srp_handle_t* *hd, const char *salt, int salt_len, const char *verifier, int verifier_len)

Set the Salt and Verifier pre-generated for a given password. This should be used only if the actual password is not available. The public key can then be generated using *esp_srp_srv_pubkey_from_salt_verifier()* and not *esp_srp_srv_pubkey()*

参数

- **hd** -- esp_srp_handle
- **salt** -- pre-generated salt bytes
- **salt_len** -- length of the salt bytes
- **verifier** -- pre-generated verifier
- **verifier_len** -- length of the verifier bytes

返回 esp_err_t ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_srv_pubkey_from_salt_verifier** (*esp_srp_handle_t* *hd, char **bytes_B, int *len_B)

Returns B (pub key)[Step2.b] when the salt and verifier are set using *esp_srp_set_salt_verifier()*

备注: *bytes_B MUST NOT BE FREED BY THE CALLER

参数

- **hd** -- esp_srp handle
- **bytes_B** -- Key returned to the called
- **len_B** -- Length of the key returned

返回 esp_err_t ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_get_session_key** (*esp_srp_handle_t* *hd, char *bytes_A, int len_A, char **bytes_key, uint16_t *len_key)

Get session key in *bytes_key given by len in *len_key. [Step2.c].

This calculated session key is used for further communication given the proofs are exchanged/authenticated with *esp_srp_exchange_proofs*

备注: *bytes_key MUST NOT BE FREED BY THE CALLER

参数

- **hd** -- esp_srp handle
- **bytes_A** -- Private Key
- **len_A** -- Private Key length
- **bytes_key** -- Key returned to the caller
- **len_key** -- length of the key in *bytes_key

返回 esp_err_t ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_exchange_proofs** (*esp_srp_handle_t* *hd, char *username, uint16_t username_len, char *bytes_user_proof, char *bytes_host_proof)

Complete the authentication. If this step fails, the session_key exchanged should not be used.

This is the final authentication step in SRP algorithm [Step4.1, Step4.b, Step4.c]

参数

- **hd** -- esp_srp handle
- **username** -- Username not expected NULL terminated
- **username_len** -- Username length
- **bytes_user_proof** -- param in
- **bytes_host_proof** -- parameter out (should be SHA512_DIGEST_LENGTH) bytes in size

返回 esp_err_t ESP_OK if user's proof is ok and subsequently bytes_host_proof is populated with our own proof.

Type Definitions

typedef struct esp_srp_handle **esp_srp_handle_t**

esp_srp handle as the result of esp_srp_init

The handle is returned by esp_srp_init on successful init. It is then passed for subsequent API calls as an argument. esp_srp_free can be used to clean up the handle. After esp_srp_free the handle becomes invalid.

Enumerations

enum **esp_ng_type_t**

Large prime+generator to be used for the algorithm.

Values:

enumerator **ESP_NG_3072**

Header File

- [components/protocomm/include/transport/protocomm_httpd.h](#)
- This header file can be included with:

```
#include "protocomm_httpd.h"
```

- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

Functions

esp_err_t protocomm_httpd_start (*protocomm_t* *pc, const *protocomm_httpd_config_t* *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

备注: This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

参数

- **pc** -- [in] Protocomm instance pointer obtained from protocomm_new()

- **config** -- **[in]** Pointer to config structure for initializing HTTP server
- 返回
- ESP_OK : Success
 - ESP_ERR_INVALID_ARG : Null arguments
 - ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
 - ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
 - ESP_ERR_NO_MEM : Memory allocation for server resource failed
 - ESP_ERR_HTTPD_* : HTTP server error on start

esp_err_t **protocomm_httpd_stop** (*protocomm_t* *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

参数 **pc** -- **[in]** Same protocomm instance that was passed to `protocomm_httpd_start()`

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Unions

union **protocomm_httpd_config_data_t**

#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

Public Members

void ***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

protocomm_http_server_config_t **config**

HTTP Server Configuration, if a server is not already active

Structures

struct **protocomm_http_server_config_t**

Config parameters for protocomm HTTP server.

Public Members

uint16_t **port**

Port on which the HTTP server will listen

size_t **stack_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task_priority**

Priority of server task

struct **protocomm_httpd_config_t**

Config parameters for protocomm HTTP server.

Public Members

bool **ext_handle_provided**

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t **data**

Protocomm HTTPD Configuration Data

Macros

PROTOCOLM_HTTPD_DEFAULT_CONFIG()

2.7.2 统一配网

概述

ESP-IDF 支持统一配网，提供可扩展的机制，支持开发者使用不同传输方式和安全方案配置设备的 Wi-Fi 凭证和其他自定义配置。ESP-IDF 为不同的使用场景提供完整可用的 Wi-Fi 配网解决方案，并附带 iOS 和 Android 示例应用程序。开发者可以扩展设备端和手机应用端实现，来满足发送额外自定义配置数据的需求。以下为该实现的重要功能：

1. 可扩展协议

该协议高度灵活，支持开发者在配网过程中发送自定义配置，以及在应用程序中自定义数据格式。

2. 传输方式灵活

该协议可以作为 Wi-Fi (SoftAP + HTTP 服务器) 或低功耗蓝牙上的传输方式，并且可轻松应用于任何支持请求—响应行为的传输方式。

3. 安全方案灵活

配网过程中，各使用场景可能需要不同安全方案来保护传输的数据。部分应用程序可能使用 WPA2 保护的 SoftAP 或具有“即插即用 (just-works)”安全方案的低功耗蓝牙。亦或者，应用程序可能认为传输不安全，需要应用层的安全方案。统一配网框架支持应用程序根据需要选择合适的安全方案。

4. 数据格式紧凑

该协议使用 [Google Protobufs](#) 作为会话设置和 Wi-Fi 配网的数据格式。该方案提供紧凑的数据格式，并可以使用不同编程语言进行数据解析。请注意，该配网的应用数据格式并不只局限于 Protobufs，开发者可以自行选择自己想用的数据格式。

配网过程示例

选择传输方式

统一配网支持 Wi-Fi (SoftAP + HTTP 服务器) 和低功耗蓝牙 (基于 GATT) 传输方式。要选择最佳传输方式，需要考虑以下几点：

1. 基于低功耗蓝牙的传输方式的优势在于，在配网过程中，设备和客户端之间的低功耗蓝牙通信通道稳定，可以提供可靠的配网反馈信息。
2. 基于低功耗蓝牙的配网实现可以提升手机应用的用户体验，因为在 Android 和 iOS 系统中，用户可以直接在手机应用内发现并连接设备。
3. 然而，低功耗蓝牙传输在运行时会占用约 110 KB 内存。如果产品在配网完成后不再使用低功耗蓝牙或经典蓝牙功能，几乎所有内存都可以回收并添加到堆中。

图 38: 配网过程示例

4. 基于 SoftAP 的传输方式兼容性很强，但以下两点需要关注：
 - 设备使用同一频段来托管 SoftAP 以及连接到配置的 AP。由于 AP 可能位于不同信道，可能导致手机无法可靠地接收到连接状态更新。
 - 手机（即客户端）必须先断开与当前 AP 的连接才能连接到 SoftAP。配网过程完成并且 SoftAP 关闭后，原始网络才会恢复。
5. 使用 SoftAP 传输方式时，不需要为 Wi-Fi 使用场景分配太多额外内存。
6. 在 iOS 系统中，如果使用基于 SoftAP 的配网，用户需要将手机切换到 系统设置页面，手动连接 Wi-Fi 热点。由于 iOS 系统限制，iOS 应用程序中无法使用发现（即扫描）和连接 API。

选择安全方案

应用程序开发者需要根据传输方式和其他限制选择相应安全方案。从配网安全角度，需要考虑以下因素：

1. 必须保护客户端发送的配置数据安全以及设备响应数据安全。
2. 客户端应该对连接的设备进行身份验证。
3. 设备制造商可以使用所有权证明 (proof-of-possession, PoP) 这一安全措施，即为每个设备配置一个独特的设备密钥。设备配网时需要输入该密钥，以确保只有设备的合法持有者可以对其进行配网。

有两种安全方案层级可供选择，开发者可以根据需求选择其中一种或结合使用。

1. 传输层安全

对于 SoftAP 配网，可以使用 WPA2 保护的安全方案，则每个设备都会有唯一密码，且该密码也可以用作 PoP。对于低功耗蓝牙配网，在考量其支持的安全层级后，可以使用“即插即用”方案保护传输层的安全。

2. 应用程序层安全

统一配网子系统支持应用层的安全方案 (*Security 1 方案*)，即通过 PoP 提供数据保护和身份验证。如果应用程序不使用传输层的安全方案，或者传输层的安全方案不满足使用场景的需求，可以使用该方案。

设备发现

广播和设备发现由应用程序自行处理。根据所选协议，手机应用程序和设备固件应用程序可以选择适当的广播和发现方法。

对于 SoftAP + HTTP 传输方式，通常可以通过设备托管 AP 的 SSID（网络名称）发现。

对于低功耗蓝牙传输方式，可以使用设备名称或包含在广播中的主要服务 (Primary service) 进行发现，也可以将两者结合。

架构

以下图表展示了统一配网的架构：

统一配网依赖名为 *协议通信* (protocomm) 的基础层，该层提供了安全方案和传输机制的框架。Wi-Fi 配网层使用 protocomm 提供简单的回调函数，供应用程序设置配置和获取 Wi-Fi 状态。应用程序可以控制这些回调的实现方式。此外，应用程序还可以直接使用 protocomm 来注册自定义处理程序。

应用程序会创建一个 protocomm 实例，该实例会映射到特定传输方式和安全方案。protocomm 中的每个传输方式都有“端点”概念，对应特定类型信息通信的逻辑通道。例如，进行安全握手的端点与 Wi-Fi 配置端点不同。每个端点都用字符串标识，具体取决于传输内部对端点变化的表示方式。对于 SoftAP + HTTP 传输方式，端点对应 URI；而对于低功耗蓝牙，端点对应具有特定 UUID 的 GATT 特征。开发者可以创建自定义端点，为同一端点接收或发送的数据实现处理程序。

安全方案

目前，统一配网支持以下安全方案：

1. Security 0

无安全功能（即无加密）。

图 39: 统一配网架构

2. Security 1

基于 Curve25519 的密钥交换、共享密钥派生和 AES256-CTR 模式的数据加密。该方案支持两种模式：

- a. 授权模式 - 使用 PoP 字符串授权会话以及派生共享密钥。
- b. 无授权模式（不启用 PoP） - 仅通过密钥交换派生共享密钥。

3. Security 2

基于 SRP6a 的共享密钥派生和 AES256-GCM 模式的数据加密。

备注：要启用相应安全方案，需要设置项目配置菜单，更多详情请参考[启用 *protocomm* 安全版本](#)。

Security 1 方案

以下时序图展示了 Security 1 方案的详情：

Security 2 方案

Security 2 方案基于 Secure Remote Password (SRP6a) 协议，详情请参阅 [RFC 5054](#)。

该协议要求预先使用标识用户名 I 和明文密码 p 生成盐值 (salt) 和验证器 (verifier)，然后将盐值和验证器存储在 ESP32-S2。

- 应通过适当方式（例如二维码贴纸）将密码 p 和用户名 I 提供给手机应用程序（即配网实体）。

以下时序图展示了 Security 2 方案的详情：

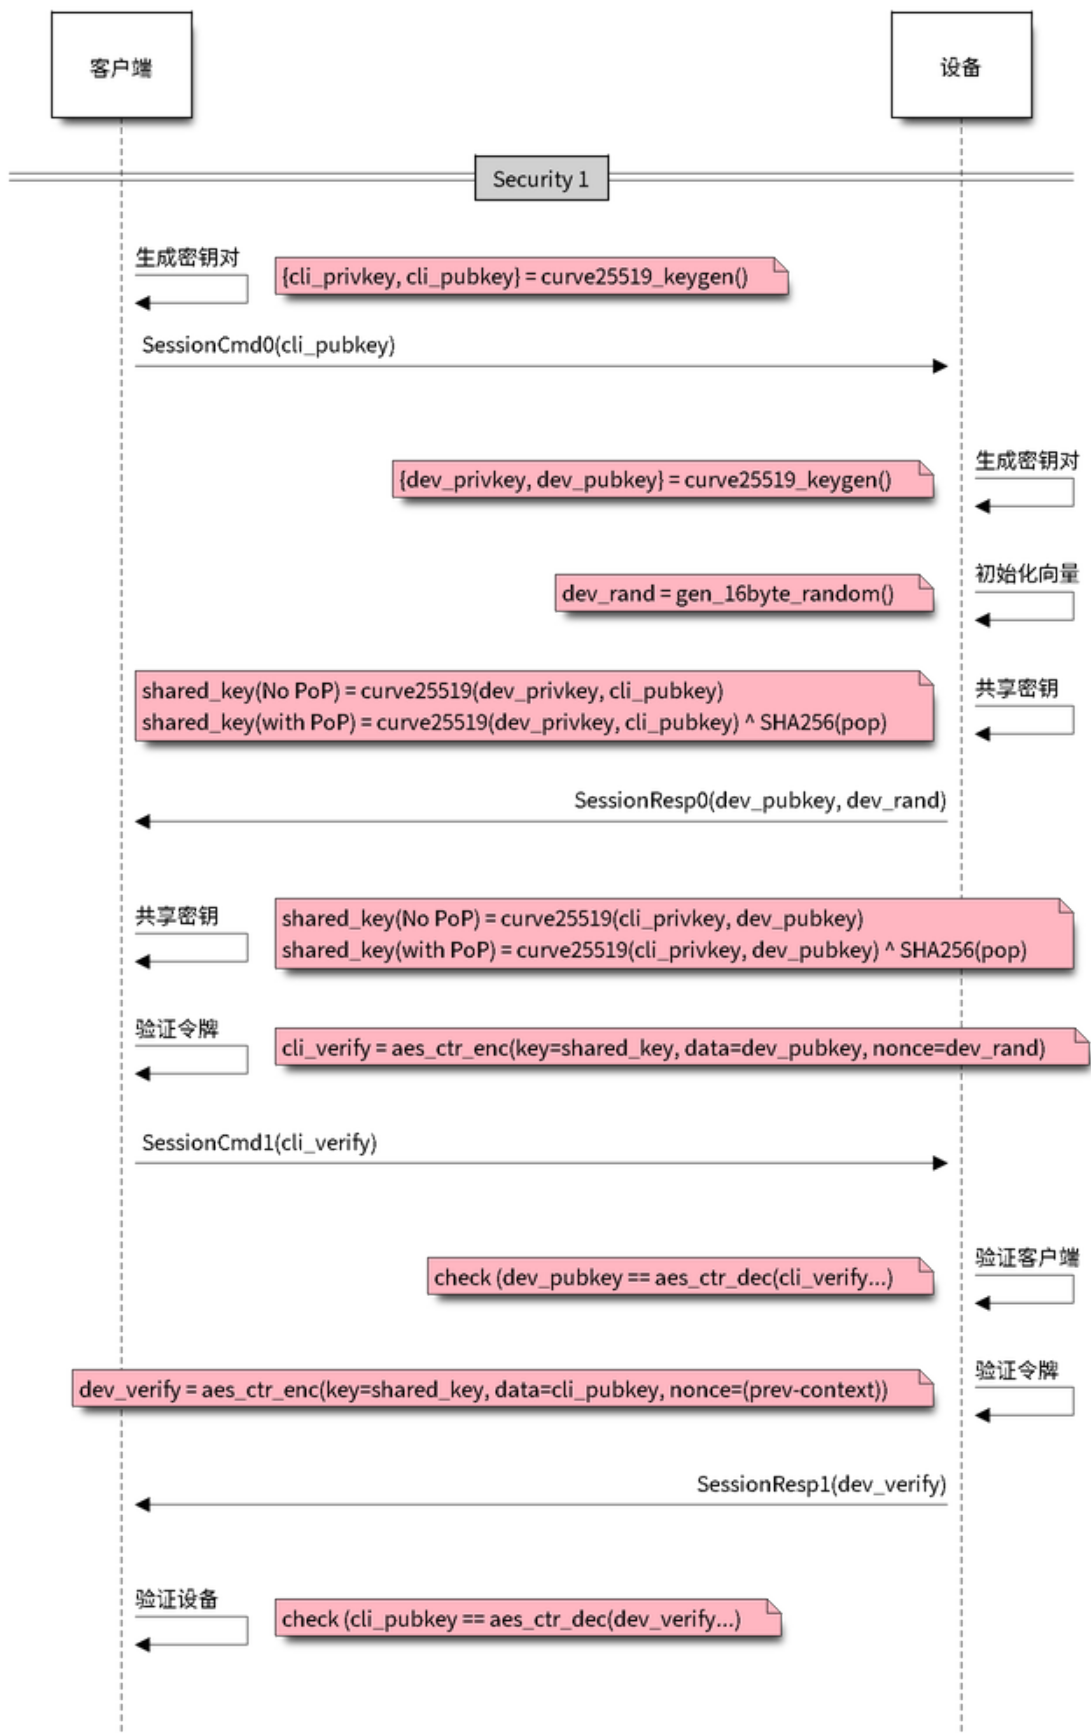

图 40: Security 1

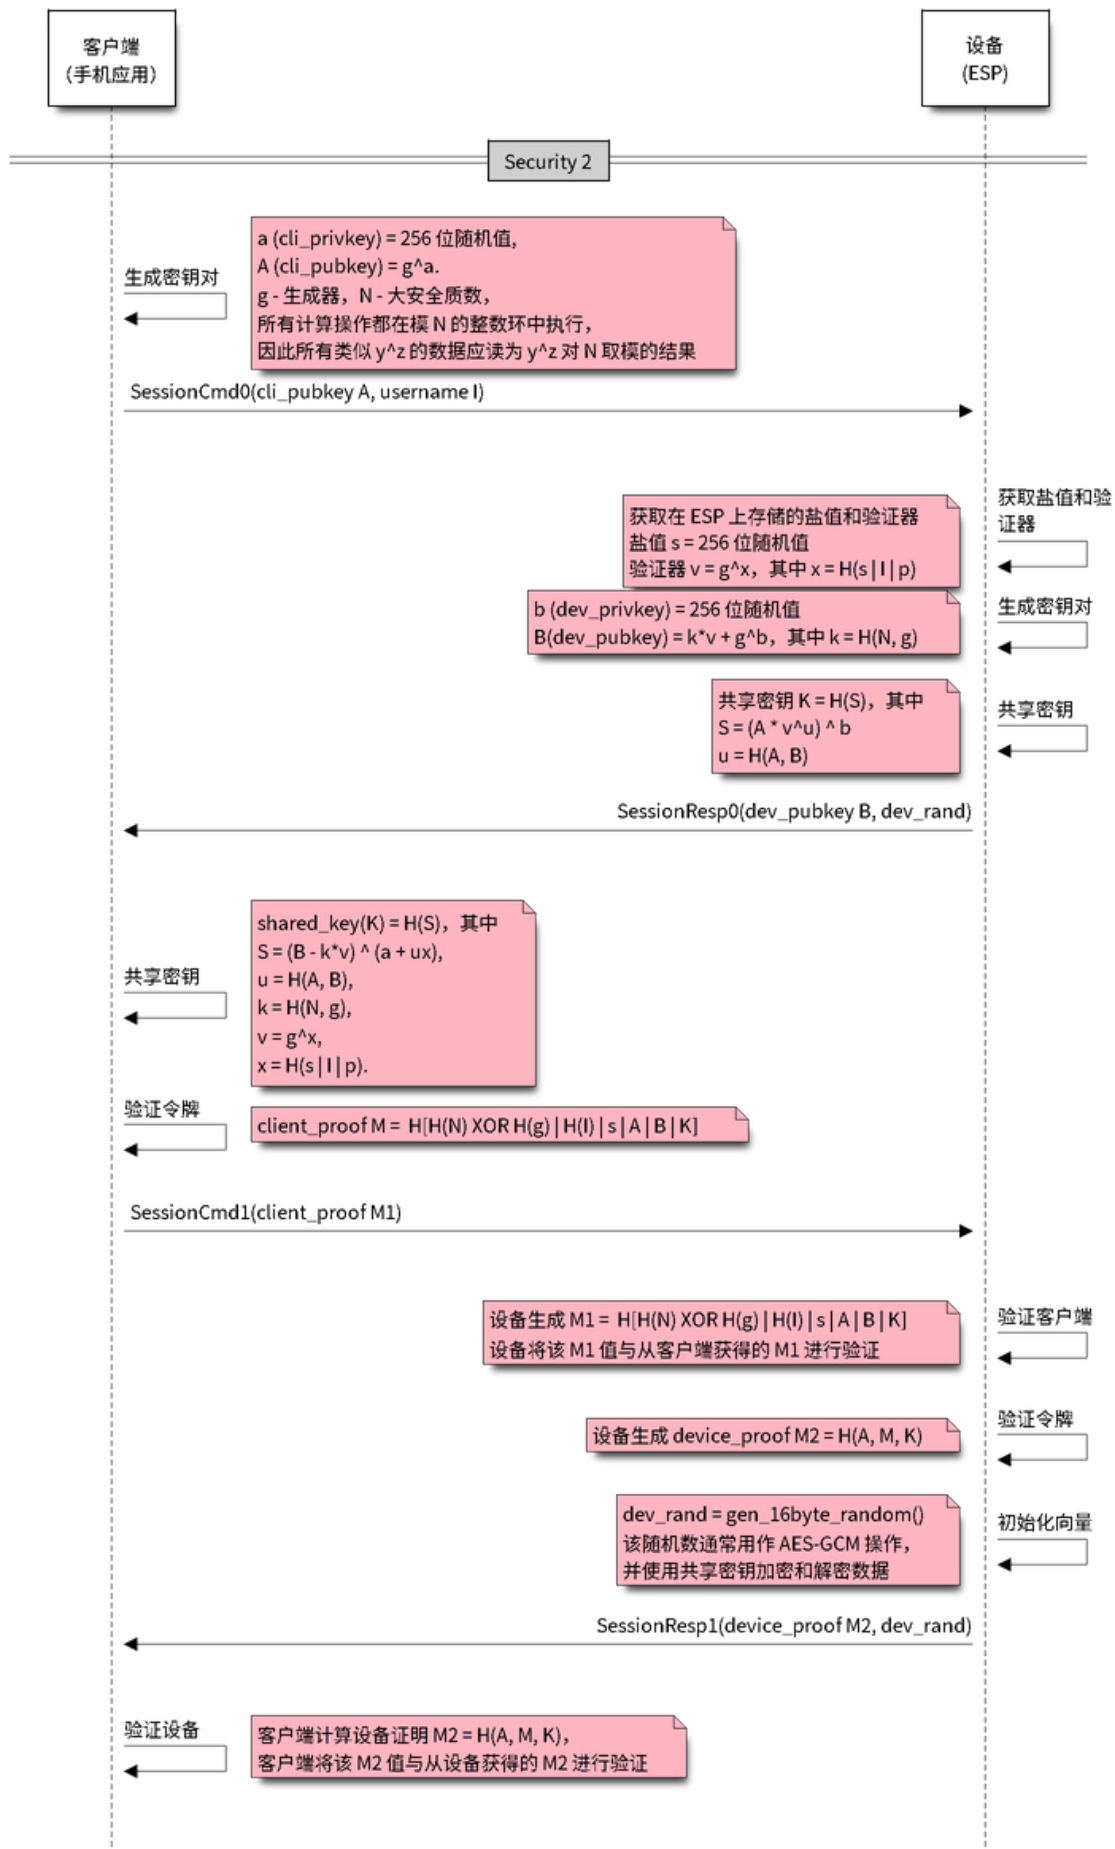

图 41: Security 2

示例代码

关于 API 指南和示例用法的代码片段，请参阅[协议通信](#) 和 [Wi-Fi 配网](#)。

关于应用程序的实现示例，请参阅 [provisioning](#)。

配网工具

以下为各平台的配网应用程序，包括源代码：

- **Android:**
 - [Play Store 上的低功耗蓝牙配网应用程序](#)。
 - [Play Store 上的 SoftAP 配网应用程序](#)。
 - [GitHub 上的源代码](#)：[esp-idf-provisioning-android](#)。
- **iOS:**
 - [App Store 上的低功耗蓝牙配网应用程序](#)。
 - [App Store 上的 SoftAP 配网应用程序](#)。
 - [GitHub 上的源代码](#)：[esp-idf-provisioning-ios](#)。
- **Linux/macOS/Windows:** 基于 Python 的命令行工具 [tools/esp_prov](#)，可用于设备配网。

手机应用程序界面简洁，便于用户使用，而开发者可以使用命令行应用程序，便于调试。

2.7.3 Wi-Fi 配网

概述

该组件提供控制 Wi-Fi 配网服务的 API，可以通过 SoftAP 或低功耗蓝牙建立[协议通信](#) 安全会话，接收和配置 Wi-Fi 凭证。通过一组 `wifi_prov_mgr_` API，可以快速实现配网服务，该服务具备必要功能、代码量少且足够灵活。

初始化 调用 `wifi_prov_mgr_init()` 可以配置和初始化配网管理器，因此在调用任何其他 `wifi_prov_mgr_` API 之前必须先调用此函数。请注意，该管理器依赖于 ESP-IDF 的其他组件，包括 NVS、TCP/IP、Event Loop 和 Wi-Fi，以及可选的 mDNS，因此在调用之前必须先初始化这些组件。调用 `wifi_prov_mgr_deinit()` 可以随时反初始化管理器。

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

以下配置结构体 `wifi_prov_mgr_config_t` 里包含的部分字段可用于指定特定管理器行为：

- `wifi_prov_mgr_config_t::scheme` - 用于指定配网方案。每个方案对应一种 `protoncomm` 支持的传输模式，因此支持三个选项：
 - `wifi_prov_scheme_ble` - 使用低功耗蓝牙传输和 GATT 服务器来处理配网命令。
 - `wifi_prov_scheme_softap` - 使用 Wi-Fi SoftAP 传输和 HTTP 服务器来处理配网命令。
 - `wifi_prov_scheme_console` - 使用串口传输和控制台来处理配网命令。
- `wifi_prov_mgr_config_t::scheme_event_handler` - 为方案定义的专属事件处理程序。选择适当方案后，其专属事件处理程序支持管理器自动处理特定事项。目前，该选项不适用于 SoftAP 或基于控制台的配网方案，但对于低功耗蓝牙配网方案来说非常方便。因为蓝牙需要相当多内存才能正常工作，所以配网完成后，主应用程序需要使用低功耗蓝牙或经典蓝牙时，可能需要回收配网所占的全部或部分内存。此外，未来每当配网设备重启时，都需要再次回收内存。为了便于使用 `wifi_prov_scheme_ble` 选

项，各方案定义了专属处理程序。设备会根据所选处理程序，在反初始化配网管理器时自动释放低功耗蓝牙、经典蓝牙或蓝牙双模的内存。可用选项包括：

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - 同时释放经典蓝牙和低功耗蓝牙或蓝牙双模的内存，可以在主应用程序不需要蓝牙时使用该选项。
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - 只释放低功耗蓝牙的内存，可以在主应用程序需要经典蓝牙时使用该选项。
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - 仅释放经典蓝牙的内存，可以在主应用程序需要低功耗蓝牙时使用该选项，内存会在初始化管理器时立即释放。
 - `WIFI_PROV_EVENT_HANDLER_NONE` - 不使用任何特定方案的专属处理程序。以下情况可使用该选项：不使用低功耗蓝牙配网方案，即使用 `SoftAP` 或控制台方案；主应用程序需要自行回收内存；主应用程序需要同时使用低功耗蓝牙和经典蓝牙。
- `wifi_prov_mgr_config_t::app_event_handler` (不推荐) - 目前建议使用默认的事件循环处理程序捕获生成的 `WIFI_PROV_EVENT`。关于配网服务生成事件的列表，请参阅 `wifi_prov_cb_event_t` 的定义。以下是配网事件示例摘录：

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↪*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
↪"\n\tSSID      : %s\n\tPassword : %s",
                (const char *) wifi_sta_cfg->ssid,
                (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↪reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
↪"\n\tPlease reset to factory and retry_
↪provisioning",
                (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                "Wi-Fi station authentication failed" : "Wi-Fi_
↪access-point not found");
                break;
            }
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /*配网完成后，反初始化管理器。*/
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

调用 `wifi_prov_mgr_deinit()` 可以随时反初始化管理器。

检查配网状态 在运行时，可以调用 `wifi_prov_mgr_is_provisioned()` 检查设备是否配网完成，该函数会在内部检查 Wi-Fi 凭据是否存储在 NVS 中。

请注意，目前管理器并没有自己的 NVS 命名空间来存储 Wi-Fi 凭据，而是依赖 `esp_wifi_ API` 来设置和获取存储在默认位置的 NVS 中的凭据。

可以采用以下任一方法重置配网状态：

- 手动擦除 NVS 分区的配网相关部分。
- 主应用程序必须实现某种逻辑，以在运行时调用 `esp_wifi_ API` 来擦除凭据。
- 主应用程序必须实现某种逻辑，以在不考虑配网状态的情况下，强制启动配网。

```
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

启动配网服务 在启动配网服务时，需要指定服务名称和相应密钥，即：

- 使用 `wifi_prov_scheme_softap` 方案时，服务名称对应 Wi-Fi SoftAP 的 SSID，密钥对应密码。
- 使用 `wifi_prov_scheme_ble` 方案时，服务名称对应低功耗蓝牙设备名称，无需指定密钥。

此外，由于管理器内部使用了 `protocomm`，可以选择其提供的任一安全功能：

- Security 1 是安全通信，该安全通信需要先握手，其中涉及 X25519 密钥交换和使用所有权证明 `pop` 完成身份验证，随后使用 AES-CTR 加密或解密后续消息。
- Security 0 是纯文本通信，会直接忽略 `pop`。

关于安全功能的更多详情，请参阅[统一配网](#)。

```
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );
```

如果收到有效的 Wi-Fi AP 凭据，且设备成功连接到该 AP 并获取了 IP，配网服务会自动结束。此外，调用 `wifi_prov_mgr_stop_provisioning()` 可以随时停止配网服务。

备注：如果设备使用提供的凭据无法连接，则它不再接受新的凭据，但在设备重新启动前，配网服务仍然会继续运行，并向客户端传递连接失败的信息。设备重新启动后配网状态将变为已配网，因为在 NVS 中找到了凭据，但除非出现与凭据匹配的可用 AP，否则设备仍然无法使用原凭据进行连接。可以通过重置 NVS 中的凭据或强制启动配网服务来解决这个问题，详情请参阅上文[检查配网状态](#)。

等待配网完成 主应用程序通常会等待配网服务完成，然后反初始化管理器以释放资源，最后开始执行自己的逻辑。

有两种方法可以实现这一点，其中调用阻塞 `wifi_prov_mgr_wait()` 更为简单。

```
// 启动配网服务
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

// 等待服务完成
wifi_prov_mgr_wait();

// 最后反初始化管理器
wifi_prov_mgr_deinit();
```

另一种方法是使用默认的事件循环处理程序捕获 `WIFI_PROV_EVENT` 并在事件 ID 为 `WIFI_PROV_END` 时调用 `wifi_prov_mgr_deinit()`：

```

static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* 配网完成后反初始化管理器 */
        wifi_prov_mgr_deinit();
    }
}

```

用户端实现 启动服务时，通过广播服务名称识别即将配网的设备。根据选择的传输方式，该服务名称为低功耗蓝牙设备的名称或 SoftAP SSID。

使用 SoftAP 传输方式时，为便于服务发现，必须在启动配网之前初始化 mDNS。在这种情况下，应使用主应用程序设置的主机名，并且在内部将服务类型设置为 `_esp_wifi_prov`。

使用低功耗蓝牙传输方式时，应使用 `wifi_prov_scheme_ble_set_service_uuid()` 设置一个自定义的 128 位 UUID。该 UUID 将包含在低功耗蓝牙广播中，并对应于提供配网端点作为 GATT 特征的主要服务。每个 GATT 特征都基于主要服务 UUID 形成，其中从第 0 个字节开始计数，第 12 和第 13 个字节为自动分配的不同字节。由于端点特征 UUID 自动分配，因此不应将其用于识别端点。客户端应用程序应通过读取每个特征的用户特征描述符 (0x2901) 来识别端点，该描述符包含特征的端点名称。例如，如果将服务 UUID 设置为 55cc035e-fb27-4f80-be02-3c60828b7451，每个端点特征将分配到一个类似于 55cc____-fb27-4f80-be02-3c60828b7451 的 UUID，其中第 12 和第 13 个字节具有唯一值。

连接设备后，可以通过以下方式识别与配网相关的 `protocomm` 端点：

表 9: 配网服务提供的端点

| 端点名称即低功耗蓝牙 + GATT 服务器 | URI 即 SoftAP + HTTP 服务器 + mDNS | 描述 |
|-----------------------|---|-------------------------|
| prov-session | <a href="http://<mdns-hostname>.local/prov-session">http://<mdns-hostname>.local/prov-session | 用于建立会话的安全端点 |
| prov-scan | http://wifi-prov.local/prov-scan | 用于启动 Wi-Fi 扫描和接收扫描结果的端点 |
| prov-ctrl | http://wifi-prov.local/prov-ctrl | 用于控制 Wi-Fi 配网状态的端点 |
| prov-config | <a href="http://<mdns-hostname>.local/prov-config">http://<mdns-hostname>.local/prov-config | 用于在设备上配置 Wi-Fi 凭据的端点 |
| proto-ver | <a href="http://<mdns-hostname>.local/proto-ver">http://<mdns-hostname>.local/proto-ver | 用于获取版本信息的端点 |

连接后，客户端应用程序可以立即从 `proto-ver` 端点获取版本或属性信息。所有与此端点的通信均未加密，因此在建立安全会话前，可以检索相关必要信息，确保会话兼容。响应结果以 JSON 格式返回，格式类似于 `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`。其中 `prov` 标签提供了配网服务的版本 `ver` 和属性 `cap`。目前仅支持 `no_pop` 属性，表示该服务不需要验证所有权证明。任何与应用程序相关的版本或属性将由其他标签给出，如本示例中的 `my_app`。使用 `wifi_prov_mgr_set_app_info()` 可以设置这些附加字段。

用户端应用程序需要根据所配置的安全方案实现签名握手，以建立和认证 `protocomm` 安全会话。当管理器配置为使用 `protocomm security 0` 时，则不需要实现签名握手。

关于安全握手和加密的详情，请参阅[统一配网](#)。应用程序必须使用 `protocomm/proto` 中的 `.proto` 文件。`.proto` 文件定义了 `prov-session` 端点支持的 `protobuf` 消息结构。

建立会话后，以下 `wifi_config` 命令集可用于配置 Wi-Fi 凭据，这些命令会被序列化为 `protobuf` 消息，对应的 `.proto` 文件存放在 `wifi_provisioning/proto` 中。

- `get_status` - 用于查询 Wi-Fi 连接状态。设备响应状态为连接中、已连接或已断开。如果状态为已断开，则还会包含断开原因。
- `set_config` - 用于设置 Wi-Fi 连接凭据。
- `apply_config` - 用于应用先前保存的凭据，即由 `set_config` 设置的凭据，并启动 Wi-Fi 站点。

建立会话后，客户端还可以从设备请求 Wi-Fi 扫描结果。返回结果为 AP SSID 的列表，按信号强度降序排序。由此，客户端应用程序可以在设备配网时显示附近的 AP，并且用户可以选择其中一个 SSID 并提供密码，然后使用上述 `wifi_config` 命令发送密码。`wifi_scan` 端点支持以下 `protobuf` 命令：

- `scan_start` - 启动 Wi-Fi 扫描有多个选项，具体如下：
 - `blocking` (输入) - 如果参数为 `true`，则命令只会在扫描完成后返回。
 - `passive` (输入) - 如果参数为 `true`，则以被动模式启动扫描，扫描速度可能更慢。
 - `group_channels` (输入) - 该参数用于指定是否分组扫描。如果参数为 0，表示一次性扫描所有信道；如果参数为非零值，则表示分组扫描信道且参数值为每组中的信道数，每个连续组之间有 120 毫秒的延迟。分组扫描非常适用于使用 `SoftAP` 的传输模式，因为一次性扫描所有信道可能会导致 Wi-Fi 驱动没有足够时间发送信标，进而导致与部分站点断连。分组扫描时，管理器每扫描完一组信道，至少会等待 120 毫秒，确保驱动程序有足够时间发送信标。例如，假设共有 14 个 Wi-Fi 信道，将 `group_channels` 设置为 3 则将创建 5 个分组，每个分组包含 3 个信道，最后一个分组则为 14 除以 3 余下的 2 个信道。因此，扫描开始时，首先会扫描前 3 个信道，然后等待 120 毫秒，再继续扫描后 3 个信道，以此类推，直到扫描完 14 个信道。可以根据实际情况调整此参数，因为分组中信道数量过少可能会增加整体扫描时间，而信道数量过多则可能会导致连接再次断开。大多数情况下，将参数值设置为 4 即可。请注意，对于低功耗蓝牙等其他传输模式，可以放心将该参数设置为 0，从而在最短时间内完成扫描。
 - `period_ms` (输入) - 该扫描参数用于设置在每个信道上的等待时间。
- `scan_status` - 可以返回扫描过程的状态：
 - `scan_finished` (输出) - 扫描完成时，该参数返回为 `true`。
 - `result_count` (输出) - 该参数返回到目前为止获取的结果总数。如果扫描仍在进行，该数字会不断更新。
- `scan_result` - 用于获取扫描结果。即使扫描仍在进行，也可以调用此函数。
 - `start_index` (输入) - 从结果列表中获取条目的起始索引位置。
 - `count` (输入) - 从起始索引位置获取的条目数目。
 - `entries` (输出) - 返回条目的列表。每个条目包含 `ssid`、`channel` 和 `rsssi` 信息。

客户端还可以使用 `wifi_ctrl` 端点来控制设备的配网状态。`wifi_ctrl` 端点支持的 `protobuf` 命令如下：

- `ctrl_reset` - 仅在配网失败时，重置设备的内部状态机并清除已配置的凭据。
- `ctrl_reprov` - 仅在设备已成功配网的前提下，设备需要重新配网获取新的凭据时，重置设备的内部状态机并清除已配置的凭据。

附加端点 如果用户想要根据自己的需求定制一些附加 `protocomm` 端点，可以通过两步完成。第一步是创建一个具有特定名称的端点，第二步是为该端点注册一个处理程序。关于端点处理程序的函数签名，请参阅[协议通信](#)。自定义端点必须在初始化后、配网服务启动之前创建，但只能在配网服务启动后为该端点注册 `protocomm` 处理程序。注意在自定义端点处理程序的函数中，应使用堆来分配响应这些 `protocomm` 端点的内存，因为一旦传输层发送完毕，`protocomm` 层就会释放这部分内存。

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↳key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
↳custom_ep_data);
```

配网服务停止时，端点会自动取消注册。

在运行时，可以调用 `wifi_prov_mgr_endpoint_unregister()` 来手动停用某个端点。该函数也可以用于停用配网服务使用的内部端点。

何时以及如何停止配网服务？ 当设备使用 `apply_config` 命令设置的 Wi-Fi 凭据成功连接，配网服务将默认停止，并在响应下一个 `get_status` 命令后自动关闭低功耗蓝牙或 `softAP`。如果设备没有收到 `get_status` 命令，配网服务将在超时 30 秒后停止。

如果设备因 SSID 或密码不正确等原因无法使用 Wi-Fi 凭据成功连接，配网服务将继续运行，并通过 `get_status` 命令持续响应为断连状态，并提供断连原因。此时设备不会再接受任何新的 Wi-Fi 凭据。除非强制启动配网服务或擦除 NVS 存储，这些凭据将保留。

可以调用 `wifi_prov_mgr_disable_auto_stop()` 来禁用默认设置。禁用后，只有在显式调用 `wifi_prov_mgr_stop_provisioning()` 之后，配网服务才会停止，且该函数会安排一个任务来停止配网服务，之后立即返回。配网服务将在一定延迟后停止，并触发 `WIFI_PROV_END` 事件。该延迟时间可以由 `wifi_prov_mgr_disable_auto_stop()` 的参数指定。

如果需要在成功建立 Wi-Fi 连接后的某个时间再停止配网服务，应用程序可以采取定制行为。例如，如果应用程序需要设备连接到某个云服务并获取另一组凭证，继而通过自定义 `protocomm` 端点交换凭证，那么成功完成此操作后，可以在 `protocomm` 处理程序中调用 `wifi_prov_mgr_stop_provisioning()` 来停止配网服务。设定适当的延迟时间可以确保 `protocomm` 处理程序的响应到达客户端应用程序后，才释放传输资源。

应用程序示例

关于完整实现示例，请参阅 [provisioning/wifi_prov_mgr](#)。

配网工具

以下为各平台相应的配网应用程序，并附带源代码：

- **Android:**
 - [Play Store](#) 上的低功耗蓝牙配网应用程序。
 - [Play Store](#) 上的 SoftAP 配网应用程序。
 - [GitHub](#) 上的源代码：[esp-idf-provisioning-android](#)。
- **iOS:**
 - [App Store](#) 上的低功耗蓝牙配网应用程序。
 - [App Store](#) 上的 SoftAP 配网应用程序。
 - [GitHub](#) 上的源代码：[esp-idf-provisioning-ios](#)。
- **Linux/MacOS/Windows:** 基于 Python 的命令行工具 [tools/esp_prov](#)，可用于设备配网。

手机应用程序界面简洁，便于用户使用，而开发者可以使用命令行应用程序，便于调试。

API 参考

Header File

- [components/wifi_provisioning/include/wifi_provisioning/manager.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/manager.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event `WIFI_PROV_INIT` is emitted right after initialization is complete

参数 **config** -- [in] Configuration structure

返回

- ESP_OK : Success
- ESP_FAIL : Fail

void **wifi_prov_mgr_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

esp_err_t **wifi_prov_mgr_is_provisioned** (bool *provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

备注: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

参数 **provisioned** -- [out] True if provisioned, else false

返回

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied

bool **wifi_prov_mgr_is_sm_idle** (void)

Checks whether the provisioning state machine is idle.

返回 True if state machine is idle, else false

esp_err_t **wifi_prov_mgr_start_provisioning** (*wifi_prov_security_t* security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

备注: This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

参数

- **security** -- [in] Specify which protocomm security scheme to use :
 - WIFI_PROV_SECURITY_0 : For no security
 - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages

- WIFI_PROV_SECURITY_2: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi_prov_sec_params** -- [in] Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `wifi_prov_security1_params_t` for protocomm security 1 and `wifi_prov_security2_params_t` for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-inited.
- **service_name** -- [in] Unique name of the service. This translates to:
 - Wi-Fi SSID when provisioning mode is softAP
 - Device name when provisioning mode is BLE
- **service_key** -- [in] Key required by client to access the service (NULL if not needed). This translates to:
 - Wi-Fi password when provisioning mode is softAP
 - ignored when provisioning mode is BLE

返回

- ESP_OK : Provisioning started successfully
- ESP_FAIL : Failed to start provisioning service
- ESP_ERR_INVALID_STATE : Provisioning manager not initialized or already started

void **wifi_prov_mgr_stop_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi_prov_mgr_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

[*esp_err_t*](#) **wifi_prov_mgr_disable_auto_stop** (uint32_t `cleanup_delay`)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

备注: This must be called before executing `wifi_prov_mgr_start_provisioning()`

参数 `cleanup_delay` -- **[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

返回

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

esp_err_t `wifi_prov_mgr_set_app_info` (const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label "prov", containing only provisioning service version and capabilities. Application services should use a label other than "prov" so as not to overwrite this.

备注: This must be called before executing `wifi_prov_mgr_start_provisioning()`

参数

- **label** -- **[in]** String indicating the application name.
- **version** -- **[in]** String indicating the application version. There is no constraint on format.
- **capabilities** -- **[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total_capabilities** -- **[in]** Size of capabilities array

返回

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

esp_err_t `wifi_prov_mgr_endpoint_create` (const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

备注: This API can only be called BEFORE provisioning is started

备注: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

备注: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is

stopped and hence all endpoints are unregistered

参数 **ep_name** -- [in] unique name of the endpoint

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **wifi_prov_mgr_endpoint_register** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

备注: This API can only be called AFTER provisioning has started

备注: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

备注: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

参数

- **ep_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user_ctx** -- [in] User data

返回

- ESP_OK : Success
- ESP_FAIL : Failure

void **wifi_prov_mgr_endpoint_unregister** (const char *ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

参数 **ep_name** -- [in] Name of the endpoint

esp_err_t **wifi_prov_mgr_get_wifi_state** (*wifi_prov_sta_state_t* *state)

Get state of Wi-Fi Station during provisioning.

参数 **state** -- [out] Pointer to `wifi_prov_sta_state_t` variable to be filled

返回

- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_get_wifi_disconnect_reason** (*wifi_prov_sta_fail_reason_t* *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

参数 **reason** -- [out] Pointer to `wifi_prov_sta_fail_reason_t` variable to be filled

返回

- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_configure_sta** (wifi_config_t *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

参数 **wifi_cfg** -- [in] Pointer to Wi-Fi configuration structure

返回

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

esp_err_t **wifi_prov_mgr_reset_provisioning** (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

返回

- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config

esp_err_t **wifi_prov_mgr_reset_sm_state_on_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

返回

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

esp_err_t **wifi_prov_mgr_reset_sm_state_for_reprovision** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

备注: This API can be used only if provisioning auto-stop has been disabled using `wifi_prov_mgr_disable_auto_stop()`

返回

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

Structures

struct **wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.

Public Members

wifi_prov_cb_func_t **event_cb**

Callback function to be executed on provisioning events

void ***user_data**

User context data to pass as parameter to callback function

struct **wifi_prov_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

备注: Ready to use schemes are available:

- *wifi_prov_scheme_ble* : for provisioning over BLE transport + GATT server
 - *wifi_prov_scheme_softap* : for provisioning over SoftAP transport + HTTP server
 - *wifi_prov_scheme_console* : for provisioning over Serial UART transport + Console (for debugging)
-

Public Members

esp_err_t (***prov_start**)(*protocomm_t* *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (***prov_stop**)(*protocomm_t* *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void (***new_config**)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov_start()*

void (***delete_config**)(void *config)

Function which is to be called by the manager to delete a configuration generated using *new_config()*

esp_err_t (***set_config_service**)(void *config, const char *service_name, const char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (***set_config_endpoint**)(void *config, const char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t **wifi_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- *WIFI_MODE_APSTA* for SoftAP transport
- *WIFI_MODE_STA* for BLE transport

struct **wifi_prov_mgr_config_t**

Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t **scheme_event_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

wifi_prov_event_handler_t **app_event_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE

Event handler can be set to none if not used.

Type Definitions

```
typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

备注: Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
 - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
 - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
-

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

```
typedef protocomm_security2_params_t wifi_prov_security2_params_t
```

Security 2 params structure This needs to be passed when using `WIFI_PROV_SECURITY_2`.

Enumerations

enum `wifi_prov_cb_event_t`

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

enumerator `WIFI_PROV_INIT`

Emitted when the manager is initialized

enumerator `WIFI_PROV_START`

Indicates that provisioning has started

enumerator `WIFI_PROV_CRED_RECV`

Emitted when Wi-Fi AP credentials are received via `protocomm` endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

enumerator `WIFI_PROV_CRED_FAIL`

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

enumerator `WIFI_PROV_CRED_SUCCESS`

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

enumerator `WIFI_PROV_END`

Signals that provisioning service has stopped

enumerator `WIFI_PROV_DEINIT`

Signals that manager has been de-initialized

enum `wifi_prov_security`

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by `protocomm`

Values:

enumerator `WIFI_PROV_SECURITY_0`

No security (plain-text communication)

enumerator `WIFI_PROV_SECURITY_1`

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator `WIFI_PROV_SECURITY_2`

This secure communication mode consists of SRP6a based authentication and key exchange

- AES-GCM encryption/decryption

Header File

- [components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/scheme_ble.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

void `wifi_prov_scheme_ble_event_cb_free_bt`(void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

void `wifi_prov_scheme_ble_event_cb_free_ble`(void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

void `wifi_prov_scheme_ble_event_cb_free_bt`(void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

[esp_err_t](#) `wifi_prov_scheme_ble_set_service_uuid`(uint8_t *uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

备注: The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

参数 `uuid128` -- [in] A custom 128 bit UUID

返回

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

[esp_err_t](#) `wifi_prov_scheme_ble_set_mfg_data`(uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

备注: It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. $(mfg_data_len + 2) < 31 - (device_name_length + 2)$. If the `mfg_data` length exceeds this limit, the length will be truncated.

参数

- `mfg_data` -- [in] Custom manufacturer data
- `mfg_data_len` -- [in] Manufacturer data length

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

esp_err_t **wifi_prov_scheme_ble_set_random_addr** (const uint8_t *rand_addr)

Set Bluetooth Random address.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

This API can be used in cases where a new identity address is to be used during provisioning. This will result in this device being treated as a new device by remote devices.

This API is only to be called to set random address. Re-invoking this API after provisioning is started will have no effect.

备注: This API will change the existing BD address for the device. The address once set will remain unchanged until BLE stack tear down happens when `wifi_prov_mgr_deinit` is invoked.

参数 **rand_addr** -- [in] The static random address to be set of length 6 bytes.

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

Macros

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File

- This header file can be included with:

```
#include "wifi_provisioning/scheme_softap.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

void **wifi_prov_scheme_softap_set_httpd_handle** (void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

备注: This API should be called before `wifi_prov_mgr_start_provisioning()`

参数 **handle** -- [in] Handle to HTTPD server instance

Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_console.h`
- This header file can be included with:

```
#include "wifi_provisioning/scheme_console.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

#include "wifi_provisioning/wifi_config.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

`esp_err_t wifi_prov_config_data_handler` (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

Structures

struct `wifi_prov_sta_conn_info_t`

WiFi STA connected status information.

Public Members

char `ip_addr`[IP4ADDR_STRLEN_MAX]

IP Address received by station

char **bssid**[6]
BSSID of the AP to which connection was established

char **ssid**[33]
SSID of the to which connection was established

uint8_t **channel**
Channel of the AP

uint8_t **auth_mode**
Authorization mode of the AP

struct **wifi_prov_config_get_data_t**
WiFi status data to be sent in response to `get_status` request from master.

Public Members

wifi_prov_sta_state_t **wifi_state**
WiFi state of the station

wifi_prov_sta_fail_reason_t **fail_reason**
Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

wifi_prov_sta_conn_info_t **conn_info**
Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct **wifi_prov_config_set_data_t**
WiFi config data received by slave during `set_config` request from master.

Public Members

char **ssid**[33]
SSID of the AP to which the slave is to be connected

char **password**[64]
Password of the AP

char **bssid**[6]
BSSID of the AP

uint8_t **channel**
Channel of the AP

struct **wifi_prov_config_handlers**
Internal handlers for receiving and responding to `protocomm` requests from master.

This is to be passed as `priv_data` for `protocomm` request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Public Members

esp_err_t (***get_status_handler**)(*wifi_prov_config_get_data_t* *resp_data, *wifi_prov_ctx_t* **ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (***set_config_handler**)(const *wifi_prov_config_set_data_t* *req_data, *wifi_prov_ctx_t* **ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (***apply_config_handler**)(*wifi_prov_ctx_t* **ctx)

Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

wifi_prov_ctx_t ***ctx**

Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct *wifi_prov_ctx* **wifi_prov_ctx_t**

Type of context data passed to each get/set/apply handler function set in *wifi_prov_config_handlers* structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi_prov_config_handlers* **wifi_prov_config_handlers_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Enumerations

enum **wifi_prov_sta_state_t**

WiFi STA status for conveying back to the provisioning master.

Values:

enumerator **WIFI_PROV_STA_CONNECTING**

enumerator **WIFI_PROV_STA_CONNECTED**

enumerator **WIFI_PROV_STA_DISCONNECTED**

enum **wifi_prov_sta_fail_reason_t**

WiFi STA connection fail reason.

Values:

enumerator **WIFI_PROV_STA_AUTH_ERROR**

enumerator `WIFI_PROV_STA_AP_NOT_FOUND`

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 `provisioning` 目录下。

本部分的 API 示例代码存放在 `wifi/smart_config` 目录下。

本部分的 API 示例代码存放在 `wifi/wifi_easy_connect/dpp-enrollee` 目录下。

2.8 存储 API

本节提供高层次的存储 API 的参考文档。这些 API 基于如 SPI flash、SD/MMC 等低层次驱动。

- 分区表 API 基于分区表，允许以块为单位访问 SPI flash。
- 非易失性存储库 (NVS) 在 SPI NOR flash 上实现了一个有容错性，和磨损均衡功能的键值对存储。
- 虚拟文件系统 (VFS) 库提供了一个用于注册文件系统驱动接口。SPIFFS、FAT 以及多种其他的文件系统库都基于 VFS。
- SPIFFS 是一个专为 SPI NOR flash 优化的磨损均衡的文件系统，非常适用于小分区和低吞吐率的应用。
- FAT 是一个可用于 SPI flash 或者 SD/MMC 存储卡的标准文件系统。
- 磨损均衡库实现了一个适用于 SPI NOR flash 的 flash 翻译层 (FTL)，用于 flash 中 FAT 分区的容器。

备注： 建议使用高层次的 API (`esp_partition` 或者文件系统) 而非低层次驱动 API 去访问 SPI NOR flash。

由于 NOR flash 和乐鑫硬件的一些限制，访问主 flash 会影响各个系统的性能。关于这些限制的更多信息，参见 [SPI flash API](#)。

2.8.1 FAT 文件系统

ESP-IDF 使用 FatFs 库来实现 FAT 文件系统。FatFs 库位于 `fatfs` 组件中，支持直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS (虚拟文件系统) 使用 FatFs 库的大多数功能。

此外，我们对 FatFs 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 FatFs 驱动映射到物理磁盘。

FatFs 与 VFS 配合使用

头文件 `fatfs/vfs/esp_vfs_fat.h` 定义了连接 FatFs 和 VFS 的函数。

函数 `esp_vfs_fat_register()` 分配一个 FATFS 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 FatFs API。

函数 `esp_vfs_fat_unregister_path()` 删除在 VFS 中的注册，并释放 FATFS 结构。

多数应用程序在使用 `esp_vfs_fat_` 函数时，采用如下步骤：

1. 调用 `esp_vfs_fat_register()`，指定：
 - 挂载文件系统的路径前缀 (例如，`"/sdcard"` 或 `"/spiflash"`)
 - FatFs 驱动编号
 - 一个用于接收指向 FATFS 结构指针的变量
2. 调用 `ff_diskio_register()`，为步骤 1 中的驱动编号注册磁盘 I/O 驱动；

- 如需使用与传递到 `esp_vfs_fat_register()` 相同的驱动编号挂载文件系统，可调用 `FatFs` 函数 `f_mount()`。如果目标逻辑驱动上不存在该文件系统，`f_mount()` 将调用失败并报告 `FR_NO_FILESYSTEM` 错误。此时，应首先调用 `f_mkfs()`，在驱动上创建新的 `FatFS` 结构体，然后重新调用 `f_mount()`。注意，应在上述步骤之前调用 `f_fdisk()` 对 SD 卡进行分区。请参考 [FatFs 文档](#)，查看更多信息；
- 调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，`"/sdcard/hello.txt"`）执行打开、读取、写入、擦除、复制等操作。文件系统默认使用 [8.3 文件名格式 \(SFN\)](#)。如需使用长文件名 (LFN)，启用 `CONFIG_FATFS_LONG_FILENAMES` 选项。请参考 [FatFs 文件系统](#)，查看更多信息；
- 可以直接调用 `FatFs` 库函数，但需要使用没有 VFS 前缀的路径，如 `"/hello.txt"`；
- 关闭所有打开的文件；
- 调用 `FatFs` 函数 `f_mount()` 并使用 `NULL FATFS*` 参数，为与上述编号相同的驱动卸载文件系统；
- 调用 `FatFs` 函数 `ff_diskio_register()` 并使用 `NULL ff_diskio_impl_t*` 参数和相同的驱动编号，来释放注册的磁盘 I/O 驱动；
- 调用 `esp_vfs_fat_unregister_path()` 并使用文件系统挂载的路径将 `FatFs` 从 VFS 中移除，并释放步骤 1 中分配的 `FATFS` 结构。

便捷函数 `esp_vfs_fat_sdmmc_mount()`、`esp_vfs_fat_sdspi_mount()` 和 `esp_vfs_fat_sdcard_unmount()` 对上述步骤进行了封装，并加入了对 SD 卡初始化的处理。我们将在下一章节详细介绍以上函数。

备注： FAT 文件系统不支持硬链接，因此调用 `link()` 后会复制文件内容（仅适用于 `FatFs` 卷上的文件）。

FatFs 与 VFS 和 SD 卡配合使用

头文件 `fatfs/vfs/esp_vfs_fat.h` 定义了便捷函数 `esp_vfs_fat_sdmmc_mount()`、`esp_vfs_fat_sdspi_mount()` 和 `esp_vfs_fat_sdcard_unmount()`。这些函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码，将更多高级功能集成到产品应用中。

便捷函数 `esp_vfs_fat_sdmmc_unmount()` 用于卸载文件系统并释放从 `esp_vfs_fat_sdmmc_mount()` 函数获取的资源。

FatFs 与 VFS 配合使用（只读模式下）

头文件 `fatfs/vfs/esp_vfs_fat.h` 也定义了两个便捷函数 `esp_vfs_fat_spiflash_mount_ro()` 和 `esp_vfs_fat_spiflash_unmount_ro()`。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂配置时写入一次，之后在整个硬件生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

配置选项

FatFs 组件有以下配置选项：

- `CONFIG_FATFS_USE_FASTSEEK`** - 如果启用该选项，POSIX `lseek()` 函数将以更快的速度执行。快速查找不适用于编辑模式下的文件，所以，使用快速查找时，应在只读模式下打开（或者关闭然后重新打开）文件。
- `CONFIG_FATFS_IMMEDIATE_FSYNC`** - 如果启用该选项，`FatFs` 将在每次调用 `write()`、`pwrite()`、`link()`、`truncate()` 和 `ftruncate()` 函数后，自动调用 `f_sync()` 以同步最近的文件改动。该功能可提高文件系统中文件的一致性和文件大小报告的准确性，但由于需要频繁进行磁盘操作，性能将会受到影响。
- `CONFIG_FATFS_LINK_LOCK`** - 如果启用该选项，可保证 API 的线程安全，但如果应用程序需要快速频繁地进行小文件操作（例如将日志记录到文件），则可能有必要禁用该选项。请注意，如果禁用该选项，调用 `link()` 后的复制操作将是非原子的，此时如果在不同任务中对同一卷上的大文件调用 `link()`，则无法确保线程安全。

FatFs 磁盘 I/O 层

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 函数注册指定的 FatFs 驱动编号。

void **ff_diskio_register** (BYTE pdrv, const *ff_diskio_impl_t* *discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_XXX functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

参数

- **pdrv** -- drive number
- **discio_impl** -- pointer to *ff_diskio_impl_t* structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff_diskio_impl_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

DSTATUS (***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (***status**)(unsigned char pdrv)

disk status check function

DRESULT (***read**)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)

sector read function

DRESULT (***write**)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

DRESULT (***ioctl**)(unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void **ff_diskio_register_sdmmc** (unsigned char pdrv, sdmmc_card_t *card)

Register SD/MMC diskio driver

参数

- **pdrv** -- drive number
- **card** -- pointer to sdmmc_card_t structure describing a card; card should be initialized before calling f_mount.

esp_err_t **ff_diskio_register_wl_partition** (unsigned char pdrv, *wl_handle_t* flash_handle)

Register spi flash partition

参数

- **pdrv** -- drive number
- **flash_handle** -- handle of the wear levelling partition.

`esp_err_t ff_diskio_register_raw_partition` (unsigned char pdrv, const `esp_partition_t` *part_handle)

Register spi flash partition

参数

- **pdrv** -- drive number
- **part_handle** -- pointer to raw flash partition.

FatFs 分区生成器

我们为 FatFs ([wl_fatfs.py](#)) 提供了分区生成器，该生成器集成在构建系统中，方便用户在自己的项目中使用。

该生成器可以在主机上创建文件系统镜像，并用指定的主机文件夹内容对其进行填充。

该脚本是建立在分区生成器的基础上 ([fatfs.py](#))，目前除了可以生成分区外，也可以初始化磨损均衡。

目前的最新版本支持短文件名、长文件名、FAT12 和 FAT16。长文件名的上限是 255 个字符，文件名中可以包含多个 . 字符以及其他字符，如 +、,、;、=、[and] 等。

如需进一步了解 FatFs 分区生成器或分区分析器，请查看 [Generating and parsing FAT partition on host](#)。

构建系统中使用 FatFs 分区生成器 通过调用 `fatfs_create_partition_image` 可以直接从 CMake 构建系统中调用 FatFs 分区生成器：

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

如果不希望在生成分区时使用磨损均衡，可以使用 `fatfs_create_rawflash_image`：

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` 以及 `fatfs_create_rawflash_image` 必须从项目的 `CMakeLists.txt` 中调用。

如果决定使用 `fatfs_create_rawflash_image`（不支持磨损均衡），请注意它仅支持在设备中以只读模式安装。

该函数的参数如下：

1. `partition` - 分区的名称，需要在分区表中定义（如 [storage/fatfs/partitions_example.csv](#)）。
2. `base_dir` - 目录名称，该目录会被编码为 FatFs 分区，也可以选择将其被烧录进设备。但注意必须在分区表中指定合适的分区大小。
3. `FLASH_IN_PROJECT` 标志 - 可选参数，用户可以通过指定 `FLASH_IN_PROJECT`，选择在执行 `idf.py flash -p <PORT>` 时让分区镜像自动与应用程序二进制文件、分区表等一同烧录进设备。
4. `PRESERVE_TIME` 标志 - 可选参数，用户可强制让目标镜像保留源文件夹的时间戳。如果不保留，每个目标镜像的时间戳都将设置为 FATFS 默认初始时间（1980 年 1 月 1 日）。
5. `ONE_FAT` 标志 - 可选参数，支持生成仅包含单个 FAT（文件分配表）的 FATFS 卷。与包含两个 FAT 的 FATFS 卷相比，这样做可以拥有相对较大的可用空间（通过 FAT 使用的扇区数 * 扇区大小计算），但会增加 FATFS 卷损坏的风险。

例如：

```
fatfs_create_partition_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

没有指定 `FLASH_IN_PROJECT` 时也可以生成分区镜像，但是用户需要使用 `esptool.py` 或自定义的构建系统目标对其手动烧录。

相关示例请查看 [storage/fatfs](#)。

FatFs 分区分析器

我们为 FatFs 提供分区分析器 ([fatfsparse.py](#))。

该分析器为 FatFs 分区生成器 ([fatfsgen.py](#)) 的逆向工具，可以根据 FatFs 镜像在主机上生成文件夹结构。可以使用：

```
./fatfsparse.py [-h] [--wl-layer {detect,enabled,disabled}] [--verbose] fatfs_
↪image.img
```

生成文件夹结构之前，参数 `--verbose` 将根据 FatFs 镜像的引导扇区在终端打印详细信息。

高级 API 参考

Header File

- [components/fatfs/vfs/esp_vfs_fat.h](#)
- This header file can be included with:

```
#include "esp_vfs_fat.h"
```

- This header file is a part of the API provided by the `fatfs` component. To declare that your component depends on `fatfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES fatfs
```

or

```
PRIV_REQUIRES fatfs
```

Functions

`esp_err_t esp_vfs_fat_register_cfg` (const `esp_vfs_fat_conf_t` *conf, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. Input arguments are held in `esp_vfs_fat_conf_t` structure. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

备注： This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

参数

- **conf** -- pointer to `esp_vfs_fat_conf_t` configuration structure
- **out_fs** -- [out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

`esp_err_t esp_vfs_fat_unregister_path` (const char *base_path)

Un-register FATFS from VFS.

备注： FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_ctx`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

参数 **base_path** -- path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

esp_err_t **esp_vfs_fat_sdmmc_mount** (const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

备注: Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

参数

- **base_path** -- path where partition should be registered (e.g. `"/sdcard"`)
- **host_config** -- Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot_config** -- Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`.
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS
- **out_card** -- [out] if not NULL, pointer to the card information structure will be returned via this argument

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdspi_mount** (const char *base_path, const sdmmc_host_t *host_config_input, const *sdspi_device_config_t* *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

备注: This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

参数

- **base_path** -- path where partition should be registered (e.g. `"/sdcard"`)
- **host_config_input** -- Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot_config** -- Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SD-SPI_DEVICE_CONFIG_DEFAULT()`.
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS
- **out_card** -- **[out]** If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdmmc_unmount** (void)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

Deprecated:

Use `esp_vfs_fat_sdcard_unmount()` instead.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

esp_err_t **esp_vfs_fat_sdcard_unmount** (const char *base_path, sdmmc_card_t *card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

esp_err_t **esp_vfs_fat_sdcard_format_cfg** (const char *base_path, sdmmc_card_t *card, *esp_vfs_fat_mount_config_t* *cfg)

Format FAT filesystem with given configuration.

备注: This API should be only called when the FAT is already mounted.

参数

- **base_path** -- Path where partition should be registered (e.g. `"/sdcard"`)

- **card** -- Pointer to the card handle, which should be initialised by calling `esp_vfs_fat_sdspi_mount` first
- **cfg** -- Pointer to structure with extra parameters for formatting FATFS (only relevant fields are used). If NULL, the previous configuration will be used.

返回

- ESP_OK
- ESP_ERR_INVALID_STATE: FAT partition isn't mounted, call `esp_vfs_fat_sdmmc_mount` or `esp_vfs_fat_sdspi_mount` first
- ESP_ERR_NO_MEM: if memory can not be allocated
- ESP_FAIL: fail to format it, or fail to mount back

esp_err_t **esp_vfs_fat_sdcard_format** (const char *base_path, sdmmc_card_t *card)

Format FAT filesystem.

备注: This API should be only called when the FAT is already mounted.

参数

- **base_path** -- Path where partition should be registered (e.g. `"/sdcard"`)
- **card** -- Pointer to the card handle, which should be initialised by calling `esp_vfs_fat_sdspi_mount` first

返回

- ESP_OK
- ESP_ERR_INVALID_STATE: FAT partition isn't mounted, call `esp_vfs_fat_sdmmc_mount` or `esp_vfs_fat_sdspi_mount` first
- ESP_ERR_NO_MEM: if memory can not be allocated
- ESP_FAIL: fail to format it, or fail to mount back

esp_err_t **esp_vfs_fat_spiflash_mount_rw_wl** (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config, *wl_handle_t* *wl_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

参数

- **base_path** -- path where FATFS partition should be mounted (e.g. `"/spiflash"`)
- **partition_label** -- label of the partition which should be used
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS
- **wl_handle** -- [out] wear levelling driver handle

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_rw_wl` was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

esp_err_t **esp_vfs_fat_spiflash_unmount_rw_wl** (const char *base_path, *wl_handle_t* wl_handle)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_rw_wl`.

参数

- **base_path** -- path where partition should be registered (e.g. `"/spiflash"`)
- **wl_handle** -- wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount_rw_wl`

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount_rw_wl` hasn't been called

esp_err_t **esp_vfs_fat_spiflash_format_cfg_rw_wl** (const char *base_path, const char *partition_label, *esp_vfs_fat_mount_config_t* *cfg)

Format FAT filesystem with given configuration.

备注: This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn't mounted (by calling `esp_vfs_fat_spiflash_mount_rw_wl`), this API will first mount the FAT then format it, then restore back to the original state.

参数

- **base_path** -- Path where partition should be registered (e.g. `"/spiflash"`)
- **partition_label** -- Label of the partition which should be used
- **cfg** -- Pointer to structure with extra parameters for formatting FATFS (only relevant fields are used). If NULL and mounted the previous configuration will be used. If NULL and unmounted the default configuration will be used.

返回

- `ESP_OK`
- `ESP_ERR_NO_MEM`: if memory can not be allocated
- Other errors from `esp_vfs_fat_spiflash_mount_rw_wl`

esp_err_t **esp_vfs_fat_spiflash_format_rw_wl** (const char *base_path, const char *partition_label)

Format FAT filesystem.

备注: This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn't mounted (by calling `esp_vfs_fat_spiflash_mount_rw_wl`), this API will first mount the FAT then format it, then restore back to the original state.

参数

- **base_path** -- Path where partition should be registered (e.g. `"/spiflash"`)
- **partition_label** -- Label of the partition which should be used

返回

- `ESP_OK`
- `ESP_ERR_NO_MEM`: if memory can not be allocated
- Other errors from `esp_vfs_fat_spiflash_mount_rw_wl`

esp_err_t **esp_vfs_fat_spiflash_mount_ro** (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined `partition_label`. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

备注: Wear levelling is not used when FAT is mounted in read-only mode using this function.

参数

- **base_path** -- path where FATFS partition should be mounted (e.g. `"/spiflash"`)
- **partition_label** -- label of the partition which should be used
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_ro` was already called for the same partition
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

esp_err_t **esp_vfs_fat_spiflash_unmount_ro** (const char *base_path, const char *partition_label)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_ro`.

参数

- **base_path** -- path where partition should be registered (e.g. `"/spiflash"`)
- **partition_label** -- label of partition to be unmounted

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_ro` hasn't been called

esp_err_t **esp_vfs_fat_info** (const char *base_path, uint64_t *out_total_bytes, uint64_t *out_free_bytes)

Get information for FATFS partition.

参数

- **base_path** -- Base path of the partition examined (e.g. `"/spiflash"`)
- **out_total_bytes** -- [out] Size of the file system
- **out_free_bytes** -- [out] Free bytes available in the file system

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in `errno`)

esp_err_t **esp_vfs_fat_create_contiguous_file** (const char *base_path, const char *full_path, uint64_t size, bool alloc_now)

Create a file with contiguous space at given path.

备注: The file cannot exist before calling this function (or the file size has to be 0) For more information see documentation for `f_expand` from FATFS library

参数

- **base_path** -- Base path of the partition examined (e.g. `"/spiflash"`)
- **full_path** -- Full path of the file (e.g. `"/spiflash/ABC.TXT"`)
- **size** -- File size expanded to, number of bytes in size to prepare or allocate for the file
- **alloc_now** -- True == allocate space now, false == prepare to allocate –see `f_expand` from FATFS

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid arguments (e.g. any of arguments are NULL or size lower or equal to 0)
- ESP_ERR_INVALID_STATE if partition not found

- ESP_FAIL if another FRESULT error (saved in errno)

`esp_err_t esp_vfs_fat_test_contiguous_file` (const char *base_path, const char *full_path, bool *is_contiguous)

Test if a file is contiguous in the FAT filesystem.

参数

- **base_path** -- Base path of the partition examined (e.g. "/spiflash")
- **full_path** -- Full path of the file (e.g. "/spiflash/ABC.TXT")
- **is_contiguous** -- [out] True == allocate space now, false == prepare to allocate –see `f_expand` from FATFS

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid arguments (e.g. any of arguments are NULL)
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

Structures

struct **esp_vfs_fat_conf_t**

Configuration structure for `esp_vfs_fat_register`.

Public Members

const char ***base_path**

Path prefix where FATFS should be registered,

const char ***fat_drive**

FATFS drive specification; if only one drive is used, can be an empty string.

size_t **max_files**

Maximum number of files which can be open at the same time.

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount_rw_wl` functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max_files**

Max number of open files.

size_t **allocation_unit_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and $128 * \text{sector size}$. For SD cards, sector size is always 512 bytes. For wear_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool `disk_status_check_enable`

Enables real `ff_disk_status` function implementation for SD cards (`ff_sdmmc_status`). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn't do anything for other memory storage media.

bool `use_one_fat`

Use 1 FAT (File Allocation Tables) instead of 2. This decreases reliability, but makes more space available (usually only one sector). Note that this option has effect only when the filesystem is formatted. When mounting an already-formatted partition, the actual number of FATs may be different.

Macros

`VFS_FAT_MOUNT_DEFAULT_CONFIG()`

Type Definitions

typedef `esp_vfs_fat_mount_config_t` `esp_vfs_fat_sdmmc_mount_config_t`

2.8.2 量产程序

介绍

这一程序主要用于量产时为每一设备创建工厂 NVS（非易失性存储器）分区镜像。NVS 分区镜像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制镜像，您需要使用以下工具将镜像烧录到设备上：

- [esptool.py](#)
- [Flash 下载工具](#)（仅适用于 Windows）。下载后解压，然后按照 doc 文件夹中的说明操作。
- 使用定制的生产工具直接烧录程序

准备工作

该程序依赖于 `esp-idf` 的 NVS 分区程序

- 操作系统要求：
 - Linux、MacOS 或 Windows（标准版）
- 安装依赖包：
 - [Python](#)

备注：

使用该程序之前，请确保：

- Python 路径已添加到 PATH 环境变量中；
 - 已经安装 `requirement.txt` 中的软件包，`requirement.txt` 在 `esp-idf` 根目录下。
-

具体流程

CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。

配置文件中数据格式如下（*REPEAT* 标签可选）：

```
name1,namespace,    <-- 第一个条目应该为 "namespace" 类型
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

备注： 文件第一行应始终为 namespace 条目。

每行应包含三个参数：key、type 和 encoding，并以逗号分隔。如果有 REPEAT 标签，则主 CSV 文件中所有设备此键值均相同。

有关各个参数的详细说明，请参阅 NVS 分区生成程序的 *README* 文件。

CSV 配置文件示例如下：

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

备注：

请确保：

- 逗号',' 前后无空格；
- CSV 文件每行末尾无空格。

主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行均对应一个设备实体。

主 CSV 文件的数据格式如下：

```
key1,key2,key3,....
value1,value2,value3,....
```

备注： 文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列 (键)，这些列将被视为元数据，而不会编译进最终二进制文件。

每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行（即第一个条目）输入对应的值，后面其他行为空。

参数描述如下：

value Data value

value 是与键对应的键值。

主 CSV 文件示例如下：

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

备注：如果出现 *REPEAT* 标签，则会在相同目录下生成一个新的主 CSV 文件用作主输入文件，并在每行为带有 *REPEAT* 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。

中间 CSV 文件的格式如下：

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

运行量产程序

使用方法：

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

可选参数：

| 序号 | 参数 | 描述 |
|----|------------|-----------|
| 1 | -h, --help | 显示帮助信息并退出 |

命令：

运行 `mfg_gen.py {command} -h` 查看更多帮助信息

| 序号 | 参数 | 描述 |
|----|--------------|-----------|
| 1 | generate | 生成 NVS 分区 |
| 2 | generate-key | 生成加密密钥 |

为每个设备生成工厂镜像（默认）

使用方法：

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                             [--keyfile KEYFILE] [--inputkey INPUTKEY]
                             [--outdir OUTDIR]
                             conf values prefix size
```

位置参数:

| 参数 | 描述 |
|--------|---------------------------------|
| conf | 待解析的 CSV 配置文件路径 |
| values | 待解析的主 CSV 文件路径 |
| prefix | 每个输出文件名前缀的唯一名称 |
| size | NVS 分区大小 (以字节为单位, 且为 4096 的整数倍) |

可选参数:

| 参数 | 描述 |
|---------------------|---|
| -h, --help | 显示帮助信息并退出 |
| --fileid FILEID | 每个文件名后缀的唯一文件标识符 (主 CSV 文件中的任意键), 默认为数值 1、2、3... |
| --version {1,2} | <ul style="list-style-type: none"> • 设置多页 Blob 版本。 • 版本 1 - 禁用多页 Blob; • 版本 2 - 启用多页 Blob; • 默认版本: 版本 2 |
| --keygen | 生成 NVS 分区加密密钥 |
| --inputkey INPUTKEY | 内含 NVS 分区加密密钥的文件 |
| --outdir OUTDIR | 输出目录, 用于存储创建的文件 (默认当前目录) |

请运行以下命令为每个设备生成工厂镜像, 量产程序同时提供了一个 CSV 示例文件:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000
```

主 CSV 文件应在 file 类型下设置一个相对路径, 相对于运行该程序的当前目录。

为每个设备生成工厂加密镜像

运行以下命令为每一设备生成工厂加密镜像, 量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

备注: 创建的加密密钥格式为 <outdir>/keys/keys-<prefix>-<fileid>.bin。加密密钥存储于新建文件的 keys/ 目录下, 与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 提供加密密钥用作二进制输入文件来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

仅生成加密密钥

使用方法:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数: +-----+-----+ | 参数 | 描述 | +-----+-----+
+-----+ | -h, --help | 显示帮助信息并退出 | +-----+-----+
+-----+ | --keyfile KEYFILE | 加密密钥文件的输出路径 | +-----+-----+
+-----+ | --outdir OUTDIR | 输出目录, 用于存储创建的文件 (默认当前目录) | +-----+-----+
+-----+

运行以下命令仅生成加密密钥:

```
python mfg_gen.py generate-key
```

备注: 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。时间戳格式为: `%m-%d_%H-%M`。如需自定义目标文件名, 请使用 `--keyfile` 参数。

生成的加密密钥二进制文件还可以用于为每个设备的工厂镜像加密。

`fileid` 参数的默认值为 1、2、3..., 与主 CSV 文件中的行一一对应, 内含设备配置值。

运行量产程序时, 将在指定的 `outdir` 目录下创建以下文件夹:

- `bin/` 存储生成的二进制文件
- `csv/` 存储生成的中间 CSV 文件
- `keys/` 存储加密密钥 (创建工厂加密镜像时会用到)

2.8.3 非易失性存储库

简介

非易失性存储 (NVS) 库主要用于在 flash 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

底层存储 NVS 库通过调用 `esp_partition` API 使用主 flash 的部分空间, 即类型为 `data` 且子类型为 `nvs` 的所有分区。应用程序可调用 `nvs_open()` API 选择使用带有 `nvs` 标签的分区, 也可以通过调用 `nvs_open_from_partition()` API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端, 来将数据保存至其他 flash 芯片 (SPI 或 I2C 接口)、RTC 或 FRAM 中。

备注: 如果 NVS 分区被截断 (例如, 更改分区表布局时), 则应擦除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase-flash` 命令擦除 flash 上的所有内容。

备注: NVS 最适合存储一些较小的数据, 而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串, 请考虑使用基于磨损均衡库的 FAT 文件系统。

键值对 NVS 的操作对象为键值对, 其中键是 ASCII 字符串, 当前支持的最大键长为 15 个字符。值可以为以下几种类型:

- 整数型: `uint8_t`、`int8_t`、`uint16_t`、`int16_t`、`uint32_t`、`int32_t`、`uint64_t` 和 `int64_t`;
- 以 0 结尾的字符串;
- 可变长度的二进制数据 (BLOB)

备注: 字符串值当前上限为 4000 字节, 其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小的 97.6% 减去 4000 字节, 以较低值为准。

后续可能会增加对 `float` 和 `double` 等其他类型数据的支持。

键必须唯一。为现有的键写入新值时, 会将旧的值及数据类型更新为写入操作指定的值和数据类型。

读取值时会执行数据类型检查。如果读取操作预期的数据类型与对应键的数据类型不匹配，则返回错误。

命名空间 为了减少不同组件之间键名的潜在冲突，NVS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则，例如，最多可占 15 个字符。此外，单个 NVS 分区最多只能容纳 254 个不同的命名空间。命名空间的名称在调用 `nvs_open()` 或 `nvs_open_from_partition` 中指定，调用后将返回一个不透明句柄，用于后续调用 `nvs_get_*`、`nvs_set_*` 和 `nvs_commit` 函数。这样，一个句柄关联一个命名空间，键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVS 分区中具有相同名称的命名空间将被视为不同的命名空间。

NVS 迭代器 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVS 中存储的键值对。

使用以下函数，可执行相关操作：

- `nvs_entry_find`: 创建一个不透明句柄，用于后续调用 `nvs_entry_next` 和 `nvs_entry_info` 函数；
- `nvs_entry_next`: 让迭代器指向下一个键值对；
- `nvs_entry_info`: 返回每个键值对的信息。

总的来说，所有通过 `nvs_entry_find()` 获得的迭代器（包括 NULL 迭代器）都必须使用 `nvs_release_iterator()` 释放。

一般情况下，`nvs_entry_find()` 和 `nvs_entry_next()` 会将给定的迭代器设置为 NULL 或为一个有效的迭代器。但如果出现参数错误（如返回 `ESP_ERR_NVS_NOT_FOUND`），给定的迭代器不会被修改。因此，在调用 `nvs_entry_find()` 之前最好将迭代器初始化为 NULL，这样可以避免在释放迭代器之前进行复杂的错误检查。

安全性、篡改性及鲁棒性 NVS 与 ESP32-S2 flash 加密系统不直接兼容。然而，如果 NVS 加密与 ESP32-S2 flash 加密或 HMAC 外设一起使用，数据仍可以加密形式存储。详情请参考 [NVS 加密](#)。

如果未启用 NVS 加密，任何对 flash 芯片有物理访问权限的用户都可以修改、擦除或添加键值对。NVS 加密启用后，如果不知道相应的 NVS 加密密钥，则无法修改或添加键值对并将其识别为有效键值对。但是，针对擦除操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVS 库会尝试恢复。在任何时间点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库还应该能够在 flash 中存在任何随机数据的情况下正常初始化。

NVS 加密

详情请参考 [NVS 加密](#)。

NVS 分区生成程序

NVS 分区生成程序帮助生成 NVS 分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由 CSV 文件提供，详情请参考 [NVS 分区生成程序](#)。

可以直接使用函数 `nvs_create_partition_image` 通过 CMake 创建分区二进制文件，无需手动调用 `nvs_partition_gen.py` 工具：

```
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep_
↪dep ...])
```

位置参数：

| 参数 | 描述 |
|------------------------|--------------|
| <code>partition</code> | NVS 分区名 |
| <code>csv</code> | 解析的 CSV 文件路径 |

可选参数:

| 参数 | 描述 |
|------------------|-----------|
| FLASH_IN_PROJECT | NVS 分区名 |
| DEPENDS | 指定命令依赖的文件 |

在没有指定 `FLASH_IN_PROJECT` 的情况下，也支持生成分区镜像，不过此时需要使用 `idf.py <partition>-flash` 手动进行烧录。举个例子，如果分区名为 `nvs`，则需使用的命令为 `idf.py nvs-flash`。

目前，仅支持从组件中的 `CMakeLists.txt` 文件调用 `nvs_create_partition_image`，且此选项仅适用于非加密分区。

应用示例

ESP-IDF `storage` 目录下提供了数个代码示例：

[storage/nvs_rw_value](#)

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32-S2 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。诊断程序以纯文本形式提供，有助于追踪程序流程，及时发现问题。

[storage/nvs_rw_blob](#)

演示如何读取及写入 NVS 单个整数值和 BLOB（二进制大对象），并在 NVS 中存储这一数值，即便 ESP32-S2 模组重启也不会消失。

- `value` - 记录 ESP32-S2 模组软重启次数和硬重启次数。
- `blob` - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。每次手动软重启后，表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉 GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

[storage/nvs_rw_value_cxx](#)

这个例子与 [storage/nvs_rw_value](#) 完全一样，只是使用了 C++ 的 NVS 句柄类。

内部实现

键值对日志 NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在日志最后增加一对新的键值对，同时将旧的键值对标记为已擦除。

页面和条目 NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分的整体日志。逻辑页面对应 flash 的一个物理扇区，正在使用中的页面具有与之相关联的序列号。序列号赋予了页面顺序，较高的序列号对应较晚创建的页面。页面有以下几种状态：

空或未初始化 页面对应的 flash 扇区为空白状态（所有字节均为 `0xff`）。此时，页面未存储任何数据且没有关联的序列号。

活跃状态 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，可写入数据。任意时刻，至多有一个页面处于活跃状态。

写满状态 flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入新键值对，但仍可将一些键值对标记为已擦除。

擦除状态 未擦除的键值对将移至其他页面，以便擦除当前页面。这一状态仅为暂时性状态，即 API 调用返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未擦除的键值对移至其他页面，并继续擦除当前页面。

损坏状态 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无法访问。相应的 flash 扇区并不会被立即擦除，而是与其他处于未初始化状态的扇区一起等待后续使用。这一状态可能对调试有用。

flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序列号组织页面。

页面结构 当前，我们假设 flash 扇区大小为 4096 字节，并且 ESP32-S2 flash 加密硬件在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适配具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32-S2 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息详见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）。

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32-S2 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其变更为擦除状态。

头部中的 version 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 0xff 开始依次递减（例如，version-1 为 0xff，version-2 为 0xfe，以此类推）。

头部中 CRC32 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 0xff 字节填充。

条目结构和条目状态位图的详细信息见下文描述。

条目和条目状态位图 每个条目可处于以下三种状态之一，每个状态在条目状态位图中用两位表示。位图中的最后四位 (256 - 2 * 126) 未使用。

空 (2'b11) 条目还未写入任何内容，处于未初始化状态（全部字节为 0xff）。

写入 (2'b10) 一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。

擦除 (2'b00) 条目中的键值对已丢弃，条目内容不再解析。

条目结构 如果键值类型为基础类型，即 1 - 8 个字节长度的整数型，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，即以新格式储存至条目。

条目结构中各个字段含义如下：

命名空间 (NS, NameSpace) 该条目的命名空间索引，详细信息参见命名空间实现章节。

类型 (Type) 一个字节表示的值的数据类型，[nvs_flash/include/nvs_handle.hpp](#) 下的 `ItemType` 枚举了可能的类型。

跨度 (Span) 该键值对所用的条目数量。如果键值为整数型，条目数量即为 1。如果键值为字符串或 BLOB，则条目数量取决于值的长度。

块索引 (ChunkIndex) 用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 `0xff`。

CRC32 对条目下所有字节进行校验后，所得的校验和（CRC32 字段不计算在内）。

键 (Key) 即以零结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字节的零终止符。

数据 (Data) 如果键值类型为整数型，则数据字段仅包含键值。如果键值小于八个字节，使用 `0xff` 填充未使用的部分（右侧）。

如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- **块大小** 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。
- **ChunkCount** 存储过程中 BLOB 分成的数据块总量。该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块索引，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：

- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，此字段也应将零终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字节的校验和，该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 `Span` 字段将指明使用了多少条目。

命名空间 如上所述，每个键值对属于一个命名空间。命名空间标识符（字符串）也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。

| | |
|---|-----------------------------------|
| NS=0 Type=uint8_t Key="wifi" Value=1 | Entry describing namespace "wifi" |
| NS=1 Type=uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi" |
| NS=0 Type=uint8_t Key="pwm" Value=2 | Entry describing namespace "pwm" |
| NS=2 Type=uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm" |

条目哈希列表 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。Page::findItem 首先从哈希列表中检索条目哈希值，如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目、两个链表指针和一个 32 位计数字段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

API 参考

Header File

- [components/nvs_flash/include/nvs_flash.h](#)
- This header file can be included with:

```
#include "nvs_flash.h"
```

- This header file is a part of the API provided by the nvs_flash component. To declare that your component depends on nvs_flash, add the following to your CMakeLists.txt:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

Functions

esp_err_t **nvs_flash_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

When "NVS_ENCRYPTION" is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any "data" type partition which has the subtype value set to "nvs_keys")
- If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- Internally call "nvs_flash_secure_init()" with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

返回

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label "nvs" is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when "NVS_ENCRYPTION" is enabled).
- error codes from nvs_flash_generate_keys API (when "NVS_ENCRYPTION" is enabled).
- error codes from nvs_flash_secure_init_partition API (when "NVS_ENCRYPTION" is enabled) .

esp_err_t **nvs_flash_init_partition** (const char *partition_label)

Initialize NVS flash storage for the specified partition.

参数 **partition_label** -- [in] Label of the partition. Must be no longer than 16 characters.

返回

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_init_partition_ptr** (const *esp_partition_t* *partition)

Initialize NVS flash storage for the partition specified by partition pointer.

参数 **partition** -- [in] pointer to a partition obtained by the ESP partition API.

返回

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with "nvs" label in the partition table.

返回

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

esp_err_t **nvs_flash_deinit_partition** (const char *partition_label)

Deinitialize NVS storage for the given NVS partition.

参数 **partition_label** -- [in] Label of the partition

返回

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t **nvs_flash_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label "nvs").

备注: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be

initialized again to be used.

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled "nvs" in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition** (const char *part_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

备注: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

参数 **part_name** -- [in] Name (label) of the partition which should be erased

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition_ptr** (const *esp_partition_t* *partition)

Erase custom partition.

Erase all content of specified custom partition.

备注: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

参数 **partition** -- [in] pointer to a partition obtained by the ESP partition API.

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init** (*nvs_sec_cfg_t* *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

参数 **cfg** -- [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

返回

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label "nvs" is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init_partition** (const char *partition_label, *nvs_sec_cfg_t* *cfg)

Initialize NVS flash storage for the specified partition.

参数

- **partition_label** -- **[in]** Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** -- **[in]** Security configuration (keys) to be used for NVS encryption/decryption. If **cfg** is null, no encryption/decryption is used.

返回

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_generate_keys** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Generate and store NVS keys in the provided esp partition.

参数

- **partition** -- **[in]** Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- **[out]** Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

返回

- ESP_OK, if **cfg** was read successfully;
- ESP_ERR_INVALID_ARG, if **partition** or **cfg** is NULL;
- or error codes from `esp_partition_write/erase` APIs.

esp_err_t **nvs_flash_read_security_cfg** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration from a partition.

备注: Provided partition is assumed to be marked 'encrypted'.

参数

- **partition** -- **[in]** Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- **[out]** Pointer to nvs security configuration structure. Pointer must be non-NULL.

返回

- ESP_OK, if **cfg** was read successfully;
- ESP_ERR_INVALID_ARG, if **partition** or **cfg** is NULL
- ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys.
- ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt
- or error codes from `esp_partition_read` API.

esp_err_t **nvs_flash_register_security_scheme** (*nvs_sec_scheme_t* *scheme_cfg)

Registers the given security scheme for NVS encryption The scheme registered with `sec_scheme_id` by this API be used as the default security scheme for the "nvs" partition. Users will have to call this API explicitly in their application.

参数 **scheme_cfg** -- **[in]** Pointer to the security scheme configuration structure that the user (or the `nvs_key_provider`) wants to register.

返回

- ESP_OK, if security scheme registration succeeds;
- ESP_ERR_INVALID_ARG, if **scheme_cfg** is NULL;
- ESP_FAIL, if security scheme registration fails

nvs_sec_scheme_t ***nvs_flash_get_default_security_scheme** (void)

Fetch the configuration structure for the default active security scheme for NVS encryption.

返回 Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

esp_err_t **nvs_flash_generate_keys_v2** (*nvs_sec_scheme_t* *scheme_cfg, *nvs_sec_cfg_t* *cfg)

Generate (and store) the NVS keys using the specified key-protection scheme.

参数

- **scheme_cfg** -- **[in]** Security scheme specific configuration
- **cfg** -- **[out]** Security configuration (encryption keys)

返回

- ESP_OK, if cfg was populated successfully with generated encryption keys;
- ESP_ERR_INVALID_ARG, if scheme_cfg or cfg is NULL;
- ESP_FAIL, if the key generation process fails

esp_err_t **nvs_flash_read_security_cfg_v2** (*nvs_sec_scheme_t* *scheme_cfg, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration set by the specified security scheme.

参数

- **scheme_cfg** -- **[in]** Security scheme specific configuration
- **cfg** -- **[out]** Security configuration (encryption keys)

返回

- ESP_OK, if cfg was read successfully;
- ESP_ERR_INVALID_ARG, if scheme_cfg or cfg is NULL;
- ESP_FAIL, if the key reading process fails

Structures

struct **nvs_sec_cfg_t**

Key for encryption and decryption.

Public Members

uint8_t **eky**[NVS_KEY_SIZE]

XTS encryption and decryption key

uint8_t **tky**[NVS_KEY_SIZE]

XTS tweak key

struct **nvs_sec_scheme_t**

NVS encryption: Security scheme configuration structure.

Public Members

int **scheme_id**

Security Scheme ID (E.g. HMAC)

void ***scheme_data**

Scheme-specific data (E.g. eFuse block for HMAC-based key generation)

nvs_flash_generate_keys_t **nvs_flash_key_gen**

Callback for the nvs_flash_key_gen implementation

nvs_flash_read_cfg_t **nvs_flash_read_cfg**

Callback for the `nvs_flash_read_keys` implementation

Macros

NVS_KEY_SIZE

Type Definitions

typedef *esp_err_t* (***nvs_flash_generate_keys_t**)(const void *scheme_data, *nvs_sec_cfg_t* *cfg)

Callback function prototype for generating the NVS encryption keys.

typedef *esp_err_t* (***nvs_flash_read_cfg_t**)(const void *scheme_data, *nvs_sec_cfg_t* *cfg)

Callback function prototype for reading the NVS encryption keys.

Header File

- `components/nvs_flash/include/nvs.h`
- This header file can be included with:

```
#include "nvs.h"
```

- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

Functions

esp_err_t **nvs_set_i8** (*nvs_handle_t* handle, const char *key, *int8_t* value)

set *int8_t* value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called. Regardless whether key-value pair is created or updated, function always requires at least one `nvs` available entry. See `nvs_get_stats`. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

参数

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set.

返回

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value

- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

`esp_err_t nvs_set_u8` (*nvs_handle_t* handle, const char *key, uint8_t value)

set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16` (*nvs_handle_t* handle, const char *key, int16_t value)

set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16` (*nvs_handle_t* handle, const char *key, uint16_t value)

set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32` (*nvs_handle_t* handle, const char *key, int32_t value)

set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32` (*nvs_handle_t* handle, const char *key, uint32_t value)

set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64` (*nvs_handle_t* handle, const char *key, int64_t value)

set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64` (*nvs_handle_t* handle, const char *key, uint64_t value)

set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str` (*nvs_handle_t* handle, const char *key, const char *value)

set string for given key

Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

参数

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

返回

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value

- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`

get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

out_value has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

参数

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **key** -- [in] Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out_value** -- Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

返回

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`

get uint8_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`

get int16_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`

get uint16_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`

get int32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`

get uint32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64` (*nvs_handle_t* handle, const char *key, int64_t *out_value)

get int64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64` (*nvs_handle_t* handle, const char *key, uint64_t *out_value)

get uint64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str` (*nvs_handle_t* handle, const char *key, char *out_value, size_t *length)

get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

参数

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **key** -- [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **out_value** -- [out] Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** -- [inout] A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

返回

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

`esp_err_t nvs_get_blob` (*nvs_handle_t* handle, const char *key, void *out_value, size_t *length)

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

esp_err_t **nvs_open** (const char *namespace_name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

参数

- **namespace_name** -- **[in]** Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** -- **[in]** NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

返回

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "nvs" is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP_ERR_NOT_ALLOWED if the NVS partition is read-only and mode is NVS_READWRITE
- ESP_ERR_INVALID_ARG if out_handle is equal to NULL
- other error codes from the underlying storage driver

esp_err_t **nvs_open_from_partition** (const char *part_name, const char *namespace_name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

参数

- **part_name** -- **[in]** Label (name) of the partition of interest for object read/write/erase
- **namespace_name** -- **[in]** Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** -- **[in]** NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

返回

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)

- `ESP_ERR_NOT_ALLOWED` if the NVS partition is read-only and mode is `NVS_READWRITE`
- `ESP_ERR_INVALID_ARG` if `out_handle` is equal to `NULL`
- other error codes from the underlying storage driver

`esp_err_t nvs_set_blob` (`nvs_handle_t` handle, const char *key, const void *value, size_t length)

set variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See `nvs_get_stats`. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until `nvs_commit` is called.

参数

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set.
- **length** -- **[in]** length of binary value to set, in bytes; Maximum length is 508000 bytes or $(97.6\%$ of the partition size - 4000) bytes whichever is lower.

返回

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

`esp_err_t nvs_find_key` (`nvs_handle_t` handle, const char *key, `nvs_type_t` *out_type)

Lookup key-value pair with given key name.

Note that function may indicate both existence of the key as well as the data type of NVS entry if it is found.

参数

- **handle** -- **[in]** Storage handle obtained with `nvs_open`.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out_type** -- **[out]** Pointer to the output variable populated with data type of NVS entry in case key was found. May be `NULL`, respective data type is then not provided.

返回

- `ESP_OK` if NVS entry for key provided was found
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- other error codes from the underlying storage driver

`esp_err_t nvs_erase_key` (`nvs_handle_t` handle, const char *key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

参数

- **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

- **key** -- **[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.

返回

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

esp_err_t **nvs_erase_all** (*nvs_handle_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

参数 handle -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

返回

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

esp_err_t **nvs_commit** (*nvs_handle_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

参数 handle -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

返回

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

void **nvs_close** (*nvs_handle_t* handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

参数 handle -- **[in]** Storage handle to close

esp_err_t **nvs_get_stats** (const char *part_name, *nvs_stats_t* *nvs_stats)

Fill structure *nvs_stats_t*. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```
// Example of nvs_get_stats() to get overview of actual statistics of data_
→entries :
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (
→%lu), AllEntries = (%lu)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_
→entries, nvs_stats.total_entries);
```

参数

- **part_name** -- **[in]** Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ("nvs").
- **nvs_stats** -- **[out]** Returns filled structure nvs_stats_t. It provides info about used memory the partition.

返回

- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "name" is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats is equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

esp_err_t **nvs_get_used_entry_count** (*nvs_handle_t* handle, *size_t* *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs.
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
// the total number of entries occupied by the namespace
total_entries_namespace = used_entries + 1;
}
```

参数

- **handle** -- **[in]** Handle obtained from nvs_open function.
- **used_entries** -- **[out]** Returns amount of used entries from a namespace.

返回

- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_INVALID_ARG if used_entries is equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

esp_err_t **nvs_entry_find** (const char *part_name, const char *namespace_name, *nvs_type_t* type, *nvs_iterator_t* *output_iterator)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified
↳partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↳ANY, &it);
```

(下页继续)

```

while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

参数

- **part_name** -- [in] Partition name
- **namespace_name** -- [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** -- [in] One of `nvs_type_t` values.
- **output_iterator** -- [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is NULL, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

返回

- `ESP_OK` if no internal error or programming error occurred.
- `ESP_ERR_NVS_NOT_FOUND` if no element of specified criteria has been found.
- `ESP_ERR_NO_MEM` if memory has been exhausted during allocation of internal structures.
- `ESP_ERR_INVALID_ARG` if any of the parameters is NULL. Note: don't release `output_iterator` in case `ESP_ERR_INVALID_ARG` has been returned

`esp_err_t nvs_entry_find_in_handle` (`nvs_handle_t` handle, `nvs_type_t` type, `nvs_iterator_t` *output_iterator)

Create an iterator to enumerate NVS entries based on a handle and type.

```

// Example of listing all the key-value pairs of any type under specified
↳handle (which defines a partition and namespace)
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

参数

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **type** -- [in] One of `nvs_type_t` values.
- **output_iterator** -- [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is NULL, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

返回

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_NVS_INVALID_HANDLE if unknown handle was specified.
- ESP_ERR_INVALID_ARG if `output_iterator` parameter is NULL. Note: don't release `output_iterator` in case ESP_ERR_INVALID_ARG has been returned

esp_err_t **nvs_entry_next** (*nvs_iterator_t* *iterator)

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

参数 **iterator** -- **[inout]** Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL. If any error except ESP_ERR_INVALID_ARG occurs, `iterator` is set to NULL. If ESP_ERR_INVALID_ARG occurs, `iterator` is not changed.

返回

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if `iterator` is NULL.
- Possibly other errors in the future for internal programming or flash errors.

esp_err_t **nvs_entry_info** (const *nvs_iterator_t* iterator, *nvs_entry_info_t* *out_info)

Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

参数

- **iterator** -- **[in]** Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL.
- **out_info** -- **[out]** Structure to which entry information is copied.

返回

- ESP_OK if all parameters are valid; current iterator data has been written to `out_info`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.

void **nvs_release_iterator** (*nvs_iterator_t* iterator)

Release iterator.

参数 **iterator** -- **[in]** Release iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` or `nvs_entry_next` function. NULL argument is allowed.

Structures

struct **nvs_entry_info_t**

information about entry obtained from `nvs_entry_info` function

Public Members

char **namespace_name**[NVS_NS_NAME_MAX_SIZE]

Namespace to which key-value belong

char **key**[NVS_KEY_NAME_MAX_SIZE]

Key of stored key-value pair

nvs_type_t **type**

Type of stored key-value pair

struct **nvs_stats_t**

备注: Info about storage space NVS.

Public Members

size_t **used_entries**

Number of used entries.

size_t **free_entries**

Number of free entries. It includes also reserved entries.

size_t **available_entries**

Number of entries available for data storage.

size_t **total_entries**

Number of all entries.

size_t **namespace_count**

Number of namespaces.

Macros

ESP_ERR_NVS_BASE

Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED

The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND

A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH

The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY

Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE

There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME

Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE

Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG

Key name is too long

ESP_ERR_NVS_PAGE_FULL

Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH

String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND

Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND

NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED

XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED

XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED

XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND

XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED

NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED

NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART

NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS

Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME

Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE

maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE

Maximum length of NVS key name (including null terminator)

NVS_NS_NAME_MAX_SIZE

Maximum length of NVS namespace name (including null terminator)

NVS_GUARD_SYSVIEW_MACRO_EXPANSION_PUSH ()**NVS_GUARD_SYSVIEW_MACRO_EXPANSION_POP ()****Type Definitions**

2.8.4 NVS 加密

概述

本文档主要介绍 NVS 加密功能，这一功能有助于实现设备在 flash 中的安全存储。

存储在 NVS 分区中的数据可以用 XTS-AES 进行加密，与磁盘加密标准 IEEE P1619 中提到的加密方式类似。加密时，每个条目都被视作一个 sector，而条目的相对地址（相对于分区起始位置）作为 sector-number 输入加密算法。

根据要使用的具体方案，可以选择启用 `CONFIG_NVS_ENCRYPTION` 和 `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` > `CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC` 或 `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` 实现 NVS 加密。

NVS 加密：基于 flash 加密的方案

在这个方案中，NVS 加密所需的密钥存储在另一个分区中，该分区用 *flash 加密* 进行保护。因此，使用该方案时，必须先启用 *flash 加密*。

启用 *flash 加密* 时需同时启用 NVS 加密，因为 Wi-Fi 驱动程序会将凭据（如 SSID 和密码）储存在默认的分表分区中。如已启用平台级加密，那么则需要同时启用 NVS 加密。

要用这一方案进行 NVS 加密，分区表中必须包含 *NVS 密钥分区*。在分区表选项 (menuconfig > Partition Table) 中，有两个包含 *NVS 密钥分区* 的分区表，可通过项目配置菜单 (idf.py menuconfig) 进行选择。要了解如何配置和使用 NVS 加密功能，请参考示例 [security/flash_encryption](#)。

NVS 密钥分区 应用如果要使用 NVS 加密（使用基于 flash 加密的方案）编译时，须使用类型为 data 和子类型为 key 的密钥分区。该分区应被标记为 encrypted 且最小为 4 KB（最小分区大小）。参考 [分区表](#) 了解详情。在分区表选项 (menuconfig > Partition Table) 中，有两个包含 *NVS 密钥分区* 的额外分区表，可以直接用于 NVS 加密。分区的结构如下所示：

| |
|-------------------------------|
| -----+-----+-----+-----+----- |
| XTS encryption key (32) |
| -----+-----+-----+-----+----- |
| XTS tweak key (32) |
| -----+-----+-----+-----+----- |
| CRC32 (4) |
| -----+-----+-----+-----+----- |

可以通过以下两种方式之一生成 *NVS 密钥分区* 中的 XTS 加密密钥：

在 ESP32-S2 芯片上生成密钥

- 启用 NVS 加密时，可使用 API 函数 `nvs_flash_init()` 来初始化加密的默认 NVS 分区。该 API 函数会内部生成 ESP 芯片的 XTS 加密密钥，并找到第一个 *NVS 密钥分区*。
- 然后，该 API 函数使用 `nvs_flash/include/nvs_flash.h` 提供的 `nvs_flash_generate_keys()` API 函数，自动生成 NVS 密钥并存储到该分区。只有当相应的密钥分区为空时，才会生成和存储新密钥。然后，就可以利用 `nvs_flash_secure_init_partition()` 用此密钥分区来读取安全配置，以初始化自定义的加密 NVS 分区。
- API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 不会内部生成密钥。如果要使用这两个 API 函数初始化加密的 NVS 分区，可以在启动后使用 `nvs_flash.h` 提供的 `nvs_flash_generate_keys()` API 函数生成密钥，然后由该 API 函数将生成的密钥以加密形式写入密钥分区中。

备注： 请注意，在使用此方法启动应用程序前，必须完全擦除 `nvs_keys` 分区。否则，应用程序可能会生成 `ESP_ERR_NVS_CORRUPT_KEY_PART` 错误代码，该代码假设 `nvs_keys` 分区不为空并且包含格式错误的分区。可以使用以下命令来实现：

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --
  ↳partition-table-offset PARTITION_TABLE_OFFSET erase_partition --
  ↳partition-type=data --partition-subtype=nvs_keys
```

使用预生成的 NVS 密钥分区

如果 *NVS 密钥分区* 中的密钥不是由应用程序生成，则需要使用预先生成的密钥分区。可以使用 *NVS 分区生成程序* 生成包含 XTS 加密密钥的 *NVS 密钥分区*。然后使用以下两个命令将预生成的密钥分区存储到 flash 上：

1. 构建并烧写分区表

```
idf.py partition-table partition-table-flash
```

2. 使用 `parttool.py`（参见 [分区表](#) 中分区工具相关章节）将密钥存储在 flash 上的 *NVS 密钥分区* 中

```
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET_
↳write_partition --partition-name="name of nvs_key partition" --input_
↳NVS_KEY_PARTITION_FILE
```

备注： 如果设备是在 flash 加密开发模式下加密的，那么要更新 NVS 密钥分区就需要使用 `parttool.py` 来加密 NVS 密钥分区，并提供一个指向你构建目录中未加密分区表的指针 (`build/partition_table`)，因为设备上的分区表也是加密的。命令如下：

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table-
↳file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_
↳OFFSET write_partition --partition-name="nvs_key 分区名称" --input NVS_
↳KEY_PARTITION_FILE
```

由于密钥分区被标记为 `encrypted`，且 `flash 加密` 已启用，引导程序会在首次启动时使用 flash 加密密钥对此分区进行加密。

一个应用程序可以使用不同的密钥对不同的 NVS 分区进行加密，从而拥有多个密钥分区。应用程序应为加密或解密操作提供正确的密钥分区和密钥信息。

NVS 加密：基于 HMAC 外设的方案

此方案中，用于 NVS 加密的 XTS 密钥来自 eFuse 中编程的 HMAC 密钥，其目的是 `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`。由于加密密钥在运行时生成，不存储在 flash 中，因此这个功能不需要单独的 NVS 密钥分区。

备注： 通过这个方案，无需启用 flash 加密就能在 ESP32-S2 上实现安全存储。

重要： 注意，此方案使用一个 eFuse 块来存储获取加密密钥所需的 HMAC 密钥。

- NVS 加密启用时后，可用 API 函数 `nvs_flash_init()` 来初始化加密的默认 NVS 分区。该 API 函数首先检查 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 处是否存在一个 HMAC 密钥。

备注： `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 配置的有效范围为 0 (`hmac_key_id_t::HMAC_KEY0`) 到 5 (`hmac_key_id_t::HMAC_KEY5`)。默认情况下该配置为 6 (`hmac_key_id_t::HMAC_KEY_MAX`)，须在构建用户应用程序之前进行修改。

- 如果找不到密钥，会内部生成一个密钥，并储存在 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 指定的 eFuse 块中。
- 如果找到用于 `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP` 的密钥，该密钥也会用于 XTS 加密密钥的生成。
- 如果指定的 eFuse 块被 `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP` 以外目的的密钥占用，则会引发错误。
- 然后，API `nvs_flash_init()` 使用 `nvs_flash/include/nvs_flash.h` 提供的 `nvs_flash_generate_keys_v2()` API 函数，自动生成所需的 NVS 密钥。该密钥还可用于读取安全配置（参见 `nvs_flash_read_security_cfg_v2()`）并通过 `nvs_flash_secure_init_partition()` 初始化自定义的加密 NVS 分区。
- API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 不会内部生成密钥。使用这些 API 函数初始化加密的 NVS 分区时，可在启动后用 API 函数 `nvs_flash_generate_keys_v2()` 生成密钥，或使用 `nvs_flash_read_security_cfg_v2()` 获取并填充 NVS 安全配置结构 `nvs_sec_cfg_t`，将其输入到上述 API 中。

备注： 可以使用以下命令预先在 eFuse 中设置自己的 HMAC 密钥：

```
espefuse.py -p PORT burn_key <BLOCK_KEYN> <hmac_key_file.bin> HMAC_UP
```

加密读/写

NVS API 函数 `nvs_get_*` 或 `nvs_set_*` 也可用于读取和写入加密的 NVS 分区。

加密默认的 NVS 分区

- 要为默认 NVS 分区启用加密，无需额外的步骤。在启用 `CONFIG_NVS_ENCRYPTION` 时，API 函数 `nvs_flash_init()` 会根据使用的方案（由 `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` 设置）在内部执行一些额外步骤，为默认的 NVS 分区启用加密。
- 在基于 flash 加密的方案中，加密密钥由找到的第一个 **NVS 密钥分区** 生成。在 HMAC 方案中，密钥由 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 中烧录的 HMAC 密钥生成（参考 API 文档以了解更多信息）。

另外，还可使用 API 函数 `nvs_flash_secure_init()` 为默认 NVS 分区启用加密。

加密自定义 NVS 分区

- 要为一个自定义的 NVS 分区启用加密，使用 API 函数 `nvs_flash_secure_init_partition()` 代替 `nvs_flash_init_partition()`。
- 使用 API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 时，为了在启用加密的情况下执行 NVS 读/写操作，应用程序应遵守以下步骤：
 1. 填充 NVS 安全配置结构 `nvs_sec_cfg_t`
 - 对基于 flash 加密的方案
 - * 使用 API 函数 `esp_partition_find*` 查找密钥分区和 NVS 数据分区。
 - * 使用 API 函数 `nvs_flash_read_security_cfg()` 或 `nvs_flash_generate_keys()` 填充 `nvs_sec_cfg_t` 结构体。
 - 对基于 HMAC 的方案
 - * 用 `nvs_sec_config_hmac_t` 为设置特定方案配置数据，并使用 API `nvs_sec_provider_register_hmac()` 注册此基于 HMAC 的方案。该 API 也将用于填充特定方案的句柄（参见 `nvs_sec_scheme_t`）。
 - * 使用 API 函数 `nvs_flash_read_security_cfg_v2()` 或 `nvs_flash_generate_keys_v2()` 填充 `nvs_sec_cfg_t` 结构体。

```
nvs_sec_cfg_t cfg = {};
nvs_sec_scheme_t *sec_scheme_handle = NULL;

nvs_sec_config_hmac_t sec_scheme_cfg = {};
hmac_key_id_t hmac_key = HMAC_KEY0;
sec_scheme_cfg.hmac_key_id = hmac_key;

ret = nvs_sec_provider_register_hmac(&sec_scheme_cfg, &sec_scheme_
↪handle);
if (ret != ESP_OK) {
return ret;
}

ret = nvs_flash_read_security_cfg_v2(sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
if (ret == ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND) {
ret = nvs_flash_generate_keys_v2(&sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
ESP_LOGE(TAG, "Failed to generate NVS encr-keys!");
return ret;
}
}
}
}
```

(下页继续)

(续上页)

```

ESP_LOGE(TAG, "Failed to read NVS security cfg!");
return ret;
}

```

2. 使用 API 函数 `nvs_flash_secure_init()` 或 `nvs_flash_secure_init_partition()` 初始化 NVS flash 分区。
3. 使用 API 函数 `nvs_open()` 或 `nvs_open_from_partition()` 打开一个命名空间。
4. 使用 `nvs_get_*` 或 `nvs_set_*` 执行 NVS 读/写操作。
5. 使用 `nvs_flash_deinit()` 取消初始化 NVS 分区。

备注: 在采用基于 HMAC 的方案时, 可以在不启用任何 NVS 加密的配置选项的情况下开始上述工作流: `CONFIG_NVS_ENCRYPTION`, `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` -> `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` 和 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`, 以使用 `nvs_flash_secure_init()` API 加密默认分区及自定义的 NVS 分区。

NVS Security Provider

组件 `nvs_sec_provider` 存储了 NVS 加密方案的所有特定实现代码, 并且适用于未来的方案。此组件充当 `nvs_flash` 组件处理加解密密钥的接口。组件 `nvs_sec_provider` 有自己的配置菜单, 选定的安全方案和相应设置基于这一菜单注册到 `nvs_flash` 组件。

该组件通过工厂函数注册了特殊的安全框架, 可以实现出厂即用的安全方案。在该方案中, 无需使用 API 来生成、读取加解密密钥 (如 `nvs_sec_provider_register_hmac()`)。要了解 API 的使用, 参考示例 `security/nvs_encryption_hmac`。

API 参考

Header File

- `components/nvs_sec_provider/include/nvs_sec_provider.h`
- This header file can be included with:

```
#include "nvs_sec_provider.h"
```

- This header file is a part of the API provided by the `nvs_sec_provider` component. To declare that your component depends on `nvs_sec_provider`, add the following to your CMakeLists.txt:

```
REQUIRES nvs_sec_provider
```

or

```
PRIV_REQUIRES nvs_sec_provider
```

Functions

`esp_err_t nvs_sec_provider_register_flash_enc` (const `nvs_sec_config_flash_enc_t` *`sec_scheme_cfg`, `nvs_sec_scheme_t` **`sec_scheme_handle_out`)

Register the Flash-Encryption based scheme for NVS Encryption.

参数

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data
- `sec_scheme_handle_out` -- [out] Security scheme specific configuration handle

返回

- `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_cfg_hmac` is `NULL`;

- `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`
- `ESP_ERR_NOT_FOUND`, if no `nvs_keys` partition is found

`esp_err_t nvs_sec_provider_register_hmac` (const `nvs_sec_config_hmac_t` *`sec_scheme_cfg`,
`nvs_sec_scheme_t` **`sec_scheme_handle_out`)

Register the HMAC-based scheme for NVS Encryption.

参数

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data
- `sec_scheme_handle_out` -- [out] Security scheme specific configuration handle

返回

- `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_cfg_hmac` is NULL;
- `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`

`esp_err_t nvs_sec_provider_deregister` (`nvs_sec_scheme_t` *`sec_scheme_handle`)

Deregister the NVS encryption scheme registered with the given handle.

参数 `sec_scheme_handle` -- [in] Security scheme specific configuration handle

返回

- `ESP_OK`, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_handle` is NULL;

Structures

struct `nvs_sec_config_flash_enc_t`

Flash encryption-based scheme specific configuration data.

Public Members

const `esp_partition_t` *`nvs_keys_part`

Partition of subtype `nvs_keys` holding the NVS encryption keys

struct `nvs_sec_config_hmac_t`

HMAC-based scheme specific configuration data.

Public Members

`hmac_key_id_t` `hmac_key_id`

HMAC Key ID used for generating the NVS encryption keys

Macros

`ESP_ERR_NVS_SEC_BASE`

Starting number of error codes

`ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND`

HMAC Key required to generate the NVS encryption keys not found

ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED

Provided eFuse block for HMAC key generation is already in use

ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED

Failed to generate/write the HMAC key to eFuse

ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED

Failed to derive the NVS encryption keys based on the HMAC-based scheme

NVS_SEC_PROVIDER_CFG_FLASH_ENC_DEFAULT ()

Helper for populating the Flash encryption-based scheme specific configuration data.

NVS_SEC_PROVIDER_CFG_HMAC_DEFAULT ()

Helper for populating the HMAC-based scheme specific configuration data.

Enumerationsenum **nvs_sec_scheme_id_t**

NVS Encryption Keys Protection Scheme.

Values:

enumerator **NVS_SEC_SCHEME_FLASH_ENC**

Protect NVS encryption keys using Flash Encryption

enumerator **NVS_SEC_SCHEME_HMAC**

Protect NVS encryption keys using HMAC peripheral

enumerator **NVS_SEC_SCHEME_MAX**

2.8.5 NVS 分区生成程序

介绍

NVS 分区生成程序 ([nvs_flash/nvs_partition_generator/nvs_partition_gen.py](#)) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与[非易失性存储库](#)中定义的 NVS 结构兼容。

NVS 分区生成程序适合用于生成二进制数据 (blob)，其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个应用固件的基础上，通过自定义参数，如序列号，为每个设备生成不同配置的二进制 NVS 分区。

准备工作

在加密模式下使用该程序，需安装下列软件包：

- cryptography

根目录下的 *requirements.txt* 包含必需 python 包，请预先安装。

CSV 文件格式 CSV 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表：

| 序号 | 参数 | 描述 | 说明 |
|----|----------|--|--|
| 1 | Key | 主键，应用程序可通过查询此键来获取数据。 | |
| 2 | Type | 支持 file、data 和 namespace。 | |
| 3 | Encoding | 支持 u8、i8、u16、i16、u32、i32、u64、i64、string、hex2bin、base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。 | file 类型当前仅支持 hex2bin、base64、string 和 binary 编码。 |
| 4 | Value | Data value | namespace 字段的 encoding 和 value 应为空。namespace 的 encoding 和 value 为固定值，不可设置。这些单元格中的所有值都会被忽视。 |

备注： CSV 文件的第一行应始终为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下：

```
key, type, encoding, value      <-- 列标题
namespace_name, namespace,,    <-- 第一个条目为 "namespace"
key1, data, u8, 1
key2, file, string, /path/to/file
```

备注：

请确保：

- 逗号',' 前后无空格；
- CSV 文件每行末尾无空格。

NVS 条目和命名空间 (namespace) 的关联

如 CSV 文件中出现命名空间条目，后续条目均会被视为该命名空间的一部分，直至找到下一个命名空间条目。找到新命名空间条目后，后续所有条目都会被视为新命名空间的一部分。

备注： CSV 文件中第一个条目应始终为 namespace。

支持多页 blob

默认情况下，二进制 blob 可跨多页，格式参考[条目结构](#) 章节。如需使用旧版格式，可在程序中禁用该功能。

支持加解密

NVS 分区生成程序还可使用 XTS-AES 加密生成二进制加密文件或对此类文件进行解密。更多信息详见[NVS 加密](#)。

运行程序

使用方法:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

可选参数:

| 序号 | 参数 | 描述 |
|----|-----------|-----------|
| 1 | -h/--help | 显示帮助信息并退出 |

命令:

运行 `nvs_partition_gen.py {command} -h` 查看更多帮助信息

| 序号 | 参数 | 描述 |
|----|--------------|-----------|
| 1 | generate | 生成 NVS 分区 |
| 2 | generate-key | 生成加密密钥 |
| 3 | encrypt | 加密 NVS 分区 |
| 4 | decrypt | 解密 NVS 分区 |

生成 NVS 分区 (默认模式) 使用方法:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]_
↳input output size
```

位置参数:

| 参数 | 描述 |
|--------|---------------------------------|
| input | 待解析的 CSV 文件路径 |
| output | NVS 二进制文件的输出路径 |
| size | NVS 分区大小 (以字节为单位, 且为 4096 的整数倍) |

可选参数:

| 参数 | 描述 |
|-----------------|--|
| -h/--help | 显示帮助信息并退出 |
| --version {1,2} | <ul style="list-style-type: none"> 设置多页 blob 版本, 默认为版本 2。 版本 1: 禁用多页 blob; 版本 2: 启用多页 blob。 |
| --outdir OUTDIR | 输出目录, 用于存储创建的文件。(默认当前目录) |

运行如下命令创建 NVS 分区, 该程序同时会提供 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

生成加密密钥分区 使用方法:

```
python nvs_partition_gen.py generate-key [-h] [--key_protect_hmac] [--kp_hmac_
↳keygen]
                                [--kp_hmac_keyfile KP_HMAC_KEYFILE]_
↳[--kp_hmac_inputkey KP_HMAC_INPUTKEY]
                                [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数:

| 参数 | 描述 |
|-------------------|--------------------------|
| -h / --help | 显示帮助信息并退出 |
| --keyfile KEYFILE | 加密密钥分区文件的输出路径 |
| --outdir OUTDIR | 输出目录, 用于存储创建的文件 (默认当前目录) |

可选参数 (仅适用于 HMAC 方案):

| 参数 | 描述 |
|--|---|
| --key_protect_hmac | 设置后使用基于 HMAC 的 NVS 加密密钥保护方案, 否则使用基于 flash 加密的默认方案 |
| --kp_hmac_keygen | 为基于 HMAC 的加密方案生成 HMAC 密钥 |
| --kp_hmac_keyfile KP_HMAC_KEYFILE | HMAC 密钥文件的输出路径 |
| --kp_hmac_inputkey KP_HMAC_INPUTKEY | 包含 HMAC 密钥的文件, 用于生成 NVS 加密密钥 |

运行以下命令仅生成加密密钥分区:

```
python nvs_partition_gen.py generate-key
```

运行以下命令, 为基于 HMAC 的方案生成加密密钥:

- 生成 HMAC 密钥和 NVS 加密密钥:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
```

备注: 上述命令生成 <outdir>/keys/keys-<timestamp>.bin 格式的加密密钥和 <outdir>/keys/hmac-keys-<timestamp>.bin 格式的 HMAC 密钥。

- 基于 HMAC 密钥生成 NVS 加密密钥:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey_
↪testdata/sample_hmac_key.bin
```

备注: 可将自定义文件名作为参数提供给 HMAC 密钥和加密密钥。

生成 NVS 加密分区 使用方法:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                  [--keyfile KEYFILE] [--inputkey INPUTKEY] [--
↪outdir OUTDIR]
                                  [--key_protect_hmac] [--kp_hmac_keygen]
                                  [--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_
↪inputkey KP_HMAC_INPUTKEY]
                                  input output size
```

位置参数:

| 参数 | 描述 |
|--------|---------------------------------|
| input | 待解析的 CSV 文件路径 |
| output | NVS 二进制文件的输出路径 |
| size | NVS 分区大小 (以字节为单位, 且为 4096 的整数倍) |

可选参数:

| 参数 | 描述 |
|---------------------|---|
| -h/--help | 显示帮助信息并退出 |
| --version {1,2} | <ul style="list-style-type: none"> • 设置多页 blob 版本，默认为版本 2。 • 版本 1: 禁用多页 blob; • 版本 2: 启用多页 blob。 |
| --keygen | 生成 NVS 分区加密密钥 |
| --keyfile KEYFILE | 密钥文件的输出路径 |
| --inputkey INPUTKEY | 内含 NVS 分区加密密钥的文件 |
| --outdir OUTDIR | 输出目录，用于存储创建的文件。(默认当前目录) |

可选参数 (仅适用于 HMAC 方案) :

| 参数 | 描述 |
|--|--|
| --key_protect_hmac | 设置后使用基于 HMAC 的 NVS 加密密钥保护方案，否则使用基于 flash 加密的默认方案 |
| --kp_hmac_keygen | 为基于 HMAC 的加密方案生成 HMAC 密钥 |
| --kp_hmac_keyfile KP_HMAC_KEYFILE | HMAC 密钥文件的输出路径 |
| --kp_hmac_inputkey KP_HMAC_INPUTKEY | 包含 HMAC 密钥的文件，用于生成 NVS 加密密钥 |

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen
```

备注: 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

- 要使用基于 HMAC 的方案生成加密分区，可将上述命令与附加参数搭配使用。
 - 通过 NVS 分区生成程序生成加密密钥和 HMAC 密钥，从而进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.
↪bin 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen
```

备注: 上述命令生成 <outdir>/keys/keys-<timestamp>.bin 格式的加密密钥和 <outdir>/keys/hmac-keys-<timestamp>.bin 格式的 HMAC 密钥。

- 通过 NVS 分区生成程序使用用户提供的 HMAC 密钥生成加密密钥，从而进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.
↪bin 0x3000 --keygen --key_protect_hmac --kp_hmac_inputkey testdata/
↪sample_hmac_key.bin
```

备注: 可将自定义文件名作为参数提供给 HMAC 密钥和加密密钥。

- 通过 NVS 分区生成程序生成加密密钥，并将密钥存储于自定义的文件中:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen --keyfile sample_keys.bin
```

备注:

- 创建的加密密钥格式为 <outdir>/keys/sample_keys.bin。
- 加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 将加密密钥用作二进制输入文件来进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↳0x3000 --inputkey sample_keys.bin
```

解密 NVS 分区 使用方法:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

位置参数:

| 参数 | 描述 |
|--------|-------------------|
| input | 待解析的 NVS 加密分区文件路径 |
| key | 含有解密密钥的文件路径 |
| output | 已解密的二进制文件输出路径 |

可选参数:

| 参数 | 描述 |
|-----------------|------------------------|
| -h / --help | 显示帮助信息并退出 |
| --outdir OUTDIR | 输出目录，用于存储创建的文件（默认当前目录） |

运行以下命令解密已加密的 NVS 分区:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

可以在命令中提供版本参数，选择格式版本号:

- 版本 1: 禁用多页 blob
- 版本 2: 启用多页 blob

版本 1: 禁用多页 blob 如需禁用多页 blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -
↳-version 1
```

版本 2: 启用多页 blob 如需启用多页 blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↳version 2
```

备注:

- NVS 分区最小为 0x3000 字节。
- 将二进制文件烧录至设备时，请确保与应用的 sdkconfig 设置一致。

说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键；
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

2.8.6 NVS 分区解析程序

介绍

NVS 分区解析程序 `nvs_flash/nvs_partition_tool/nvs_tool.py` 加载并解析 NVS 存储分区，以便于调试和数据提取。该程序还支持完整性检查功能，可扫描分区中可能存在的错误。Blob 数据以 `base64` 格式进行编码。

加密分区

此程序不支持解密。如需解密 NVS 分区，请使用 [NVS 分区生成程序](#)。该工具支持 NVS 分区加解密。

使用方法

该程序提供了 `-f` 或 `-format` 选项，对应两种不同的输出格式：

- `json` - 所有输出均以 JSON 格式打印。
- `text` - 输出以可读文本的格式打印，有以下输出格式可选。

针对 `text` 输出格式，该程序提供了 `-d` 或 `-dump` 选项，包含六种不同的输出方式：

- `all` (默认) - 打印所有带有元数据的条目。
- `written` - 只打印带有元数据的写入条目。
- `minimal` - 打印写入的 `namespace:key = value` 对。
- `namespaces` - 打印所有写入的命名空间。
- `blobs` - 打印所有 blob 和字符串（若 blob 和字符串是以分块的形式，则对其进行重组）。
- `storage_info` - 打印每一页面的条目状态计数。

注意：该程序还提供 `none` 选项，该选项不会打印任何内容。如果 NVS 分区的内容并不相关，可以将该选项和完整性检查选项一起使用。

该程序支持完整性检查功能，选择选项 `-i` 或 `--integrity-check` 即可运行（该选项会导致 `json` 输出格式无效，因此只适用于 `text` 格式）。此功能可扫描整个分区，并打印出可能存在的错误。当此功能和 `-d none` 一起使用时，可只打印可能存在的错误。

2.8.7 SD/SDIO/MMC 驱动程序

概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动 (`esp_driver_sdmmc/include/driver/sdmmc_host.h` 和 `esp_driver_sdspi/include/driver/sdspi_host.h`) 为以下功能提供 API：

- 发送命令至从设备

- 接收和发送数据
- 处理总线错误

初始化函数及配置函数：

- 如需初始化和配置 SD SPI 主机，请参阅 [SD SPI 主机 API](#)

管脚配置

..only:: SOC_SDMMC_USE_IOMUX and not SOC_SDMMC_USE_GPIO_MATRIX

SDMMC 管脚为专用管脚，无需配置。

..only:: SOC_SDMMC_USE_GPIO_MATRIX and not SOC_SDMMC_USE_IOMUX

SDMMC 管脚信号通过 GPIO 交换矩阵配置，请在 `sdmmc_slot_config_t` 中配置管脚。

..only:: esp32p4

SDMMC 有两个卡槽：

- 卡槽 0 管脚为 UHS-I 模式专用，但驱动程序尚不支持此模式。
- 卡槽 1 管脚可通过 GPIO 交换矩阵配置，用于 UHS-I 之外的情况。如要使用卡槽 1，请在 `sdmmc_slot_config_t` 中配置管脚。

应用示例

ESP-IDF [storage/sd_card](#) 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例，演示了先初始化卡，然后使用 POSIX 和 C 库 API 向卡读写数据。请参考示例目录下 `README.md` 文件，查看更多详细信息。

复合卡（存储 + IO） 该驱动程序不支持 SD 复合卡，复合卡会被视为 IO 卡。

线程安全 多数应用程序仅需在一个任务中使用协议层。因此，协议层在 `sdmmc_card_t` 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时不使用任何类型的锁。这种锁通常在较高层级实现，例如文件系统驱动程序。

API 参考

Header File

- [components/sdmmc/include/sdmmc_cmd.h](#)
- This header file can be included with:

```
#include "sdmmc_cmd.h"
```

- This header file is a part of the API provided by the `sdmmc` component. To declare that your component depends on `sdmmc`, add the following to your `CMakeLists.txt`:

```
REQUIRES sdmmc
```

or

```
PRIV_REQUIRES sdmmc
```

Functions

esp_err_t **sdmmc_card_init** (const sdmmc_host_t *host, sdmmc_card_t *out_card)

Probe and initialize SD/MMC card using given host

备注: Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

参数

- **host** -- pointer to structure defining host controller
- **out_card** -- pointer to structure which will receive information about the card when the function completes

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc_card_print_info** (FILE *stream, const sdmmc_card_t *card)

Print information about the card to a stream.

参数

- **stream** -- stream obtained using fopen or fdopen
- **card** -- card information structure initialized using sdmmc_card_init

esp_err_t **sdmmc_get_status** (sdmmc_card_t *card)

Get status of SD/MMC card

参数 **card** -- pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_write_sectors** (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)

Write given number of sectors to SD/MMC card

参数

- **card** -- pointer to card information structure previously initialized using sdmmc_card_init
- **src** -- pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- **start_sector** -- sector where to start writing
- **sector_count** -- number of sectors to write

返回

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_read_sectors** (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)

Read given number of sectors from the SD/MMC card

参数

- **card** -- pointer to card information structure previously initialized using sdmmc_card_init
- **dst** -- pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- **start_sector** -- sector where to start reading
- **sector_count** -- number of sectors to read

返回

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_erase_sectors** (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)

Erase given number of sectors from the SD/MMC card

备注: When `sdmmc_erase_sectors` used with cards in SDSPI mode, it was observed that card requires re-init after erase operation.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **start_sector** -- sector where to start erase
- **sector_count** -- number of sectors to erase
- **arg** -- erase command (CMD38) argument

返回

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_can_discard** (sdmmc_card_t *card)

Check if SD/MMC card supports discard

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

返回

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_can_trim** (sdmmc_card_t *card)

Check if SD/MMC card supports trim

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

返回

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_mmc_can_sanitize** (sdmmc_card_t *card)

Check if SD/MMC card supports sanitize

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

返回

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_mmc_sanitize** (sdmmc_card_t *card, uint32_t timeout_ms)

Sanitize the data that was unmapped by a Discard command

备注: Discard command has to precede sanitize operation. To discard, use `MMC_DISCARD_ARG` with `sdmmc_erase_sectors` argument

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout_ms** -- timeout value in milliseconds required to sanitize the selected range of sectors.

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_full_erase** (sdmmc_card_t *card)

Erase complete SD/MMC card

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_byte** (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **out_byte** -- **[out]** output, receives the value read from the card

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_byte** (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **in_byte** -- value to be written
- **out_byte** -- **[out]** if not NULL, receives new byte value read from the card (read-after-write).

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_bytes** (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where reading starts
- **dst** -- buffer which receives the data read from card. Aligned to 4 byte boundary unless `SDMMC_HOST_FLAG_ALLOC_ALIGNED_BUF` flag is set when calling `sdmmc_card_init`. The flag is mandatory when the buffer is behind the cache.
- **size** -- number of bytes to read, 1 to 512.

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_bytes** (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written. Aligned to 4 byte boundary unless `SDMMC_HOST_FLAG_ALLOC_ALIGNED_BUF` flag is set when calling `sdmmc_card_init`. The flag is mandatory when the buffer is behind the cache.
- **size** -- number of bytes to write, 1 to 512.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_blocks** (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **dst** -- buffer which receives the data read from card. Aligned to 4 byte boundary, and also cache line size if the buffer is behind the cache.
- **size** -- number of bytes to read, must be divisible by the card block size.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_blocks** (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts

- **src** -- data to be written. Aligned to 4 byte boundary, and also cache line size if the buffer is behind the cache.
- **size** -- number of bytes to read, must be divisible by the card block size.

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_enable_int** (sdmmc_card_t *card)

Enable SDIO interrupt in the SDMMC host

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

esp_err_t **sdmmc_io_wait_int** (sdmmc_card_t *card, TickType_t timeout_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout_ticks** -- time to wait for the interrupt, in RTOS ticks

返回

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

esp_err_t **sdmmc_io_get_cis_data** (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **out_buffer** -- Output buffer of the CIS data
- **buffer_size** -- Size of the buffer.
- **inout_cis_size** -- Mandatory, pointer to a size, input and output.
 - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
 - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

返回

- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- ESP_ERR_NOT_FOUND: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

esp_err_t **sdmmc_io_print_cis_info** (uint8_t *buffer, size_t buffer_size, FILE *fp)

Parse and print the CIS information of an SDIO card.

备注: Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can

add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

参数

- **buffer** -- Buffer to parse
- **buffer_size** -- Size of the buffer.
- **fp** -- File pointer to print to, set to NULL to print to stdout.

返回

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

Macros

SDMMC_IO_FIXED_ADDR

Call `sdmmc_io_read_bytes`, `sdmmc_io_write_bytes`, `sdmmc_io_read_blocks` or `sdmmc_io_write_bocks` APIs with address ORed by this flag to send CMD53 with OP Code clear (fixed address)

Header File

- `components/esp_driver_sdmmc/include/driver/sdmmc_types.h`
- This header file can be included with:

```
#include "driver/sdmmc_types.h"
```

- This header file is a part of the API provided by the `esp_driver_sdmmc` component. To declare that your component depends on `esp_driver_sdmmc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_sdmmc
```

or

```
PRIV_REQUIRES esp_driver_sdmmc
```

2.8.8 分区 API

概述

`esp_partition` 组件提供了高层次的 API 函数，用于访问定义在分区表中的分区。这些 API 基于 *SPI flash API* 提供的低层次 API。

分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息，包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参阅分区表，查看详细信息。

该组件在 `esp_partition.h` 中声明了一些 API 函数，用以枚举在分区表中找到的分区，并对这些分区执行操作：

- `esp_partition_find()`：在分区表中查找特定类型的条目，返回一个不透明迭代器；
- `esp_partition_get()`：返回一个结构体，描述给定迭代器的分区；
- `esp_partition_next()`：将迭代器移至下一个找到的分区；

- `esp_partition_iterator_release()`: 释放 `esp_partition_find()` 中返回的迭代器;
- `esp_partition_find_first()`: 返回描述 `esp_partition_find()` 中找到的第一个分区结构;
- `esp_partition_read()`、`esp_partition_write()` 和 `esp_partition_erase_range()` 等同于 `esp_flash_read()`、`esp_flash_write()` 和 `esp_flash_erase_region()`, 但在分区边界内执行。

另请参考

- [分区表](#)
- [空中升级 \(OTA\)](#) 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- [非易失性存储库](#) 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

分区表 API 参考

Header File

- [components/esp_partition/include/esp_partition.h](#)
- This header file can be included with:

```
#include "esp_partition.h"
```

- This header file is a part of the API provided by the `esp_partition` component. To declare that your component depends on `esp_partition`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_partition
```

or

```
PRIV_REQUIRES esp_partition
```

Functions

`esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)`

Find partition based on one or more parameters.

参数

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

返回 iterator which can be used to enumerate all the partitions found, or `NULL` if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

`const esp_partition_t *esp_partition_find_first(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)`

Find first partition based on one or more parameters.

参数

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.

- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

返回 pointer to *esp_partition_t* structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_partition_get** (*esp_partition_iterator_t* iterator)

Get *esp_partition_t* structure for given partition.

参数 **iterator** -- Iterator obtained using *esp_partition_find*. Must be non-NULL.

返回 pointer to *esp_partition_t* structure. This pointer is valid for the lifetime of the application.

esp_partition_iterator_t **esp_partition_next** (*esp_partition_iterator_t* iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

参数 **iterator** -- Iterator obtained using *esp_partition_find*. Must be non-NULL.

返回 NULL if no partition was found, valid *esp_partition_iterator_t* otherwise.

void **esp_partition_iterator_release** (*esp_partition_iterator_t* iterator)

Release partition iterator.

参数 **iterator** -- Iterator obtained using *esp_partition_find*. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

const *esp_partition_t* ***esp_partition_verify** (const *esp_partition_t* *partition)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from *esp_partition_get()*, as a test for equality.

参数 **partition** -- Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

返回

- If partition not found, returns NULL.
- If found, returns a pointer to the *esp_partition_t* structure in flash. This pointer is always valid for the lifetime of the application.

esp_err_t **esp_partition_read** (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

参数

- **partition** -- Pointer to partition structure obtained using *esp_partition_find_first* or *esp_partition_get*. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

返回 ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `esp_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `esp_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

备注: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

参数

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

返回 `ESP_OK`, if data was written successfully; `ESP_ERR_INVALID_ARG`, if `dst_offset` exceeds partition size; `ESP_ERR_INVALID_SIZE`, if write would go out of bounds of the partition; `ESP_ERR_NOT_ALLOWED`, if partition is read-only; or one of error codes from lower-level flash driver.

esp_err_t `esp_partition_read_raw` (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

备注: This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

参数

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

返回 `ESP_OK`, if data was read successfully; `ESP_ERR_INVALID_ARG`, if `src_offset` exceeds partition size; `ESP_ERR_INVALID_SIZE`, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t `esp_partition_write_raw` (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

备注: This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

备注: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

参数

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

返回 ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if `dst_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of the error codes from lower-level flash driver.

esp_err_t **esp_partition_erase_range** (const *esp_partition_t* *partition, size_t offset, size_t size)

Erase part of the partition.

参数

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where erase operation should start. Must be aligned to `partition->erase_size`.
- **size** -- Size of the range which should be erased, in bytes. Must be divisible by `partition->erase_size`.

返回 ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or `dst` are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_mmap** (const *esp_partition_t* *partition, size_t offset, size_t size, *esp_partition_mmap_memory_t* memory, const void **out_ptr, *esp_partition_mmap_handle_t* *out_handle)

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `esp_partition_munmap` function.

参数

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where mapping should start.
- **size** -- Size of the area to be mapped.
- **memory** -- Memory space where the region should be mapped
- **out_ptr** -- Output, pointer to the mapped memory region
- **out_handle** -- Output, handle which should be used for `esp_partition_munmap` call

返回 ESP_OK, if successful

void **esp_partition_munmap** (*esp_partition_mmap_handle_t* handle)

Release region previously obtained using `esp_partition_mmap`.

备注: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

参数 **handle** -- Handle obtained from `spi_flash_mmap`

esp_err_t **esp_partition_get_sha256** (const *esp_partition_t* *partition, uint8_t *sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

参数

- **partition** -- [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** -- [out] Returned SHA-256 digest for a given partition.

返回

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn't contain a valid app image.
- ESP_FAIL: An allocation error occurred.

bool **esp_partition_check_identity** (const *esp_partition_t* *partition_1, const *esp_partition_t* *partition_2)

Check for the identity of two partitions by SHA-256 digest.

参数

- **partition_1** -- [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2** -- [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

返回

- True: In case of the two firmware is equal.
- False: Otherwise

esp_err_t **esp_partition_register_external** (*esp_flash_t* *flash_chip, size_t offset, size_t size, const char *label, *esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const *esp_partition_t* **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp_flash_t* structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

参数

- **flash_chip** -- Pointer to the structure identifying the flash chip
- **offset** -- Address in bytes, where the partition starts
- **size** -- Size of the partition in bytes
- **label** -- Partition name
- **type** -- One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** -- One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** -- [out] Output, if non-NULL, receives the pointer to the resulting *esp_partition_t* structure

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn't fit into the flash chip size

esp_err_t **esp_partition_deregister_external** (const *esp_partition_t* *partition)

Deregister the partition previously registered using `esp_partition_register_external`.

参数 `partition` -- pointer to the partition structure obtained from `esp_partition_register_external`,

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using `esp_partition_register_external` function.

void **esp_partition_unload_all** (void)

Unload partitions and free space allocated by them.

Structures

struct **esp_partition_t**

partition information structure

This is not the format in flash, that format is `esp_partition_info_t`.

However, this is the format used by this API.

Public Members

esp_flash_t ***flash_chip**

SPI flash chip on which the partition resides

esp_partition_type_t **type**

partition type (app/data)

esp_partition_subtype_t **subtype**

partition subtype

uint32_t **address**

starting address of the partition in flash

uint32_t **size**

size of the partition, in bytes

uint32_t **erase_size**

size the erase operation should be aligned to

char **label**[17]

partition label, zero-terminated ASCII string

bool **encrypted**

flag is set to true if partition is encrypted

bool **readonly**

flag is set to true if partition is read-only

Macros

ESP_PARTITION_SUBTYPE_OTA (i)

Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

Type Definitions

```
typedef uint32_t esp_partition_mmap_handle_t
```

Opaque handle for memory region obtained from `esp_partition_mmap`.

```
typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t
```

Opaque partition iterator type.

Enumerations

```
enum esp_partition_mmap_memory_t
```

Enumeration which specifies memory space requested in an `mmap` call.

Values:

```
enumerator ESP_PARTITION_MMAP_DATA
```

map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

```
enumerator ESP_PARTITION_MMAP_INST
```

map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

```
enum esp_partition_type_t
```

Partition type.

备注: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

```
enumerator ESP_PARTITION_TYPE_APP
```

Application partition type.

```
enumerator ESP_PARTITION_TYPE_DATA
```

Data partition type.

```
enumerator ESP_PARTITION_TYPE_ANY
```

Used to search for partitions with any type.

```
enum esp_partition_subtype_t
```

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

备注: These ESP-IDF-defined partition subtypes apply to partitions of type `ESP_PARTITION_TYPE_APP` and `ESP_PARTITION_TYPE_DATA`.

Values:

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**

Factory application partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**

Base for OTA partition subtypes.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_0**

OTA partition 0.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_1**

OTA partition 1.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_2**

OTA partition 2.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_3**

OTA partition 3.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**

OTA partition 4.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**

OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**

OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**

OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**

OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**

OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**

OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**

OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**

OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**

OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**

OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**

OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**

Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**

Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**

OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**

PHY init data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**

NVS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**

COREDUMP partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**

Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**

Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**

FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**

SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_LITTLEFS**

LITTLEFS partition.

enumerator **ESP_PARTITION_SUBTYPE_ANY**

Used to search for partitions with any subtype.

2.8.9 SPIFFS 文件系统

概述

SPIFFS 是一个用于 SPI NOR flash 设备的嵌入式文件系统，支持磨损均衡、文件系统一致性检查等功能。

说明

- 目前，SPIFFS 尚不支持目录，但可以生成扁平结构。如果 SPIFFS 挂载在 /spiffs 下，在 /spiffs/tmp/myfile.txt 路径下创建一个文件则会在 SPIFFS 中生成一个名为 /tmp/myfile.txt 的文件，而不是在 /spiffs/tmp 下生成名为 myfile.txt 的文件；
- SPIFFS 并非实时栈，每次写操作耗时不等；
- 目前，SPIFFS 尚不支持检测或处理已损坏的块。
- SPIFFS 只能稳定地使用约 75% 的指定分区容量。
- 当文件系统空间不足时，垃圾收集器会尝试多次扫描文件系统来寻找可用空间。根据所需空间的不同，写操作会被调用多次，每次函数调用将花费几秒。同一操作可能会花费不同时长的问题缘于 SPIFFS 的设计，且已在官方的 [SPIFFS github 仓库](#) 或是 <https://github.com/espressif/esp-idf/issues/1737> 中被多次报告。这个问题可以通过 [SPIFFS 配置](#) 部分缓解。
- 当垃圾收集器尝试多次（默认为 10 次）扫描整个文件系统以回收空间时，在每次扫描期间，如果有可用的数据块，则垃圾收集器会释放一个数据块。因此，如果为垃圾收集器设置的最大运行次数为 n（可通过 SPIFFS_GC_MAX_RUNS 选项配置，该选项位于 [SPIFFS 配置](#) 中），那么 n 倍数据块大小的空间将可用于写入数据。如果尝试写入超过 n 倍数据块大小的数据，写入操作可能会失败并返回错误。
- 如果 ESP32-S2 在文件系统操作期间断电，可能会导致 SPIFFS 损坏。但是仍可通过 `esp_spiffs_check` 函数恢复文件系统。详情请参阅官方 [SPIFFS FAQ](#)。

工具

`spiffsgen.py` [spiffsgen.py](#)（只写）是 SPIFFS 的一种 Python 实现，可用于从主机文件夹内容生成文件系统镜像。打开终端并运行以下命令即可使用 `spiffsgen.py`：

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

参数（必选）说明如下：

- **image_size**：分区大小，用于烧录生成的 SPIFFS 镜像；
- **base_dir**：创建 SPIFFS 镜像的目录；
- **output_file**：SPIFFS 镜像输出文件。

其他参数（可选）也参与控制镜像的生成，用户可以运行以下帮助命令，查看这些参数的具体信息：

```
python spiffsgen.py --help
```

上述可选参数对应 SPIFFS 构建配置选项。若想顺利生成可用的镜像，请确保使用的参数或配置与构建 SPIFFS 时所用的参数或配置相同。运行帮助命令将显示参数所对应的 SPIFFS 构建配置。如未指定参数，将使用帮助信息中的默认值。

镜像生成后，用户可以使用 `esptool.py` 或 `parttool.py` 烧录镜像。

用户可以在命令行或脚本中手动单独调用 `spiffsgen.py`，也可以直接从构建系统调用 `spiffs_create_partition_image` 来使用 `spiffsgen.py`：

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_
↪dep dep dep...])
```

在构建系统中使用 `spiffsgen.py` 更为方便，构建配置会自动传递给 `spiffsgen.py` 工具，确保生成的镜像可用于构建。比如，单独调用 `spiffsgen.py` 时需要用到 `image_size` 参数，但在构建系统中调用 `spiffs_create_partition_image` 时，仅需要 `partition` 参数，镜像大小将直接从工程分区表中获取。

使用 `spiffs_create_partition_image`，必须从组件 `CMakeLists.txt` 文件调用。

用户也可以指定 `FLASH_IN_PROJECT`，然后使用 `idf.py flash` 将镜像与应用程序二进制文件、分区表等一起自动烧录至设备，例如：

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

不指定 `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` 也可以生成镜像，但须使用 `esptool.py`、`parttool.py` 或自定义构建系统目标手动烧录。

有时基本目录中的内容是在构建时生成的，用户可以使用 `DEPENDS/SPIFFS_IMAGE_DEPENDS` 指定目标，因此可以在生成镜像之前执行此目标：

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

请参考 [storage/spiffsgen](#)，查看示例。

mkspiffs 用户也可以使用 `mkspiffs` 工具创建 SPIFFS 分区镜像。与 `spiffsgen.py` 相似，`mkspiffs` 也可以用于从指定文件夹中生成镜像，然后使用 `esptool.py` 烧录镜像。

该工具需要获取以下参数：

- **Block Size**: 4096 (SPI flash 标准)
- **Page Size**: 256 (SPI flash 标准)
- **Image Size**: 分区大小 (以字节为单位，可从分区表中获取)
- **Partition Offset**: 分区起始地址 (可从分区表中获取)

运行以下命令，将文件夹打包成 1 MB 大小的镜像：

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

运行以下命令，将镜像烧录到 ESP32-S2 (偏移量: 0x110000)：

```
python esptool.py --chip esp32s2 --port [port] --baud [baud] write_flash -z_
↳0x110000 spiffs.bin
```

选择合适的 SPIFFS 工具 上面介绍的两款 SPIFFS 工具功能相似，需根据实际情况，选择合适的一款。

以下情况优先选用 `spiffsgen.py` 工具：

1. 仅需在构建时简单生成 SPIFFS 镜像，请选择使用 `spiffsgen.py`，因为 `spiffsgen.py` 可以直接在构建系统中使用函数或命令生成 SPIFFS 镜像。
2. 主机没有可用的 C/C++ 编译器时，可以选择使用 `spiffsgen.py` 工具，因为 `spiffsgen.py` 不需要编译。

以下情况优先选用 `mkspiffs` 工具：

1. 如果用户除了需要生成镜像外，还需要拆包 SPIFFS 镜像，请选择使用 `mkspiffs` 工具，因为 `spiffsgen.py` 目前尚不支持此功能。
2. 如果用户当前环境中 Python 解释器不可用，但主机编译器可用，或者有预编译的 `mkspiffs` 二进制文件，此时请选择使用 `mkspiffs` 工具。但是，`mkspiffs` 没有集成到构建系统，用户必须自己完成以下工作：在构建期间编译 `mkspiffs` (如果未使用预编译的二进制文件)，为输出文件创建构建规则或目标，将适当的参数传递给工具等。

另请参阅

- [分区表](#)

应用示例

`storage/spiffs` 目录下提供了 SPIFFS 应用示例。该示例初始化并挂载了一个 SPIFFS 分区，然后使用 POSIX 和 C 库 API 写入和读取数据。请参考 `example` 目录下的 `README.md` 文件，获取详细信息。

高级 API 参考

Header File

- `components/spiffs/include/esp_spiffs.h`
- This header file can be included with:

```
#include "esp_spiffs.h"
```

- This header file is a part of the API provided by the `spiffs` component. To declare that your component depends on `spiffs`, add the following to your `CMakeLists.txt`:

```
REQUIRES spiffs
```

or

```
PRIV_REQUIRES spiffs
```

Functions

`esp_err_t esp_vfs_spiffs_register` (const `esp_vfs_spiffs_conf_t` *conf)

Register and mount SPIFFS to VFS with given path prefix.

参数 `conf` -- Pointer to `esp_vfs_spiffs_conf_t` configuration structure

返回

- `ESP_OK` if success
- `ESP_ERR_NO_MEM` if objects could not be allocated
- `ESP_ERR_INVALID_STATE` if already mounted or partition is encrypted
- `ESP_ERR_NOT_FOUND` if partition for SPIFFS was not found
- `ESP_FAIL` if mount or format fails

`esp_err_t esp_vfs_spiffs_unregister` (const char *partition_label)

Unregister and unmount SPIFFS from VFS

参数 `partition_label` -- Same label as passed to `esp_vfs_spiffs_register`.

返回

- `ESP_OK` if successful
- `ESP_ERR_INVALID_STATE` already unregistered

bool `esp_spiffs_mounted` (const char *partition_label)

Check if SPIFFS is mounted

参数 `partition_label` -- Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

返回

- true if mounted
- false if not mounted

`esp_err_t esp_spiffs_format` (const char *partition_label)

Format the SPIFFS partition

参数 `partition_label` -- Same label as passed to `esp_vfs_spiffs_register`.

返回

- ESP_OK if successful
- ESP_FAIL on error

esp_err_t **esp_spiffs_info** (const char *partition_label, size_t *total_bytes, size_t *used_bytes)

Get information for SPIFFS

参数

- **partition_label** -- Same label as passed to esp_vfs_spiffs_register
- **total_bytes** -- [out] Size of the file system
- **used_bytes** -- [out] Current used bytes in the file system

返回

- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

esp_err_t **esp_spiffs_check** (const char *partition_label)

Check integrity of SPIFFS

参数 **partition_label** -- Same label as passed to esp_vfs_spiffs_register

返回

- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

esp_err_t **esp_spiffs_gc** (const char *partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

参数

- **partition_label** -- Label of the partition to be garbage-collected. The partition must be already mounted.
- **size_to_gc** -- The number of bytes that the GC process should attempt to make available.

返回

- ESP_OK on success
- ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
- ESP_ERR_INVALID_STATE if the partition is not mounted
- ESP_FAIL on all other errors

Structures

struct **esp_vfs_spiffs_conf_t**

Configuration structure for esp_vfs_spiffs_register.

Public Members

const char ***base_path**

File path prefix associated with the filesystem.

`const char *partition_label`

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

`size_t max_files`

Maximum files that could be open at the same time.

`bool format_if_mount_failed`

If true, it will format the file system if it fails to mount.

2.8.10 虚拟文件系统组件

概述

虚拟文件系统 (VFS) 组件为驱动程序提供一个统一接口，可以操作类文件对象。这类驱动程序可以是 FAT、SPIFFS 等真实文件系统，也可以是提供文件类接口的设备驱动程序。

VFS 组件支持 C 库函数（如 `fopen` 和 `fprintf` 等）与文件系统 (FS) 驱动程序协同工作。在高层级，每个 FS 驱动程序均与某些路径前缀相关联。当一个 C 库函数需要打开文件时，VFS 组件将搜索与该文件所在文件路径相关联的 FS 驱动程序，并将调用传递给该驱动程序。针对该文件的读取、写入等其他操作的调用也将传递给这个驱动程序。

例如，使用 `/fat` 前缀注册 FAT 文件系统驱动，之后即可调用 `fopen("/fat/file.txt", "w")`。之后，VFS 将调用 FAT 驱动的 `open` 函数，并将参数 `/file.txt` 和合适的打开模式传递给 `open` 函数；后续对返回的 `FILE*` 数据流调用 C 库函数也同样会传递给 FAT 驱动。

注册 FS 驱动程序

如需注册 FS 驱动程序，应用程序首先要定义一个 `esp_vfs_t` 结构体实例，并用指向 FS API 的函数指针填充它。

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

在上述代码中需要用到 `read`、`write` 或 `read_p`、`write_p`，具体使用哪组函数由 FS 驱动程序 API 的声明方式决定。

示例 1: 声明 API 函数时不带额外的上下文指针参数，即 FS 驱动程序为单例模式，此时使用 `write`

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized
```

(下页继续)

```
// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

示例 2: 声明 API 函数时需要一个额外的上下文指针作为参数, 即可支持多个 FS 驱动程序实例, 此时使用 `write_p`

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

同步输入/输出多路复用 VFS 组件支持通过 `select()` 进行同步输入/输出多路复用, 其实现方式如下:

1. 调用 `select()`, 使用时提供的文件描述符可以属于不同的 VFS 驱动。
2. 文件描述符被分为几组, 每组属于一个 VFS 驱动。
3. 非套接字 VFS 驱动的文件描述符由 `start_select()` 移交给指定的 VFS 驱动, 后文会对此进行详述。该函数代表指定驱动 `select()` 的实现。这是一个非阻塞的调用, 意味着在设置好检查与指定文件描述符相关事件的环境后, 该函数应该立即返回。
4. 套接字 VFS 驱动的文件描述符由 `socket_select()` 移交给套接字 VFS 驱动, 后文会对此进行详述。这是一个阻塞调用, 意味着只有当有一个与套接字文件描述符相关的事件或非套接字驱动发出信号让 `socket_select()` 退出时, 它才会返回。
5. 从各个 VFS 驱动程序收集结果, 并通过对事件检查环境取消初始化来终止所有驱动程序。
6. `select()` 调用结束并返回适当的结果。

非套接字 VFS 驱动 如果要使用非套接字 VFS 驱动的文件描述符调用 `select()`, 那么需要用函数 `start_select()` 和 `end_select()` 注册该驱动, 具体如下:

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

调用 `start_select()` 函数可以设置环境, 检测指定 VFS 驱动的文件描述符读取/写入/错误条件。

调用 `end_select()` 函数可以终止/取消初始化/释放由 `start_select()` 设置的环境。

备注: 在少数情况下, 在调用 `end_select()` 之前可能并没有调用过 `start_select()`。因此 `end_select()` 的实现必须在该情况下返回错误而不能崩溃。

如需获取更多信息, 请参考 [esp_driver_uart/src/uart_vfs.c](#) 中 UART 外设的 VFS 驱动, 尤其是函数 `uart_vfs_dev_register()`、`uart_start_select()` 和 `uart_end_select()`。

请参考以下示例, 查看如何使用 VFS 文件描述符调用 `select()`:

- [peripherals/uart/uart_select](#)
- [system/select](#)

套接字 VFS 驱动 套接字 VFS 驱动会使用自实现的 `socket_select()` 函数，在读取/写入/错误条件时，非套接字 VFS 驱动会通知该函数。

可通过定义以下函数注册套接字 VFS 驱动：

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

函数 `socket_select()` 是套接字驱动对 `select()` 的内部实现。该函数只对套接字 VFS 驱动的文件描述符起作用。

`get_socket_select_semaphore()` 返回信号对象 (semaphore)，用于非套接字驱动程序中，以终止 `socket_select()` 的等待。

`stop_socket_select()` 通过传递 `get_socket_select_semaphore()` 函数返回的对象来终止 `socket_select()` 函数的等待。

`stop_socket_select_isr()` 与 `stop_socket_select()` 的作用相似，但是前者可在 ISR 中使用。请参考 [lwip/port/esp32xx/vfs_lwip.c](#) 以了解使用 LWIP 的套接字驱动参考实现。

备注：如果 `select()` 用于套接字文件描述符，可以禁用 `CONFIG_VFS_SUPPORT_SELECT` 选项来减少代码量，提高性能。不要在 `select()` 调用过程中更改套接字驱动，否则会出现一些未定义行为。

路径

已注册的 FS 驱动程序均有一个路径前缀与之关联，此路径前缀即为分区的挂载点。

如果挂载点中嵌套了其他挂载点，则在打开文件时使用具有最长匹配路径前缀的挂载点。例如，假设以下文件系统已在 VFS 中注册：

- 在 `/data` 下注册 FS 驱动程序 1
- 在 `/data/static` 下注册 FS 驱动程序 2

那么：

- 打开 `/data/log.txt` 会调用驱动程序 FS 1；
- 打开 `/data/static/index.html` 需调用 FS 驱动程序 2；
- 即便 FS 驱动程序 2 中没有 `/index.html`，也不会 FS 驱动程序 1 中查找 `/static/index.html`。

挂载点名称必须以路径分隔符 (/) 开头，且分隔符后至少包含一个字符。但在以下情况中，VFS 同样支持空的挂载点名称：1. 应用程序需要提供一个“最后方案”下使用的文件系统；2. 应用程序需要同时覆盖 VFS 功能。如果没有与路径匹配的前缀，就会使用到这种文件系统。

VFS 不会对路径中的点 (.) 进行特殊处理，也不会将 `..` 视为对父目录的引用。在上述示例中，使用 `/data/static/./log.txt` 路径不会调用 FS 驱动程序 1 打开 `/log.txt`。特定的 FS 驱动程序（如 FATFS）可能以不同的方式处理文件名中的点。

执行打开文件操作时，FS 驱动程序仅得到文件的相对路径（挂载点前缀已经被去除）：

1. 以 `/data` 为路径前缀注册 `myfs` 驱动；
2. 应用程序调用 `fopen("/data/config.json", ...)`；
3. VFS 调用 `myfs_open("/config.json", ...)`；
4. `myfs` 驱动打开 `/config.json` 文件。

VFS 对文件路径长度没有限制，但文件系统路径前缀受 `ESP_VFS_PATH_MAX` 限制，即路径前缀上限为 `ESP_VFS_PATH_MAX`。各个文件系统驱动则可能会对自己的文件名长度设置一些限制。

文件描述符

文件描述符是一组很小的正整数，从 0 到 `FD_SETSIZE - 1`，`FD_SETSIZE` 定义在 `sys/select.h`。最大文件描述符由 `CONFIG_LWIP_MAX_SOCKETS` 定义，且为套接字保留。VFS 中包含一个名为 `s_fd_table` 的查找表，用于将全局文件描述符映射至 `s_vfs` 数组中注册的 VFS 驱动索引。

标准 IO 流 (`stdin`, `stdout`, `stderr`)

如果 `menuconfig` 中 `UART for console output` 选项没有设置为 `None`，则 `stdin`、`stdout` 和 `stderr` 将默认从 UART 读取或写入。UART0 或 UART1 可用作标准 IO。默认情况下，UART0 使用 115200 波特率，TX 管脚为 GPIO1，RX 管脚为 GPIO3。上述参数可以在 `menuconfig` 中更改。

对 `stdout` 或 `stderr` 执行写入操作将会向 UART 发送 FIFO 发送字符，对 `stdin` 执行读取操作则会从 UART 接收 FIFO 中取出字符。

默认情况下，VFS 使用简单的函数对 UART 进行读写操作。在所有数据放进 UART FIFO 之前，写操作将处于 `busy-wait` 状态，读操作处于非阻塞状态，仅返回 FIFO 中已有数据。由于读操作为非阻塞，高层级 C 库函数调用（如 `fscanf("%d\n", &var);`）可能获取不到所需结果。

如果应用程序使用 UART 驱动，则可以调用 `uart_vfs_dev_use_driver()` 函数来指导 VFS 使用驱动中断、读写阻塞功能等，也可以调用 `uart_vfs_dev_use_nonblocking()` 来恢复非阻塞函数。

VFS 还为输入和输出提供换行符转换功能（可选）。多数应用程序在程序内部发送或接收以 LF (“\n”) 结尾的行，但不同的终端程序可能需要不同的换行符，比如 CR 或 CRLF。应用程序可以通过 `menuconfig` 或者调用 `uart_vfs_dev_port_set_rx_line_endings()` 和 `uart_vfs_dev_port_set_tx_line_endings()` 为输入输出配置换行符。

标准流和 FreeRTOS 任务 `stdin`、`stdout` 和 `stderr` 的 FILE 对象在所有 FreeRTOS 任务之间共享，指向这些对象的指针分别存储在每个任务的 `struct _reent` 中。

预处理器把如下代码解释为 `fprintf(__getreent()->_stderr, "42\n");`:

```
fprintf(stderr, "42\n");
```

其中 `__getreent()` 函数将为每个任务返回一个指向 `newlib libc` 中 `struct _reent` 的指针。每个任务的 TCB 均拥有一个 `struct _reent` 结构体，任务初始化后，`struct _reent` 结构体中的 `_stdin`、`_stdout` 和 `_stderr` 将会被赋予 `_GLOBAL_REENT` 中 `_stdin`、`_stdout` 和 `_stderr` 的值，`_GLOBAL_REENT` 即为 FreeRTOS 启动之前所用结构体。

这样设计带来的结果是：

- 允许设置给定任务的 `stdin`、`stdout` 和 `stderr`，而不影响其他任务，例如通过 `stdin = fopen("/dev/uart/1", "r");`
- 但使用 `fclose` 关闭默认 `stdin`、`stdout` 或 `stderr` 将同时关闭相应的 FILE 流对象，因此会影响其他任务；
- 如需更改新任务的默认 `stdin`、`stdout` 和 `stderr` 流，请在创建新任务之前修改 `_GLOBAL_REENT->_stdin` (`_stdout`、`_stderr`)。

eventfd()

`eventfd()` 是一个很强大的工具，可以循环通知基于 `select()` 的自定义事件。在 ESP-IDF 中，`eventfd()` 的实现大体上与 [man\(2\) eventfd](#) 中的描述相同，主要区别如下：

- 在调用 `eventfd()` 之前必须先调用 `esp_vfs_eventfd_register()`；
- 标志中没有 `EFD_CLOEXEC`、`EFD_NONBLOCK` 和 `EFD_SEMAPHORE` 选项；
- `EFD_SUPPORT_ISR` 选项已经被添加到标志中。在中断处理程序中读取和写入 `eventfd` 需要这个标志。

注意，用 `EFD_SUPPORT_ISR` 创建 `eventfd` 将导致在读取、写入文件时，以及在设置这个文件的 `select()` 开始和结束时，暂时禁用中断。

API 参考

Header File

- [components/vfs/include/esp_vfs.h](#)
- This header file can be included with:

```
#include "esp_vfs.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

`ssize_t esp_vfs_write` (struct `_reent` *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (struct `_reent` *r, int fd, off_t size, int mode)

`ssize_t esp_vfs_read` (struct `_reent` *r, int fd, void *dst, size_t size)

`int esp_vfs_open` (struct `_reent` *r, const char *path, int flags, int mode)

`int esp_vfs_close` (struct `_reent` *r, int fd)

`int esp_vfs_fstat` (struct `_reent` *r, int fd, struct stat *st)

`int esp_vfs_stat` (struct `_reent` *r, const char *path, struct stat *st)

`int esp_vfs_link` (struct `_reent` *r, const char *n1, const char *n2)

`int esp_vfs_unlink` (struct `_reent` *r, const char *path)

`int esp_vfs_rename` (struct `_reent` *r, const char *src, const char *dst)

`int esp_vfs_utime` (const char *path, const struct utimbuf *times)

`esp_err_t esp_vfs_register` (const char *base_path, const `esp_vfs_t` *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

参数

- **base_path** -- file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a `"/` and must not end with `"/`. For example, `"/data` or `"/dev/spi` are valid. These VFSes would then be called to handle file paths such as `"/data/myfile.txt` or `"/dev/spi/0`. In the special case of an empty `base_path`, a "fallback" VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** -- Pointer to `esp_vfs_t`, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- **ctx** -- If `vfs->flags` has `ESP_VFS_FLAG_CONTEXT_PTR` set, a pointer which should be passed to VFS functions. Otherwise, `NULL`.

返回 `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

esp_err_t **esp_vfs_register_fd_range** (const *esp_vfs_t* *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

参数

- **vfs** -- Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** -- Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **min_fd** -- The smallest file descriptor this VFS will use.
- **max_fd** -- Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_register_with_id** (const *esp_vfs_t* *vfs, void *ctx, *esp_vfs_id_t* *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn't pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

参数

- **vfs** -- Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** -- Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **vfs_id** -- Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_unregister** (const char *base_path)

Unregister a virtual filesystem for given path prefix

参数 **base_path** -- file prefix previously used in esp_vfs_register call

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

esp_err_t **esp_vfs_unregister_with_id** (*esp_vfs_id_t* vfs_id)

Unregister a virtual filesystem with the given index

参数 **vfs_id** -- The VFS ID returned by esp_vfs_register_with_id

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn't been registered

esp_err_t **esp_vfs_register_fd** (*esp_vfs_id_t* vfs_id, int *fd)

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id. This function should only be used to register permanent file descriptors (socket fd) that are not removed after being closed.

参数

- **vfs_id** -- VFS identifier returned by esp_vfs_register_with_id.
- **fd** -- The registered file descriptor will be written to this address.

返回 ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

esp_err_t **esp_vfs_register_fd_with_local_fd** (*esp_vfs_id_t* vfs_id, int local_fd, bool permanent, int *fd)

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

参数

- **vfs_id** -- VFS identifier returned by esp_vfs_register_with_id.
- **local_fd** -- The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- **permanent** -- Whether the fd should be treated as permanent (not removed after close())
- **fd** -- The registered file descriptor will be written to this address.

返回 ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

esp_err_t **esp_vfs_unregister_fd** (*esp_vfs_id_t* vfs_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

参数

- **vfs_id** -- VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** -- File descriptor which should be unregistered.

返回 ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

int **esp_vfs_select** (int nfd, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX `select()` for VFS.

参数

- **nfd** -- Specifies the range of descriptors which should be checked. The first `nfd`s descriptors will be checked in each set.
- **readfds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** -- If not NULL, then points to `timeval` structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

返回 The number of descriptors set in the descriptor sets, or -1 when an error (specified by `errno`) have occurred.

void **esp_vfs_select_triggered** (*esp_vfs_select_sem_t* sem)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

参数 **sem** -- semaphore structure which was passed to the driver by the `start_select` call

void **esp_vfs_select_triggered_isr** (*esp_vfs_select_sem_t* sem, BaseType_t *woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

参数

- **sem** -- semaphore structure which was passed to the driver by the `start_select` call
- **woken** -- is set to `pdTRUE` if the function wakes up a task with higher priority

ssize_t **esp_vfs_pread** (int fd, void *dst, size_t size, off_t offset)

Implements the VFS layer of POSIX `pread()`

参数

- **fd** -- File descriptor used for read
- **dst** -- Pointer to the buffer where the output will be written
- **size** -- Number of bytes to be read
- **offset** -- Starting offset of the read

返回 A positive return value indicates the number of bytes read. -1 is return on failure and `errno` is set accordingly.

ssize_t **esp_vfs_pwrite** (int fd, const void *src, size_t size, off_t offset)

Implements the VFS layer of POSIX pwrite()

参数

- **fd** -- File descriptor used for write
- **src** -- Pointer to the buffer from where the output will be read
- **size** -- Number of bytes to write
- **offset** -- Starting offset of the write

返回 A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

void **esp_vfs_dump_fds** (FILE *fp)

Dump the existing VFS FDs data to FILE* fp.

Dump the FDs in the format:

```
<VFS Path Prefix><FD seen by App><FD seen by driver>
```

where:

```
VFS Path Prefix      : file prefix used in the esp_vfs_register call
FD seen by App      : file descriptor returned by the vfs to the application.
→for the path prefix
FD seen by driver   : file descriptor used by the driver for the same file.
→prefix.
```

参数 fp -- File descriptor where data will be dumped

Structures

struct **esp_vfs_select_sem_t**

VFS semaphore type for select()

Public Members

bool **is_sem_local**

type of "sem" is SemaphoreHandle_t when true, defined by socket driver otherwise

void ***sem**

semaphore instance

struct **esp_vfs_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to NULL.

Public Members**int flags**ESP_VFS_FLAG_CONTEXT_PTR and/or ESP_VFS_FLAG_READONLY_FS or
ESP_VFS_FLAG_DEFAULTssize_t (***write_p**)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (***write**)(int fd, const void *data, size_t size)

Write without context pointer

off_t (***lseek_p**)(void *p, int fd, off_t size, int mode)

Seek with context pointer

off_t (***lseek**)(int fd, off_t size, int mode)

Seek without context pointer

ssize_t (***read_p**)(void *ctx, int fd, void *dst, size_t size)

Read with context pointer

ssize_t (***read**)(int fd, void *dst, size_t size)

Read without context pointer

ssize_t (***pread_p**)(void *ctx, int fd, void *dst, size_t size, off_t offset)

pread with context pointer

ssize_t (***pread**)(int fd, void *dst, size_t size, off_t offset)

pread without context pointer

ssize_t (***pwrite_p**)(void *ctx, int fd, const void *src, size_t size, off_t offset)

pwrite with context pointer

ssize_t (***pwrite**)(int fd, const void *src, size_t size, off_t offset)

pwrite without context pointer

int (***open_p**)(void *ctx, const char *path, int flags, int mode)

open with context pointer

int (***open**)(const char *path, int flags, int mode)

open without context pointer

int (***close_p**)(void *ctx, int fd)

close with context pointer

int (***close**)(int fd)

close without context pointer

int (***fstat_p**)(void *ctx, int fd, struct *stat* *st)

fstat with context pointer

int (***fstat**)(int fd, struct *stat* *st)

fstat without context pointer

int (***stat_p**)(void *ctx, const char *path, struct *stat* *st)

stat with context pointer

int (***stat**)(const char *path, struct *stat* *st)

stat without context pointer

int (***link_p**)(void *ctx, const char *n1, const char *n2)

link with context pointer

int (***link**)(const char *n1, const char *n2)

link without context pointer

int (***unlink_p**)(void *ctx, const char *path)

unlink with context pointer

int (***unlink**)(const char *path)

unlink without context pointer

int (***rename_p**)(void *ctx, const char *src, const char *dst)

rename with context pointer

int (***rename**)(const char *src, const char *dst)

rename without context pointer

DIR *(***opendir_p**)(void *ctx, const char *name)

opendir with context pointer

DIR *(***opendir**)(const char *name)

opendir without context pointer

struct dirent *(***readdir_p**)(void *ctx, DIR *pdir)

readdir with context pointer

struct dirent *(***readdir**)(DIR *pdir)

readdir without context pointer

int (***readdir_r_p**)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)

readdir_r with context pointer

int (***readdir_r**)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)

readdir_r without context pointer

tcflow without context pointer

pid_t (***tcgetsid_p**)(void *ctx, int fd)

tcgetsid with context pointer

pid_t (***tcgetsid**)(int fd)

tcgetsid without context pointer

int (***tcsendbreak_p**)(void *ctx, int fd, int duration)

tcsendbreak with context pointer

int (***tcsendbreak**)(int fd, int duration)

tcsendbreak without context pointer

esp_err_t (***start_select**)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,

esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (***socket_select**)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval

*timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (***stop_socket_select**)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (***stop_socket_select_isr**)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver

void (***get_socket_select_semaphore**)(void)

end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (***end_select**)(void *end_select_args)

get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS

Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX

Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT

Default value of flags member in `esp_vfs_t` structure.

ESP_VFS_FLAG_CONTEXT_PTR

Flag which indicates that FS needs extra context pointer in syscalls.

ESP_VFS_FLAG_READONLY_FS

Flag which indicates that FS is located on read-only partition.

Type Definitions

```
typedef int esp_vfs_id_t
```

Header File

- [components/vfs/include/esp_vfs_dev.h](#)
- This header file can be included with:

```
#include "esp_vfs_dev.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

```
void esp_vfs_dev_uart_register (void)
```

```
void esp_vfs_dev_uart_use_nonblocking (int uart_num)
```

```
void esp_vfs_dev_uart_use_driver (int uart_num)
```

```
int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
```

```
int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
```

```
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
```

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines ('
, LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

备注: this function is not thread safe w.r.t. reading from UART

参数 `mode` -- line endings expected on UART

void **esp_vfs_dev_uart_set_tx_line_endings** (esp_line_endings_t mode)

Set the line endings to sent to UART.

This specifies the conversion between newlines ('
, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

备注: this function is not thread safe w.r.t. writing to UART

参数 mode -- line endings to send to UART

void **esp_vfs_usb_serial_jtag_use_driver** (void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

备注: application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

void **esp_vfs_usb_serial_jtag_use_nonblocking** (void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Header File

- [components/esp_driver_uart/include/driver/uart_vfs.h](#)
- This header file can be included with:

```
#include "driver/uart_vfs.h"
```

- This header file is a part of the API provided by the `esp_driver_uart` component. To declare that your component depends on `esp_driver_uart`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_uart
```

or

```
PRIV_REQUIRES esp_driver_uart
```

Functions

void **uart_vfs_dev_register** (void)

Add /dev/uart virtual filesystem driver.

This function is called from startup code to enable serial output

int **uart_vfs_dev_port_set_rx_line_endings** (int uart_num, esp_line_endings_t mode)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines ('
, LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

备注: this function is not thread safe w.r.t. reading from UART

参数

- `uart_num` -- the UART number
- `mode` -- line endings to send to UART

返回 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

int `uart_vfs_dev_port_set_tx_line_endings` (int `uart_num`, `esp_line_endings_t` `mode`)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (‘

’, LF) on stdout and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

备注: this function is not thread safe w.r.t. writing to UART

参数

- `uart_num` -- the UART number
- `mode` -- line endings to send to UART

返回 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

void `uart_vfs_dev_use_nonblocking` (int `uart_num`)

set VFS to use simple functions for reading and writing UART

Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

参数 `uart_num` -- UART peripheral number

void `uart_vfs_dev_use_driver` (int `uart_num`)

set VFS to use UART driver for reading and writing

备注: Application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

参数 `uart_num` -- UART peripheral number

Header File

- [components/vfs/include/esp_vfs_eventfd.h](#)
- This header file can be included with:

```
#include "esp_vfs_eventfd.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

PRIV_REQUIRES vfs
```

Functions

`esp_err_t esp_vfs_eventfd_register` (const `esp_vfs_eventfd_config_t` *config)

Registers the event vfs.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFses are registered.

`esp_err_t esp_vfs_eventfd_unregister` (void)

Unregisters the event vfs.

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

int `eventfd` (unsigned int initval, int flags)

Structures

struct `esp_vfs_eventfd_config_t`

Eventfd vfs initialization settings.

Public Members

size_t `max_fds`

The maximum number of eventfds supported

Macros

`EFD_SUPPORT_ISR`

`ESP_VFS_EVENTD_CONFIG_DEFAULT` ()

2.8.11 磨损均衡 API

概述

ESP32-S2 所使用的 flash，特别是 SPI flash，多数具备扇区结构，且每个扇区仅允许有限次数的擦除/修改操作。为了避免过度使用某一扇区，乐鑫提供了磨损均衡组件，无需用户介入即可帮助用户均衡各个扇区之间的磨损。

磨损均衡组件包含了通过分区组件对外部 SPI flash 进行数据读取、写入、擦除和存储器映射相关的 API 函数。磨损均衡组件还具有软件上更高级别的 API 函数，与 [FAT 文件系统](#) 协同工作。

磨损均衡组件与 FAT 文件系统组件共用 FAT 文件系统的扇区，扇区大小为 4096 字节，是标准 flash 扇区的大小。在这种模式下，磨损均衡组件性能达到最佳，但需要在 RAM 中占用更多内存。

为了节省内存，磨损均衡组件还提供了另外两种模式，均使用 512 字节大小的扇区：

- **性能模式**：先将数据保存在 RAM 中，擦除扇区，然后将数据存储回 flash。如果设备在扇区擦写过程中突然断电，则整个扇区（4096 字节）数据将全部丢失。

- **安全模式**: 数据先保存在 flash 中空余扇区, 擦除扇区后, 数据即存储回去。如果设备断电, 上电后可立即恢复数据。

设备默认设置如下:

- 定义扇区大小为 512 字节
- 默认使用性能模式

您可以使用配置菜单更改设置。

磨损均衡组件不会将数据缓存在 RAM 中。写入和擦除函数直接修改 flash, 函数返回后, flash 即完成修改。

磨损均衡访问 API

处理 flash 数据常用的 API 如下所示:

- `wl_mount` - 为指定分区挂载并初始化磨损均衡模块
- `wl_unmount` - 卸载分区并释放磨损均衡模块
- `wl_erase_range` - 擦除 flash 中指定的地址范围
- `wl_write` - 将数据写入分区
- `wl_read` - 从分区读取数据
- `wl_size` - 返回可用内存的大小 (以字节为单位)
- `wl_sector_size` - 返回一个扇区的大小

请尽量避免直接使用原始磨损均衡函数, 建议您使用文件系统特定的函数。

内存大小

内存大小是根据分区参数在磨损均衡模块中计算所得, 由于模块使用 flash 部分扇区存储内部数据, 因此计算所得内存大小有少许偏差。

另请参阅

- [FAT 文件系统](#)
- [分区表](#)

应用示例

[storage/wear_levelling](#) 中提供了一款磨损均衡驱动与 FatFs 库结合使用的示例。该示例初始化磨损均衡驱动, 挂载 FAT 文件系统分区, 并使用 POSIX (可移植操作系统接口) 和 C 库 API 从中写入和读取数据。如需了解更多信息, 请参考 [storage/wear_levelling/README.md](#)。

高级 API 参考

头文件

有关高级磨损均衡函数 `esp_vfs_fat_spiflash_mount_rw_wl()`、`esp_vfs_fat_spiflash_unmount_rw_wl()` 和结构体 `esp_vfs_fat_mount_config_t` 的详细内容, 请参见 [FAT 文件系统](#)。

中层 API 参考

Header File

- `components/wear_levelling/include/wear_levelling.h`
- This header file can be included with:

```
#include "wear_levelling.h"
```

- This header file is a part of the API provided by the `wear_levelling` component. To declare that your component depends on `wear_levelling`, add the following to your `CMakeLists.txt`:

```
REQUIRES wear_levelling
```

or

```
PRIV_REQUIRES wear_levelling
```

Functions

`esp_err_t wl_mount` (const `esp_partition_t` *partition, `wl_handle_t` *out_handle)

Mount WL for defined partition.

参数

- **partition** -- that will be used for access
- **out_handle** -- handle of the WL instance

返回

- `ESP_OK`, if the WL allocation is successful;
- `ESP_ERR_INVALID_ARG`, if the arguments for WL configuration are not valid;
- `ESP_ERR_NO_MEM`, if the WL allocation fails because of insufficient memory;

`esp_err_t wl_unmount` (`wl_handle_t` handle)

Unmount WL for defined partition.

参数 **handle** -- WL partition handle

返回

- `ESP_OK`, if the operation is successful;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_erase_range` (`wl_handle_t` handle, `size_t` start_addr, `size_t` size)

Erase part of the WL storage.

参数

- **handle** -- WL handle that are related to the partition
- **start_addr** -- Address from where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.
- **size** -- Size of the range which should be erased, in bytes. Must be divisible by the result of function `wl_sector_size(...)`.

返回

- `ESP_OK`, if the given range was erased successfully;
- `ESP_ERR_INVALID_ARG`, if iterator or dst are NULL;
- `ESP_ERR_INVALID_SIZE`, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_write` (`wl_handle_t` handle, `size_t` dest_addr, const void *src, `size_t` size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

备注: Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

参数

- **handle** -- WL handle corresponding to the WL partition
- **dest_addr** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

返回

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)`

Read data from the WL storage.

参数

- **handle** -- WL module instance that was initialized before
- **dest** -- Pointer to the buffer where data should be stored. The Pointer must be non-NULL and the buffer must be at least 'size' bytes long.
- **src_addr** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

返回

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`size_t wl_size (wl_handle_t handle)`

Get the actual flash size in use for the WL storage partition.

参数 **handle** -- WL module handle that was initialized before

返回 usable size, in bytes

`size_t wl_sector_size (wl_handle_t handle)`

Get sector size of the WL instance.

参数 **handle** -- WL module handle that was initialized before

返回 sector size, in bytes

Macros

WL_INVALID_HANDLE

Type Definitions

```
typedef int32_t wl_handle_t
```

wear levelling handle

此部分 API 代码示例存放在 ESP-IDF 示例项目的 [storage](#) 目录下。

2.9 系统 API

2.9.1 应用程序镜像格式

应用程序镜像结构

应用程序镜像包含以下内容：

1. `esp_image_header_t` 结构体描述了 SPI flash 的模式和内存段的数量。
2. `esp_image_segment_header_t` 结构体描述了每个段、每个段的长度及其在 ESP32-S2 内存中的位置，此描述后接长度为 `data_len` 的数据。镜像中每个段的数据偏移量的计算方式如下：
 - 0 段的偏移量 = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`
 - 1 段的偏移量 = 0 段的偏移量 + 0 段长度 + `sizeof(esp_image_segment_header_t)`
 - 2 段的偏移量 = 1 段的偏移量 + 1 段长度 + `sizeof(esp_image_segment_header_t)`
 - ...

`segment_count` 字段定义了每个段的数量，存储在 `esp_image_header_t` 中。各段段数量不能超过 `ESP_IMAGE_MAX_SEGMENTS`。

运行以下命令，获取镜像段列表：

```
esptool.py --chip esp32s2 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments

↳0) load

```

有关内存段类型和地址范围的详细信息，请参阅 [ESP32-S2 技术参考手册 > 系统和存储器 > 内部存储器 \[PDF\]](#)。

3. 镜像有一个校验和字节，位于最后一个段之后。此字节写在一个十六字节填充边界上，因此应用程序镜像可能需要填充。
4. 如果在 `esp_image_header_t` 中设置了 `hash_appended` 字段，则会附加 SHA256 校验和字段。SHA256 哈希值的计算范围是从第一个字节开始，到这个字段为止。该字段长度为 32 字节。
5. 如果选项 `CONFIG_SECURE_SIGNED_APPS_SCHEME` 设置为 ECDSA，那么应用程序镜像将有额外的 68 字节用于 ECDSA 签名，其中包括：
 - 版本号 (4 字节)
 - 签名数据 (64 字节)
6. 如果选项 `CONFIG_SECURE_SIGNED_APPS_SCHEME` 设置为 RSA 或 ECDSA (V2)，则应用程序镜像将有一个额外的签名扇区，大小为 4K 字节。关于此签名扇区格式的更多内容，请参考 [Signature Block Format](#)。

应用程序描述

应用程序二进制文件的 DROM 段从 `esp_app_desc_t` 结构体开始，该结构体中包含了用于描述应用程序的特定字段，如下所示：

- `magic_word`: `esp_app_desc_t` 结构体的魔术词
- `secure_version`: 参见 [防回滚](#)
- `version`: 参见 [应用程序版本](#)¹
- `project_name`: 通过 `PROJECT_NAME` 填充¹
- `time` 和 `date`: 编译时间和日期
- `idf_ver`: ESP-IDF 的版本¹
- `app_elf_sha256`: 包含应用程序 ELF 文件的 sha256 哈希

这个结构体有助于识别通过空中升级 (OTA) 上传的镜像，因为其中包含一个固定的偏移量，大小为 `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`。一旦设备接收到包含此结构体的第一个段，就能根据其中的充分信息来确定是否应继续更新。

要获取当前运行的应用程序的 `esp_app_desc_t` 结构体，请调用 `esp_app_get_description()`。

要获取另一个 OTA 分区的 `esp_app_desc_t` 结构体，请调用 `esp_ota_get_partition_description()`。

向应用程序添加自定义结构体

也可以自定义类似的结构体，并使其相对于镜像起始位置有一个固定的偏移量。

采用以下方式向镜像添加自定义结构体：

```

const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↳app_desc = { ... }

```

¹ 最大长度为 32 个字符，其中包括 null 终止符。也就是说，如果 `PROJECT_NAME` 的长度超过 31 个字符，超出的字符将被忽略。

自定义结构体的偏移量为 `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`。

需在 `CMakeLists.txt` 中添加 `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")`，确保自定义结构体在未使用时也位于镜像中。

uint8_t **magic**

Magic word `ESP_IMAGE_HEADER_MAGIC`

uint8_t **segment_count**

Count of memory segments

uint8_t **spi_mode**

flash read mode (`esp_image_spi_mode_t` as `uint8_t`)

uint8_t **spi_speed**

flash frequency (`esp_image_spi_freq_t` as `uint8_t`)

uint8_t **spi_size**

flash chip size (`esp_image_flash_size_t` as `uint8_t`)

uint32_t **entry_addr**

Entry address

uint8_t **wp_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to `0xEE=disabled`)

uint8_t **spi_pin_drv**[3]

Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t **chip_id**

Chip identification number

uint8_t **min_chip_rev**

Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use `min_chip_rev_full` instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

uint16_t **min_chip_rev_full**

Minimal chip revision supported by image, in format: major * 100 + minor

uint16_t **max_chip_rev_full**

Maximal chip revision supported by image, in format: major * 100 + minor

uint8_t **reserved**[4]

Reserved bytes in additional header space, currently unused

uint8_t **hash_appended**

If 1, a SHA256 digest "simple hash" (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct **esp_image_segment_header_t**

Header of binary image segment.

Public Members

uint32_t **load_addr**

Address of segment

uint32_t **data_len**

Length of data

Macros

ESP_IMAGE_HEADER_MAGIC

The magic word for the *esp_image_header_t* structure.

ESP_IMAGE_MAX_SEGMENTS

Max count of segments in the image.

Enumerations

enum **esp_chip_id_t**

ESP chip ID.

Values:

enumerator **ESP_CHIP_ID_ESP32**

chip ID: ESP32

enumerator **ESP_CHIP_ID_ESP32S2**

chip ID: ESP32-S2

enumerator **ESP_CHIP_ID_ESP32C3**

chip ID: ESP32-C3

enumerator **ESP_CHIP_ID_ESP32S3**

chip ID: ESP32-S3

enumerator **ESP_CHIP_ID_ESP32C2**

chip ID: ESP32-C2

enumerator **ESP_CHIP_ID_ESP32C6**

chip ID: ESP32-C6

enumerator **ESP_CHIP_ID_ESP32H2**

chip ID: ESP32-H2

enumerator **ESP_CHIP_ID_ESP32P4**

chip ID: ESP32-P4

enumerator **ESP_CHIP_ID_INVALID**

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

enum **esp_image_spi_mode_t**

SPI flash mode, used in [esp_image_header_t](#).

Values:

enumerator **ESP_IMAGE_SPI_MODE_QIO**

SPI mode QIO

enumerator **ESP_IMAGE_SPI_MODE_QOUT**

SPI mode QOUT

enumerator **ESP_IMAGE_SPI_MODE_DIO**

SPI mode DIO

enumerator **ESP_IMAGE_SPI_MODE_DOUT**

SPI mode DOUT

enumerator **ESP_IMAGE_SPI_MODE_FAST_READ**

SPI mode FAST_READ

enumerator **ESP_IMAGE_SPI_MODE_SLOW_READ**

SPI mode SLOW_READ

enum **esp_image_spi_freq_t**

SPI flash clock division factor.

Values:

enumerator **ESP_IMAGE_SPI_SPEED_DIV_2**

The SPI flash clock frequency is divided by 2 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_3**

The SPI flash clock frequency is divided by 3 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_4**

The SPI flash clock frequency is divided by 4 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_1**

The SPI flash clock frequency equals to the clock source

enum **esp_image_flash_size_t**

Supported SPI flash sizes.

Values:

enumerator **ESP_IMAGE_FLASH_SIZE_1MB**

SPI flash size 1 MB

enumerator **ESP_IMAGE_FLASH_SIZE_2MB**

SPI flash size 2 MB

enumerator **ESP_IMAGE_FLASH_SIZE_4MB**

SPI flash size 4 MB

enumerator **ESP_IMAGE_FLASH_SIZE_8MB**

SPI flash size 8 MB

enumerator **ESP_IMAGE_FLASH_SIZE_16MB**

SPI flash size 16 MB

enumerator **ESP_IMAGE_FLASH_SIZE_32MB**

SPI flash size 32 MB

enumerator **ESP_IMAGE_FLASH_SIZE_64MB**

SPI flash size 64 MB

enumerator **ESP_IMAGE_FLASH_SIZE_128MB**

SPI flash size 128 MB

enumerator **ESP_IMAGE_FLASH_SIZE_MAX**

SPI flash size MAX

2.9.2 引导加载程序镜像的格式

引导加载程序镜像与应用程序镜像具有相同的结构，参见[应用程序镜像结构](#)。二者唯一的区别在于[描述引导加载程序的结构体](#)不同。

要查看关于引导加载程序镜像的更多内容，请运行以下命令：

```
esptool.py --chip esp32s2 image_info build/bootloader/bootloader.bin --version 2
```

输出结果如下形式所示：

```
File size: 26576 (bytes)

ESP32 image header
=====
Image version: 1
Entry point: 0x40080658
Segments: 4
Flash size: 2MB
Flash freq: 40m
Flash mode: DIO

ESP32 extended image header
=====
WP pin: 0xee
Flash pins drive settings: clk_drv: 0x0, q_drv: 0x0, d_drv: 0x0, cs0_drv: 0x0, hd_
↳drv: 0x0, wp_drv: 0x0
Chip ID: 0
Minimal chip revision: v0.0, (legacy min_rev = 0)
Maximal chip revision: v3.99

Segments information
=====
Segment   Length   Load addr   File offs   Memory types
-----
1   0x01bb0  0x3fff0030  0x00000018  BYTE_ACCESSIBLE, DRAM, DIRAM_DRAM
2   0x03c90  0x40078000  0x00001bd0  CACHE_APP
3   0x00004  0x40080400  0x00005868  IRAM
4   0x00f2c  0x40080404  0x00005874  IRAM

ESP32 image footer
=====
Checksum: 0x65 (valid)

↳(valid)

Bootloader information
=====
Bootloader version: 1
ESP-IDF: v5.1-dev-4304-gcb51a3b-dirty
Compile time: Mar 30 2023 19:14:17
```

引导加载程序描述

引导加载程序二进制文件的 DRAM0 段起始位置为 `esp_bootloader_desc_t` 结构体，其中包含描述引导加载程序的特定字段。此结构体位置具有固定偏移量，大小为 `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`。

- `magic_byte`: `esp_bootloader_desc` 结构体的魔术字节
- `reserved`: 保留供 IDF 未来使用

- `version`: 引导加载程序版本, 参见 `CONFIG_BOOTLOADER_PROJECT_VER`
- `idf_ver`: IDF 版本。¹
- `date` 和 `time`: 编译日期和时间
- `reserved2`: 保留供 IDF 未来使用

如需从正在运行的引导加载程序中获取 `esp_bootloader_desc_t` 结构体, 请使用 `esp_bootloader_get_description()`。

如需从正在运行的应用程序中获取 `esp_bootloader_desc_t` 结构体, 请使用 `esp_ota_get_bootloader_description()`。

API 参考

Header File

- `components/esp_bootloader_format/include/esp_bootloader_desc.h`
- This header file can be included with:

```
#include "esp_bootloader_desc.h"
```

- This header file is a part of the API provided by the `esp_bootloader_format` component. To declare that your component depends on `esp_bootloader_format`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_bootloader_format
```

or

```
PRIV_REQUIRES esp_bootloader_format
```

Functions

const `esp_bootloader_desc_t`*`esp_bootloader_get_description` (void)

Return `esp_bootloader_desc` structure.

Intended for use by the bootloader.

返回 Pointer to `esp_bootloader_desc` structure.

Structures

struct `esp_bootloader_desc_t`

Bootloader description structure.

Public Members

`uint8_t magic_byte`

Magic byte ESP_BOOTLOADER_DESC_MAGIC_BYTE

`uint8_t reserved[3]`

reserved for IDF

`uint32_t version`

Bootloader version

char `idf_ver[32]`

Version IDF

¹ 最大长度为 32 个字符, 包括空终止符。

```
char date_time[24]
    Compile date and time

uint8_t reserved2[16]
    reserved for IDF
```

Macros

ESP_BOOTLOADER_DESC_MAGIC_BYTE

The magic byte for the `esp_bootloader_desc` structure that is in DRAM.

2.9.3 应用级追踪

概述

ESP-IDF 支持用于程序行为分析的 **应用级追踪**功能。在 `menuconfig` 中启用该功能后，即可通过 JTAG 接口在主机和 ESP32-S2 之间传输任意数据，最小化程序的执行开销。

在程序运行时，开发人员可使用该库向主机发送应用程序的特定执行状态，并接收来自应用程序的命令或其他信息。该库的主要用例包括：

1. 收集特定应用程序的数据，参见[特定应用程序的跟踪](#)。
2. 向主机发送轻量级日志，参见[记录日志到主机](#)。
3. 系统行为分析，参见[基于 SEGGER System View 的系统行为分析](#)。

API 参考

Header File

- `components/app_trace/include/esp_app_trace.h`
- This header file can be included with:

```
#include "esp_app_trace.h"
```

- This header file is a part of the API provided by the `app_trace` component. To declare that your component depends on `app_trace`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_trace
```

or

```
PRIV_REQUIRES app_trace
```

Functions

`esp_err_t esp_apprtrace_init` (void)

Initializes application tracing module.

备注： Should be called before any `esp_apprtrace_xxx` call.

返回 ESP_OK on success, otherwise see `esp_err_t`

void **esp_apptrace_down_buffer_config** (uint8_t *buf, uint32_t size)

Configures down buffer.

备注: Needs to be called before attempting to receive any data using `esp_apptrace_down_buffer_get` and `esp_apptrace_read`. This function does not protect internal data by lock.

参数

- **buf** -- Address of buffer to use for down channel (host to target) data.
- **size** -- Size of the buffer.

uint8_t ***esp_apptrace_buffer_get** (*esp_apptrace_dest_t* dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, `esp_apptrace_buffer_put` must be called to indicate it.

参数

- **dest** -- Indicates HW interface to send data.
- **size** -- Size of data to write to trace buffer.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

返回 non-NULL on success, otherwise NULL.

esp_err_t **esp_apptrace_buffer_put** (*esp_apptrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by `esp_apptrace_buffer_get`.

参数

- **dest** -- Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_apptrace_buffer_get`.
- **ptr** -- Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_buffer_get`.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

返回 `ESP_OK` on success, otherwise see `esp_err_t`

esp_err_t **esp_apptrace_write** (*esp_apptrace_dest_t* dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

参数

- **dest** -- Indicates HW interface to send data.
- **data** -- Address of data to write to trace buffer.
- **size** -- Size of data to write to trace buffer.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

返回 `ESP_OK` on success, otherwise see `esp_err_t`

int **esp_apptrace_vprintf_to** (*esp_apptrace_dest_t* dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

参数

- **dest** -- Indicates HW interface to send data.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- **fmt** -- Address of format string.
- **ap** -- List of arguments.

返回 Number of bytes written.

int **esp_apptrace_vprintf** (const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

参数

- **fmt** -- Address of format string.
 - **ap** -- List of arguments.
- 返回 Number of bytes written.

esp_err_t **esp_appttrace_flush** (*esp_appttrace_dest_t* dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

参数

- **dest** -- Indicates HW interface to flush data on.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t **esp_appttrace_flush_nolock** (*esp_appttrace_dest_t* dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_appttrace_flush which should be called from panic handler.

参数

- **dest** -- Indicates HW interface to flush data on.
- **min_sz** -- Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t **esp_appttrace_read** (*esp_appttrace_dest_t* dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

参数

- **dest** -- Indicates HW interface to read the data on.
- **data** -- Address of buffer to put data from trace buffer.
- **size** -- Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

uint8_t ***esp_appttrace_down_buffer_get** (*esp_appttrace_dest_t* dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_appttrace_down_buffer_put must be called to indicate it.

参数

- **dest** -- Indicates HW interface to receive data.
- **size** -- Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 non-NULL on success, otherwise NULL.

esp_err_t **esp_appttrace_down_buffer_put** (*esp_appttrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_appttrace_down_buffer_get.

参数

- **dest** -- Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_appttrace_down_buffer_get.
- **ptr** -- Address of trace buffer to release. Should be the value returned by call to esp_appttrace_down_buffer_get.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

bool **esp_appttrace_host_is_connected** (*esp_appttrace_dest_t* dest)

Checks whether host is connected.

参数 dest -- Indicates HW interface to use.

返回 true if host is connected, otherwise false

void ***esp_appttrace_fopen** (*esp_appttrace_dest_t* dest, const char *path, const char *mode)

Opens file on host. This function has the same semantic as 'fopen' except for the first argument.

参数

- **dest** -- Indicates HW interface to use.
- **path** -- Path to file.
- **mode** -- Mode string. See fopen for details.

返回 non zero file handle on success, otherwise 0

int **esp_appttrace_fclose** (*esp_appttrace_dest_t* dest, void *stream)

Closes file on host. This function has the same semantic as 'fclose' except for the first argument.

参数

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by esp_appttrace_fopen.

返回 Zero on success, otherwise non-zero. See fclose for details.

size_t **esp_appttrace_fwrite** (*esp_appttrace_dest_t* dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writes to file on host. This function has the same semantic as 'fwrite' except for the first argument.

参数

- **dest** -- Indicates HW interface to use.
- **ptr** -- Address of data to write.
- **size** -- Size of an item.
- **nmemb** -- Number of items to write.
- **stream** -- File handle returned by esp_appttrace_fopen.

返回 Number of written items. See fwrite for details.

size_t **esp_appttrace_fread** (*esp_appttrace_dest_t* dest, void *ptr, size_t size, size_t nmemb, void *stream)

Read file on host. This function has the same semantic as 'fread' except for the first argument.

参数

- **dest** -- Indicates HW interface to use.
- **ptr** -- Address to store read data.
- **size** -- Size of an item.
- **nmemb** -- Number of items to read.
- **stream** -- File handle returned by esp_appttrace_fopen.

返回 Number of read items. See fread for details.

int **esp_appttrace_fseek** (*esp_appttrace_dest_t* dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as 'fseek' except for the first argument.

参数

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by esp_appttrace_fopen.
- **offset** -- Offset. See fseek for details.
- **whence** -- Position in file. See fseek for details.

返回 Zero on success, otherwise non-zero. See fseek for details.

int **esp_appttrace_ftell** (*esp_appttrace_dest_t* dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as 'ftell' except for the first argument.

参数

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by esp_appttrace_fopen.

返回 Current position in file. See `ftell` for details.

int `esp_apptrace_fstop` (`esp_apptrace_dest_t` dest)

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

参数 `dest` -- Indicates HW interface to use.

返回 `ESP_OK` on success, otherwise see `esp_err_t`

int `esp_apptrace_feof` (`esp_apptrace_dest_t` dest, void *stream)

Test end-of-file indicator on a stream. This function has the same semantic as 'feof' except for the first argument.

参数

- `dest` -- Indicates HW interface to use.

- `stream` -- File handle returned by `esp_apptrace_fopen`.

返回 Non-Zero if end-of-file indicator is set for stream. See `feof` for details.

void `esp_gcov_dump` (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum `esp_apptrace_dest_t`

Application trace data destinations bits.

Values:

enumerator `ESP_APPTRACE_DEST_JTAG`

JTAG destination.

enumerator `ESP_APPTRACE_DEST_TRAX`

xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator `ESP_APPTRACE_DEST_UART`

UART destination.

enumerator `ESP_APPTRACE_DEST_MAX`

enumerator `ESP_APPTRACE_DEST_NUM`

Header File

- `components/app_trace/include/esp_sysview_trace.h`
- This header file can be included with:

```
#include "esp_sysview_trace.h"
```

- This header file is a part of the API provided by the `app_trace` component. To declare that your component depends on `app_trace`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_trace
```

or

```
PRIV_REQUIRES app_trace
```

Functions

static inline *esp_err_t* **esp_sysview_flush** (uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

参数 **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK.

int **esp_sysview_vprintf** (const char *format, va_list args)

vprintf-like function to sent log messages to the host.

参数

- **format** -- Address of format string.
- **args** -- List of arguments.

返回 Number of bytes written.

esp_err_t **esp_sysview_heap_trace_start** (uint32_t tmo)

Starts SystemView heap tracing.

参数 **tmo** -- Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

返回 ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

esp_err_t **esp_sysview_heap_trace_stop** (void)

Stops SystemView heap tracing.

返回 ESP_OK.

void **esp_sysview_heap_trace_alloc** (void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

参数

- **addr** -- Address of allocated block.
- **size** -- Size of allocated block.
- **callers** -- Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void **esp_sysview_heap_trace_free** (void *addr, const void *callers)

Sends heap de-allocation event to the host.

参数

- **addr** -- Address of de-allocated block.
- **callers** -- Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.9.4 使用外部堆栈调用函数

概述

执行某个给定函数时，可以使用用户分配的堆栈空间，且该堆栈空间独立于当前任务的堆栈。这一机制能够节省在调用常用函数时浪费大量堆栈空间，例如 `printf` 函数。具体而言，将给定函数作为参数传入 `esp_execute_shared_stack_function()` 中，给定函数便会在共享堆栈空间内作为回调函数延迟执行。

警告: `esp_execute_shared_stack_function()` 只会为所提供的共享堆栈内存做最基础的设置。传递给该函数以在共享堆栈空间上执行的函数，或调用该函数的任何函数，都不应执行以下任何操作：

- 使用线程局部存储 (TLS)
- 调用 `vTaskDelete(NULL)` 删除当前运行的任务

此外，从共享堆栈上运行的函数或调用该函数的任何函数来调用回溯，回溯信息都可能不正确。这方面的限制十分严格，因此将来 `esp_execute_shared_stack_function()` 可能会被弃用。如有用例必须使用 `esp_execute_shared_stack_function()` 函数才能实现，请提交 [GitHub Issue](#)。

使用方法

`esp_execute_shared_stack_function()` 需要四个参数：

- 由调用者分配的互斥锁，防止同一函数共享分配的堆栈
- 指向分配的堆栈顶部的指针
- 以字节为单位的堆栈的大小
- 指向需要共享堆栈的函数的指针

通过这一功能，用户指定的函数被作为回调函数延迟执行，并在用户分配的空间中调用，无需从当前任务堆栈中获取空间。

该函数的使用方式如下所示：

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//假设要使用一个单独的堆栈空间来调用 printf 函数
//允许应用程序减小其堆栈大小
void app_main()
{
    //从堆中或以静态方式分配一个堆栈 buffer:
    StackType_t *shared_stack = malloc(8192 * sizeof(StackType_t));
    assert(shared_stack != NULL);

    //分配一个互斥锁:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //使用宏助手调用所需函数:
    esp_execute_shared_stack_function(printf_lock,
                                     shared_stack,
                                     8192,
                                     external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API 参考

Header File

- `components/esp_system/include/esp_expression_with_stack.h`
- This header file can be included with:

```
#include "esp_expression_with_stack.h"
```

Functions

void **esp_execute_shared_stack_function** (*SemaphoreHandle_t* lock, void *stack, size_t stack_size, *shared_stack_function* function)

Calls function on user defined shared stack space.

After returning, the original stack is used again.

备注: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

警告: This function does minimal preparation of the provided piece of memory (*stack*). DO NOT do any of the following in *function* or any of its callees:

- Use Thread-local storage
- Use the Floating-point unit on ESP32-P4
- Use the AI co-processor on ESP32-P4
- Call `vTaskDelete(NULL)` (deleting the currently running task) Furthermore, backtraces will be wrong when called from *function* or any of its callees. The limitations are quite sever, so that we might deprecate this function in the future. If you have any use case which can only be implemented using this function, please open an issue on github.

参数

- **lock** -- Mutex object to protect in case of shared stack
- **stack** -- Pointer to user allocated stack
- **stack_size** -- Size of current stack in bytes
- **function** -- pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK (lock, stack, stack_size, expression)

Type Definitions

```
typedef void (*shared_stack_function)(void)
```

2.9.5 芯片版本

概述

ESP32-S2 可能包含多个芯片版本。引入不同的版本主要用于修复问题，有时也用于添加新功能。[版本控制方案](#) 描述了这些芯片修订的版本以及运行时读取版本信息所用的 API。

须考虑应用程序、ESP-IDF 版本和芯片版本之间的兼容性：

- 应用程序可能依赖于某个芯片版本的修复内容或功能。
- 较新版本的硬件可能与较早版本的 ESP-IDF 不兼容。

本文档的[ESP-IDF 兼容性检查](#) 部分描述了应用程序如何明确芯片版本需求，以及 ESP-IDF 如何对兼容性进行检查。文档最后提供了此方案的故障排除相关信息。

版本控制方案

芯片版本号通常以 `vX.Y` 的形式表示，其中：

- X 表示主版本号。该号码变更表示在旧版芯片上使用的软件与新版芯片不兼容，必须升级软件方可使用。
- Y 表示次版本号。该号码变更表示在旧版芯片上使用的软件与新版芯片兼容，无需升级软件。

如果新版芯片不包含重大变更，则可以兼容旧版芯片上运行的软件。此时，新版芯片的主版本号不变，次版本号加 1。例如，版本号从 v1.1 变为 v1.2。

相反，如果新版芯片包含重大变更，则 **无法兼容** 旧版芯片的软件。此时，新版芯片的主版本号增加，次版本号设置为 0。例如，版本号从 v1.1 变为 v2.0。

此版本控制方式能够表示芯片版本之间的衍生关系，并清晰表明芯片变更是否为重大变更。

在芯片发生非重大变更时，ESP-IDF 的执行逻辑应与此前最近版本的逻辑相同，从而达到无缝衔接。在这样便可直接将编译后的二进制文件迁移到更新了次版本的芯片上，无需升级 ESP-IDF 版本并重新编译整个项目。

当二进制文件在更新了主版本的芯片上意外执行时，软件也能够根据主版本报告问题。此主次版本方案还允许硬件变更分支化。

备注： 目前的主次版本号芯片版本方案是从 ESP-IDF v5.0 开始引入的。因此，早期 ESP-IDF 创建的引导加载程序将继续使用晶圆版本表示的芯片版本方案。

用于芯片版本的 eFuse 位 芯片使用以下几个 eFuse 字段来进行版本控制：

- 主版本号 (WAFER_VERSION_MAJOR eFuse)
- 次版本号 (WAFER_VERSION_MINOR eFuse)
- 忽略最大版本限制位 (DISABLE_WAFER_VERSION_MAJOR eFuse)。请参考 [ESP-IDF 兼容性检查](#) 了解此 eFuse 字段。

备注： 此前的版本控制逻辑基于单一的 eFuse 版本字段，即 WAFER_VERSION。这种方式无法表明芯片的更新是否为重大更新，是一种线性的版本控制逻辑。

芯片版本 API 使用下列 API 从 eFuse 中读取芯片版本：

- `efuse_hal_chip_revision()`，返回的版本格式为 `major * 100 + minor`。
- `efuse_hal_get_major_chip_version()` 返回主版本号。
- `efuse_hal_get_minor_chip_version()` 返回次版本号。

下列 Kconfig 选项（格式为 `major * 100 + minor`）可以将芯片版本依赖添加到代码中：

- `CONFIG_ESP32S2_REV_MIN_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP32S2_REV_MAX_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

ESP-IDF 兼容性检查

如果构建的应用程序需要支持特定芯片的多个版本，可通过 Kconfig 指定支持的最小和最大芯片版本号。

最小芯片版本号可以通过 Kconfig 选项 `CONFIG_ESP32S2_REV_MIN` 来选择。设置最小芯片版本后，软件只能在较新的芯片版本上运行，以便支持某些功能或修复某些错误。

最大芯片版本号无法指定，只能由当前使用的 ESP-IDF 版本自动决定。ESP-IDF 会拒绝启动任何超过最大芯片版本号的芯片版本。由于特定版本的 ESP-IDF 无法预知未来的芯片版本更新，因此最大芯片版本号通常设置为 `maximum supported MAJOR version + 99`。可以设置“忽略最大版本” eFuse 来绕过最大版本限制，但这不能确保软件正常工作。

下文介绍了芯片版本未通过兼容性检查时显示的故障排除信息及解决方法，并描述了在早期 ESP-IDF 版本中与软件行为和兼容性检查相关的技术细节。

故障排除

1. 如果第二阶段引导加载程序所运行的芯片版本低于镜像（如软件镜像）中指定的最小版本，会发生重启并显示以下消息：

```
Image requires chip rev >= v3.0, but chip is v1.0
```

要解决此问题，

- 确保使用的芯片达到了要求的最低版本及以上。
- 减小 `CONFIG_ESP32S2_REV_MIN` 的值并重建镜像，使镜像的版本与当前芯片版本兼容。

1. 如果应用程序所需的芯片版本不处于最小和最大芯片版本的区间范围内，会发生重启并显示以下消息：

```
Image requires chip rev <= v2.99, but chip is v3.0
```

为解决此问题，需更新 **ESP-IDF** 到较新版本，以支持该芯片版本 (`CONFIG_ESP32S2_REV_MAX_FULL`)。也可以在 **eFuse** 中设置 `Ignore maximal revision` 位，或使用与当前 **ESP-IDF** 版本兼容的其他芯片版本。

二进制镜像的常见版本需求 二级引导程序和应用程序二进制镜像中包含 `esp_image_header_t` 头文件，其中记录了可以运行该软件的芯片版本号。这一头文件有 3 个与版本相关的字段：

- `min_chip_rev` - 镜像所需芯片的最小主版本号（但对于 ESP32-C3，该字段指次版本号）。其值由 `CONFIG_ESP32S2_REV_MIN` 确定。
- `min_chip_rev_full` - 镜像所需芯片的最小次版本号，格式为 `major * 100 + minor`。其值由 `CONFIG_ESP32S2_REV_MIN` 确定。
- `max_chip_rev_full` - 镜像所需芯片的最大版本，格式为 `major * 100 + minor`。其值由 `CONFIG_ESP32S2_REV_MAX_FULL` 确定。用户无法对其进行修改，仅当 **ESP-IDF** 支持新版本时由乐鑫官方进行更改。

最大和最小版本限制 应用启动过程中，检查最小和最大版本的顺序如下：

1. 在运行第 2 阶段引导启动程序前，第 1 阶段引导启动程序（ROM 引导启动程序）不会在 `esp_image_header_t` 中检查最小和最大版本字段。
2. 在第 2 阶段引导启动程序的初始化阶段，会检查引导程序自身是否可以在此版本的芯片上启动。它从引导启动程序镜像的头文件中读取最小版本，并与 **eFuse** 中的芯片版本进行比较。如果芯片版本低于最小版本，引导启动程序会拒绝启动并中止运行。此阶段不检查最大版本。
3. 然后，第 2 阶段引导启动程序会检查应用程序的版本要求。它从应用程序镜像的头文件中读取最小和最大版本，并与 **eFuse** 中的芯片版本进行比较。如果该芯片版本低于最小版本或高于最大版本，引导程序会拒绝启动并中止。然而，如果设置了忽略最大版本位，则可以忽略最大版本限制。软件确定可以使用此芯片版本时，用户可以自行设置忽略位。
4. 在空中升级 (OTA) 阶段，运行中的应用程序会检查新软件是否与芯片版本相匹配。它会从新应用程序镜像的标头中提取最小和最大版本，并与 **eFuse** 中的芯片版本进行比较。应用程序检查版本匹配的方式与引导启动程序相同，即芯片版本须处在最小和最大版本之间（忽略最大版本的逻辑也相同）。

向后兼容旧版 ESP-IDF 构建的引导启动程序 主要版本号和次版本号的 **eFuse** 位对于旧版引导启动程序（由早于 v5.0 版本的 **ESP-IDF** 进行构建）而言是未知的。旧版启动引导程序只使用一个 **eFuse** 位来表示芯片版本。

在 **ESP-IDF** v4.2 中添加了对 ESP32-S2 芯片的支持。由于 Minimum Supported ESP32-S2 Revision `Kconfig` 选项未引入，ESP32-S2 芯片在 `esp_image_header_t` 头文件中将 `rev_min` 设置为 0。这表明旧版引导启动程序不会检查芯片版本。在 v0.0 至 v3.15 范围内，任何应用程序都可以通过此类引导加载程序加载。

请使用 `esptool chip_id` 命令查看芯片版本。

API 参考

Header File

- `components/hal/include/hal/efuse_hal.h`
- This header file can be included with:

```
#include "hal/efuse_hal.h"
```

Functions

void `efuse_hal_get_mac` (uint8_t *mac)

get factory mac address

uint32_t `efuse_hal_chip_revision` (void)

Returns chip version.

返回 Chip version in format: Major * 100 + Minor

uint32_t `efuse_hal_blk_version` (void)

Return block version.

返回 Block version in format: Major * 100 + Minor

bool `efuse_hal_flash_encryption_enabled` (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

返回 true if flash encryption is enabled.

bool `efuse_hal_get_disable_wafer_version_major` (void)

Returns the status of whether the bootloader (and OTA) will check the maximum chip version or not.

返回 true - Skip the maximum chip version check.

uint32_t `efuse_hal_get_major_chip_version` (void)

Returns major chip version.

uint32_t `efuse_hal_get_minor_chip_version` (void)

Returns minor chip version.

2.9.6 控制台终端

ESP-IDF 提供了 `console` 组件，它包含了开发基于串口的交互式控制终端所需要的所有模块，主要支持以下功能：

- 行编辑，由 `linenoise` 库具体实现，它支持处理退格键和方向键，支持回看命令的历史记录，支持命令的自动补全和参数提示。
- 将命令行拆分为参数列表。
- 参数解析，由 `argtable3` 库具体实现，该库提供解析 GNU 样式的命令行参数的 API。
- 用于注册和调度命令的函数。
- 帮助创建 REPL (Read-Evaluate-Print-Loop) 环境的函数。

备注： 这些功能模块可以一起使用，也可以独立使用，例如仅使用行编辑和命令注册的功能，然后使用 `getopt` 函数或者自定义的函数来实现参数解析，而不是直接使用 `argtable3` 库。同样地，还可以使用更简单的命令输入方法（比如 `fgets` 函数）和其他用于命令分割和参数解析的方法。

备注： 当在支持硬件 USB 串行接口的芯片上使用控制台应用程序时，建议禁用次级串口控制台输出。次级输出仅用于显示，对于交互式应用程序没有任何作用。

行编辑

行编辑功能允许用户通过按键输入来编辑命令，使用退格键删除符号，使用左/右键在命令中移动光标，使用上/下键导航到之前输入的命令，使用制表键（“Tab”）来自动补全命令。

备注： 此功能依赖于终端应用程序对 ANSI 转义符的支持。因此，显示原始 UART 数据的串口监视器不能与行编辑库一同使用。如果运行 `system/console` 示例程序的时候看到的输出结果是 `[6n` 或者类似的转义字符而不是命令行提示符 `esp>` 时，就表明当前的串口监视器不支持 ANSI 转义字符。已知可用的串口监视程序有 GNU `screen`、`minicom` 和 `esp-idf-monitor`（可以通过在项目目录下执行 `idf.py monitor` 来调用）。

前往这里可以查看 [linenoise](#) 库提供的所有函数的描述。

配置 `linenoise` 库不需要显式地初始化，但是在调用行编辑函数之前，可能需要对某些配置的默认值稍作修改。

- `linenoiseClearScreen()`
使用转义字符清除终端屏幕，并将光标定位在左上角。
- `linenoiseSetMultiLine()`
在单行和多行编辑模式之间进行切换。单行模式下，如果命令的长度超过终端的宽度，会在行内滚动命令文本以显示文本的结尾，在这种情况下，文本的开头部分会被隐藏。单行模式在每次按下按键时发送给屏幕刷新的数据比较少，与多行模式相比更不容易发生故障。另一方面，在单行模式下编辑命令和复制命令将变得更加困难。默认情况下开启的是单行模式。
- `linenoiseAllowEmpty()`
设置 `linenoise` 库收到空行的解析行为，设置为 `true` 时返回长度为零的字符串（""），设置为 `false` 时返回 `NULL`。默认情况下，将返回长度为零的字符串。
- `linenoiseSetMaxLineLen()`
设置 `linenoise` 库中每行的最大长度，默认长度为 4096 字节，可以通过更新该默认值来优化 RAM 内存的使用。

主循环

- `linenoise()`
在大多数情况下，控制台应用程序都会具有相同的工作形式——在某个循环中不断读取输入的内容，然后解析再处理。`linenoise()` 是专门用来获取用户按键输入的函数，当回车键被按下后会返回完整的一行内容。因此可以用它来完成前面循环中的“读取”任务。
- `linenoiseFree()`
必须调用此函数才能释放从 `linenoise()` 函数获取的命令行缓冲区。

提示和补全

- `linenoiseSetCompletionCallback()`
当用户按下制表键时，`linenoise` 会调用 **补全回调函数**，该回调函数会检查当前已经输入的内容，然后调用 `linenoiseAddCompletion()` 函数来提供所有可能的补全后的命令列表。启用补全功能，需要事先调用 `linenoiseSetCompletionCallback()` 函数来注册补全回调函数。

console 组件提供了一个现成的函数来为注册的命令提供补全功能 `esp_console_get_completion()` (见下文)。

- `linenoiseAddCompletion()`
补全回调函数会通过调用此函数来通知 `linenoise` 库当前键入命令所有可能的补全结果。
- `linenoiseSetHintsCallback()`
每当用户的输入改变时, `linenoise` 就会调用此回调函数, 检查到目前为止输入的命令行内容, 然后提供带有提示信息的字符串 (例如命令参数列表), 然后会在同一行上用不同的颜色显示出该文本。
- `linenoiseSetFreeHintsCallback()`
如果 **提示回调函数** 返回的提示字符串是动态分配的或者需要以其它方式回收, 就需要使用 `linenoiseSetFreeHintsCallback()` 注册具体的清理函数。

历史记录

- `linenoiseHistorySetMaxLen()`
该函数设置要保留在内存中的最近输入的命令的数量。用户通过使用向上/向下箭头来导航历史记录。
- `linenoiseHistoryAdd()`
`Linenoise` 不会自动向历史记录中添加命令, 应用程序需要调用此函数来将命令字符串添加到历史记录中。
- `linenoiseHistorySave()`
该函数将命令的历史记录从 `RAM` 中保存为文本文件, 例如保存到 `SD` 卡或者 `flash` 的文件系统中。
- `linenoiseHistoryLoad()`
与 `linenoiseHistorySave` 相对应, 从文件中加载历史记录。
- `linenoiseHistoryFree()`
释放用于存储命令历史记录的内存在。当使用完 `linenoise` 库后需要调用此函数。

将命令行拆分成参数列表

console 组件提供 `esp_console_split_argv()` 函数来将命令行字符串拆分为参数列表。该函数会返回参数的数量 (`argc`) 和一个指针数组, 该指针数组可以作为 `argv` 参数传递给任何接受 `argc, argv` 格式参数的函数。

根据以下规则来将命令行拆分成参数列表:

- 参数由空格分隔
- 如果参数本身需要使用空格, 可以使用 `\` (反斜杠) 对它们进行转义
- 其它能被识别的转义字符有 `\\` (显示反斜杠本身) 和 `\"` (显示双引号)
- 可以使用双引号来引用参数, 引号只可能出现在参数的开头和结尾。参数中的引号必须如上所述进行转义。参数周围的引号会被 `esp_console_split_argv()` 函数删除

示例:

- `abc def 1 20 .3 > [abc, def, 1, 20, .3]`
- `abc "123 456" def > [abc, 123 456, def]`
- ``a\ b\\c\" > [a b\c]`

参数解析

对于参数解析, console 组件使用 `argtable3` 库。有关 `argtable3` 的介绍请查看 [教程](#) 或者 [Github](#) 仓库中的 [示例代码](#)。

命令的注册与调度

console 组件包含了一些工具函数, 用来注册命令, 将用户输入的命令和已经注册的命令进行匹配, 使用命令行输入的参数调用命令。

应用程序首先调用 `esp_console_init()` 来初始化命令注册模块, 然后调用 `esp_console_cmd_register()` 函数注册命令处理程序。

对于每个命令，应用程序需要提供以下信息（需要以 `esp_console_cmd_t` 结构体的形式给出）：

- 命令名字（不含空格的字符串）
- 帮助文档，解释该命令的用途
- 可选的提示文本，列出命令的参数。如果应用程序使用 `Argtable3` 库来解析参数，则可以通过提供指向 `argtable` 参数定义结构体的指针来自动生成提示文本
- 命令处理函数（无上下文），或
- 命令处理函数（有上下文）。如要使用此函数，则必须在调用其他命令 **之前** 调用 `esp_console_cmd_set_context()` 初始化上下文。

备注： 使用接受上下文的命令处理函数或者不接受上下文的命令处理函数均可，但两者不能同时使用。如果使用接受上下文的命令处理程序函数，则必须调用 `esp_console_cmd_set_context()` 初始化上下文，否则该函数可能会访问未初始化的上下文。

命令注册模块还提供了其它函数：

- `esp_console_run()`
该函数接受命令行字符串，使用 `esp_console_split_argv()` 函数将其拆分为 `argc/argv` 形式的参数列表，在已经注册的组件列表中查找命令，如果找到，则执行其对应的处理程序。
- `esp_console_register_help_command()`
将 `help` 命令添加到已注册命令列表中，此命令将会以列表的方式打印所有注册的命令及其参数和帮助文本。
- `esp_console_get_completion()`
与 `linenoise` 库中的 `linenoiseSetCompletionCallback()` 一同使用的回调函数，根据已经注册的命令列表为 `linenoise` 提供补全功能。
- `esp_console_get_hint()`
与 `linenoise` 库中 `linenoiseSetHintsCallback()` 一同使用的回调函数，为 `linenoise` 提供已经注册的命令的参数提示功能。

初始化 REPL 环境

除了上述的各种函数，`console` 组件还提供了一些 API 来帮助创建一个基本的 REPL 环境。

在一个典型的 `console` 应用中，你只需要调用 `esp_console_new_repl_uart()`，它会为你初始化好构建在 UART 基础上的 REPL 环境，其中包括安装 UART 驱动，基本的 `console` 配置，创建一个新的线程来执行 REPL 任务，注册一些基本的命令（比如 `help` 命令）。

之后你可以使用 `esp_console_cmd_register()` 来注册其它命令。REPL 环境在初始化后需要再调用 `esp_console_start_repl()` 函数才能开始运行。

应用程序示例

`system/console` 目录下提供了 `console` 组件的示例应用程序，展示了具体的使用方法。该示例介绍了如何初始化 UART 和 VFS 的功能，设置 `linenoise` 库，从 UART 中读取命令并加以处理，然后将历史命令存储到 flash 中。更多信息，请参阅示例代码目录中的 `README.md` 文件。

此外，ESP-IDF 还提供了众多基于 `console` 组件的示例程序，它们可以辅助应用程序的开发。例如，`peripherals/i2c/i2c_tools`，`wifi/iperf` 等等。

API 参考

Header File

- `components/console/esp_console.h`
- This header file can be included with:

```
#include "esp_console.h"
```

- This header file is a part of the API provided by the `console` component. To declare that your component depends on `console`, add the following to your `CMakeLists.txt`:

```
REQUIRES console
```

or

```
PRIV_REQUIRES console
```

Functions

esp_err_t **esp_console_init** (const *esp_console_config_t* *config)

initialize console module

备注: Call this once before using other console module features

参数 **config** -- console configuration

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

esp_err_t **esp_console_deinit** (void)

de-initialize console module

备注: Call this once when done using console module functions

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

esp_err_t **esp_console_cmd_register** (const *esp_console_cmd_t* *cmd)

Register console command.

备注: If the member `func_w_context` of `cmd` is set instead of `func`, then the member `context` is passed to the function pointed to by `func_w_context`.

参数 **cmd** -- pointer to the command description; can point to a temporary value

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments
- ESP_ERR_INVALID_ARG if both `func` and `func_w_context` members of `cmd` are non-NULL
- ESP_ERR_INVALID_ARG if both `func` and `func_w_context` members of `cmd` are NULL

esp_err_t **esp_console_run** (const char *cmdline, int *cmd_ret)

Run command line.

参数

- **cmdline** -- command line (command name followed by a number of arguments)
- **cmd_ret** -- [out] return code from the command (set if command was run)

返回

- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn't registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn't called

size_t **esp_console_split_argv** (char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
*
*   'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
*   spaces are preserved and quotes are stripped.
*
*   'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*   'a\ b\\c\"' -> [ 'a b\c"' ]
*
```

备注: Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

参数

- **line** -- pointer to buffer to parse; it is modified in place
- **argv** -- array where the pointers to arguments are written
- **argv_size** -- number of elements in argv_array (max. number of arguments)

返回 number of arguments found (argc)

void **esp_console_get_completion** (const char *buf, *linenoiseCompletions* *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

参数

- **buf** -- the string typed by the user
- **lc** -- linenoiseCompletions to be filled in

const char ***esp_console_get_hint** (const char *buf, int *color, int *bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

参数

- **buf** -- line typed by the user
- **color** -- **[out]** ANSI color code to be used when displaying the hint
- **bold** -- **[out]** set to 1 if hint has to be displayed in bold

返回 string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

esp_err_t **esp_console_register_help_command** (void)

Register a 'help' command.

Default 'help' command prints the list of registered commands along with hints and help strings if no additional argument is given. If an additional argument is given, the help command will look for a command with the same name and only print the hints and help strings of that command.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn't called

esp_err_t **esp_console_new_repl_uart** (const *esp_console_dev_uart_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

备注: This is an all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
 - Configures the stdin/stdout to go through the UART driver
 - Initializes linenoise
 - Spawn new thread to run REPL in the background
-

参数

- **dev_config** -- [in] UART device configuration
- **repl_config** -- [in] REPL configuration
- **ret_repl** -- [out] return REPL handle after initialization succeed, return NULL otherwise

返回

- ESP_OK on success
- ESP_FAIL Parameter error

esp_err_t **esp_console_new_repl_usb_cdc** (const *esp_console_dev_usb_cdc_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL environment over USB CDC.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

备注: This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes linenoise
 - Spawn new thread to run REPL in the background
-

参数

- **dev_config** -- [in] USB CDC configuration
- **repl_config** -- [in] REPL configuration
- **ret_repl** -- [out] return REPL handle after initialization succeed, return NULL otherwise

返回

- ESP_OK on success

- ESP_FAIL Parameter error

`esp_err_t esp_console_start_repl (esp_console_repl_t *repl)`

Start REPL environment.

备注: Once the REPL gets started, it won't be stopped until the user calls `repl->del(repl)` to destroy the REPL environment.

参数 `repl` -- [in] REPL handle returned from `esp_console_new_repl_XXX`

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if `repl` has started already

Structures

struct `esp_console_config_t`

Parameters for console initialization.

Public Members

size_t `max_cmdline_length`

length of command line buffer, in bytes

size_t `max_cmdline_args`

maximum number of command line arguments to parse

uint32_t `heap_alloc_caps`

where to (e.g. MALLOC_CAP_SPIRAM) allocate heap objects such as `cmds` used by `esp_console`

int `hint_color`

ASCII color code of hint text.

int `hint_bold`

Set to 1 to print hint text in bold.

struct `esp_console_repl_config_t`

Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t `max_history_len`

maximum length for the history

const char *`history_save_path`

file path used to save history commands, set to NULL won't save to file system

uint32_t `task_stack_size`

repl task stack size

uint32_t **task_priority**

repl task priority

BaseType_t **task_core_id**

repl task affinity, i.e. which core the task is pinned to

const char ***prompt**

prompt (NULL represents default: "esp> ")

size_t **max_cmdline_length**

maximum length of a command line. If 0, default value will be used

struct **esp_console_dev_uart_config_t**

Parameters for console device: UART.

Public Members

int **channel**

UART channel number (count from zero)

int **baud_rate**

Communication baud rate.

int **tx_gpio_num**

GPIO number for TX path, -1 means using default one.

int **rx_gpio_num**

GPIO number for RX path, -1 means using default one.

struct **esp_console_dev_usb_cdc_config_t**

Parameters for console device: USB CDC.

备注: It's an empty structure for now, reserved for future

struct **esp_console_cmd_t**

Console command description.

Public Members

const char ***command**

Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

const char ***help**

Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in 'help' output.

const char ***hint**

Hint text, usually lists possible arguments. If set to NULL, and 'argtable' field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t **func**

Pointer to a function which implements the command.

备注: : Setting both `func` and `func_w_context` is not allowed.

void ***argtable**

Array or structure of pointers to `arg_xxx` structures, may be NULL. Used to generate hint text if 'hint' is set to NULL. Array/structure which this field points to must end with an `arg_end`. Only used for the duration of `esp_console_cmd_register` call.

esp_console_cmd_func_with_context_t **func_w_context**

Pointer to a context aware function which implements the command.

备注: : Setting both `func` and `func_w_context` is not allowed.

void ***context**

Context pointer to user-defined per-command context data. This is used if context aware function `func_w_context` is set.

struct **esp_console_repl_s**

Console REPL base structure.

Public Members

esp_err_t (***del**)(*esp_console_repl_t* *repl)

Delete console REPL environment.

Param repl [in] REPL handle returned from `esp_console_new_repl_xxx`

Return

- ESP_OK on success
- ESP_FAIL on errors

Macros

ESP_CONSOLE_CONFIG_DEFAULT ()

Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT ()

Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT ()

ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT ()

Type Definitions

typedef struct *linenoiseCompletions* **linenoiseCompletions**

typedef int (***esp_console_cmd_func_t**)(int argc, char **argv)

Console command main function.

Param argc number of arguments

Param argv array with argc entries, each pointing to a zero-terminated string argument

Return console command return code, 0 indicates "success"

typedef int (***esp_console_cmd_func_with_context_t**)(void *context, int argc, char **argv)

Console command main function, with context.

Param context a user context given at invocation

Param argc number of arguments

Param argv array with argc entries, each pointing to a zero-terminated string argument

Return console command return code, 0 indicates "success"

typedef struct *esp_console_repl_s* **esp_console_repl_t**

Type defined for console REPL.

2.9.7 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

Hardware Description

The ESP32-S2 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see **ESP32-S2 Technical Reference Manual > eFuse Controller (eFuse)** [PDF]. Some eFuse bits are available for user applications.

ESP32-S2 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used entirely for system purposes;
- EFUSE_BLK2 is used entirely for system purposes;
- EFUSE_BLK3 (also named EFUSE_BLK_USER_DATA) can be used for user purposes;
- EFUSE_BLK4 (also named EFUSE_BLK_KEY0) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK5 (also named EFUSE_BLK_KEY1) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK6 (also named EFUSE_BLK_KEY2) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK7 (also named EFUSE_BLK_KEY3) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK8 (also named EFUSE_BLK_KEY4) can be used as key (for secure_boot or flash_encryption) or for user purposes;

- EFUSE_BLK9 (also named EFUSE_BLK_KEY5) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK10 (also named EFUSE_BLK_SYS_DATA_PART2) is reserved for system purposes.

Each block is divided into 8 32-bits registers.

eFuse Manager Component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility checks with the *common* CSV file.

CSV files:

- *common* (`esp_efuse_table.csv`) - contains eFuse fields which are used inside the ESP-IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- *custom* - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

Description CSV File

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_
↳count(1..256), comment
```

Individual params in CSV file the following meanings:

field_name

Name of field. The prefix `ESP_EFUSE_` is added to the name, and this field name is available in the code. This name is used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The `field_name` supports structured format using `.` to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).

efuse_block

Block number. It determines where the eFuse bits are placed for this field. Available `EFUSE_BLK0..EFUSE_BLK10`.

bit_start

Start bit number (0..255). The `bit_start` field can be omitted. In this case, it is set to `bit_start + bit_count` from the previous record, if it has the same `efuse_block`. Otherwise (if `efuse_block` is different, or this is the first entry), an error will be generated.

bit_count

The number of bits to use in this field (1..-). This parameter cannot be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length has the maximum block length.

comment

This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, indicating that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This field is available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

Structured eFuse Fields

```
WR_DIS,              EFUSE_BLK0,    0,    32,    Write protection
WR_DIS.RD_DIS,      EFUSE_BLK0,    0,    1,    Write protection for
↳RD_DIS
WR_DIS.FIELD_1,     EFUSE_BLK0,    1,    1,    Write protection for
↳FIELD_1
WR_DIS.FIELD_2,     EFUSE_BLK0,    2,    4,    Write protection for
↳FIELD_2 (includes B1 and B2)
WR_DIS.FIELD_2.B1,  EFUSE_BLK0,    2,    2,    Write protection for
↳FIELD_2.B1
WR_DIS.FIELD_2.B2,  EFUSE_BLK0,    4,    2,    Write protection for
↳FIELD_2.B2
WR_DIS.FIELD_3,     EFUSE_BLK0,    5,    1,    Write protection for
↳FIELD_3
WR_DIS.FIELD_3.ALIAS, EFUSE_BLK0,    5,    1,    Write protection for
↳FIELD_3 (just a alias for WR_DIS.FIELD_3)
WR_DIS.FIELD_4,     EFUSE_BLK0,    7,    1,    Write protection for
↳FIELD_4
```

The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field - `WR_DIS` and cannot be out of the parent's range.

It is possible to use some levels of structured fields as `WR_DIS.FIELD_2.B1` and `B2`. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The ESP-IDF names for structured eFuse fields should be unique. The `efuse_table_gen` tool generates the final names where the dot is replaced by `_`. The names for using in ESP-IDF are `ESP_EFUSE_WR_DIS`, `ESP_EFUSE_WR_DIS_RD_DIS`, `ESP_EFUSE_WR_DIS_FIELD_2_B1`, etc.

The `efuse_table_gen` tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

```
Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_
↳BLK3, 0, 32
```

Solution: Describe `SERIAL_NUMBER` to be included in `USER_DATA`. (`USER_DATA.SERIAL_NUMBER`).

```
Field at FIELD, EFUSE_BLK3, 0, 50 out of range FIELD.MAJOR_NUMBER, EFUSE_BLK3,
↳60, 32
```

Solution: Change `bit_start` for `FIELD.MAJOR_NUMBER` from 60 to 0, so `MAJOR_NUMBER` is in the `FIELD` range.

efuse_table_gen.py Tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional *custom* file is used, it will be checked with the existing *common* file (*esp_efuse_table.csv*). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type *esp_efuse_desc_t*.

To generate a *common* files, use the following command `idf.py efuse-common-table` or:

```
cd $IDF_PATH/components/efuse/  
./efuse_table_gen.py --idf_target esp32s2 esp32s2/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32s2` create:

- *esp_efuse_table.c* file.
- In *include* folder *esp_efuse_table.c* file.

To generate a *custom* files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/  
./efuse_table_gen.py --idf_target esp32s2 esp32s2/esp_efuse_table.csv PROJECT_PATH/  
↪main/esp_efuse_custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- *esp_efuse_custom_table.c* file.
- In *include* folder *esp_efuse_custom_table.c* file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"  
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

Supported Coding Scheme

Coding schemes are used to protect against data corruption. ESP32-S2 supports two coding schemes:

- None. EFUSE_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE_BLK0 can be written many times.
- RS. EFUSE_BLK1 - EFUSE_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software encodes the 32-byte EFUSE_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

备注: If there is already pre-written data in the eFuse block using the Reed-Solomon encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- *esp_efuse_read_field_blob()* - returns an array of read eFuse bits.
- *esp_efuse_read_field_cnt()* - returns the number of bits programmed as "1".
- *esp_efuse_write_field_blob()* - writes an array.
- *esp_efuse_write_field_cnt()* - writes a required count of bits as "1".
- *esp_efuse_get_field_size()* - returns the number of bits by the field name.
- *esp_efuse_read_reg()* - returns value of eFuse register.
- *esp_efuse_write_reg()* - writes value to eFuse register.
- *esp_efuse_get_coding_scheme()* - returns eFuse coding scheme for blocks.
- *esp_efuse_read_block()* - reads key to eFuse block starting at the offset and the required size.
- *esp_efuse_write_block()* - writes key to eFuse block starting at the offset and the required size.
- *esp_efuse_batch_write_begin()* - set the batch mode of writing fields.
- *esp_efuse_batch_write_commit()* - writes all prepared data for batch writing mode and reset the batch writing mode.
- *esp_efuse_batch_write_cancel()* - reset the batch writing mode and prepared data.
- *esp_efuse_get_key_dis_read()* - Returns a read protection for the key block.
- *esp_efuse_set_key_dis_read()* - Sets a read protection for the key block.
- *esp_efuse_get_key_dis_write()* - Returns a write protection for the key block.
- *esp_efuse_set_key_dis_write()* - Sets a write protection for the key block.
- *esp_efuse_get_key_purpose()* - Returns the current purpose set for an eFuse key block.
- *esp_efuse_write_key()* - Programs a block of key data to an eFuse block
- *esp_efuse_write_keys()* - Programs keys to unused eFuse blocks
- *esp_efuse_find_purpose()* - Finds a key block with the particular purpose set.
- *esp_efuse_get_keypurpose_dis_write()* - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- *esp_efuse_key_block_unused()* - Returns true if the key block is unused, false otherwise.
- *esp_efuse_destroy_block()* - Destroys the data in this eFuse block. There are two things to do (1) if write protection is not set, then the remaining unset bits are burned, (2) set read protection for this block if it is not locked.

For frequently used fields, special functions are made, like this *esp_efuse_get_pkg_ver()*.

eFuse API for Keys

EFUSE_BLK_KEY0 - EFUSE_BLK_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an ESP_EFUSE_KEY_PURPOSE_x field which defines the purpose of these keys. The purpose field is described in *esp_efuse_purpose_t*.

The purposes like ESP_EFUSE_KEY_PURPOSE_XTS_AES... are used for flash encryption.

The purposes like ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST... are used for secure boot.

There are some eFuse APIs useful to work with states of keys.

- *esp_efuse_get_purpose_field()* - Returns a pointer to a key purpose for an eFuse key block.
- *esp_efuse_get_key()* - Returns a pointer to a key block.
- *esp_efuse_set_key_purpose()* - Sets a key purpose for an eFuse key block.
- *esp_efuse_set_keypurpose_dis_write()* - Sets a write protection of the key purpose field for an eFuse key block.
- *esp_efuse_find_unused_key_block()* - Search for an unused key block and return the first one found.
- *esp_efuse_count_unused_key_blocks()* - Returns the number of unused eFuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- *esp_efuse_get_digest_revoke()* - Returns the status of the Secure Boot public key digest revocation bit.
- *esp_efuse_set_digest_revoke()* - Sets the Secure Boot public key digest revocation bit.

- `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.

How to Add a New Field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32s2/esp_efuse_table.csv --info
Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32s2/esp_efuse_table.
↪ csv ...

(下页继续)

```
[0 255]
```

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for ↪Espressif)

The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the *Structured efuse fields* technique. For example, adding the fields: SERIAL_NUMBER, MODEL_NUMBER and HARDWARE REV to an existing USER_DATA field. Use . (dot) to show an attachment in a field.

| | | | |
|--------------------------|-------------|-----|-----|
| USER_DATA.SERIAL_NUMBER, | EFUSE_BLK3, | 0, | 32, |
| USER_DATA.MODEL_NUMBER, | EFUSE_BLK3, | 32, | 10, |
| USER_DATA.HARDWARE_REV, | EFUSE_BLK3, | 42, | 10, |

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.

You may get errors such as intersects with or out of range. Please see how to solve them in the *Structured efuse fields* article.

Bit Order

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```
$ espefuse.py dump

USER_DATA      (BLOCK3      ) [3 ] read_regs: 03020100 07060504 0B0A0908↪
↪0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4        (BLOCK4      ) [4 ] read_regs: 03020100 07060504 0B0A0908↪
↪0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

where is the register representation:

EFUSE_RD_USR_DATA0_REG = 0x03020100
EFUSE_RD_USR_DATA1_REG = 0x07060504
EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
EFUSE_RD_USR_DATA4_REG = 0x13121111
EFUSE_RD_USR_DATA5_REG = 0x17161514
EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C

where is the byte representation:

byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31]↪
↪= 0x1F
```

For example, csv file describes the USER_DATA field, which occupies all 256 bits (a whole block).

| | | | | |
|-------------------|-------------|-----|------|--------------|
| USER_DATA, | EFUSE_BLK3, | 0, | 256, | User data |
| USER_DATA.FIELD1, | EFUSE_BLK3, | 16, | 16, | Field1 |
| ID, | EFUSE_BLK4, | 8, | 3, | ID bit[0..2] |
| , | EFUSE_BLK4, | 16, | 2, | ID bit[3..4] |
| , | EFUSE_BLK4, | 32, | 3, | ID bit[5..7] |

Thus, reading the eFuse USER_DATA block written as above gives the following results:

```

uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this_
↳case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first_
↳2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // cannot be used because_
↳it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
//   [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001

```

Get eFuses During Build

There is a way to get the state of eFuses at the build stage of the project. There are two cmake functions for this:

- `espefuse_get_json_summary()` - It calls the `espefuse.py summary --format json` command and returns a json string (it is not stored in a file).
- `espefuse_get_efuse()` - It finds a given eFuse name in the json string and returns its property.

The json string has the following properties:

```

{
  "MAC": {
    "bit_len": 48,
    "block": 0,
    "category": "identity",
    "description": "Factory MAC Address",
    "efuse_type": "bytes:6",
    "name": "MAC",
    "pos": 0,
    "readable": true,
    "value": "94:b9:7e:5a:6e:58 (CRC 0xe2 OK)",
    "word": 1,
    "writeable": true
  },
}

```

These functions can be used from a top-level project `CMakeLists.txt` (`get-started/hello_world/CMakeLists.txt`):

```

# ...
project(hello_world)

espefuse_get_json_summary(efuse_json)

```

(下页继续)

(续上页)

```
espefuse_get_efuse(ret_data ${efuse_json} "MAC" "value")
message("MAC:" ${ret_data})
```

The format of the `value` property is the same as shown in `espefuse.py` summary.

```
MAC:94:b9:7e:5a:6e:58 (CRC 0xe2 OK)
```

There is an example test [system/efuse/CMakeLists.txt](#) which adds a custom target `efuse-summary`. This allows you to run the `idf.py efuse-summary` command to read the required eFuses (specified in the `efuse_names` list) at any time, not just at project build time.

Debug eFuse & Unit Tests

Virtual eFuses The Kconfig option `CONFIG_EFUSE_VIRTUAL` virtualizes eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the `partition_table` should have the `efuse` partition. `partition.csv`: `"efuse_em, data, efuse, , 0x2000, "`. During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test `secure_boot` and `flash_encryption` features with this option).

Flash Encryption Testing Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: `key` and `FLASH_CRYPT_CNT`. If FE is not actually enabled then enabling the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The `bootloader_flash_write()` is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

espefuse.py esptool includes a useful tool for reading/writing ESP32-S2 eFuse bits - [espefuse.py](#).

```
espefuse.py -p PORT summary

espefuse.py v4.6-dev
Connecting....
Detecting chip type... Unsupported detection protocol, switching and trying again..
↳.
Detecting chip type... ESP32-S2

Enumerations

enum **esp_efuse_block_t**

Type of eFuse blocks ESP32S2.

Values:

enumerator **EFUSE_BLK0**

Number of eFuse BLOCK0. REPEAT_DATA

enumerator **EFUSE_BLK1**

Number of eFuse BLOCK1. MAC_SPI_8M_SYS

enumerator **EFUSE_BLK2**

Number of eFuse BLOCK2. SYS_DATA_PART1

enumerator **EFUSE_BLK_SYS_DATA_PART1**

Number of eFuse BLOCK2. SYS_DATA_PART1

enumerator **EFUSE_BLK3**

Number of eFuse BLOCK3. USER_DATA

enumerator **EFUSE_BLK_USER_DATA**

Number of eFuse BLOCK3. USER_DATA

enumerator **EFUSE_BLK4**

Number of eFuse BLOCK4. KEY0

enumerator **EFUSE_BLK_KEY0**

Number of eFuse BLOCK4. KEY0

enumerator **EFUSE_BLK5**

Number of eFuse BLOCK5. KEY1

enumerator **EFUSE_BLK_KEY1**

Number of eFuse BLOCK5. KEY1

enumerator **EFUSE_BLK6**

Number of eFuse BLOCK6. KEY2

enumerator **EFUSE_BLK_KEY2**

Number of eFuse BLOCK6. KEY2

enumerator **EFUSE_BLK7**

Number of eFuse BLOCK7. KEY3

enumerator **EFUSE_BLK_KEY3**

Number of eFuse BLOCK7. KEY3

enumerator **EFUSE_BLK8**

Number of eFuse BLOCK8. KEY4

enumerator **EFUSE_BLK_KEY4**

Number of eFuse BLOCK8. KEY4

enumerator **EFUSE_BLK9**

Number of eFuse BLOCK9. KEY5

enumerator **EFUSE_BLK_KEY5**

Number of eFuse BLOCK9. KEY5

enumerator **EFUSE_BLK_KEY_MAX**

enumerator **EFUSE_BLK10**

Number of eFuse BLOCK10. SYS_DATA_PART2

enumerator **EFUSE_BLK_SYS_DATA_PART2**

Number of eFuse BLOCK10. SYS_DATA_PART2

enumerator **EFUSE_BLK_MAX**

enum **esp_efuse_coding_scheme_t**

Type of coding scheme.

Values:

enumerator **EFUSE_CODING_SCHEME_NONE**

None

enumerator **EFUSE_CODING_SCHEME_RS**

Reed-Solomon coding

enum **esp_efuse_purpose_t**

Type of key purpose.

Values:

enumerator **ESP_EFUSE_KEY_PURPOSE_USER**

User purposes (software-only use)

enumerator **ESP_EFUSE_KEY_PURPOSE_RESERVED**

Reserved

enumerator **ESP_EFUSE_KEY_PURPOSE_XTS_AES_256_KEY_1**

XTS_AES_256_KEY_1 (flash/PSRAM encryption)

enumerator **ESP_EFUSE_KEY_PURPOSE_XTS_AES_256_KEY_2**

XTS_AES_256_KEY_2 (flash/PSRAM encryption)

enumerator **ESP_EFUSE_KEY_PURPOSE_XTS_AES_128_KEY**

XTS_AES_128_KEY (flash/PSRAM encryption)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_ALL**

HMAC Downstream mode

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG**

JTAG soft enable key (uses HMAC Downstream mode)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_DIGITAL_SIGNATURE**

Digital Signature peripheral key (uses HMAC Downstream mode)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_UP**

HMAC Upstream mode

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST0**

SECURE_BOOT_DIGEST0 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST1**

SECURE_BOOT_DIGEST1 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST2**

SECURE_BOOT_DIGEST2 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_MAX**

MAX PURPOSE

Functions

esp_err_t **esp_efuse_read_field_blob** (const *esp_efuse_desc_t* *field[], void *dst, size_t dst_size_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in "field" structure or "dst_size_bits" required size. Use "esp_efuse_get_field_size()" function to determine the length of the field.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **dst** -- [out] A pointer to array that will contain the result of reading.
- **dst_size_bits** -- [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

bool **esp_efuse_read_field_bit** (const *esp_efuse_desc_t* *field[])

Read a single bit eFuse field as a boolean value.

备注: The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

备注: If assertions are enabled and the parameter is invalid, execution will abort

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数 **field** -- [in] A pointer to the structure describing the fields of efuse.

返回

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

esp_err_t **esp_efuse_read_field_cnt** (const *esp_efuse_desc_t* *field[], size_t *out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as "1".

If the bits are set not sequentially, they will still be counted.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数

- **field** -- [in] A pointer to the structure describing the fields of efuse.

- **out_cnt** -- **[out]** A pointer that will contain the number of programmed as "1" bits.
- 返回
- ESP_OK: The operation was successfully completed.
 - ESP_ERR_INVALID_ARG: Error in the passed arguments.

esp_err_t **esp_efuse_write_field_blob** (const *esp_efuse_desc_t* *field[], const void *src, size_t src_size_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in "field" structure or "src_size_bits" required size. Use "esp_efuse_get_field_size()" function to determine the length of the field. After the function is completed, the writing registers are cleared.

参数

- **field** -- **[in]** A pointer to the structure describing the fields of efuse.
- **src** -- **[in]** A pointer to array that contains the data for writing.
- **src_size_bits** -- **[in]** The number of bits required to write.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_field_cnt** (const *esp_efuse_desc_t* *field[], size_t cnt)

Writes a required count of bits as "1" to EFUSE field.

If there are no free bits in the field to set the required number of bits to "1", ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

参数

- **field** -- **[in]** A pointer to the structure describing the fields of efuse.
- **cnt** -- **[in]** Required number of programmed as "1" bits.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

esp_err_t **esp_efuse_write_field_bit** (const *esp_efuse_desc_t* *field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

参数 **field** -- **[in]** Pointer to the structure describing the efuse field.

返回

- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

esp_err_t **esp_efuse_set_write_protect** (*esp_efuse_block_t* blk)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

参数 **blk** -- **[in]** Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)`

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

参数 `blk` -- **[in]** Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

返回

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])`

Returns the number of bits used by field.

参数 `field` -- **[in]** A pointer to the structure describing the fields of efuse.

返回 Returns the number of bits used by field.

`uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)`

Returns value of efuse register.

This is a thread-safe implementation. Example: `EFUSE_BLK2_RDATA3_REG` where (`blk=2`, `num_reg=3`)

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数

- `blk` -- **[in]** Block number of eFuse.
- `num_reg` -- **[in]** The register number in the block.

返回 Value of register

`esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)`

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: `EFUSE_BLK3_WDATA0_REG` where (`blk=3`, `num_reg=0`)

参数

- `blk` -- **[in]** Block number of eFuse.
- `num_reg` -- **[in]** The register number in the block.
- `val` -- **[in]** Value to write.

返回

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.

`esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme (esp_efuse_block_t blk)`

Return efuse coding scheme for blocks.

备注: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

参数 `blk` -- **[in]** Block number of eFuse.

返回 Return efuse coding scheme for blocks

esp_err_t **esp_efuse_read_block** (*esp_efuse_block_t* blk, void *dst_key, size_t offset_in_bits, size_t size_bits)

Read key to efuse block starting at the offset and the required size.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数

- **blk** -- **[in]** Block number of eFuse.
- **dst_key** -- **[in]** A pointer to array that will contain the result of reading.
- **offset_in_bits** -- **[in]** Start bit in block.
- **size_bits** -- **[in]** The number of bits required to read.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_block** (*esp_efuse_block_t* blk, const void *src_key, size_t offset_in_bits, size_t size_bits)

Write key to efuse block starting at the offset and the required size.

参数

- **blk** -- **[in]** Block number of eFuse.
- **src_key** -- **[in]** A pointer to array that contains the key for writing.
- **offset_in_bits** -- **[in]** Start bit in block.
- **size_bits** -- **[in]** The number of bits required to write.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

uint32_t **esp_efuse_get_pkg_ver** (void)

Returns chip package from efuse.

返回 chip package

void **esp_efuse_reset** (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

备注: This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

esp_err_t **esp_efuse_disable_rom_download_mode** (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

备注: Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

备注: If ROM Download Mode is already disabled, this function does nothing and returns success.

返回

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

esp_err_t **esp_efuse_set_rom_log_scheme** (*esp_efuse_rom_log_scheme_t* log_scheme)

Set boot ROM log scheme via eFuse.

备注: By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can't be changed again.

参数 **log_scheme** -- Supported ROM log scheme

返回

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

esp_err_t **esp_efuse_enable_rom_secure_download_mode** (void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

备注: If Secure Download mode is already enabled, this function does nothing and returns success.

备注: Disabling the ROM Download Mode also disables Secure Download Mode.

返回

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_INVALID_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

uint32_t **esp_efuse_read_secure_version** (void)

Return secure_version from efuse field.

返回 Secure version from efuse field

bool **esp_efuse_check_secure_version** (uint32_t secure_version)

Check secure_version from app and secure_version and from efuse field.

参数 **secure_version** -- Secure version from app.

返回

- True: If version of app is equal or more then secure_version from efuse.

esp_err_t **esp_efuse_update_secure_version** (uint32_t secure_version)

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

参数 **secure_version** -- [in] Secure version from app.

返回

- ESP_OK: Successful.
- ESP_FAIL: secure version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

esp_err_t esp_efuse_batch_write_begin (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new
↳value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
↳because uncommitted changes are not readable, it will be available only
↳after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be
↳done in the last commit().

...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

备注: Please note that reading in the batch mode does not show uncommitted changes.

返回

- ESP_OK: Successful.

esp_err_t esp_efuse_batch_write_cancel (void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

返回

- ESP_OK: Successful.

- `ESP_ERR_INVALID_STATE`: The batch mode was not set.

`esp_err_t esp_efuse_batch_write_commit` (void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_STATE`: The deferred writing mode was not set.

bool `esp_efuse_block_is_empty` (`esp_efuse_block_t` block)

Checks that the given block is empty.

返回

- True: The block is empty.
- False: The block is not empty or was an error.

bool `esp_efuse_get_key_dis_read` (`esp_efuse_block_t` block)

Returns a read protection for the key block.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回 True: The key block is read protected False: The key block is readable.

`esp_err_t esp_efuse_set_key_dis_read` (`esp_efuse_block_t` block)

Sets a read protection for the key block.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

bool `esp_efuse_get_key_dis_write` (`esp_efuse_block_t` block)

Returns a write protection for the key block.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回 True: The key block is write protected False: The key block is writeable.

`esp_err_t esp_efuse_set_key_dis_write` (`esp_efuse_block_t` block)

Sets a write protection for the key block.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

bool `esp_efuse_key_block_unused` (`esp_efuse_block_t` block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (`ESP_EFUSE_KEY_PURPOSE_USER`)

参数 **block** -- key block to check.

返回

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool **esp_efuse_find_purpose** (*esp_efuse_purpose_t* purpose, *esp_efuse_block_t* *block)

Find a key block with the particular purpose set.

参数

- **purpose** -- [in] Purpose to search for.
- **block** -- [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

返回

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool **esp_efuse_get_keypurpose_dis_write** (*esp_efuse_block_t* block)

Returns a write protection of the key purpose field for an efuse key block.

备注: For ESP32: no keypurpose, it returns always True.

参数 block -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 True: The key purpose is write protected. False: The key purpose is writeable.

esp_efuse_purpose_t **esp_efuse_get_key_purpose** (*esp_efuse_block_t* block)

Returns the current purpose set for an efuse key block.

参数 block -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

const *esp_efuse_desc_t* ****esp_efuse_get_purpose_field** (*esp_efuse_block_t* block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use `esp_efuse_read_field_blob()` or `esp_efuse_get_key_purpose()`.

参数 block -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

const *esp_efuse_desc_t* ****esp_efuse_get_key** (*esp_efuse_block_t* block)

Returns a pointer to a key block.

参数 block -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

esp_err_t **esp_efuse_set_key_purpose** (*esp_efuse_block_t* block, *esp_efuse_purpose_t* purpose)

Sets a key purpose for an efuse key block.

参数

- **block** -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- **purpose** -- [in] Key purpose.

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_set_keypurpose_dis_write** (*esp_efuse_block_t* block)

Sets a write protection of the key purpose field for an efuse key block.

参数 block -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_efuse_block_t **esp_efuse_find_unused_key_block** (void)

Search for an unused key block and return the first one found.

See `esp_efuse_key_block_unused` for a description of an unused key block.

返回 First unused key block, or `EFUSE_BLK_KEY_MAX` if no unused key block is found.

unsigned **esp_efuse_count_unused_key_blocks** (void)

Return the number of unused efuse key blocks in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`.

bool **esp_efuse_get_digest_revoke** (unsigned num_digest)

Returns the status of the Secure Boot public key digest revocation bit.

参数 `num_digest` -- [in] The number of digest in range 0..2

返回

- True: If key digest is revoked,
- False; If key digest is not revoked.

esp_err_t **esp_efuse_set_digest_revoke** (unsigned num_digest)

Sets the Secure Boot public key digest revocation bit.

参数 `num_digest` -- [in] The number of digest in range 0..2

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_write_protect_of_digest_revoke** (unsigned num_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

参数 `num_digest` -- [in] The number of digest in range 0..2

返回 True: The revocation bit is write protected. False: The revocation bit is writeable.

esp_err_t **esp_efuse_set_write_protect_of_digest_revoke** (unsigned num_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

参数 `num_digest` -- [in] The number of digest in range 0..2

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_key** (*esp_efuse_block_t* block, *esp_efuse_purpose_t* purpose, const void *key, size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

备注: This API also enables the read protection efuse bit for certain key blocks like XTS-AES, HMAC, ECDSA etc. This ensures that the key is only accessible to hardware peripheral.

备注: For SoC's with capability `SOC_EFUSE_ECDSA_USE_HARDWARE_K` (e.g., ESP32-H2), this API writes an additional efuse bit for ECDSA key purpose to enforce hardware TRNG generated k mode in the peripheral.

参数

- **block** -- [in] Block to read purpose for. Must be in range `EFUSE_BLK_KEY0` to `EFUSE_BLK_KEY_MAX`. Key block must be unused (`esp_efuse_key_block_unused`).
- **purpose** -- [in] Purpose to set for this key. Purpose must be already unset.
- **key** -- [in] Pointer to data to write.
- **key_size_bytes** -- [in] Bytes length of data to write.

返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_INVALID_STATE`: Error in efuses state, unused block not found.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_keys` (const `esp_efuse_purpose_t` purposes[], uint8_t keys[][32], unsigned number_of_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

备注: This API also enables the read protection efuse bit for certain key blocks like XTS-AES, HMAC, ECDSA etc. This ensures that the key is only accessible to hardware peripheral.

备注: For SoC's with capability `SOC_EFUSE_ECDSA_USE_HARDWARE_K` (e.g., ESP32-H2), this API writes an additional efuse bit for ECDSA key purpose to enforce hardware TRNG generated k mode in the peripheral.

参数

- **purposes** -- [in] Array of purposes (`purpose[number_of_keys]`).
- **keys** -- [in] Array of keys (`uint8_t keys[number_of_keys][32]`). Each key is 32 bytes long.
- **number_of_keys** -- [in] The number of keys to write (up to 6 keys).

返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_INVALID_STATE`: Error in efuses state, unused block not found.
- `ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS`: Error not enough unused key blocks available
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_secure_boot_read_key_digests` (`esp_secure_boot_key_digests_t` *trusted_key_digests)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

参数 `trusted_key_digests` -- [out] Trusted keys digests, stored in this parameter after successfully completing this function. The number of digests depends on the SOC's capabilities.

返回

- `ESP_OK`: Successful.
- `ESP_FAIL`: If `trusted_keys` is NULL or there is no valid digest.

esp_err_t **esp_efuse_check_errors** (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

备注: Refers to ESP32-C3 only.

返回

- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

esp_err_t **esp_efuse_destroy_block** (*esp_efuse_block_t* block)

Destroys the data in the given efuse block, if possible.

Data destruction occurs through the following steps: 1) Destroy data in the block:

- If write protection is inactive for the block, then unset bits are burned.
- If write protection is active, the block remains unaltered. 2) Set read protection for the block if possible (check write-protection for RD_DIS). In this case, data becomes inaccessible, and the software reads it as all zeros. If write protection is enabled and read protection can not be set, data in the block remains readable (returns an error).

Do not use the batch mode with this function as it does the burning itself!

参数 **block** -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回

- ESP_OK: Successful.
- ESP_FAIL: Data remained readable because the block is write-protected and read protection can not be set.

Structures

struct **esp_efuse_desc_t**

Type definition for an eFuse field.

Public Members

esp_efuse_block_t **efuse_block**

Block of eFuse

uint8_t **bit_start**

Start bit [0..255]

uint16_t **bit_count**

Length of bit field [1..-]

struct **esp_secure_boot_key_digests_t**

Pointers to the trusted key digests.

The number of digests depends on the SOC's capabilities.

Public Members

const void ***key_digests**[3]
Pointers to the key digests

Macros

ESP_ERR_EFUSE

Base error code for efuse api.

ESP_OK_EFUSE_CNT

OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL

Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG

Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING

Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS

Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING

Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

Enumerations

enum **esp_efuse_rom_log_scheme_t**

Type definition for ROM log scheme.

Values:

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_ON**

Always enable ROM logging

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**

ROM logging is enabled when specific GPIO level is low during start up

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**

ROM logging is enabled when specific GPIO level is high during start up

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**

Disable ROM logging permanently

2.9.8 错误代码和辅助函数

本节列出了 ESP-IDF 中常见错误代码的定义，以及部分与错误处理相关的辅助函数。

有关 ESP-IDF 中错误代码的基本信息，请参阅[错误处理](#)。

有关 ESP-IDF 定义的错误代码的完整列表，请参阅[错误代码参考](#)。

API 参考

Header File

- [components/esp_common/include/esp_check.h](#)
- This header file can be included with:

```
#include "esp_check.h"
```

Macros

ESP_RETURN_ON_ERROR (x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT()`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##__VA_ARGS__`. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

ESP_RETURN_ON_ERROR_ISR (x, log_tag, format, ...)

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_VOID_ON_ERROR (x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. This macro is used when the function returns void.

ESP_RETURN_VOID_ON_ERROR_ISR (x, log_tag, format, ...)

A version of ESP_RETURN_VOID_ON_ERROR() macro that can be called from ISR.

ESP_GOTO_ON_ERROR (x, goto_tag, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable 'ret' to the code, and then exits by jumping to 'goto_tag'.

ESP_GOTO_ON_ERROR_ISR (x, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_ON_FALSE (a, err_code, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message and returns with the supplied 'err_code'.

ESP_RETURN_ON_FALSE_ISR (a, err_code, log_tag, format, ...)

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_RETURN_VOID_ON_FALSE (a, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message and returns without a value.

ESP_RETURN_VOID_ON_FALSE_ISR (a, log_tag, format, ...)

A version of ESP_RETURN_VOID_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE (a, err_code, goto_tag, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message, sets the local variable 'ret' to the supplied 'err_code', and then exits by jumping to 'goto_tag'.

ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File

- `components/esp_common/include/esp_err.h`
- This header file can be included with:

```
#include "esp_err.h"
```

Functions

const char ***esp_err_to_name** (*esp_err_t* code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script `tools/gen_esp_err_to_name.py` which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

参数 `code` -- esp_err_t error code

返回 string error message

const char ***esp_err_to_name_r** (*esp_err_t* code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script `tools/gen_esp_err_to_name.py` which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

参数

- `code` -- esp_err_t error code
- `buf` -- [out] buffer where the error message should be written
- `buflen` -- Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

返回 buf containing the string error message

Macros

ESP_OK

esp_err_t value indicating success (no error)

ESP_FAIL

Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM

Out of memory

ESP_ERR_INVALID_ARG

Invalid argument

ESP_ERR_INVALID_STATE

Invalid state

ESP_ERR_INVALID_SIZE

Invalid size

ESP_ERR_NOT_FOUND

Requested resource not found

ESP_ERR_NOT_SUPPORTED

Operation or feature not supported

ESP_ERR_TIMEOUT

Operation timed out

ESP_ERR_INVALID_RESPONSE

Received response was invalid

ESP_ERR_INVALID_CRC

CRC or checksum was invalid

ESP_ERR_INVALID_VERSION

Version was invalid

ESP_ERR_INVALID_MAC

MAC address was invalid

ESP_ERR_NOT_FINISHED

Operation has not fully completed

ESP_ERR_NOT_ALLOWED

Operation is not allowed

ESP_ERR_WIFI_BASE

Starting number of WiFi error codes

ESP_ERR_MESH_BASE

Starting number of MESH error codes

ESP_ERR_FLASH_BASE

Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE

Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE

Starting number of Memory Protection API error codes

ESP_ERROR_CHECK (x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT (x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with `ESP_ERROR_CHECK()`, this prints the same error message but isn't terminating the program.

Type Definitions

```
typedef int esp_err_t
```

2.9.9 ESP HTTPS OTA 升级**概述**

`esp_https_ota` 是现有 OTA（空中升级）API 的抽象层，其中提供了简化的 API，能够通过 HTTPS 升级固件。

应用示例

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

服务器验证

验证服务器时，应将 PEM 格式的根证书提供给 `esp_http_client_config_t::cert_pem` 成员。如需了解有关服务器验证的更多信息，请参阅 [TLS 服务器验证](#)。

备注： 应使用服务器端点的 **根证书** 应用于验证，而不能使用证书链中的任何中间证书，因为根证书有效期最长，且通常长时间维持不变。用户还可以通过 `esp_http_client_config_t::cert_bundle_attach` 成员使用 ESP_x509 证书包功能进行验证，其中涵盖了大多数受信任的根证书。

通过 HTTPS 下载部分镜像

要使用部分镜像下载功能，请启用 `esp_https_ota_config_t` 中的 `partial_http_download` 配置。启用此配置后，固件镜像将通过多个指定大小的 HTTP 请求进行下载。将 `max_http_request_size` 设置为所需值，即可指定每个请求的最大内容长度。

在从 AWS S3 等服务获取镜像时，这一选项非常有用。在启用该选项时，可以将 mbedTLS Rx 的 buffer 大小（即 `CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`）设置为较小的值。不启用此配置时，无法将其设置为较小值。

mbedTLS Rx buffer 的默认大小为 16 KB，但如果将 `partial_http_download` 的 `max_http_request_size` 设置为 4 KB，便能将 mbedTLS Rx 的 buffer 减小到 4 KB。使用这一配置方式预计可以节省约 12 KB 内存。

签名验证

要进一步提升安全性，还可以验证 OTA 固件镜像的签名。更多内容请参考[没有安全启动的安全 OTA 升级](#)。

高级 API

`esp_https_ota` 还提供一些高级 API，用于查看 OTA 过程的更多信息并满足其他控制需求。

如需查看使用高级 ESP_HTTPS_OTA API 的示例，请前往 [system/ota/advanced_https_ota](#)。

使用预加密固件进行 OTA 升级

如需使用预加密的固件进行 OTA 升级，请在组件的菜单配置中启用 `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB` 选项。

如需查看使用预加密固件进行 OTA 升级的示例，请前往 [system/ota/pre_encrypted_ota](#)。

OTA 系统事件

ESP HTTPS OTA 过程中可能发生各种系统事件。当特定事件发生时，会由[事件循环库](#)触发处理程序。此处理程序必须使用 `esp_event_handler_register()` 注册。这有助于 ESP HTTPS OTA 进行事件处理。

`esp_https_ota_event_t` 中包含了使用 ESP HTTPS OTA 升级时可能发生的所有事件。

事件处理程序示例

```
/* 用于捕获系统事件的事件处理程序 */
static void event_handler(void* arg, esp_event_base_t event_base,
                          int32_t event_id, void* event_data)
{
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
            case ESP_HTTPS_OTA_GET_IMG_DESC:
                ESP_LOGI(TAG, "Reading Image Description");
                break;
            case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
                ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_
→chip_id_t *)event_data);
                break;
            case ESP_HTTPS_OTA_DECRYPT_CB:
                ESP_LOGI(TAG, "Callback to decrypt function");
        }
    }
}
```

(下页继续)

```

        break;
    case ESP_HTTPS_OTA_WRITE_FLASH:
        ESP_LOGD(TAG, "Writing to flash: %d written", *(int_
↪*)event_data);
        break;
    case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
        ESP_LOGI(TAG, "Boot partition updated. Next Partition: %d
↪", *(esp_partition_subtype_t *)event_data);
        break;
    case ESP_HTTPS_OTA_FINISH:
        ESP_LOGI(TAG, "OTA finish");
        break;
    case ESP_HTTPS_OTA_ABORT:
        ESP_LOGI(TAG, "OTA abort");
        break;
    }
}
}
}

```

系统事件循环中，不同 ESP HTTPS OTA 事件的预期数据类型如下所示：

- ESP_HTTPS_OTA_START : NULL
- ESP_HTTPS_OTA_CONNECTED : NULL
- ESP_HTTPS_OTA_GET_IMG_DESC : NULL
- ESP_HTTPS_OTA_VERIFY_CHIP_ID : esp_chip_id_t

Header File

- [components/esp_https_ota/include/esp_https_ota.h](#)
- This header file can be included with:

```
#include "esp_https_ota.h"
```

- This header file is a part of the API provided by the esp_https_ota component. To declare that your component depends on esp_https_ota, add the following to your CMakeLists.txt:

```
REQUIRES esp_https_ota
```

or

```
PRIV_REQUIRES esp_https_ota
```

Functions

esp_err_t **esp_https_ota** (const *esp_https_ota_config_t* *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of ota_config->http_config.

备注： This API handles the entire OTA operation, so if this API is being used then no other APIs from

`esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

参数 `ota_config` -- [in] pointer to `esp_https_ota_config_t` structure.

返回

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's `app_update` component.

esp_err_t `esp_https_ota_begin` (const *esp_https_ota_config_t* *ota_config, *esp_https_ota_handle_t* *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

备注: This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

参数

- `ota_config` -- [in] pointer to `esp_https_ota_config_t` structure
- `handle` -- [out] pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

返回

- `ESP_OK`: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in `app_update` component and `esp_http_client` component in esp-idf.

esp_err_t `esp_https_ota_perform` (*esp_https_ota_handle_t* https_ota_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

参数 `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure

返回

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
- `ESP_OK`: OTA update was successful
- `ESP_FAIL`: OTA update failed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_VERSION`: Invalid chip revision in image header
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.

- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app_update component.

bool **esp_https_ota_is_complete_data_received** (*esp_https_ota_handle_t* https_ota_handle)

Checks if complete data was received or not.

备注: This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

参数 `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure
返回

- false
- true

esp_err_t **esp_https_ota_finish** (*esp_https_ota_handle_t* https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

备注: If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image. `esp_https_ota_finish` should not be called after calling `esp_https_ota_abort`

参数 `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure
返回

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

esp_err_t **esp_https_ota_abort** (*esp_https_ota_handle_t* https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

备注: `esp_https_ota_abort` should not be called after calling `esp_https_ota_finish`

参数 `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure
返回

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`: Invalid ESP HTTPS OTA state
- `ESP_FAIL`: OTA not started
- `ESP_ERR_NOT_FOUND`: OTA handle not found
- `ESP_ERR_INVALID_ARG`: Invalid argument

esp_err_t **esp_https_ota_get_img_desc** (*esp_https_ota_handle_t* https_ota_handle, *esp_app_desc_t* *new_app_info)

Reads app description from image header. The app description provides information like the "Firmware version" of the image.

备注: This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

参数

- **https_ota_handle** -- [in] pointer to esp_https_ota_handle_t structure
- **new_app_info** -- [out] pointer to an allocated esp_app_desc_t structure

返回

- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

int **esp_https_ota_get_image_len_read** (esp_https_ota_handle_t https_ota_handle)

This function returns OTA image data read so far.

备注: This API should be called only if esp_https_ota_perform() has been called at least once or if esp_https_ota_get_img_desc has been called before.

参数 **https_ota_handle** -- [in] pointer to esp_https_ota_handle_t structure

返回

- -1 On failure
- total bytes read so far

int **esp_https_ota_get_image_size** (esp_https_ota_handle_t https_ota_handle)

This function returns OTA image total size.

备注: This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

参数 **https_ota_handle** -- [in] pointer to esp_https_ota_handle_t structure

返回

- -1 On failure or chunked encoding
- total bytes of image

Structures

struct **esp_https_ota_config_t**

ESP HTTPS OTA configuration.

Public Members

const esp_http_client_config_t ***http_config**

ESP HTTP client configuration

http_client_init_cb_t **http_client_init_cb**

Callback after ESP HTTP client is initialised

bool **bulk_flash_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool **partial_http_download**

Enable Firmware image to be downloaded over multiple HTTP requests

int **max_http_request_size**

Maximum request size for partial HTTP download

uint32_t **buffer_caps**

The memory capability to use when allocating the buffer for OTA update. Default capability is MAL-LOC_CAP_DEFAULT

Macros

ESP_ERR_HTTPS_OTA_BASE

ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void ***esp_https_ota_handle_t**

typedef *esp_err_t* (***http_client_init_cb_t**)(*esp_http_client_handle_t*)

Enumerations

enum **esp_https_ota_event_t**

Events generated by OTA process.

Values:

enumerator **ESP_HTTPS_OTA_START**

OTA started

enumerator **ESP_HTTPS_OTA_CONNECTED**

Connected to server

enumerator **ESP_HTTPS_OTA_GET_IMG_DESC**

Read app description from image header

enumerator **ESP_HTTPS_OTA_VERIFY_CHIP_ID**

Verify chip id of new image

enumerator **ESP_HTTPS_OTA_DECRYPT_CB**

Callback to decrypt function

enumerator **ESP_HTTPS_OTA_WRITE_FLASH**

Flash write operation

enumerator **ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION**

Boot partition update after successful ota update

enumerator **ESP_HTTPS_OTA_FINISH**

OTA finished

enumerator **ESP_HTTPS_OTA_ABORT**

OTA aborted

2.9.10 事件循环库

概述

事件循环库使组件能够声明事件，允许其他组件注册处理程序（即在事件发生时执行的代码片段）。此时，无需直接涉及应用程序，松散耦合组件也能够其他组件状态变化时附加所需的行为。此外，通过将代码执行序列化，在指定的任务中运行事件循环库，可以简化事件处理程序，实现更高效的事件处理。

例如，当某个高级库要使用 Wi-Fi 库时，它可以直接订阅[ESP32 Wi-Fi 编程模型](#)，对有关事件做出相应。

调用 esp_event API

使用事件循环库时应注意区分“事件”与“事件循环”。

事件表示重要的发生事件，如 Wi-Fi 成功连接到接入点。引用事件时应使用由两部分组成的标识符，详情请参阅[事件定义与事件声明](#)。事件循环是连接事件和事件处理程序之间的桥梁，事件源通过使用事件循环库提供的 API 将事件发布到事件循环中，注册到事件循环中的事件处理程序会响应特定类型的事件。

以下为事件循环库的使用流程：

1. 定义一个函数，并在事件发布到事件循环中时运行该函数。此函数被称为事件处理程序，应具有与 `esp_event_handler_t` 同类型的签名。
2. 调用 `esp_event_loop_create()` 创建事件循环，该函数输出类型为 `esp_event_loop_handle_t` 的循环句柄，使用此 API 创建的事件循环称为用户事件循环。另有一种特殊事件循环，请参阅[默认事件循环](#)。
3. 调用 `esp_event_handler_register_with()` 将事件处理程序注册到循环中。处理程序可以注册到多个循环中，请参阅[注册处理程序注意事项](#)。
4. 事件源调用 `esp_event_post_to()` 将事件发布到事件循环中。
5. 调用 `esp_event_handler_unregister_with()`，组件可以在事件循环中取消注册事件处理程序。
6. 调用 `esp_event_loop_delete()` 删除不再需要的事件循环。

上述流程代码如下：

```
// 1. 定义事件处理程序
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    // 事件处理程序逻辑
}

void app_main()
{
    // 2. 用一个类型为 esp_event_loop_args_t
↳的配置结构体，指定所创建循环的属性。获取一个类型为 esp_event_loop_handle_t
↳的句柄，用于其他 API 引用循环、执行操作。
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
    }
}
```

(下页继续)

```

        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. 注册在 (1) 中定义的事件处理程序。MY_EVENT_BASE 和 MY_EVENT_ID_
    ↪ 指定了一个假设事件：将处理程序 run_on_event 发布到循环中时，执行该处理程序。
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
    ↪ on_event, ...);

    ...

    // 4.
    ↪ 将事件发布到循环中。此时，事件排入事件循环队列，在某个时刻，事件循环会执行已注册到发布事件的事件
    ↪ run_on_event。为简化过程，此示例从 app_main 调用 esp_event_post_
    ↪ to，实际应用中可从任何其他任务中发布事件。
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. 注销无用的处理程序。
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
    ↪ on_event);

    ...

    // 6. 删除无用的事件循环。
    esp_event_loop_delete(loop_handle);
}

```

事件定义与事件声明

如前所述，事件标识符由两部分组成：事件根基和事件 ID。事件根基标识独立的事件组；事件 ID 标识组中的特定事件。可以将事件根基和事件 ID 类比为人的姓和名，姓表示一个家族，名表示家族中的某个人。

事件循环库提供了宏以便声明和定义事件根基。

声明事件根基：

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE);
```

定义事件根基：

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE);
```

备注：在 ESP-IDF 中，系统事件的根基标识符为大写字母，并以 `_EVENT` 结尾。例如，Wi-Fi 事件的根基声明为 `WIFI_EVENT`，以太网的事件根基声明为 `ETHERNET_EVENT` 等。这样一来，事件根基与常量类似（尽管根据宏 `ESP_EVENT_DECLARE_BASE` 和 `ESP_EVENT_DEFINE_BASE` 的定义，它们属于全局变量）。

建议以枚举类型声明事件 ID，它们通常放在公共头文件中。

事件 ID：

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

默认事件循环

默认事件循环是一种特殊循环，用于处理系统事件（如 Wi-Fi 事件）。用户无法使用该循环的句柄，创建、删除、注册/注销处理程序以及事件发布均通过用户事件循环 API 的变体完成，下表列出了这些变体及其对应用户事件循环。

| 用户事件循环 | 默认事件循环 |
|--|--|
| <code>esp_event_loop_create()</code> | <code>esp_event_loop_create_default()</code> |
| <code>esp_event_loop_delete()</code> | <code>esp_event_loop_delete_default()</code> |
| <code>esp_event_handler_register_with()</code> | <code>esp_event_handler_register()</code> |
| <code>esp_event_handler_unregister_with()</code> | <code>esp_event_handler_unregister()</code> |
| <code>esp_event_post_to()</code> | <code>esp_event_post()</code> |

比较二者签名可知，它们大部分是相似的，唯一区别在于默认事件循环的 API 不需要指定循环句柄。

除了 API 的差异和用于系统事件的特殊分类外，默认事件循环和用户事件循环的行为并无差异。实际上，用户甚至可以将自己的事件发布到默认事件循环中，以节省内存而无需创建自己的循环。

注册处理程序注意事项

通过重复调用 `esp_event_handler_register_with()`，可以将单个处理程序独立注册到多个事件中，且每次调用均可指定处理程序应执行的具体事件根基和事件 ID。

然而，在某些情况下，你可能希望处理程序在以下情况时执行：

- (1) 所有发布到循环的事件
- (2) 特定基本标识符的所有事件

为此，可调用特殊的事件根基标识符 `ESP_EVENT_ANY_BASE` 和特殊的事件 `ESP_EVENT_ANY_ID` 实现，这些特殊标识符可以作为 `esp_event_handler_register_with()` 的事件根基和事件 ID 参数传递。

因此 `esp_event_handler_register_with()` 的有效参数为：

1. `<event base>`, `<event ID>` - 根基为 `<event base>` 且 ID 为 `<event ID>` 的事件发布到循环中时，执行处理程序。
2. `<event base>`, `ESP_EVENT_ANY_ID` - 任何根基为 `<event base>` 的事件发布到循环中时，执行处理程序。
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - 任何事件发布到循环中时，执行处理程序。

例如，如果注册了以下处理程序：

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

如果假设事件由 `MY_EVENT_BASE` 和 `MY_EVENT_ID` 组成，则三个处理程序 `run_on_event_1`、`run_on_event_2` 和 `run_on_event_3` 都会执行。

如果假设事件由 `MY_EVENT_BASE` 和 `MY_OTHER_EVENT_ID` 组成，则仅执行处理程序 `run_on_event_2` 和 `run_on_event_3`。

如果假设事件由 `MY_OTHER_EVENT_BASE` 和 `MY_OTHER_EVENT_ID` 组成，则仅执行处理程序 `run_on_event_3`。

处理程序自行注销 通常情况下，由事件循环运行的事件处理程序 **不允许在该事件循环上执行任何注册/注销活动**，但允许处理程序自行注销。例如，可以执行以下操作：

```
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    esp_event_loop_handle_t *loop_handle = (esp_event_loop_handle_t*) handler_arg;
    esp_event_handler_unregister_with(*loop_handle, MY_EVENT_BASE, MY_EVENT_ID,
↳run_on_event);
}

void app_main(void)
{
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, &loop_handle);
    // ... 发布事件 MY_EVENT_BASE 和 MY_EVENT_ID, 并在某些时候运行循环
}
```

注册处理程序及处理程序调度顺序 一般而言，对于在调度期间与某个已发布事件匹配的处理程序，先注册的也会先执行。在所有注册均使用单个任务执行的情况下，可以通过在其他处理程序注册前注册目标处理程序，控制处理程序的执行顺序。如果计划利用这一规则，在有多个任务注册处理程序的情况下要多加小心。此时，虽然“先注册，先执行”的规则仍然成立，但率先执行的任务也会率先注册其处理程序，而由单个任务连续注册的处理函数仍然按相对顺序调度。但如果该任务在注册期间被另一个任务抢占，而该任务还注册了处理程序，则在调度期间，那些处理程序也将在处理其他任务时执行。

事件循环性能分析

要启动数据收集，统计所有已创建事件循环的数据，请激活配置选项 `CONFIG_ESP_EVENT_LOOP_PROFILING`，函数 `esp_event_dump()` 可将收集的统计数据输出到文件流中。有关转储信息的更多详情，请参阅 `esp_event_dump()` API 参考。

应用示例

使用 `esp_event` 库的示例存放在 `system/esp_event` 中，涵盖事件声明、循环创建、处理程序注册和注销以及事件发布。

其他使用 `esp_event` 库的示例：

- [NMEA Parser](#)，该示例将解码从 GPS 接收到的语句。

```

Functions

esp_err_t **esp_event_loop_create** (const *esp_event_loop_args_t* *event_loop_args, *esp_event_loop_handle_t* *event_loop)

Create a new event loop.

参数

- **event_loop_args** -- [in] configuration structure for the event loop to create
- **event_loop** -- [out] handle to the created event loop

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete** (*esp_event_loop_handle_t* event_loop)

Delete an existing event loop.

参数 **event_loop** -- [in] event loop to delete, must not be NULL

返回

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_create_default** (void)

Create default event loop.

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_ERR_INVALID_STATE: Default event loop has already been created
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete_default** (void)

Delete the default event loop.

返回

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_run** (*esp_event_loop_handle_t* event_loop, TickType_t ticks_to_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

备注: encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

参数

- **event_loop** -- **[in]** event loop to dispatch posted events from, must not be NULL
- **ticks_to_run** -- **[in]** number of ticks to run the loop

返回

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_handler_register** (*esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

备注: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

参数

- **event_base** -- **[in]** the base ID of the event to register the handler for
- **event_id** -- **[in]** the ID of the event to register the handler for
- **event_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_register_with** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

备注: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

参数

- **event_loop** -- **[in]** the event loop to register this handler function to, must not be NULL
- **event_base** -- **[in]** the base ID of the event to register the handler for
- **event_id** -- **[in]** the ID of the event to register the handler for
- **event_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,
                                                esp_event_base_t event_base, int32_t
                                                event_id, esp_event_handler_t
                                                event_handler, void *event_handler_arg,
                                                esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

备注: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

备注: Calling this function with `instance` set to NULL is equivalent to calling `esp_event_handler_register_with`.

参数

- **event_loop** -- **[in]** the event loop to register this handler function to, must not be NULL
- **event_base** -- **[in]** the base ID of the event to register the handler for
- **event_id** -- **[in]** the ID of the event to register the handler for
- **event_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called

- **instance** -- **[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

esp_err_t **esp_event_handler_instance_register** (*esp_event_base_t* event_base, *int32_t* event_id, *esp_event_handler_t* event_handler, void *event_handler_arg, *esp_event_handler_instance_t* *instance)

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

备注: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

备注: Calling this function with instance set to NULL is equivalent to calling `esp_event_handler_register`.

参数

- **event_base** -- **[in]** the base ID of the event to register the handler for
- **event_id** -- **[in]** the ID of the event to register the handler for
- **event_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called
- **instance** -- **[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

esp_err_t **esp_event_handler_unregister** (*esp_event_base_t* event_base, *int32_t* event_id, *esp_event_handler_t* event_handler)

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handlers that were registered with the same wildcard arguments.

备注: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

参数

- **event_base** -- **[in]** the base of the event with which to unregister the handler
- **event_id** -- **[in]** the ID of the event with which to unregister the handler
- **event_handler** -- **[in]** the handler to unregister

返回 ESP_OK success

返回 ESP_ERR_INVALID_ARG invalid combination of event base and event ID

返回 others fail

```
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop,
                                           esp_event_base_t event_base, int32_t event_id,
                                           esp_event_handler_t event_handler)
```

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

参数

- **event_loop** -- **[in]** the event loop with which to unregister this handler function, must not be NULL
- **event_base** -- **[in]** the base of the event with which to unregister the handler
- **event_id** -- **[in]** the ID of the event with which to unregister the handler
- **event_handler** -- **[in]** the handler to unregister

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop,
                                                    esp_event_base_t event_base, int32_t
                                                    event_id, esp_event_handler_instance_t
                                                    instance)
```

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler instance, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handler instances that were registered with the same wildcard arguments.

备注: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

参数

- **event_loop** -- **[in]** the event loop with which to unregister this handler function, must not be NULL
- **event_base** -- **[in]** the base of the event with which to unregister the handler
- **event_id** -- **[in]** the ID of the event with which to unregister the handler
- **instance** -- **[in]** the instance object of the registration to be unregistered

返回

- ESP_OK: Success

- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_instance_unregister** (*esp_event_base_t* event_base, *int32_t* event_id, *esp_event_handler_instance_t* instance)

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with`, except that it unregisters the handler instance from the default event loop.

参数

- **event_base** -- **[in]** the base of the event with which to unregister the handler
- **event_id** -- **[in]** the ID of the event with which to unregister the handler
- **instance** -- **[in]** the instance object of the registration to be unregistered

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_post** (*esp_event_base_t* event_base, *int32_t* event_id, const void *event_data, *size_t* event_data_size, *TickType_t* ticks_to_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

参数

- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data
- **ticks_to_wait** -- **[in]** number of ticks to block on a full event queue

返回

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_post_to** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, *int32_t* event_id, const void *event_data, *size_t* event_data_size, *TickType_t* ticks_to_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as `esp_event_post`, except the additional specification of the event loop to post the event to.

参数

- **event_loop** -- **[in]** the event loop to post to, must not be NULL
- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data
- **ticks_to_wait** -- **[in]** number of ticks to block on a full event queue

返回

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR

- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_isr_post** (*esp_event_base_t* event_base, *int32_t* event_id, *const void **event_data, *size_t* event_data_size, *BaseType_t* *task_unblocked)

Special variant of `esp_event_post` for posting events from interrupt handlers.

备注: this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

备注: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

参数

- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data; max is 4 bytes
- **task_unblocked** -- **[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

返回

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

esp_err_t **esp_event_isr_post_to** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, *int32_t* event_id, *const void **event_data, *size_t* event_data_size, *BaseType_t* *task_unblocked)

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

备注: this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

备注: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

参数

- **event_loop** -- **[in]** the event loop to post to, must not be NULL
- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data
- **task_unblocked** -- **[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

返回

- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full

- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

`esp_err_t esp_event_dump` (FILE *file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```

event loop
  handler
  handler
  ...
event loop
  handler
  handler
  ...

where:

event loop
  format: address,name rx:total_received dr:total_dropped
  where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_received - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue_
→being full

handler
  format: address ev:base,id inv:total_invoked run:total_runtime
  where:
    address - address of the handler function
    base,id - the event specified by event base and ID this handler_
→executes
    total_invoked - number of times this handler has been invoked
    total_runtime - total amount of time used for invoking this handler

```

备注: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

参数 `file` -- [in] the file stream to output to

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

Structures

struct `esp_event_loop_args_t`

Configuration for creating event loops.

Public Members

`int32_t queue_size`

size of the event loop queue

const char ***task_name**

name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t **task_priority**

priority of the event loop task, ignored if task name is NULL

uint32_t **task_stack_size**

stack size of the event loop task, ignored if task name is NULL

BaseType_t **task_core_id**

core to which the event loop task is pinned to, ignored if task name is NULL

Header File

- [components/esp_event/include/esp_event_base.h](#)
- This header file can be included with:

```
#include "esp_event_base.h"
```

- This header file is a part of the API provided by the `esp_event` component. To declare that your component depends on `esp_event`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_event
```

or

```
PRIV_REQUIRES esp_event
```

Macros

ESP_EVENT_DECLARE_BASE (id)

ESP_EVENT_DEFINE_BASE (id)

ESP_EVENT_ANY_BASE

register handler for any event base

ESP_EVENT_ANY_ID

register handler for any event id

Type Definitions

typedef void ***esp_event_loop_handle_t**

a number that identifies an event with respect to a base

typedef void (***esp_event_handler_t**)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)

function called when an event is posted to the queue

typedef void ***esp_event_handler_instance_t**

context identifying an instance of a registered event handler

2.9.11 FreeRTOS 概述

概述

FreeRTOS 是一个开源的 RTOS（实时操作系统）内核，它以组件的形式集成到 ESP-IDF 中。因此，所有的 ESP-IDF 应用程序及多种 ESP-IDF 组件都基于 FreeRTOS 编写。FreeRTOS 内核已移植到 ESP 芯片的所有 CPU 架构（即 Xtensa 和 RISC-V）中。

此外，ESP-IDF 还提供了不同的 FreeRTOS 实现，支持在多核 ESP 目标芯片上的 SMP（对称多处理）。本文档主要介绍了 FreeRTOS 组件、ESP-IDF 提供的 FreeRTOS 实现，并简要介绍了这些实现的共同之处。

实现

官方 FreeRTOS（下文称为原生 FreeRTOS）是一个单核 RTOS。为了支持各种多核 ESP 目标芯片，ESP-IDF 支持下述不同的 FreeRTOS 实现。

ESP-IDF FreeRTOS

ESP-IDF FreeRTOS 是基于原生 FreeRTOS v10.5.1 的 FreeRTOS 实现，其中包含支持 SMP 的大量更新。ESP-IDF FreeRTOS 最多支持两个核（即双核 SMP），但在设计上对这种场景进行了优化。关于 ESP-IDF FreeRTOS 及具体更新内容，请参考 [FreeRTOS \(IDF\)](#) 文档。

备注：ESP-IDF FreeRTOS 是目前 ESP-IDF 默认的 FreeRTOS 实现。

Amazon SMP FreeRTOS

Amazon SMP FreeRTOS 是由 Amazon 官方支持的 FreeRTOS SMP 实现。Amazon SMP FreeRTOS 能够支持 N 核，即双核以上。通过 [CONFIG_FREERTOS_SMP](#) 选项能够启用 Amazon SMP FreeRTOS。关于 Amazon SMP FreeRTOS 的更多细节，请参考 [官方 Amazon SMP FreeRTOS 文档](#)。

警告：Amazon SMP FreeRTOS 实现（及其在 ESP-IDF 中的移植）目前处于试验/测试状态，因此，可能会发生重大的行为变化及 API 变更。

配置

内核配置 原生 FreeRTOS 要求移植工具和应用程序通过在 `FreeRTOSConfig.h` 头文件中添加各种 `#define config...` 宏定义来配置内核。原生 FreeRTOS 支持一系列内核配置选项，允许启用或禁用各种内核行为和功能。

然而，对于 ESP-IDF 中的所有 FreeRTOS 移植，`FreeRTOSConfig.h` 头文件被视为私有文件，用户不得修改。由于该选项在 ESP-IDF 中是必选项或不被支持，`FreeRTOSConfig.h` 中的大量内核配置选项均为硬编码。所有用户可配置的内核配置选项都在 `Component Config/FreeRTOS/Kernel` 下的 `menuconfig` 中。

关于用户可配置内核选项的完整列表，参见 [项目配置](#)。下列为常用的内核配置选项：

- `CONFIG_FREERTOS_UNICORE`: 仅在核 0 上运行 FreeRTOS。注意, 这不等同于运行原生 FreeRTOS。另外, 此选项还可能影响除 `freertos` 外其他组件的行为。关于在单核上运行 FreeRTOS 的更多内容, 请参考 [单核模式](#) (使用 ESP-IDF FreeRTOS 时) 或参考 Amazon SMP FreeRTOS 的官方文档, 还可以在 ESP-IDF 组件中搜索 `CONFIG_FREERTOS_UNICORE`。

备注: 由于 ESP32-S2 是一个单核 SoC, 所以总是会启用 `CONFIG_FREERTOS_UNICORE` 配置。

- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` 可以向后兼容某些 FreeRTOS 宏、类型或函数, 这些宏、类型或函数已在 v8.0 及以上版本中弃用。

端口配置 其他不属于内核配置的 FreeRTOS 相关配置选项都在 Component Config/FreeRTOS/Port 下的 `menuconfig` 中。这些选项可以配置以下内容:

- FreeRTOS 端口本身 (如 tick 定时器选择, ISR 堆栈大小)
- 其他添加到 FreeRTOS 实现或端口的功能

使用 FreeRTOS

应用程序入口点 与原生 FreeRTOS 不同, 在 ESP-IDF 中使用 FreeRTOS 的用户 **永远不应调用** `vTaskStartScheduler()` 和 `vTaskEndScheduler()`。相反, ESP-IDF 会自动启动 FreeRTOS。用户必须定义一个 `void app_main(void)` 函数作为用户应用程序的入口点, 并在 ESP-IDF 启动时自动调用。

- 通常, 用户会从 `app_main` 中启动应用程序的其他任务。
- `app_main` 函数可以在任何时候返回 (应用终止前)。
- `app_main` 函数由 `main` 任务调用。

后台任务 在启动过程中, ESP-IDF 和 FreeRTOS 内核会自动创建多个在后台运行的任务, 如下表所示。

表 10: 启动过程创建任务列表

| 任务名称 | 描述 | 堆栈大小 | 亲和性 | 优先级 |
|----------------------------|---|---|-----|--------------------|
| 空闲任务 (IDLE _x) | 为每个 CPU 核创建并分配一个空闲任务 (IDLE _x), 其中 <i>x</i> 是 CPU 核的编号。当启用单核配置时, <i>x</i> 将被删除。 | <code>CON-核</code> <code>FIG_FREERTOS_IDLE_TASK_STACK_SIZE</code> | | 0 |
| FreeRTOS 定时器任务 (Tmr Svc) | 如果应用程序调用了任何 FreeRTOS 定时器 API, FreeRTOS 会创建定时器服务或守护任务 | <code>CON-核</code> <code>FIG_FREERTOS_TIMER_TASK_STACK_SIZE</code> | | <code>CON-核</code> |
| 主任务 (main) | 简单调用 <code>app_main</code> 的任务在 <code>app_main</code> 返回时会自我删除 | <code>CON-核</code> <code>FIG_ESP_MAIN_TASK_STACK_SIZE</code> | | 1 |
| IPC 任务 (ipc _x) | 当 <code>CONFIG_FREERTOS_UNICORE</code> 为假时, 为每个 CPU 核创建并分配一个 IPC 任务 (ipc _x)。IPC 任务用于实现处理器间调用 (IPC) 功能 | <code>CON-核</code> <code>FIG_ESP_IPC_TASK_STACK_SIZE</code> | | 24 |
| ESP 定时器任务 (esp_timer) | ESP-IDF 创建 ESP 定时器任务用于处理 ESP 定时器回调 | <code>CON-核</code> <code>FIG_ESP_TIMER_TASK_STACK_SIZE</code> | | 22 |

备注：注意，如果应用程序使用了其他 ESP-IDF 功能（如 Wi-Fi 或蓝牙），那么这些功能可能会在上表的任务之外创建自己的后台任务。

FreeRTOS 附加功能

ESP-IDF 还为 FreeRTOS 提供了一些补充功能，如环形 buffer、ESP-IDF 风格的 tick 钩子和 idle 钩子、以及 TLSP 删除回调。要了解更多信息，请参见[FreeRTOS（附加功能）](#)。

FreeRTOS 堆

原生 FreeRTOS 自带堆实现选择，然而 ESP-IDF 已经实现了自己的堆（参见[堆内存分配](#)），因此不使用原生 FreeRTOS 的堆实现。ESP-IDF 中的所有 FreeRTOS 端口都将 FreeRTOS 内存分配或释放调用（例如 `pvPortMalloc()` 和 `pvPortFree()`）映射到 ESP-IDF 堆 API（即 `heap_caps_malloc()` 和 `heap_caps_free()`）。然而 FreeRTOS 端口可以确保 FreeRTOS 分配的所有动态内存都放在内部内存中。

备注：如果希望将 FreeRTOS 任务或对象放在外部内存中，可以使用以下方法：

- 使用一个 `...CreateWithCaps()` API，如 `xTaskCreateWithCaps()` 和 `xQueueCreateWithCaps()` 来分配任务或对象（参见[IDF 附加 API](#) 获取更多详细信息）。
- 使用 `heap_caps_malloc()` 为这些对象手动分配外部内存，然后使用 FreeRTOS 的一个 `...CreateStatic()` 函数从分配的内存中创建对象。

2.9.12 FreeRTOS (IDF)

本文档介绍了 ESP-IDF 框架内的 FreeRTOS 双核 SMP 实现，包含以下小节：

目录

- [FreeRTOS \(IDF\)](#)
 - [概述](#)
 - [对称多处理](#)
 - [任务](#)
 - [SMP 调度器](#)
 - [临界区](#)
 - [其他事项](#)
 - [API 参考](#)

概述

原始 FreeRTOS（下文称 Vanilla FreeRTOS）是一款小巧高效的实时操作系统，适用于许多单核 MCU 和 SoC。但为了支持双核 ESP 芯片，如 ESP32、ESP32-S3、ESP32-P4，ESP-IDF 特别提供了支持双核对称多处理 (SMP) 的 FreeRTOS 实现（下文称 IDF FreeRTOS）。

IDF FreeRTOS 源代码基于 Vanilla FreeRTOS v10.5.1，但内核行为和 API 都有重大修改，以支持双核 SMP。不过用户也可以启用 `CONFIG_FREERTOS_UNICORE` 选项，将 IDF FreeRTOS 配置为支持单核，详情请参阅[单核模式](#)。

备注： 本文档假定读者已具备 Vanilla FreeRTOS 的必要背景知识，即了解其特性、行为和 API 用法。如需了解背景知识，请参阅 [Vanilla FreeRTOS 文档](#)。

对称多处理

基本概念 对称多处理是一种计算架构，其中，两个及以上相同的 CPU 核连接到单个共享的主内存，并由单个操作系统控制。SMP 系统通常具有以下特点：

- 多个核独立运行。每个核都有自己的寄存器文件、中断和中断处理。
- 对每个核呈现相同的内存视图。因此，无论在哪个核上运行，访问特定内存地址的代码都会产生相同的效果。

与单核或非对称多处理系统相比，SMP 系统的主要优势在于：

- 存在多个核，支持多个硬件线程，从而提高整体处理吞吐量。
- 对称内存支持线程在执行期间切换核，从而提高 CPU 利用率。

尽管 SMP 系统支持线程切换核，但在某些情况下，线程必须或应该仅在特定核上运行。因此，在 SMP 系统中，线程也具备核亲和性，指定线程在哪个特定核上运行。

- 分配给特定核的线程只能在该核上运行。
- 未分配给特定核的线程支持在执行期间切换核。

ESP 芯片上的 SMP ESP32、ESP32-S3、ESP32-P4 等 ESP 芯片是双核 SMP SoC，具有以下硬件特性以支持 SMP：

- 具有两个完全相同的核，分别称为核 0 和核 1。代码段无论在哪个核上运行，都有相同的执行效果。
- 具有对称内存（除了少数例外情况）。
 - 如果多个核同时访问相同的内存地址，它们的访问会被内存总线串行化。
 - 通过 ISA 提供的原子比较和交换指令，可以实现对同一内存地址的真正原子访问。
- 跨核中断支持由一个核触发另一个核上的中断，这使得核间可以互相发送信号，如请求在另一个核上进行上下文切换。

备注： 在 ESP-IDF 中，核 0 和核 1 有时分别又被称为 PRO_CPU 和 APP_CPU。别名 PRO_CPU 和 APP_CPU 反映了典型 ESP-IDF 应用程序使用这两个 CPU 的方式。负责处理 Wi-Fi 或蓝牙等协议相关处理程序的任务通常会分配给核 0，因此称核 0 为 PRO_CPU；而处理应用程序其余部分的任务会分配给核 1，因此称核 1 为 APP_CPU。

任务

创建任务 Vanilla FreeRTOS 提供以下用于创建任务的函数：

- 使用 `xTaskCreate()` 创建任务时，任务内存动态分配。
- 使用 `xTaskCreateStatic()` 创建任务时，任务内存静态分配，即由用户提供。

然而，在 SMP 系统中，任务需要分配到特定核。因此，ESP-IDF 提供了 Vanilla FreeRTOS 任务创建函数的 `...PinnedToCore()` 版本：

- 使用 `xTaskCreatePinnedToCore()` 可以创建具有特定核亲和性的任务，任务内存动态分配。
- 使用 `xTaskCreateStaticPinnedToCore()` 可以创建具有特定核亲和性的任务，任务内存静态分配，即由用户提供。

不同于普通的任务创建函数 API，`...PinnedToCore()` 版本的任务创建函数 API 有额外的 `xCoreID` 参数，用于指定所创建任务的核亲和性。核亲和性的有效值包括：

- 0：将创建的任务分配给核 0
- 1：将创建的任务分配给核 1
- `tskNO_AFFINITY`：支持任务在两个核上运行

注意，IDF FreeRTOS 仍支持普通的任务创建函数，但这些标准函数已经过调整，会内部调用其 ... `PinnedToCore()` 版本，同时将核亲和性设置为 `tskNO_AFFINITY`。

备注：IDF FreeRTOS 还更改了任务创建函数中的 `ulStackDepth` 参数。在 Vanilla FreeRTOS 中，任务堆栈的大小以字为单位指定，而在 IDF FreeRTOS 中，任务堆栈的大小以字节为单位指定。

执行任务 IDF FreeRTOS 中任务的结构与 Vanilla FreeRTOS 相同。具体而言，IDF FreeRTOS 任务：

- 只能处于以下任一状态：运行中、就绪、阻塞或挂起。
- 任务函数通常为无限循环。
- 任务函数不应返回。

删除任务 调用 `vTaskDelete()` 可以在 Vanilla FreeRTOS 中删除任务。该函数可用于删除其他任务，若任务句柄为 `NULL` 则删除当前运行任务。如果删除的任务是当前正在运行的任务时，任务的内存释放有时会委托给空闲任务执行。

IDF FreeRTOS 提供了同样的 `vTaskDelete()` 函数。然而，IDF FreeRTOS 是一个双核系统，因此调用 `vTaskDelete()` 时，行为上会与 Vanilla FreeRTOS 有以下差异：

- 删除另一个核上运行的任务时，会在另一个核上触发一次让步，任务内存由其中一个空闲任务释放。
- 如果删除的任务没有在任一核上运行，则会立即释放其内存。

请避免删除正在另一个核上运行的任务，否则由于无法确定该任务正在执行的操作，可能会导致难以预料的行为，例如：

- 删除持有互斥锁的任务。
- 删除尚未释放其先前分配的内存的任务。

请尽可能自己设计应用程序，确保在调用 `vTaskDelete()` 时，删除的任务处于已知状态。例如：

- 当任务完成执行操作并清理了任务内使用的所有资源时，任务调用 `vTaskDelete(NULL)` 自行删除。
- 在被另一个任务删除前，任务调用 `vTaskSuspend()` 将自己置于挂起状态。

SMP 调度器

对 Vanilla FreeRTOS 调度器最确切的描述是 **具有时间分片和固定优先级的抢占式调度器**，这意味着：

- 每个任务在创建时都赋予了固定优先级，调度器会执行具有最高优先级且处于就绪状态的任务。
- 调度器可以在不需要当前运行任务的协作下切换执行到另一个任务。
- 调度器会采用轮转方式，定期在具有相同优先级的就绪状态任务间切换执行，时间分片由时钟中断控制。

IDF FreeRTOS 调度器支持相同的调度特性，即固定优先级、抢占和时间分片，但也存在细微的行为差异。

固定优先级 在 Vanilla FreeRTOS 中，当调度器选择要运行的新任务时，往往会选择当前优先级最高的就绪任务。而在 IDF FreeRTOS 中，每个核都独立地调度要运行的任务。当特定核选择一个任务时，该核会选择优先级最高且可以在该核上运行的就绪状态任务。满足以下条件时，任务可以在核上运行：

- 任务亲和性兼容，即已分配或未分配给当前核。
- 该任务当前没有在其他核上运行。

但是，两个具有最高优先级的就绪任务不一定始终由调度器运行，因为还需考虑到任务的核亲和性。例如，给定以下任务：

- 优先级为 10 的任务 A，分配给核 0
- 优先级为 9 的任务 B，分配给核 0
- 优先级为 8 的任务 C，分配给核 1

经过调度后，任务 A 将在核 0 上运行，任务 C 将在核 1 上运行。即使任务 B 是第二优先级任务，也不会被执行。

抢占 在 Vanilla FreeRTOS 中，如果优先级更高的任务已准备好执行，调度器可以抢占当前正在运行的任务。同样，在 IDF FreeRTOS 任务中，如果调度器确定一个优先级更高的任务可以在某个核上运行，那么调度器可以单独抢占各个核。

但在某些情况下，一个优先级更高的就绪任务可以在多个核上运行。此时，调度器只会抢占一个核。即便当前有多个核可以抢占，调度器总是优先选择当前核。换句话说，如果优先级更高的就绪任务未分配，并且其优先级高于两个核的当前优先级，调度器将始终选择抢占当前核。例如，给定以下任务：

- 优先级为 8 的任务 A 当前在核 0 上运行
- 优先级为 9 的任务 B 当前在核 1 上运行
- 优先级为 10 的任务 C 未分配，并由任务 B 解除了阻塞

经过调度后，任务 A 将在核 0 上运行，任务 C 将抢占任务 B，因为调度器总是优先选择当前核。

时间分片 Vanilla FreeRTOS 实现了时间分片，这意味着如果当前优先级最高的就绪任务包含多个就绪任务，调度器会在这些任务间轮转定期切换。

然而，在 IDF FreeRTOS 中，由于以下原因，特定任务可能无法在特定核上运行，因此无法实现完美的轮转时间分片：

- 任务分配给了另一个核。
- 任务未分配，但已经由其他核运行。

因此，当核在所有就绪状态任务中搜索寻找要运行的任务时，可能需要跳过同一优先级列表中的一些任务，或者降低优先级，以找到可以运行的就绪状态任务。

IDF FreeRTOS 调度器会确保已选择运行的任务置于列表末尾，为同一优先级的就绪状态任务实现最佳轮转时间分片。这样，在下次调度迭代（即，下一个滴答中断或让步）中，未经选择的任务优先级会更高。

以下示例展示了最佳轮转时间分片的实操。假设：

- 有四个相同优先级的就绪状态任务 AX、B0、C1 和 D1，其中：
 - 优先级是当前具有就绪状态任务的最高优先级。
 - 第一个字符代表任务名称，即 A、B、C、D。
 - 第二个字符表示任务核的分配情况，X 表示未分配。
- 任务列表始终从头开始搜索

1. 起始状态，尚未选择要运行的就绪状态任务。

```
Head [ AX , B0 , C1 , D0 ] Tail
```

2. 核 0 有一个滴答中断，搜索要运行的任务。选择任务 A，并将其移至列表末尾。

```
Core 0 ┌
      │
      ▼
Head [ AX , B0 , C1 , D0 ] Tail
      [0]
Head [ B0 , C1 , D0 , AX ] Tail
```

3. 核 1 有一个滴答中断，搜索要运行的任务。由于亲和性不兼容，任务 B 无法运行，因此核 1 跳到任务 C。选择任务 C，并将其移至列表末尾。

```
Core 1 ┌
      │
      ▼
Head [ B0 , C1 , D0 , AX ] Tail
      [0] [1]
Head [ B0 , D0 , AX , C1 ] Tail
```

4. 核 0 有另一个滴答中断，搜索要运行的任务。选择任务 B，并将其移至列表末尾。

5. 核 1 有另一个滴答中断，搜索要运行的任务。由于亲和性不兼容，任务 D 无法运行，因此核 1 跳到任务 A。选择任务 A，并将其移至列表末尾。

在使用最佳轮转时间分片时需注意：

- 相同优先级的多个就绪状态任务不一定可以像在 Vanilla FreeRTOS 中一样按顺序运行。如以上示例所示，核可能会跳过任务。
- 然而，经过足够的滴答次数，任务最终将获得一些处理时间。
- 如果核找不到优先级最高的可运行就绪任务，它将降低优先级来搜索任务。
- 为了实现理想的轮转时间分片，应确保特定优先级的所有任务都分配给同一个核。

时钟中断 Vanilla FreeRTOS 要求定期发生滴答中断，滴答中断有以下作用：

- 增加调度器的滴答计数
- 为超时的阻塞任务解除阻塞
- 检查是否需要时间分片，即触发上下文切换
- 执行应用程序滴答函数

在 IDF FreeRTOS 中，每个核都会接收到定期中断，并独立运行滴答中断。每个核上的滴答中断周期相同，但可能不同步。然而，上述滴答中断任务不会由所有核同时执行，具体而言：

- 核 0 执行上述所有滴答中断任务
- 核 1 仅检查是否需要时间分片并执行应用程序滴答函数

备注：在 IDF FreeRTOS 中，核 0 是负责时间计数的唯一核。因此，任何阻止核 0 增加滴答计数的情况，例如暂停核 0 上的调度器，都会导致整个调度器的时间计数滞后。

空闲任务 启动调度器时，Vanilla FreeRTOS 会隐式创建一个优先级为 0 的空闲任务。当没有其他任务准备运行时，空闲任务运行并有以下作用：

- 释放已删除任务的内存
- 执行应用程序的空闲函数

而 IDF FreeRTOS 为每个核单独创建了一个固定的空闲任务。每个核上的空闲任务起到与其 Vanilla FreeRTOS 对应任务相同的作用。

调度器挂起 Vanilla FreeRTOS 支持调用 `vTaskSuspendAll()` 挂起调度器，调用 `xTaskResumeAll()` 恢复调度器。调度器挂起时：

- 禁用任务切换，但仍启用中断。
- 禁止调用任何阻塞或让出函数，禁用时间分片。
- 时钟计数冻结，但仍会发生时钟中断以执行应用程序时钟函数。

调度器恢复时，`xTaskResumeAll()` 会补上所有丢失的时钟计数，并解除超时任务的阻塞。

在 IDF FreeRTOS 中，无法在多个核上同时挂起调度器。因此，在特定核上（如核 A）调用 `vTaskSuspendAll()` 时：

- 只在核 A 上禁用任务切换，但仍启用核 A 的中断。
- 禁止在核 A 上调用任何阻塞或让出函数，在核 A 上禁用时间分片。
- 核 A 上的中断解除任务阻塞时，对核 A 亲和的任务会进入核 A 的待执行任务列表。未分配的任务或对其他核亲和的任务可以在运行调度器的核上调度。
- 所有核上的调度器均挂起时，由中断解除阻塞的任务将进入它们分配的核的待执行任务列表。如果任务未分配，则进入调用中断的核的待执行任务列表。
- 如果核 A 是核 0，则时钟计数将被冻结，挂起的时钟计数将递增，但仍会发生时钟中断以执行应用程序时钟函数。

在特定核（如核 A）上调用 `xTaskResumeAll()` 时：

- 任何添加到核 A 的待执行任务列表中的任务将恢复执行。
- 如果核 A 是核 0，则挂起的时钟计数将回退，补上丢失的时钟计数。

警告： IDF FreeRTOS 上的调度器挂起仅暂停特定核上的调度，因此调度器挂起 **不能** 确保访问共享数据时任务互斥。如果需要互斥，请使用适当的锁定机制，如互斥锁或自旋锁。

临界区

禁用中断 Vanilla FreeRTOS 支持通过调用 `taskDISABLE_INTERRUPTS` 和 `taskENABLE_INTERRUPTS` 分别禁用和启用中断。IDF FreeRTOS 提供了相同的 API，但中断只能在当前核上禁用或启用。

在 Vanilla FreeRTOS 以及其他普通单核系统中，禁用中断可以有效实现互斥，但在 SMP 系统中，禁用中断并不能确保实现互斥，而应使用有自旋锁的临界区以实现互斥。

API 变更 Vanilla FreeRTOS 通过禁用中断实现临界区 (Critical Section)，以防止在临界区内发生抢占式上下文切换和中断服务，确保进入临界区的任务或 ISR 是访问共享资源的唯一实体。Vanilla FreeRTOS 中的临界区提供以下 API：

- `taskENTER_CRITICAL()` 通过禁用中断进入临界区
- `taskEXIT_CRITICAL()` 通过重新启用中断退出临界区
- `taskENTER_CRITICAL_FROM_ISR()` 通过禁用中断嵌套从 ISR 进入临界区
- `taskEXIT_CRITICAL_FROM_ISR()` 通过重新启用中断嵌套从 ISR 退出临界区

然而，在 SMP 系统中，仅禁用中断并不能构成临界区，因为存在其他核意味着共享资源仍可以同时访问。因此，IDF FreeRTOS 中的临界区是使用自旋锁实现的。为适应自旋锁，IDF FreeRTOS 中的临界区 API 包含一个额外的自旋锁参数，具体如下：

- 自旋锁为 `portMUX_TYPE` (请勿与 FreeRTOS 互斥混淆)
- `taskENTER_CRITICAL(&spinlock)` 从任务上下文进入临界区
- `taskEXIT_CRITICAL(&spinlock)` 从任务上下文退出临界区
- `taskENTER_CRITICAL_ISR(&spinlock)` 从中断上下文进入临界区
- `taskEXIT_CRITICAL_ISR(&spinlock)` 从中断上下文退出临界区

备注： 临界区 API 可以递归调用，即可以嵌套使用临界区。只要退出临界区的次数与进入的次数相同，多次递归进入临界区就是有效的。但是，由于临界区可以针对不同的自旋锁，因此在递归进入临界区时，应注意避免死锁。

自旋锁可以静态或动态分配。因此，提供了静态和动态初始化自旋锁的宏，如下代码片段所示。

- 静态分配自旋锁并使用 `portMUX_INITIALIZER_UNLOCKED` 初始化：

```
// 静态分配并初始化自旋锁
static portMUX_TYPE my_spinlock = portMUX_INITIALIZER_UNLOCKED;

void some_function(void)
{
    taskENTER_CRITICAL(&my_spinlock);
    // 此时已处于临界区
    taskEXIT_CRITICAL(&my_spinlock);
}

```

- 动态分配自旋锁并使用 portMUX_INITIALIZER() 初始化:

```
// 动态分配自旋锁
portMUX_TYPE *my_spinlock = malloc(sizeof(portMUX_TYPE));
// 动态初始化自旋锁
portMUX_INITIALIZER(my_spinlock);

...

taskENTER_CRITICAL(my_spinlock);
// 访问资源
taskEXIT_CRITICAL(my_spinlock);

```

实现 IDF FreeRTOS 中，特定核进入和退出临界区的过程如下：

- 对于 taskENTER_CRITICAL(&spinlock) 或 taskENTER_CRITICAL_ISR(&spinlock)
 1. 核禁用其中断或中断嵌套，直到达到 configMAX_SYSCALL_INTERRUPT_PRIORITY。
 2. 接着，核使用原子比较和设置指令在自旋锁上自旋，直到获取锁。当核能够将锁的所有者值设置为核的 ID 时，就获得了锁。
 3. 一旦获取了自旋锁，函数返回。剩余的临界区部分将在禁用中断或中断嵌套的情况下运行。
- 对于 taskEXIT_CRITICAL(&spinlock) 或 taskEXIT_CRITICAL_ISR(&spinlock)
 1. 核通过清除自旋锁的所有者值释放自旋锁。
 2. 核重新启用中断或中断嵌套。

限制与注意事项 由于在临界区内禁用了中断或中断嵌套，产生了多个关于在临界区内可执行操作的限制，请牢记以下操作限制和注意事项：

- 临界区应尽可能短
 - 临界区持续时间越长，越可能延迟挂起中断的执行。
 - 临界区通常应仅涉及少量数据结构和/或硬件寄存器。
 - 如果可以，尽可能将执行操作和/或事件处理程序推迟到临界区之外。
- 不应在临界区内调用 FreeRTOS API
- 不应在临界区内调用任何阻塞或让出函数

其他事项

单核模式 尽管 IDF FreeRTOS 是为双核 SMP 专门设计的，但也可通过启用 `CONFIG_FREERTOS_UNICORE` 选项，将 IDF FreeRTOS 配置为支持单核。

对于 ESP32-S2 和 ESP32-C3 等单核芯片，`CONFIG_FREERTOS_UNICORE` 选项始终启用。对于 ESP32 和 ESP32-S3 等多核芯片也可以设置 `CONFIG_FREERTOS_UNICORE`，对于多核目标（如 ESP32 和 ESP32-S3），也可以设置 `CONFIG_FREERTOS_UNICORE`，但启用该选项后应用仅在核 0 上运行。

在单核模式下，IDF FreeRTOS 与 Vanilla FreeRTOS 完全相同，因此无需考虑前文提到的对内核行为的 SMP 更改。因此，在单核模式下构建 IDF FreeRTOS 具有以下特点：

- 内核在临界区内执行的所有操作都是确定的（即在临界区内不走链表）。
- 恢复了 Vanilla FreeRTOS 调度算法（包括完美的轮转时间分片）。
- 移除了所有单核构建中的 SMP 专用数据。

在单核模式下仍可调用 SMP API，这些 API 仍然保持公开，以便为单核和多核构建源代码，而无需调用不同的 API 集。不过，SMP API 在单核模式下不会展示任何 SMP 行为，因此实际上等同于其对应的单核模式 API。例如：

- 任何 `...ForCore(..., BaseType_t xCoreID)` SMP API 将只接受 0 为 `xCoreID` 的有效值。
- `...PinnedToCore()` 任务创建 API 将直接忽略 `xCoreID` 核亲和参数。
- 临界区 API 仍需要自旋锁参数，但不会使用自旋锁，临界区将恢复为仅用于禁用/启用中断。

API 参考

本节介绍了 FreeRTOS 类型、函数和宏，均从 FreeRTOS 头文件自动生成。

任务 API

Header File

- `components/freertos/FreeRTOS-Kernel/include/freertos/task.h`
- This header file can be included with:

```
#include "freertos/task.h"
```

Functions

static inline BaseType_t **xTaskCreate** (TaskFunction_t pxTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pxCreatedTask)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;
```

(下页继续)

```

// Create the task, storing the handle. Note that the passed parameter_
→ucParameterToPass
// must exist for the lifetime of the task, so in this case is declared static.
→ If it was just an
// an automatic stack variable it might no longer exist, or at least have been_
→corrupted, by the time
// the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
→PRIORITY, &xHandle );
    configASSERT( xHandle );

// Use the handle to delete the task.
if( xHandle != NULL )
{
    vTaskDelete( xHandle );
}
}

```

备注: If `configNUMBER_OF_CORES > 1`, this function will create an unpinned task (see `tskNO_AFFINITY` for more details).

备注: If program uses thread local variables (ones specified with `__thread` keyword) then storage for them will be allocated on the task's stack.

参数

- **pxTaskCode** -- Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** -- A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- **usStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `(2 | portPRIVILEGE_BIT)`.
- **pxCreatedTask** -- Used to pass back a handle by which the created task can be referenced.

返回 `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

```

static inline TaskHandle_t xTaskCreateStatic (TaskFunction_t pxTaskCode, const char *const pcName,
                                             const uint32_t ulStackDepth, void *const pvParameters,
                                             UBaseType_t uxPriority, StackType_t *const
                                             puxStackBuffer, StaticTask_t *const pxTaskBuffer)

```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions of the buffer that the task being created will use as its stack.
// NOTE: This is the number of words the stack will hold, not the number of
// bytes. For example, if each stack item is 32-bits, and this is set to 100,
// then 400 bytes (100 * 32-bits) will be allocated.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,          // Function that implements the task.
        "NAME",             // Text name for the task.
        STACK_SIZE,        // Stack size in words, not bytes.
        ( void * ) 1,       // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,             // Array to use as the task's stack.
        &xTaskBuffer );    // Variable to hold the task's data
    ↪structure.

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}

```

备注: If `configNUMBER_OF_CORES > 1`, this function will create an unpinned task (see `tskNO_AFFINITY` for more details).

备注: If program uses thread local variables (ones specified with `__thread` keyword) then storage for them will be allocated on the task's stack.

参数

- **pxTaskCode** -- Pointer to the task entry function. Tasks must be implemented to never

return (i.e. continuous loop).

- **pcName** -- A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by `configMAX_TASK_NAME_LEN` in `FreeRTOSConfig.h`.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task will run.
- **pxStackBuffer** -- Must point to a `StackType_t` array that has at least `ulStackDepth` indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** -- Must point to a variable of type `StaticTask_t`, which will then be used to hold the task's data structures, removing the need for the memory to be allocated dynamically.

返回 If neither `pxStackBuffer` nor `pxTaskBuffer` are `NULL`, then the task will be created and a handle to the created task is returned. If either `pxStackBuffer` or `pxTaskBuffer` are `NULL` then the task will not be created and `NULL` is returned.

void **vTaskAllocateMPURegions** (*TaskHandle_t* xTask, const *MemoryRegion_t* *const pxRegions)

Memory regions are assigned to a restricted task when the task is created by a call to `xTaskCreateRestricted()`. These regions can be redefined using `vTaskAllocateMPURegions()`.

Example usage:

```
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
    // Base address      Length      Parameters
    { ucOneKByte,      1024,      portMPU_REGION_READ_WRITE },
    { 0,                0,         0 },
    { 0,                0,         0 }
};

void vATask( void *pvParameters )
{
    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}
```

参数

- **xTask** -- The handle of the task being updated.
- **pxRegions** -- A pointer to a `MemoryRegion_t` structure that contains the new memory region definitions.

void **vTaskDelete** (*TaskHandle_t* xTaskToDelete)

`INCLUDE_vTaskDelete` must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel's management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to `vTaskDelete()`. Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file `death.c` for sample code that utilises `vTaskDelete()`.

Example usage:

```
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

参数 `xTaskToDelete` -- The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void **`vTaskDelay`**(const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant `portTICK_PERIOD_MS` can be used to calculate real time from the tick rate - with the resolution of one tick period.

`INCLUDE_vTaskDelay` must be defined as 1 for this function to be available. See the configuration section for more information.

`vTaskDelay()` specifies a time at which the task wishes to unblock relative to the time at which `vTaskDelay()` is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after `vTaskDelay()` is called. `vTaskDelay()` does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will affect the frequency at which `vTaskDelay()` gets called and therefore the time at which the task next executes. See `xTaskDelayUntil()` for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

参数 `xTicksToDelay` -- The amount of time, in tick periods, that the calling task should block.

BaseType_t **xTaskDelayUntil** (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay () in one important aspect: vTaskDelay () will cause a task to block for the specified number of ticks from the time vTaskDelay () is called. It is therefore difficult to use vTaskDelay () by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay () may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay () specifies a wake time relative to the time at which the function is called, xTaskDelayUntil () specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

参数

- **pxPreviousWakeTime** -- Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil ().
- **xTimeIncrement** -- The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

返回 Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task was delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

BaseType_t **xTaskAbortDelay** (TaskHandle_t xTask)

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used

in a call to `xTaskAbortDelay()` then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no 'FromISR' version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

参数 xTask -- The handle of the task to remove from the Blocked state.

返回 If the task referenced by `xTask` was not in the Blocked state then `pdFAIL` is returned. Otherwise `pdPASS` is returned.

`UBaseType_t uxTaskPriorityGet (const TaskHandle_t xTask)`

`INCLUDE_uxTaskPriorityGet` must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

参数 xTask -- Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

返回 The priority of `xTask`.

`UBaseType_t uxTaskPriorityGetFromISR (const TaskHandle_t xTask)`

A version of `uxTaskPriorityGet()` that can be used from an ISR.

eTaskState **eTaskGetState** (*TaskHandle_t* xTask)

`INCLUDE_eTaskGetState` must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the `eTaskState` enumerated type.

参数 xTask -- Handle of the task to be queried.

返回 The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo** (*TaskHandle_t* xTask, *TaskStatus_t* *pxTaskStatus, BaseType_t xGetFreeStackSpace, *eTaskState* eState)

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

参数

- **xTask** -- Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** -- A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** -- The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** -- The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void **vTaskPrioritySet** (*TaskHandle_t* xTask, UBaseType_t uxNewPriority)

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// ...

// Use the handle to raise the priority of the created task.
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

// ...

// Use a NULL handle to raise our priority to the same value.
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}

```

参数

- **xTask** -- Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** -- The priority to which the task will be set.

void **vTaskSuspend** (*TaskHandle_t* xTaskToSuspend)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// ...

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Suspend ourselves.
vTaskSuspend( NULL );
}

```

(下页继续)

```
// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.
}
```

参数 xTaskToSuspend -- Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void **vTaskResume** (*TaskHandle_t* xTaskToResume)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ().

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

参数 xTaskToResume -- Handle to the task being readied.

BaseType_t **xTaskResumeFromISR** (*TaskHandle_t* xTaskToResume)

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

参数 `xTaskToResume` -- Handle to the task being readied.

返回 `pdTRUE` if resuming the task should result in a context switch, otherwise `pdFALSE`. This is used by the ISR to determine if a context switch may be required following the ISR.

void **vTaskSuspendAll** (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling `vTaskSuspendAll()` the calling task will continue to execute without risk of being swapped out until a call to `xTaskResumeAll()` has been made.

API functions that have the potential to cause a context switch (for example, `xTaskDelayUntil()`, `xQueueSend()`, etc.) must not be called while the scheduler is suspended.

Example usage:

```
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL()/taskEXIT_CRITICAL() as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}
```

BaseType_t **xTaskResumeAll** (void)

Resumes scheduler activity after it was suspended by a call to `vTaskSuspendAll()`.

`xTaskResumeAll()` only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to `vTaskSuspend()`.

Example usage:

```
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
```

(下页继续)

```

// which it does not want to get swapped out. It cannot use
// taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
// operation may cause interrupts to be missed - including the
// ticks.

// Prevent the real time kernel swapping out the task.
    vTaskSuspendAll ();

// Perform the operation here. There is no need to use critical
// sections as we have all the microcontroller processing time.
// During this time interrupts will still operate and the real
// time kernel tick count will be maintained.

// ...

// The operation is complete. Restart the kernel. We want to force
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if( !xTaskResumeAll () )
    {
        taskYIELD ();
    }
}

```

返回 If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTaskGetTickCount** (void)

返回 The count of ticks since vTaskStartScheduler was called.

TickType_t **xTaskGetTickCountFromISR** (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

返回 The count of ticks since vTaskStartScheduler was called.

UBaseType_t **uxTaskGetNumberOfTasks** (void)

返回 The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char ***pcTaskGetName** (*TaskHandle_t* xTaskToQuery)

返回 The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t **xTaskGetHandle** (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

返回 The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

BaseType_t **xTaskGetStaticBuffers** (*TaskHandle_t* xTask, StackType_t **ppuxStackBuffer, StaticTask_t **ppxTaskBuffer)

Retrieve pointers to a statically created task's data structure buffer and stack buffer. These are the same buffers that are supplied at the time of creation.

参数

- **xTask** -- The task for which to retrieve the buffers.
- **ppuxStackBuffer** -- Used to return a pointer to the task's stack buffer.
- **ppxTaskBuffer** -- Used to return a pointer to the task's data structure buffer.

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

UBaseType_t **uxTaskGetStackHighWaterMark** (*TaskHandle_t* xTask)

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

参数 **xTask** -- Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

返回 The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle_t* xTask)

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

参数 **xTask** -- Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

返回 The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

void **vTaskSetApplicationTaskTag** (*TaskHandle_t* xTask, *TaskHookFunction_t* pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask. Passing xTask as NULL has the effect of setting the calling tasks hook function.

TaskHookFunction_t **xTaskGetApplicationTaskTag** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t **xTaskGetApplicationTaskTagFromISR** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void **vTaskSetThreadLocalStoragePointer** (*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue)

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish. The following two functions are used to set and query a pointer respectively.

void ***pvTaskGetThreadLocalStoragePointer** (*TaskHandle_t* xTaskToQuery, BaseType_t xIndex)

```
void vApplicationGetIdleTaskMemory (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t
                                   **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

参数

- **ppxIdleTaskTCBBuffer** -- A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** -- A handle to a statically allocated Stack buffer for the idle task
- **pulIdleTaskStackSize** -- A pointer to the number of elements that will fit in the allocated stack buffer

```
BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)
```

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

pvParameter is passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

```
TaskHandle_t xTaskGetIdleTaskHandle (void)
```

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task of the current core. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

```
UBaseType_t uxTaskGetSystemState (TaskStatus_t *const pxTaskStatusArray, const UBaseType_t
                                   uxArraySize, configRUN_TIME_COUNTER_TYPE *const
                                   pulTotalRunTime)
```

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    configRUN_TIME_COUNTER_TYPE ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
```

(下页继续)

```

    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
        ↪ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter /
                ↪ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",
                    ↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                    ↪ulStatsAsPercentage );

                else
                {
                    // If the percentage is zero here then the task has
                    // consumed less than 1% of the total run time.
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",
                    ↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );

                    pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
                }
            }

            // The array is no longer needed, free the memory it consumes.
            vPortFree( pxTaskStatusArray );
        }
    }

```

参数

- **pxTaskStatusArray** -- A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** -- The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** -- If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see <https://www.FreeRTOS.org/rtos-run-time-stats.html>) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

返回 The number of `TaskStatus_t` structures that were populated by `uxTaskGetSystemState()`. This should equal the number returned by the `uxTaskGetNumberOfTasks()` API function, but will be zero if the value passed in the `uxArraySize` parameter was too small.

void **vTaskList** (char *pcWriteBuffer)

`configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskList()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays task: names, states, priority, stack usage and task number. Stack usage specified as the number of unused `StackType_t` words stack can hold on top of stack - not the number of bytes.

`vTaskList()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskList()`.

参数 pcWriteBuffer -- A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **vTaskGetRunTimeStats** (char *pcWriteBuffer)

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. Calling `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskGetRunTimeStats()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

`vTaskGetRunTimeStats()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskGetRunTimeStats()`.

参数 pcWriteBuffer -- A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

`configRUN_TIME_COUNTER_TYPE` **ulTaskGetIdleRunTimeCounter** (void)

`configGENERATE_RUN_TIME_STATS`, `configUSE_STATS_FORMATTING_FUNCTIONS` and `INCLUDE_xTaskGetIdleTaskHandle` must all be defined as 1 for these functions to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. While `uxTaskGetSystemState()` and `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, `ulTaskGetIdleRunTimeCounter()` returns the total execution time of just the idle task and `ulTaskGetIdleRunTimePercent()` returns the percentage of the CPU time used by just the idle task.

Note the amount of idle time is only a good measure of the slack time in a system if there are no other tasks executing at the idle priority, tickless idle is not used, and `configIDLE_SHOULD_YIELD` is set to 0.

备注: If `configNUMBER_OF_CORES > 1`, calling this function will query the idle task of the current core.

返回 The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` macros.

`configRUN_TIME_COUNTER_TYPE` **ulTaskGetIdleRunTimePercent** (void)

`BaseType_t` **xTaskGenericNotifyWait** (`UBaseType_t` uxIndexToWaitOn, `uint32_t` ulBitsToClearOnEntry, `uint32_t` ulBitsToClearOnExit, `uint32_t` *pulNotificationValue, `TickType_t` xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyWait()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyWait()` is equivalent to calling `xTaskNotifyWaitIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

参数

- **uxIndexToWaitOn** -- The index within the calling task's array of notification values on which the calling task will wait for a notification to be received. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyWait()` does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** -- Bits that are set in `ulBitsToClearOnEntry` value will be cleared in the calling task's notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting `ulBitsToClearOnEntry` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0. Setting `ulBitsToClearOnEntry` to 0 will leave the task's notification value unchanged.
- **ulBitsToClearOnExit** -- If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task's notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any bits that are set in `ulBitsToClearOnExit` will be cleared in the task's notification value (note `*pulNotificationValue` is set before any bits are cleared). Setting `ulBitsToClearOnExit` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task's notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task's notification value).
- **pulNotificationValue** -- Used to pass the task's notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- **xTicksToWait** -- The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

返回 If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

```
void vTaskGenericNotifyGiveFromISR (TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify,
                                     BaseType_t *pxHigherPriorityTaskWoken)
```

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the

need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

参数

- **`xTaskToNotify`** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **`uxIndexToNotify`** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGiveFromISR()` does not have this parameter and always sends notifications to index 0.
- **`pxHigherPriorityTaskWoken`** -- `vTaskNotifyGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `vTaskNotifyGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

`BaseType_t xTaskGenericNotifyStateClear` (*TaskHandle_t* xTask, `UBaseType_t` uxIndexToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be 'pending' until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set `xTask` to `NULL` to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

参数

- **xTask** -- The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task's handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task's name in a call to xTaskGetHandle().
- **uxIndexToClear** -- The index within the target task's array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

返回 pdTRUE if the task's notification state was set to eNotWaitingNotification, otherwise pdFALSE.

uint32_t **ulTaskGenericNotifyValueClear** (*TaskHandle_t* xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

参数

- **xTask** -- The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task's handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task's name in a call to xTaskGetHandle().
- **uxIndexToClear** -- The index within the target task's array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** -- Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task's notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task's notification value without clearing any bits.

返回 The value of the target task's notification value before the bits specified by ulBitsToClear were cleared.

void **vTaskSetTimeoutState** (Timeout_t *const pxTimeout)

Capture the current time for future use with xTaskCheckForTimeout().

参数 pxTimeout -- Pointer to a timeout object into which the current time is to be captured. The captured time includes the tick count and the number of times the tick count has overflowed since the system first booted.

BaseType_t **xTaskCheckForTimeout** (Timeout_t *const pxTimeout, TickType_t *const pxTicksToWait)

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeoutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```

// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
        // any time that has been spent in the Blocked state within this
        // function so far to ensure the total amount of time spent in the
        // Blocked state does not exceed MAX_TIME_TO_WAIT.
        if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
        {
            //Timed out before the wanted number of bytes were available,
            // exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the
        // receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake( pdTRUE, xTicksToWait );
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
    // The actual number of bytes read (which might be less than
    // uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                                pucBuffer,
                                                uxWantedBytes );

    return uxReceived;
}

```

参见:

<https://www.FreeRTOS.org/xTaskCheckForTimeOut.html>

参数

- **pxTimeOut** -- The time status as captured previously using `vTaskSetTimeOutState`. If the timeout has not yet occurred, it is updated to reflect the current time status.

- **pxTicksToWait** -- The number of ticks to check for timeout i.e. if pxTicksToWait ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckForTimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated to reflect the number of remaining ticks.

返回 If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait is updated to reflect the number of remaining ticks.

BaseType_t **xTaskCatchUpTicks** (TickType_t xTicksToCatchUp)

This function corrects the tick count value after the application code has held interrupts disabled for an extended period resulting in tick interrupts having been missed.

This function is similar to vTaskStepTick(), however, unlike vTaskStepTick(), xTaskCatchUpTicks() may move the tick count forward past a time at which a task should be removed from the blocked state. That means tasks may have to be removed from the blocked state as the tick count is moved.

参数 xTicksToCatchUp -- The number of tick interrupts that have been missed due to interrupts being disabled. Its value is not computed automatically, so must be computed by the application writer.

返回 pdTRUE if moving the tick count forward resulted in a task leaving the blocked state and a context switch being performed. Otherwise pdFALSE.

Structures

struct **xTASK_STATUS**

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

Public Members

TaskHandle_t **xHandle**

The handle of the task to which the rest of the information in the structure relates.

const char ***pcTaskName**

A pointer to the task's name. This value will be invalid if the task was deleted since the structure was populated!

UBaseType_t **xTaskNumber**

A number unique to the task.

eTaskState **eCurrentState**

The state in which the task existed when the structure was populated.

UBaseType_t **uxCurrentPriority**

The priority at which the task was running (may be inherited) when the structure was populated.

UBaseType_t **uxBasePriority**

The priority to which the task will return if the task's current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE_MUTEXES is defined as 1 in FreeRTOSConfig.h.

configRUN_TIME_COUNTER_TYPE **ulRunTimeCounter**

The total run time allocated to the task so far, as defined by the run time stats clock. See <https://www.FreeRTOS.org/rtos-run-time-stats.html>. Only valid when configGENERATE_RUN_TIME_STATS is defined as 1 in FreeRTOSConfig.h.

StackType_t ***pxStackBase**

Points to the lowest address of the task's stack area.

configSTACK_DEPTH_TYPE **usStackHighWaterMark**

The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

BaseType_t **xCoreID**

Core this task is pinned to (0, 1, or tskNO_AFFINITY). If configNUMBER_OF_CORES == 1, this will always be 0.

Macros

tskIDLE_PRIORITY

Defines the priority used by the idle task. This must not be modified.

tskNO_AFFINITY

Macro representing an unpinned (i.e., "no affinity") task in xCoreID parameters

taskVALID_CORE_ID (xCoreID)

Macro to check if an xCoreID value is valid

返回 pdTRUE if valid, pdFALSE otherwise.

taskYIELD ()

Macro for forcing a context switch.

taskENTER_CRITICAL (x)

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

taskENTER_CRITICAL_FROM_ISR ()

taskENTER_CRITICAL_ISR (x)

taskEXIT_CRITICAL (x)

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_FROM_ISR (x)

taskEXIT_CRITICAL_ISR (x)

taskDISABLE_INTERRUPTS ()

Macro to disable all maskable interrupts.

taskENABLE_INTERRUPTS ()

Macro to enable microcontroller interrupts.

taskSCHEDULER_SUSPENDED

Definitions returned by xTaskGetSchedulerState(). taskSCHEDULER_SUSPENDED is 0 to generate more optimal code when configASSERT() is defined as the constant is used in assert() statements.

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING**xTaskNotifyIndexed** (xTaskToNotify, uxIndexToNotify, ulValue, eAction)See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification to be pending. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

eIncrement - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithOverwrite - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

pdPreviousNotificationValue - Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

参数

- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotify()` does not have this parameter and always sends notifications to index 0.
- **ulValue** -- Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** -- Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:

返回 Dependent on the value of `eAction`. See the description of the `eAction` parameter.

xTaskNotifyAndQueryIndexed (`xTaskToNotify`, `uxIndexToNotify`, `ulValue`, `eAction`, `pulPreviousNotifyValue`)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`xTaskNotifyAndQueryIndexed()` performs the same operation as `xTaskNotifyIndexed()` with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional `pulPreviousNotifyValue` parameter.

`xTaskNotifyAndQuery()` performs the same operation as `xTaskNotify()` with the addition that it also returns the subject task's prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional `pulPreviousNotifyValue` parameter.

xTaskNotifyIndexedFromISR (`xTaskToNotify`, `uxIndexToNotify`, `ulValue`, `eAction`, `pxHigherPriorityTaskWoken`)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

A version of `xTaskNotifyIndexed()` that can be used from an interrupt service routine (ISR).

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyFromISR()` is equivalent to calling `xTaskNotifyIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

eSetBits - The task's notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

eIncrement - The task's notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

eSetValueWithOverwrite - The task's notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task's notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

参数

- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue** -- Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction** -- Specifies how the notification updates the task's notification value, if at all. Valid values for eAction are as follows:
- **pxHigherPriorityTaskWoken** -- xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

返回 Dependent on the value of eAction. See the description of the eAction parameter.

xTaskNotifyAndQueryIndexedFromISR (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyWait (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyWaitIndexed (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyGiveIndexed (xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task's notification array in a manner similar to giving a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these macros to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`xTaskNotifyGiveIndexed()` is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the `xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGiveIndexed()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyGive()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyGive()` is equivalent to calling `xTaskNotifyGiveIndexed()` with the `uxIndexToNotify` parameter set to 0.

参数

- **`xTaskToNotify`** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **`uxIndexToNotify`** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGive()` does not have this parameter and always sends notifications to index 0.

返回 `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

`vTaskNotifyGiveFromISR` (`xTaskToNotify`, `pxHigherPriorityTaskWoken`)

`vTaskNotifyGiveIndexedFromISR` (`xTaskToNotify`, `uxIndexToNotify`, `pxHigherPriorityTaskWoken`)

`ulTaskNotifyTakeIndexed` (`uxIndexToWaitOn`, `xClearCountOnExit`, `xTicksToWait`)

Waits for a direct to task notification on a particular index in the calling task's notification array in a manner similar to taking a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`ulTaskNotifyTakeIndexed()` is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the `xSemaphoreTake()` API function, the equivalent action that instead uses a task notification is `ulTaskNotifyTakeIndexed()`.

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the `xTaskNotifyGiveIndexed()` macro, or `xTaskNotifyIndex()` function with the `eAction` parameter set to `eIncrement`.

`ulTaskNotifyTakeIndexed()` can either clear the task's notification value at the array index specified by the `uxIndexToWaitOn` parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification. The task does not consume any CPU time while it is in the Blocked state.

Where as `xTaskNotifyWaitIndexed()` will return when a notification is pending, `ulTaskNotifyTakeIndexed()` will return when the task's notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyTake()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `ulTaskNotifyTake()` is equivalent to calling `ulTaskNotifyTakeIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

参数

- **`uxIndexToWaitOn`** -- The index within the calling task's array of notification values on which the calling task will wait for a notification to be non-zero. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.
- **`xClearCountOnExit`** -- if `xClearCountOnExit` is `pdFALSE` then the task's notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If `xClearCountOnExit` is not `pdFALSE` then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **`xTicksToWait`** -- The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when `ulTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

返回 The task's notification count before it is either cleared to zero or decremented (see the `xClearCountOnExit` parameter).

`xTaskNotifyStateClear` (`xTask`)

`xTaskNotifyStateClearIndexed` (`xTask`, `uxIndexToClear`)

`ulTaskNotifyValueClear` (`xTask`, `ulBitsToClear`)

`ulTaskNotifyValueClearIndexed` (`xTask`, `uxIndexToClear`, `ulBitsToClear`)

Type Definitions

```
typedef struct tskTaskControlBlock *TaskHandle_t
```

```
typedef BaseType_t (*TaskHookFunction_t)(void*)
```

Defines the prototype to which the application task hook function must conform.

```
typedef struct xTASK_STATUS TaskStatus_t
```

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

Enumerations

```
enum eTaskState
```

Task states returned by eTaskGetState.

Values:

```
enumerator eRunning
```

A task is querying the state of itself, so must be running.

```
enumerator eReady
```

The task being queried is in a ready or pending ready list.

```
enumerator eBlocked
```

The task being queried is in the Blocked state.

```
enumerator eSuspended
```

The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.

```
enumerator eDeleted
```

The task being queried has been deleted, but its TCB has not yet been freed.

```
enumerator eInvalid
```

Used as an 'invalid state' value.

```
enum eNotifyAction
```

Actions that can be performed when vTaskNotify() is called.

Values:

```
enumerator eNoAction
```

Notify the task without updating its notify value.

```
enumerator eSetBits
```

Set bits in the task's notification value.

```
enumerator eIncrement
```

Increment the task's notification value.

```
enumerator eSetValueWithOverwrite
```

Set the task's notification value to a specific value even if the previous value has not yet been read by the task.

enumerator eSetValueWithoutOverwrite

Set the task's notification value if the previous value has been read by the task.

enum eSleepModeStatus

Possible return values for eTaskConfirmSleepModeStatus().

Values:

enumerator eAbortSleep

A task has been made ready or a context switch pended since portSUPPRESS_TICKS_AND_SLEEP() was called - abort entering a sleep mode.

enumerator eStandardSleep

Enter a sleep mode that will not last any longer than the expected idle time.

队列 API**Header File**

- [components/freertos/FreeRTOS-Kernel/include/freertos/queue.h](#)
- This header file can be included with:

```
#include "freertos/queue.h"
```

Functions

BaseType_t **xQueueGenericSend** (*QueueHandle_t* xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
```

(下页继续)

```

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10,
↳queueSEND_TO_BACK ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = &xMessage;
xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0,
↳queueSEND_TO_BACK );
}

//... Rest of task code.
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** -- Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

BaseType_t **xQueuePeek** (*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
}

```

(下页继续)

```

} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxdMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueuePeek( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
        {
            // pxRxdMessage now points to the struct AMessage variable posted
            // by vATask, but the item still remains on the queue.
        }
    }

    // ... Rest of task code.
}

```

参数

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueuePeekFromISR** (QueueHandle_t xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a

buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

参数

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueReceive** (*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See `xQueueReceiveFromISR` for an alternative that can.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxdMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
    }
}

```

(下页继续)

(续上页)

```

if( xQueueReceive( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
{
    // pCRxdMessage now points to the struct AMessage variable posted
    // by vATask.
}

// ... Rest of task code.
}

```

参数

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

UBaseType_t **uxQueueMessagesWaiting** (const [QueueHandle_t](#) xQueue)

Return the number of messages stored in a queue.

参数 **xQueue** -- A handle to the queue being queried.

返回 The number of messages available in the queue.

UBaseType_t **uxQueueSpacesAvailable** (const [QueueHandle_t](#) xQueue)

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

参数 **xQueue** -- A handle to the queue being queried.

返回 The number of spaces available in the queue.

void **vQueueDelete** ([QueueHandle_t](#) xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

参数 **xQueue** -- A handle to the queue to be deleted.

BaseType_t **xQueueGenericSendFromISR** ([QueueHandle_t](#) xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendToBackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;
}

```

(下页继续)

```

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post each byte.
    xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
↪ queueSEND_TO_BACK );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if( xHigherPriorityTaskWokenByPost )
{
    portYIELD_FROM_ISR();
}
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- **xCopyPosition** -- Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

BaseType_t **xQueueGiveFromISR** (*QueueHandle_t* xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t **xQueueReceiveFromISR** (*QueueHandle_t* xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```

QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
}

```

(下页继续)

```

}

// ...

// Post some characters that will be used within an ISR. If the queue
// is full then this task will block for xTicksToWait ticks.
cValueToPost = 'a';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
cValueToPost = 'b';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ... keep posting characters ... this task may block when the queue
// becomes full.

cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
BaseType_t xTaskWokenByReceive = pdFALSE;
char cRxdChar;

while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxdChar, &
↪xTaskWokenByReceive) )
{
// A character was received. Output the character now.
vOutputCharacter( cRxdChar );

// If removing the character from the queue woke the task that was
// posting onto the queue xTaskWokenByReceive will have been set to
// pdTRUE. No matter how many times this loop iterates only one
// task will be woken.
}

if( xTaskWokenByReceive != ( char ) pdFALSE;
{
taskYIELD ();
}
}

```

参数

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** -- A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueIsQueueEmptyFromISR** (const [QueueHandle_t](#) xQueue)

Queries a queue to determine if the queue is empty. This function should only be used in an ISR.

参数 **xQueue** -- The handle of the queue being queried

返回 pdFALSE if the queue is not empty, or pdTRUE if the queue is empty.

BaseType_t **xQueueIsQueueFullFromISR** (const [QueueHandle_t](#) xQueue)

Queries a queue to determine if the queue is full. This function should only be used in an ISR.

参数 **xQueue** -- The handle of the queue being queried

返回 pdFALSE if the queue is not full, or pdTRUE if the queue is full.

UBaseType_t **uxQueueMessagesWaitingFromISR** (const *QueueHandle_t* xQueue)

A version of uxQueueMessagesWaiting() that can be called from an ISR. Return the number of messages stored in a queue.

参数 **xQueue** -- A handle to the queue being queried.

返回 The number of messages available in the queue.

void **vQueueAddToRegistry** (*QueueHandle_t* xQueue, const char *pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not affect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

If vQueueAddToRegistry is called more than once with the same xQueue parameter, the registry will store the pcQueueName parameter from the most recent call to vQueueAddToRegistry.

参数

- **xQueue** -- The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName** -- The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** (*QueueHandle_t* xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

参数 **xQueue** -- The handle of the queue being removed from the registry.

const char ***pcQueueGetName** (*QueueHandle_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue's handle.

参数 **xQueue** -- The handle of the queue the name of which will be returned.

返回 If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

QueueSetHandle_t **xQueueCreateSet** (const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

参数 uxEventQueueLength -- Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to $(5 + 12 + 1)$, or 18.
- If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to $(1 + 1 + 1)$, or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to $(5 + 3)$, or 8.

返回 If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

BaseType_t **xQueueAddToSet** (*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

参数

- **xQueueOrSemaphore** -- The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** -- The handle of the queue set to which the queue or semaphore is being added.

返回 If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

BaseType_t **xQueueRemoveFromSet** (*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

参数

- **xQueueOrSemaphore** -- The handle of the queue or semaphore being removed from the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** -- The handle of the queue set in which the queue or semaphore is included.

返回 If the queue or semaphore was successfully removed from the queue set then `pdPASS` is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then `pdFAIL` is returned.

QueueSetMemberHandle_t **xQueueSelectFromSet** (*QueueSetHandle_t* xQueueSet, const TickType_t xTicksToWait)

`xQueueSelectFromSet()` selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). `xQueueSelectFromSet()` effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

参数

- **xQueueSet** -- The queue set on which the task will (potentially) block.
- **xTicksToWait** -- The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

返回 `xQueueSelectFromSet()` will return the handle of a queue (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that contains data, or the handle of a semaphore (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

[*QueueSetMemberHandle_t*](#) **xQueueSelectFromSetFromISR** ([*QueueSetHandle_t*](#) xQueueSet)

A version of `xQueueSelectFromSet()` that can be used from an ISR.

Macros

xQueueCreate (uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {

```

(下页继续)

```
// Queue was not created and must not be used.
}

// ... Rest of task code.
}
```

参数

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

返回 If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

xQueueCreateStatic (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
    →hold.
                            ITEM_SIZE // The size of each item in the queue
    →hold the items in the queue.
                            &( ucQueueStorage[ 0 ] ), // The buffer that will
    →queue structure.
                            &xQueueBuffer ); // The buffer that will hold the

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.
```

(下页继续)

```
// ... Rest of task code.
}
```

参数

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** -- If uxItemSize is not zero then pucQueueStorage must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemSize) bytes. If uxItemSize is zero then pucQueueStorage can be NULL.
- **pxQueueBuffer** -- Must point to a variable of type StaticQueue_t, which will be used to hold the queue's data structure.

返回 If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

xQueueGetStaticBuffers (xQueue, ppucQueueStorage, ppxStaticQueue)

Retrieve pointers to a statically created queue's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

参数

- **xQueue** -- The queue for which to retrieve the buffers.
- **ppucQueueStorage** -- Used to return a pointer to the queue's storage area buffer.
- **ppxStaticQueue** -- Used to return a pointer to the queue's data structure buffer.

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

xQueueSendToFront (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...
```

(下页继续)

```

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    ↪pdPASS )
    {
// Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
    pxMessage = &xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

```

(下页继续)

```

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = &xMessage;
xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSend (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

```

(下页继续)

```

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueOverwrite (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

Example usage:

```

void vFunction( void *pvParameters )
{
QueueHandle_t xQueue;
uint32_t ulVarToSend, ulValReceived;

// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwrite() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue. A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
// Error unless the item was removed by a different task.
}

// The queue is still full. Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
// Error!
}

// ...
}

```

参数

- **xQueue** -- The handle of the queue to which the data is being sent.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

返回 xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.

xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called

from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        taskYIELD ();
    }
}
```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;
```

(下页继续)

```

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
  cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
  xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
  taskYIELD ();
}
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueOverwriteFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```

QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwriteFromISR() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
// xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
BaseType_t xHigherPriorityTaskWoken = pdFALSE;
uint32_t ulVarToSend, ulValReceived;

```

(下页继续)

```

// Write the value 10 to the queue using xQueueOverwriteFromISR().
ulVarToSend = 10;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// The queue is full, but calling xQueueOverwriteFromISR() again will still
// pass because the value held in the queue will be overwritten with the
// new value.
ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

// ...

if( xHigherPriorityTaskWoken == pdTRUE )
{
// Writing to the queue caused a task to unblock and the unblocked task
// has a priority higher than or equal to the priority of the currently
// executing task (the task this interrupt interrupted). Perform a context
// switch so this interrupt returns directly to the unblocked task.
portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

xQueueSendFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
 BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

```

```

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
    xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
// Actual macro used here is port specific.
    portYIELD_FROM_ISR ();
}
}

```

参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueReset (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

Type Definitions

```
typedef struct QueueDefinition *QueueHandle_t
```

```
typedef struct QueueDefinition *QueueSetHandle_t
```

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

```
typedef struct QueueDefinition *QueueSetMemberHandle_t
```

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

```

Macros**semBINARY_SEMAPHORE_QUEUE_LENGTH****semSEMAPHORE_QUEUE_ITEM_LENGTH****semGIVE_BLOCK_TIME****vSemaphoreCreateBinary** (xSemaphore)

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

This old vSemaphoreCreateBinary() macro is now deprecated in favour of the xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be 'given' before it can be 'taken'.

Macro that implements a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as we don't want to actually store any data - we just want to know if the queue is empty or full.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary ().
    // This is a macro so pass the variable in directly.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

参数

- **xSemaphore** -- Handle to the created semaphore. Should be of type SemaphoreHandle_t.

xSemaphoreCreateBinary ()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see

<https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old `vSemaphoreCreateBinary()` macro is now deprecated in favour of this `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the the semaphore must first be 'given' before it can be 'taken'.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

返回 Handle to the created semaphore, or NULL if the memory required to hold the semaphore's data structures could not be allocated.

xSemaphoreCreateBinaryStatic (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;
```

(下页继续)

```

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinary( &xSemaphoreBuffer );

    // Rest of task code goes here.
}

```

参数

- **pxStaticSemaphore** -- Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

返回 If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

xSemaphoreTake (xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = xSemaphoreCreateBinary();
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.

            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
    }
    else
    {

```

(下页继续)

```
// We could not obtain the semaphore and can therefore not access
// the shared resource safely.
    }
}
}
```

参数

- **xSemaphore** -- A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime** -- The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

返回 pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

xSemaphoreTakeRecursive (xMutex, xBlockTime)

Macro to recursively obtain, or 'take', a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called xSemaphoreGiveRecursive() for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

Example usage:

```
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...

            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
```

(下页继续)

```

// a more complex call structure.
    xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
    xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

// The mutex has now been 'taken' three times, so will not be
// available to another task until it has also been given back
// three times. Again it is unlikely that real code would have
// these calls sequentially, but instead buried in a more complex
// call structure. This is just for illustrative purposes.
    xSemaphoreGiveRecursive( xMutex );
    xSemaphoreGiveRecursive( xMutex );
    xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
}
else
{
// We could not obtain the mutex and can therefore not access
// the shared resource safely.
}
}
}

```

参数

- **xMutex** -- A handle to the mutex being obtained. This is the handle returned by `xSemaphoreCreateRecursiveMutex()`;
- **xBlockTime** -- The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then `xSemaphoreTakeRecursive()` will return immediately no matter what the value of `xBlockTime`.

返回 `pdTRUE` if the semaphore was obtained. `pdFALSE` if `xBlockTime` expired without the semaphore becoming available.

xSemaphoreGive (xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`, and obtained using `xSemaphoreTake()`.

This macro must not be used from an ISR. See `xSemaphoreGiveFromISR()` for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using `xSemaphoreCreateRecursiveMutex()`.

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
// Create the semaphore to guard a shared resource.
xSemaphore = vSemaphoreCreateBinary();

if( xSemaphore != NULL )
{
if( xSemaphoreGive( xSemaphore ) != pdTRUE )
{
// We would expect this call to fail because we cannot give

```

(下页继续)

```

// a semaphore without first "taking" it!
}

// Obtain the semaphore - don't block if the semaphore is not
// immediately available.
if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
{
// We now have the semaphore and can access the shared resource.

// ...

// We have finished accessing the shared resource so can free the
// semaphore.
if( xSemaphoreGive( xSemaphore ) != pdTRUE )
{
// We would not expect this call to fail because we must have
// obtained the semaphore to get here.
}
}
}
}

```

参数

- **xSemaphore** -- A handle to the semaphore being released. This is the handle returned when the semaphore was created.

返回 pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

xSemaphoreGiveRecursive (xMutex)

Macro to recursively release, or 'give', a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called xSemaphoreGiveRecursive() for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
// Create the mutex to guard a shared resource.
xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
// ... Do other things.

if( xMutex != NULL )

```

(下页继续)

```

{
// See if we can obtain the mutex.  If the mutex is not available
// wait 10 ticks to see if it becomes free.
if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
    {
// We were able to obtain the mutex and can now access the
// shared resource.

// ...
// For some reason due to the nature of the code further calls to
// xSemaphoreTakeRecursive() are made on the same mutex.  In real
// code these would not be just sequential calls as this would make
// no sense.  Instead the calls are likely to be buried inside
// a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

// The mutex has now been 'taken' three times, so will not be
// available to another task until it has also been given back
// three times.  Again it is unlikely that real code would have
// these calls sequentially, it would be more likely that the calls
// to xSemaphoreGiveRecursive() would be called as a call stack
// unwound.  This is just for demonstrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
    }
else
    {
// We could not obtain the mutex and can therefore not access
// the shared resource safely.
    }
}
}

```

参数

- **xMutex** -- A handle to the mutex being released, or 'given'. This is the handle returned by xSemaphoreCreateMutex();

返回 pdTRUE if the semaphore was given.

xSemaphoreGiveFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```

#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )

```

(下页继续)

```

{
  for( ;; )
  {
    // We want this task to run every 10 ticks of a timer. The semaphore
    // was created before this task was started.

    // Block waiting for the semaphore to become available.
    if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
    {
      // It is time to execute.

      // ...

      // We have finished our task. Return to the top of the loop where
      // we will block on the semaphore until it is time to execute
      // again. Note when using the semaphore for synchronisation with an
      // ISR in this manner there is no need to 'give' the semaphore back.
    }
  }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
  static uint8_t ucLocalTickCount = 0;
  static BaseType_t xHigherPriorityTaskWoken;

  // A timer tick has occurred.

  // ... Do other time functions.

  // Is it time for vATask () to run?
  xHigherPriorityTaskWoken = pdFALSE;
  ucLocalTickCount++;
  if( ucLocalTickCount >= TICKS_TO_WAIT )
  {
    // Unblock the task by releasing the semaphore.
    xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

    // Reset the count so we release the semaphore again in 10 ticks time.
    ucLocalTickCount = 0;
  }

  if( xHigherPriorityTaskWoken != pdFALSE )
  {
    // We can force a context switch here. Context switching from an
    // ISR uses port specific syntax. Check the demo task for your port
    // to find the syntax required.
  }
}

```

参数

- **xSemaphore** -- A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -- xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

参数

- **xSemaphore** -- A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -- xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

xSemaphoreCreateMutex ()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

返回 If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

xSemaphoreCreateMutexStatic (pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using `xSemaphoreCreateMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateMutex()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using `xSemaphoreCreateMutexStatic()` then the application writer must provide the memory. `xSemaphoreCreateMutexStatic()` therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the `xSemaphoreTake()` and `xSemaphoreGive()` macros. The `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

参数

- **pxMutexBuffer** -- Must point to a variable of type `StaticSemaphore_t`, which will be used to hold the mutex's data structure, removing the need for the memory to be allocated dynamically.

返回 If the mutex was successfully created then a handle to the created mutex is returned. If `pxMutexBuffer` was `NULL` then `NULL` is returned.

xSemaphoreCreateRecursiveMutex ()

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a

task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

返回 xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

xSemaphoreCreateRecursiveMutexStatic (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

```

参数

- **pxStaticSemaphore** -- Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex's data structure, removing the need for the memory to be allocated dynamically.

返回 If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxStaticSemaphore was NULL then NULL is returned.

xSemaphoreCreateCounting (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
SemaphoreHandle_t xSemaphore = NULL;

// Semaphore cannot be used before a call to xSemaphoreCreateCounting().
// The max value to which the semaphore can count should be 10, and the
// initial value assigned to the count should be 0.
xSemaphore = xSemaphoreCreateCounting( 10, 0 );

if( xSemaphore != NULL )
{
// The semaphore was created successfully.
// The semaphore can now be used.
}
}

```

参数

- **uxMaxCount** -- The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.

返回 Handle to the created semaphore. Null if the semaphore could not be created.

xSemaphoreCreateCountingStatic (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the - maximum count value, indicating that all resources are free.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
SemaphoreHandle_t xSemaphore = NULL;

// Counting semaphore cannot be used before they have been created. Create
// a counting semaphore using xSemaphoreCreateCountingStatic(). The max
// value to which the semaphore can count is 10, and the initial value
// assigned to the count will be 0. The address of xSemaphoreBuffer is
// passed in and will be used to hold the semaphore structure, so no dynamic
// memory allocation will be used.
xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

// No memory allocation was attempted so xSemaphore cannot be NULL, so there
// is no need to check its value.
}

```

参数

- **uxMaxCount** -- The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer** -- Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

返回 If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

vSemaphoreDelete (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

参数

- **xSemaphore** -- A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

uxSemaphoreGetCountFromISR (xSemaphore)

semphr.h

```

UBaseType_t uxSemaphoreGetCountFromISR( SemaphoreHandle_t xSemaphore );

```

If the semaphore is a counting semaphore then uxSemaphoreGetCountFromISR() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCountFromISR() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

xSemaphoreGetStaticBuffer (xSemaphore, ppxSemaphoreBuffer)

Retrieve pointer to a statically created binary semaphore, counting semaphore, or mutex semaphore's data structure buffer. This is the same buffer that is supplied at the time of creation.

参数

- **xSemaphore** -- The semaphore for which to retrieve the buffer.
- **ppxSemaphoreBuffer** -- Used to return a pointer to the semaphore's data structure buffer.

返回 pdTRUE if buffer was retrieved, pdFALSE otherwise.

```

Functions

TimerHandle_t **xTimerCreate** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const BaseType_t xAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* #define NUM_TIMERS 5
*
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
*
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
*
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
```

(下页继续)

```

* {
* int32_t lArrayIndex;
* const int32_t xMaxExpiryCountBeforeStopping = 10;
*
* // Optionally do something if the pxTimer parameter is NULL.
* configASSERT( pxTimer );
*
* // Which timer expired?
* lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*
* // Increment the number of times that pxTimer has expired.
* lExpireCounters[ lArrayIndex ] += 1;
*
* // If the timer has expired 10 times then stop it from running.
* if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
* {
*     // Do not use a block time if calling a timer API function from a
*     // timer callback function, as doing so could cause a deadlock!
*     xTimerStop( pxTimer, 0 );
* }
* }
*
* void main( void )
* {
* int32_t x;
*
* // Create then start some timers. Starting the timers before the
↳scheduler
* // has been started means the timers will start running immediately that
* // the scheduler starts.
* for( x = 0; x < NUM_TIMERS; x++ )
* {
*     xTimers[ x ] = xTimerCreate( "Timer", // Just a text
↳name, not used by the kernel.
*                               ( 100 * ( x + 1 ) ), // The timer
↳period in ticks.
*                               pdTRUE, // The timers
↳will auto-reload themselves when they expire.
*                               ( void * ) x, // Assign each
↳timer a unique id equal to its array index.
*                               vTimerCallback // Each timer
↳calls the same callback when it expires.
*                               );
*
*     if( xTimers[ x ] == NULL )
*     {
*         // The timer was not created.
*     }
*     else
*     {
*         // Start the timer. No block time is specified, and even if one
↳was
*         // it would be ignored because the scheduler has not yet been
*         // started.
*         if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
*         {
*             // The timer could not be set into the Active state.
*         }
*     }
* }
* }

```

```

* // ...
* // Create tasks here.
* // ...
*
* // Starting the scheduler will start the timers running as they have_
↪already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

参数

- **pcTimerName** -- A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** -- The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xTimerPeriodInTicks` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xPeriod` can be set to $(500 / \text{portTICK_PERIOD_MS})$ provided `configTICK_RATE_HZ` is less than or equal to 1000. Time timer period must be greater than 0.
- **xAutoReload** -- If `xAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `xAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** -- An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** -- The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is "void vCallbackFunction(TimerHandle_t xTimer);".

返回 If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created because there is insufficient FreeRTOS heap remaining to allocate the timer structures then `NULL` is returned.

TimerHandle_t **xTimerCreateStatic** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const BaseType_t xAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction, StaticTimer_t *pxTimerBuffer)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```

*
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created. After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
*     UBaseType_t *puxVariableToIncrement;
*     BaseType_t xReturned;
*
*     // Obtain the address of the variable to increment from the timer ID.
*     puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(
*     ↪xExpiredTimer );
*
*     // Increment the variable to show the timer callback has executed.
*     ( *puxVariableToIncrement )++;
*
*     // If this callback has executed the required number of times, stop the
*     // timer.
*     if( *puxVariableToIncrement == 5 )
*     {
*         // This is called from a timer callback so must not block.
*         xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*     }
* }
*
* void main( void )
* {
*     // Create the software time. xTimerCreateStatic() has an extra parameter
*     // than the normal xTimerCreate() API function. The parameter is a
*     ↪pointer
*     // to the StaticTimer_t structure that will hold the software timer
*     // structure. If the parameter is passed as NULL then the structure
*     ↪will be
*     // allocated dynamically, just as if xTimerCreate() had been called.
*     xTimer = xTimerCreateStatic( "T1", // Text name for the task.
*     ↪ Helps debugging only. Not used by FreeRTOS.
*     xTimerPeriod, // The period of the
*     ↪timer in ticks.
*     pdTRUE, // This is an auto-reload
*     ↪timer.
*     ( void * ) &uxVariableToIncrement, // A
*     ↪variable incremented by the software timer's callback function
*     prvTimerCallback, // The function to
*     ↪execute when the timer expires.
*     &xTimerBuffer ); // The buffer that will
*     ↪hold the software timer structure.
*
*     // The scheduler has not started yet so a block time is not used.
*     xReturned = xTimerStart( xTimer, 0 );
*
*     // ...
*     // Create tasks here.
*     // ...
*
* }

```

(下页继续)

```

* // Starting the scheduler will start the timers running as they have_
↪already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

参数

- **pcTimerName** -- A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** -- The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
- **xAutoReload** -- If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** -- An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** -- The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);".
- **pxTimerBuffer** -- Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer's data structures, removing the need for the memory to be allocated dynamically.

返回 If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

void ***pvTimerGetTimerID** (const *TimerHandle_t* xTimer)

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

参数 **xTimer** -- The timer being queried.

返回 The ID assigned to the timer being queried.

void **vTimerSetTimerID** (*TimerHandle_t* xTimer, void *pvNewID)

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

参数

- **xTimer** -- The timer being updated.
- **pvNewID** -- The ID to assign to the timer.

BaseType_t **xTimerIsTimerActive** (*TimerHandle_t* xTimer)

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is active, do something.
*     }
*     else
*     {
*         // xTimer is not active, do something else.
*     }
* }
*
```

参数 **xTimer** -- The timer being queried.

返回 pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

TaskHandle_t **xTimerGetTimerDaemonTaskHandle** (void)

Simply returns the handle of the timer service/daemon task. It is not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

BaseType_t **xTimerPendFunctionCallFromISR** (*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with 'Timer').

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```

*
* // The callback function that will execute in the context of the daemon_
* ↪task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*
*     // ...Perform the processing here...
* }
*
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t ) ↪
*     ↪xInterfaceToService, &xHigherPriorityTaskWoken );
*
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
*

```

参数

- **xFunctionToPend** -- The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** -- The value of the callback function's first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** -- The value of the callback function's second parameter.
- **pxHigherPriorityTaskWoken** -- As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

返回 pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

BaseType_t **xTimerPendFunctionCall** (*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with "Timer").

参数

- **xFunctionToPend** -- The function to execute from the timer service/ daemon task. The function must conform to the *PendedFunction_t* prototype.
- **pvParameter1** -- The value of the callback function's first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** -- The value of the callback function's second parameter.
- **xTicksToWait** -- Calling this function will result in a message being sent to the timer daemon task on a queue. *xTicksToWait* is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

返回 pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

const char ***pcTimerGetName** (*TimerHandle_t* xTimer)

Returns the name that was assigned to a timer when the timer was created.

参数 **xTimer** -- The handle of the timer being queried.

返回 The name assigned to the timer specified by the *xTimer* parameter.

void **vTimerSetReloadMode** (*TimerHandle_t* xTimer, const BaseType_t xAutoReload)

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数

- **xTimer** -- The handle of the timer being updated.
- **xAutoReload** -- If *xAutoReload* is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer's period (see the *xTimerPeriodInTicks* parameter of the *xTimerCreate()* API function). If *xAutoReload* is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

BaseType_t **xTimerGetReloadMode** (*TimerHandle_t* xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数 **xTimer** -- The handle of the timer being queried.

返回 If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

UBaseType_t **uxTimerGetReloadMode** (*TimerHandle_t* xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数 **xTimer** -- The handle of the timer being queried.

返回 If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTimerGetPeriod** (*TimerHandle_t* xTimer)

Returns the period of a timer.

参数 **xTimer** -- The handle of the timer being queried.

返回 The period of the timer in ticks.

TickType_t **xTimerGetExpiryTime** (*TimerHandle_t* xTimer)

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

参数 xTimer -- The handle of the timer being queried.

返回 If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

BaseType_t **xTimerGetStaticBuffer** (*TimerHandle_t* xTimer, StaticTimer_t **ppxTimerBuffer)

Retrieve pointer to a statically created timer's data structure buffer. This is the same buffer that is supplied at the time of creation.

参数

- **xTimer** -- The timer for which to retrieve the buffer.
- **ppxTimerBuffer** -- Used to return a pointer to the timers's data structure buffer.

返回 pdTRUE if the buffer was retrieved, pdFALSE otherwise.

void **vApplicationGetTimerTaskMemory** (StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

参数

- **ppxTimerTaskTCBBuffer** -- A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** -- A handle to a statically allocated Stack buffer for the idle task
- **pulTimerTaskStackSize** -- A pointer to the number of elements that will fit in the allocated stack buffer

Macros

xTimerStart (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerStart() was called, where 'n' is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

参数

- **xTimer** -- The handle of the timer being started/restarted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

返回 pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will

depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerStop (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStop()` stops a timer that was previously started using either of the `The xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` or `xTimerChangePeriodFromISR()` API functions.

Stopping a timer ensures the timer is not in the active state.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStop()` to be available.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

参数

- **xTimer** -- The handle of the timer being stopped.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStop()` was called. `xTicksToWait` is ignored if `xTimerStop()` is called before the scheduler is started.

返回 `pdFAIL` will be returned if the stop command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerChangePeriod (xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerChangePeriod()` changes the period of a timer that was previously created using the `xTimerCreate()` API function.

`xTimerChangePeriod()` can be called to change the period of an active or dormant state timer.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerChangePeriod()` to be available.

Example usage:

```
* // This function assumes xTimer has already been created. If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted. If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     →equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
```

(下页继续)

```

*      // xTimer is already active - delete it.
*      xTimerDelete( xTimer );
*    }
*    else
*    {
*      // xTimer is not active, change its period to 500ms. This will also
*      // cause the timer to start. Block for a maximum of 100 ticks if the
*      // change period command cannot immediately be sent to the timer
*      // command queue.
*      if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS )
*      {
*        // The command was successfully sent.
*      }
*      else
*      {
*        // The command could not be sent, even after waiting for 100
*        // ticks
*        // to pass. Take appropriate action here.
*      }
*    }
* }
*

```

参数

- **xTimer** -- The handle of the timer that is having its period changed.
- **xNewPeriod** -- The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

返回 pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerDelete (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.

参数

- **xTimer** -- The handle of the timer being deleted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

返回 pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerReset (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerReset() was called, where 'n' is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds
↪pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer.
*
* TimerHandle_t xBacklightTimer = NULL;
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
```

(下页继续)

```

*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
* }
*
* void main( void )
* {
*     int32_t x;
*
*     // Create then start the one-shot timer that is responsible for turning
*     // the back-light off if no keys are pressed within a 5 second period.
*     xBacklightTimer = xTimerCreate( "BacklightTimer",           // Just a
* ↪text name, not used by the kernel.
*
* ↪timer period in ticks.
*                                     ( 5000 / portTICK_PERIOD_MS), // The
* ↪is a one-shot timer.
*                                     pdFALSE,                       // The timer
* ↪not used by the callback so can take any value.
*                                     0,                             // The id is
* ↪callback function that switches the LCD back-light off.
*                                     vBacklightTimerCallback        // The
*                                     );
*
*     if( xBacklightTimer == NULL )
*     {
*         // The timer was not created.
*     }
*     else
*     {
*         // Start the timer. No block time is specified, and even if one was
*         // it would be ignored because the scheduler has not yet been
*         // started.
*         if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
*         {
*             // The timer could not be set into the Active state.
*         }
*     }
*
*     // ...
*     // Create tasks here.
*     // ...
*
*     // Starting the scheduler will start the timer running as it has already
*     // been set into the active state.
*     vTaskStartScheduler();
*
*     // Should not reach here.
*     for( ;; );
* }

```

参数

- **xTimer** -- The handle of the timer being reset/started/restarted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

返回 pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command

was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStartFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then restart the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
*     {
*         // The start command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed. The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler. Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).

```

(下页继续)

```
*   }
* }
*
```

参数

- **xTimer** -- The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the timer should be simply stopped.
*
* // The interrupt service routine that stops the timer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // The interrupt has occurred - simply stop the timer.
* // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
* // (within this function). As this is an interrupt service routine, only
* // FreeRTOS API functions that end in "FromISR" can be used.
* if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
* {
* // The stop command was not executed successfully. Take appropriate
* // action here.
* }
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*
```

参数

- **xTimer** -- The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerChangePeriodFromISR (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
*
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // The interrupt has occurred - change the period of xTimer to 500ms.
* // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
* // (within this function). As this is an interrupt service routine, only
* // FreeRTOS API functions that end in "FromISR" can be used.
* if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
* {
* // The command to change the timers period was not executed
* // successfully. Take appropriate action here.
* }
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*
```

参数

- **xTimer** -- The handle of the timer that is having its period changed.
- **xNewPeriod** -- The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been spec-

ified in milliseconds. For example, if the timer must expire after 100 ticks, then `xNewPeriod` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xNewPeriod` can be set to $(500 / \text{portTICK_PERIOD_MS})$ provided `configTICK_RATE_HZ` is less than or equal to 1000.

- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerChangePeriodFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerChangePeriodFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerChangePeriodFromISR()` function. If `xTimerChangePeriodFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

返回 `pdFAIL` will be returned if the command to change the timers period could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerResetFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of `xTimerReset()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
*     {
```

(下页继续)

```

*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed. The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler. Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*

```

参数

- **xTimer** -- The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Type Definitions

```
typedef struct tmrTimerControl *TimerHandle_t
```

```
typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
```

Defines the prototype to which timer callback functions must conform.

```
typedef void (*PendedFunction_t)(void*, uint32_t)
```

Defines the prototype to which functions used with the xTimerPendFunctionCallFromISR() function must conform.

```

Functions

EventGroupHandle_t **xEventGroupCreate** (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

返回 If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then `NULL` is returned. See <https://www.FreeRTOS.org/a00111.html>

EventGroupHandle_t **xEventGroupCreateStatic** (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

参数 pxEventGroupBuffer -- pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

返回 If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

EventBits_t xEventGroupWaitBits (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToWaitFor, const *BaseType_t* xClearOnExit, const *BaseType_t* xWaitForAllBits, *TickType_t* xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;
const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

// Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
// the event group. Clear the bits before exiting.
uxBits = xEventGroupWaitBits(
    xEventGroup,      // The event group being tested.
    BIT_0 | BIT_4,   // The bits within the event group to wait_
    →for.
    pdTRUE,          // BIT_0 and BIT_4 should be cleared before_
    →returning.
    pdFALSE,        // Don't wait for both bits, either bit will_
    →do.
    xTicksToWait ); // Wait a maximum of 100ms for either bit to_
    →be set.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
{
// xEventGroupWaitBits() returned because both bits were set.
}
else if( ( uxBits & BIT_0 ) != 0 )
{
// xEventGroupWaitBits() returned because just BIT_0 was set.
}
else if( ( uxBits & BIT_4 ) != 0 )
```

(下页继续)

```

    {
// xEventGroupWaitBits() returned because just BIT_4 was set.
    }
else
    {
// xEventGroupWaitBits() returned because xTicksToWait ticks passed
// without either BIT_0 or BIT_4 becoming set.
    }
}

```

参数

- **xEventGroup** -- The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToWaitFor** -- A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xClearOnExit** -- If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
- **xWaitForAllBits** -- If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
- **xTicksToWait** -- The maximum amount of time (specified in 'ticks') to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set. A value of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

返回 The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

EventBits_t xEventGroupClearBits (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;

// Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being cleared.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {

```

(下页继续)

```

// Both bit 0 and bit 4 were set before xEventGroupClearBits() was
// called. Both will now be clear (not set).
}
else if( ( uxBits & BIT_0 ) != 0 )
{
// Bit 0 was set before xEventGroupClearBits() was called. It will
// now be clear.
}
else if( ( uxBits & BIT_4 ) != 0 )
{
// Bit 4 was set before xEventGroupClearBits() was called. It will
// now be clear.
}
else
{
// Neither bit 0 nor bit 4 were set in the first place.
}
}

```

参数

- **xEventGroup** -- The event group in which the bits are to be cleared.
- **uxBitsToClear** -- A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

返回 The value of the event group before the specified bits were cleared.

EventBits_t xEventGroupSetBits (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBitsFromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;

// Set bit 0 and bit 4 in xEventGroup.
uxBits = xEventGroupSetBits(
            xEventGroup,    // The event group being updated.
            BIT_0 | BIT_4 ); // The bits being set.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
{
// Both bit 0 and bit 4 remained set when the function returned.
}
else if( ( uxBits & BIT_0 ) != 0 )
{
// Bit 0 remained set when the function returned, but bit 4 was
// cleared. It might be that bit 4 was cleared automatically as a
// task that was waiting for bit 4 was removed from the Blocked
// state.
}
else if( ( uxBits & BIT_4 ) != 0 )

```

(下页继续)

```

    {
// Bit 4 remained set when the function returned, but bit 0 was
// cleared. It might be that bit 0 was cleared automatically as a
// task that was waiting for bit 0 was removed from the Blocked
// state.
    }
else
{
// Neither bit 0 nor bit 4 remained set. It might be that a task
// was waiting for both of the bits to be set, and the bits were
// cleared as the task left the Blocked state.
    }
}

```

参数

- **xEventGroup** -- The event group in which the bits are to be set.
- **uxBitsToSet** -- A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

返回 The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

EventBits_t xEventGroupSync (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet, const *EventBits_t* uxBitsToWaitFor, *TickType_t* xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```

// Bits used by the three tasks.
#define TASK_0_BIT      ( 1 << 0 )
#define TASK_1_BIT      ( 1 << 1 )
#define TASK_2_BIT      ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

for( ;; )
{

```

(下页继续)

```

// Perform task functionality here.

// Set bit 0 in the event flag to note this task has reached the
// sync point. The other two tasks will set the other two bits defined
// by ALL_SYNC_BITS. All three tasks have reached the synchronisation
// point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
// for this to happen.
    uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
↪xTicksToWait );

if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
{
// All three tasks reached the synchronisation point before the call
// to xEventGroupSync() timed out.
}
}

void vTask1( void *pvParameters )
{
for( ;; )
{
// Perform task functionality here.

// Set bit 1 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
    xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
}
}

void vTask2( void *pvParameters )
{
for( ;; )
{
// Perform task functionality here.

// Set bit 2 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
    xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
}
}

```

参数

- **xEventGroup** -- The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToSet** -- The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWait` parameter are set.

- **uxBitsToWaitFor** -- A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xTicksToWait** -- The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by uxBitsToWaitFor to become set.

返回 The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

EventBits_t **xEventGroupGetBitsFromISR** (*EventGroupHandle_t* xEventGroup)

A version of xEventGroupGetBits() that can be called from an ISR.

参数 **xEventGroup** -- The event group being queried.

返回 The event group bits at the time xEventGroupGetBitsFromISR() was called.

void **vEventGroupDelete** (*EventGroupHandle_t* xEventGroup)

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

参数 **xEventGroup** -- The event group being deleted.

BaseType_t **xEventGroupGetStaticBuffer** (*EventGroupHandle_t* xEventGroup, StaticEventGroup_t **ppxEventGroupBuffer)

Retrieve a pointer to a statically created event groups's data structure buffer. It is the same buffer that is supplied at the time of creation.

参数

- **xEventGroup** -- The event group for which to retrieve the buffer.
- **ppxEventGroupBuffer** -- Used to return a pointer to the event groups's data structure buffer.

返回 pdTRUE if the buffer was retrieved, pdFALSE otherwise.

Macros

xEventGroupClearBitsFromISR (xEventGroup, uxBitsToClear)

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
// Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
                xEventGroup, // The event group being updated.
```

(下页继续)

```

        BIT_0 | BIT_4 ); // The bits being set.

if( xResult == pdPASS )
    {
// The message was posted successfully.
    portYIELD_FROM_ISR(pdTRUE);
    }
}

```

备注: If this function returns `pdPASS` then the timer task is ready to run and a `portYIELD_FROM_ISR(pdTRUE)` should be executed to perform the needed clear on the event group. This behavior is different from `xEventGroupSetBitsFromISR` because the parameter `xHigherPriorityTaskWoken` is not present.

参数

- **xEventGroup** -- The event group in which the bits are to be cleared.
- **uxBitsToClear** -- A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

返回 If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

xEventGroupSetBitsFromISR (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
BaseType_t xHigherPriorityTaskWoken, xResult;

// xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

// Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 // The bits being set.
        &xHigherPriorityTaskWoken );

// Was the message posted successfully?
if( xResult == pdPASS )
    {
// If xHigherPriorityTaskWoken is now set to pdTRUE then a context

```

(下页继续)

```

// switch should be requested. The macro used is port specific and
// will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
// refer to the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
}

```

参数

- **xEventGroup** -- The event group in which the bits are to be set.
- **uxBitsToSet** -- A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** -- As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

返回 If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupGetBits (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

参数

- **xEventGroup** -- The event group being queried.

返回 The event group bits at the time xEventGroupGetBits() was called.

Type Definitions

```
typedef struct EventGroupDef_t *EventGroupHandle_t
```

```
typedef TickType_t EventBits_t
```

流缓冲区 API**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h
- This header file can be included with:

```
#include "freertos/stream_buffer.h"
```

Functions

```
BaseType_t xStreamBufferGetStaticBuffers (StreamBufferHandle_t xStreamBuffer, uint8_t
                                         **ppucStreamBufferStorageArea, StaticStreamBuffer_t
                                         **ppxStaticStreamBuffer)
```

Retrieve pointers to a statically created stream buffer's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

参数

- **xStreamBuffer** -- The stream buffer for which to retrieve the buffers.
- **ppucStreamBufferStorageArea** -- Used to return a pointer to the stream buffer's storage area buffer.

- **ppxStaticStreamBuffer** -- Used to return a pointer to the stream buffer's data structure buffer.

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

size_t **xStreamBufferSend** (*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

参数

- **xStreamBuffer** -- The handle of the stream buffer to which a stream is being sent.
- **pvTxData** -- A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** -- The maximum number of bytes to copy from pvTxData into the stream buffer.

- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to port-MAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

返回 The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size_t **xStreamBufferSendFromISR** (*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
```

(下页继续)

(续上页)

```
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

参数

- **xStreamBuffer** -- The handle of the stream buffer to which a stream is being sent.
- **pvTxData** -- A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** -- The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** -- It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

返回 The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn't have enough free space for all the bytes to be written.

size_t **xStreamBufferReceive** (*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)

Receives bytes from a stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                          ( void * ) ucRxData,
                                          sizeof( ucRxData ),
                                          xBlockTime );
}
```

(下页继续)

```

if( xReceivedBytes > 0 )
{
// A ucRxData contains another xReceivedBytes bytes of data, which can
// be processed here....
}
}

```

参数

- **xStreamBuffer** -- The handle of the stream buffer from which bytes are to be received.
- **pvRxData** -- A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

返回 The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

size_t **xStreamBufferReceiveFromISR** (*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```

// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

// Receive the next stream from the stream buffer.
xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
( void * ) ucRxData,
sizeof( ucRxData ),
&xHigherPriorityTaskWoken );

if( xReceivedBytes > 0 )
{
// ucRxData contains xReceivedBytes read from the stream buffer.
// Process the stream here....
}
}

```

```

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xStreamBufferReceiveFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

参数

- **xStreamBuffer** -- The handle of the stream buffer from which a stream is being received.
- **pvRxData** -- A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken** -- It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The number of bytes read from the stream buffer, if any.

void **vStreamBufferDelete** (*StreamBufferHandle_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

参数 xStreamBuffer -- The handle of the stream buffer to be deleted.

BaseType_t **xStreamBufferIsFull** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

参数 xStreamBuffer -- The handle of the stream buffer being queried.

返回 If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferIsEmpty** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

参数 xStreamBuffer -- The handle of the stream buffer being queried.

返回 If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReset** (*StreamBufferHandle_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

参数 xStreamBuffer -- The handle of the stream buffer being reset.

返回 If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size_t **xStreamBufferSpacesAvailable** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

参数 xStreamBuffer -- The handle of the stream buffer being queried.

返回 The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size_t **xStreamBufferBytesAvailable** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

参数 xStreamBuffer -- The handle of the stream buffer being queried.

返回 The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType_t **xStreamBufferSetTriggerLevel** (*StreamBufferHandle_t* xStreamBuffer, size_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

参数

- **xStreamBuffer** -- The handle of the stream buffer being updated.
- **xTriggerLevel** -- The new trigger level for the stream buffer.

返回 If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferSendCompletedFromISR** (*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xStreamBuffer** -- The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReceiveCompletedFromISR** (*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xStreamBuffer** -- The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Macros

xStreamBufferCreateWithCallback (xBufferSizeBytes, xTriggerLevelBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
// There was not enough heap memory space available to create the
// stream buffer.
}
else
{
// The stream buffer was created successfully and can now be used.
}
}
```

参数

- **xBufferSizeBytes** -- The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pxSendCompletedCallback** -- Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

返回 If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

xStreamBufferCreateStaticWithCallback (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```
// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucStorageBuffer ),
                                              xTriggerLevel,
                                              ucStorageBuffer,
                                              &xStreamBufferStruct );
}
```

(下页继续)

```
// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
// parameters were NULL, xStreamBuffer will not be NULL, and can be used to
// reference the created stream buffer in other stream buffer API calls.

// Other code that uses the stream buffer can go here.
}
```

参数

- **xBufferSizeBytes** -- The size, in bytes, of the buffer pointed to by the pucStream-BufferStorageArea parameter.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** -- Must point to a uint8_t array that is at least xBufferSizeBytes big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** -- Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer's data structure.
- **pxSendCompletedCallback** -- Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

返回 If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

Type Definitions

```
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

```
typedef void (*StreamBufferCallbackFunction_t)(StreamBufferHandle_t xStreamBuffer, BaseType_t xIsInsideISR, BaseType_t *const pxHigherPriorityTaskWoken)
```

Type used as a stream buffer's optional callback.

消息缓冲区 API**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h
- This header file can be included with:

```
#include "freertos/message_buffer.h"
```

Macros

xMessageBufferCreateWithCallback (xBufferSizeBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

参数

- **xBufferSizeBytes** -- The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.
- **pxSendCompletedCallback** -- Callback invoked when a send operation to the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, then it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when a receive operation from the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

返回 If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

xMessageBufferCreateStaticWithCallback (xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```
// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucStorageBuffer ),
                                                ucStorageBuffer,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}
```

参数

- **xBufferSizeBytes** -- The size, in bytes, of the buffer pointed to by the `pucMessageBufferStorageArea` parameter. When a message is written to the message buffer an additional `sizeof(size_t)` bytes are also written to store the message's length. `sizeof(size_t)` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually `(xBufferSizeBytes - 1)`.
- **pucMessageBufferStorageArea** -- Must point to a `uint8_t` array that is at least `xBufferSizeBytes` big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer** -- Must point to a variable of type `StaticMessageBuffer_t`, which will be used to hold the message buffer's data structure.
- **pxSendCompletedCallback** -- Callback invoked when a new message is sent to the message buffer. If the parameter is `NULL` or `xMessageBufferCreate()` is called without the parameter, then it will use the default implementation provided by `sbSEND_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.
- **pxReceiveCompletedCallback** -- Callback invoked when a message is read from a message buffer. If the parameter is `NULL` or `xMessageBufferCreate()` is called without the parameter, it will use the default implementation provided by `sbRECEIVE_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.

返回 If the message buffer is created successfully then a handle to the created message buffer is returned. If either `pucMessageBufferStorageArea` or `pxStaticmessageBuffer` are `NULL` then `NULL` is returned.

xMessageBufferGetStaticBuffers (`xMessageBuffer`, `ppucMessageBufferStorageArea`, `ppxStaticMessageBuffer`)

Retrieve pointers to a statically created message buffer's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

参数

- **xMessageBuffer** -- The message buffer for which to retrieve the buffers.
- **ppucMessageBufferStorageArea** -- Used to return a pointer to the message buffer's storage area buffer.
- **ppxStaticMessageBuffer** -- Used to return a pointer to the message buffer's data structure buffer.

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

xMessageBufferSend (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    ↪sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
    ↪strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

参数

- **xMessageBuffer** -- The handle of the message buffer to which a message is being sent.
- **pvTxData** -- A pointer to the message that is to be copied into the message buffer.

- **xDataLengthBytes** -- The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** -- The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

返回 The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

xMessageBufferSendFromISR (xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                            ( void * ) pcStringToSend,
                                            strlen( pcStringToSend ),
                                            &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

(下页继续)

```

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

参数

- **xMessageBuffer** -- The handle of the message buffer to which a message is being sent.
- **pvTxData** -- A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** -- The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **pxHigherPriorityTaskWoken** -- It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The number of bytes actually written to the message buffer. If the message buffer didn't have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( MessageBuffer_t xMessageBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive the next message from the message buffer. Wait in the Blocked
// state (so not using any CPU processing time) for a maximum of 100ms for
// a message to become available.
xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                        ( void * ) ucRxData,
                                        sizeof( ucRxData ),
                                        xBlockTime );

if( xReceivedBytes > 0 )
{
// A ucRxData contains a message that is xReceivedBytes long. Process
// the message here....
}
}

```

参数

- **xMessageBuffer** -- The handle of the message buffer from which a message is being received.
- **pvRxData** -- A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

返回 The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

xMessageBufferReceiveFromISR (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-

FromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

参数

- **xMessageBuffer** -- The handle of the message buffer from which a message is being received.
- **pvRxData** -- A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken** -- It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The length, in bytes, of the message read from the message buffer, if any.

vMessageBufferDelete (xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-

BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

参数

- **xMessageBuffer** -- The handle of the message buffer to be deleted.

xMessageBufferIsFull (xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

返回 If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferIsEmpty (xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

返回 If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReset (xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

参数

- **xMessageBuffer** -- The handle of the message buffer being reset.

返回 If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

xMessageBufferSpaceAvailable (xMessageBuffer)

message_buffer.h

```
size_t xMessageBufferSpaceAvailable( MessageBufferHandle_t xMessageBuffer );
```

Returns the number of bytes of free space in the message buffer.

参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

返回 The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

xMessageBufferSpacesAvailable (xMessageBuffer)

xMessageBufferNextLengthBytes (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

返回 The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

xMessageBufferSendCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xMessageBuffer** -- The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReceiveCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xMessageBuffer** -- The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Type Definitions

```
typedef StreamBufferHandle_t MessageBufferHandle_t
```

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc. Message buffer is essentially built as a stream buffer hence its handle is also set to same type as a stream buffer handle.

2.9.13 FreeRTOS (附加功能)

ESP-IDF 为 FreeRTOS 提供了多种附加功能。这些附加功能适用于 ESP-IDF 支持的所有 FreeRTOS 实现，即 ESP-IDF FreeRTOS 和 Amazon SMP FreeRTOS。本文档介绍了这些附加功能，内容包括以下几个部分：

目录

- *FreeRTOS* (附加功能)
 - 概述
 - 环形 *buffer*
 - *ESP-IDF tick* 钩子和 *idle* 钩子
 - *TLSP* 删除回调
 - *IDF* 附加 *API*
 - 组件专用功能
 - *API* 参考

概述

ESP-IDF 为 FreeRTOS 提供了以下附加功能：

- **环形 buffer**：FIFO 缓冲区，支持任意长度的数据项。
- **ESP-IDF tick 钩子和 idle 钩子**：ESP-IDF 提供了多个自定义的 tick 钩子和 idle 钩子，相较于 FreeRTOS，支持的钩子数量更多且更灵活。
- **线程本地存储指针 (TLSP) 删除回调**：当一个任务被删除时，TLSP 删除回调会自动运行，从而自动清理 TLSP。
- **IDF 附加 API**：专用于 ESP-IDF 的附加函数，用于增强 FreeRTOS 的功能。
- **组件专用功能**：目前只添加了一个专用于组件的功能，即 `ORIG_INCLUDE_PATH`。

环形 buffer

FreeRTOS 提供了流 buffer 和消息 buffer，作为在任务和 ISR 之间发送任意大小数据的主要机制。然而，FreeRTOS 流 buffer 和消息 buffer 具有以下限制：

- 仅支持单一的发送者和单一的接收者
- 数据通过复制的方式进行传递
- 无法为延迟发送（即发送获取）预留 buffer 空间

为此，ESP-IDF 提供了一个单独的环形 buffer 来解决上述问题。

ESP-IDF 环形 buffer 是一个典型的 FIFO buffer，支持任意大小的数据项。在数据项大小可变的条件下，环形 buffer 比 FreeRTOS 队列更节约内存，可以替代 FreeRTOS 队列使用。环形 buffer 的容量不是由可以存储的数据项数量衡量的，而是由用于存储数据项的内存量来衡量的。

环形 buffer 提供了 API 来发送数据项，或为环形 buffer 中的数据项分配空间，以便进行手动填充。为提高效率，**数据项都通过引用的方式从环形 buffer 中检索出来**。因此，所有检索出的数据项也**必须**通过 `vRingbufferReturnItem()` 或 `vRingbufferReturnItemFromISR()` 返回到环形 buffer，以便将其从环形 buffer 中完全移除。

环形 buffer 分为以下三种类型：

不可分割 buffer：确保将一个数据项存储在连续的内存中，并且在任何情况下都不会尝试分割数据项。当数据项必须占用连续的内存时，请使用不可分割 buffer。**仅不可分割 buffer 允许为延迟发送保留缓冲空间**。更多信息请参考函数 `xRingbufferSendAcquire()` 和 `xRingbufferSendComplete()` 的文档。

可分割 buffer：当数据项在 buffer 末尾绕回时，如果 buffer 头部和尾部的总空间足够，则支持将一个数据项分成两部分进行存储。可分割 buffer 比不可分割 buffer 更节省内存，但在检索时可能会返回数据项的两个部分。

字节 buffer：不将数据存储为单独的数据项。所有数据都存储为字节序列，每次可以发送或检索任意大小的字节。当不需要单独维护数据项时，推荐使用字节 buffer，例如字节流。

备注：不可分割 buffer 和可分割 buffer 在 32 位对齐地址上存储数据项。因此，在检索一个数据项时，数据项指针一定也是 32 位对齐的。这在向 DMA 发送数据时非常有用。

备注：存储在不可分割或可分割 `buffer` 中的每个数据项 **需要额外的 8 字节用于标头**。数据项大小会向上取整为 32 位对齐大小，即 4 字节的倍数，实际的数据项大小则记录在标头中。不可分割和可分割 `buffer` 的大小在创建时也会向上取整。

使用方法 以下示例演示了如何使用 `xRingbufferCreate()` 和 `xRingbufferSend()` 来创建环形 `buffer`，并向其发送数据项：

```
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

//创建环形 buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//发送一个数据项
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↪TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

以下示例演示了如何使用 `xRingbufferSendAcquire()` 和 `xRingbufferSendComplete()` 代替 `xRingbufferSend()` 来获取环形 `buffer` (`RINGBUF_TYPE_NOSPLIT` 类型) 上的内存，然后向其发送一个数据项。虽然增加了一个步骤，但可以实现获取要写入内存的地址，并自行写入内存。

```
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))

...

//为 DMA 描述符和相应的数据 buffer 检索空间
//此步骤必须通过 SendAcquire 完成，否则，复制时地址可能会不同
dma_item_t *item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    (void**) &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_
↪TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = item->buf,
};
//实际发送到环形 buffer 以供使用
```

(下页继续)

```

res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

以下示例演示了使用 `xRingbufferReceive()` 和 `vRingbufferReturnItem()` 从不可分割环形 `buffer` 中检索和返回数据项:

```

...

//从不可分割环形 buffer 中接收一个数据项
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_
↪TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //返回数据项
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //数据项检索失败
    printf("Failed to receive item\n");
}

```

以下示例演示了使用 `xRingbufferReceiveSplit()` 和 `vRingbufferReturnItem()` 从可分割环形 `buffer` 中检索和返回数据项:

```

...

//从可分割环形 buffer 中接收一个数据项
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void_
↪*)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//检查收到的数据项
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //接收数据项失败
    printf("Failed to receive item\n");
}

```

以下示例演示了使用 `xRingbufferReceiveUpTo()` 和 `vRingbufferReturnItem()` 从字节 `buffer` 中检索和返回数据项:

```

...

//从字节 buffer 中接收数据
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000), sizeof(tx_item));

//检查接收到的数据
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //返回数据项
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //接收数据项失败
    printf("Failed to receive item\n");
}

```

对于以上函数的 ISR 安全版本，请调用 `xRingbufferSendFromISR()`、`xRingbufferReceiveFromISR()`、`xRingbufferReceiveSplitFromISR()`、`xRingbufferReceiveUpToFromISR()` 和 `vRingbufferReturnItemFromISR()`。

备注：当字节在环形 buffer 的末端绕回时，需调用 `RingbufferReceive[UpTo][FromISR]()` 两次。

发送到环形 buffer 以下图表将不可分割和可分割 buffer 与字节 buffer 进行对比，说明了三者在发送数据或数据项方面的差异。图表中，假设分别向 **128 字节的 buffer** 发送大小为 **18、3 和 27 字节** 的三个数据项：

图 42: 向不可分割或可分割的环形 buffer 发送数据项

对于不可分割和可分割 buffer，每个数据项前都有 8 字节标头信息。此外，为了保持整体的 32 位对齐，每个数据项占用的空间都会 **向上取整到最接近的 32 位对齐大小**。数据项的实际大小会记录在标头中，并在检索数据项时返回。

参考上图，18、3 和 27 字节的数据项分别 **向上取整为 20、4 和 28 字节**，然后在每个数据项前面添加一个 8 字节的标头。

字节 buffer 将数据视为一个字节序列，不会引入任何额外开销，不添加标头信息。因此，发送到字节 buffer 的所有数据都会合并成一个数据项。

参考上图，18、3 和 27 字节的数据项被顺序写入字节 buffer，并 **合并成一个 48 字节的数据项**。

使用 SendAcquire 和 SendComplete 不可分割 buffer 中的数据项严格按照 FIFO 顺序通过 `SendAcquire` 获取，并且必须通过 `SendComplete` 发送到 buffer 以便访问。也可以发送或获取多个数据项，且无需严格遵照获取顺序，但接收数据项却必须遵循 FIFO。所以，如果不为最早获取的数据项调用 `SendComplete`，就无法接收后续数据项。

图 43: 向字节 buffer 发送数据项

以下图表说明了当 `SendAcquire` 和 `SendComplete` 顺序不同时的情形。一开始，已经有一个 16 字节的数据项发送到环形 buffer。然后调用 `SendAcquire` 在环形 buffer 上获取 20、8、24 字节的空间。

图 44: 在不可分割环形 buffer 中 `SendAcquire/SendComplete` 数据项

然后填充 buffer，按照 8、24、20 字节的顺序通过 `SendComplete` 将数据项发送到环形 buffer。当 8 字节和 24 字节的数据发送后，仍只能获取 16 字节的数据项。因此，如果不为 20 字节数据项调用 `SendComplete`，就无法获取该数据项，也无法获取 20 字节后的数据项。

当 20 字节数据项最终发送完成后，就可以在 buffer 中最初的 16 字节数据项之后，按照 20、8、24 字节的顺序接收所有的三个数据项。

由于 `SendAcquire` 及 `SendComplete` 要求所获取的 buffer 必须是完整的（未包装的），故可分割 buffer 和字节 buffer 不支持上述调用操作。

绕回 以下图表说明了发送数据项需要绕回时，不可分割、可分割和字节 buffer 之间的差异。图表假设有一个 128 字节的 buffer，其中有 56 字节的空闲空间可以绕回使用，并发送了一个 28 字节的数据项。

图 45: 在不可分割 buffer 中绕回

不可分割 buffer 只在连续的空闲空间中存储数据项，在任何情况下都不分割数据项。当 buffer 尾部的空闲空间不足以完全存储数据项及其标头时，尾部的空闲空间将被标记为虚拟数据。然后，数据项将绕回并存储在 buffer 头部的空闲空间中。

参考上图，buffer 尾部的 16 字节空闲空间不足以存储 28 字节的数据项，因此，这 16 字节被标记为虚拟数据，然后将数据项写入了 buffer 头部的空闲空间中。

图 46: 在可分割 buffer 中绕回

当 buffer 尾部的空闲空间不足以存储数据项及其标头时，可分割 buffer 会尝试 **将数据项分割成两部分**。分割的两部分数据项都将有自己的标头，因此会产生额外的 8 字节开销。

参考上图，buffer 尾部的 16 字节空闲空间不足以存储 28 字节的数据项。因此将数据项分割成两部分（8 字节和 20 字节），并将两部分写入 buffer。

备注： 可分割 buffer 将其分割好的两部分数据视为两个独立的数据项，因此不应调用 `xRingbufferReceive()`。需调用 `xRingbufferReceiveSplit()` 以线程安全的方式接收分割的两部分数据项。

图 47: 在字节 buffer 中绕回

字节 buffer **将尽可能多的数据存储到 buffer 尾部的空闲空间中**。剩余的数据会存储在 buffer 头部的空闲空间。在字节 buffer 中绕回不会产生任何额外开销。

参考上图，buffer 尾部的 16 字节空闲空间不足以完全存储 28 字节的数据，因此，将数据填入这 16 字节空闲空间后，剩余的 12 字节会被写入 buffer 头部的空闲空间。此时，buffer 包含两个独立的连续数据，并且每个连续数据都被字节 buffer 视为一个独立数据项。

检索/返回 以下图表说明了在检索和返回数据时，不可分割、可分割 buffer 和字节 buffer 之间的差异：

图 48: 在不可分割和可分割环形 buffer 中检索/返回数据项

不可分割 buffer 和可分割 buffer 中的数据项 **按严格的 FIFO 顺序检索并 必须返回**，以释放占用的空间。在返回之前可以检索多个数据项，且不必按照检索的顺序返回数据项。但是，释放空间必须按 FIFO 顺序进行，因此如果不返回最早检索的数据项，就无法释放后续数据项占用的空间。

参考上图，**16、20 和 8 字节的数据项按 FIFO 顺序被检索出来**。但是，这些数据项并不是按照被检索的顺序返回的。最先返回的是 20 字节的数据项，然后分别返回 8 字节和 16 字节的数据项。直到第一个数据项（即 16 字节的数据项）返回后，空间才会被释放。

图 49: 在字节 buffer 中检索/返回数据

字节 buffer **不允许在返回之前进行多次检索**（每次检索必须在下一次检索之前返回结果）。使用 `xRingbufferReceive()` 或 `xRingbufferReceiveFromISR()` 时，会检索所有连续存储的数据。使用 `xRingbufferReceiveUpTo()` 或 `xRingbufferReceiveUpToFromISR()` 可限制检索的最大字节数。由于每次检索后都必须返回，因此数据一返回就会释放空间。

参考上图，buffer 尾部 38 字节连续存储的数据被检索、返回和释放。然后，下一次调用 `xRingbufferReceive()` 或 `xRingbufferReceiveFromISR()` 时，buffer 将绕回并对头部的 30 字节连续存储数据进行同样的处理。

使用队列集的环形 buffer 使用 `xRingbufferAddToQueueSetRead()` 可以将环形 buffer 添加到 FreeRTOS 队列集中，这样每次环形 buffer 接收一个数据项或数据时，队列集都会收到通知。添加到队列集后，每次从环形 buffer 检索数据项时都应该先调用 `xQueueSelectFromSet()`。要检查选定的队列集成员是否为环形 buffer，调用 `xRingbufferCanRead()`。

以下示例演示了如何使用包含环形 buffer 的队列集：

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

//创建环形 buffer 和队列集
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//向队列集中添加环形 buffer
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}

...

//阻塞队列集
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_
↪TICKS(1000));

//检查成员是否为环形 buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
}
```

(下页继续)

```

    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //处理数据项
    ...

} else {
    ...
}

```

使用静态分配的环形 buffer `xRingbufferCreateStatic()` 可用于创建具有特定内存需求的环形 buffer (如在外部 RAM 中分配的环形 buffer)。环形 buffer 使用的所有内存块都必须在创建之前手动分配, 然后传递给 `xRingbufferCreateStatic()` 以初始化为环形 buffer。这些内存块中包括:

- 环形 buffer 的数据结构类型 `StaticRingbuffer_t`。
- 环形 buffer 的存储区域, 大小为 `xBufferSize`。注意, 对于不可分割和可分割 buffer, `xBufferSize` 必须为 32 位对齐大小。

这些块的分配方式取决于具体的需求。例如, 静态声明所有块, 或动态分配为具有特定功能的块, 如外部 RAM。

备注: 当删除通过 `xRingbufferCreateStatic()` 创建的环形 buffer 时, `vRingbufferDelete()` 函数不会释放任何内存块。释放内存必须在调用 `vRingbufferDelete()` 后手动完成。

下面的代码片段演示了一个完全在外部 RAM 中分配的环形 buffer:

```

#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE    400    //32 位对齐大小
#define BUFFER_TYPE    RINGBUF_TYPE_NOSPLIT
...

//将 环形 buffer 数据结构体和存储区分配到外部 RAM 中
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_
↳malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE,
↳MALLOC_CAP_SPIRAM);

//使用手动分配的内存创建环形 buffer
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_
↳storage, buffer_struct);

...

//使用后删除环形 buffer
vRingbufferDelete(handle);

//手动释放所有内存块
free(buffer_struct);
free(buffer_storage);

```

ESP-IDF tick 钩子和 idle 钩子

FreeRTOS 允许应用程序在编译时提供一个 tick 钩子和一个 idle 钩子:

- FreeRTOS tick 钩子可以通过 `CONFIG_FREERTOS_USE_TICK_HOOK` 选项启用。应用程序必须提供 `void vApplicationTickHook(void)` 回调。
- FreeRTOS idle 钩子可以通过 `CONFIG_FREERTOS_USE_IDLE_HOOK` 选项启用。应用程序必须提供 `void vApplicationIdleHook(void)` 回调。

然而，FreeRTOS tick 钩子和 idle 钩子有以下不足：

- FreeRTOS 钩子是在编译时注册的
- 每种钩子只能注册一个
- 在多核目标芯片上，FreeRTOS 钩子是对称的，即每个内核的 tick 中断和 idle 任务最终都会调用同一个钩子

因此，ESP-IDF 提供了 tick 钩子和 idle 钩子来补充 FreeRTOS tick 和 idle 钩子的功能。ESP-IDF 钩子具有以下功能：

- 钩子可以在运行时注册和注销
- 可以注册多个钩子。每个内核中，同一类型的钩子最多可以注册 8 个
- 在多核目标芯片上，钩子可以是不对称的，即可以为每个内核注册不同的钩子

使用以下 API 注册和注销 ESP-IDF 钩子：

- 对于 tick 钩子：
 - 用 `esp_register_freertos_tick_hook()` 或 `esp_register_freertos_tick_hook_for_cpu()` 注册
 - 用 `esp_deregister_freertos_tick_hook()` 或 `esp_deregister_freertos_tick_hook_for_cpu()` 注销
- 对于 idle 钩子：
 - 使用 `esp_register_freertos_idle_hook()` 或 `esp_register_freertos_idle_hook_for_cpu()` 注册
 - 使用 `esp_deregister_freertos_idle_hook()` 或 `esp_deregister_freertos_idle_hook_for_cpu()` 注销

备注：在 cache 被禁用时，tick 中断仍保持活动，因此任何 tick 钩子（FreeRTOS 或 ESP-IDF）函数都必须放在内部 RAM 中。请参考 [SPI flash API documentation](#) 了解详情。

TLSP 删除回调

原生 FreeRTOS 提供了线程本地存储指针 (TLSP) 功能，这些指针直接存储在特定任务的任务控制块 (TCB) 中。TLSP 允许每个任务拥有自己的数据结构指针集合。在原生 FreeRTOS 中：

- 在任务创建后，需调用 `vTaskSetThreadLocalStoragePointer()` 设置任务的 TLSP。
- 在任务的生命周期中，需调用 `pvTaskGetThreadLocalStoragePointer()` 获取任务的 TLSP。
- 在删除任务前，需释放 TLSP 指向的内存。

然而，为了能够自动释放 TLSP 内存，ESP-IDF 额外提供了 TLSP 删除回调功能。当删除任务时，这些删除回调函数会被自动调用，从而清除 TLSP 内存，无需在每个任务的代码中显式添加内存清除逻辑。

设置 TLSP 删除回调的方式与设置 TLSP 类似。

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` 设置了特定的 TLSP 及其关联的回调。
- 调用原生 FreeRTOS 函数 `vTaskSetThreadLocalStoragePointer()` 只会将 TLSP 的关联删除回调设置为 `NULL`，也就是说，在任务删除期间不会调用该 TLSP 的回调。

在实现 TLSP 回调时，应注意以下几点：

- 回调 **绝对不能尝试阻塞或让出**，并且应尽可能缩短临界区的时间。
- 回调是在删除任务的内存即将被释放前调用的。因此，回调可以通过 `vTaskDelete()` 本身调用，也可以从空闲任务中调用。

IDF 附加 API

`freertos/esp_additions/include/freertos/idf_additions.h` 头文件包含了 ESP-IDF 添加的与 FreeRTOS 相关的辅助函数。通过 `#include "freertos/idf_additions.h"` 可添加此头文件。

组件专用功能

除了基本 CMake 构建属性中提供的标准组件变量外，FreeRTOS 组件还提供了参数（目前只有一个参数）以简化与其他模块的集成：

- `ORIG_INCLUDE_PATH` - 包含指向 FreeRTOS 根包含文件夹的绝对路径。因此可以直接用 `#include "FreeRTOS.h"` 引用头文件，而无需使用 `#include "freertos/FreeRTOS.h"`。

API 参考

环形 buffer API

Header File

- `components/esp_ringbuf/include/freertos/ringbuf.h`
- This header file can be included with:

```
#include "freertos/ringbuf.h"
```

- This header file is a part of the API provided by the `esp_ringbuf` component. To declare that your component depends on `esp_ringbuf`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_ringbuf
```

or

```
PRIV_REQUIRES esp_ringbuf
```

Functions

`RingbufHandle_t xRingbufferCreate` (`size_t xBufferSize`, `RingbufferType_t xBufferType`)

Create a ring buffer.

备注： `xBufferSize` of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

参数

- **`xBufferSize`** -- **[in]** Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
- **`xBufferType`** -- **[in]** Type of ring buffer, see documentation.

返回 A handle to the created ring buffer, or NULL in case of error.

`RingbufHandle_t xRingbufferCreateNoSplit` (`size_t xItemSize`, `size_t xItemNum`)

Create a ring buffer of type `RINGBUF_TYPE_NOSPLIT` for a fixed `item_size`.

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

参数

- **`xItemSize`** -- **[in]** Size of each item to be put into the ring buffer
- **`xItemNum`** -- **[in]** Maximum number of items the buffer needs to hold simultaneously

返回 A `RingbufHandle_t` handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateStatic** (size_t xBufferSize, *RingbufferType_t* xBufferType, uint8_t *pucRingbufferStorage, *StaticRingbuffer_t* *pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

备注: xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

参数

- **xBufferSize** -- [in] Size of the buffer in bytes.
- **xBufferType** -- [in] Type of ring buffer, see documentation
- **pucRingbufferStorage** -- [in] Pointer to the ring buffer's storage area. Storage area must have the same size as specified by xBufferSize
- **pxStaticRingbuffer** -- [in] Pointed to a struct of type *StaticRingbuffer_t* which will be used to hold the ring buffer's data structure

返回 A handle to the created ring buffer

BaseType_t **xRingbufferSend** (*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

备注: For no-split/allow-split buffers, an xItemSize of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an xItemSize of 0 will simply return pdTRUE without copying any data.

参数

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** -- [in] Size of data to insert.
- **xTicksToWait** -- [in] Ticks to wait for room in the ring buffer.

返回

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendFromISR** (*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

备注: For no-split/allow-split buffers, an xItemSize of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an xItemSize of 0 will simply return pdTRUE without copying any

data.

参数

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** -- [in] Size of data to insert.
- **pxHigherPriorityTaskWoken** -- [out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

返回

- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

BaseType_t **xRingbufferSendAcquire** (*RingbufHandle_t* xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

备注: Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

备注: An xItemSize of 0 will result in a buffer being acquired, but the buffer will have a size of 0.

参数

- **xRingbuffer** -- [in] Ring buffer to allocate the memory
- **ppvItem** -- [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **xItemSize** -- [in] Size of item to acquire.
- **xTicksToWait** -- [in] Ticks to wait for room in the ring buffer.

返回

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendComplete** (*RingbufHandle_t* xRingbuffer, void *pvItem)

Actually send an item into the ring buffer allocated before by `xRingbufferSendAcquire`.

备注: Only applicable for no-split ring buffers. Only call for items allocated by `xRingbufferSendAcquire`.

参数

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to item in allocated memory to insert.

返回

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

void ***xRingbufferReceive** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

备注: A call to `vRingbufferReturnItem()` is required after this to free the item retrieved.

备注: It is possible to receive items with a `pxItemSize` of 0 on no-split/allow split buffers.

参数

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.

返回

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL on timeout, `*pxItemSize` is untouched in that case.

void ***xRingbufferReceiveFromISR** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

备注: A call to `vRingbufferReturnItemFromISR()` is required after this to free the item retrieved.

备注: Byte buffers do not allow multiple retrievals before returning an item

备注: Two calls to `RingbufferReceiveFromISR()` are required if the bytes wrap around the end of the ring buffer.

备注: It is possible to receive items with a `pxItemSize` of 0 on no-split/allow split buffers.

参数

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.

返回

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL when the ring buffer is empty, `*pxItemSize` is untouched in that case.

BaseType_t **xRingbufferReceiveSplit** (*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

备注: Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

备注: This function should only be called on allow-split buffers

备注: It is possible to receive items with a `pxItemSize` of 0 on allow split buffers.

参数

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **ppvHeadItem** -- [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** -- [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** -- [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** -- [out] Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.

返回

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

BaseType_t **xRingbufferReceiveSplitFromISR** (*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

备注: Calls to `vRingbufferReturnItemFromISR()` is required after this to free up the item(s) retrieved.

备注: This function should only be called on allow-split buffers

备注: It is possible to receive items with a `pxItemSize` of 0 on allow split buffers.

参数

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **ppvHeadItem** -- [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** -- [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** -- [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** -- [out] Pointer to size of second part (unmodified if item is not split)

返回

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

void ***xRingbufferReceiveUpTo** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

备注: A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

备注: This function should only be called on byte buffers

备注: Byte buffers do not allow multiple retrievals before returning an item

备注: Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

参数

- **xRingbuffer** -- **[in]** Ring buffer to retrieve the item from
- **pxItemSize** -- **[out]** Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** -- **[in]** Ticks to wait for items in the ring buffer.
- **xMaxSize** -- **[in]** Maximum number of bytes to return.

返回

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void ***xRingbufferReceiveUpToFromISR** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

备注: A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

备注: This function should only be called on byte buffers

备注: Byte buffers do not allow multiple retrievals before returning an item

参数

- **xRingbuffer** -- **[in]** Ring buffer to retrieve the item from
- **pxItemSize** -- **[out]** Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** -- **[in]** Maximum number of bytes to return. Size of 0 simply returns NULL.

返回

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

void **vRingbufferReturnItem** (*RingbufHandle_t* xRingbuffer, void *pvItem)

Return a previously-retrieved item to the ring buffer.

备注: If a split item is retrieved, both parts should be returned by calling this function twice

参数

- **xRingbuffer** -- [in] Ring buffer the item was retrieved from
- **pvItem** -- [in] Item that was received earlier

void **vRingbufferReturnItemFromISR** (*RingbufHandle_t* xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

备注: If a split item is retrieved, both parts should be returned by calling this function twice

参数

- **xRingbuffer** -- [in] Ring buffer the item was retrieved from
- **pvItem** -- [in] Item that was received earlier
- **pxHigherPriorityTaskWoken** -- [out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void **vRingbufferDelete** (*RingbufHandle_t* xRingbuffer)

Delete a ring buffer.

备注: This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

参数 **xRingbuffer** -- [in] Ring buffer to delete

size_t **xRingbufferGetMaxItemSize** (*RingbufHandle_t* xRingbuffer)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

备注: The max item size for a no-split buffer is limited to $((\text{buffer_size}/2) - \text{header_size})$. This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer's read/write/free pointers.

参数 **xRingbuffer** -- [in] Ring buffer to query

返回 Maximum size, in bytes, of an item that can be placed in a ring buffer.

size_t **xRingbufferGetCurFreeSize** (*RingbufHandle_t* xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

备注: An empty no-split buffer has a max current free size for an item that is limited to $((\text{buffer_size}/2) - \text{header_size})$. See API reference for `xRingbufferGetMaxItemSize()`.

警告: This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application's responsibility to ensure atomic access to this API and the subsequent Send

参数 **xRingbuffer** -- [in] Ring buffer to query
返回 Current free size, in bytes, available for an entry

BaseType_t **xRingbufferAddToQueueSetRead** (*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Add the ring buffer to a queue set. Notified when data has been written to the ring buffer.

This function adds the ring buffer to a queue set, thus allowing a task to block on multiple queues/ring buffers. The queue set is notified when the new data becomes available to read on the ring buffer.

参数

- **xRingbuffer** -- [in] Ring buffer to add to the queue set
- **xQueueSet** -- [in] Queue set to add the ring buffer to

返回

- pdTRUE on success, pdFALSE otherwise

static inline BaseType_t **xRingbufferCanRead** (*RingbufHandle_t* xRingbuffer, *QueueSetMemberHandle_t* xMember)

Check if the selected queue set member is a particular ring buffer.

This API checks if queue set member returned from xQueueSelectFromSet() is a particular ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

参数

- **xRingbuffer** -- [in] Ring buffer to check
- **xMember** -- [in] Member returned from xQueueSelectFromSet

返回

- pdTRUE when selected queue set member is the ring buffer
- pdFALSE otherwise.

BaseType_t **xRingbufferRemoveFromQueueSetRead** (*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Remove the ring buffer from a queue set.

This function removes a ring buffer from a queue set. The ring buffer must have been previously added to the queue set using xRingbufferAddToQueueSetRead().

参数

- **xRingbuffer** -- [in] Ring buffer to remove from the queue set
- **xQueueSet** -- [in] Queue set to remove the ring buffer from

返回

- pdTRUE on success
- pdFALSE otherwise

void **vRingbufferGetInfo** (*RingbufHandle_t* xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)

Get information about ring buffer status.

Get information of a ring buffer's current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

参数

- **xRingbuffer** -- [in] Ring buffer handle
- **uxFree** -- [out] Pointer use to store free pointer position
- **uxRead** -- [out] Pointer use to store read pointer position
- **uxWrite** -- [out] Pointer use to store write pointer position
- **uxAcquire** -- [out] Pointer use to store acquire pointer position

- **uxItemsWaiting** -- **[out]** Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo** (*RingbufHandle_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

参数 **xRingbuffer** -- Ring buffer to show

BaseType_t **xRingbufferGetStaticBuffer** (*RingbufHandle_t* xRingbuffer, uint8_t
**ppucRingbufferStorage, *StaticRingbuffer_t*
**ppxStaticRingbuffer)

Retrieve the pointers to a statically created ring buffer.

参数

- **xRingbuffer** -- **[in]** Ring buffer
- **ppucRingbufferStorage** -- **[out]** Used to return a pointer to the queue's storage area buffer
- **ppxStaticRingbuffer** -- **[out]** Used to return a pointer to the queue's data structure buffer

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

RingbufHandle_t **xRingbufferCreateWithCaps** (size_t xBufferSize, *RingbufferType_t* xBufferType,
UBaseType_t uxMemoryCaps)

Creates a ring buffer with specific memory capabilities.

This function is similar to xRingbufferCreate(), except that it allows the memory allocated for the ring buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

备注: A queue created using this function must only be deleted using vRingbufferDeleteWithCaps()

参数

- **xBufferSize** -- **[in]** Size of the buffer in bytes
- **xBufferType** -- **[in]** Type of ring buffer, see documentation.
- **uxMemoryCaps** -- **[in]** Memory capabilities of the queue's memory (see esp_heap_caps.h)

返回 Handle to the created ring buffer or NULL on failure.

void **vRingbufferDeleteWithCaps** (*RingbufHandle_t* xRingbuffer)

Deletes a ring buffer previously created using xRingbufferCreateWithCaps()

参数 **xRingbuffer** -- Ring buffer

Structures

struct **xSTATIC_RINGBUFFER**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Type Definitions

typedef void ***RingbufHandle_t**

Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

typedef struct *xSTATIC_RINGBUFFER* **StaticRingbuffer_t**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Enumerations

enum **RingbufferType_t**

Values:

enumerator **RINGBUF_TYPE_NOSPLIT**

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF_TYPE_ALLOWSPLIT**

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF_TYPE_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

enumerator **RINGBUF_TYPE_MAX**

钩子 API

Header File

- `components/esp_system/include/esp_freertos_hooks.h`
- This header file can be included with:

```
#include "esp_freertos_hooks.h"
```

Functions

esp_err_t **esp_register_freertos_idle_hook_for_cpu** (*esp_freertos_idle_cb_t* new_idle_cb, UBaseType_t cpuid)

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

警告: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

参数

- **new_idle_cb** -- [in] Callback to be called
- **cpuid** -- [in] id of the core

返回

- ESP_OK: Callback registered to the specified core's idle hook
- ESP_ERR_NO_MEM: No more space on the specified core's idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_idle_hook** (*esp_freertos_idle_cb_t* new_idle_cb)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

警告: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

参数 **new_idle_cb** -- [in] Callback to be called

返回

- ESP_OK: Callback registered to the calling core's idle hook
- ESP_ERR_NO_MEM: No more space on the calling core's idle hook to register callback

esp_err_t **esp_register_freertos_tick_hook_for_cpu** (*esp_freertos_tick_cb_t* new_tick_cb, UBaseType_t cpuid)

Register a callback to be called from the specified core's tick hook.

参数

- **new_tick_cb** -- [in] Callback to be called
- **cpuid** -- [in] id of the core

返回

- ESP_OK: Callback registered to specified core's tick hook
- ESP_ERR_NO_MEM: No more space on the specified core's tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_tick_hook** (*esp_freertos_tick_cb_t* new_tick_cb)

Register a callback to be called from the calling core's tick hook.

参数 **new_tick_cb** -- [in] Callback to be called

返回

- ESP_OK: Callback registered to the calling core's tick hook
- ESP_ERR_NO_MEM: No more space on the calling core's tick hook to register the callback

void **esp_deregister_freertos_idle_hook_for_cpu** (*esp_freertos_idle_cb_t* old_idle_cb, UBaseType_t cpuid)

Unregister an idle callback from the idle hook of the specified core.

参数

- **old_idle_cb** -- [in] Callback to be unregistered
- **cpuid** -- [in] id of the core

void **esp_deregister_freertos_idle_hook** (*esp_freertos_idle_cb_t* old_idle_cb)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

参数 **old_idle_cb** -- [in] Callback to be unregistered

void **esp_deregister_freertos_tick_hook_for_cpu** (*esp_freertos_tick_cb_t* old_tick_cb, UBaseType_t cpuid)

Unregister a tick callback from the tick hook of the specified core.

参数

- **old_tick_cb** -- [in] Callback to be unregistered

- **cpuid** -- [in] id of the core

void **esp_deregister_freertos_tick_hook** (*esp_freertos_tick_cb_t* old_tick_cb)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

参数 **old_tick_cb** -- [in] Callback to be unregistered

Type Definitions

```
typedef bool (*esp_freertos_idle_cb_t)(void)
```

```
typedef void (*esp_freertos_tick_cb_t)(void)

Functions

BaseType_t **xTaskCreatePinnedToCore** (TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pxCreatedTask, const BaseType_t xCoreID)

Create a new task that is pinned to a particular core.

This function is similar to `xTaskCreate()`, but allows the creation of a pinned task. The task's pinned core is specified by the `xCoreID` argument. If `xCoreID` is set to `tskNO_AFFINITY`, then the task is unpinned and can run on any core.

备注: If (`configNUMBER_OF_CORES == 1`), setting `xCoreID` to `tskNO_AFFINITY` will be treated as 0.

参数

- **pxTaskCode** -- Pointer to the task entry function.
- **pcName** -- A descriptive name for the task.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pxCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **xCoreID** -- The core to which the task is pinned to, or `tskNO_AFFINITY` if the task has no core affinity.

返回 `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

TaskHandle_t **xTaskCreateStaticPinnedToCore** (TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new static task that is pinned to a particular core.

This function is similar to `xTaskCreateStatic()`, but allows the creation of a pinned task. The task's pinned core is specified by the `xCoreID` argument. If `xCoreID` is set to `tskNO_AFFINITY`, then the task is unpinned and can run on any core.

备注: If (`configNUMBER_OF_CORES == 1`), setting `xCoreID` to `tskNO_AFFINITY` will be treated as 0.

参数

- **pxTaskCode** -- Pointer to the task entry function.
- **pcName** -- A descriptive name for the task.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pxStackBuffer** -- Must point to a `StackType_t` array that has at least `ulStackDepth` indexes
- **pxTaskBuffer** -- Must point to a variable of type `StaticTask_t`, which will then be used to hold the task's data structures,
- **xCoreID** -- The core to which the task is pinned to, or `tskNO_AFFINITY` if the task has no core affinity.

返回 The task handle if the task was created, NULL otherwise.

`BaseType_t xTaskGetCoreID (TaskHandle_t xTask)`

Get the current core ID of a particular task.

Helper function to get the core ID of a particular task. If the task is pinned to a particular core, the core ID is returned. If the task is not pinned to a particular core, `tskNO_AFFINITY` is returned.

If `CONFIG_FREERTOS_UNICORE` is enabled, this function simply returns 0.

[refactor-todo] See if this needs to be deprecated (IDF-8145)(IDF-8164)

备注: If `CONFIG_FREERTOS_SMP` is enabled, please call `vTaskCoreAffinityGet()` instead.

备注: In IDF FreeRTOS when `configNUMBER_OF_CORES == 1`, this function will always return 0,

参数 `xTask` -- The task to query

返回 The task's core ID or `tskNO_AFFINITY`

`TaskHandle_t xTaskGetCurrentTaskHandleForCore (BaseType_t xCoreID)`

Get the handle of the task currently running on a certain core.

Because of the nature of SMP processing, there is no guarantee that this value will still be valid on return and should only be used for debugging purposes.

[refactor-todo] See if this needs to be deprecated (IDF-8145)

参数 `xCoreID` -- The core to query

返回 Handle of the current task running on the queried core

`uint8_t *pxTaskGetStackStart (TaskHandle_t xTask)`

Returns the start of the stack associated with `xTask`.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

[refactor-todo] Change return type to StackType_t (IDF-8158)

参数 **xTask** -- Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

返回 A pointer to the start of the stack.

```
void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet,
                                                    BaseType_t xIndex, void *pvValue,
                                                    TlsDeleteCallbackFunction_t
                                                    pvDelCallback)
```

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

参数

- **xTaskToSet** -- Task to set thread local storage pointer for
- **xIndex** -- The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** -- Pointer value to set.
- **pvDelCallback** -- Function to call to dispose of the local storage pointer when the task is deleted.

```
BaseType_t xTaskCreatePinnedToCoreWithCaps (TaskFunction_t pvTaskCode, const char *const
                                           pcName, const configSTACK_DEPTH_TYPE
                                           usStackDepth, void *const pvParameters,
                                           UBaseType_t uxPriority, TaskHandle_t *const
                                           pvCreatedTask, const BaseType_t xCoreID,
                                           UBaseType_t uxMemoryCaps)
```

Creates a pinned task where its stack has specific memory capabilities.

This function is similar to xTaskCreatePinnedToCore(), except that it allows the memory allocated for the task's stack to have specific capabilities (e.g., MALLOC_CAP_SPIRAM).

However, the specified capabilities will NOT apply to the task's TCB as a TCB must always be in internal RAM.

参数

- **pvTaskCode** -- Pointer to the task entry function
- **pcName** -- A descriptive name for the task
- **usStackDepth** -- The size of the task stack specified as the number of bytes
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pvCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **xCoreID** -- Core to which the task is pinned to, or tskNO_AFFINITY if unpinned.
- **uxMemoryCaps** -- Memory capabilities of the task stack's memory (see esp_heap_caps.h)

返回 pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

```
static inline BaseType_t xTaskCreateWithCaps (TaskFunction_t pvTaskCode, const char *const pcName,
                                             configSTACK_DEPTH_TYPE usStackDepth, void *const
                                             pvParameters, UBaseType_t uxPriority, TaskHandle_t
                                             *pvCreatedTask, UBaseType_t uxMemoryCaps)
```

Creates a task where its stack has specific memory capabilities.

This function is similar to `xTaskCreate()`, except that it allows the memory allocated for the task's stack to have specific capabilities (e.g., `MALLOC_CAP_SPIRAM`).

However, the specified capabilities will NOT apply to the task's TCB as a TCB must always be in internal RAM.

备注: A task created using this function must only be deleted using `vTaskDeleteWithCaps()`

参数

- **pvTaskCode** -- Pointer to the task entry function
- **pcName** -- A descriptive name for the task
- **usStackDepth** -- The size of the task stack specified as the number of bytes
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pvCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **uxMemoryCaps** -- Memory capabilities of the task stack's memory (see `esp_heap_caps.h`)

返回 `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

void **vTaskDeleteWithCaps** (*TaskHandle_t* xTaskToDelete)

Deletes a task previously created using `xTaskCreateWithCaps()` or `xTaskCreatePinnedToCoreWithCaps()`

备注: It is recommended to use this API to delete tasks from another task's context, rather than self-deletion. When the task is being deleted, it is vital to ensure that it is not running on another core. This API must not be called from an interrupt context.

参数 **xTaskToDelete** -- A handle to the task to be deleted

QueueHandle_t **xQueueCreateWithCaps** (*UBaseType_t* uxQueueLength, *UBaseType_t* uxItemSize, *UBaseType_t* uxMemoryCaps)

Creates a queue with specific memory capabilities.

This function is similar to `xQueueCreate()`, except that it allows the memory allocated for the queue to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

备注: A queue created using this function must only be deleted using `vQueueDeleteWithCaps()`

参数

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require.
- **uxMemoryCaps** -- Memory capabilities of the queue's memory (see `esp_heap_caps.h`)

返回 Handle to the created queue or `NULL` on failure.

void **vQueueDeleteWithCaps** (*QueueHandle_t* xQueue)

Deletes a queue previously created using `xQueueCreateWithCaps()`

参数 **xQueue** -- A handle to the queue to be deleted.

static inline *SemaphoreHandle_t* **xSemaphoreCreateBinaryWithCaps** (*UBaseType_t* uxMemoryCaps)

Creates a binary semaphore with specific memory capabilities.

This function is similar to `vSemaphoreCreateBinary()`, except that it allows the memory allocated for the binary semaphore to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

备注: A binary semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

参数 `uxMemoryCaps` -- Memory capabilities of the binary semaphore's memory (see `esp_heap_caps.h`)

返回 Handle to the created binary semaphore or NULL on failure.

static inline *SemaphoreHandle_t* **xSemaphoreCreateCountingWithCaps** (UBaseType_t uxMaxCount,
UBaseType_t uxInitialCount,
UBaseType_t uxMemoryCaps)

Creates a counting semaphore with specific memory capabilities.

This function is similar to `xSemaphoreCreateCounting()`, except that it allows the memory allocated for the counting semaphore to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

备注: A counting semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

参数

- **uxMaxCount** -- The maximum count value that can be reached.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.
- **uxMemoryCaps** -- Memory capabilities of the counting semaphore's memory (see `esp_heap_caps.h`)

返回 Handle to the created counting semaphore or NULL on failure.

static inline *SemaphoreHandle_t* **xSemaphoreCreateMutexWithCaps** (UBaseType_t uxMemoryCaps)

Creates a mutex semaphore with specific memory capabilities.

This function is similar to `xSemaphoreCreateMutex()`, except that it allows the memory allocated for the mutex semaphore to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

备注: A mutex semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

参数 `uxMemoryCaps` -- Memory capabilities of the mutex semaphore's memory (see `esp_heap_caps.h`)

返回 Handle to the created mutex semaphore or NULL on failure.

static inline *SemaphoreHandle_t* **xSemaphoreCreateRecursiveMutexWithCaps** (UBaseType_t
uxMemoryCaps)

Creates a recursive mutex with specific memory capabilities.

This function is similar to `xSemaphoreCreateRecursiveMutex()`, except that it allows the memory allocated for the recursive mutex to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

备注: A recursive mutex created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

参数 `uxMemoryCaps` -- Memory capabilities of the recursive mutex's memory (see `esp_heap_caps.h`)

返回 Handle to the created recursive mutex or NULL on failure.

void **vSemaphoreDeleteWithCaps** (*SemaphoreHandle_t* xSemaphore)

Deletes a semaphore previously created using one of the xSemaphoreCreate...WithCaps() functions.

参数 **xSemaphore** -- A handle to the semaphore to be deleted.

static inline *StreamBufferHandle_t* **xStreamBufferCreateWithCaps** (size_t xBufferSizeBytes, size_t xTriggerLevelBytes, UBaseType_t uxMemoryCaps)

Creates a stream buffer with specific memory capabilities.

This function is similar to xStreamBufferCreate(), except that it allows the memory allocated for the stream buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

备注: A stream buffer created using this function must only be deleted using vStreamBufferDeleteWithCaps()

参数

- **xBufferSizeBytes** -- The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before unblocking
- **uxMemoryCaps** -- Memory capabilities of the stream buffer's memory (see esp_heap_caps.h)

返回 Handle to the created stream buffer or NULL on failure.

static inline void **vStreamBufferDeleteWithCaps** (*StreamBufferHandle_t* xStreamBuffer)

Deletes a stream buffer previously created using xStreamBufferCreateWithCaps()

参数 **xStreamBuffer** -- A handle to the stream buffer to be deleted.

static inline *MessageBufferHandle_t* **xMessageBufferCreateWithCaps** (size_t xBufferSizeBytes, UBaseType_t uxMemoryCaps)

Creates a message buffer with specific memory capabilities.

This function is similar to xMessageBufferCreate(), except that it allows the memory allocated for the message buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

备注: A message buffer created using this function must only be deleted using vMessageBufferDeleteWithCaps()

参数

- **xBufferSizeBytes** -- The total number of bytes (not messages) the message buffer will be able to hold at any one time.
- **uxMemoryCaps** -- Memory capabilities of the message buffer's memory (see esp_heap_caps.h)

返回 Handle to the created message buffer or NULL on failure.

static inline void **vMessageBufferDeleteWithCaps** (*MessageBufferHandle_t* xMessageBuffer)

Deletes a stream buffer previously created using xMessageBufferCreateWithCaps()

参数 **xMessageBuffer** -- A handle to the message buffer to be deleted.

EventGroupHandle_t **xEventGroupCreateWithCaps** (UBaseType_t uxMemoryCaps)

Creates an event group with specific memory capabilities.

This function is similar to xEventGroupCreate(), except that it allows the memory allocated for the event group to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

备注: An event group created using this function must only be deleted using `vEventGroupDeleteWithCaps()`

参数 `uxMemoryCaps` -- Memory capabilities of the event group's memory (see `esp_heap_caps.h`)

返回 Handle to the created event group or NULL on failure.

void `vEventGroupDeleteWithCaps` (`EventGroupHandle_t` xEventGroup)

Deletes an event group previously created using `xEventGroupCreateWithCaps()`

参数 `xEventGroup` -- A handle to the event group to be deleted.

Type Definitions

typedef void (*`TlsDeleteCallbackFunction_t`)(int, void*)

Prototype of local storage pointer deletion callback.

2.9.14 堆内存分配

栈 (stack) 和堆 (heap) 的区别

ESP-IDF 应用程序使用常见的计算机架构模式：由程序控制流动态分配的内存（即 **栈**）、由函数调用动态分配的内存（即 **堆**）以及在编译时分配的 **静态内存**。

由于 ESP-IDF 是一个多线程 RTOS 环境，因此每个 RTOS 任务都有自己的栈，这些栈默认在创建任务时从堆中分配。有关栈静态分配的方法，请参阅 `xTaskCreateStatic()`。

ESP32-S2 使用多种类型的 RAM，因此具备不同属性的堆，即基于属性的内存分配器允许应用程序按不同目的进行堆分配。

多数情况下，可直接使用 C 标准函数库中的 `malloc()` 和 `free()` 函数实现堆分配。为充分利用各种内存类型及其特性，ESP-IDF 还具有基于内存属性的堆内存分配器。要配备具有特定属性的内存，如 **DMA 存储器** 或可执行内存，可以创建具备所需属性的 OR 掩码，将其传递给 `heap_caps_malloc()`。

内存属性

ESP32-S2 包含多种类型的 RAM：

- **DRAM**（数据 RAM）是连接到 CPU 数据总线上的内存，用于存储数据。这是作为堆访问最常见的一种内存。
- **IRAM**（指令 RAM）是连接到 CPU 指令总线上的内存，通常仅用于存储可执行数据（即指令）。如果作为通用内存访问，则所有访问必须为 **32 位可访问内存**。
- **D/IRAM** 是连接到 CPU 数据总线和指令总线的 RAM，因此可用作指令 RAM 或数据 RAM。

有关内存类型的详细信息，请参阅 [存储器类型](#)。

也可将外部 SPI RAM 连接到 ESP32-S2。通过缓存将 **片外 RAM** 集成到 ESP32-S2 的内存映射中，访问方式与 DRAM 类似。

所有的 DRAM 内存都可以单字节访问，因此所有的 DRAM 堆都具有 `MALLOC_CAP_8BIT` 属性。要获取所有 DRAM 堆的剩余空间大小，请调用 `heap_caps_get_free_size(MALLOC_CAP_8BIT)`。

调用 `malloc()` 时，ESP-IDF `malloc()` 内部调用 `heap_caps_malloc_default(size)`，使用属性 `MALLOC_CAP_DEFAULT` 分配内存。该属性可实现字节寻址功能，即存储空间的最小编址单位为字节。

`malloc()` 使用基于属性的分配系统，所以使用 `heap_caps_malloc()` 分配的内存可以通过调用标准的 `free()` 函数释放。

可用堆空间

DRAM 启动时，DRAM 堆包含应用程序未静态分配的所有数据内存，减少静态分配的 `buffer` 将增加可用的空闲堆空间。

调用命令 `idf.py size` 可查找静态分配内存大小。

备注：运行时可用的 DRAM 堆空间可能少于编译时计算的大小，因为启动时会在运行 FreeRTOS 调度程序之前从堆中分配部分内存，包括初始 FreeRTOS 任务的栈内存。

IRAM 启动时，IRAM 堆包含所有应用程序可执行代码未使用的指令内存。

调用命令 `idf.py size` 查找应用程序使用的 IRAM 量。

D/IRAM 一些内存存在 ESP32-S2 中可用作 DRAM 或 IRAM。如果从 D/IRAM 区域分配内存，则两种类型的内存的可用堆空间都会减少。

堆空间大小 启动时，所有 ESP-IDF 应用程序都会记录全部堆地址（和空间大小）的摘要，级别为 `Info`：

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

查找可用堆 请参阅[堆内存信息](#)。

特殊用途

DMA 存储器 使用 `MALLOC_CAP_DMA` 标志分配适合与硬件 DMA 引擎（如 SPI 和 I2S）配合使用的内存，此属性标志不包括外部 PSRAM。

32 位可访问内存 如果某个内存结构体仅以 32 位为单位寻址，例如一个整数或指针数组，则可以使用 `MALLOC_CAP_32BIT` 标志分配。通过这一方式，分配器能够在无法调用 `malloc()` 的情况下提供 IRAM 内存，从而充分利用 ESP32-S2 中的所有可用内存。

请注意，使用 `MALLOC_CAP_32BIT` 分配的内存只能通过 32 位读写访问，其他类型的访问将导致 `LoadStoreError` 异常。

外部 SPI 内存 当启用片外 RAM 时，可以根据配置调用标准 `malloc` 或通过 `heap_caps_malloc(MALLOC_CAP_SPIRAM)` 分配外部 SPI RAM，详情请参阅[配置片外 RAM](#)。

线程安全性

堆函数是线程安全的，因此可不受限制，在不同任务中同时调用多个堆函数。

从中断处理程序 (ISR) 上下文中调用 `malloc`、`free` 和相关函数虽然在技术层面可行（请参阅[从 ISR 调用堆相关函数](#)），但不建议使用此种方法，因为调用堆函数可能会延迟其他中断。建议重构应用程序，将 ISR 使用的任何 `buffer` 预先分配到 ISR 之外。之后可能会删除从 ISR 调用堆函数的功能。

从 ISR 调用堆相关函数

堆组件中的以下函数可以在中断处理程序 (ISR) 中调用：

- `heap_caps_malloc()`
- `heap_caps_malloc_default()`
- `heap_caps_realloc_default()`
- `heap_caps_malloc_prefer()`
- `heap_caps_realloc_prefer()`
- `heap_caps_calloc_prefer()`
- `heap_caps_free()`
- `heap_caps_realloc()`
- `heap_caps_calloc()`
- `heap_caps_aligned_alloc()`
- `heap_caps_aligned_free()`

备注： 不建议使用此种方法。

堆跟踪及调试

以下功能介绍详见[堆内存调试](#)：

- [堆信息](#)（释放内存空间等）
- [堆分配与释放函数挂钩](#)
- [堆损坏检测](#)
- [堆跟踪](#)（检测、监控内存泄漏等）

实现说明

堆属性分配器对芯片内存区域的了解源于 SoC 组件，该组件包含芯片的内存布局信息以及每个区域的不同属性。各区域的功能为首要考虑因素，如会优先使用 DRAM 和 IRAM 特定区域而非用途更广的 D/IRAM 区域来分配内存。

每个连续的内存区域都包含其自己的内存堆，由 `multi_heap` 函数创建。`multi_heap` 允许将任何连续的内存区域作为堆使用。

堆属性分配器通过对内存区域的了解初始化每个单独的堆，堆属性 API 中的分配函数将基于所需的属性、可用空间和每个区域使用的首选项为分配函数找到最合适的堆，随后为位于特定内存区域的堆调用 `multi_heap_malloc()`。

调用 `free()` 查找对应释放地址的特定堆，随后在特定的 `multi_heap` 实例上调用 `multi_heap_free()`。

API 参考 - 堆分配

Header File

- `components/heap/include/esp_heap_caps.h`
- This header file can be included with:

```
#include "esp_heap_caps.h"
```

Functions

`esp_err_t heap_caps_register_failed_alloc_callback(esp_alloc_failed_hook_t callback)`

registers a callback function to be invoked if a memory allocation operation fails

参数 `callback` -- caller defined callback to be invoked

返回 ESP_OK if callback was registered.

void ***heap_caps_malloc** (size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

参数

- **size** -- Size, in bytes, of the amount of memory to allocate
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void **heap_caps_free** (void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).

参数 **ptr** -- Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void ***heap_caps_realloc** (void *ptr, size_t size, uint32_t caps)

Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).

'caps' parameter can be different to the capabilities that any original 'ptr' was allocated with. In this way, realloc can be used to "move" a buffer if necessary to ensure it meets a new set of capabilities.

参数

- **ptr** -- Pointer to previously allocated memory, or NULL for a new allocation.
- **size** -- Size of the new buffer requested, or 0 to free the buffer.
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

返回 Pointer to a new buffer of size 'size' with capabilities 'caps', or NULL if allocation failed.

void ***heap_caps_aligned_alloc** (size_t alignment, size_t size, uint32_t caps)

Allocate an aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

参数

- **alignment** -- How the pointer received needs to be aligned must be a power of two
- **size** -- Size, in bytes, of the amount of memory to allocate
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void **heap_caps_aligned_free** (void *ptr)

Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

备注: This function is deprecated, please consider using heap_caps_free() instead

参数 **ptr** -- Pointer to the memory allocated

void ***heap_caps_aligned_calloc** (size_t alignment, size_t n, size_t size, uint32_t caps)

Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

参数

- **alignment** -- How the pointer received needs to be aligned must be a power of two
- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_malloc** (size_t n, size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to `libc calloc()`, for capability-aware memory.

In IDF, `calloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT)`.

参数

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

size_t **heap_caps_get_total_size** (uint32_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

参数 caps -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

返回 total size in bytes

size_t **heap_caps_get_free_size** (uint32_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

备注: Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

参数 caps -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

返回 Amount of free bytes in the regions

size_t **heap_caps_get_minimum_free_size** (uint32_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

备注: Note the result may be less than the global all-time minimum available heap of this kind, as "low watermarks" are tracked per-region. Individual regions' heaps may have reached their "low watermarks" at different points in time. However, this result still gives a "worst case" indication for all-time minimum free heap.

参数 caps -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

返回 Amount of free bytes in the regions

size_t **heap_caps_get_largest_free_block** (uint32_t caps)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

参数 caps -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

返回 Size of the largest free block in bytes.

esp_err_t **heap_caps_monitor_local_minimum_free_size_start** (void)

Start monitoring the value of `minimum_free_bytes` from the moment this function is called instead of from startup.

备注: This allows to detect local lows of the `minimum_free_bytes` value that wouldn't be detected otherwise.

返回 `esp_err_t` ESP_OK if the function executed properly ESP_FAIL if called when monitoring already active

esp_err_t **heap_caps_monitor_local_minimum_free_size_stop** (void)

Stop monitoring the value of `minimum_free_bytes`. After this call the `minimum_free_bytes` value calculated from startup will be returned in `heap_caps_get_info` and `heap_caps_get_minimum_free_size`.

返回 `esp_err_t` ESP_OK if the function executed properly ESP_FAIL if called when monitoring not active

void **heap_caps_get_info** (*multi_heap_info_t* *info, uint32_t caps)

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for *multi_heap_info_t*, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

参数

- **info** -- Pointer to a structure which will be filled with relevant heap metadata.
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_print_heap_info** (uint32_t caps)

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

参数 caps -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

bool **heap_caps_check_integrity_all** (bool print_errors)

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

备注: Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM enabled.

参数 print_errors -- Print specific errors if heap corruption is found.

返回 True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity** (uint32_t caps, bool print_errors)

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

备注: Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM capability flag.

参数

- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory
- **print_errors** -- Print specific errors if heap corruption is found.

返回 True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity_addr** (intptr_t addr, bool print_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work, and you should call `heap_caps_check_integrity` or `heap_caps_check_integrity_all` instead.

备注: The entire heap region around the address is checked, not only the adjacent heap blocks.

参数

- **addr** -- Address in memory. Check for corruption in region containing this address.
- **print_errors** -- Print specific errors if heap corruption is found.

返回 True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

void **heap_caps_malloc_extmem_enable** (size_t limit)

Enable `malloc()` in external memory and set limit below which `malloc()` attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

参数 **limit** -- Limit, in bytes.

void ***heap_caps_malloc_prefer** (size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

参数

- **size** -- Size, in bytes, of the amount of memory to allocate
- **num** -- Number of variable parameters

返回 A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_realloc_prefer** (void *ptr, size_t size, size_t num, ...)

Reallocate a chunk of memory as preference in decreasing order.

参数

- **ptr** -- Pointer to previously allocated memory, or NULL for a new allocation.
- **size** -- Size of the new buffer requested, or 0 to free the buffer.
- **num** -- Number of variable parameters

返回 Pointer to a new buffer of size 'size', or NULL if allocation failed.

void ***heap_caps_malloc_prefer** (size_t n, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

参数

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **num** -- Number of variable parameters

返回 A pointer to the memory allocated on success, NULL on failure

void **heap_caps_dump** (uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

参数 caps -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_dump_all** (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t **heap_caps_get_allocated_size** (void *ptr)

Return the size that a particular pointer was allocated with.

备注: The app will crash with an assertion failure if the pointer is not valid.

参数 ptr -- Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

返回 Size of the memory allocated at this block.

void **heap_caps_walk** (uint32_t caps, *heap_caps_walker_cb_t* walker_func, void *user_data)

Function called to walk through the heaps with the given set of capabilities.

参数

- **caps** -- The set of capabilities assigned to the heaps to walk through
- **walker_func** -- Callback called for each block of the heaps being traversed
- **user_data** -- Opaque pointer to user defined data

void **heap_caps_walk_all** (*heap_caps_walker_cb_t* walker_func, void *user_data)

Function called to walk through all heaps defined by the heap component.

参数

- **walker_func** -- Callback called for each block of the heaps being traversed
- **user_data** -- Opaque pointer to user defined data

Structures

struct **walker_heap_info**

Structure used to store heap related data passed to the walker callback function.

Public Members

intptr_t **start**

Start address of the heap in which the block is located.

intptr_t **end**

End address of the heap in which the block is located.

struct **walker_block_info**

Structure used to store block related data passed to the walker callback function.

Public Members

void ***ptr**

Pointer to the block data.

size_t **size**

The size of the block.

bool **used**

Block status. True: used, False: free.

Macros

HEAP_IRAM_ATTR

MALLOC_CAP_EXEC

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

MALLOC_CAP_32BIT

Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT

Memory must allow for 8/16/...-bit data accesses.

MALLOC_CAP_DMA

Memory must be able to accessed by DMA.

MALLOC_CAP_PID2

Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3

Memory must be mapped to PID3 memory space (PIDs are not currently used)

MALLOC_CAP_PID4

Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5

Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6

Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7

Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM

Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT

Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

MALLOC_CAP_IRAM_8BIT

Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RETENTION

Memory must be able to accessed by retention DMA.

MALLOC_CAP_RTCRAM

Memory must be in RTC fast memory.

MALLOC_CAP_TCM

Memory must be in TCM memory.

MALLOC_CAP_DMA_DESC_AHB

Memory must be capable of containing AHB DMA descriptors.

MALLOC_CAP_DMA_DESC_AXI

Memory must be capable of containing AXI DMA descriptors.

MALLOC_CAP_CACHE_ALIGNED

Memory must be aligned to the cache line size of any intermediate caches.

MALLOC_CAP_INVALID

Memory can't be used / list end marker.

Type Definitions

typedef void (***esp_alloc_failed_hook_t**)(size_t size, uint32_t caps, const char *function_name)

callback called when an allocation operation fails, if registered

Param size in bytes of failed allocation

Param caps capabilities requested of failed allocation

Param function_name function which generated the failure

typedef struct *walker_heap_info* **walker_heap_info_t**

Structure used to store heap related data passed to the walker callback function.

typedef struct *walker_block_info* **walker_block_info_t**

Structure used to store block related data passed to the walker callback function.

typedef bool (***heap_caps_walker_cb_t**)(*walker_heap_info_t* heap_info, *walker_block_info_t* block_info, void *user_data)

Function callback used to get information of memory block during calls to `heap_caps_walk` or `heap_caps_walk_all`.

Param heap_info See `walker_heap_info_t`

Param block_info See `walker_block_info_t`

Param user_data Opaque pointer to user defined data

Return True to proceed with the heap traversal False to stop the traversal of the current heap and continue with the traversal of the next heap (if any)

API 参考 - 初始化

Header File

- `components/heap/include/esp_heap_caps_init.h`
- This header file can be included with:

```
#include "esp_heap_caps_init.h"
```

Functions

void **heap_caps_init** (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap_caps_enable_nonos_stack_heaps** (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t **heap_caps_add_region** (intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in `soc_memory_layout.c` for the SoC, and are registered via `heap_caps_init()`. Some regions can't be used immediately and are later enabled via `heap_caps_enable_nonos_stack_heaps()`.

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the "reserved" regions or other data in `soc_memory_layout`, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in `soc_memory_layout.c`.

Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

备注: Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:      0x1000 <-> 0x3000 (Allowed)
New region:      0x1000 <-> 0x2000 (Allowed)
New region:      0x0000 <-> 0x1000 (Allowed)
New region:      0x3000 <-> 0x4000 (Allowed)
New region:      0x0000 <-> 0x2000 (NOT Allowed)
New region:      0x0000 <-> 0x4000 (NOT Allowed)
New region:      0x1000 <-> 0x4000 (NOT Allowed)
New region:      0x2000 <-> 0x4000 (NOT Allowed)
```

参数

- **start** -- Start address of new region.
- **end** -- End address of new region.

返回 `ESP_OK` on success, `ESP_ERR_INVALID_ARG` if a parameter is invalid, `ESP_ERR_NOT_FOUND` if the specified start address doesn't reside in a known region, or any error returned by `heap_caps_add_region_with_caps()`.

esp_err_t `heap_caps_add_region_with_caps` (const uint32_t caps[], intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to `heap_caps_add_region()`, only custom memory capabilities are specified by the caller.

备注: Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:      0x1000 <-> 0x3000 (Allowed)
New region:      0x1000 <-> 0x2000 (Allowed)
New region:      0x0000 <-> 0x1000 (Allowed)
New region:      0x3000 <-> 0x4000 (Allowed)
New region:      0x0000 <-> 0x2000 (NOT Allowed)
New region:      0x0000 <-> 0x4000 (NOT Allowed)
New region:      0x1000 <-> 0x4000 (NOT Allowed)
New region:      0x2000 <-> 0x4000 (NOT Allowed)
```

参数

- **caps** -- Ordered array of capability masks for the new region, in order of priority. Must have length `SOC_MEMORY_TYPE_NO_PRIOS`. Does not need to remain valid after the call returns.
- **start** -- Start address of new region.
- **end** -- End address of new region.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if a parameter is invalid
- `ESP_ERR_NO_MEM` if no memory to register new heap.
- `ESP_ERR_INVALID_SIZE` if the memory region is too small to fit a heap
- `ESP_FAIL` if region overlaps the start and/or end of an existing region

API 参考 - 多堆 API

(注意：堆属性分配器在内部使用多堆 API，而多数 IDF 程序不需要直接调用此 API。)

Header File

- [components/heap/include/multi_heap.h](#)
- This header file can be included with:

```
#include "multi_heap.h"
```

Functions

void **multi_heap_aligned_alloc** (*multi_heap_handle_t* heap, size_t size, size_t alignment)

allocate a chunk of memory with specific alignment

参数

- **heap** -- Handle to a registered heap.
- **size** -- size in bytes of memory chunk
- **alignment** -- how the memory must be aligned

返回 pointer to the memory allocated, NULL on failure

void **multi_heap_malloc** (*multi_heap_handle_t* heap, size_t size)

malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

参数

- **heap** -- Handle to a registered heap.
- **size** -- Size of desired buffer.

返回 Pointer to new memory, or NULL if allocation fails.

void **multi_heap_aligned_free** (*multi_heap_handle_t* heap, void *p)

free() a buffer aligned in a given heap.

备注: This function is deprecated, consider using multi_heap_free() instead

参数

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void **multi_heap_free** (*multi_heap_handle_t* heap, void *p)

free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument 'p' must be NULL or have been allocated in the specified heap.

参数

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void **multi_heap_realloc** (*multi_heap_handle_t* heap, void *p, size_t size)

realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument 'p' must be NULL or have been allocated in the specified heap.

参数

- **heap** -- Handle to a registered heap.

- **p** -- NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.
- **size** -- Desired new size for buffer.

返回 New buffer of 'size' containing contents of 'p', or NULL if reallocation failed.

`size_t multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)`

Return the size that a particular pointer was allocated with.

参数

- **heap** -- Handle to a registered heap.
- **p** -- Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

返回 Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

`multi_heap_handle_t multi_heap_register (void *start, size_t size)`

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

参数

- **start** -- Start address of the memory to use for a new heap.
- **size** -- Size (in bytes) of the new heap.

返回 Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

`void multi_heap_set_lock (multi_heap_handle_t heap, void *lock)`

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

参数

- **heap** -- Handle to a registered heap.
- **lock** -- Optional pointer to a locking structure to associate with this heap.

`void multi_heap_dump (multi_heap_handle_t heap)`

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

参数 **heap** -- Handle to a registered heap.

`bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)`

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAIL_PRINTF` in `multi_heap_platform.h`.

备注: This function is not thread-safe as it sets a global variable with the value of `print_errors`.

参数

- **heap** -- Handle to a registered heap.
- **print_errors** -- If true, errors will be printed to stderr.

返回 true if heap is valid, false otherwise.

`size_t multi_heap_free_size (multi_heap_handle_t heap)`

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single `malloc()` may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

参数 `heap` -- Handle to a registered heap.

返回 Number of free bytes.

`size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)`

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime "low watermark" of possible values returned from `multi_free_heap_size()`, for the specified heap.

参数 `heap` -- Handle to a registered heap.

返回 Number of free bytes.

`void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)`

Return metadata about a given heap.

Fills a `multi_heap_info_t` structure with information about the specified heap.

参数

- **heap** -- Handle to a registered heap.
- **info** -- Pointer to a structure to fill with heap metadata.

`void *multi_heap_aligned_alloc_offs (multi_heap_handle_t heap, size_t size, size_t alignment, size_t offset)`

Perform an aligned allocation from the provided offset.

参数

- **heap** -- The heap in which to perform the allocation
- **size** -- The size of the allocation
- **alignment** -- How the memory must be aligned
- **offset** -- The offset at which the alignment should start

返回 `void*` The ptr to the allocated memory

`size_t multi_heap_reset_minimum_free_bytes (multi_heap_handle_t heap)`

Reset the `minimum_free_bytes` value (setting it to `free_bytes`) and return the former value.

参数 `heap` -- The heap in which the reset is taking place

返回 `size_t` the value of `minimum_free_bytes` before it is reset

`void multi_heap_restore_minimum_free_bytes (multi_heap_handle_t heap, const size_t new_minimum_free_bytes_value)`

Set the value of `minimum_free_bytes` to `new_minimum_free_bytes_value` or keep the current value of `minimum_free_bytes` if it is smaller than `new_minimum_free_bytes_value`.

参数

- **heap** -- The heap in which the restore is taking place
- **new_minimum_free_bytes_value** -- The value to restore the `minimum_free_bytes` to

`void multi_heap_walk (multi_heap_handle_t heap, multi_heap_walker_cb_t walker_func, void *user_data)`

Call the `tlsf_walk_pool` function of the heap given as parameter with the walker function passed as parameter.

参数

- **heap** -- The heap to traverse
- **walker_func** -- The walker to trigger on each block of the heap

- **user_data** -- Opaque pointer to user defined data

Structures

struct **multi_heap_info_t**

Structure to access heap metadata via `multi_heap_get_info`.

Public Members

size_t **total_free_bytes**

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

size_t **total_allocated_bytes**

Total bytes allocated to data in the heap.

size_t **largest_free_block**

Size of the largest free block in the heap. This is the largest malloc-able size.

size_t **minimum_free_bytes**

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.

size_t **allocated_blocks**

Number of (variable size) blocks allocated in the heap.

size_t **free_blocks**

Number of (variable size) free blocks in the heap.

size_t **total_blocks**

Total number of (variable size) blocks in the heap.

Type Definitions

typedef struct multi_heap_info ***multi_heap_handle_t**

Opaque handle to a registered heap.

typedef bool (***multi_heap_walker_cb_t**)(void *block_ptr, size_t block_size, int block_used, void *user_data)

Callback called when walking the given heap blocks of memory.

Param block_ptr Pointer to the block data

Param block_size The size of the block

Param block_used Block status. 0: free, 1: allocated

Param user_data Opaque pointer to user defined data

Return True if the walker is expected to continue the heap traversal False if the walker is expected to stop the traversal of the heap

2.9.15 基于 MMU 的存储管理

简介

ESP32-S2 的存储管理单元 (MMU) 相对简单。它可以在物理存储地址和虚拟存储地址之间进行存储地址转换，因此，CPU 可以通过虚拟存储地址来访问物理存储。虚拟存储地址有多种类型，分别具有不同的功能。

ESP-IDF 提供了一个存储器映射驱动程序，用于管理这些物理存储地址和虚拟存储地址之间的关系，实现一些功能。例如，可以通过指针从 SPI flash 中读取内容。

存储映射驱动程序实际上是一个基于属性的虚拟存储地址分配器，允许应用程序为不同的目的分配虚拟存储地址。下文将此驱动程序称为 `esp_mmap` 驱动程序。

ESP-IDF 还提供了一个存储器同步驱动程序来处理潜在的不同步的情况。

物理存储类型

存储映射驱动程序目前支持映射到以下物理存储类型：

- SPI flash
- PSRAM

虚拟存储的功能

- `MMU_MEM_CAP_EXEC`：此功能表示虚拟存储地址具有执行权限。注意，此权限的范围仅限 MMU 硬件内部。
- `MMU_MEM_CAP_READ`：此功能表示虚拟存储地址具有读取权限。注意，此权限的范围仅限 MMU 硬件内部。
- `MMU_MEM_CAP_WRITE`：此功能表示虚拟存储地址具有写入权限。注意，此权限的范围仅限 MMU 硬件内部。
- `MMU_MEM_CAP_32BIT`：此功能表示允许访问 32 位或 32 位倍数的虚拟存储。
- `MMU_MEM_CAP_8BIT`：此功能表示允许访问 8 位或 8 位倍数的虚拟存储。

由于硬件限制，不能分配具有 `MMU_MEM_CAP_EXEC` 和 `MMU_MEM_CAP_READ` 功能的 4 MB 外部存储地址（从 `0x40400000` 到 `0x40800000`）。

如需了解具有特定功能的最大连续可映射块大小，请调用 `esp_mmu_map_get_max_consecutive_free_block_size()`。

存储管理驱动程序

驱动程序

术语解释 虚拟存储池由一个或多个虚拟存储区域组成，如下图所示：

- 一个虚拟存储池是指可以映射到物理存储的整个虚拟地址范围。
- 一个虚拟存储区域是指具有相同属性的虚拟地址范围。
- 一个虚拟存储块是指一块动态映射的虚拟地址范围。
- 一个间隙是指两个虚拟存储块之间的虚拟地址范围。

- 一个物理存储块是指一块待映射或已映射到虚拟存储块的物理地址范围。
- 动态映射是指调用 esp_mmap 驱动程序 API `esp_mmu_map()` 进行的映射，此 API 会将给定的物理存储块映射到 esp_mmap 驱动程序分配的虚拟存储块中。

存储块的关系 在映射物理存储块 A 时，存储块 A 与此前已映射的另一个物理存储块 B 之间可能存在以下关系之一：

- 包含：块 A 被完全包含在块 B 内，如下图所示：

- 相同：块 A 与块 B 完全相同，如下图所示：

注意，esp_mmap 驱动程序将相同 **视为包含**。

- 重叠：块 A 与块 B 重叠，如下图所示：

特殊情况下，当块 A 完全包围块 B 时，如下图所示：

注意，`esp_mmap` 驱动程序将这种情况 **视为重叠**。

驱动程序行为

存储映射 可以调用 `esp_mmu_map()` 进行动态映射。该 API 会根据你所选择的虚拟存储的属性分配一定大小的虚拟存储块，然后按照要求将此虚拟存储块映射到物理存储块中。`esp_mmap` 驱动程序支持映射到一种或多种物理存储，因此，应在映射时指定物理存储目标。

默认情况下，物理存储块和虚拟存储块是一对一映射。因此，当调用 `esp_mmu_map()` 时，如果存储关系不同，API 的行为也有所不同：

- 如果是“包含”的情形，此 API 将返回 `ESP_ERR_INVALID_STATE`。此时，由于之前已映射的虚拟存储包含待映射的虚拟存储，因此返回的 `out_ptr` 会指向之前映射的虚拟存储的起始地址。
- 如果是“相同”的情形，此 API 的行为与“包含”的情况完全相同。
- 如果是“重叠”的情形，此 API 默认返回 `ESP_ERR_INVALID_ARG`。这表明，`esp_mmap` 驱动程序在默认情况下，不允许将一个物理存储地址映射到多个虚拟存储地址。

但是，可以使用 `ESP_MMU_MMAP_FLAG_PADDR_SHARED` flag，代表在物理地址和虚拟地址之间的一对多映射：

- 如果是“重叠”的情形，此 API 将按照要求分配一个新的虚拟存储块，并将其映射到给定的物理存储块中。

取消存储映射 可以调用 `esp_mmu_unmap()` 来取消先前存储块的映射。如果尝试取消映射的虚拟存储块实际尚未映射到任何物理存储块，此 API 将返回 `ESP_ERR_NOT_FOUND`。

存储地址转换 `esp_mmap` 驱动程序提供了两个辅助 API，用于虚拟存储地址和物理存储地址之间的转换：

- `esp_mmu_vaddr_to_paddr()` 可将虚拟存储地址转换为物理存储地址。
- `esp_mmu_paddr_to_vaddr()` 可将物理存储地址转换为虚拟存储地址。

存储同步 可以通过一种或多种方法来访问支持 MMU 的物理存储。

SPI flash 可以通过 SPI1 (ESP-IDF `spi_flash` 驱动 API) 或指针进行访问。ESP-IDF `spi_flash` 驱动 API 中已经考虑了存储同步，因此在使用时无需额外考虑存储同步。

PSRAM 可以通过指针进行访问。当只通过指针访问 PSRAM 时，硬件可以保证数据的一致性。

线程安全

`esp_mmu_map.h` 中的 API 不能确保线程的安全性。

`esp_cache.h` 中的 API 能够确保线程的安全性。

API 参考

API 参考 - ESP MMIO 驱动

Header File

- `components/esp_mm/include/esp_mmu_map.h`
- This header file can be included with:

```
#include "esp_mmu_map.h"
```

- This header file is a part of the API provided by the `esp_mm` component. To declare that your component depends on `esp_mm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_mm
```

or

```
PRIV_REQUIRES esp_mm
```

Functions

`esp_err_t esp_mmu_map(esp_paddr_t paddr_start, size_t size, mmu_target_t target, mmu_mem_caps_t caps, int flags, void **out_ptr)`

Map a physical memory block to external virtual address block, with given capabilities.

备注: This API does not guarantee thread safety

参数

- **paddr_start** -- [in] Start address of the physical memory block
- **size** -- [in] Size to be mapped. Size will be rounded up by to the nearest multiple of MMU page size
- **target** -- [in] Physical memory target you're going to map to, see `mmu_target_t`
- **caps** -- [in] Memory capabilities, see `mmu_mem_caps_t`
- **flags** -- [in] Mmap flags
- **out_ptr** -- [out] Start address of the mapped virtual memory

返回

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Invalid argument, see printed logs
- `ESP_ERR_NOT_SUPPORTED`: Only on ESP32, PSRAM is not a supported physical memory target
- `ESP_ERR_NOT_FOUND`: No enough size free block to use
- `ESP_ERR_NO_MEM`: Out of memory, this API will allocate some heap memory for internal usage
- `ESP_ERR_INVALID_STATE`: Paddr is mapped already, this API will return corresponding `vaddr_start + new_block_offset` as per the previously mapped block. Only to-be-mapped paddr block is totally enclosed by a previously mapped block will lead to this error. (Identical scenario will behave similarly) `new_block_start new_block_end`
 |-----New Block -----||-----Block -----| `block_start block_end`

`esp_err_t esp_mmu_unmap(void *ptr)`

Unmap a previously mapped virtual memory block.

备注: This API does not guarantee thread safety

参数 **ptr** -- [in] Start address of the virtual memory

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Null pointer
- ESP_ERR_NOT_FOUND: Vaddr is not in external memory, or it's not mapped yet

esp_err_t **esp_mmu_map_get_max_consecutive_free_block_size** (mmu_mem_caps_t caps, mmu_target_t target, size_t *out_len)

Get largest consecutive free external virtual memory block size, with given capabilities and given physical target.

参数

- **caps** -- [in] Bitwise OR of MMU_MEM_CAP_* flags indicating the memory block
- **target** -- [in] Physical memory target you're going to map to, see mmu_target_t.
- **out_len** -- [out] Largest free block length, in bytes.

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid arguments, could be null pointer

esp_err_t **esp_mmu_map_dump_mapped_blocks** (FILE *stream)

Dump all the previously mapped blocks

备注: This API shall not be called from an ISR.

备注: This API does not guarantee thread safety

参数 **stream** -- stream to print information to; use stdout or stderr to print to the console; use fopen/open_memstream to print to a string buffer.

返回

- ESP_OK

esp_err_t **esp_mmu_vaddr_to_paddr** (void *vaddr, *esp_paddr_t* *out_paddr, mmu_target_t *out_target)

Convert virtual address to physical address.

参数

- **vaddr** -- [in] Virtual address
- **out_paddr** -- [out] Physical address
- **out_target** -- [out] Physical memory target, see mmu_target_t

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Null pointer, or vaddr is not within external memory
- ESP_ERR_NOT_FOUND: Vaddr is not mapped yet

esp_err_t **esp_mmu_paddr_to_vaddr** (*esp_paddr_t* paddr, mmu_target_t target, mmu_vaddr_t type, void **out_vaddr)

Convert physical address to virtual address.

参数

- **paddr** -- [in] Physical address
- **target** -- [in] Physical memory target, see mmu_target_t
- **type** -- [in] Virtual address type, could be either instruction or data
- **out_vaddr** -- [out] Virtual address

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Null pointer
- ESP_ERR_NOT_FOUND: Paddr is not mapped yet

`esp_err_t esp_mmu_paddr_find_caps` (const `esp_paddr_t` paddr, `mmu_mem_caps_t` *out_caps)

If the physical address is mapped, this API will provide the capabilities of the virtual address where the physical address is mapped to.

备注: : Only return value is ESP_OK(which means physically address is successfully mapped), then caps you get make sense.

备注: This API only check one page (see CONFIG_MMU_PAGE_SIZE), starting from the paddr

参数

- **paddr** -- [in] Physical address
- **out_caps** -- [out] Bitwise OR of MMU_MEM_CAP_* flags indicating the capabilities of a virtual address where the physical address is mapped to.

返回

- ESP_OK: Physical address successfully mapped.
- ESP_ERR_INVALID_ARG: Null pointer
- ESP_ERR_NOT_FOUND: Physical address is not mapped successfully.

Macros

ESP_MMU_MMAP_FLAG_PADDR_SHARED

Share this mapping.

MMU Memory Mapping Driver APIs for MMU supported memory

Driver Backgrounds:

Type Definitions

typedef uint32_t esp_paddr_t
```

Physical memory type.

2.9.16 Memory Synchronization

Introduction

ESP32-S2 can access its connected PSRAM via these ways:

- CPU
- DMA

By default, CPU accesses the above mentioned memory via cache. Whereas DMA accesses the memory directly, without going through cache.

This leads to potential cache data coherence issue:

- When a DMA transaction changes the content of a piece of memory, and the content has been cached already. Under this condition:
 - CPU may read stale data.
 - the stale data in the cache may be written back to the memory. The new data updated by the previous DMA transaction will be overwritten.
- CPU changes the content of an address. The content is in the cache, but not in the memory yet (cache will write back the content to the memory according to its own strategy). Under this condition:
 - The next DMA transactions to read this content from the memory will get stale data.

There are three common methods to address such cache data coherence issue:

1. Hardware based cache Coherent Interconnect, ESP32-S2 does not have such ability.
2. Use the DMA buffer from non-cacheable memory. Memory that CPU access it without going through cache is called non-cacheable memory.
3. Explicitly call a memory synchronization API to writeback the content in the cache back to the memory, or invalidate the content in the cache.

Memory Synchronisation Driver

The suggested way to deal with such cache data coherence issue is by using the memory synchronization API `esp_cache_msync()` provided by ESP-IDF `esp_mm` component.

Driver Concept Direction of the cache memory synchronization:

- `ESP_CACHE_MSINC_FLAG_DIR_C2M`, for synchronization from cache to memory.
- `ESP_CACHE_MSINC_FLAG_DIR_M2C`, for synchronization from memory to cache.

Type of the cache memory synchronization:

- `ESP_CACHE_MSINC_FLAG_TYPE_DATA`, for synchronization to a data address region.
- `ESP_CACHE_MSINC_FLAG_TYPE_INST`, for synchronization to an instruction address region.

Driver Behaviour Calling `esp_cache_msync()` will do a synchronization between cache and memory. The first parameter `addr` and the second parameter `size` together describe the memory region that is to be synchronized. About the third parameter `flags`:

- `ESP_CACHE_MSINC_FLAG_DIR_C2M`. With this flag, content in the specified address region is written back to the memory. This direction is usually used **after** the content of an address is updated by the CPU, e.g. a memset to the address. Operation in this direction should happen **before** a DMA operation to the same address.
- `ESP_CACHE_MSINC_FLAG_DIR_M2C`. With this flag, content in the specified address region is invalidated from the cache. This direction is usually used **after** the content of an address is updated by the DMA. Operation in this direction should happen **before** a CPU read operation to the same address.

The above two flags help select the synchronization direction. Specially, if neither of these two flags are used, `esp_cache_msync()` will by default select the `ESP_CACHE_MSINC_FLAG_DIR_C2M` direction. Users are not allowed to set both of the two flags at the same time.

- `ESP_CACHE_MSINC_FLAG_TYPE_DATA`.
- `ESP_CACHE_MSINC_FLAG_TYPE_INST`.

The above two flags help select the type of the synchronization address. Specially, if neither of these two flags are used, `esp_cache_msync()` will by default select the `ESP_CACHE_MSINC_FLAG_TYPE_DATA` direction. Users are not allowed to set both of the two flags at the same time.

- `ESP_CACHE_MSINC_FLAG_INVALIDATE`. This flag is used to trigger a cache invalidation to the specified address region, after the region is written back to the memory. This flag is mainly used for `ESP_CACHE_MSINC_FLAG_DIR_C2M` direction. For `ESP_CACHE_MSINC_FLAG_DIR_M2C` direction, behaviour is the same as if the `ESP_CACHE_MSINC_FLAG_INVALIDATE` flag is not set.
- `ESP_CACHE_MSINC_FLAG_UNALIGNED`. This flag force the `esp_cache_msync()` API to do synchronization without checking the address and size alignment. For more details, see chapter *Address Alignment Requirement* following.

Address Alignment Requirement

There is address and size alignment requirement (in bytes) for using `esp_cache_msync()`. The alignment requirement comes from cache.

- An address region whose start address and size both meet the cache memory synchronization alignment requirement is defined as an **aligned address region**.
- An address region whose start address or size does not meet the cache memory synchronization alignment requirement is defined as an **unaligned address region**.

By default, if you specify an unaligned address region, `esp_cache_msync()` will return an `ESP_ERR_INVALID_ARG` error, together with the required alignment.

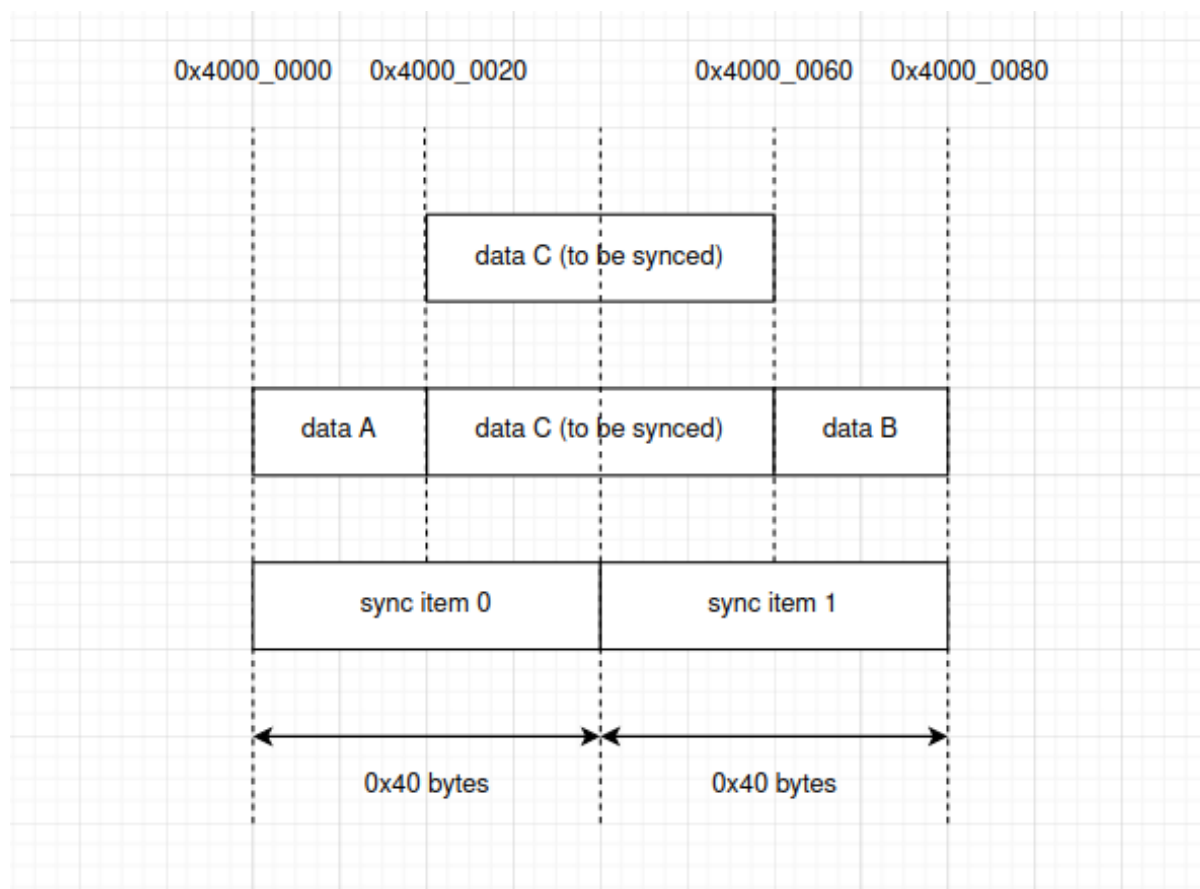

Warning for Address Alignment Requirement You can set the `ESP_CACHE_MSYNC_FLAG_UNALIGNED` flag to bypass such check. Note you should be very careful about using this flag. cache memory synchronization to an unaligned address region may silently corrupt the memory.

For example, assume:

- alignment requirement is 0x40 bytes.
- a call to `esp_cache_msync()`, with `ESP_CACHE_MSYNC_FLAG_DIR_M2C` | `ESP_CACHE_MSYNC_FLAG_UNALIGNED` flags, the specified address region is 0x4000_0020 ~ 0x4000_0060 (see **data C** in below graph).

Above settings will trigger a cache invalidation to the address region 0x4000_0000 ~ 0x4000_0080, see **sync item0** and **sync item1** in the below graph.

If the content in 0x4000_0000 ~ 0x4000_0020 (**data A** in the below graph) or 0x4000_0060 ~ 0x4000_0080 (**data B** in the below graph) are not written back to the memory yet, then these **data A** and **data B** will be discarded.

API Reference

API Reference - ESP Msync Driver

Header File

- [components/esp_mm/include/esp_cache.h](#)
- This header file can be included with:

```
#include "esp_cache.h"
```

- This header file is a part of the API provided by the `esp_mm` component. To declare that your component depends on `esp_mm`, add the following to your CMakeLists.txt:

```
REQUIRES esp_mm
```

or

```
PRIV_REQUIRES esp_mm
```

Functions

esp_err_t **esp_cache_msync** (void *addr, size_t size, int flags)

Memory sync between Cache and storage memory.

For cache-to-memory (C2M) direction:

- For cache writeback supported chips (you can refer to `SOC_CACHE_WRITEBACK_SUPPORTED` in `soc_caps.h`)
 - This API will do a writeback to synchronise between cache and storage memory
 - With `ESP_CACHE_MSYNCR_FLAG_INVALIDATE`, this API will also invalidate the values that just written
 - Note: although ESP32 is with PSRAM, but cache writeback isn't supported, so this API will do nothing on ESP32
- For other chips, this API will do nothing. The out-of-sync should be already dealt by the SDK

For memory-to-cache (M2C) direction:

- This API will by default do an invalidation

This API is cache-safe and thread-safe

备注: If you don't set direction (`ESP_CACHE_MSYNCR_FLAG_DIR_x` flags), this API is by default C2M direction

备注: If you don't set type (`ESP_CACHE_MSYNCR_FLAG_TYPE_x` flags), this API is by default doing msync for data

备注: You should not call this during any Flash operations (e.g. `esp_flash` APIs, `nvs` and some other APIs that are based on `esp_flash` APIs)

备注: If `XIP_From_PSRAM` is enabled (by enabling both `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` and `CONFIG_SPIRAM_RODATA`), you can call this API during Flash operations

参数

- **addr** -- **[in]** Starting address to do the msync

- **size** -- **[in]** Size to do the msync
- **flags** -- **[in]** Flags, see `ESP_CACHE_MSINC_FLAG_x`

返回

- `ESP_OK`:
 - Successful msync
 - For C2M direction, if this chip doesn't support cache writeback, if the input addr is a cache supported one, this API will return `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Invalid argument, not cache supported addr, see printed logs

Macros**ESP_CACHE_MSINC_FLAG_INVALIDATE**

Do an invalidation.

Cache msync flags

- For cache-to-memory (C2M) direction: setting this flag will start an invalidation after the cache writeback operation
- For memory-to-cache (M2C) direction: setting / unsetting this flag will behave similarly, trigger an invalidation

ESP_CACHE_MSINC_FLAG_UNALIGNED

Allow msync to a address block that are not aligned to the data cache line size.

ESP_CACHE_MSINC_FLAG_DIR_C2M

Cache msync direction: from Cache to memory.

备注: If you don't set direction (`ESP_CACHE_MSINC_FLAG_DIR_x` flags), it is by default cache-to-memory (C2M) direction

ESP_CACHE_MSINC_FLAG_DIR_M2C

Cache msync direction: from memory to Cache.

ESP_CACHE_MSINC_FLAG_TYPE_DATA

Cache msync type: data.

备注: If you don't set type (`ESP_CACHE_MSINC_FLAG_TYPE_x` flags), it is by default data type

ESP_CACHE_MSINC_FLAG_TYPE_INST

Cache msync type: instruction.

2.9.17 堆内存调试

概述

ESP-IDF 集成了用于请求堆内存信息、堆内存损坏检测和堆内存跟踪的工具，有助于跟踪内存相关错误。有关堆内存分配器的基本信息，请参阅堆内存分配。

堆内存信息

要获取堆内存状态的相关信息，请调用以下函数：

- `heap_caps_get_free_size()` 返回不同属性内存的当前空闲内存。
- `heap_caps_get_largest_free_block()` 返回堆中最大的空闲块，也是当前可分配的最大内存块。跟踪此值并将其与总空闲堆对比，可以检测堆碎片化情况。
- `heap_caps_get_minimum_free_size()` 可以跟踪堆启动以来的“低水位”。
- `heap_caps_get_info()` 返回一个 `multi_heap_info_t` 结构体，包含上述函数的信息，以及一些额外的特定堆内存数据（分配数量等）。
- `heap_caps_print_heap_info()` 将 `heap_caps_get_info()` 返回的信息摘要打印到标准输出。
- `heap_caps_dump()` 和 `heap_caps_dump_all()` 输出堆中每个内存块结构的详细信息。注意，这可能会产生大量输出。

堆内存分配与释放钩子函数

通过堆内存分配及释放检测钩子，可获取每次堆内存分配及释放操作成功的提示：

- 定义 `esp_heap_trace_alloc_hook()` 获取堆内存分配操作成功的提示
- 定义 `esp_heap_trace_free_hook()` 获取堆内存释放操作成功的提示

要启用此功能，请设置 `CONFIG_HEAP_USE_HOOKS` 选项。`esp_heap_trace_alloc_hook()` 和 `esp_heap_trace_free_hook()` 具有弱声明（即 `__attribute__((weak))`），因此无需为这两个钩子提供声明。鉴于从 ISR 中分配和释放堆内存存在技术上是可行的（但强烈不建议），`esp_heap_trace_alloc_hook()` 和 `esp_heap_trace_free_hook()` 可能会从 ISR 中调用。

不建议在钩子函数中执行（或调用 API 函数执行）阻塞操作或堆内存分配与释放。一般而言，最好保持代码简洁，避免在钩子函数中进行复杂计算。

要定义堆内存分配及释放钩子，请参阅如下示例：

```
#include "esp_heap_caps.h"

void esp_heap_trace_alloc_hook(void* ptr, size_t size, uint32_t caps)
{
    ...
}

void esp_heap_trace_free_hook(void* ptr)
{
    ...
}

void app_main()
{
    ...
}
```

堆内存损坏检测

堆内存损坏检测可检测到各类堆内存错误，包括：

- 越界写入和缓冲区溢出
- 写入已释放的内存
- 从已释放或未初始化的内存读取

断言 如 `heap/multi_heap.c` 等堆的实现方式包含许多断言，堆内存损坏则断言失败。为高效检测堆内存损坏，请确保在项目配置中通过 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 选项启用断言。

如果堆完整性断言失败，将打印一行类似 CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c 的内容，打印的内存地址即内容损坏的堆结构地址。

调用 `heap_caps_check_integrity_all()` 或相关函数可手动检测堆内存完整性，该函数可以检测所有请求的堆内存完整性，在禁用断言时仍可生效。若此完整性检测检测到错误，将打印相应错误及内容损坏的堆内存结构地址。

内存分配失败钩子 用户可以使用 `heap_caps_register_failed_alloc_callback()` 注册回调函数，每次内存分配操作失败时都会调用该函数。

此外，若启用 `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS` 选项，可以在任何分配操作失败时，自动中止系统。

要注册内存分配失败的回调函数，请参阅如下示例：

```
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char_*
↳*function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↳",function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↳failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

定位堆内存损坏 内存损坏可能是最难定位和修复的错误类型之一，因为导致内存损坏的原因可能与问题的表现毫不相干。以下是有关定位堆内存损坏的一些提示：

- 如果系统崩溃并提示 CORRUPT HEAP:，打印信息中通常包含栈跟踪，但此栈跟踪往往无效，因为系统会在检测到堆内存损坏后崩溃，但实际的损坏通常发生在其他位置，且损坏时间早于系统发现的时间。
- 将堆内存调试配置项级别增加到“轻度影响”或“全面”可以得到更准确的信息，定位首个内存损坏的地址。
- 在代码中定期调用 `heap_caps_check_integrity_all()` 或 `heap_caps_check_integrity_addr()` 可以定位内存损坏发生的确切时间。可以反复调整检测函数位置，以定位导致堆内存损坏的代码块。
- 根据损坏的内存地址，按照 [JTAG 调试](#) 在此地址上设置监视点，并在写入时使 CPU 暂停。
- 如果没有 JTAG，但大致了解损坏发生的时间，则可以通过 `esp_cpu_set_watchpoint()` 在软件中提前设置监视点，触发监视点将导致致命错误。函数使用示例为 `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`。注意，监视点在各个 CPU 独立存在，并且仅设置在当前运行的 CPU 上，因此，若无法确定哪个 CPU 破坏了内存，则需要两个 CPU 上分别调用此函数。
- 对于缓冲区溢出，以 `HEAP_TRACE_ALL` 模式进行 [堆内存跟踪](#) 可以看到哪些调用函数正在从堆中分配哪些地址，详情请参阅 [堆内存跟踪定位堆内存损坏](#)。如果可以找到在已损坏地址的前一地址分配内存的函数，这些函数很可能就是使缓冲区溢出的函数。
- 调用 `heap_caps_dump()` 或 `heap_caps_dump_all()` 提示损坏区域周围堆块的情况，并了解哪些堆块可能已经溢出或下溢等。

配置项 暂时提高堆内存损坏检测级别，可以进一步获取有关堆内存损坏错误的详细信息。

在项目配置菜单中，可以在 Component config 下找到 Heap memory debugging 菜单，其中的 `CONFIG_HEAP_CORRUPTION_DETECTION` 选项可以设置为以下三种级别：

基本模式（无污染） 此为默认级别，默认情况下，不会启用任何特殊的堆内存损坏检测功能。但会启用提供的断言。如果堆的任何内部数据结构出现覆盖或损坏，就会打印出一个堆内存损坏错误。这通常表示缓冲区溢出或越界写入。

启用断言时，如果出现重复释放相同内存的情况（即双重释放），则会触发断言。

在基本模式调用 `heap_caps_check_integrity()`，可以检查所有堆结构的完整性，并在出错时打印错误信息。

轻微影响模式 在此级别下，每个分配的内存块都会在头尾加入“canary 字节”进行“污染”。如果应用程序在已分配缓冲区的边界外写入数据，则会破坏这些 canary 字节，导致完整性检查失败。

头 canary 字的值为 0xABBA1234（按字节顺序为 3412BAAB），尾 canary 字的值为 0xBAAD5678（按字节顺序为 7856ADBA）。

基本模式下的堆内存损坏检测可以检测到大多数越界写入，在检测到错误前的越界字节数取决于堆属性。但轻微影响模式更精确，可以检测到单个字节的越界写入。

启用轻微影响模式检测会增加内存使用量，每次内存分配需要 9 至 12 个额外的字节，具体取决于对齐方式。

在轻微影响模式下，每次调用 `heap_caps_free()` 时，都会检查要释放的缓冲区头尾 canary 字节是否匹配预期值。

调用 `heap_caps_check_integrity()` 时，会检查所有已分配的堆内存块的 canary 字节是否匹配预期值。

以上两种情况检查的是，在缓冲区返回给用户之前，已分配块的前 4 个字节是否为 0xABBA1234，以及在缓冲区返回给用户之后，最后 4 个字节是否为 0xBAAD5678。

如果检查到字节与上述值不同，通常表示缓冲区越界或下溢。其中越界表示在写入内存时，写入的数据超过了所分配内存的大小，导致写入到了未分配的内存区域；下溢表示在读取内存时，读取的数据超出了所分配内存的范围，读取了未分配的内存区域的数据。

全面检测模式 此级别包含了轻微影响模式的检测功能，此外还会检查未初始化访问和使用已释放内存产生的错误。此模式会将所有新分配的内存填充为 0xCE，将所有已释放的内存填充为 0xFE。

启用全面检测模式会对运行性能产生实质影响，因为每次 `heap_caps_malloc()` 或 `heap_caps_free()` 操作完成时，都需要将所有内存设置为分配模式，并检查内存。但是，此模式更容易检测到其他方式难以发现的内存损坏错误。建议只在调试时启用此模式，请勿在生产环境中启用。

全面检测模式下程序崩溃 全面检测模式下，如果应用程序在读取或写入与 0xCECECECE 相关地址时崩溃，表示它读取了未初始化内存。此时，应修改应用程序，使用 `heap_caps calloc()` 将内存清零，或在使用前初始化内存。在栈分配的自动变量中也可能存在 0xCECECECE 的值，因为 ESP-IDF 中的大多数任务栈最初由堆分配，而在 C 中，栈内存默认未初始化。

如果应用程序崩溃，且异常寄存器转储指示某些地址或值为 0xFEFEFEFE，表示它读取了已释放的堆内存。此时，应修改应用程序，避免访问已释放的堆内存。

调用 `heap_caps_malloc()` 或 `heap_caps_realloc()` 时，如果在已释放的内存中找到了不同于 0xFEFEFEFE 的值，将导致应用程序崩溃。这表示应用程序写入了已经释放的内存，从而产生错误。

全面检测模式下手动堆内存检测 调用 `heap_caps_check_integrity()` 会打印与 0xFEFEFEFE、0xABBA1234、或 0xBAAD5678 相关的错误。在不同情况下，检测器均会检测给定模式，若未找到，则输出相应错误：

- 对于已释放的堆内存块，检测器会检查是否所有字节都设置为 0xFE，检测到任何其他值都表示错误写入了已释放内存。
- 对于已分配的堆内存块，检测器的检查模式与轻微影响模式相同，即在每个分配的缓冲区头部和尾部检查 canary 字节 0xABBA1234 和 0xBAAD5678，检测到任何其他字节都表示缓冲区越界或下溢。

堆任务跟踪

堆任务跟踪可获取堆内存分配的各任务信息，应用程序须指定计划跟踪堆分配的堆属性。

示例代码可参考 [system/heap_task_tracking](#)。

堆内存跟踪

堆内存跟踪支持跟踪用于分配或释放内存的代码，且支持以下两种跟踪模式：

- 独立模式。此模式下，跟踪数据保存在设备上（因此收集的信息大小受指定缓冲区限制），并由设备上的代码完成分析。部分 API 可访问和转储收集的信息。
- 主机模式。此模式不受独立模式所受限制，其跟踪数据使用 `app_trace` 库通过 JTAG 连接发送到主机，随后使用特殊工具完成分析。

堆内存跟踪具有以下两种功能：

- 泄漏检测：检测已分配但未释放的内存。
- 堆内存使用分析：显示在跟踪运行期间所有分配或释放内存的函数。

如何判断内存泄漏 如果怀疑存在内存泄漏，首先要找出程序中存在泄漏的部分。调用 `heap_caps_get_free_size()` 或 [堆内存信息](#) 中的其他相关函数，跟踪应用程序的内存使用情况，尝试将泄漏范围缩小到某个或一系列空闲内存始终减少而没有恢复的函数。

独立模式 确定存在泄漏的代码后，请执行以下步骤：

- 启用 `CONFIG_HEAP_TRACING_DEST` 选项。
- 在程序早期调用函数 `heap_trace_init_standalone()` 注册一个可用于记录内存跟踪的缓冲区。
- 在有内存泄漏之嫌的代码块前，调用函数 `heap_trace_start()` 记录系统中的所有内存分配和释放操作。
- 在有内存泄露之嫌的代码块后，调用函数 `heap_trace_stop()` 停止跟踪。
- 调用函数 `heap_trace_dump()` 导出内存跟踪结果。

应用程序代码初始化、启动和停止堆内存跟踪的一般过程，见以下代码片段示例：

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // 该缓冲区必须在内部 RAM 中

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
```

(下页继续)

```

do_something_you_suspect_is_leaking();

ESP_ERROR_CHECK( heap_trace_stop() );
heap_trace_dump();
...
}

```

堆内存跟踪堆输出将类似以下格式的内容：

```

2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller_
↳0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
↳blink.c:27

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main././blink.c:52

8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller_
↳0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
↳blink.c:29

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main././blink.c:52

40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

```

备注：以上示例输出使用 *IDF 监视器*，自动将 PC 地址解码为其源文件和行号。

第一行表示与缓冲区的总大小相比，缓冲区内的分配条目数量。

在 HEAP_TRACE_LEAKS 模式下，对跟踪的每个未释放的已分配内存，打印的信息中都会包含以下内容：

- XX bytes: 分配的字节数。
- @ 0x...: 从 `heap_caps_malloc()` 或 `heap_caps_malloc()` 返回的堆地址。
- Internal 或 PSRAM: 分配内存的一般位置。
- CPU x: 分配过程中运行的 CPU (CPU 0 或 CPU 1)。
- ccount 0x...: 分配时的 COUNTER (CPU 循环计数器) 寄存器值，CPU 0 与 CPU 1 中的这一值不同。
- caller 0x... 作为 PC 地址列表，给出 `heap_caps_malloc()` 或 `heap_caps_free()` 的调用栈，可解码到源文件和行号，如上文所示。

每个跟踪条目记录的调用栈深度可以在项目配置菜单下进行配置，选择 Heap Memory Debugging > Enable heap tracing > `CONFIG_HEAP_TRACING_STACK_DEPTH`。每个内存分配最多可以记录 32 个栈帧（默认为 2），每增加一个栈帧，每个 `heap_trace_record_t` 记录的内存使用量将增加 8 个字节。

最后，将打印“泄漏”的总字节数（即在跟踪期间分配但未释放的总字节数），以及它所代表的总分配次数。

如果跟踪缓冲区不足以容纳所有分配，则会打印警告。如果看到此警告，请考虑缩短跟踪时间，或增加跟踪缓冲区中记录的数量。

主机模式 确定存在泄漏的代码后，请执行以下步骤：

- 在项目配置菜单中，导航至 Component settings > Heap Memory Debugging > `CONFIG_HEAP_TRACING_DEST` 并选择 Host-Based。

- 在项目配置菜单中，导航至 Component settings > Application Level Tracing > [CONFIG_APPTRACE_DESTINATION1](#) 并选择 Trace memory。
- 在项目配置菜单中，导航至 Component settings > Application Level Tracing > FreeRTOS SystemView Tracing 并启用 [CONFIG_APPTRACE_SV_ENABLE](#)。
- 在程序早期，调用函数 `heap_trace_init_tohost()`，初始化 JTAG 堆内存跟踪模块。
- 在有内存泄漏之嫌的代码块前，调用函数 `heap_trace_start()` 开始记录系统中的内存分配和释放操作。
主机模式忽略该函数参数，堆内存跟踪模块以 `HEAP_TRACE_ALL` 传递后的方式运行，即所有的内存分配和释放都发送到主机。
- 在有内存泄露之嫌的代码块后，调用函数 `heap_trace_stop()` 停止跟踪。

应用程序代码初始化、启动和停止基于主机模式堆内存跟踪的一般过程，请参阅以下代码片段示例：

```
#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

要收集并分析堆内存跟踪结果，请在主机上完成以下操作：

1. 构建程序并将其下载到目标设备，详情请参阅[第五步：开始使用 ESP-IDF](#)吧。
2. 运行 OpenOCD（请参阅[JTAG 调试](#)）。

备注： 使用此功能需要 v0.10.0-esp32-20181105 或更高版本的 OpenOCD。

3. 使用 GDB 可以自动启动和/或停止跟踪，为此应准备特殊的 gdbinit 文件：

```
target remote :3333

mon reset halt
maintenance flush register-cache

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
end

c
```

使用此文件，GDB 将连接到目标设备、重置该设备，在程序触发 `heap_trace_start()` 断点时开始跟踪，在程序触发 `heap_trace_stop()` 断点时停止跟踪。跟踪数据将保存至 `/tmp/heap_log.svdat`。

4. 使用命令 `xtensa-esp32s2-elf-gdb -x gdbinit </path/to/program/elf>` 运行 GDB
5. 调用 `heap_trace_stop()` 函数使程序停止运行时，退出 GDB，跟踪数据将保存至 `/tmp/heap.svdat`
6. 运行处理脚本 `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

堆内存跟踪堆输出将类似以下格式的内容：

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 byte!)
Process events from '['/tmp/heap.svdat']'...

堆内存跟踪定位堆内存损坏 堆内存跟踪也是一种定位堆内存损坏位置的方法。当堆中的某个区域损坏时，可能是因为程序中的其他部分在相邻地址分配内存。

如果大致了解堆内存损坏发生的时间范围，启用 `HEAP_TRACE_ALL` 模式的堆内存跟踪，可以记录分配内存的所有函数及其相应地址。

以此方法使用堆内存跟踪与上文描述的内存泄漏检测类似，对已分配但未释放的内存输出结果相同，但还会显示已释放内存的记录。

性能影响 在 `menuconfig` 中启用堆内存跟踪，会增加程序代码的大小，即便未运行堆内存跟踪，也会对堆内存分配或释放操作的性能产生较小的负面影响。

运行堆内存跟踪时，堆内存分配或释放操作的速度明显变慢。增加为各内存分配的栈帧深度（见上文）也会造成这种性能影响。

为减轻堆内存跟踪运行时的性能损失，请启用 `CONFIG_HEAP_TRACE_HASH_MAP`。此时，将使用哈希映射机制处理堆内存跟踪记录，减少堆内存分配或释放操作的执行时长。设置 `CONFIG_HEAP_TRACE_HASH_MAP_SIZE` 的值可以调整哈希映射的大小。

默认情况下，哈希映射会放置在内部 RAM 中，启用 `CONFIG_HEAP_TRACE_HASH_MAP_IN_EXT_RAM` 时也可将其放置在外部 RAM 中。要启用此配置，请确保已启用 `CONFIG_SPIRAM` 和 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`。

内存泄漏误报 并非所有由 `heap_trace_dump()` 打印的信息都是内存泄漏，以下情况也可能打印信息：

- 在调用 `heap_trace_start()` 后分配且在调用 `heap_trace_stop()` 后才释放的内存都会出现在泄漏信息中。
- 系统中的其他任务也可能进行内存分配。根据这些任务的时间安排，报错的这部分内存很可能在调用 `heap_trace_stop()` 后释放。
- 当任务第一次使用 `stdio`，如调用 `heap_caps_printf()` 时，`libc` 会分配一个锁，即 `RTOS` 互斥信号量，该分配将持续至任务删除。
- 进行打印浮点数等调用 `heap_caps_printf()` 的操作时，会根据需要，从堆中分配一些内存，这些分配将持续至任务删除。
- 蓝牙、Wi-Fi 和 TCP/IP 库会分配堆内存缓冲区，处理传入或传出的数据，这些内存缓冲区通常持续时间较短。但如果在运行堆内存泄漏跟踪期间，网络底层接收或发送了数据，一些缓冲区可能会出现在堆内存泄漏跟踪输出中。
- 由于存在 `TIME_WAIT` 状态，TCP 连接在关闭后仍会使用一些内存，`TIME_WAIT` 状态结束后将释放这些内存。

要区分“真实”和“误报”的内存泄漏，可以在堆内存跟踪运行时多次调用可疑代码，并在堆内存跟踪输出中查找重复出现的内存分配情况。

API 参考 - 堆内存跟踪

Header File

- `components/heap/include/esp_heap_trace.h`
- This header file can be included with:

```
#include "esp_heap_trace.h"
```

Functions

`esp_err_t heap_trace_init_standalone(heap_trace_record_t *record_buffer, size_t num_records)`

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0)`;

参数

- **record_buffer** -- Provide a buffer to use for heap trace data. Note: External RAM is allowed, but it prevents recording allocations made from ISR's.
- **num_records** -- Size of the heap trace buffer, as number of record structures.

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

esp_err_t **heap_trace_init_tohost** (void)

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

返回

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

esp_err_t **heap_trace_start** (*heap_trace_mode_t* mode)

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

备注: `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

备注: Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

参数 mode -- Mode for tracing.

- HEAP_TRACE_ALL means all heap allocations and frees are traced.
- HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- ESP_OK Tracing is started.

esp_err_t **heap_trace_stop** (void)

Stop heap tracing.

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped..

esp_err_t **heap_trace_resume** (void)

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when `heap_trace_start()` was last called (or `HEAP_TRACE_ALL` if `heap_trace_start()` was never called).

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

size_t **heap_trace_get_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

esp_err_t **heap_trace_get** (size_t index, *heap_trace_record_t* *record)

Return a raw record from the heap trace buffer.

备注: It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

参数

- **index** -- Index (zero-based) of the record to return.
- **record** -- **[out]** Record where the heap trace record will be copied.

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

void **heap_trace_dump** (void)

Dump heap trace record data to stdout.

备注: It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

void **heap_trace_dump_caps** (const uint32_t caps)

Dump heap trace from the memory of the capabilities passed as parameter.

参数 caps -- Capability(ies) of the memory from which to dump the trace. Set MAL-LOC_CAP_INTERNAL to dump heap trace data from internal memory. Set MAL-LOC_CAP_SPIRAM to dump heap trace data from PSRAM. Set both to dump both heap trace data.

esp_err_t **heap_trace_summary** (*heap_trace_summary_t* *summary)

Get summary information about the result of a heap trace.

备注: It is safe to call this function while heap tracing is running.

Structures

struct **heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

Public Members

uint32_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void ***address**

Address which was allocated. If NULL, then this record is empty.

size_t **size**

Size of the allocation.

void ***allocated_by**[CONFIG_HEAP_TRACING_STACK_DEPTH]

Call stack of the caller which allocated the memory.

void ***freed_by**[CONFIG_HEAP_TRACING_STACK_DEPTH]

Call stack of the caller which freed the memory (all zero if not freed.)

struct **heap_trace_summary_t**

Stores information about the result of a heap trace.

Public Members

heap_trace_mode_t **mode**

The heap trace mode we just completed / are running.

size_t **total_allocations**

The total number of allocations made during tracing.

size_t **total_frees**

The total number of frees made during tracing.

size_t **count**

The number of records in the internal buffer.

size_t **capacity**

The capacity of the internal buffer.

size_t **high_water_mark**

The maximum value that 'count' got to.

size_t **has_overflowed**

True if the internal buffer overflowed at some point.

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Type Definitions

typedef struct *heap_trace_record_t* **heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

Enumerations

enum **heap_trace_mode_t**

Values:

enumerator **HEAP_TRACE_ALL**

enumerator **HEAP_TRACE_LEAKS**

2.9.18 ESP 定时器

API 参考

Header File

- [components/esp_timer/include/esp_timer.h](#)
- This header file can be included with:

```
#include "esp_timer.h"
```

- This header file is a part of the API provided by the `esp_timer` component. To declare that your component depends on `esp_timer`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_timer
```

or

```
PRIV_REQUIRES esp_timer
```

Functions

esp_err_t **esp_timer_early_init** (void)

Minimal initialization of `esp_timer`.

This function can be called very early in startup process, after this call only [esp_timer_get_time\(\)](#) function can be used.

备注: This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs.

返回

- `ESP_OK` on success

esp_err_t **esp_timer_init** (void)

Initialize `esp_timer` library.

This function will be called from startup code on every core. If Kconfig option `CONFIG_ESP_TIMER_ISR_AFFINITY` is set to `NO_AFFINITY`, it allocates the timer ISR on `MULTIPLE` cores and creates the timer task which can be run on any core.

备注: This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs. Before calling this function, [esp_timer_early_init\(\)](#) must be called by the startup code.

返回

- `ESP_OK` on success

- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

esp_err_t **esp_timer_deinit** (void)

De-initialize esp_timer library.

备注: Normally this function should not be called from applications

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

esp_err_t **esp_timer_create** (const *esp_timer_create_args_t* *create_args, *esp_timer_handle_t* *out_handle)

Create an esp_timer instance.

备注: When timer no longer needed, delete it using *esp_timer_delete()*.

参数

- **create_args** -- Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out_handle** -- [out] Output, pointer to esp_timer_handle_t variable that holds the created timer handle.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

esp_err_t **esp_timer_start_once** (*esp_timer_handle_t* timer, uint64_t timeout_us)

Start a one-shot timer.

Timer represented by `timer` should not be running when this function is called.

参数

- **timer** -- timer handle created using *esp_timer_create()*
- **timeout_us** -- timer timeout, in microseconds relative to the current moment

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_start_periodic** (*esp_timer_handle_t* timer, uint64_t period)

Start a periodic timer.

Timer represented by `timer` should not be running when this function is called. This function starts the timer which will trigger every `period` microseconds.

参数

- **timer** -- timer handle created using *esp_timer_create()*
- **period** -- timer period, in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_restart** (*esp_timer_handle_t* timer, uint64_t timeout_us)

Restart a currently running timer.

| Type of timer | Action |
|----------------|--|
| One-shot timer | Restarted immediately and times out once in <code>timeout_us</code> microseconds |
| Periodic timer | Restarted immediately with a new period of <code>timeout_us</code> microseconds |

参数

- **timer** -- timer handle created using *esp_timer_create()*
- **timeout_us** -- Timeout in microseconds relative to the current time. In case of a periodic timer, also represents the new period.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is not running

esp_err_t **esp_timer_stop** (*esp_timer_handle_t* timer)

Stop a running timer.

This function stops the timer previously started using *esp_timer_start_once()* or *esp_timer_start_periodic()*.

参数 **timer** -- timer handle created using *esp_timer_create()*

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

esp_err_t **esp_timer_delete** (*esp_timer_handle_t* timer)

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

参数 **timer** -- timer handle created using *esp_timer_create()*

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

int64_t **esp_timer_get_time** (void)

Get time in microseconds since boot.

返回 Number of microseconds since the initialization of ESP Timer

int64_t **esp_timer_get_next_alarm** (void)

Get the timestamp of the next expected timeout.

返回 Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by *esp_timer_get_time()*.

int64_t **esp_timer_get_next_alarm_for_wake_up** (void)

Get the timestamp of the next expected timeout excluding those timers that should not interrupt light sleep (such timers have *esp_timer_create_args_t::skip_unhandled_events* enabled)

返回 Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by *esp_timer_get_time()*.

esp_err_t **esp_timer_get_period** (*esp_timer_handle_t* timer, uint64_t *period)

Get the period of a timer.

This function fetches the timeout period of a timer. For a one-shot timer, the timeout period will be 0.

参数

- **timer** -- timer handle created using *esp_timer_create()*

- **period** -- memory to store the timer period value in microseconds
- 返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

esp_err_t **esp_timer_get_expiry_time** (*esp_timer_handle_t* timer, uint64_t *expiry)

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

备注: Passing the timer handle of a periodic timer will result in an error.

参数

- **timer** -- timer handle created using *esp_timer_create()*
- **expiry** -- memory to store the timeout value in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

esp_err_t **esp_timer_dump** (FILE *stream)

Dump the list of timers to a stream.

By default, this function prints the list of active (running) timers. The output format is:

```
| Name | Period | Alarm |
```

- Name —timer pointer
- Period —period of timer in microseconds, or 0 for one-shot timer
- Alarm - time of the next alarm in microseconds since boot, or 0 if the timer is not started

To print the list of all created timers, enable Kconfig option `CONFIG_ESP_TIMER_PROFILING`. In this case, the output format is:

```
| Name | Period | Alarm | Times_armed | Times_trigg | Times_skip | Cb_exec_time |
```

- Name —timer name
- Period —same as above
- Alarm —same as above
- Times_armed —number of times the timer was armed via `esp_timer_start_X`
- Times_triggered - number of times the callback was triggered
- Times_skipped - number of times the callback was skipped
- Callback_exec_time - total time taken by callback to execute, across all calls

参数 **stream** -- stream (such as stdout) to which to dump the information

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

void **esp_timer_isr_dispatch_need_yield** (void)

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

bool **esp_timer_is_active** (*esp_timer_handle_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active (running) or not.

参数 *timer* -- timer handle created using *esp_timer_create()*
返回

- 1 if timer is still active (running)
- 0 if timer is not active

esp_err_t **esp_timer_new_etm_alarm_event** (*esp_etm_event_handle_t* *out_event)

Get the ETM event handle of esp_timer underlying alarm event.

备注: The created ETM event object can be deleted later using *esp_etm_del_event()*

备注: The ETM event is generated by the underlying hardware - systimer; therefore, if the esp_timer is not clocked by systimer, then no ETM event will be generated.

参数 *out_event* -- [out] Returned ETM event handle
返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **esp_timer_create_args_t**

Timer configuration passed to *esp_timer_create()*

Public Members

esp_timer_cb_t **callback**

Callback function to execute when timer expires.

void ***arg**

Argument to pass to callback.

esp_timer_dispatch_t **dispatch_method**

Dispatch callback from task or ISR; if not specified, esp_timer task.

const char ***name**

Timer name, used in *esp_timer_dump()* function.

bool **skip_unhandled_events**

Setting to skip unhandled events in light sleep for periodic timers.

Type Definitions

typedef struct esp_timer ***esp_timer_handle_t**

Opaque type representing a single timer handle.

typedef void (***esp_timer_cb_t**)(void *arg)

Timer callback function type.

Param arg pointer to opaque user-specific data

Enumerations

enum **esp_timer_dispatch_t**

Method to dispatch timer callback.

Values:

enumerator **ESP_TIMER_TASK**

Callback is dispatched from esp_timer task.

enumerator **ESP_TIMER_ISR**

Callback is dispatched from interrupt handler.

enumerator **ESP_TIMER_MAX**

Sentinel value for the number of callback dispatch methods.

2.9.19 内部 API 和不稳定的 API

该文档列举了一些 API，这些 API 供内部使用或可能在 ESP-IDF 后续版本中被更改或删除。

API 参考

Header File

- [components/esp_rom/include/esp_rom_sys.h](#)
- This header file can be included with:

```
#include "esp_rom_sys.h"
```

Functions

void **esp_rom_software_reset_system** (void)

Software Reset digital core include RTC.

It is not recommended to use this function in esp-idf, use esp_restart() instead.

void **esp_rom_software_reset_cpu** (int cpu_no)

Software Reset cpu core.

It is not recommended to use this function in esp-idf, use esp_restart() instead.

参数 cpu_no -- : The CPU to reset, 0 for PRO CPU, 1 for APP CPU.

int **esp_rom_printf** (const char *fmt, ...)

Print formatted string to console device.

备注: float and long long data are not supported!

参数

- **fmt** -- Format string
 - ... -- Additional arguments, depending on the format string
- 返回 int: Total number of characters written on success; A negative number on failure.

void **esp_rom_delay_us** (uint32_t us)

Pauses execution for us microseconds.

参数 **us** -- Number of microseconds to pause

void **esp_rom_install_channel_putc** (int channel, void (*putc)(char c))

esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

参数

- **channel** -- Channel number (starting from 1)
- **putc** -- Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

void **esp_rom_install_uart_printf** (void)

Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putc(1, esp_rom_output_putc)

soc_reset_reason_t **esp_rom_get_reset_reason** (int cpu_no)

Get reset reason of CPU.

参数 **cpu_no** -- CPU number

返回 Reset reason code (see in soc/reset_reasons.h)

void **esp_rom_route_intr_matrix** (int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)

Route peripheral interrupt sources to CPU's interrupt port by matrix.

Usually there're 4 steps to use an interrupt:

- a. Route peripheral interrupt source to CPU. e.g. `esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)`
- b. Set interrupt handler for CPU
- c. Enable CPU interrupt
- d. Enable peripheral interrupt

参数

- **cpu_core** -- The CPU number, which the peripheral interrupt will inform to
- **periph_intr_id** -- The peripheral interrupt source number
- **cpu_intr_num** -- The CPU (external) interrupt number. On targets that use CLIC as their interrupt controller, this number represents the external interrupt number. For example, passing `cpu_intr_num = i` to this function would in fact bind peripheral source to CPU interrupt `CLIC_EXT_INTR_NUM_OFFSET + i`.

uint32_t **esp_rom_get_cpu_ticks_per_us** (void)

Get the real CPU ticks per us.

返回 CPU ticks per us

void **esp_rom_set_cpu_ticks_per_us** (uint32_t ticks_per_us)

Set the real CPU tick rate.

备注: Call this function when CPU frequency is changed, otherwise the `esp_rom_delay_us` can be inaccurate.

参数 **ticks_per_us** -- CPU ticks per us

2.9.20 中断分配

概述

ESP32-S2 有一个核，32 个中断。每个中断都有一个确定的优先级别，大多数中断（但不是全部）都连接到中断矩阵。

由于中断源数量多于中断，有时多个驱动程序可以共用一个中断。`esp_intr_alloc()` 抽象隐藏了这些实现细节。

驱动程序可以通过调用 `esp_intr_alloc()`，或 `esp_intr_alloc_intrstatus()` 为某个外设分配中断。通过向此函数传递 `flag`，可以指定中断类型、优先级和触发方式。然后，中断分配代码会找到适用的中断，使用中断矩阵将其连接到外设，并为其安装给定的中断处理程序和 ISR。

中断分配器提供两种不同的中断类型：共享中断和非共享中断，这两种中断需要不同处理方式。非共享中断在每次调用 `esp_intr_alloc()` 时，都会分配一个单独的中断，该中断仅用于与其相连的外设，只调用一个 ISR。共享中断则可以由多个外设触发，当其中一个外设发出中断信号时，会调用多个 ISR。因此，针对共享中断的 ISR 应检查对应外设的中断状态，以确定是否需要采取任何操作。

非共享中断可由电平或边缘触发。共享中断只能由电平触发，因为使用边缘触发可能会错过中断。

要解释为什么共享中断只能由电平触发，以外设 A 和外设 B 共用一个边缘触发中断为例进行说明：当外设 B 触发中断时，会将其中断信号设置为高电平，产生一个从低到高的边缘，进而锁存 CPU 中断位，并触发 ISR。接着，ISR 开始执行，检查到此时外设 A 没有触发中断，于是继续处理外设 B 的中断信号，最后将外设 B 的中断状态清除。最后，CPU 会在 ISR 返回之前清除中断位锁存器。因此在整个中断处理过程中，如果外设 A 触发了中断，该中断会因 CPU 清除中断位锁存器而丢失。

IRAM-safe 中断处理程序

`ESP_INTR_FLAG_IRAM` `flag` 注册的中断处理程序始终在 IRAM（并从 DRAM 读取其所有数据）中运行，因此在擦除和写入 flash 时无需禁用。

这对于需要保证最小执行延迟的中断来说非常有用，因为 flash 写入和擦除操作可能很慢（擦除可能需要数十毫秒或数百毫秒才能完成）。

如果中断被频繁调用，可以将中断处理程序保留在 IRAM 中，避免 flash cache 丢失。

有关更多详细信息，请参阅 [SPI flash API 相关文档](#)。

多个处理程序共用一个中断源

如果用 `ESP_INTR_FLAG_SHARED` `flag` 分配所有处理程序，可能将多个处理程序分配给同一个源。这些程序会被分配给与源关联的中断，并在源可用时按顺序调用。处理程序可以单独禁用和释放。如果启用了的一个或多个处理程序，则会将源关联到中断（启用），否则会取消关联。禁用的处理程序永远不会被调用，但是只要启用了源的任何一个处理程序，这个源仍然能被触发。

关联到非共享中断的源不支持此功能。

默认情况下，指定 `ESP_INTR_FLAG_SHARED` `flag` 时，中断分配器仅分配优先级为 1 的中断。可以使用 `ESP_INTR_FLAG_SHARED | ESP_INTR_FLAG_LOWMED` 允许分配优先级为 2 和 3 的共享中断。

尽管支持此功能，使用时也必须 **非常小心**。通常存在两种办法可以阻止中断触发：**禁用源**或**屏蔽外设中断状态**。ESP-IDF 仅处理源本身的启用和禁用，中断源的状态位和屏蔽位须由用户操作。

状态位须在负责该位的处理程序禁用前屏蔽，也可以在另一个启用的中断中屏蔽和处理该状态位。

备注：如果不屏蔽状态位而让其处于未处理状态，同时禁用这些状态位的处理程序，就会导致无限次触发中断，引起系统崩溃。

排除中断分配故障

CPU 中断在大多数 Espressif SoC 上都是有限的资源。因此，一个运行的程序有可能耗尽 CPU 中断，例如初始化多个外设驱动程序的情况。这通常导致驱动程序的初始化函数返回 `ESP_ERR_NOT_FOUND` 错误。

这种情况下，可使用 `esp_intr_dump()` 函数打印中断列表及其状态。此函数输出通常如下：

```
CPU 0 interrupt status:
Int  Level  Type   Status
0    1      Level  Reserved
1    1      Level  Reserved
2    1      Level  Used: RTC_CORE
3    1      Level  Used: TG0_LACT_LEVEL
...
```

输出列含义如下：

- **Int:** CPU 中断输入编号。通常不直接在软件中使用，仅作为参考。
- **Level:** CPU 中断的优先级 (1-7)。此优先级固定在硬件上，无法更改。
- **Type:** CPU 中断的中断类型 (电平或边缘中断)。此类型在硬件上固定，无法更改。
- **Status: 中断的可能状态:**
 - **Reserved:** 中断在硬件层面保留，或由 ESP-IDF 的某些部分保留。不能使用 `esp_intr_alloc()` 分配。
 - **Used: <source>:** 中断已分配并连接到单个外设。
 - **Shared: <source1> <source2> ...:** 中断已分配并连接到多个外设。参见本文档 [多个处理程序共用一个中断源](#) 章节。
 - **Free:** 中断未分配，可以由 `esp_intr_alloc()` 使用。
- **Free (not general-use):** 中断未分配，但它是高优先级中断 (级别 4-7) 或边缘触发中断。高优先级中断可以使用 `esp_intr_alloc()` 分配，但要求处理程序必须用汇编语言编写，参见 [高优先级中断处理程序](#)。低优先级和中优先级的边缘触发中断也可以用 `esp_intr_alloc()` 分配，但很少使用，因为大多数外设中断是电平触发的。

如果已确认应用程序的确用完了中断，可组合采用下列建议解决问题：

- 找到可接受更高延迟的中断，并用 `ESP_INTR_FLAG_SHARED` flag (或与 `ESP_INTR_FLAG_LOWMED` 进行 OR 运算) 分配这些中断。对两个或更多外设使用此 flag 能让它们使用单个中断输入，从而为其他外设节约中断输入。参见 [多个处理程序共用一个中断源](#)。
- 一些外设驱动程序可能默认使用 `ESP_INTR_FLAG_LEVEL1` flag 来分配中断，因此默认情况下不会使用优先级为 2 或 3 的中断。如果 `esp_intr_dump()` 显示某些优先级为 2 或 3 的中断可用，尝试在初始化驱动程序时将中断分配 flag 改为 `ESP_INTR_FLAG_LEVEL2` 或 `ESP_INTR_FLAG_LEVEL3`。
- 检查是否有些外设驱动程序不需要一直启用，并按需将其初始化或取消初始化。这样可以减少同时分配的中断数量。

API 参考

Header File

- [components/esp_hw_support/include/esp_intr_types.h](#)
- This header file can be included with:

```
#include "esp_intr_types.h"
```

Macros

`ESP_INTR_CPU_AFFINITY_TO_CORE_ID` (cpu_affinity)

Convert `esp_intr_cpu_affinity_t` to CPU core ID.

Type Definitions

```
typedef void (*intr_handler_t)(void *arg)
```

Function prototype for interrupt handler function

```
typedef struct intr_handle_data_t *intr_handle_t
```

Handle to an interrupt handler

Enumerations

```
enum esp_intr_cpu_affinity_t
```

Interrupt CPU core affinity.

This type specify the CPU core that the peripheral interrupt is connected to.

Values:

```
enumerator ESP_INTR_CPU_AFFINITY_AUTO
```

Install the peripheral interrupt to ANY CPU core, decided by on which CPU the interrupt allocator is running.

```
enumerator ESP_INTR_CPU_AFFINITY_0
```

Install the peripheral interrupt to CPU core 0.

```
enumerator ESP_INTR_CPU_AFFINITY_1
```

Install the peripheral interrupt to CPU core 1.

Header File

- [components/esp_hw_support/include/esp_intr_alloc.h](#)
- This header file can be included with:

```
#include "esp_intr_alloc.h"
```

Functions

```
esp_err_t esp_intr_mark_shared(int intno, int cpu, bool is_in_iram)
```

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

参数

- **intno** -- The number of the interrupt (0-31)
- **cpu** -- CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram** -- Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

返回 ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

```
esp_err_t esp_intr_reserve(int intno, int cpu)
```

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

参数

- **intno** -- The number of the interrupt (0-31)
- **cpu** -- CPU on which the interrupt should be marked as shared (0 or 1)

返回 ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_alloc** (int source, int flags, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

参数

- **source** -- The interrupt source. One of the ETS*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL*_INTR_SOURCE sources as defined in this header.
- **flags** -- An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** -- The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** -- Optional argument for passed to the interrupt handler
- **ret_handle** -- Pointer to an *intr_handle_t* to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

esp_err_t **esp_intr_alloc_intrstatus** (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as *esp_intr_alloc*, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

参数

- **source** -- The interrupt source. One of the ETS*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL*_INTR_SOURCE sources as defined in this header.
- **flags** -- An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** -- The address of an interrupt status register
- **intrstatusmask** -- A mask. If a read of address *intrstatusreg* has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** -- The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** -- Optional argument for passed to the interrupt handler
- **ret_handle** -- Pointer to an *intr_handle_t* to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

esp_err_t **esp_intr_free** (*intr_handle_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

备注: When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

参数 handle -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
返回 `ESP_ERR_INVALID_ARG` the handle is NULL `ESP_FAIL` failed to release this handle
`ESP_OK` otherwise

int **esp_intr_get_cpu** (*intr_handle_t* handle)

Get CPU number an interrupt is tied to.

参数 handle -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
返回 The core number where the interrupt is allocated

int **esp_intr_get_intno** (*intr_handle_t* handle)

Get the allocated interrupt for a certain handle.

参数 handle -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
返回 The interrupt number

esp_err_t **esp_intr_disable** (*intr_handle_t* handle)

Disable the interrupt associated with the handle.

备注:

- For local interrupts (`ESP_INTERNAL_*` sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
 - When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.
-

参数 handle -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
返回 `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

esp_err_t **esp_intr_enable** (*intr_handle_t* handle)

Enable the interrupt associated with the handle.

备注: For local interrupts (`ESP_INTERNAL_*` sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

参数 handle -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
返回 `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

esp_err_t **esp_intr_set_in_iram** (*intr_handle_t* handle, bool is_in_iram)

Set the "in IRAM" status of the handler.

备注: Does not work on shared interrupts.

参数

- **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
- **is_in_iram** -- Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

返回 `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

void **esp_intr_noniram_disable** (void)

Disable interrupts that aren't specifically marked as running from IRAM.

void **esp_intr_noniram_enable** (void)

Re-enable interrupts disabled by `esp_intr_noniram_disable`.

void **esp_intr_enable_source** (int inum)

enable the interrupt source based on its number

参数 inum -- interrupt number from 0 to 31

void **esp_intr_disable_source** (int inum)

disable the interrupt source based on its number

参数 inum -- interrupt number from 0 to 31

static inline int **esp_intr_flags_to_level** (int flags)

Get the lowest interrupt level from the flags.

参数 flags -- The same flags that pass to `esp_intr_alloc_intrstatus` API

static inline int **esp_intr_level_to_flags** (int level)

Get the interrupt flags from the supplied level (priority)

参数 level -- The interrupt priority level

esp_err_t **esp_intr_dump** (FILE *stream)

Dump the status of allocated interrupts.

参数 stream -- The stream to dump to, if NULL then stdout is used

返回 `ESP_OK` on success

Macros

ESP_INTR_FLAG_LEVEL1

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling `esp_intr_alloc*` needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2

Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3

Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4

Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5

Accept a Level 5 interrupt vector.

ESP_INTR_FLAG_LEVEL6

Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI

Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED

Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE

Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM

ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED

Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED

Low and medium prio interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH

High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK

Mask for all level flags

ETS_INTERNAL_TIMER0_INTR_SOURCE

Platform timer 0 interrupt source.

The `esp_intr_alloc*` functions can allocate an int for all `ETS_*_INTR_SOURCE` interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE

Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE

Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE

Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE

Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE

Int source for profiling.

ETS_INTERNAL_UNUSED_INTR_SOURCE

Interrupt is not assigned to any source.

ETS_INTERNAL_INTR_SOURCE_OFF

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE (inum)

Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)

Disable interrupt by interrupt number

2.9.21 日志库

概述

日志库提供了三种设置日志级别的方式：

- **编译时**：在 `menuconfig` 中，使用选项 `CONFIG_LOG_DEFAULT_LEVEL` 来设置日志级别。
- 另外，还可以选择在 `menuconfig` 中使用选项 `CONFIG_LOG_MAXIMUM_LEVEL` 设置最高日志级别。这个选项默认被配置为默认级别，但这个选项也可以被配置为更高级别，将更多的可选日志编译到固件中。
- **运行时**：默认启用所有级别低于 `CONFIG_LOG_DEFAULT_LEVEL` 的日志。`esp_log_level_set()` 函数可以为各个模块分别设置不同的日志级别，可通过人类可读的 ASCII 零终止字符串标签来识别不同的模块。
- **运行时**：启用 `CONFIG_LOG_MASTER_LEVEL` 时，可以使用 `esp_log_set_level_master()` 函数设置主日志级别 (Master logging level)。该选项会为所有已编译的日志添加额外的日志级别检查。注意，使用此选项会增加应用程序大小。如果希望在运行时编译大量可选日志，同时避免在不需要日志输出时查找标签及其级别带来的性能损耗，此功能会非常有用。

以下是不同的日志级别：

- 错误 (Error, 最低级别)
- 警告 (Warning)
- 普通 (Info)
- 调试 (Debug)
- 冗余 (Verbose, 最高级别)

备注：注意，函数 `esp_log_level_set()` 无法将日志级别设置为高于 `CONFIG_LOG_MAXIMUM_LEVEL` 指定的级别。如需在编译时将特定文件的日志级别提高到此最高级别以上，请使用 `LOG_LOCAL_LEVEL` 宏 (详细信息见下文)。

如何使用日志库

在使用日志功能的所有 C 文件中，将 TAG 变量定义如下：

```
static const char* TAG = "MyModule";
```

然后使用一个日志宏进行输出，例如：

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_
↵ * 100, baud_req, baud_real);
```

可使用下列宏来定义不同的日志级别:

- ESP_LOGE - 错误 (最低级别)
- ESP_LOGW - 警告
- ESP_LOGI - 普通
- ESP_LOGD - 调试
- ESP_LOGV - 冗余 (最高级别)

此外, 上述宏还有对应的 ESP_EARLY_LOGx 版本, 如 `ESP_EARLY_LOGE`。这些版本的宏必须在堆分配器和系统调用初始化之前, 在早期启动代码中显式使用。通常情况下, 编译引导加载程序时也可以使用普通的 ESP_LOGx 宏, 但其最终实现与 ESP_EARLY_LOGx 宏相同。

上述宏还有对应的 ESP_DRAM_LOGx 版本, 如 `ESP_DRAM_LOGE`。在禁用中断或无法访问 flash cache 的情况下需要输出日志时, 可以使用这些版本的宏。但是, 应尽量避免使用这些宏版本, 因为在上述情况下输出日志可能会影响性能。

备注: 在关键部分中断被禁用, 因此只能使用 ESP_DRAM_LOGx (首选) 或 ESP_EARLY_LOGx 宏。尽管这样可以输出日志, 但最好可以调整程序使其不用输出日志。

如需在文件或组件范围内覆盖默认的日志级别, 请定义 LOG_LOCAL_LEVEL 宏。

在文件中, 该宏应在包含 esp_log.h 文件前进行定义, 例如:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

在组件中, 该宏应在组件的 CMakeList 中进行定义:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_
↳VERBOSE")
```

如需在运行时按模块配置日志输出, 请按如下方式调用 `esp_log_level_set()` 函数:

```
esp_log_level_set("*", ESP_LOG_ERROR);           // 将所有组件的日志级别设置为错误_
↳ (ERROR) 级别
esp_log_level_set("wifi", ESP_LOG_WARN);        // 启用来自 WiFi 堆栈的警告 (WARN)_
↳ 日志
esp_log_level_set("dhcpc", ESP_LOG_INFO);       // 启用来自 DHCP 客户端的普通 (INFO)_
↳ 日志
```

备注: 上文介绍的“DRAM”和“EARLY”日志宏变型不支持按照模块设置日志级别。这些宏始终以“默认”级别记录日志, 且只能在运行时调用 `esp_log_level("*", level)` 对日志级别进行更改。

即使已通过标签名称禁用日志输出, 每个条目仍需约 10.9 微秒的处理时间。

主日志级别 要启用主日志级别功能, 须启用 `CONFIG_LOG_MASTER_LEVEL` 选项。该功能在调用 `esp_log_write()` 之前为 ESP_LOGx 宏添加了额外的级别检查。这样就可以设置更高的 `CONFIG_LOG_MAXIMUM_LEVEL`, 并且不会在正常操作期间对性能造成影响 (仅在指示时)。应用程序可以全局设置主日志级别 (`esp_log_set_level_master()`) 以强制执行最高日志级别。高于此级别的 ESP_LOGx 宏将直接跳过, 不会调用 `esp_log_write()` 并进行标签查找。建议只在顶层应用程序中使用此功能, 不要在共享组件中使用, 因为这将覆盖所有使用该组件的用户的全局日志级别。默认情况下, 启动时主日志级别是 `CONFIG_LOG_DEFAULT_LEVEL`。

注意, 由于此功能为所有 ESP_LOGx 宏添加了额外的检查, 会导致应用程序的大小增加。

以下代码片段展示了主日志级别的运行方式。将主日志级别设置为 ESP_LOG_NONE 将在全局范围内禁用所有日志记录。 `esp_log_level_set()` 目前不会影响日志记录。但在主日志级别释放后, 日志将按照 `esp_log_level_set()` 中的设置打印输出。

```

// 在启动时，主日志级别为 CONFIG_LOG_DEFAULT_LEVEL，并等于 ESP_LOG_INFO
ESP_LOGI("lib_name", "用于打印的消息");           // 打印普通 (INFO) 级别消息
esp_log_level_set("lib_name", ESP_LOG_WARN);       // 启用 lib_name 的警告 (WARN) 日志
↳ 日志

esp_log_set_level_master(ESP_LOG_NONE);           // 全局禁用所有日志。esp_log_
↳ level_set 目前没有生效

ESP_LOGW("lib_name", "用于打印的消息");           // 主日志级别阻止了打印
esp_log_level_set("lib_name", ESP_LOG_INFO);       // 启用 lib_name 的 INFO 日志
ESP_LOGI("lib_name", "用于打印的消息");           // 主日志级别阻止了打印

esp_log_set_level_master(ESP_LOG_INFO);           // 全局启用所有 INFO 日志

ESP_LOGI("lib_name", "用于打印的消息");           // 打印一条 INFO 消息

```

通过 JTAG 将日志记录到主机 默认情况下，日志库使用类似 `vprintf` 的函数将格式化输出写入专用 UART。通过调用一个简单的 API，即可将所有日志通过 JTAG 输出，将日志输出速度提高数倍。如需了解详情，请参阅[记录日志到主机](#)。

线程安全 日志字符串首先被写入内存 `buffer`，然后发送到 UART 打印。日志调用是线程安全的，即不同线程的日志不会互相冲突。

应用示例

大多数 ESP-IDF 组件和示例都会使用日志库。如需查看有关日志功能的应用示例，请前往 ESP-IDF 的 `examples` 目录。与日志最相关的示例如下：

- [system/ota](#)
- [storage/sd_card](#)
- [protocols/https_request](#)

API 参考

Header File

- [components/log/include/esp_log.h](#)
- This header file can be included with:

```
#include "esp_log.h"
```

Functions

void `esp_log_set_level_master` (*esp_log_level_t* level)

Master log level.

Optional master log level to check against for `ESP_LOGx` macros before calling `esp_log_write`. Allows one to set a higher `CONFIG_LOG_MAXIMUM_LEVEL` but not impose a performance hit during normal operation (only when instructed). An application may set `esp_log_set_level_master(level)` to globally enforce a maximum log level. `ESP_LOGx` macros above this level will be skipped immediately, rather than calling `esp_log_write` and doing a cache hit.

The tradeoff is increased application size.

参数 level -- Master log level

esp_log_level_t **esp_log_get_level_master** (void)

Returns master log level.

返回 Master log level

void **esp_log_level_set** (const char *tag, *esp_log_level_t* level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

备注: Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

参数

- **tag** -- Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- **level** -- Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

esp_log_level_t **esp_log_level_get** (const char *tag)

Get log level for a given tag, can be used to avoid expensive log statements.

参数 **tag** -- Tag of the log to query current level. Must be a non-NULL zero terminated string.

返回 The current log level for the given tag

vprintf_like_t **esp_log_set_vprintf** (*vprintf_like_t* func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

备注: Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

参数 **func** -- new Function used for output. Must have same signature as vprintf.

返回 func old Function used for output.

uint32_t **esp_log_timestamp** (void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

返回 timestamp, in milliseconds

char ***esp_log_system_timestamp** (void)

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as "HH:MM:SS.sss". The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

返回 timestamp, in "HH:MM:SS.sss"

uint32_t **esp_log_early_timestamp** (void)

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

返回 timestamp, in milliseconds

void **esp_log_write** (*esp_log_level_t* level, const char *tag, const char *format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp_log_writew** (*esp_log_level_t* level, const char *tag, const char *format, va_list args)

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

参见:

esp_log_write()

Macros

ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff_len** -- length of buffer in bytes
- **level** -- level of the log

ESP_LOG_BUFFER_CHAR_LEVEL (tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff_len** -- length of buffer in bytes
- **level** -- level of the log

ESP_LOG_BUFFER_HEXDUMP (tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```

W (195) log_example: 0x3ffb4280  45 53 50 33 32 20 69 73  20 67 72 65 61 74
↪2c 20 |ESP32 is great, |
W (195) log_example: 0x3ffb4290  77 6f 72 6b 69 6e 67 20  61 6c 6f 6e 67 20
↪77 69 |working along wi|
W (205) log_example: 0x3ffb42a0  74 68 20 74 68 65 20 49  44 46 2e 00
↪      |th the IDF..|

```

It is highly recommended to use terminals with over 102 text width.

参数

- **tag** -- description tag

- **buffer** -- Pointer to the buffer array
- **buff_len** -- length of buffer in bytes
- **level** -- level of the log

ESP_LOG_BUFFER_HEX (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

参见:

`esp_log_buffer_hex_level`

参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff_len** -- length of buffer in bytes

ESP_LOG_BUFFER_CHAR (tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

参见:

`esp_log_buffer_char_level`

参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff_len** -- length of buffer in bytes

ESP_EARLY_LOGE (tag, format, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at `ESP_LOG_ERROR` level.

参见:

`printf,ESP_LOGE,ESP_DRAM_LOGE` In the future, we want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##_VA_ARGS_`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##_VA_ARGS_`.

ESP_EARLY_LOGW (tag, format, ...)

macro to output logs in startup code at `ESP_LOG_WARN` level.

参见:

`ESP_EARLY_LOGE,ESP_LOGE,printf`

ESP_EARLY_LOGI (tag, format, ...)

macro to output logs in startup code at `ESP_LOG_INFO` level.

参见:

`ESP_EARLY_LOGE,ESP_LOGE,printf`

ESP_EARLY_LOGD (tag, format, ...)

macro to output logs in startup code at ESP_LOG_DEBUG level.

参见:

ESP_EARLY_LOGE, ESP_LOGE, printf

ESP_EARLY_LOGV (tag, format, ...)

macro to output logs in startup code at ESP_LOG_VERBOSE level.

参见:

ESP_EARLY_LOGE, ESP_LOGE, printf

_ESP_LOG_EARLY_ENABLED (log_level)

ESP_LOG_EARLY_IMPL (tag, format, log_level, log_tag_letter, ...)

ESP_LOGE (tag, format, ...)

ESP_LOGW (tag, format, ...)

ESP_LOGI (tag, format, ...)

ESP_LOGD (tag, format, ...)

ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)

runtime macro to output logs at a specified level.

参见:

printf

参数

- **tag** -- tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** -- level of the output log.
- **format** -- format of the output log. See `printf`
- ... -- variables to be replaced into the log. See `printf`

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)

runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`. If `CONFIG_LOG_MASTER_LEVEL` set, also check first against `esp_log_get_level_master()`.

参见:

printf, ESP_LOG_LEVEL

ESP_DRAM_LOGE (tag, format, ...)

Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...)`, where TAG is a `char*` that points to a str in the DRAM.

参见:

ESP_EARLY_LOGE, the log level cannot be changed per-tag, however `esp_log_level_set("**", level)` will set the default level which controls these log lines also.

参见:

`esp_rom_printf`, `ESP_LOGE`

备注: Unlike normal logging macros, it's possible to use this macro when interrupts are disabled or inside an ISR.

备注: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

ESP_DRAM_LOGW (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_WARN level.

参见:

`ESP_DRAM_LOGW`, `ESP_LOGW`, `esp_rom_printf`

ESP_DRAM_LOGI (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_INFO level.

参见:

`ESP_DRAM_LOGI`, `ESP_LOGI`, `esp_rom_printf`

ESP_DRAM_LOGD (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

参见:

`ESP_DRAM_LOGD`, `ESP_LOGD`, `esp_rom_printf`

ESP_DRAM_LOGV (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

参见:

`ESP_DRAM_LOGV`, `ESP_LOGV`, `esp_rom_printf`

Type Definitions

`typedef int (*vprintf_like_t)(const char*, va_list)`

Enumerations

enum `esp_log_level_t`

Log level.

Values:

enumerator **ESP_LOG_NONE**

No log output

enumerator **ESP_LOG_ERROR**

Critical errors, software module can not recover on its own

enumerator **ESP_LOG_WARN**

Error conditions from which recovery measures have been taken

enumerator **ESP_LOG_INFO**

Information messages which describe normal flow of events

enumerator **ESP_LOG_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP_LOG_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.9.22 杂项系统 API

软件复位

函数 `esp_restart()` 用于执行芯片的软件复位。调用此函数时，程序停止执行，CPU 复位，应用程序由 bootloader 加载并重启。

函数 `esp_register_shutdown_handler()` 用于注册复位前会自动调用的例程（复位过程由 `esp_restart()` 函数触发），这与 `atexit` POSIX 函数的功能类似。

复位原因

ESP-IDF 应用程序启动或复位的原因有多种。调用 `esp_reset_reason()` 函数可获取最近一次复位的原因。复位的所有可能原因，请查看 `esp_reset_reason_t` 中的描述。

堆内存

ESP-IDF 中有两个与堆内存相关的函数：

- 函数 `esp_get_free_heap_size()` 用于查询当前可用的堆内存大小。
- 函数 `esp_get_minimum_free_heap_size()` 用于查询整个过程中可用的最小堆内存大小（例如应用程序生命周期内可用的最小堆内存大小）。

请注意，ESP-IDF 支持功能不同的多个堆。上文中函数返回的堆内存大小可使用 `malloc` 函数族来进行分配。有关堆内存的更多信息，请参阅[堆内存分配](#)。

MAC 地址

以下 API 用于查询和自定义支持的网络接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址。

要获取特定接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址，请调用函数 `esp_read_mac()`。

在 ESP-IDF 中，各个网络接口的 MAC 地址是根据单个 **基准 MAC 地址 (Base MAC address)** 计算出来的。默认情况下使用乐鑫指定的基准 MAC 地址，该基准地址在产品生产过程中已预烧录至 ESP32-S2 eFuse。

| 接口 | MAC 地址 (默认 2 个全局地址) | MAC 地址 (1 个全局地址) |
|---------------|--------------------------------|--|
| Wi-Fi Station | base_mac | base_mac |
| Wi-Fi SoftAP | base_mac 最后一组字节后加 1 | 本地 MAC (由 Wi-Fi Station MAC 生成) |
| 以太网 | 本地 MAC (由 Wi-Fi SoftAP MAC 生成) | 本地 MAC (在 base_mac 最后一组字节后加 1 生成, 不推荐) |

备注: [配置选项](#) 配置了乐鑫提供的全局 MAC 地址的数量。

备注: ESP32-S2 内部未集成以太网 MAC 地址，但仍可以计算得出该地址。不过，以太网 MAC 地址只能与外部以太网接口（如 SPI 以太网设备）一起使用，具体请参阅[以太网](#)。

自定义接口 MAC 有时用户可能需要自定义 MAC 地址，这些地址并不由基准 MAC 地址生成。如需设置自定义接口 MAC 地址，请使用 `esp_iface_mac_addr_set()` 函数。该函数用于覆盖由基准 MAC 地址设置（或尚未设置）的接口 MAC 地址。一旦设置某个接口 MAC 地址，即使更改基准 MAC 地址，也不会对其产生影响。

自定义基准 MAC 乐鑫已将默认的基准 MAC 地址预烧录至 eFuse BLK1 中。如需设置自定义基准 MAC 地址，请在初始化任一网络接口或调用 `esp_read_mac()` 函数前调用 `esp_base_mac_addr_set()` 函数。自定义基准 MAC 地址可以存储在任何支持的存储设备中（例如 flash、NVS）。

分配自定义基准 MAC 地址时，应避免 MAC 地址重叠。请根据上面的表格配置选项 `CONFIG_ESP32S2_UNIVERSAL_MAC_ADDRESSES`，设置可从自定义基准 MAC 地址生成的有效全局 MAC 地址。

备注: 也可以调用函数 `esp_netif_set_mac()`，在网络初始化后设置网络接口使用的特定 MAC。但建议使用此处介绍的自定义基准 MAC 地址的方法，以避免原始 MAC 地址在更改前短暂出现在网络上。

eFuse 中的自定义 MAC 地址 ESP-IDF 提供了 `esp_efuse_mac_get_custom()` 函数，从 eFuse 读取自定义 MAC 地址时，调用该函数将从 eFuse BLK3 加载 MAC 地址。用户也可以调用 `esp_read_mac()` 函数，此时需使用 `ESP_MAC_EFUSE_CUSTOM` 参数。`esp_efuse_mac_get_custom()` 函数假定自定义基准 MAC 地址的存储格式如下：

| 字段 | 比特数 | 比特范围 |
|-------------|-----|---------|
| MAC address | 48 | 200:248 |

备注: eFuse BLK3 在烧写时使用 RS 编码，这意味着必须同时烧写该块中的所有 eFuse 字段。

调用 `esp_efuse_mac_get_custom()` 或 `esp_read_mac()` 函数获得自定义 eFuse MAC 地址后，请将此 MAC 地址设置为基准 MAC 地址。有以下两种方法：

1. 使用原有 API：调用 `esp_base_mac_addr_set()`。
2. 使用新 API：调用 `esp_iface_mac_addr_set()`，此时需使用 `ESP_MAC_BASE` 参数。

本地 MAC 地址和全局 MAC 地址 在 ESP32-S2 中，乐鑫已预烧录足够数量的有效乐鑫全局 MAC 地址，供所有内部接口使用。上文中的表格已经介绍了如何根据基准 MAC 地址计算出具体接口的 MAC 地址。

当使用自定义 MAC 地址时，可能并非所有接口都能被分配到一个全局 MAC 地址。此时，接口会被分配一个本地 MAC 地址。请注意，这些地址仅用于单个本地网络。

本地 MAC 地址和全局 MAC 地址的定义，请参见 [此处](#)。

内部调用函数 `esp_derive_local_mac()`，可从全局 MAC 地址生成本地 MAC 地址。具体流程如下：

1. 在全局 MAC 地址的第一个字节组中设置 U/L 位（位值为 0x2），创建本地 MAC 地址。
2. 如果该位已存在于全局 MAC 地址中（即现有的“全局”MAC 地址实际上已经是本地 MAC 地址），则本地 MAC 地址的第一个字节组与 0x4 异或。

芯片版本

`esp_chip_info()` 函数用于填充 `esp_chip_info_t` 结构体中的芯片信息，包括芯片版本、CPU 数量和芯片中已启用功能的位掩码。

SDK 版本

调用函数 `esp_get_idf_version()` 可返回一个字符串，该字符串包含了用于编译应用程序的 ESP-IDF 版本，与构建系统中通过 `IDF_VER` 变量所获得的值相同。该版本字符串的格式即 `git describe` 命令的运行结果。

也有其它的版本宏可用于在构建过程中获取 ESP-IDF 版本，它们可根据 ESP-IDF 版本启用或禁用部分程序。

- `ESP_IDF_VERSION_MAJOR`、`ESP_IDF_VERSION_MINOR` 和 `ESP_IDF_VERSION_PATCH` 分别被定义为代表主要版本、次要版本和补丁版本的整数。
- `ESP_IDF_VERSION_VAL` 和 `ESP_IDF_VERSION` 可在确认版本时使用：

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // 启用 ESP-IDF v4.0 中的功能
#endif
```

应用程序版本

应用程序版本存储在 `esp_app_desc_t` 结构体中。该结构体位于 DROM 扇区，有一个从二进制文件头部计算的固定偏移值。该结构体位于 `esp_image_header_t` 和 `esp_image_segment_header_t` 结构体之后。字段 `Version` 类型为字符串，最大长度为 32 字节。

若需手动设置版本，需要在项目的 `CMakeLists.txt` 文件中设置 `PROJECT_VER` 变量，即在 `CMakeLists.txt` 文件中，在包含 `project.cmake` 之前添加 `set(PROJECT_VER "0.1.0.1")`。

如果设置了 `CONFIG_APP_PROJECT_VER_FROM_CONFIG` 选项，则将使用 `CONFIG_APP_PROJECT_VER` 的值。否则，如果在项目中未设置 `PROJECT_VER` 变量，则该变量将从 `$(PROJECT_PATH)/version.txt` 文件（若有）中检索，或使用 `git` 命令 `git describe` 检索。如果两者都不可用，则 `PROJECT_VER` 将被设置为“1”。应用程序可通过调用 `esp_app_get_description()` 或 `esp_ota_get_partition_description()` 函数来获取应用程序的版本信息。

API 参考

Header File

- `components/esp_system/include/esp_system.h`
- This header file can be included with:

```
#include "esp_system.h"
```

Functions

`esp_err_t esp_register_shutdown_handler` (*shutdown_handler_t* handle)

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

参数 `handle` -- function to execute on restart
返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

`esp_err_t esp_unregister_shutdown_handler` (*shutdown_handler_t* handle)

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn't been registered before

void `esp_restart` (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

`esp_reset_reason_t esp_reset_reason` (void)

Get reason of last reset.

返回 See description of `esp_reset_reason_t` for explanation of each value.

uint32_t `esp_get_free_heap_size` (void)

Get the size of available heap.

备注: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

返回 Available heap size, in bytes.

uint32_t `esp_get_free_internal_heap_size` (void)

Get the size of available internal heap.

备注: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

返回 Available internal heap size, in bytes.

uint32_t `esp_get_minimum_free_heap_size` (void)

Get the minimum heap that has ever been available.

返回 Minimum free heap ever available

void `esp_system_abort` (const char *details)

Trigger a software abort.

参数 `details` -- Details that will be displayed during panic handling.

Type Definitions

typedef void (***shutdown_handler_t**)(void)

Shutdown handler type

Enumerations

enum **esp_reset_reason_t**

Reset reasons.

Values:

enumerator **ESP_RST_UNKNOWN**

Reset reason can not be determined.

enumerator **ESP_RST_POWERON**

Reset due to power-on event.

enumerator **ESP_RST_EXT**

Reset by external pin (not applicable for ESP32)

enumerator **ESP_RST_SW**

Software reset via esp_restart.

enumerator **ESP_RST_PANIC**

Software reset due to exception/panic.

enumerator **ESP_RST_INT_WDT**

Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP_RST_TASK_WDT**

Reset due to task watchdog.

enumerator **ESP_RST_WDT**

Reset due to other watchdogs.

enumerator **ESP_RST_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP_RST_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP_RST_SDIO**

Reset over SDIO.

enumerator **ESP_RST_USB**

Reset by USB peripheral.

enumerator **ESP_RST_JTAG**

Reset by JTAG.

enumerator **ESP_RST_EFUSE**

Reset due to efuse error.

enumerator **ESP_RST_PWR_GLITCH**

Reset due to power glitch detected.

enumerator **ESP_RST_CPU_LOCKUP**

Reset due to CPU lock up.

Header File

- [components/esp_common/include/esp_idf_version.h](#)
- This header file can be included with:

```
#include "esp_idf_version.h"
```

Functions

const char ***esp_get_idf_version** (void)

Return full IDF version string, same as 'git describe' output.

备注: If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don't differentiate between development, pre-release and release versions, but the output of this function does.

返回 constant string from IDF_VER

Macros

ESP_IDF_VERSION_MAJOR

Major version number (X.x.x)

ESP_IDF_VERSION_MINOR

Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH

Patch version number (x.x.X)

ESP_IDF_VERSION_VAL (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

ESP_IDF_VERSION

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

Header File

- [components/esp_hw_support/include/esp_mac.h](#)
- This header file can be included with:

```
#include "esp_mac.h"
```

Functions

esp_err_t esp_base_mac_addr_set (const uint8_t *mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

备注: Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

备注: If not using a valid OUI, set the "locally administered" bit (bit value 0x02 in the first byte) to avoid collisions.

参数 mac -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48

返回 ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

esp_err_t esp_base_mac_addr_get (uint8_t *mac)

Return base MAC address which is set using esp_base_mac_addr_set.

备注: If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

参数 mac -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL
ESP_ERR_INVALID_MAC base MAC address has not been set

esp_err_t esp_efuse_mac_get_custom (uint8_t *mac)

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.

备注: This function is currently only supported on ESP32.

参数 mac -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL
ESP_ERR_INVALID_MAC CUSTOM_MAC address has not been set, all zeros (for esp32-xx) ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32) ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

esp_err_t esp_efuse_mac_get_default (uint8_t *mac)

Return base MAC address which is factory-programmed by Espressif in EFUSE.

参数 mac -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

esp_err_t **esp_read_mac** (uint8_t *mac, *esp_mac_type_t* type)

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using `esp_base_mac_addr_get()`. Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

The MAC address set by the `esp_iface_mac_addr_set()` function will not depend on the base MAC address.

参数

- **mac** -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)
- **type** -- Type of MAC address to return

返回 ESP_OK on success

esp_err_t **esp_derive_local_mac** (uint8_t *local_mac, const uint8_t *universal_mac)

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the "locally administered" bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

参数

- **local_mac** -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48
- **universal_mac** -- Source universal MAC address, length: 6 bytes.

返回 ESP_OK on success

esp_err_t **esp_iface_mac_addr_set** (const uint8_t *mac, *esp_mac_type_t* type)

Set custom MAC address of the interface. This function allows you to overwrite the MAC addresses of the interfaces set by the base MAC address.

参数

- **mac** -- MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for ESP_MAC_IEEE802154 type, if CONFIG_SOC_IEEE802154_SUPPORTED=y)
- **type** -- Type of MAC address

返回 ESP_OK on success

size_t **esp_mac_addr_len_get** (*esp_mac_type_t* type)

Return the size of the MAC type in bytes.

If CONFIG_SOC_IEEE802154_SUPPORTED is set then for these types:

- ESP_MAC_IEEE802154 is 8 bytes.
- ESP_MAC_BASE, ESP_MAC_EFUSE_FACTORY and ESP_MAC_EFUSE_CUSTOM the MAC size is 6 bytes.
- ESP_MAC_EFUSE_EXT is 2 bytes. If CONFIG_SOC_IEEE802154_SUPPORTED is not set then for all types it returns 6 bytes.

参数 **type** -- Type of MAC address

返回 0 MAC type not found (not supported) 6 bytes for MAC-48. 8 bytes for EUI-64.

Macros

MAC2STR (a)

MACSTR

Enumerations

enum **esp_mac_type_t**

Values:

enumerator **ESP_MAC_WIFI_STA**

MAC for WiFi Station (6 bytes)

enumerator **ESP_MAC_WIFI_SOFTAP**

MAC for WiFi Soft-AP (6 bytes)

enumerator **ESP_MAC_BT**

MAC for Bluetooth (6 bytes)

enumerator **ESP_MAC_ETH**

MAC for Ethernet (6 bytes)

enumerator **ESP_MAC_IEEE802154**

if CONFIG_SOC_IEEE802154_SUPPORTED=y, MAC for IEEE802154 (8 bytes)

enumerator **ESP_MAC_BASE**

Base MAC for that used for other MAC types (6 bytes)

enumerator **ESP_MAC_EFUSE_FACTORY**

MAC_FACTORY eFuse which was burned by Espressif in production (6 bytes)

enumerator **ESP_MAC_EFUSE_CUSTOM**

MAC_CUSTOM eFuse which can be burned by customer (6 bytes)

enumerator **ESP_MAC_EFUSE_EXT**

if CONFIG_SOC_IEEE802154_SUPPORTED=y, MAC_EXT eFuse which is used as an extender for IEEE802154 MAC (2 bytes)

Header File

- [components/esp_hw_support/include/esp_chip_info.h](#)
- This header file can be included with:

```
#include "esp_chip_info.h"
```

Functions

void **esp_chip_info** (*esp_chip_info_t* *out_info)

Fill an *esp_chip_info_t* structure with information about the chip.

参数 **out_info** -- [out] structure to be filled

Structures

struct **esp_chip_info_t**

The structure represents information about the chip.

Public Members

`esp_chip_model_t` **model**

chip model, one of `esp_chip_model_t`

`uint32_t` **features**

bit mask of `CHIP_FEATURE_x` feature flags

`uint16_t` **revision**

chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

`uint8_t` **cores**

number of CPU cores

Macros

CHIP_FEATURE_EMB_FLASH

Chip has embedded flash memory.

CHIP_FEATURE_WIFI_BGN

Chip has 2.4GHz WiFi.

CHIP_FEATURE_BLE

Chip has Bluetooth LE.

CHIP_FEATURE_BT

Chip has Bluetooth Classic.

CHIP_FEATURE_IEEE802154

Chip has IEEE 802.15.4.

CHIP_FEATURE_EMB_PSRAM

Chip has embedded psram.

Enumerations

enum **esp_chip_model_t**

Chip models.

Values:

enumerator **CHIP_ESP32**

ESP32.

enumerator **CHIP_ESP32S2**

ESP32-S2.

enumerator **CHIP_ESP32S3**

ESP32-S3.

enumerator **CHIP_ESP32C3**

ESP32-C3.

enumerator **CHIP_ESP32C2**

ESP32-C2.

enumerator **CHIP_ESP32C6**

ESP32-C6.

enumerator **CHIP_ESP32H2**

ESP32-H2.

enumerator **CHIP_ESP32P4**

ESP32-P4.

enumerator **CHIP_ESP32C61**

ESP32-C61.

enumerator **CHIP_POSIX_LINUX**

The code is running on POSIX/Linux simulator.

Header File

- [components/esp_hw_support/include/esp_cpu.h](#)
- This header file can be included with:

```
#include "esp_cpu.h"
```

Functions

void **esp_cpu_stall** (int core_id)

Stall a CPU core.

参数 **core_id** -- The core's ID

void **esp_cpu_unstall** (int core_id)

Resume a previously stalled CPU core.

参数 **core_id** -- The core's ID

void **esp_cpu_reset** (int core_id)

Reset a CPU core.

参数 **core_id** -- The core's ID

void **esp_cpu_wait_for_intr** (void)

Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

int **esp_cpu_get_core_id** (void)

Get the current core's ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

返回 The current core's ID [0..SOC_CPU_CORES_NUM - 1]

void ***esp_cpu_get_sp** (void)

Read the current stack pointer address.

返回 Stack pointer address

esp_cpu_cycle_count_t **esp_cpu_get_cycle_count** (void)

Get the current CPU core's cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

返回 Current CPU's cycle count, 0 if not supported.

void **esp_cpu_set_cycle_count** (*esp_cpu_cycle_count_t* cycle_count)

Set the current CPU core's cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

参数 **cycle_count** -- CPU cycle count

void ***esp_cpu_pc_to_addr** (uint32_t pc)

Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU's PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned

参数 **pc** -- PC value

返回 Virtual address

void **esp_cpu_intr_get_desc** (int core_id, int intr_num, *esp_cpu_intr_desc_t* *intr_desc_ret)

Get a CPU interrupt's descriptor.

Each CPU interrupt has a descriptor describing the interrupt's capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

参数

- **core_id** -- [in] The core's ID
- **intr_num** -- [in] Interrupt number
- **intr_desc_ret** -- [out] The interrupt's descriptor

void **esp_cpu_intr_set_ivt_addr** (const void *ivt_addr)

Set the base address of the current CPU's Interrupt Vector Table (IVT)

参数 **ivt_addr** -- Interrupt Vector Table's base address

bool **esp_cpu_intr_has_handler** (int intr_num)

Check if a particular interrupt already has a handler function.

Check if a particular interrupt on the current CPU already has a handler function assigned.

备注: This function simply checks if the IVT of the current CPU already has a handler assigned.

参数 **intr_num** -- Interrupt number (from 0 to 31)

返回 True if the interrupt has a handler function, false otherwise.

void **esp_cpu_intr_set_handler** (int intr_num, *esp_cpu_intr_handler_t* handler, void *handler_arg)

Set the handler function of a particular interrupt.

Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

备注: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

参数

- **intr_num** -- Interrupt number (from 0 to 31)
- **handler** -- Handler function
- **handler_arg** -- Argument passed to the handler function

void ***esp_cpu_intr_get_handler_arg** (int intr_num)

Get a handler function's argument of.

Get the argument of a previously assigned handler function on the current CPU.

参数 intr_num -- Interrupt number (from 0 to 31)

返回 The the argument passed to the handler function

void **esp_cpu_intr_enable** (uint32_t intr_mask)

Enable particular interrupts on the current CPU.

参数 intr_mask -- Bit mask of the interrupts to enable

void **esp_cpu_intr_disable** (uint32_t intr_mask)

Disable particular interrupts on the current CPU.

参数 intr_mask -- Bit mask of the interrupts to disable

uint32_t **esp_cpu_intr_get_enabled_mask** (void)

Get the enabled interrupts on the current CPU.

返回 Bit mask of the enabled interrupts

void **esp_cpu_intr_edge_ack** (int intr_num)

Acknowledge an edge interrupt.

参数 intr_num -- Interrupt number (from 0 to 31)

void **esp_cpu_configure_region_protection** (void)

Configure the CPU to disable access to invalid memory regions.

esp_err_t **esp_cpu_set_breakpoint** (int bp_num, const void *bp_addr)

Set and enable a hardware breakpoint on the current CPU.

备注: This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

备注: Overwrites previously set breakpoint with same breakpoint number.

参数

- **bp_num** -- Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]
- **bp_addr** -- Address to set a breakpoint on

返回 ESP_OK if breakpoint is set. Failure otherwise

esp_err_t **esp_cpu_clear_breakpoint** (int bp_num)

Clear a hardware breakpoint on the current CPU.

备注: Clears a breakpoint regardless of whether it was previously set

参数 bp_num -- Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]

返回 ESP_OK if breakpoint is cleared. Failure otherwise

esp_err_t **esp_cpu_set_watchpoint** (int wp_num, const void *wp_addr, size_t size, *esp_cpu_watchpoint_trigger_t* trigger)

Set and enable a hardware watchpoint on the current CPU.

Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.

备注: Overwrites previously set watchpoint with same watchpoint number. On RISC-V chips, this API uses method0(Exact matching) and method1(NAPOT matching) according to the riscv-debug-spec-0.13 specification for address matching. If the watch region size is 1byte, it uses exact matching (method 0). If the watch region size is larger than 1byte, it uses NAPOT matching (method 1). This mode requires the watching region start address to be aligned to the watching region size.

参数

- **wp_num** -- Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]
- **wp_addr** -- Watchpoint's base address, must be naturally aligned to the size of the region
- **size** -- Size of the region to watch. Must be one of 2^n and in the range of [1 ... SOC_CPU_WATCHPOINT_MAX_REGION_SIZE]
- **trigger** -- Trigger type

返回 ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

esp_err_t **esp_cpu_clear_watchpoint** (int wp_num)

Clear a hardware watchpoint on the current CPU.

备注: Clears a watchpoint regardless of whether it was previously set

参数 **wp_num** -- Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]

返回 ESP_OK if watchpoint was cleared. Failure otherwise.

bool **esp_cpu_dbggr_is_attached** (void)

Check if the current CPU has a debugger attached.

返回 True if debugger is attached, false otherwise

void **esp_cpu_dbggr_break** (void)

Trigger a call to the current CPU's attached debugger.

intptr_t **esp_cpu_get_call_addr** (intptr_t return_address)

Given the return address, calculate the address of the preceding call instruction This is typically used to answer the question "where was the function called from?".

参数 **return_address** -- The value of the return address register. Typically set to the value of `__builtin_return_address(0)`.

返回 Address of the call instruction preceding the return address.

bool **esp_cpu_compare_and_set** (volatile uint32_t *addr, uint32_t compare_value, uint32_t new_value)

Atomic compare-and-set operation.

参数

- **addr** -- Address of atomic variable
- **compare_value** -- Value to compare the atomic variable to
- **new_value** -- New value to set the atomic variable to

返回 Whether the atomic variable was set or not

Structures

struct **esp_cpu_intr_desc_t**

CPU interrupt descriptor.

Each particular CPU interrupt has an associated descriptor describing that particular interrupt's characteristics. Call `esp_cpu_intr_get_desc()` to get the descriptors of a particular interrupt.

Public Members

int **priority**

Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

esp_cpu_intr_type_t **type**

Whether the interrupt is an edge or level type interrupt, `ESP_CPU_INTR_TYPE_NA` if the type is configurable.

uint32_t **flags**

Flags indicating extra details.

Macros

ESP_CPU_INTR_DESC_FLAG_SPECIAL

Interrupt descriptor flags of *esp_cpu_intr_desc_t*.

The interrupt is a special interrupt (e.g., a CPU timer interrupt)

ESP_CPU_INTR_DESC_FLAG_RESVD

The interrupt is reserved for internal use

Type Definitions

typedef uint32_t **esp_cpu_cycle_count_t**

CPU cycle count type.

This data type represents the CPU's clock cycle count

typedef void (***esp_cpu_intr_handler_t**)(void *arg)

CPU interrupt handler type.

Enumerations

enum **esp_cpu_intr_type_t**

CPU interrupt type.

Values:

enumerator **ESP_CPU_INTR_TYPE_LEVEL**

enumerator **ESP_CPU_INTR_TYPE_EDGE**

enumerator **ESP_CPU_INTR_TYPE_NA**

enum **esp_cpu_watchpoint_trigger_t**

CPU watchpoint trigger type.

Values:

enumerator **ESP_CPU_WATCHPOINT_LOAD**

enumerator **ESP_CPU_WATCHPOINT_STORE**

enumerator **ESP_CPU_WATCHPOINT_ACCESS**

Header File

- `components/esp_app_format/include/esp_app_desc.h`
- This header file can be included with:

```
#include "esp_app_desc.h"
```

- This header file is a part of the API provided by the `esp_app_format` component. To declare that your component depends on `esp_app_format`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_app_format
```

or

```
PRIV_REQUIRES esp_app_format
```

Functions

const `esp_app_desc_t` ***esp_app_get_description** (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

返回 Pointer to `esp_app_desc` structure.

int **esp_app_get_elf_sha256** (char *dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

参数

- **dst** -- Destination buffer
- **size** -- Size of the buffer

返回 Number of bytes written to dst (including null terminator)

char ***esp_app_get_elf_sha256_str** (void)

Return SHA256 of the ELF file which is already formatted as hexadecimal, null-terminated included. Can be used in panic handler or core dump during when cache is disabled. The length is defined by `CONFIG_APP_RETRIEVE_LEN_ELF_SHA` option.

返回 Hexadecimal SHA256 string

Structures

struct **esp_app_desc_t**

Description about application.

Public Members

`uint32_t magic_word`
Magic word `ESP_APP_DESC_MAGIC_WORD`

`uint32_t secure_version`
Secure version

`uint32_t reserv1[2]`
reserv1

`char version[32]`
Application version

`char project_name[32]`
Project name

`char time[16]`
Compile time

`char date[16]`
Compile date

`char idf_ver[32]`
Version IDF

`uint8_t app_elf_sha256[32]`
sha256 of elf file

`uint32_t reserv2[20]`
reserv2

Macros

`ESP_APP_DESC_MAGIC_WORD`

The magic word for the `esp_app_desc` structure that is in DRAM.

2.9.23 空中升级 (OTA)

OTA 流程概览

OTA 升级机制可以让设备在固件正常运行时根据接收数据（如通过 Wi-Fi、蓝牙或以太网）进行自我更新。

要运行 OTA 机制，需配置设备的分区表，该分区表至少包括两个 OTA 应用程序分区（即 `ota_0` 和 `ota_1`）和一个 OTA 数据分区。

OTA 功能启动后，向当前未用于启动的 OTA 应用分区写入新的应用固件镜像。镜像验证后，OTA 数据分区更新，指定在下次启动时使用该镜像。

OTA 数据分区

所有使用 OTA 功能项目，其分区表必须包含一个 OTA 数据分区（类型为 data，子类型为 ota）。

工厂启动设置下，OTA 数据分区中应没有数据（所有字节擦写成 0xFF）。如果分区表中有工厂应用程序，ESP-IDF 软件引导加载程序会启动工厂应用程序。如果分区表中没有工厂应用程序，则启动第一个可用的 OTA 分区（通常是 ota_0）。

第一次 OTA 升级后，OTA 数据分区更新，指定下一次启动哪个 OTA 应用程序分区。

OTA 数据分区的容量是 2 个 flash 扇区的大小（0x2000 字节），防止写入时电源故障引发问题。两个扇区单独擦除、写入匹配数据，若存在不一致，则用计数器字段判定哪个扇区为最新数据。

应用程序回滚

应用程序回滚的主要目的是确保设备在更新后正常工作。如果新版应用程序出现严重错误，该功能可使设备回滚到之前正常运行的应用版本。在使能回滚并且 OTA 升级应用程序至新版本后，可能出现的结果如下：

- 应用程序运行正常，`esp_ota_mark_app_valid_cancel_rollback()` 将正在运行的应用程序状态标记为 ESP_OTA_IMG_VALID，启动此应用程序无限制。
- 应用程序出现严重错误，无法继续工作，必须回滚到此前的版本，`esp_ota_mark_app_invalid_rollback_and_reboot()` 将正在运行的版本标记为 ESP_OTA_IMG_INVALID 然后复位。引导加载程序不会选取此版本，而是启动此前正常运行的版本。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，则无需调用函数便可复位，回滚至之前的应用版本。

可使用以下代码检测 OTA 更新后应用程序的首次启动。首次启动时，应用程序会检查其状态并执行检测。如果检测成功，应用程序调用 `esp_ota_mark_app_valid_cancel_rollback()` 函数，确认应用运行成功。如果检测失败，应用程序调用 `esp_ota_mark_app_invalid_rollback_and_reboot()` 函数，回滚至之前的应用版本。

如果应用程序由于中止、重启或掉电无法启动或运行上述代码，引导加载程序在下次启动尝试中会将该应用程序的状态标记为 ESP_OTA_IMG_INVALID，并回滚至之前的应用版本。

```
const esp_partition_t *running = esp_ota_get_running_partition();
esp_ota_img_states_t ota_state;
if (esp_ota_get_state_partition(running, &ota_state) == ESP_OK) {
    if (ota_state == ESP_OTA_IMG_PENDING_VERIFY) {
        // run diagnostic function ...
        bool diagnostic_is_ok = diagnostic();
        if (diagnostic_is_ok) {
            ESP_LOGI(TAG, "Diagnostics completed successfully! Continuing_
↪execution ...");
            esp_ota_mark_app_valid_cancel_rollback();
        } else {
            ESP_LOGE(TAG, "Diagnostics failed! Start rollback to the previous_
↪version ...");
            esp_ota_mark_app_invalid_rollback_and_reboot();
        }
    }
}
```

请查看 [system/ota/native_ota_example](#) 获取包含上述代码片段的完整示例。

备注：应用程序的状态不是写到程序的二进制镜像，而是写到 otadata 分区。该分区有一个 ota_seq 计数器，该计数器是 OTA 应用分区的指针，指向下次启动时选取应用所在的分区 (ota_0, ota_1, ...)。

应用程序 OTA 状态 状态控制了选取启动应用程序的过程：

| 状态 | 引导加载程序选取启动应用程序的限制 |
|----------------------------|---|
| ESP_OTA_IMG_VALID | 没有限制，可以选取。 |
| ESP_OTA_IMG_UNDELETED | 没有限制，可以选取。 |
| ESP_OTA_IMG_INVALID | 不会选取。 |
| ESP_OTA_IMG_ABORTED | 不会选取。 |
| ESP_OTA_IMG_NEW | 如使能 <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> ，则仅会选取一次。在引导加载程序中，状态立即变为 <code>ESP_OTA_IMG_PENDING_VERIFY</code> 。 |
| ESP_OTA_IMG_PENDING_VERIFY | 如使能 <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> ，则不会选取，状态变为 <code>ESP_OTA_IMG_ABORTED</code> 。 |

如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 没有使能（默认情况），则 `esp_ota_mark_app_valid_cancel_rollback()` 和 `esp_ota_mark_app_invalid_rollback_and_reboot()` 为可选功能，`ESP_OTA_IMG_NEW` 和 `ESP_OTA_IMG_PENDING_VERIFY` 不会使用。

Kconfig 中的 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 可以帮助用户追踪新版应用程序的第一次启动。应用程序需调用 `esp_ota_mark_app_valid_cancel_rollback()` 函数确认可以运行，否则将会在重启时回滚至旧版本。该功能可让用户在启动阶段控制应用程序的可操作性。新版应用程序仅有一次机会尝试是否能成功启动。

回滚过程 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能时，回滚过程如下：

- 新版应用程序下载成功，`esp_ota_set_boot_partition()` 函数将分区设为可启动，状态设为 `ESP_OTA_IMG_NEW`。该状态表示应用程序为新版本，第一次启动需要监测。
- 重新启动 `esp_restart()`。
- 引导加载程序检查 `ESP_OTA_IMG_PENDING_VERIFY` 状态，如有设置，则将其写入 `ESP_OTA_IMG_ABORTED`。
- 引导加载程序选取一个新版应用程序来引导，这样应用程序状态就不会设置为 `ESP_OTA_IMG_INVALID` 或 `ESP_OTA_IMG_ABORTED`。
- 引导加载程序检查所选取的新版应用程序，若状态设置为 `ESP_OTA_IMG_NEW`，则写入 `ESP_OTA_IMG_PENDING_VERIFY`。该状态表示，需确认应用程序的可操作性，如不确认，发生重启，则状态会重写为 `ESP_OTA_IMG_ABORTED`（见上文），该应用程序不可再启动，将回滚至上一版本。
- 新版应用程序启动，应进行自测。
- 若通过自测，则必须调用函数 `esp_ota_mark_app_valid_cancel_rollback()`，因为新版应用程序在等待确认其可操作性（`ESP_OTA_IMG_PENDING_VERIFY` 状态）。
- 若未通过自测，则调用函数 `esp_ota_mark_app_invalid_rollback_and_reboot()`，回滚至之前能正常工作的应用程序版本，同时将无效的新版本应用程序设置为 `ESP_OTA_IMG_INVALID`。
- 如果新版应用程序可操作性没有确认，则状态一直为 `ESP_OTA_IMG_PENDING_VERIFY`。下一次启动时，状态变更为 `ESP_OTA_IMG_ABORTED`，阻止其再次启动，之后回滚到之前的版本。

意外复位 如果在新版应用第一次启动时发生断电或意外崩溃，则会回滚至之前正常运行的版本。

建议：尽快完成自测，防止因断电回滚。

只有 OTA 分区可以回滚。工厂分区不会回滚。

启动无效/中止的应用程序 用户可以启动此前设置为 `ESP_OTA_IMG_INVALID` 或 `ESP_OTA_IMG_ABORTED` 的应用程序：

- 获取最后一个无效应用分区 `esp_ota_get_last_invalid_partition()`。
- 将获取的分区传递给 `esp_ota_set_boot_partition()`，更新 otadata。
- 重启 `esp_restart()`。引导加载程序会启动指定应用程序。

要确定是否在新版应用程序启动时进行自测，可以调用 `esp_ota_get_state_partition()` 函数。如果结果为 `ESP_OTA_IMG_PENDING_VERIFY`，则需要自测，后续确认应用程序的可操作性。

如何设置状态 下文简单描述了如何设置应用程序状态：

- ESP_OTA_IMG_VALID 由函数 `esp_ota_mark_app_valid_cancel_rollback()` 设置。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 没有使能，ESP_OTA_IMG_UNDEFINED 由函数 `esp_ota_set_boot_partition()` 设置。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，ESP_OTA_IMG_NEW 由函数 `esp_ota_set_boot_partition()` 设置。
- ESP_OTA_IMG_INVALID 由函数 `esp_ota_mark_app_invalid_rollback_and_reboot()` 设置。
- 如果应用程序的可操作性无法确认，发生重启（`CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能），则设置 ESP_OTA_IMG_ABORTED。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，选取的应用程序状态为 ESP_OTA_IMG_NEW，则在引导加载程序中设置 ESP_OTA_IMG_PENDING_VERIFY。

防回滚

防回滚机制可以防止回滚到安全版本号低于芯片 eFuse 中烧录程序的应用程序版本。

设置 `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`，启动防回滚机制。在引导加载程序中选取可启动的应用程序，会额外检查芯片和应用程序镜像的安全版本号。可启动固件中的应用安全版本号必须等于或高于芯片中的应用安全版本号。

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` 和 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 一起使用。此时，只有安全版本号等于或高于芯片中的应用安全版本号时才会回滚。

典型的防回滚机制

- 新发布的固件解决了此前版本的安全问题。
- 开发者在确保固件可以运行之后，增加安全版本号，发布固件。
- 下载新版应用程序。
- 运行函数 `esp_ota_set_boot_partition()`，将新版应用程序设为可启动。如果新版应用程序的安全版本号低于芯片中的应用安全版本号，新版应用程序会被擦除，无法更新到新固件。
- 重新启动。
- 在引导加载程序中选取安全版本号等于或高于芯片中应用安全版本号的应用程序。如果 otadata 处于初始阶段，通过串行通道加载了安全版本号高于芯片中应用安全版本的固件，则引导加载程序中 eFuse 的安全版本号会立即更新。
- 新版应用程序启动，之后进行可操作性检测，如果通过检测，则调用函数 `esp_ota_mark_app_valid_cancel_rollback()`，将应用程序标记为 ESP_OTA_IMG_VALID，更新芯片中应用程序的安全版本号。注意，如果调用函数 `esp_ota_mark_app_invalid_rollback_and_reboot()`，可能会因为设备中没有可启动的应用程序而回滚失败，返回 ESP_ERR_OTA_ROLLBACK_FAILED 错误，应用程序状态一直为 ESP_OTA_IMG_PENDING_VERIFY。
- 如果运行的应用程序处于 ESP_OTA_IMG_VALID 状态，则可再次更新。

建议：

如果想避免因服务器应用程序的安全版本号低于运行的应用程序，造成不必要的下载和擦除，必须从镜像的第一个包中获取 `new_app_info.secure_version`，和 eFuse 的安全版本号比较。如果 `esp_efuse_check_secure_version(new_app_info.secure_version)` 函数为真，则下载继续，反之则中断。

```

....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {

```

(下页继续)

(续上页)

```

        // check current version with downloading
        if (esp_efuse_check_secure_version(new_app_info.secure_version) ==
↪false) {
            ESP_LOGE(TAG, "This a new app can not be downloaded due to a
↪secure version is lower than stored in efuse.");
            http_cleanup(client);
            task_fatal_error();
        }

        image_header_was_checked = true;

        esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
    }
}
esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
}
...

```

限制:

- `secure_version` 字段最多有 16 位。也就是说，防回滚最多可以做 16 次。用户可以使用 `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` 减少该 eFuse 字段的长度。
- 防回滚不支持工厂和测试分区，因此分区表中不应有设置为 工厂或 测试的分区。

`security_version`:

- 存储在应用程序镜像中的 `esp_app_desc` 里。版本号用 `CONFIG_BOOTLOADER_APP_SECURE_VERSION` 设置。

没有安全启动的安全 OTA 升级

即便硬件安全启动没有使能，也可验证已签名的 OTA 升级。可通过设置 `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` 和 `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT` 实现。

OTA 工具 `otatool.py`

`app_update` 组件中有 `app_update/otatool.py` 工具，用于在目标设备上完成下列 OTA 分区相关操作:

- 读取 `otadata` 分区 (`read_otadata`)
- 擦除 `otadata` 分区，将设备复位至工厂应用程序 (`erase_otadata`)
- 切换 OTA 分区 (`switch_ota_partition`)
- 擦除 OTA 分区 (`erase_ota_partition`)
- 写入 OTA 分区 (`write_ota_partition`)
- 读取 OTA 分区 (`read_ota_partition`)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用该 OTA 工具，或者从 Shell 脚本调用该 OTA 工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API 首先，确保已导入 `otatool` 模块。

```

import sys
import os

idf_path = os.environ["IDF_PATH"] # 从环境中获取 IDF_PATH 的值
otatool_dir = os.path.join(idf_path, "components", "app_update") # otatool.py
↪位于 $IDF_PATH/components/app_update 下

```

(下页继续)

(续上页)

```
sys.path.append(otatool_dir) # 使能 Python 寻找 otatool 模块
from otatool import * # 导入 otatool 模块内的所有名称
```

要使用 OTA 工具的 Python API，第一步是创建 *OtatoolTarget* 对象：

```
# 创建 parttool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 *OtatoolTarget* 在目标设备上完成操作：

```
# 擦除 otadata，将设备复位至工厂应用程序
target.erase_otadata()

# 擦除 OTA 应用程序分区 0
target.erase_ota_partition(0)

# 将启动分区切换至 OTA 应用程序分区 1
target.switch_ota_partition(1)

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

要操作的 OTA 分区通过应用程序分区序号或分区名称指定。

更多关于 Python API 的信息，请查看 OTA 工具的代码注释。

命令行界面 otatool.py 的命令行界面具有如下结构：

```
otatool.py [command-args] [subcommand] [subcommand-args]
```

- command-args - 执行主命令 (otatool.py) 所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数

```
# 擦除 otadata，将设备复位至工厂应用程序
otatool.py --port "/dev/ttyUSB1" erase_otadata

# 擦除 OTA 应用程序分区 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# 将启动分区切换至 OTA 应用程序分区 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

更多信息可用 `--help` 指令查看：

```
# 显示可用的子命令和主命令描述
otatool.py --help

# 显示子命令的描述
otatool.py [subcommand] --help
```

Header File

- [components/app_update/include/esp_ota_ops.h](#)
- This header file can be included with:

```
#include "esp_ota_ops.h"
```

- This header file is a part of the API provided by the `app_update` component. To declare that your component depends on `app_update`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_update
```

or

```
PRIV_REQUIRES app_update
```

Functions

const [esp_app_desc_t](#) *[esp_ota_get_app_description](#) (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

备注: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_description`

返回 Pointer to `esp_app_desc` structure.

int [esp_ota_get_app_elf_sha256](#) (char *dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

备注: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_elf_sha256`

参数

- **dst** -- Destination buffer
- **size** -- Size of the buffer

返回 Number of bytes written to `dst` (including null terminator)

[esp_err_t](#) [esp_ota_begin](#) (const [esp_partition_t](#) *partition, size_t image_size, [esp_ota_handle_t](#) *out_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass `OTA_SIZE_UNKNOWN` which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until `esp_ota_end()` is called with the returned handle.

Note: If the rollback option is enabled and the running application has the `ESP_OTA_IMG_PENDING_VERIFY` state then it will lead to the `ESP_ERR_OTA_ROLLBACK_INVALID_STATE` error. Confirm the running app before to run download a new app, use `esp_ota_mark_app_valid_cancel_rollback()` function for it (this should be done as early as possible when you first download a new application).

参数

- **partition** -- Pointer to info for partition which will receive the OTA update. Required.
- **image_size** -- Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or `OTA_SIZE_UNKNOWN`, the entire partition is erased.
- **out_handle** -- On success, returns a handle which should be used for subsequent `esp_ota_write()` and `esp_ota_end()` calls.

返回

- `ESP_OK`: OTA operation commenced successfully.
- `ESP_ERR_INVALID_ARG`: partition or out_handle arguments were NULL, or partition doesn't point to an OTA app partition.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_OTA_PARTITION_CONFLICT`: Partition holds the currently running firmware, cannot update in place.
- `ESP_ERR_NOT_FOUND`: Partition argument not found in partition table.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: The OTA data partition contains invalid data.
- `ESP_ERR_INVALID_SIZE`: Partition doesn't fit in configured flash size.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_ROLLBACK_INVALID_STATE`: If the running app has not confirmed state. Before performing an update, the application must be valid.

esp_err_t **esp_ota_write** (*esp_ota_handle_t* handle, const void *data, size_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

参数

- **handle** -- Handle obtained from `esp_ota_begin`
- **data** -- Data buffer to write
- **size** -- Size of data buffer in bytes.

返回

- `ESP_OK`: Data was written to flash successfully, or size = 0
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid app image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: OTA data partition has invalid contents

esp_err_t **esp_ota_write_with_offset** (*esp_ota_handle_t* handle, const void *data, size_t size, uint32_t offset)

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

备注: While performing OTA, if the packets arrive out of order, `esp_ota_write_with_offset()` can be used to write data in non-contiguous manner. Use of `esp_ota_write_with_offset()` in combination with `esp_ota_write()` is not recommended.

参数

- **handle** -- Handle obtained from `esp_ota_begin`
- **data** -- Data buffer to write
- **size** -- Size of data buffer in bytes
- **offset** -- Offset in flash partition

返回

- `ESP_OK`: Data was written to flash successfully.
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid app image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: OTA data partition has invalid contents

esp_err_t `esp_ota_end` (*esp_ota_handle_t* handle)

Finish OTA update and validate newly written app image.

备注: After calling `esp_ota_end()`, the handle is no longer valid and any memory associated with it is freed (regardless of result).

参数 **handle** -- Handle obtained from `esp_ota_begin()`.

返回

- `ESP_OK`: Newly written OTA app image is valid.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.
- `ESP_ERR_INVALID_ARG`: Handle was never written to.
- `ESP_ERR_OTA_VALIDATE_FAILED`: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- `ESP_ERR_INVALID_STATE`: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

esp_err_t `esp_ota_abort` (*esp_ota_handle_t* handle)

Abort OTA update, free the handle and memory associated with it.

参数 **handle** -- obtained from `esp_ota_begin()`.

返回

- `ESP_OK`: Handle and its associated memory is freed successfully.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.

esp_err_t `esp_ota_set_boot_partition` (const *esp_partition_t* *partition)

Configure OTA data for a new boot partition.

备注: If this function returns `ESP_OK`, calling `esp_restart()` will boot the newly configured app partition.

参数 **partition** -- Pointer to info for partition containing app image to boot.

返回

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_ERR_INVALID_ARG`: partition argument was NULL or didn't point to a valid OTA partition of type "app".
- `ESP_ERR_OTA_VALIDATE_FAILED`: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- `ESP_ERR_NOT_FOUND`: OTA data partition not found.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash erase or write failed.

```
const esp_partition_t *esp_ota_get_boot_partition (void)
```

Get partition info of currently configured boot app.

If `esp_ota_set_boot_partition()` has been called, the partition which was set by that function will be returned.

If `esp_ota_set_boot_partition()` has not been called, the result is usually the same as `esp_ota_get_running_partition()`. The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use `esp_image_verify(ESP_IMAGE_VERIFY, ...)` to verify if the returned partition contains a bootable image.

返回 Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_ota_get_running_partition (void)
```

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

返回 Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)
```

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

参数 `start_from` -- If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition. The result of this function is never the same as this argument.

返回 Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

```
esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)
```

Returns `esp_app_desc` structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

参数

- **partition** -- [in] Pointer to app partition. (only app partition)
- **app_desc** -- [out] Structure of info about app.

返回

- ESP_OK Successful.
- ESP_ERR_NOT_FOUND `app_desc` structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition's offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

esp_err_t **esp_ota_get_bootloader_description** (const *esp_partition_t* *bootloader_partition, *esp_bootloader_desc_t* *desc)

Returns the description structure of the bootloader.

参数

- **bootloader_partition** -- **[in]** Pointer to bootloader partition. If NULL, then the current bootloader is used (the default location).
offset = CONFIG_BOOTLOADER_OFFSET_IN_FLASH,
size = CONFIG_PARTITION_TABLE_OFFSET - CONFIG_BOOTLOADER_OFFSET_IN_FLASH,
- **desc** -- **[out]** Structure of info about bootloader.

返回

- ESP_OK Successful.
- ESP_ERR_NOT_FOUND Description structure is not found in the bootloader image. Magic byte is incorrect.
- ESP_ERR_INVALID_ARG Arguments is NULL.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

uint8_t **esp_ota_get_app_partition_count** (void)

Returns number of ota partitions provided in partition table.

返回

- Number of OTA partitions

esp_err_t **esp_ota_mark_app_valid_cancel_rollback** (void)

This function is called to indicate that the running app is working well.

返回

- ESP_OK: if successful.

esp_err_t **esp_ota_mark_app_invalid_rollback_and_reboot** (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

返回

- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

const *esp_partition_t* ***esp_ota_get_last_invalid_partition** (void)

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

返回

partition.

esp_err_t **esp_ota_get_state_partition** (const *esp_partition_t* *partition, *esp_ota_img_states_t* *ota_state)

Returns state for given partition.

参数

- **partition** -- **[in]** Pointer to partition.
- **ota_state** -- **[out]** state of partition (if this partition has a record in otadata).

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

esp_err_t **esp_ota_erase_last_boot_app_partition** (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

返回

- ESP_OK: Successful, otherwise ESP_ERR.

bool **esp_ota_check_rollback_is_possible** (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

返回

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

esp_err_t **esp_ota_revoke_secure_boot_public_key** (*esp_ota_secure_boot_public_key_index_t* index)

Revokes the signature digest denoted by the given index. This should be called in the application only after the rollback logic otherwise the device may end up in unrecoverable state.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3, ESP32-C6, ESP32-H2 where up to 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When a key used to sign an app is invalidated, an OTA update is to be sent with an app signed with at least one of the other two keys which has not been revoked already. After successfully booting the OTA app should call this function to revoke Key #N-1.

参数 **index** -- - The index of the signature block to be revoked

返回

- ESP_OK: If revocation is successful.
- ESP_ERR_INVALID_ARG: If the index of the public key to be revoked is incorrect.
- ESP_FAIL: If secure boot v2 has not been enabled.

Macros

OTA_SIZE_UNKNOWN

Used for esp_ota_begin() if new image size is unknown

OTA_WITH_SEQUENTIAL_WRITES

Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

ESP_ERR_OTA_BASE

Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT

Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID

Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED

Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER

Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE

Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t **esp_ota_handle_t**

Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

Enumerations

enum **esp_ota_secure_boot_public_key_index_t**

Secure Boot V2 public key indexes.

Values:

enumerator **SECURE_BOOT_PUBLIC_KEY_INDEX_0**

Points to the 0th index of the Secure Boot v2 public key

enumerator **SECURE_BOOT_PUBLIC_KEY_INDEX_1**

Points to the 1st index of the Secure Boot v2 public key

enumerator **SECURE_BOOT_PUBLIC_KEY_INDEX_2**

Points to the 2nd index of the Secure Boot v2 public key

OTA 升级失败排查**2.9.24 性能监视器**

性能监视器组件提供了多个 API，可以通过这些 API 来使用 ESP32-S2 的内部性能计数器，分析函数和应用程序。

应用示例

在目录 `examples/system/perfmon` 下提供了一个结合性能监视器的示例。此示例初始化并执行了性能监视器，同时打印了统计信息。

高级 API 参考**头文件**

- This header file can be included with:

```
#include "xtensa_perfmon_access.h"
```

- This header file is a part of the API provided by the `perfmon` component. To declare that your component depends on `perfmon`, add the following to your `CMakeLists.txt`:

```
REQUIRES perfmon
```

or

```
PRIV_REQUIRES perfmon
```

Functions

esp_err_t **xtensa_perfmon_init** (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)

Init Performance Monitor.

Initialize performance monitor register with define values

参数

- **id** -- [in] performance counter number
- **select** -- [in] select value from PMCTRLx register
- **mask** -- [in] mask value from PMCTRLx register
- **kernelcnt** -- [in] kernelcnt value from PMCTRLx register
- **tracelevel** -- [in] tracelevel value from PMCTRLx register

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

esp_err_t **xtensa_perfmon_reset** (int id)

Reset PM counter.

Reset PM counter. Writes 0 to the PMx register.

参数 **id** -- [in] performance counter number

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

void **xtensa_perfmon_start** (void)

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

void **xtensa_perfmon_stop** (void)

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

uint32_t **xtensa_perfmon_value** (int id)

Read PM counter.

Read value of defined PM counter.

参数 **id** -- [in] performance counter number

返回

- Performance counter value

esp_err_t **xtensa_perfmon_overflow** (int id)

Read PM overflow state.

Read overflow value of defined PM counter.

参数 id -- [in] performance counter number

返回

- ESP_OK if there is no overflow (overflow = 0)
- ESP_FAIL if overflow occur (overflow = 1)

void **xtensa_perfmon_dump** (void)

Dump PM values.

Dump all PM register to the console.

Header File

- [components/perfmon/include/xtensa_perfmon_apis.h](#)
- This header file can be included with:

```
#include "xtensa_perfmon_apis.h"
```

- This header file is a part of the API provided by the perfmon component. To declare that your component depends on perfmon, add the following to your CMakeLists.txt:

```
REQUIRES perfmon
```

or

```
PRIV_REQUIRES perfmon
```

Functions

esp_err_t **xtensa_perfmon_exec** (const *xtensa_perfmon_config_t* *config)

Execute PM.

Execute performance counter for dedicated function with defined parameters

参数 config -- [in] pointer to the configuration structure

返回

- ESP_OK if no errors
- ESP_ERR_INVALID_ARG if one of the required parameters not defined
- ESP_FAIL - counter overflow

void **xtensa_perfmon_view_cb** (void *params, uint32_t select, uint32_t mask, uint32_t value)

Dump PM results.

Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout

参数

- **params** -- [in] used parameters passed from configuration (callback_params). This parameter expected as FILE* handle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- **select** -- [in] select value for current counter
- **mask** -- [in] mask value for current counter
- **value** -- [in] counter value for current counter

Structures

struct **xtensa_perfmon_config**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

Public Members

int **repeat_count**

how much times function will be called before the callback will be repeated

float **max_deviation**

Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void ***call_params**

This pointer will be passed to the call_function as a parameter

void (***call_function**)(void *params)

pointer to the function that have to be called

void (***callback**)(void *params, uint32_t select, uint32_t mask, uint32_t value)

pointer to the function that will be called with result parameters

void ***callback_params**

parameter that will be passed to the callback

int **tracelevel**

trace level for all counters. In case of negative value, the filter will be ignored. If it's ≥ 0 , then the perfmon will count only when interrupt level $>$ tracelevel. It's useful to monitor interrupts.

uint32_t **counters_size**

amount of counter in the list

const uint32_t ***select_mask**

list of the select/mask parameters

Type Definitions

typedef struct *xtensa_perfmon_config* **xtensa_perfmon_config_t**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

2.9.25 电源管理

概述

ESP-IDF 中集成的电源管理算法可以根据应用程序组件的需求，调整外围总线 (APB) 频率和 CPU 频率，并使芯片进入 Light-sleep 模式，尽可能减少运行应用程序的功耗。

应用程序组件可以通过创建和获取电源管理锁来控制功耗。

例如：

- 对于从 APB 获得时钟频率的外设，其驱动可以要求在使用该外设时，将 APB 频率设置为 80 MHz。
- RTOS 可以要求 CPU 在有任务准备开始运行时以最高配置频率工作。

- 一些外设可能需要中断才能启用，因此其驱动也会要求禁用 Light-sleep 模式。

请求较高的 APB 频率或 CPU 频率以及禁用 Light-sleep 模式会增加功耗，因此请将组件使用的电源管理锁降到最少。

电源管理配置

编译时可使用 `CONFIG_PM_ENABLE` 选项启用电源管理功能。

启用电源管理功能将会增加中断延迟。额外延迟与多个因素有关，例如：CPU 频率、单/双核模式、是否需要进行频率切换等。CPU 频率为 240 MHz 且未启用频率调节时，最小额外延迟为 0.2 us；如果启用频率调节，且在中断入口将频率由 40 MHz 调节至 80 MHz，则最大额外延迟为 40 us。

通过调用 `esp_pm_configure()` 函数可以在应用程序中启用动态调频 (DFS) 功能和自动 Light-sleep 模式。此函数的参数 `esp_pm_config_t` 定义了频率调节的相关设置。在此参数结构中，需要初始化以下三个字段：

- `max_freq_mhz`：最大 CPU 频率 (MHz)，即获取 `ESP_PM_CPU_FREQ_MAX` 锁后所使用的频率。该字段通常设置为 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`。
- `min_freq_mhz`：最小 CPU 频率 (MHz)，即未持有电源管理锁时所使用的频率。注意，10 MHz 是生成 1 MHz 的 `REF_TICK` 默认时钟所需的最小频率。
 - `light_sleep_enable`：没有获取任何管理锁时，决定系统是否需要自动进入 Light-sleep 状态 (true/false)。

如果在 `menuconfig` 中启用了 `CONFIG_PM_DFS_INIT_AUTO` 选项，最大 CPU 频率将由 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` 设置决定，最小 CPU 频率将锁定为 XTAL 频率。

备注： 自动 Light-sleep 模式基于 FreeRTOS Tickless Idle 功能，因此如果在 `menuconfig` 中没有启用 `CONFIG_FREERTOS_USE_TICKLESS_IDLE` 选项，在请求自动 Light-sleep 时，`esp_pm_configure()` 将会返回 `ESP_ERR_NOT_SUPPORTED` 错误。

备注： Light-sleep 状态下，外设有有时钟门控，不会产生来自 GPIO 和内部外设的中断。[睡眠模式](#) 文档中所提到的唤醒源可用于从 Light-sleep 状态触发唤醒。

例如，EXT0 和 EXT1 唤醒源可以通过 GPIO 唤醒芯片。

电源管理锁

应用程序可以通过获取或释放管理锁来控制电源管理算法。应用程序获取电源管理锁后，电源管理算法的操作将受到下面的限制。释放电源管理锁后，限制解除。

电源管理锁设有获取/释放计数器，如果已多次获取电源管理锁，则需要将电源管理锁释放相同次数以解除限制。

ESP32-S2 支持下表中三种电源管理锁。

| 电源管理锁 | 描述 |
|------------------------------------|---|
| <code>ESP_PM_CPU_FREQ_MAX</code> | 请求使用 <code>esp_pm_configure()</code> 将 CPU 频率设置为最大值。ESP32-S2 可以将该值设置为 80 MHz, 160 MHz, 或 240 MHz。 |
| <code>ESP_PM_APB_FREQ_MAX</code> | 请求将 APB 频率设置为最大值，ESP32-S2 支持的最大频率为 80 MHz。 |
| <code>ESP_PM_NO_LIGHT_SLEEP</code> | 禁止自动切换至 Light-sleep 模式。 |

ESP32-S2 电源管理算法

下表列出了启用动态调频时如何切换 CPU 频率和 APB 频率。可以使用 `esp_pm_configure()` 或 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` 指定 CPU 最大频率。

| CPU 最高频率 | 电源管理锁获取情况 | APB 频率和 CPU 频率 |
|----------|--|---|
| 240 | 获取 ESP_PM_CPU_FREQ_MAX | CPU: 240 MHz APB: 80 Mhz |
| | 获取 ESP_PM_APB_FREQ_MAX, 未获得 ESP_PM_CPU_FREQ_MAX | CPU: 80 MHz APB: 80 Mhz |
| | 无 | 使用 <code>esp_pm_configure()</code> 为二者设置最小值 |
| 160 | 获取 ESP_PM_CPU_FREQ_MAX | CPU: 160 MHz APB: 80 Mhz |
| | 获取 ESP_PM_APB_FREQ_MAX, 未获得 ESP_PM_CPU_FREQ_MAX | CPU: 80 MHz APB: 80 Mhz |
| | 无 | 使用 <code>esp_pm_configure()</code> 为二者设置最小值 |
| 80 | 获取 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX | CPU: 80 MHz APB: 80 Mhz |
| | 无 | 使用 <code>esp_pm_configure()</code> 为二者设置最小值 |

如果没有获取任何管理锁，调用 `esp_pm_configure()` 将启动 Light-sleep 模式。Light-sleep 模式持续时间由以下因素决定：

- 处于阻塞状态的 FreeRTOS 任务数（有限超时）
- 高分辨率定时器 API 注册的计数器数量

也可以设置 Light-sleep 模式在最近事件（任务解除阻塞，或计时器超时）之前的持续时间，在持续时间结束后再唤醒芯片。

为了跳过不必要的唤醒，可以将 `skip_unhandled_events` 选项设置为 `true` 来初始化 `esp_timer`。带有此标志的定时器不会唤醒系统，有助于减少功耗。

动态调频和外设驱动

启用动态调频后，APB 频率可在一个 RTOS 滴答周期内多次更改。有些外设不受 APB 频率变更的影响，但有些外设可能会出现。例如，Timer Group 外设定时器会继续计数，但定时器计数的速度将随 APB 频率的变更而变更。

时钟频率不受 APB 频率影响的外设时钟源通常有 REF_TICK, XTAL, RC_FAST (i.e., RTC_8M)。因此, 为了保证外设在 DFS 期间的行为一致, 建议在上述时钟中选择其一作为外设的时钟源。如果想要了解更多详情可以浏览每个外设” API 参考 > 外设 API “页面的“电源管理”章节。

目前以下外设驱动程序可感知动态调频, 并在调频期间使用 ESP_PM_APB_FREQ_MAX 锁:

- SPI master
- I2C
- I2S (如果 APLL 锁在使用中, I2S 则会启用 ESP_PM_NO_LIGHT_SLEEP 锁)
- SDMMC

启用以下驱动程序时, 将占用 ESP_PM_APB_FREQ_MAX 锁:

- **SPI slave:** 从调用 `spi_slave_initialize()` 至 `spi_slave_free()` 期间。
- **GPTimer:** 从调用 `gptimer_enable()` 至 `gptimer_disable()` 期间。
- **Ethernet:** 从调用 `esp_eth_driver_install()` 至 `esp_eth_driver_uninstall()` 期间。
- **WiFi:** 从调用 `esp_wifi_start()` 至 `esp_wifi_stop()` 期间。如果启用了调制解调器睡眠模式, 广播关闭时将释放此管理锁。
- **TWAI:** 从调用 `twai_driver_install()` 至 `twai_driver_uninstall()` 期间 (只有在 TWAI 时钟源选择为 `TWAI_CLK_SRC_APB` 的时候生效)。

以下外设驱动程序无法感知动态调频, 应用程序需自己获取/释放管理锁:

- PCNT
- Sigma-delta
- 旧版定时器驱动 (Timer Group)

Light-sleep 外设下电

API 参考

Header File

- `components/esp_pm/include/esp_pm.h`
- This header file can be included with:

```
#include "esp_pm.h"
```

- This header file is a part of the API provided by the `esp_pm` component. To declare that your component depends on `esp_pm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_pm
```

or

```
PRIV_REQUIRES esp_pm
```

Functions

`esp_err_t esp_pm_configure` (const void *config)

Set implementation-specific power management configuration.

参数 config -- pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

esp_err_t **esp_pm_get_configuration** (void *config)

Get implementation-specific power management configuration.

参数 **config** -- pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

esp_err_t **esp_pm_lock_create** (*esp_pm_lock_type_t* lock_type, int arg, const char *name, *esp_pm_lock_handle_t* *out_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.

备注: If the lock_type argument is not valid, it will cause an abort.

参数

- **lock_type** -- Power management constraint which the lock should control
- **arg** -- argument, value depends on lock_type, see esp_pm_lock_type_t
- **name** -- arbitrary string identifying the lock (e.g. "wifi" or "spi"). Used by the esp_pm_dump_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out_handle** -- [out] handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure can not be allocated
- ESP_ERR_INVALID_ARG if out_handle is NULL
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_acquire** (*esp_pm_lock_handle_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of 'mode').

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

参数 **handle** -- handle obtained from esp_pm_lock_create function

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_release** (*esp_pm_lock_handle_t* handle)

Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

参数 handle -- handle obtained from `esp_pm_lock_create` function

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the handle is invalid
- `ESP_ERR_INVALID_STATE` if lock is not acquired
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

esp_err_t **esp_pm_lock_delete** (*esp_pm_lock_handle_t* handle)

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

参数 handle -- handle obtained from `esp_pm_lock_create` function

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the handle argument is `NULL`
- `ESP_ERR_INVALID_STATE` if the lock is still acquired
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

esp_err_t **esp_pm_dump_locks** (`FILE *stream`)

Dump the list of all locks to `stderr`

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

参数 stream -- stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

返回

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

Structures

struct **esp_pm_config_t**

Power management config.

Pass a pointer to this structure as an argument to `esp_pm_configure` function.

Public Members

int **max_freq_mhz**

Maximum CPU frequency, in MHz

int **min_freq_mhz**

Minimum CPU frequency to use when no locks are taken, in MHz

bool **light_sleep_enable**

Enter light sleep when no locks are taken

Type Definitions

typedef *esp_pm_config_t* **esp_pm_config_esp32_t**

backward compatibility newer chips no longer require this typedef

```
typedef esp_pm_config_t esp_pm_config_esp32s2_t
```

```
typedef esp_pm_config_t esp_pm_config_esp32s3_t
```

```
typedef esp_pm_config_t esp_pm_config_esp32c3_t
```

```
typedef esp_pm_config_t esp_pm_config_esp32c2_t
```

```
typedef esp_pm_config_t esp_pm_config_esp32c6_t
```

```
typedef struct esp_pm_lock *esp_pm_lock_handle_t
```

Opaque handle to the power management lock.

Enumerations

```
enum esp_pm_lock_type_t
```

Power management constraints.

Values:

```
enumerator ESP_PM_CPU_FREQ_MAX
```

Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

```
enumerator ESP_PM_APB_FREQ_MAX
```

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

```
enumerator ESP_PM_NO_LIGHT_SLEEP
```

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

```
enumerator ESP_PM_LOCK_MAX
```

2.9.26 POSIX Thread

概述

ESP-IDF 基于 FreeRTOS，但提供了一系列与 POSIX 兼容的 API，以便轻松移植第三方代码，例如支持 pthread 常用的 pthread API。

在 ESP-IDF 中，pthread 对 FreeRTOS 中的等效功能进行了包装。pthread API 所需的运行内存或性能开销很低，但 pthread 或 FreeRTOS 的可用功能并非都可以通过 ESP-IDF 的 pthread 支持来实现。

添加标准 pthread.h 头文件后可以在 ESP-IDF 中使用 pthread，该头文件已包含在工具链 libc 中。还有另一个专用于 ESP-IDF 的头文件 esp_pthread.h，其中提供了一些额外的非 POSIX API，以便通过 pthread 使用一些 ESP-IDF 功能。

C++ 标准库中的 `std::thread`、`std::mutex`、`std::condition_variable` 等功能也是通过 pthread (利用 GCC libstdc++) 实现的。因此，本文档提到的限制条件也同样适用于 C++ 标准库中等效功能。

RTOS 集成

与许多使用 `pthread` 的操作系统不同，ESP-IDF 是一个实时操作系统，具有实时调度程序。这意味着只有当一个更高优先级的任务准备就绪、线程在 OS 同步结构（如 `mutex`）上发生阻塞、或者线程调用 `sleep`、`vTaskDelay()`、`usleep` 等函数时，线程才会停止运行。

备注： 如果调用 C 标准库或 C++ `sleep` 函数，例如在 `unistd.h` 中定义的 `usleep`，那么只有当睡眠时间超过一个 *FreeRTOS 滴答周期* 时，任务才会阻塞并让出内核。如果时间较短，线程将处于忙等待状态，不会让步给另一个 RTOS 任务。

默认情况下，所有 `pthread` 具有相同的 RTOS 优先级，但可以通过调用 *ESP-IDF 提供的扩展 API* 对此优先级进行更改。

标准功能

ESP-IDF 中实现了以下标准 API。

请参考 [标准 pthread 文档](#) 或 `pthread.h`，了解每个函数标准参数和行为的详细信息。下文还列出了 `pthread` API 与标准 API 相比的差异或局限性。

线程 API

- `pthread_create()`
 - `attr` 参数仅支持设置堆栈大小和分离状态，其他属性字段将被忽略。
 - 与 FreeRTOS 任务函数不同，`start_routine` 函数允许返回。如果函数返回，分离类型的线程会被自动删除。而默认的可连接类型线程将被挂起，直到调用 `pthread_join()`。
- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- `pthread_self()`
 - 如果从不是 `pthread` 的 FreeRTOS 任务中调用此函数，断言会失败。
- `pthread_equal()`

线程属性

- `pthread_attr_init()`
- `pthread_attr_destroy()`
 - 此函数不需要释放任何资源，而是将 `attr` 结构体重置为默认值。其实现与 `pthread_attr_init()` 相同。
- `pthread_attr_getstacksize() / pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate() / pthread_attr_setdetachstate()`

Once

- `pthread_once()`

支持静态初始化常量 `PTHREAD_ONCE_INIT`。

备注： 在使用 `pthread` 或 FreeRTOS API 创建的任务中都可以调用此函数。

互斥锁 POSIX 互斥锁被实现为 FreeRTOS 互斥信号量（普通类型用于“快速”或“错误检查”互斥锁，递归类型用于“递归”互斥锁），因此与使用 `xSemaphoreCreateMutex()` 创建的互斥锁具有相同的优先级继承行为。

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

支持静态初始化常量 `PTHREAD_MUTEX_INITIALIZER`，但不支持其他互斥锁类型的非标准静态初始化常量。

备注： 在使用 `pthread` 或 `FreeRTOS API` 创建的任务中都可以调用这些函数。

条件变量

- **`pthread_cond_init()`**
- `attr` 参数未实现，将被忽略。
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

支持静态初始化常量 `PTHREAD_COND_INITIALIZER`。

- `pthread_cond_timedwait()` 超时的分辨率为 `RTOS` 滴答周期（参见 [CONFIG_FREERTOS_HZ](#)）。在请求超时后，超时最多会延迟一个滴答周期。

备注： 在使用 `pthread` 或 `FreeRTOS API` 创建的任务中都可以调用这些函数。

信号量 `ESP-IDF` 中实现了 `POSIX` 未命名信号量，下文介绍了可访问的 `API`。除非另有说明，否则 `ESP-IDF` 中未命名信号量的实现遵循 `POSIX` 标准规定的信号量。

- `sem_init()`
- `sem_destroy()`
- `pshared` 被忽略。信号量始终可以在 `FreeRTOS` 任务之间共享。
- `sem_post()`
- 如果信号量的值已经是 `SEM_VALUE_MAX`，则返回 `-1`，并将 `errno` 设置为 `EAGAIN`。
- `sem_wait()`
- `sem_trywait()`
- `sem_timedwait()`
- 通过 `abstime` 传递的时间值将被向上舍入到下一个 `FreeRTOS` 时钟滴答。
- 超时实际发生在被舍入到的滴答之后，下一个滴答之前。
- 在计算超时后，任务有可能被立即抢占（可能性较小），从而延迟下一个阻塞操作系统调用的超时，延迟的时间等于抢占的持续时间。
- `sem_getvalue()`

读/写锁 `ESP-IDF` 中实现了 `POSIX` 读写锁规范的以下 `API` 函数：

- `pthread_rwlock_init()`
- `attr` 参数未实现，将被忽略。
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_tryrdlock()`

- `pthread_rwlock_wrlock()`
- `pthread_rwlock_trywrlock()`
- `pthread_rwlock_unlock()`

支持静态初始化器常量 `PTHREAD_RWLOCK_INITIALIZER`。

备注：在 `pthread` 或 FreeRTOS API 创建的任务中都可以调用此函数。

线程特定数据

- `pthread_key_create()`
 - 支持 `destr_function` 参数。如果线程函数正常退出并调用 `pthread_exit()`，此参数就会被调用，或者在使用 FreeRTOS 函数 `vTaskDelete()` 直接删除了底层任务时被调用。
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

备注：在 `pthread` 或 FreeRTOS API 创建的任务中都可以调用此函数。当从 FreeRTOS API 创建的任务中调用这些函数时，必须先启用 `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS` 配置选项，以确保在删除任务之前清理线程数据。

备注：ESP-IDF 中还有其他的线程本地存储选项，包括性能更高的选项。参见 [线程局部存储](#)。

未实现 API

`pthread.h` 头文件是一个标准头文件，包含了在 ESP-IDF 中未实现的额外 API 和功能，包括：

- 如果调用 `pthread_cancel()`，返回 `ENOSYS`。
- `pthread_condattr_init()` 如果被调用，返回 `ENOSYS`。

其他未列出的 `pthread` 函数未在 ESP-IDF 中实现，如果从 ESP-IDF 应用程序中直接引用，将产生编译器错误或链接器错误。如果希望 ESP-IDF 支持某个尚未实现的 API，请在 [GitHub](#) 上发起功能请求 并提供详细信息。

ESP-IDF 扩展

在 `esp_pthreads.h` 头文件中定义的 API `esp_pthread_set_cfg()` 提供了自定义扩展，能够对后续 `pthread_create()` 的调用行为进行控制。目前提供以下配置：

- 如果调用 `pthread_create()` 时未指定默认堆栈大小，可设置新线程的默认堆栈大小（覆盖 `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`）。
- 堆栈内存属性决定用于分配 `pthread` 堆栈的内存类型。该字段使用 ESP-IDF 堆属性标志，这一标志在 `heap/include/esp_heap_caps.h` 文件中定义。为了确保分配的内存能够通过 8 位地址访问 (`MALLOC_CAP_8BIT`)，用户必须设置相应的标志，此外也可添加其他自定义标志。用户应当确保选择了正确的堆栈内存属性。了解内存位置的更多信息，请参考 [内存属性](#) 文档。
- 新线程的 RTOS 优先级（覆盖 `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`）。
- 新线程的 FreeRTOS 任务名称（覆盖 `CONFIG_PTHREAD_TASK_NAME_DEFAULT`）

此配置的作用范围是调用线程或 FreeRTOS 任务，这意味着 `esp_pthread_set_cfg()` 可以在不同的线程或任务中独立调用。如果在当前配置中设置了 `inherit_cfg` 标志，那么当一个线程递归调用 `pthread_create()` 时，任何新创建的线程都会继承该线程的配置，否则新线程将采用默认配置。

示例

- [system/pthread](#) 演示了如何使用 pthread API 创建线程。
- [cxx/pthread](#) 演示了如何通过线程使用 C++ 标准库函数。

API 参考

Header File

- [components/pthread/include/esp_pthread.h](#)
- This header file can be included with:

```
#include "esp_pthread.h"
```

- This header file is a part of the API provided by the pthread component. To declare that your component depends on pthread, add the following to your CMakeLists.txt:

```
REQUIRES pthread
```

or

```
PRIV_REQUIRES pthread
```

Functions

esp_pthread_cfg_t **esp_pthread_get_default_config** (void)

Creates a default pthread configuration based on the values set via menuconfig.

返回 A default configuration structure.

esp_err_t **esp_pthread_set_cfg** (const *esp_pthread_cfg_t* *cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

备注: If `cfg->stack_alloc_caps` is 0, it is automatically set to valid default stack memory capabilities. If `cfg->stack_alloc_caps` is non-zero, the developer is responsible for its correctness. This function only checks that the capabilities are `MALLOC_CAP_8BIT`, the rest is unchecked.

备注: Passing non-NULL attributes to pthread_create() will override the `stack_size` parameter set using this API

参数 `cfg` -- The pthread config parameters

返回

- `ESP_OK` if configuration was successfully set
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_ARG` if `stack_size` is less than `PTHREAD_STACK_MIN`
- `ESP_ERR_INVALID_ARG` if `stack_alloc_caps` does not include `MALLOC_CAP_8BIT`

esp_err_t **esp_pthread_get_cfg** (*esp_pthread_cfg_t* *p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

参数 **p** -- Pointer to the pthread config structure that will be updated with the currently configured parameters

返回

- ESP_OK if the configuration was available
- ESP_ERR_NOT_FOUND if a configuration wasn't previously set

esp_err_t **esp_pthread_init** (void)

Initialize pthread library.

Structures

struct **esp_pthread_cfg_t**

pthread configuration structure that influences pthread creation

Public Members

size_t **stack_size**

The stack size of the pthread

size_t **prio**

The thread's priority

bool **inherit_cfg**

Inherit this configuration further

const char ***thread_name**

The thread name.

int **pin_to_core**

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

uint32_t **stack_alloc_caps**

A bit mask of memory capabilities (MALLOC_CAPS*) to use when allocating the stack. The memory must be 8 bit accessible (MALLOC_CAP_8BIT). The developer is responsible for the correctness of stack_alloc_caps.

Macros

PTHREAD_STACK_MIN

2.9.27 随机数发生器

ESP32-S2 中包含一个硬件随机数发生器 (RNG), 可以调用 API *esp_random()* 和 *esp_fill_random()* 从中获取随机数值。

满足下列任意一个或多个条件时, 硬件 RNG 会产生真随机数:

- RF 子系统已启用, 即 Wi-Fi 已启用。
- 调用 *bootloader_random_enable()* 启用了内部熵源, 并且熵源尚未被 *bootloader_random_disable()* 禁用。

- 在 ESP-IDF 二级引导程序运行时。这是因为默认的 ESP-IDF 引导加载程序启动时会调用 `bootloader_random_enable()`，并在执行应用程序前调用 `bootloader_random_disable()`。

当上述任一条件为真时，物理噪声样本会连续混合到内部硬件 RNG 状态中来提供熵。如需了解详情，请参阅 [ESP32-S2 技术参考手册 > 随机数发生器 \(RNG\) \[PDF\]](#) 章节。

如果上述条件都不满足，那么 RNG 的输出仅应被看作伪随机数。

启动

在启动过程中，ESP-IDF 引导加载程序暂时会启用一个非 RF 熵源（内部参考电压噪声），为首次生成的启动密钥提供熵。当应用程序开始执行后，一直到 Wi-Fi 初始化完成前，通常只有伪随机数可用。

如需在应用程序启动期间临时重启熵源，或为不使用 Wi-Fi 的应用程序临时重启熵源，请调用函数 `bootloader_random_enable()` 重启内部熵源。在使用 ADC、或使用 Wi-Fi 前，必须调用函数 `bootloader_random_disable()` 以禁用熵源。

备注：ESP-IDF 第二阶段引导加载程序在启动过程中启用的熵源会用熵来初始化内部 RNG 状态。但是，内部硬件 RNG 状态的大小并不足以提供连续的真随机数流。因此，在需要真随机数时必须启用连续的熵源。

备注：如果应用程序需要真随机数源，但无法永久性地启用硬件熵源，可以考虑使用软件 DRBG（确定性随机数发生器）来实现，如 `mbedtls CTR-DRBG` 或 `HMAC-DRBG`，并使用来自硬件 RNG 真随机数来获取初始熵。

二级熵源

ESP32-S2 RNG 包含一个基于异步 8 MHz 内部振荡器采样的二级熵源（详情请参阅技术参考手册）。该熵源在 ESP-IDF 中始终处于启用状态，并通过硬件持续混合到 RNG 状态中。在测试中，即使在不启用主熵源时，这个二级熵源也足以通过 `Dieharder` 随机数测试套件（测试输入数据是通过连续重置 ESP32-S2 生成短样本并将其拼接来创建的）。但是，目前只有在同时启用上文所述的主熵源时，才能保证产生真随机数。

API 参考

Header File

- `components/esp_hw_support/include/esp_random.h`
- This header file can be included with:

```
#include "esp_random.h"
```

Functions

`uint32_t esp_random (void)`

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide "Random Number Generation" section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

返回 Random value between 0 and `UINT32_MAX`

void **esp_fill_random** (void *buf, size_t len)

Fill a buffer with random bytes from hardware RNG.

备注: This function is implemented via calls to `esp_random()`, so the same constraints apply.

参数

- **buf** -- Pointer to buffer to fill with random numbers.
- **len** -- Length of buffer in bytes

Header File

- [components/bootloader_support/include/bootloader_random.h](#)
- This header file can be included with:

```
#include "bootloader_random.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

Functions

void **bootloader_random_enable** (void)

Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

Consult ESP-IDF Programming Guide "Random Number Generation" section for details.

警告: This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

void **bootloader_random_disable** (void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after `bootloader_random_enable()` and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide "Random Number Generation" section for details.

void **bootloader_fill_random** (void *buffer, size_t length)

Fill buffer with 'length' random bytes.

备注: If this function is being called from app code only, and never from the bootloader, then it's better to call `esp_fill_random()`.

参数

- **buffer** -- Pointer to buffer
- **length** -- This many bytes of random data will be copied to buffer

getrandom()

为方便移植，还提供了与 Linux 的 `getrandom()` 函数兼容的版本：

```
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

此函数通过内部调用 `esp_fill_random()` 来实现。

`flags` 参数将被忽略。该函数始终是非阻塞的，但随机数的强度取决于本文档所述条件。

如果 `buf` 参数为 `NULL`，返回值为 `-1`，并将 `errno` 设置为 `EFAULT`。否则返回 `buflen`。

getentropy()

为了便于移植，还提供了与 Linux 的 `getentropy()` 函数兼容的版本：

```
#include <unistd.h>

int getentropy(void *buffer, size_t length);
```

此函数通过内部调用 `getrandom()` 实现。

随机数强度取决于本文档所述条件。

如果执行成功则返回 `0`，否则返回 `-1`，同时：

- 如果 `buffer` 参数为 `NULL`，`errno` 设置为 `EFAULT`。
- 如果 `length` 超过 `256`，`errno` 设置为 `EIO`。

2.9.28 睡眠模式**概述**

ESP32-S2 具有 `Light-sleep` 和 `Deep-sleep` 两种睡眠节能模式。根据应用所使用的功能，还有一些细分的子睡眠模式。关于这些睡眠模式和其子模式，参见[睡眠节能模式](#)。另外，还可以配置一些断电选项来进一步减少功耗，请参见[断电选项](#)。

睡眠模式有多种唤醒源。这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。[唤醒源](#)详细描述了这些唤醒源，以及配置 API。

断电选项和唤醒源的配置不是必要的，并且可以在进入睡眠模式前的任意时候进行。

最后，应用通过调用开始睡眠的 API 来使芯片进入其中一种睡眠模式，更多详情请参见[进入睡眠模式](#)。当唤醒条件满足，芯片就会从睡眠中被唤醒。关于如何获取唤醒原因，请参见[检查睡眠唤醒原因](#)。关于醒来后如何处理唤醒源，请参见[禁用睡眠模式唤醒源](#)。

睡眠节能模式

在 Light-sleep 模式下，数字外设、CPU、以及大部分 RAM 都使用时钟门控，同时其供电电压降低。退出该模式后，数字外设、CPU 和 RAM 恢复运行，并且内部状态将被保留。

在 Deep-sleep 模式下，CPU、大部分 RAM、以及所有由时钟 APB_CLK 驱动的数字外设都会被断电。芯片上继续处于供电状态的部分仅包括：

- RTC 控制器
- ULP 协处理器
- RTC 高速内存
- RTC 低速内存

睡眠模式下的 Wi-Fi 功能 在 Light-sleep 和 Deep-sleep 模式下，无线外设会被断电。因此，在进入这两种睡眠模式前，应用程序必须调用恰当的函数 (`esp_wifi_stop()`) 来禁用 Wi-Fi。在 Light-sleep 或 Deep-sleep 模式下，即使不调用此函数也无法连接 Wi-Fi。

如需保持 Wi-Fi 连接，请启用 Wi-Fi Modem-sleep 模式和自动 Light-sleep 模式（请参阅[电源管理 API](#)）。在这两种模式下，Wi-Fi 驱动程序发出请求时，系统将自动从睡眠中被唤醒，从而保持与 AP 的连接。

子睡眠模式 下表首行表示子睡眠模式，首列表示不同模式支持的功能。在睡眠模式下，支持更多功能的模式功耗可能更大。睡眠系统会自动选择满足用户功能需求且功耗最小的模式。

Deep-sleep:

| | DSLP_ULTRA_LOW | DSLP_DEFAULT | DSLP_8MD256/ DSLP_ADC_TSENS |
|---------------------------------|----------------|--------------|--------------------------------|
| ULP/触摸传感器(仅限 ESP32-S2、ESP32-S3) | Y | Y | Y |
| RTC IO 输入/高温下 RTC 内存 | | Y | Y |
| ADC_TSEN_MONITOR | | | Y |
| 8MD256 作为 RTC_SLOW_CLK 时钟源 | | | Y |

功能:

1. RTC IO 输入/高温下 RTC 内存（试验功能）：将 RTC IO 用作输入管脚，或在高温下使用 RTC 内存。禁用上述功能，芯片可进入超低功耗模式。由 API `rtc_sleep_enable_ultra_low()` 控制。
2. ADC_TSEN_MONITOR：在 monitor 模式下使用 ADC/温度传感器（由 ULP 控制），通过 `ulp_adc_init()` 或其更高级别的 API 启用。仅适用于支持 monitor 模式的 ESP32-S2 和 ESP32-S3 芯片。
3. 8MD256 作为 RTC_SLOW_CLK 时钟源：通过 `CONFIG_RTC_CLK_SRC_INT_8MD256` 选择 8MD256 作为 RTC_SLOW_CLK 时钟源时，芯片在 Deep-sleep 模式下将自动进入该子睡眠模式。

Light-sleep:

| | LSLP_DEFAULT | LSLP_ADC_TSENS | LSLP_8MD256 | LSLP_LEDC8M/ LSLP_XTAL_FPU |
|---------------------------------|--------------|----------------|-------------|-------------------------------|
| ULP/触摸传感器（仅限 ESP32-S2、ESP32-S3） | Y | Y | Y | Y |
| RTC IO 输入/高温下 RTC 内存 | Y | Y | Y | Y |
| ADC_TSEN_MONITOR | | Y | Y | Y |
| 8MD256 作为 RTC_SLOW_CLK 时钟源 | | | Y | Y |
| 数字外设使用 8 MHz RC 时钟源 | | | | Y |
| 保持 XTAL 时钟开启 | | | | Y |

功能：（了解 Deep-sleep 模式，请参考前文 8MD256 和 ADC_TSEN_MONITOR 功能描述）

1. 数字外设使用 8 MHz RC 时钟源：目前，只有 LEDC 在 Light-sleep 模式下使用该时钟源。当 LEDC 选用该时钟源时，此功能将自动启用。
2. 保持 XTAL 时钟开启：在 Light-sleep 模式下保持 XTAL 时钟开启，由 ESP_PD_DOMAIN_XTAL 电源域控制。

ESP32-S2 的 LSLP_8MD256、LSLP_LEDC8M 和 LSLP_XTAL_FPU 功能使用相同的功耗模式。

唤醒源

通过 API `esp_sleep_enable_X_wakeup` 可启用唤醒源。唤醒源在芯片被唤醒后并不会被禁用，若你不再需要某些唤醒源，可通过 API `esp_sleep_disable_wakeup_source()` 将其禁用，详见[禁用睡眠模式唤醒源](#)。

以下是 ESP32-S2 所支持的唤醒源。

定时器 RTC 控制器中内嵌定时器，可用于在预定义的时间到达后唤醒芯片。时间精度为微秒，但其实际分辨率依赖于为 `RTC_SLOW_CLK` 所选择的时钟源。

关于 RTC 时钟选项的更多细节，请参考 [ESP32-S2 技术参考手册 > ULP 协处理器 \[PDF\]](#)。

在这种唤醒模式下，无需为睡眠模式中的 RTC 外设或内存供电。

调用 `esp_sleep_enable_timer_wakeup()` 函数可启用使用定时器唤醒睡眠模式。

触摸传感器 RTC IO 模块中包含这样一个逻辑——当发生触摸传感器中断时，触发唤醒。要启用此唤醒源，用户需要在芯片进入睡眠模式前配置触摸传感器中断功能。

可调用 `esp_sleep_enable_touchpad_wakeup()` 函数来启用该唤醒源。

外部唤醒 (ext0) RTC IO 模块中包含这样一个逻辑——当某个 RTC GPIO 被设置为预定义的逻辑值时，触发唤醒。RTC IO 是 RTC 外设电源域的一部分，因此如果该唤醒源被请求，RTC 外设将在 Deep-sleep 模式期间保持供电。

在此模式下，RTC IO 模块被使能，因此也可以使用内部上拉或下拉电阻。配置时，应用程序需要在调用函数 `esp_deep_sleep_start()` 前先调用函数 `rtc_gpio_pullup_en()` 和 `rtc_gpio pulldown_en()`。

可调用 `esp_sleep_enable_ext0_wakeup()` 函数来启用此唤醒源。

警告： 从睡眠模式中唤醒后，用于唤醒的 IO pad 将被配置为 RTC IO。因此，在将该 pad 用作数字 GPIO 之前，请调用 `rtc_gpio_deinit()` 函数对其进行重新配置。

外部唤醒 (ext1) RTC 控制器中包含使用多个 RTC GPIO 触发唤醒的逻辑。从以下两个逻辑函数中任选其一，均可触发 ext1 唤醒：

- 当任意一个所选管脚为高电平时唤醒 (`ESP_EXT1_WAKEUP_ANY_HIGH`)
- 当任意一个所选管脚为低电平时唤醒 (`ESP_EXT1_WAKEUP_ANY_LOW`)

此唤醒源由 RTC 控制器实现。区别于 ext0 唤醒源，在 RTC 外设断电的情况下此唤醒源同样支持唤醒。虽然睡眠期间 RTC IO 所在的 RTC 外设电源域将会断电，但是 ESP-IDF 会自动在系统进入睡眠前锁定唤醒管脚的状态并在退出睡眠时解除锁定，所以仍然可为唤醒管脚配置内部上拉或下拉电阻：

```
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

如果我们关闭 `RTC_PERIPH` 域，我们将使用 HOLD 功能在睡眠期间维持管脚上的上拉和下拉电阻。所选管脚的 HOLD 功能会在系统真正进入睡眠前被开启，这有助于进一步减小睡眠时的功耗：

```
rtc_gpio_pullup_dis(gpio_num);
rtc_gpiopulldown_en(gpio_num);
```

如果某些芯片缺少 RTC_PERIPH 域，我们只能使用 HOLD 功能来在睡眠期间维持管脚上的上拉和下拉电阻：

```
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

可调用 `esp_sleep_enable_ext1_wakeup_io()` 函数可用于增加 ext1 唤醒 IO 并设置相应的唤醒电平。

可调用 `esp_sleep_disable_ext1_wakeup_io()` 函数可用于移除 ext1 唤醒 IO。

备注：由于硬件限制，当我们将多个 IO 用于 EXT1 唤醒，此时不允许将这些 IO 的唤醒模式配置成不同的电平，在 `esp_sleep_enable_ext1_wakeup_io()` 已有相应的内部检查机制。

警告：

- 使用 EXT1 唤醒源时，用于唤醒的 IO pad 将被配置为 RTC IO。因此，在将该 pad 用作数字 GPIO 之前，请调用 `rtc_gpio_deinit()` 函数对其进行重新配置。
- RTC 外设默认情况下配置为断电，此时，唤醒 IO 在进入睡眠状态前将被设置为保持状态。因此，从 Light-sleep 状态唤醒芯片后，请调用 `rtc_gpio_hold_dis` 来禁用保持功能，以便对管脚进行重新配置。对于 Deep-sleep 唤醒，此问题已经在应用启动阶段解决。

ULP 协处理器唤醒 当芯片处于睡眠模式时，ULP 协处理器仍然运行，可用于轮询传感器、监视 ADC 或触摸传感器的值，并在检测到特殊事件时唤醒芯片。ULP 协处理器是 RTC 外设电源域的一部分，运行存储在 RTC 低速内存中的程序。如果这一唤醒源被请求，RTC 低速内存将会在睡眠期间保持供电状态。RTC 外设会在 ULP 协处理器开始运行程序前自动上电；一旦程序停止运行，RTC 外设会再次自动断电。

可调用 `esp_sleep_enable_ulp_wakeup()` 函数来启用此唤醒源。

GPIO 唤醒（仅适用于 Light-sleep 模式） 除了上述 EXT0 和 EXT1 唤醒源之外，还有一种从外部唤醒 Light-sleep 模式的方法——使用函数 `gpio_wakeup_enable()`。启用该唤醒源后，可将每个管脚单独配置为在高电平或低电平时唤醒。EXT0 和 EXT1 唤醒源只能用于 RTC IO，但此唤醒源既可以用于 RTC IO，也可用于数字 IO。

可调用 `esp_sleep_enable_gpio_wakeup()` 函数来启用此唤醒源。

警告：在进入 Light-sleep 模式前，请查看将要驱动的 GPIO 管脚的电源域。如果有管脚属于 VDD_SPI 电源域，必须将此电源域配置为在睡眠期间保持供电。

例如，在 ESP32-WROOM-32 开发板上，GPIO16 和 GPIO17 连接到 VDD_SPI 电源域。如果这两个管脚被配置为在睡眠期间保持高电平，则需将对应电源域配置为保持供电。为此，可以使用函数 `esp_sleep_pd_config()`：

```
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

UART 唤醒（仅适用于 Light-sleep 模式） 当 ESP32-S2 从外部设备接收 UART 输入时，通常需要在输入数据可用时唤醒芯片。UART 外设支持在 RX 管脚上观测到一定数量的上升沿时，将芯片从 Light-sleep 模式中唤醒。调用 `uart_set_wakeup_threshold()` 函数可设置被观测上升沿的数量。请注意，触发唤醒的字符（及该字符前的所有字符）在唤醒后不会被 UART 接收，因此在发送数据之前，外部设备通常需要首先向 ESP32-S2 额外发送一个字符以触发唤醒。

可调用 `esp_sleep_enable_uart_wakeup()` 函数来启用此唤醒源。

使用 UART 唤醒之后，在芯片 Active 模式下需要让 UART 接受一些数据用来清零内部的唤醒指示信号。不然的话，下一次 UART 唤醒的触发将只需要比配置的阈值少两个上升沿的数量。

禁用睡眠模式唤醒源 调用 API `esp_sleep_disable_wakeup_source()` 可以禁用给定唤醒源的触发器，从而禁用该唤醒源。此外，如果将参数设置为 `ESP_SLEEP_WAKEUP_ALL`，该函数可用于禁用所有触发器。

断电选项

应用程序可以使用 API `esp_sleep_pd_config()` 强制 RTC 外设和 RTC 内存进入特定断电模式。在 Deep-sleep 模式下，你还可以通过隔离一些 IO 来进一步降低功耗。

RTC 外设和内存断电 默认情况下，调用函数 `esp_deep_sleep_start()` 和 `esp_light_sleep_start()` 后，所有唤醒源不需要的 RTC 电源域都会被断电。可调用函数 `esp_sleep_pd_config()` 来修改这一设置。

如果程序中的某些值被放入 RTC 低速内存中（例如使用 `RTC_DATA_ATTR` 属性），RTC 低速内存将默认保持供电。如果有需要，也可以使用函数 `esp_sleep_pd_config()` 对其进行修改。

flash 断电 默认情况下，调用函数 `esp_light_sleep_start()` 后，flash 不会断电，因为在 sleep 过程中断电 flash 存在风险。具体而言，flash 断电需要时间，但是在此期间，系统有可能被唤醒，导致 flash 重新被上电。此时，断电尚未完成又重新上电的硬件行为有可能导致 flash 无法正常工作。

理论上讲，在 flash 完全断电后可以仅唤醒系统，然而现实情况是 flash 断电所需的时间很难预测。如果用户为 flash 供电电路添加了滤波电容，断电所需时间可能会更长。此外，即使可以预知 flash 彻底断电所需的时间，有时也不能通过设置足够长的睡眠时间来确保 flash 断电的安全（比如，突发的异步唤醒源会使得实际的睡眠时间不可控）。

警告： 如果在 flash 的供电电路上添加了滤波电容，那么应当尽一切可能避免 flash 断电。

因为这些不可控的因素，ESP-IDF 很难保证 flash 断电的绝对安全。因此 ESP-IDF 不推荐用户断电 flash。对于一些功耗敏感型应用，可以通过设置 Kconfig 配置项 `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` 来减少 Light-sleep 期间 flash 的功耗。这种方式在几乎所有场景下都要比断电 flash 更好，兼顾了安全性和功耗。

值得一提的是，PSRAM 也有一个类似的 Kconfig 配置项 `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`。

考虑到有些用户能够充分评估断电 flash 的风险，并希望通过断电 flash 来获得更低的功耗，因此 ESP-IDF 提供了两种断电 flash 的机制：

- 设置 Kconfig 配置项 `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` 将使 ESP-IDF 以一个严格的条件来断电 flash。严格的条件具体指的是，RTC timer 是唯一的唤醒源且睡眠时间比 flash 彻底断电所需时间更长。
- 调用函数 `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` 将使 ESP-IDF 以一个宽松的条件来断电 flash。宽松的条件具体指的是 RTC timer 唤醒源未被使能或睡眠时间比 flash 彻底断电所需时间更长。

备注：

- Light-sleep 模式下，ESP-IDF 没有提供保证 flash 一定会被断电的机制。
- 不管用户的配置如何，函数 `esp_deep_sleep_start()` 都会强制断电 flash。

配置 IO (仅适用于 Deep-sleep) 一些 ESP32-S2 IO 在默认情况下启用内部上拉或下拉电阻。如果这些管脚在 Deep-sleep 模式下中受外部电路驱动，电流流经这些上下拉电阻时，可能会增加电流消耗。

想要隔离这些管脚以避免额外的电流消耗，请调用 `rtc_gpio_isolate()` 函数。

例如，在 ESP32-WROVER 模组上，GPIO12 在外部上拉，但其在 ESP32 芯片中也有内部下拉。这意味着在 Deep-sleep 模式中，电流会流经这些外部和内部电阻，使电流消耗超出可能的最小值。

在函数 `esp_deep_sleep_start()` 前增加以下代码即可避免额外电流消耗：

```
rtc_gpio_isolate(GPIO_NUM_12);
```

进入睡眠模式

应用程序通过 API `esp_light_sleep_start()` 或 `esp_deep_sleep_start()` 进入 Light-sleep 或 Deep-sleep 模式。此时，系统将按照被请求的唤醒源和断电选项配置有关的 RTC 控制器参数。

允许在未配置唤醒源的情况下进入睡眠模式。在此情况下，芯片将一直处于睡眠模式，直到从外部被复位。

UART 输出处理 在进入睡眠模式之前，调用函数 `esp_deep_sleep_start()` 会冲刷掉 UART FIFO 缓存。

当使用函数 `esp_light_sleep_start()` 进入 Light-sleep 模式时，UART FIFO 将不会被冲刷。与之相反，UART 输出将被暂停，FIFO 中的剩余字符将在 Light-sleep 唤醒后被发送。

检查睡眠唤醒原因

`esp_sleep_get_wakeup_cause()` 函数可用于检测是何种唤醒源在睡眠期间被触发。

对于触摸传感器唤醒源，可以调用函数 `esp_sleep_get_touchpad_wakeup_status()` 来确认触发唤醒的触摸管脚。

对于 ext1 唤醒源，可以调用函数 `esp_sleep_get_ext1_wakeup_status()` 来确认触发唤醒的触摸管脚。

应用程序示例

- `protocols/sntp`: 如何实现 Deep-sleep 模式的基本功能，周期性唤醒 ESP 模块，以从 NTP 服务器获取时间。
- `wifi/power_save`: 如何通过 Wi-Fi Modem-sleep 模式和自动 Light-sleep 模式保持 Wi-Fi 连接。
- `system/deep_sleep`: 如何使用 Deep-sleep 唤醒触发器和 ULP 协处理器编程。
- `system/light_sleep`: 如何使用多种芯片支持的唤醒源，如定时器，GPIO，触摸传感器等，触发 Light-sleep 唤醒。

- This header file can be included with:

```
#include "esp_sleep.h"
```

Functions

esp_err_t **esp_sleep_disable_wakeup_source** (*esp_sleep_source_t* source)

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

备注: This function does not modify wake up configuration in RTC. It will be performed in `esp_deep_sleep_start/esp_light_sleep_start` function.

参数 **source** -- - number of source to disable of type `esp_sleep_source_t`

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

esp_err_t **esp_sleep_enable_ulp_wakeup** (void)

Enable wakeup by ULP coprocessor.

备注: On ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced, to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

esp_err_t **esp_sleep_enable_timer_wakeup** (uint64_t time_in_us)

Enable wakeup by timer.

参数 **time_in_us** -- time before wakeup, in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

esp_err_t **esp_sleep_enable_touchpad_wakeup** (void)

Enable wakeup by touch sensor.

备注: On ESP32, touch wakeup source can not be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

备注: The FSM mode of the touch button should be configured as the timer trigger mode.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

touch_pad_t **esp_sleep_get_touchpad_wakeup_status** (void)

Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

返回 touch pad which caused wakeup

bool **esp_sleep_is_valid_wakeup_gpio** (gpio_num_t gpio_num)

Returns true if a GPIO number is valid for use as wakeup source.

备注: For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

参数 **gpio_num** -- Number of the GPIO to test for wakeup source capability

返回 True if this GPIO number will be accepted as a sleep wakeup source.

esp_err_t **esp_sleep_enable_ext0_wakeup** (gpio_num_t gpio_num, int level)

Enable wakeup using a pin.

This function uses external wakeup feature of RTC_IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

备注: This function does not modify pin configuration. The pin is configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

备注: ESP32: ext0 wakeup source can not be used together with touch or ULP wakeup sources.

参数

- **gpio_num** -- GPIO number used as wakeup source. Only GPIOs with the RTC functionality can be used. For different SoCs, the related GPIOs are:
 - ESP32: 0, 2, 4, 12-15, 25-27, 32-39;
 - ESP32-S2: 0-21;
 - ESP32-S3: 0-21.
- **level** -- input level which will trigger wakeup (0=low, 1=high)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

esp_err_t **esp_sleep_enable_ext1_wakeup** (uint64_t io_mask, *esp_sleep_ext1_wakeup_mode_t* level_mode)

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once selected pins go into the state given by level_mode argument, the chip will be woken up.

备注: This function does not modify pin configuration. The pins are configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

备注: Internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function. If we turn off the `RTC_PERIPH` domain or certain chips lack the `RTC_PERIPH` domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system entering sleep, and this can further reduce power consumption.

备注: Call this func will reset the previous ext1 configuration.

备注: This function will be deprecated in release/v6.0. Please switch to use `esp_sleep_enable_ext1_wakeup_io` and `esp_sleep_disable_ext1_wakeup_io`

参数

- **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
 - ESP32: 0, 2, 4, 12-15, 25-27, 32-39
 - ESP32-S2: 0-21
 - ESP32-S3: 0-21
 - ESP32-C6: 0-7
 - ESP32-H2: 7-14
- **level_mode** -- Select logic function used to determine wakeup condition: When target chip is ESP32:
 - `ESP_EXT1_WAKEUP_ALL_LOW`: wake up when all selected GPIOs are low
 - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high
 When target chip is ESP32-S2, ESP32-S3, ESP32-C6 or ESP32-H2:
 - `ESP_EXT1_WAKEUP_ANY_LOW`: wake up when any of the selected GPIOs is low
 - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `io_mask` is zero,, or `mode` is invalid

esp_err_t `esp_sleep_enable_ext1_wakeup_io` (uint64_t `io_mask`, *esp_sleep_ext1_wakeup_mode_t* `level_mode`)

Enable ext1 wakeup pins with IO masks.

This will append selected IOs to the wakeup IOs, it will not reset previously enabled IOs. To reset specific previously enabled IOs, call `esp_sleep_disable_ext1_wakeup_io` with the `io_mask`. To reset all the enabled IOs, call `esp_sleep_disable_ext1_wakeup_io(0)`.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once selected pins go into the state given by `level_mode` argument, the chip will be woken up.

备注: This function does not modify pin configuration. The pins are configured in `esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.

备注: Internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function. If we turn off the `RTC_PERIPH` domain or certain chips lack

the `RTC_PERIPH` domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system entering sleep, and this can further reduce power consumption.

参数

- **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
 - ESP32: 0, 2, 4, 12-15, 25-27, 32-39
 - ESP32-S2: 0-21
 - ESP32-S3: 0-21
 - ESP32-C6: 0-7
 - ESP32-H2: 7-14
- **level_mode** -- Select logic function used to determine wakeup condition: When target chip is ESP32:
 - `ESP_EXT1_WAKEUP_ALL_LOW`: wake up when all selected GPIOs are low
 - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high
 When target chip is ESP32-S2, ESP32-S3, ESP32-C6 or ESP32-H2:
 - `ESP_EXT1_WAKEUP_ANY_LOW`: wake up when any of the selected GPIOs is low
 - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if any of the selected GPIOs is not an RTC GPIO, or mode is invalid
- `ESP_ERR_NOT_ALLOWED` when wakeup level will become different between ext1 IOs if `!SOC_PM_SUPPORT_EXT1_WAKEUP_MODE_PER_PIN`

esp_err_t `esp_sleep_disable_ext1_wakeup_io` (uint64_t io_mask)

Disable ext1 wakeup pins with IO masks. This will remove selected IOs from the wakeup IOs.

参数 **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. If value is zero, this func will remove all previous ext1 configuration. For different SoCs, the related GPIOs are:

- ESP32: 0, 2, 4, 12-15, 25-27, 32-39
- ESP32-S2: 0-21
- ESP32-S3: 0-21
- ESP32-C6: 0-7
- ESP32-H2: 7-14

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if any of the selected GPIOs is not an RTC GPIO.

esp_err_t `esp_sleep_enable_gpio_wakeup` (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call `gpio_wakeup_enable`, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

备注: On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if wakeup triggers conflict

esp_err_t **esp_sleep_enable_uart_wakeup** (int uart_num)

Enable wakeup from light sleep using UART.

Use `uart_set_wakeup_threshold` function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

备注: ESP32 does not support wakeup from UART2.

参数 `uart_num` -- UART port to wake up from

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

esp_err_t **esp_sleep_enable_bt_wakeup** (void)

Enable wakeup by bluetooth.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

esp_err_t **esp_sleep_disable_bt_wakeup** (void)

Disable wakeup by bluetooth.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

esp_err_t **esp_sleep_enable_wifi_wakeup** (void)

Enable wakeup by WiFi MAC.

返回

- ESP_OK on success

esp_err_t **esp_sleep_disable_wifi_wakeup** (void)

Disable wakeup by WiFi MAC.

返回

- ESP_OK on success

esp_err_t **esp_sleep_enable_wifi_beacon_wakeup** (void)

Enable beacon wakeup by WiFi MAC, it will wake up the system into modem state.

返回

- ESP_OK on success

esp_err_t **esp_sleep_disable_wifi_beacon_wakeup** (void)

Disable beacon wakeup by WiFi MAC.

返回

- ESP_OK on success

uint64_t **esp_sleep_get_ext1_wakeup_status** (void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

返回 bit mask, if GPIO caused wakeup, BIT(n) will be set

esp_err_t **esp_sleep_pd_config** (*esp_sleep_pd_domain_t* domain, *esp_sleep_pd_option_t* option)

Set power down mode for an RTC power domain in sleep mode.

If not set using this API, all power domains default to ESP_PD_OPTION_AUTO.

参数

- **domain** -- power domain to configure
- **option** -- power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

esp_err_t **esp_deep_sleep_try_to_start** (void)

Enter deep sleep with the configured wakeup options.

The reason for the rejection can be such as a short sleep time.

备注: In general, the function does not return, but if the sleep is rejected, then it returns from it.

返回

- No return - If the sleep is not rejected.
- ESP_ERR_SLEEP_REJECT sleep request is rejected(wakeup source set before the sleep request)

void **esp_deep_sleep_start** (void)

Enter deep sleep with the configured wakeup options.

备注: The function does not do a return (no rejection). Even if wakeup source set before the sleep request it goes to deep sleep anyway.

esp_err_t **esp_light_sleep_start** (void)

Enter light sleep with the configured wakeup options.

返回

- ESP_OK on success (returned after wakeup)
- ESP_ERR_SLEEP_REJECT sleep request is rejected(wakeup source set before the sleep request)
- ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

esp_err_t **esp_deep_sleep_try** (uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

The reason for the rejection can be such as a short sleep time.

备注: In general, the function does not return, but if the sleep is rejected, then it returns from it.

参数 **time_in_us** -- deep-sleep time, unit: microsecond
 返回

- No return - If the sleep is not rejected.
- ESP_ERR_SLEEP_REJECT sleep request is rejected(wakeup source set before the sleep request)

void **esp_deep_sleep** (uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

备注: The function does not do a return (no rejection).. Even if wakeup source set before the sleep request it goes to deep sleep anyway.

参数 **time_in_us** -- deep-sleep time, unit: microsecond

esp_err_t **esp_deep_sleep_register_hook** (*esp_deep_sleep_cb_t* new_dslp_cb)

Register a callback to be called from the deep sleep prepare.

警告: deepsleep callbacks should without parameters, and MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

参数 **new_dslp_cb** -- Callback to be called
 返回

- ESP_OK: Callback registered to the deepsleep misc_modules_sleep_prepare
- ESP_ERR_NO_MEM: No more hook space for register the callback

void **esp_deep_sleep_deregister_hook** (*esp_deep_sleep_cb_t* old_dslp_cb)

Unregister an deepsleep callback.

参数 **old_dslp_cb** -- Callback to be unregistered

esp_sleep_wakeup_cause_t **esp_sleep_get_wakeup_cause** (void)

Get the wakeup source which caused wakeup from sleep.

返回 cause of wake up from last sleep (deep sleep or light sleep)

void **esp_wake_deep_sleep** (void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void **esp_set_deep_sleep_wake_stub** (*esp_deep_sleep_wake_stub_fn_t* new_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing esp_wake_deep_sleep() then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for esp_wake_deep_sleep().

void **esp_set_deep_sleep_wake_stub_default_entry** (void)

Set wake stub entry to default `esp_wake_stub_entry`

esp_deep_sleep_wake_stub_fn_t **esp_get_deep_sleep_wake_stub** (void)

Get current wake from deep sleep stub.

返回 Return current wake from deep sleep stub, or NULL if no stub is installed.

void **esp_default_wake_deep_sleep** (void)

The default esp-idf-provided `esp_wake_deep_sleep()` stub.

See docs/deep-sleep-stub.rst for details.

void **esp_deep_sleep_disable_rom_logging** (void)

Disable logging from the ROM code after deep sleep.

Using LSB of RTC_STORE4.

void **esp_sleep_config_gpio_isolate** (void)

Configure to isolate all GPIO pins in sleep state.

void **esp_sleep_enable_gpio_switch** (bool enable)

Enable or disable GPIO pins status switching between slept status and waked status.

参数 `enable` -- decide whether to switch status or not

Macros

ESP_PD_DOMAIN_RTC8M

ESP_SLEEP_POWER_DOWN_CPU

Type Definitions

typedef void (***esp_deep_sleep_cb_t**)(void)

typedef *esp_sleep_source_t* **esp_sleep_wakeup_cause_t**

typedef void (***esp_deep_sleep_wake_stub_fn_t**)(void)

Function type for stub to run on wake from sleep.

Enumerations

enum **esp_sleep_ext1_wakeup_mode_t**

Logic function used for EXT1 wakeup mode.

Values:

enumerator **ESP_EXT1_WAKEUP_ANY_LOW**

Wake the chip when any of the selected GPIOs go low.

enumerator **ESP_EXT1_WAKEUP_ANY_HIGH**

Wake the chip when any of the selected GPIOs go high.

enumerator **ESP_EXT1_WAKEUP_ALL_LOW**

enum **esp_sleep_pd_domain_t**

Power domains which can be powered down in sleep mode.

Values:

enumerator **ESP_PD_DOMAIN_RTC_PERIPH**

RTC IO, sensors and ULP co-processor.

enumerator **ESP_PD_DOMAIN_RTC_SLOW_MEM**

RTC slow memory.

enumerator **ESP_PD_DOMAIN_RTC_FAST_MEM**

RTC fast memory.

enumerator **ESP_PD_DOMAIN_XTAL**

XTAL oscillator.

enumerator **ESP_PD_DOMAIN_RC_FAST**

Internal Fast oscillator.

enumerator **ESP_PD_DOMAIN_VDDSDIO**

VDD_SDIO.

enumerator **ESP_PD_DOMAIN_MAX**

Number of domains.

enum **esp_sleep_pd_option_t**

Power down options.

Values:

enumerator **ESP_PD_OPTION_OFF**

Power down the power domain in sleep mode.

enumerator **ESP_PD_OPTION_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP_PD_OPTION_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp_sleep_source_t**

Sleep wakeup cause.

Values:

enumerator **ESP_SLEEP_WAKEUP_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP_SLEEP_WAKEUP_ALL**

Not a wakeup cause, used to disable all wakeup sources with `esp_sleep_disable_wakeup_source`.

enumerator **ESP_SLEEP_WAKEUP_EXT0**

Wakeup caused by external signal using RTC_IO.

enumerator **ESP_SLEEP_WAKEUP_EXT1**

Wakeup caused by external signal using RTC_CNTL.

enumerator **ESP_SLEEP_WAKEUP_TIMER**

Wakeup caused by timer.

enumerator **ESP_SLEEP_WAKEUP_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP_SLEEP_WAKEUP_ULP**

Wakeup caused by ULP program.

enumerator **ESP_SLEEP_WAKEUP_GPIO**

Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator **ESP_SLEEP_WAKEUP_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_WIFI**

Wakeup caused by WIFI (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_COCPU**

Wakeup caused by COCPU int.

enumerator **ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG**

Wakeup caused by COCPU crash.

enumerator **ESP_SLEEP_WAKEUP_BT**

Wakeup caused by BT (light sleep only)

enum **esp_sleep_mode_t**

Sleep mode.

Values:

enumerator **ESP_SLEEP_MODE_LIGHT_SLEEP**

light sleep mode

enumerator **ESP_SLEEP_MODE_DEEP_SLEEP**

deep sleep mode

enum **[anonymous]**

Values:

enumerator **ESP_ERR_SLEEP_REJECT**

enumerator **ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION**

2.9.29 SoC 功能

此文档介绍了 ESP32-S2 SoC 硬件功能的宏定义。ESP-IDF 中的条件编译指令通常使用这些宏来确定哪些依赖于硬件的功能受到支持，从而控制需编译的代码内容。

备注：目前，这些宏定义不属于公共 API，未来可能发生重大更改。如需了解详情，请前往[ESP-IDF 版本简介](#)。

Support delta early time for rf phy on/off

SOC_WIFI_NAN_SUPPORT

Support WIFI Aware (NAN)

SOC_ULP_HAS_ADC**SOC_PHY_COMBO_MODULE**

Only support Wi-Fi

2.9.30 系统时间

概述

ESP32-S2 使用两种硬件时钟源建立和保持系统时间。根据应用目的及对系统时间的精度要求，既可以仅使用其中一种时钟源，也可以同时使用两种时钟源。这两种硬件时钟源为：

- **RTC 定时器**：RTC 定时器在任何睡眠模式下及在任何复位后均可保持系统时间（上电复位除外，因为上电复位会重置 RTC 定时器）。时钟频率偏差取决于 **RTC 定时器时钟源**，该偏差只会在睡眠模式下影响时间精度。睡眠模式下，时间分辨率为 6.667 μ s。
- **高分辨率定时器**：高分辨率定时器在睡眠模式下及在复位后不可用，但其时间精度更高。该定时器使用 APB_CLK 时钟源（通常为 80 MHz），时钟频率偏差小于 ± 10 ppm，时间分辨率为 1 μ s。

可供选择的硬件时钟源组合如下所示：

- RTC 和高分辨率定时器（默认）
- RTC
- 高分辨率定时器
- 无

默认时钟源的时间精度最高，建议使用该配置。此外，用户也可以通过配置选项 **CONFIG_NEWLIB_TIME_SYSCALL** 来选择其他时钟源。

RTC 定时器时钟源

RTC 定时器有以下时钟源：

- 内置 90 kHz RC 振荡器 (默认): Deep-sleep 模式下电流消耗最低, 不依赖任何外部元件。但由于温度波动会影响该时钟源的频率稳定性, 在 Deep-sleep 和 Light-sleep 模式下都有可能发生时间偏移。
- 外置 32 kHz 晶振: 需要将一个 32 kHz 晶振连接到 XTAL_32K_P 和 XTAL_32K_N 管脚。频率稳定性更高, 但在 Deep-sleep 模式下电流消耗略高 (比默认模式高 1 μ A)。
- 管脚 XTAL_32K_P 外置 32 kHz 振荡器: 允许使用由外部电路产生的 32 kHz 时钟。外部时钟信号必须连接到管脚 XTAL_32K_P。正弦波信号的振幅应小于 1.2 V, 方波信号的振幅应小于 1 V。正常模式下, 电压范围应为 $0.1 < V_{cm} < 0.5 \times V_{amp}$, 其中 V_{amp} 代表信号振幅。使用此时钟源时, 管脚 XTAL_32K_P 无法用作 GPIO 管脚。
- 内置 8.5 MHz 振荡器的 256 分频时钟 (约 33 kHz): 频率稳定性优于内置 90 kHz RC 振荡器, 同样无需外部元件, 但 Deep-sleep 模式下电流消耗更高 (比默认模式高 5 μ A)。

时钟源的选择取决于系统时间精度要求和睡眠模式下的功耗要求。要修改 RTC 时钟源, 请在项目配置中设置 `CONFIG_RTC_CLK_SRC`。

想要了解外置晶振或外置振荡器的更多布线要求, 请参考 [硬件设计指南](#)。

获取当前时间

要获取当前时间, 请使用 POSIX 函数 `gettimeofday()`。此外, 也可以使用以下标准 C 库函数来获取时间并对其进行操作:

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strptime
adjtime*
```

如需立即更新当前时间, 并暂停平滑时间校正, 请使用 POSIX 函数 `settimeofday()`。

若要求时间的分辨率为 1 s, 请使用以下代码片段:

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// 将时区设置为中国标准时间
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

若要求时间的分辨率为 1 μ s, 请使用以下代码片段:

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

SNTP 时间同步

要设置当前时间, 可以使用 POSIX 函数 `settimeofday()` 和 `adjtime()`。lwIP 中的 SNTP 库会在收到 NTP 服务器的响应报文后, 调用这两个函数以更新当前的系统时间。当然, 用户可以在 lwIP SNTP 库

之外独立地使用这两个函数。

包括 `SNTP` 函数在内的一些 lwIP API 并非线程安全，因此建议在与 `SNTP` 模块交互时使用 `esp_netif` *component*。

要初始化特定的 `SNTP` 服务器并启动 `SNTP` 服务，只需创建有特定服务器名称的默认 `SNTP` 服务器配置，然后调用 `esp_netif_sntp_init()` 注册该服务器并启动 `SNTP` 服务。

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
esp_netif_sntp_init(&config);
```

一旦收到 `SNTP` 服务器的响应，此代码会自动执行时间同步。有时等待时间同步很有意义，调用 `esp_netif_sntp_sync_wait()` 可实现此目的：

```
if (esp_netif_sntp_sync_wait(pdMS_TO_TICKS(10000)) != ESP_OK) {
    printf("Failed to update system time within 10s timeout");
}
```

要配置多个 `NTP` 服务器（或使用更高级的设置，例如 `DHCP` 提供的 `NTP` 服务器），请参考 `esp_netif` 文档 *SNTP API* 中的详细说明。

lwIP `SNTP` 库可在下列任一同步模式下工作：

- `SNTP_SYNC_MODE_IMMED`（默认）：使用 `settimeofday()`，收到 `SNTP` 服务器响应后立即更新系统时间。
- `SNTP_SYNC_MODE_SMOOTH`：使用函数 `adjtime()` 逐渐减少时间误差以平滑更新时间。如果 `SNTP` 响应时间和系统时间之差超过 35 分钟，请立即使用 `settimeofday()` 更新系统时间。

如要选择 `SNTP_SYNC_MODE_SMOOTH` 模式，请将 `SNTP` 配置结构体中的 `esp_sntp_config::smooth` 设置为 `true`，否则将默认使用 `SNTP_SYNC_MODE_IMMED` 模式。

设置时间同步时的回调函数，请使用配置结构体中的 `esp_sntp_config::sync_cb` 字段。

添加此初始化代码后，应用程序将定期同步时间。时间同步周期由 `CONFIG_LWIP_SNTP_UPDATE_DELAY` 设置（默认为一小时）。如需修改，请在项目配置中设置 `CONFIG_LWIP_SNTP_UPDATE_DELAY`。

如需查看示例代码，请前往 `protocols/sntp` 目录。该目录下的示例展示了如何基于 lwIP `SNTP` 库实现时间同步。

也可以直接使用 lwIP API，但请务必注意线程安全。线程安全的 API 如下：

- `sntp_set_time_sync_notification_cb()` 用于设置通知时间同步过程的回调函数。
- `sntp_get_sync_status()` 和 `sntp_set_sync_status()` 用于获取/设置时间同步状态。
- `sntp_set_sync_mode()` 用于设置同步模式。
- `esp_sntp_setoperatingmode()` 用于设置首选操作模式。`ESP_SNTP_OPMODE_POLL` 和 `esp_sntp_init()` 可初始化 `SNTP` 模块。
- `esp_sntp_setservername()` 用于配置特定 `SNTP` 服务器。

时区

要设置本地时区，请使用以下 POSIX 函数：

1. 调用 `setenv()`，将 `TZ` 环境变量根据设备位置设置为正确的值。时间字符串的格式与 `GNU libc` 文档中描述的不同（但实现方式不同）。
2. 调用 `tzset()`，为新的时区更新 C 库的运行数据。

完成上述步骤后，请调用标准 C 库函数 `localtime()`。该函数将返回排除时区偏差和夏令时干扰后的准确本地时间。

2036 年和 2038 年溢出问题

SNTP/NTP 2036 年溢出问题 `SNTP/NTP` 时间戳为 64 位无符号定点数，其中前 32 位表示整数部分，后 32 位表示小数部分。该 64 位无符号定点数代表从 1900 年 1 月 1 日 00:00 起经过的秒数，因此 `SNTP/NTP` 时间将在 2036 年溢出。

为了解决这一问题，可以使用整数部分的 MSB（惯例为位 0）来表示 1968 年到 2104 年之间的时间范围（查看 [RFC2030](#) 了解更多信息），这一惯例将使得 SNTP/NTP 时间戳的生命周期延长。该惯例会在 lwIP 库的 SNTP 模块中实现，因此 ESP-IDF 中 SNTP 相关功能在 2104 年之前能够经受住时间的考验。

Unix 时间 2038 年溢出问题 Unix 时间（类型 `time_t`）此前为有符号的 32 位整数，因此将于 2038 年溢出（即 [Y2K38 问题](#)）。为了解决 Y2K38 问题，ESP-IDF 从 v5.0 版本起开始使用有符号的 64 位整数来表示 `time_t`，从而将 `time_t` 溢出推迟 2920 亿年。

API 参考

Header File

- `components/lwip/include/apps/esp_sntp.h`
- This header file can be included with:

```
#include "esp_sntp.h"
```

- This header file is a part of the API provided by the `lwip` component. To declare that your component depends on `lwip`, add the following to your `CMakeLists.txt`:

```
REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```

Functions

void **sntp_sync_time** (struct `timeval *tv`)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

参数 tv -- Time received from SNTP server.

void **sntp_set_sync_mode** (`sntp_sync_mode_t sync_mode`)

Set the sync mode.

Modes allowed: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

参数 sync_mode -- Sync mode.

`sntp_sync_mode_t` **sntp_get_sync_mode** (void)

Get set sync mode.

返回 `SNTP_SYNC_MODE_IMMED`: Update time immediately.
`SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

`sntp_sync_status_t` **sntp_get_sync_status** (void)

Get status of time sync.

After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

返回 `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`: Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

void **sntp_set_sync_status** (*sntp_sync_status_t* sync_status)

Set status of time sync.

参数 **sync_status** -- status of time sync (see *sntp_sync_status_t*)

void **sntp_set_time_sync_notification_cb** (*sntp_sync_time_cb_t* callback)

Set a callback function for time synchronization notification.

参数 **callback** -- a callback function

void **sntp_set_sync_interval** (uint32_t interval_ms)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the *sntp_restart()* function, otherwise, it will be applied after the last interval expired.

参数 **interval_ms** -- The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32_t **sntp_get_sync_interval** (void)

Get the sync interval of SNTP operation.

返回 the sync interval

bool **sntp_restart** (void)

Restart SNTP.

返回 True - Restart False - SNTP was not initialized yet

void **esp_sntp_setoperatingmode** (*esp_sntp_operatingmode_t* operating_mode)

Sets SNTP operating mode. The mode has to be set before init.

参数 **operating_mode** -- Desired operating mode

void **esp_sntp_init** (void)

Init and start SNTP service.

void **esp_sntp_stop** (void)

Stops SNTP service.

void **esp_sntp_setserver** (u8_t idx, const ip_addr_t *addr)

Sets SNTP server address.

参数

- **idx** -- Index of the server
- **addr** -- IP address of the server

void **esp_sntp_setservername** (u8_t idx, const char *server)

Sets SNTP hostname.

参数

- **idx** -- Index of the server
- **server** -- Name of the server

const char ***esp_sntp_getservername** (u8_t idx)

Gets SNTP server name.

参数 **idx** -- Index of the server

返回 Name of the server

const ip_addr_t ***esp_sntp_getserver** (u8_t idx)

Get SNTP server IP.

参数 **idx** -- Index of the server

返回 IP address of the server

bool **esp_sntp_enabled** (void)

Checks if sntp is enabled.

返回 true if sntp module is enabled

uint8_t **esp_sntp_getreachability** (uint8_t idx)

Gets the server reachability shift register as described in RFC 5905.

参数 **idx** -- Index of the SNTP server

返回 reachability shift register

esp_sntp_operatingmode_t **esp_sntp_getoperatingmode** (void)

Get the configured operating mode.

返回 operating mode enum

static inline void **sntp_setoperatingmode** (u8_t operating_mode)

if not build within lwip, provide translating inlines, that will warn about thread safety

static inline void **sntp_servermode_dhcp** (int set_servers_from_dhcp)

static inline void **sntp_setservername** (u8_t idx, const char *server)

static inline void **sntp_init** (void)

static inline const char ***sntp_getservername** (u8_t idx)

static inline const ip_addr_t ***sntp_getserver** (u8_t idx)

static inline uint8_t **sntp_getreachability** (uint8_t idx)

static inline *esp_sntp_operatingmode_t* **sntp_getoperatingmode** (void)

Macros

esp_sntp_sync_time

Aliases for esp_sntp prefixed API (inherently thread safe)

esp_sntp_set_sync_mode

esp_sntp_get_sync_mode

esp_sntp_get_sync_status

esp_sntp_set_sync_status

esp_sntp_set_time_sync_notification_cb

esp_sntp_set_sync_interval

esp_sntp_get_sync_interval

esp_sntp_restart

SNTP_OPMODE_POLL

Type Definitions

typedef void (***sntp_sync_time_cb_t**)(struct timeval *tv)

SNTP callback function for notifying about time sync event.

Param tv Time received from SNTP server.

Enumerations

enum **sntp_sync_mode_t**

SNTP time update mode.

Values:

enumerator **SNTP_SYNC_MODE_IMMED**

Update system time immediately when receiving a response from the SNTP server.

enumerator **SNTP_SYNC_MODE_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

enum **sntp_sync_status_t**

SNTP sync status.

Values:

enumerator **SNTP_SYNC_STATUS_RESET**

enumerator **SNTP_SYNC_STATUS_COMPLETED**

enumerator **SNTP_SYNC_STATUS_IN_PROGRESS**

enum **esp_sntp_operatingmode_t**

SNTP operating modes per lwip SNTP module.

Values:

enumerator **ESP_SNTP_OPMODE_POLL**

enumerator **ESP_SNTP_OPMODE_LISTENONLY**

2.9.31 异步内存复制

概述

ESP32-S2 有一个 DMA 引擎，能够以异步方式帮助 CPU 完成内部内存复制操作。

异步 `memcpy` API 中封装了所有 DMA 配置和操作，`esp_async_memcpy()` 的签名与标准 C 库的 `memcpy` 函数基本相同。

DMA 允许多个内存复制请求在首个请求完成之前排队，即允许计算和内存复制的重叠。此外，通过注册事件回调函数，还可以知道内存复制请求完成的准确时间。

配置并安装驱动

安装异步 memcopy 驱动的方法取决于底层 DMA 引擎：

- `esp_async_memcopy_install_cpdma()` 用于安装基于 CP DMA 引擎的异步 memcopy 驱动。
- `esp_async_memcopy_install()` 是一个通用 API，用于安装带有默认 DMA 引擎的异步 memcopy 驱动。如果 SoC 具有 CP DMA 引擎，则默认 DMA 引擎为 CP DMA，否则，默认 DMA 引擎为 AHB GDMA。

在 `async_memcopy_config_t` 中设置驱动配置：

- `backlog`：此项用于配置首个请求完成前可以排队的最大内存复制事务数量。如果将此字段设置为零，会应用默认值 4。
- `dma_burst_size`：设置单次 DMA 传输中突发数据量的大小。
- `flags`：此项可以启用一些特殊的驱动功能。

```
async_memcopy_config_t config = ASYNC_MEMCOPY_DEFAULT_CONFIG();
// 更新底层 DMA 引擎支持的最大数据流
config.backlog = 8;
async_memcopy_handle_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcopy_install(&config, &driver)); // 使用默认 DMA_
↳引擎安装驱动
```

发送内存复制请求

使用 `esp_async_memcopy()` API 将内存复制请求发送到 DMA 引擎。在驱动程序成功安装后才能调用该 API。此 API 是线程安全的，因此可以从不同的任务中调用。

与 libc 版本的 memcopy 不同，你可以选择给 `esp_async_memcopy()` 设置一个回调函数，以便在内存复制完成时收到通知。注意，回调是在 ISR 上下文中执行的，请不要在回调中调用任何阻塞函数。

回调函数的原型是 `async_memcopy_isr_cb_t`。回调函数只有在借助 RTOS API（如 `xSemaphoreGiveFromISR()`）唤醒了高优先级任务后才能返回 `true`。

```
// 回调实现，在 ISR 上下文中运行
static bool my_async_memcopy_cb(async_memcopy_handle_t mcp_hdl, async_memcopy_event_t
↳*event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(semphr, &high_task_wakeup); //↳
↳如果解锁了一些高优先级任务，则将 high_task_wakeup 设置为 pdTRUE
    return high_task_wakeup == pdTRUE;
}

// 创建一个信号量，在异步 memcopy 完成时进行报告
SemaphoreHandle_t semphr = xSemaphoreCreateBinary();

// 从用户的上下文中调用
ESP_ERROR_CHECK(esp_async_memcopy(driver_handle, to, from, copy_len, my_async_
↳memcopy_cb, my_semaphore));
// 其他事项
xSemaphoreTake(my_semaphore, portMAX_DELAY); // 等待 buffer 复制完成
```

卸载驱动

使用 `esp_async_memcopy_uninstall()` 卸载异步 memcopy 驱动。无需在每次 memcopy 操作后手动卸载。如果你的应用程序不再需要此驱动，此 API 可以帮助回收内存和其他硬件资源。

API 参考

Header File

- `components/esp_hw_support/include/esp_async_memcpy.h`
- This header file can be included with:

```
#include "esp_async_memcpy.h"
```

Functions

`esp_err_t esp_async_memcpy_install_cpdma` (const `async_memcpy_config_t` *config, `async_memcpy_handle_t` *mcp)

Install async memcpy driver, with CPDMA as the backend.

备注: CPDMA is a CPU peripheral, aiming for memory copy.

参数

- **config** -- **[in]** Configuration of async memcpy
- **mcp** -- **[out]** Returned driver handle

返回

- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy_install` (const `async_memcpy_config_t` *config, `async_memcpy_handle_t` *mcp)

Install async memcpy driver with the default DMA backend.

备注: On chip with CPDMA support, CPDMA is the default choice. On chip with AHB-GDMA support, AHB-GDMA is the default choice.

参数

- **config** -- **[in]** Configuration of async memcpy
- **mcp** -- **[out]** Returned driver handle

返回

- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy_uninstall` (`async_memcpy_handle_t` mcp)

Uninstall async memcpy driver.

参数 **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`

返回

- ESP_OK: Uninstall async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Uninstall async memcpy driver failed because of invalid argument
- ESP_FAIL: Uninstall async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy` (`async_memcpy_handle_t` mcp, void *dst, void *src, size_t n, `async_memcpy_isr_cb_t` cb_isr, void *cb_args)

Send an asynchronous memory copy request.

备注: The callback function is invoked in interrupt context, never do blocking jobs in the callback.

参数

- **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`
- **dst** -- **[in]** Destination address (copy to)
- **src** -- **[in]** Source address (copy from)
- **n** -- **[in]** Number of bytes to copy
- **cb_isr** -- **[in]** Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- **cb_args** -- **[in]** User defined argument to be passed to the callback function

返回

- **ESP_OK**: Send memory copy request successfully
- **ESP_ERR_INVALID_ARG**: Send memory copy request failed because of invalid argument
- **ESP_FAIL**: Send memory copy request failed because of other error

Structures

struct **async_memcpy_event_t**
Async memory copy event data.

Public Members

void ***data**
Event data

struct **async_memcpy_config_t**
Type of async memcpy configuration.

Public Members

uint32_t **backlog**
Maximum number of transactions that can be prepared in the background

size_t **sram_trans_align**
DMA transfer alignment (both in size and address) for SRAM memory

size_t **psram_trans_align**
DMA transfer alignment (both in size and address) for PSRAM memory

size_t **dma_burst_size**
DMA transfer burst size, in bytes

uint32_t **flags**
Extra flags to control async memcpy feature

Macros**ASYNC_MEMCPY_DEFAULT_CONFIG()**

Default configuration for async memcpy.

Type Definitions

```
typedef struct async_memcpy_context_t *async_memcpy_handle_t
```

Async memory copy driver handle.

```
typedef bool (*async_memcpy_isr_cb_t)(async_memcpy_handle_t mcp_hdl, async_memcpy_event_t *event, void *cb_args)
```

Type of async memcpy interrupt callback function.

备注: User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

Param mcp_hdl Handle of async memcpy

Param event Event object, which contains related data, reserved for future

Param cb_args User defined arguments, passed from esp_async_memcpy function

Return Whether a high priority task is woken up by the callback function

2.9.32 ULP 协处理器编程

ULP (Ultra Low Power, 超低功耗) 协处理器是一种简单的有限状态机 (FSM), 可以在主处理器处于深度睡眠模式时, 使用 ADC、温度传感器和外部 I2C 传感器执行测量操作。ULP 协处理器可以访问 RTC_SLOW_MEM 内存区域及 RTC_CNTL、RTC_IO、SARADC 外设中的寄存器。ULP 协处理器使用 32 位固定宽度的指令, 32 位内存寻址, 配备 4 个 16 位通用寄存器。在 ESP-IDF 项目中, 此协处理器被称作 ULP FSM。

ESP32-S2 基于 RISC-V 指令集架构提供另一种 ULP 协处理器。关于 ULP RISC-V 的详细信息, 请参考 [ULP-RISC-V Coprocessor](#)。

安装工具链

ULP FSM 协处理器代码由汇编语言编写, 使用 [binutils-esp32ulp 工具链](#) 进行编译。

如果按照 [快速入门指南](#) 中的介绍安装好了 ESP-IDF 及其 CMake 构建系统, 那么 ULP 工具链已经默认安装到了你的开发环境中。

编写 ULP FSM

使用受支持的指令集即可编写 ULP FSM 协处理器, 此外也可使用主处理器上的 C 语言宏进行编程。以下小节分别介绍了这两种方法:

ESP32-S2 ULP 协处理器指令

本文档详细介绍了 ESP32-S2 ULP FSM 协处理器汇编程序使用的指令。

ULP FSM 协处理器有 4 个 16 位通用寄存器, 分别标记为 R0、R1、R2、R3, 还有一个 8 位计数器寄存器 (stage_cnt) 用来实现循环。可以用特殊指令来访问阶段计数寄存器。

ULP 协处理器可以访问 8 K 字节大小的 RTC_SLOW_MEM 内存区域。内存以 32 位字单位寻址。它还可以访问 RTC_CNTL、RTC_IO 和 SENS 外设中的外设寄存器。

所有指令都是 32 位。跳转指令、ALU 指令、外设寄存器和内存访问指令在 1 个周期内执行。与外设 (TSENS、ADC 和 I2C) 相关的指令所需的周期不同，具体取决于外设操作。

指令语法不区分大小写。无论是寄存器名称还是指令名称，都可以任意混合使用大小写字母。

寻址注意事项 对于 ESP32-S2 ULP FSM 协处理器的 JUMP、ST、LD 系列指令，地址参数应以如下方式表示（具体取决于使用的地址参数类型）：

- 当地址参数作为标签时，指令中的地址应为 32 位字。
对于示例程序：

```
entry:
    NOP
    NOP
    NOP
    NOP
loop:
    MOVE R1, loop
    JUMP R1
```

当此程序被汇编和链接时，标签 loop 的地址将为 16 字节。然而 JUMP 指令期望寄存器 R1 中存储的地址以 32 位字表示。由于这种情况较为常见，汇编程序会在生成 MOVE 指令时将标签 loop 的地址从字节转换为字。因此，生成的代码相当于：

```
0000    NOP
0004    NOP
0008    NOP
000c    NOP
0010    MOVE R1, 4
0014    JUMP R1
```

- 另一种情况是，MOVE 指令的参数不是标签，而是常量。此时汇编程序将 **直接使用该常量**，不进行任何转换：

```
.set      val, 0x10
MOVE     R1, val
```

在这种情况下，加载到 R1 的值为 0x10。

但是，当使用立即数作为 LD 和 ST 指令的偏移量时，汇编程序会认为地址参数是字节，并在执行指令前将其转换为 32 位字：

```
ST R1, R2, 4      // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
```

在这种情况下，R1 中的值存储在 [R2 + offset / 4] 指向的内存位置。

请看以下代码：

```
.global array
array: .long 0
       .long 0
       .long 0
       .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0      // 将 R2 的值写入第一个数组元素，
                  // 即 array[0]

ST R2, R1, 4      // 将 R2 的值写入第二个数组元素，
                  // (4 字节偏移量)，即 array[1]

ADD R1, R1, 2     // 将地址递增 2 个字 (8 个字节)
ST R2, R1, 0      // 将 R2 的值写入第三个数组元素，
                  // 即 array[2]
```

指令执行时间注意事项 ULP 协处理器的时钟 RTC_FAST_CLK 通常来自内部的 8 MHz 振荡器。如果应用程序需要获知精确 ULP 时钟频率，可以根据主 XTAL 时钟进行校准：

```
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_
    ↪8md256_period;
```

ULP 协处理器在获取每个指令时需要一定的时钟周期，执行时同样需要一定的时钟周期，此周期数取决于具体的指令。下文详细列出了每个指令所需的执行时间信息。

指令获取时间：

- 2 个时钟周期 - ALU 和分支类的指令
- 4 个时钟周期 - 其他指令

注意，访问 RTC 存储器和 RTC 寄存器时，ULP 协处理器的优先级低于主 CPU。这意味着当主 CPU 与 ULP 访问同一块内存区域时，ULP 协处理器需要等待，主 CPU 会优先访问。

以下是所有指令的详细描述：

ESP32 ULP 和 ESP32-S2 ULP 指令集的区别 与 ESP32 ULP FSM 协处理器相比，ESP32-S2 ULP FSM 协处理器具有扩展的指令集。ESP32-S2 ULP FSM 与 ESP32 ULP FSM 二进制不兼容，但在重新构建后，ESP32 ULP FSM 的汇编程序应能在 ESP32-S2 ULP FSM 上运行。

添加到 ESP32-S2 ULP FSM 的新指令包括：LDL、LDH、STL、STH、ST32、STO、STI、STI32。

NOP - 无操作 语法

NOP

操作数

无

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

不执行任何操作，只增加 PC

示例:

```
1:    NOP
```

ADD - 做加法运算 语法

ADD Rdst, Rsrc1, Rsrc2

ADD Rdst, Rsrc1, imm

操作数

- **Rdst** - 寄存器 R[0..3]
- **Rsrc1** - 寄存器 R[0..3]
- **Rsrc2** - 寄存器 R[0..3]
- **Imm** - 16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令将源寄存器与另一个源寄存器中的值相加或与一个 16 位有符号值相加，并将结果存储在目标寄存器中。

示例:

```

1:   ADD R1, R2, R3           // R1 = R2 + R3
2:   Add R1, R2, 0x1234      // R1 = R2 + 0x1234
3:   .set value1, 0x03        // constant value1=0x03
     Add R1, R2, value1      // R1 = R2 + value1
4:   .global label           // declaration of variable label
     add R1, R2, label       // R1 = R2 + label
     ...
     label: nop              // definition of variable label

```

SUB - 做减法运算 语法

SUB Rdst, Rsrc1, Rsrc2

SUB Rdst, Rsrc1, imm

操作数

- **Rdst** - 寄存器 R[0..3]
- **Rsrc1** - 寄存器 R[0..3]
- **Rsrc2** - 寄存器 R[0..3]
- **Imm** - 16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令将两个源寄存器中的值相减，或从一个源寄存器中减去一个 16 位有符号值，并将结果存储到目标寄存器中。

示例:

```

1:   SUB R1, R2, R3           // R1 = R2 - R3
2:   sub R1, R2, 0x1234      // R1 = R2 - 0x1234
3:   .set value1, 0x03        // constant value1=0x03
     SUB R1, R2, value1       // R1 = R2 - value1
4:   .global label           // declaration of variable label
     SUB R1, R2, label       // R1 = R2 - label
     ...
     label: nop              // definition of variable label

```

AND - 两个操作数的按位与 语法

AND Rdst, Rsrc1, Rsrc2

AND Rdst, Rsrc1, imm

操作数

- **Rdst** - 寄存器 R[0..3]
- **Rsrc1** - 寄存器 R[0..3]
- **Rsrc2** - 寄存器 R[0..3]

- **Imm** - 16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令对源寄存器的值和另一个源寄存器的值或一个 16 位有符号值进行按位与操作，并将结果存储到目标寄存器中。

示例:

```

1:      AND R1, R2, R3           // R1 = R2 & R3
2:      AND R1, R2, 0x1234      // R1 = R2 & 0x1234
3:      .set value1, 0x03       // constant value1=0x03
      AND R1, R2, value1       // R1 = R2 & value1
4:      .global label          // declaration of variable label
      AND R1, R2, label        // R1 = R2 & label
      ...
label:  nop                    // definition of variable label

```

OR - 两个操作数的按位或 语法

OR Rdst, Rsrc1, Rsrc2

OR Rdst, Rsrc1, imm

操作数

- **Rdst** - 寄存器 R[0..3]
- **Rsrc1** - 寄存器 R[0..3]
- **Rsrc2** - 寄存器 R[0..3]
- **Imm** - 16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令对源寄存器的值和另一个源寄存器的值或一个 16 位有符号值进行按位或操作，并将结果存储到目标寄存器中。

示例:

```

1:      OR R1, R2, R3           // R1 = R2 || R3
2:      OR R1, R2, 0x1234      // R1 = R2 || 0x1234
3:      .set value1, 0x03       // constant value1=0x03
      OR R1, R2, value1        // R1 = R2 || value1
4:      .global label          // declaration of variable label
      OR R1, R2, label        // R1 = R2 || label
      ...
label:  nop                    // definition of variable label

```

LSH - 逻辑左移 语法

LSH Rdst, Rsrc1, Rsrc2

LSH Rdst, Rsrc1, imm

操作数

- **Rdst** - 寄存器 R[0..3]
- **Rsrc1** - 寄存器 R[0..3]
- **Rsrc2** - 寄存器 R[0..3]
- **Imm** - 16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令对源寄存器进行逻辑左移，移动的位数由另一个源寄存器或一个 16 位有符号值确定，并将结果存储到目标寄存器中。

备注: 大于 15 位的移位操作结果不确定。

示例:

```

1:      LSH R1, R2, R3           // R1 = R2 << R3
2:      LSH R1, R2, 0x03        // R1 = R2 << 0x03
3:      .set value1, 0x03       // constant value1=0x03
      LSH R1, R2, value1        // R1 = R2 << value1
4:      .global label           // declaration of variable label
      LSH R1, R2, label         // R1 = R2 << label
      ...
label:  nop                     // definition of variable label

```

RSH - 逻辑右移 语法

RSH Rdst, Rsrc1, Rsrc2

RSH Rdst, Rsrc1, imm

操作数

- **Rdst** - 寄存器 R[0..3]
- **Rsrc1** - 寄存器 R[0..3]
- **Rsrc2** - 寄存器 R[0..3]
- **Imm** - 16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令对源寄存器进行逻辑右移，移动的位数由另一个源寄存器或一个 16 位有符号值确定，并将结果存储到目标寄存器中。

备注: 大于 15 位的移位操作结果未定义。

示例:

```

1:      RSH R1, R2, R3           // R1 = R2 >> R3
2:      RSH R1, R2, 0x03        // R1 = R2 >> 0x03

```

(下页继续)

```

3:      .set value1, 0x03          // constant value1=0x03
      RSH R1, R2, value1         // R1 = R2 >> value1

4:      .global label            // declaration of variable label
      RSH R1, R2, label         // R1 = R2 >> label
label:  nop                     // definition of variable label

```

MOVE –移动到寄存器 语法**MOVE Rdst, Rsrc****MOVE Rdst, imm****操作数**

- **Rdst** –寄存器 R[0..3]
- **Rsrc** –寄存器 R[0..3]
- **Imm** –16 位有符号值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令将源寄存器的值或一个 16 位有符号值移动到目标寄存器。

备注：注意，当标签用作立即数时，标签的地址会从字节转换为字。这是因为对于 LD、ST 和 JUMP 指令，地址寄存器的值应以字表示，而不以字节表示。更多详细信息请参阅[寻址注意事项](#)。

示例：

```

1:      MOVE      R1, R2          // R1 = R2

2:      MOVE      R1, 0x03       // R1 = 0x03

3:      .set      value1, 0x03   // constant value1=0x03
      MOVE      R1, value1      // R1 = value1

4:      .global   label         // declaration of label
      MOVE      R1, label       // R1 = address_of(label) / 4
      ...
label:  nop                     // definition of label

```

ST –将数据存储到内存中 语法**ST Rsrc, Rdst, offset****操作数**

- **Rsrc** –寄存器 R[0..3]，保存要存储的 16 位值
- **Rdst** –寄存器 R[0..3]，目标地址，以 32 位字为单位
- **Offset** –13 位有符号值，以字节表示

周期

执行需要 4 个周期，获取下一条指令需要 4 个周期

描述

该指令将 Rsrc 的 16 位值存储到目标内存地址 [Rdst + offset] 中，存储的数据占目标内存中一个字的低半部分，而高半部分由当前程序计数器 PC 的值（以字为单位，左移 5 位）与 Rdst (0..3) 进行逻辑“或”运算：

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0], 3'b0, Rdst, Rsrc[15:0]}
```

应用程序可以使用高 16 位来确定 ULP 程序中的哪条指令将某个特定的字写入了内存。

备注：注意，以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例：

```
1:      ST   R1, R2, 0x12      // MEM[R2 + 0x12 / 4] = R1

2:      .data                    // Data section definition
Addr1:  .word    123            // Define label Addr1 16 bit
        .set     offs, 0x00     // Define constant offs
        .text                    // Text section definition
        MOVE    R1, 1          // R1 = 1
        MOVE    R2, Addr1      // R2 = Addr1
        ST      R1, R2, offs   // MEM[R2 + 0 / 4] = R1
                                     // MEM[Addr1 + 0] will be 32'h600001
```

STL – 将数据存储到 32 位内存的低 16 位 语法

STL Rsrc, Rdst, offset, Label

操作数

- **Rsrc** – 寄存器 R[0..3]，保存要存储的 16 位值
- **Rdst** – 寄存器 R[0..3]，目标地址，以 32 位字为单位
- **Offset** – 11 位有符号值，以字节为单位的偏移
- **Label** – 用户定义的 2 位无符号值

周期

执行需要 4 个周期，获取下一条指令需要 4 个周期

描述

该指令将 Rsrc 的 16 位值存储到地址为 [Rdst + offset / 4] 的内存的低半字中：

```
Mem[Rdst + offset / 4]{15:0} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{31:16} = {Label[1:0], Rsrc[13:0]}
```

ST 和 STL 命令可以互换使用，以保持对早期版本 ULP 核的向后兼容性。

备注：注意，以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例：

```
1:      STL  R1, R2, 0x12      // MEM[R2 + 0x12 / 4] = R1

2:      .data                    // Data section definition
Addr1:  .word    123            // Define label Addr1 16 bit
        .set     offs, 0x00     // Define constant offs
        .text                    // Text section definition
        MOVE    R1, 1          // R1 = 1
        MOVE    R2, Addr1      // R2 = Addr1
        STL     R1, R2, offs   // MEM[R2 + 0 / 4] = R1
                                     // MEM[Addr1 + 0] will be 32'hxxxx0001

3:
```

(下页继续)

```
MOVE    R1, 1           // R1 = 1
STL     R1, R2, 0x12, 1 // MEM[R2 + 0x12 / 4] = 0xxxxxx4001
```

STH –将数据存储在 32 位内存的高 16 位 语法

STH Rsrc, Rdst, offset, Label

操作数

- **Rsrc** –寄存器 R[0..3], 保存要存储的 16 位值
- **Rdst** –寄存器 R[0..3], 目标地址, 以 32 位字为单位
- **Offset** –11 位有符号值, 以字节为单位的偏移
- **Label** –用户定义的 2 位无符号值

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将 Rsrc 的 16 位值存储在地址为 [Rdst + offset / 4] 的内存的高半字中:

```
Mem[Rdst + offset / 4]{31:16} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{31:16} = {Label[1:0], Rsrc[13:0]}
```

备注: 注意, 以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例:

```
1:      STH   R1, R2, 0x12           // MEM[R2 + 0x12 / 4][31:16] = R1
2:      .data
Addr1:  .word  123                   // Data section definition
        .set   offs, 0x00           // Define label Addr1 16 bit
        .text
MOVE    R1, 1                       // Text section definition
MOVE    R2, Addr1                    // R1 = 1
STH     R1, R2, offs                 // R2 = Addr1
// MEM[R2 + 0 / 4] = R1
// MEM[Addr1 + 0] will be 32'h0001xxxx
3:      MOVE  R1, 1                   // R1 = 1
STH     R1, R2, 0x12, 1             // MEM[R2 + 0x12 / 4] 0x4001xxxx
```

ST32 –将 32 位数据存储在 32 位内存 语法

ST32 Rsrc, Rdst, offset, Label

操作数

- **Rsrc** –寄存器 R[0..3], 保存要存储的 16 位值
- **Rdst** –寄存器 R[0..3], 目标地址, 以 32 位字为单位
- **Offset** –11 位有符号值, 以字节为单位的偏移
- **Label** –用户定义的 2 位无符号值

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将 PC 的 11 位值，标签值和 Rsrc 的 16 位值存储到地址为 $[Rdst + offset / 4]$ 的 32 位内存中：

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0],0[2:0],Label[1:0],Rsrc[15:0]}
```

备注：注意，以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例：

```
1:      ST32  R1, R2, 0x12, 0      // MEM[R2 + 0x12 / 4][31:0] = {PC[10:0],
  ↪0[2:0],Label[1:0],Rsrc[15:0]}

2:      .data                      // Data section definition
  Addr1: .word    123                // Define label Addr1 16 bit
        .set     offs, 0x00        // Define constant offs
        .text                    // Text section definition
        MOVE    R1, 1              // R1 = 1
        MOVE    R2, Addr1          // R2 = Addr1
        ST32    R1, R2, offs, 1    // MEM[R2 + 0] = {PC[10:0],0[2:0],
  ↪Label[1:0],Rsrc[15:0]}
                                           // MEM[Addr1 + 0] will be 32'h00010001
```

STO—设置自动递增操作的偏移值 语法

STO offset

操作数

- **Offset**—11 位有符号值，以字节为单位的偏移

周期

执行需要 4 个周期，获取下一条指令需要 4 个周期

描述

该指令将 16 位值设置到偏移寄存器：

```
offset = value / 4
```

备注：注意，以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例：

```
1:      STO  0x12                    // Offset = 0x12 / 4

2:      .data                      // Data section definition
  Addr1: .word    123                // Define label Addr1 16 bit
        .set     offs, 0x00        // Define constant offs
        .text                    // Text section definition
        STO     offs              // Offset = 0x00
```

STI—将数据存储到 32 位内存中，并自动递增预定义地址偏移 语法

STI Rsrc, Rdst, Label

操作数

- **Rsrc** –寄存器 R[0..3], 保存要存储的 16 位值
- **Rdst** –寄存器 R[0..3], 目标地址, 以 32 位字为单位
- **Label** –用户定义的 2 位无符号值

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将 Rsrc 的 16 位值存储到地址为 $[Rdst + offset / 4]$ 的内存的低半字和高半字中。

当 STI 指令被调用两次时, 会自增偏移量。请确保在执行 STI 指令之前, 执行 STO 指令来设置该偏移值:

```
Mem[Rdst + offset / 4]{15:0/31:16} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{15:0/31:16} = {Label[1:0],Rsrc[13:0]}
```

示例:

```
1:      STO    4                // Set offset to 4
        STI   R1, R2           // MEM[R2 + 4 / 4][15:0] = R1
        STI   R1, R2           // MEM[R2 + 4 / 4][31:16] = R1
        // offset += (1 * 4) //offset is incremented by 1
↪1 word
        STI   R1, R2           // MEM[R2 + 8 / 4][15:0] = R1
        STI   R1, R2           // MEM[R2 + 8 / 4][31:16] = R1
```

STI32 –将 32 位数据存储在 32 位内存中, 并自动递增地址偏移 语法**STI32 Rsrc, Rdst, Label****操作数**

- **Rsrc** –寄存器 R[0..3], 保存要存储的 16 位值
- **Rdst** –寄存器 R[0..3], 目标地址, 以 32 位字为单位
- **Label** –用户定义的 2 位无符号值

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将 PC 的 11 位值, 标签值和 Rsrc 的 16 位值存储到地址为 $[Rdst + offset / 4]$ 的 32 位内存中。

每次调用 STI32 指令时, 偏移值都会自动增加。确保在执行 STI32 指令之前, 执行 STO 指令来设置偏移值:

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0],0[2:0],Label[1:0],Rsrc[15:0]}
```

示例:

```
1:      STO    0x12
        STI32 R1, R2, 0        // MEM[R2 + 0x12 / 4][31:0] = {PC[10:0],0[2:0],
↪Label[1:0],Rsrc[15:0]}
        // offset += (1 * 4) //offset is incremented by 1
↪word
        STI32 R1, R2, 0        // MEM[R2 + 0x16 / 4][31:0] = {PC[10:0],0[2:0],
↪Label[1:0],Rsrc[15:0]}
```

LD –从内存中加载数据 语法**LD Rdst, Rsrc, offset****操作数**

- **Rdst** –寄存器 R[0..3], 目标寄存器
- **Rsrc** –寄存器 R[0..3], 保存目标地址, 以 32 位字为单位
- **Offset** –13 位有符号值, 以字节为单位的偏移量

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将地址为 $[Rsrc + offset / 4]$ 的内存中的 16 位低半字加载到目标寄存器 Rdst 中:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

备注: 注意, 以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。详情请参阅[寻址注意事项](#)。

示例:

```
1:      LD   R1, R2, 0x12           // R1 = MEM[R2 + 0x12 / 4]
2:      .data                               // Data section definition
Addr1: .word   123                     // Define label Addr1 16 bit
      .set    offs, 0x00              // Define constant offs
      .text                               // Text section definition
      MOVE   R1, 1                     // R1 = 1
      MOVE   R2, Addr1                 // R2 = Addr1 / 4 (address of label is
↳converted into words)
      LD     R1, R2, offs              // R1 = MEM[R2 + 0]
                                           // R1 will be 123
```

LDL –从 32 位内存的低半字中加载数据 语法**LDL Rdst, Rsrc, offset****操作数**

- **Rdst** –寄存器 R[0..3], 目标寄存器
- **Rsrc** –寄存器 R[0..3], 保存目标地址, 以 32 位字为单位
- **Offset** –13 位有符号值, 以字节为单位的偏移量

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将地址为 $[Rsrc + offset / 4]$ 的内存中的 16 位低半字加载到目标寄存器 Rdst 中:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

LD 和 LDL 命令可以互换使用, 以保持对早期版本 ULP 核的向后兼容性。

备注: 注意, 以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例:

```

1:      LDL  R1, R2, 0x12           // R1 = MEM[R2 + 0x12 / 4]

2:      .data                      // Data section definition
Addr1:  .word    123                // Define label Addr1 16 bit
        .set     offs, 0x00        // Define constant offs
        .text                      // Text section definition
        MOVE    R1, 1              // R1 = 1
        MOVE    R2, Addr1          // R2 = Addr1 / 4 (address of label is_
↳converted into words)
        LDL     R1, R2, offs       // R1 = MEM[R2 + 0]
                                       // R1 will be 123

```

LDH –从 32 位内存的高半字加载数据 语法

LDH Rdst, Rsrc, offset

操作数

- **Rdst** –寄存器 R[0..3], 目标寄存器
- **Rsrc** –寄存器 R[0..3], 保存目标地址, 以 32 位字为单位
- **Offset** –13 位有符号值, 以字节为单位的偏移

周期

执行需要 4 个周期, 获取下一条指令需要 4 个周期

描述

该指令将地址为 $[Rsrc + offset / 4]$ 的内存中的 16 位高半字加载到目标寄存器 Rdst 中:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

备注: 注意, 以字节为单位指定的偏移量会在执行前被转换为 32 位字偏移量。更多信息请参阅[寻址注意事项](#)。

示例:

```

1:      LDH  R1, R2, 0x12           // R1 = MEM[R2 + 0x12 / 4]

2:      .data                      // Data section definition
Addr1:  .word    0x12345678        // Define label Addr1 16 bit
        .set     offs, 0x00        // Define constant offs
        .text                      // Text section definition
        MOVE    R1, 1              // R1 = 1
        MOVE    R2, Addr1          // R2 = Addr1 / 4 (address of label is_
↳converted into words)
        LDH     R1, R2, offs       // R1 = MEM[R2 + 0]
                                       // R1 will be 0x1234

```

JUMP –跳转到绝对地址 语法

JUMP Rdst

JUMP ImmAddr

JUMP Rdst, Condition

JUMP ImmAddr, Condition

操作数

- **Rdst** –寄存器 R[0..3] 包含要跳转到的地址 (以 32 位字表示)

- **ImmAddr** –13 位地址（以字节表示），对齐为 4 字节
- **Condition**: -EQ –如果最后的 ALU 操作结果为零，则跳转 -OV –如果最后的 ALU 设置了溢出 flag，则跳转

周期

执行需要 2 个周期，获取下一条指令需要 2 个周期。

描述

该指令跳转到指定的地址。既可以无条件跳转，也可以基于 ALU flag 跳转。

示例:

```

1:      JUMP      R1          // Jump to address in R1 (address in R1 is in
↳32-bit words)

2:      JUMP      0x120, EQ   // Jump to address 0x120 (in bytes) if ALU
↳result is zero

3:      JUMP      label      // Jump to label
      ...
label:  nop                // Definition of label

4:      .global   label      // Declaration of global label

      MOVE      R1, label    // R1 = label (value loaded into R1 is in words)
      JUMP      R1          // Jump to label
      ...
label:  nop                // Definition of label

```

JUMPR –跳转到相对偏移（条件基于 R0） 语法

JUMPR Step, Threshold, Condition

操作数

- **Step** –相对于当前位置的偏移量，以字节为单位
- **Threshold** –分支条件的阈值
- **Condition**:
 - EQ (等于) –如果 R0 中的值 == 阈值，则跳转
 - LT (小于) –如果 R0 中的值 < 阈值，则跳转
 - LE (小于或等于) –如果 R0 中的值 <= 阈值，则跳转
 - GT (大于) –如果 R0 中的值 > 阈值，则跳转
 - GE (大于或等于) –如果 R0 中的值 >= 阈值，则跳转

周期

条件 EQ, GT 和 LT: 执行需要 2 个周期，获取下一条指令需要 2 个周期。

条件 LE 和 GE 在汇编程序中使用两个 JUMPR 指令实现:

```

// JUMPR target, threshold, LE is implemented as:

      JUMPR target, threshold, EQ
      JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:

      JUMPR target, threshold, EQ
      JUMPR target, threshold, GT

```

因此，执行时间取决于所用分支：要么执行 2 个周期 + 获取 2 个周期，要么执行 4 个周期 + 获取 4 个周期。

描述

如果条件为真，该指令会跳转到相对地址。条件是指 R0 寄存器的值和阈值的比较结果。

示例:

```
1:pos:    JUMPR    16, 20, GE    // Jump to address (position + 16 bytes) if
↳value in R0 >= 20

2:        // Down counting loop using R0 register
          MOVE    R0, 16        // load 16 into R0
label:    SUB     R0, R0, 1      // R0--
          NOP     // do something
          JUMPR   label, 1, GE  // jump to label if R0 >= 1
```

JUMPS-跳转到相对地址（条件基于阶段数） 语法

JUMPS 步骤, 阈值, 条件

操作数

- **步骤**-相对于当前位置的偏移，以字节为单位
- **阈值**-分支条件的阈值
- **条件:**
 - **EQ** (等于)-如果 stage_cnt == 阈值，则跳转
 - **LT** (小于)-如果 stage_cnt < 阈值，则跳转
 - **LE** (小于或等于)-如果 stage_cnt <= 阈值，则跳转
 - **GT** (大于)-如果 stage_cnt > 阈值，则跳转
 - **GE** (大于或等于)-如果 stage_cnt >= 阈值，则跳转

周期

执行需要 2 个周期，获取下一条指令需要 2 个周期。

描述

如果条件为真，指令将跳转到相对地址。条件是计数寄存器的值和阈值的比较结果。

示例:

```
1:pos:    JUMPS    16, 20, EQ    // Jump to (position + 16 bytes) if stage_cnt_
↳== 20

2:        // Up counting loop using stage count register
          STAGE_RST          // set stage_cnt to 0
label:    STAGE_INC 1        // stage_cnt++
          NOP     // do something
          JUMPS   label, 16, LT // jump to label if stage_cnt < 16
```

STAGE_RST-重置阶段计数寄存器 语法

STAGE_RST

操作数

无操作数

描述

该指令将阶段计数寄存器设置为 0

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

示例:

```
1:      STAGE_RST      // 重置阶段计数寄存器
```

STAGE_INC –增加阶段计数寄存器 语法

STAGE_INC 值

操作数

- 值-8 位值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期。

描述

该指令将给定值增加到阶段计数寄存

示例:

```
1:      STAGE_INC      10      // stage_cnt += 10
2:      // Up counting loop example:
      STAGE_RST      // set stage_cnt to 0
label: STAGE_INC  1      // stage_cnt++
      NOP          // do something
      JUMPS      label, 16, LT // jump to label if stage_cnt < 16
```

STAGE_DEC –减少阶段计数寄存器 语法

STAGE_DEC 值

操作数

- 值-8 位值

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令从阶段计数寄存器中减去给定值

示例:

```
1:      STAGE_DEC      10      // stage_cnt -= 10;
2:      // Down counting loop example
      STAGE_RST      // set stage_cnt to 0
      STAGE_INC  16      // increment stage_cnt to 16
label: STAGE_DEC  1      // stage_cnt--;
      NOP          // do something
      JUMPS      label, 0, GT // jump to label if stage_cnt > 0
```

HALT –结束程序 语法

HALT

操作数

无操作数

周期

执行需要 2 个周期

描述

该指令会停止 ULP 协处理器并重新启动 ULP 唤醒定时器（如果定时器已启用）

示例:

```
1:      HALT      // Halt the coprocessor
```

WAKE - 唤醒芯片 语法**WAKE****操作数**

无操作数

周期

执行需要 2 个周期，获取下一条指令需要 4 个周期

描述

该指令从 ULP 协处理器向 RTC 控制器发送一个中断。

- 如果 SoC 处于深度睡眠模式并启用了 ULP 唤醒，会唤醒 SoC。
- 如果 SoC 不处在深度睡眠模式，并且在 RTC_CNTL_INT_ENA_REG 寄存器中设置了 ULP 中断位 (RTC_CNTL_ULP_CP_INT_ENA)，则会触发 RTC 中断。

备注: 注意，在使用 WAKE 指令前，ULP 程序可能需要等待 RTC 控制器就绪，才能唤醒主 CPU。此信息通过 RTC_CNTL_LOW_POWER_ST_REG 寄存器的 RTC_CNTL_RDY_FOR_WAKEUP 位来指示。当 RTC_CNTL_RDY_FOR_WAKEUP 为零时，执行 WAKE 指令唤醒无效。如果希望在主 CPU 不处于睡眠模式时使用 WAKE 指令，可以用 RTC_CNTL_LOW_POWER_ST_REG 的 RTC_CNTL_MAIN_STATE_IN_IDLE 位（位 27）来检查主 CPU 状态，确定其处于正常模式还是睡眠模式。

示例:

```
1: is_rdy_for_wakeup:                // Read RTC_CNTL_RDY_FOR_WAKEUP bit
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    AND r0, r0, 1
    JUMP is_rdy_for_wakeup, eq      // Retry until the bit is set
    WAKE                            // Trigger wake up
    REG_WR 0x006, 24, 24, 0        // Stop ULP timer (clear RTC_CNTL_ULP_CP_
↳SLP_TIMER_EN)
    HALT                            // Stop the ULP program
    // After these instructions, SoC will wake up,
    // and ULP will not run again until started by the main program.

1: check_wakeup:                    // Read RTC_CNTL_RDY_FOR_WAKEUP and RTC_
↳CNTL_MAIN_STATE_IN_IDLE bit
    READ_RTC_REG(RTC_CNTL_LOW_POWER_ST_REG, 27, 1)
    MOVE r1, r0                    // Copy result in to r1
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    OR r0, r0, r1
    JUMP check_wakeup, eq          // Retry until either of the bit are set
    WAKE                            // Trigger wake up
    HALT                            // Stop the ULP program
```

WAIT - 等待一定的周期数 语法**WAIT Cycles****操作数**

- **Cycles** –等待的周期数

周期

执行需要 (2 + **Cycles**) 个周期，获取下一条指令需要 4 个周期

描述

该指令指示延迟一定的周期数。

示例:

```
1:      WAIT      10          // Do nothing for 10 cycles
2:      .set   wait_cnt, 10    // Set a constant
        WAIT   wait_cnt      // wait for 10 cycles
```

TSENS –使用温度传感器进行测量 语法

- **TSENS Rdst, Wait_Delay**

操作数

- **Rdst** –目标寄存器 R[0..3]，结果将存储到此寄存器
- **Wait_Delay** –执行测量所需的周期数

周期

执行需要 (2 + **Wait_Delay** + 3 * TSENS_CLK) 个周期，获取下一条指令需要 4 个周期

描述

该指令使用 TSENS 进行测量，并将结果存储到通用寄存器

示例:

```
1:      TSENS    R1, 1000     // Measure temperature sensor for 1000 cycles,
                             // and store result to R1
```

ADC –使用 ADC 进行测量 语法

- **ADC Rdst, Sar_sel, Mux**
- **ADC Rdst, Sar_sel, Mux, 0** –形式已弃用

操作数

- **Rdst** –目标寄存器 R[0..3]，结果将存储到此寄存器
- **Sar_sel** –选择 ADC: 0 = SARADC1, 1 = SARADC2
- **Mux** - 选择的 PAD, SARADC Pad[Mux-1] 被启用。如果传递了 Mux 值 1，会使用 ADC pad 0。

周期

执行需要 $23 + \max(1, \text{SAR_AMP_WAIT1}) + \max(1, \text{SAR_AMP_WAIT2}) + \max(1, \text{SAR_AMP_WAIT3}) + \text{SARx_SAMPLE_CYCLE} + \text{SARx_SAMPLE_BIT}$ 个周期，获取下一条指令需要 4 个周期

描述

该指令通过 ADC 进行测量

示例

```
1:      ADC      R1, 0, 1     // Measure value using ADC1 pad 2 and store
↪result into R1
```

REG_RD - 从外设寄存器读取 语法**REG_RD Addr, High, Low****操作数**

- **Addr** - 寄存器地址，以 32 位字为单位
- **High** - 寄存器结束位号
- **Low** - 寄存器起始位号

周期

执行需要 4 个周期，获取下一条指令需要 4 个周期

描述

该指令从外设寄存器读取最多 16 位到一个通用寄存器： $R0 = \text{REG}[\text{Addr}][\text{High}:\text{Low}]$ 。

该指令可以访问 RTC_CNTL、RTC_IO、SENS 和 RTC_I2C 外设中的寄存器。从 ULP 看到的寄存器地址可以根据 PeriBUS1 总线上相同寄存器的地址计算得出，如下所示：

```
addr_ulp = (addr_peribus1 - DR_REG_RTC_CNTL_BASE) / 4
```

示例:

```
1:          REG_RD          0x120, 7, 4          // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}
```

REG_WR - 写入外设寄存器 语法**REG_WR Addr, High, Low, Data****操作数**

- **Addr** - 寄存器地址，以 32 位字为单位
- **High** - 寄存器结束位号
- **Low** - 寄存器起始位号
- **Data** - 要写入的值，8 位

周期

执行需要 8 个周期，获取下一条指令需要 4 个周期

描述

该指令将一个立即数的最多 8 位写入到外设寄存器中： $\text{REG}[\text{Addr}][\text{High}:\text{Low}] = \text{data}$ 。

此指令可以访问 RTC_CNTL、RTC_IO、SENS 和 RTC_I2C 外设中的寄存器。从 ULP 看到的寄存器地址可以根据 PeriBUS1 上同一寄存器的地址按如下方式计算：

```
addr_ulp = (addr_peribus1 - DR_REG_RTC_CNTL_BASE) / 4
```

示例:

```
1:          REG_WR          0x120, 7, 0, 0x10    // set 8 bits: REG[0x120][7:0] = 0x10
```

方便的外设寄存器访问宏 ULP 源文件在进入汇编程序之前先通过 C 预处理器，因此可以使用某些宏来方便地访问外设寄存器。

一些现有的宏定义在 soc/soc_ulp.h 头文件中，这些宏允许通过的名称访问外设寄存器的字段。可以通过这些宏使用的外设寄存器名称定义在 soc/rtc_cntl_reg.h、soc/rtc_io_reg.h、soc/sens_reg.h 和 soc/rtc_i2c_reg.h 中。

READ_RTC_REG(rtc_reg, low_bit, bit_width) 将 $\text{rtc_reg}[\text{low_bit} + \text{bit_width} - 1 : \text{low_bit}]$ 中的数读到 R0，最多 16 位。如：

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* 将 RTC_CNTL_TIME0_REG 的低 16 位读入 R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

READ_RTC_FIELD(*rtc_reg*, *field*) 将 *rtc_reg* 的一个字段读取到 R0，最多 16 位。如：

```
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* 将 SENS_SAR_SLAVE_ADDR3_REG 的 8 位 SENS_TSENS_OUT 字段读入 R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

WRITE_RTC_REG(*rtc_reg*, *low_bit*, *bit_width*, *value*) 将立即数写入 *rtc_reg*[*low_bit* + *bit_width* - 1 : *low_bit*]，最多 8 位。如：

```
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* 设置 RTC_GPIO_OUT_W1TS_REG 中 RTC_GPIO_OUT_DATA_W1TS 字段的 BIT(2) */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

WRITE_RTC_FIELD(*rtc_reg*, *field*, *value*) 将立即数写入 *rtc_reg* 的一个字段，最多 8 位。如：

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* 将 RTC_CNTL_STATE0_REG 的 RTC_CNTL_ULP_CP_SLP_TIMER_EN 字段设置为 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

Programming ULP FSM Coprocessor Using C Macros (Legacy) In addition to the existing binutils port for the ESP32-S2 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32-S2 application. Here is an example how this can be done:

```
const ulp_insn_t program[] = {
    I_MOVI(R3, 16),          // R3 <- 16
    I_LD(R0, R3, 0),        // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1),        // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1),     // R2 <- R0 + R1
    I_ST(R2, R3, 2),        // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

The program array is an array of `ulp_insn_t`, i.e., ULP coprocessor instructions. Each `I_XXX` preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0—R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

备注： Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an "initializer element is not constant" error. To fix this error, move the definition of instructions array into local scope.

备注： Load, store and move instructions use **addresses expressed in 32-bit words**. Address 0 corresponds to the first word of `RTC_SLOW_MEM`. This is different to how address arguments are handled in assembly code of the same

instructions. See the section [寻址注意事项](#) for more details for reference.

To generate branch instructions, special `M_` preprocessor defines are used. `M_LABEL` define can be used to define a branch target. Label identifier is a 16-bit integer. `M_Bxxx` defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these `M_` preprocessor defines will be translated into two `ulp_insn_t` values: one is a token value which contains label number, and the other is the actual instruction. `ulp_process_macros_and_load` function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the extra `ulp_insn_t` token which contains the label number.

Here is an example of using labels and branches:

```
const ulp_insn_t program[] = {
    I_MOVI(R0, 34),          // R0 <- 34
    M_LABEL(1),             // label_1
    I_MOVI(R1, 32),          // R1 <- 32
    I_LD(R1, R1, 0),        // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33),          // R2 <- 33
    I_LD(R2, R2, 0),        // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2),     // R3 <- R1 - R2
    I_ST(R3, R0, 0),        // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1),      // R0++
    M_BL(1, 64),           // if (R0 < 64) goto label_1
    I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

API Reference

Header File

- [components/ulp/ulp_fsm/include/esp32s2/ulp.h](#)
- This header file can be included with:

```
#include "ulp.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

static inline uint32_t **SOC_REG_TO_ULP_PERIPH_SEL**(uint32_t reg)

Map SoC peripheral register to `periph_sel` field of `RD_REG` and `WR_REG` instructions.

参数 `reg` -- peripheral register in `RTC_CNTL_`, `RTC_IO_`, `SENS_`, `RTC_I2C` peripherals.

返回 `periph_sel` value for the peripheral to which this register belongs.

Unions

union **ulp_insn**

#include <ulp.h> Instruction format structure.

All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions. This union also includes a special "macro" instruction layout. This is not a real instruction which can be executed by the CPU. It acts as a token which is removed from the program by the `ulp_process_macros_and_load` function.

These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields of these structure with the right arguments.

Public Members

uint32_t **cycles**

Number of cycles to sleep

TBD, cycles used for measurement

uint32_t **unused**

Unused

uint32_t **opcode**

Opcode (OPCODE_DELAY)

Opcode (OPCODE_ST)

Opcode (OPCODE_LD)

Opcode (OPCODE_HALT)

Opcode (OPCODE_BRANCH)

Opcode (OPCODE_ALU)

Opcode (OPCODE_WR_REG)

Opcode (OPCODE_RD_REG)

Opcode (OPCODE_ADC)

Opcode (OPCODE_TSENS)

Opcode (OPCODE_I2C)

Opcode (OPCODE_END)

Opcode (OPCODE_MACRO)

struct *ulp_insn*::[anonymous] **delay**

Format of DELAY instruction

uint32_t **dreg**

Register which contains data to store

Register where the data should be loaded to

Register which contains target PC, expressed in words (used if `.reg == 1`)

Destination register

Register where to store ADC result

Register where to store temperature measurement result

uint32_t sreg

Register which contains address in RTC memory (expressed in words)

Register with operand A

uint32_t label

Data label, 2-bit user defined unsigned value

Label number

uint32_t upper

0: write the low half-word; 1: write the high half-word

uint32_t wr_way

0: write the full-word; 1: with the label; 3: without the label

uint32_t unused1

Unused

uint32_t offset

Offset to add to sreg

Absolute value of target PC offset w.r.t. current PC, expressed in words

uint32_t unused2

Unused

uint32_t sub_opcode

Sub opcode (SUB_OPCODE_ST)

Sub opcode (SUB_OPCODE_BX)

Sub opcode (SUB_OPCODE_B)

Sub opcode (SUB_OPCODE_ALU_REG)

Sub opcode (SUB_OPCODE_ALU_IMM)

Sub opcode (SUB_OPCODE_ALU_CNT)

Sub opcode (SUB_OPCODE_WAKEUP)

SUB_OPCODE_MACRO_LABEL or SUB_OPCODE_MACRO_BRANCH

struct *ulp_insn*::[anonymous] st

Format of ST instruction

uint32_t rd_upper

0: read the high half-word; 1: read the low half-word

struct *ulp_insn*::[anonymous] ld

Format of LD instruction

struct *ulp_insn*::[anonymous] halt

Format of HALT instruction

uint32_t addr

Target PC, expressed in words (used if .reg == 0)

Address within either RTC_CNTL, RTC_IO, or SARADC

uint32_t reg

Target PC in register (1) or immediate (0)

uint32_t type

Jump condition (BX_JUMP_TYPE_XXX)

struct *ulp_insn*::[anonymous] bx

Format of BRANCH instruction (absolute address)

uint32_t imm

Immediate value to compare against

Immediate value of operand B

Immediate value

uint32_t cmp

Comparison to perform: B_CMP_L or B_CMP_GE

uint32_t sign

Sign of target PC offset: 0: positive, 1: negative

struct *ulp_insn*::[anonymous] b

Format of BRANCH instruction (relative address)

uint32_t treg

Register with operand B

uint32_t sel

Operation to perform, one of ALU_SEL_XXX

struct *ulp_insn*::[anonymous] alu_reg

Format of ALU instruction (both sources are registers)

struct *ulp_insn*::[anonymous] alu_imm

Format of ALU instruction (one source is an immediate)

uint32_t unused3

Unused

struct *ulp_insn*::[anonymous] alu_cnt

Format of ALU instruction with stage count register and an immediate

uint32_t periph_sel

Select peripheral: RTC_CNTL (0), RTC_IO(1), SARADC(2)

uint32_t **data**

8 bits of data to write

Data to read or write

uint32_t **low**

Low bit

uint32_t **high**

High bit

struct *ulp_insn*::[anonymous] **wr_reg**

Format of WR_REG instruction

struct *ulp_insn*::[anonymous] **rd_reg**

Format of RD_REG instruction

uint32_t **mux**

Select SARADC pad (mux + 1)

uint32_t **sar_sel**

Select SARADC0 (0) or SARADC1 (1)

struct *ulp_insn*::[anonymous] **adc**

Format of ADC instruction

uint32_t **wait_delay**

Cycles to wait after measurement is done

uint32_t **reserved**

Reserved, set to 0

struct *ulp_insn*::[anonymous] **tsens**

Format of TSENS instruction

uint32_t **i2c_addr**

I2C slave address

uint32_t **low_bits**

TBD

uint32_t **high_bits**

TBD

uint32_t **i2c_sel**

TBD, select reg_i2c_slave_address[7:0]

uint32_t **rw**

Write (1) or read (0)

struct *ulp_insn*::[anonymous] **i2c**

Format of I2C instruction

uint32_t **wakeup**

Set to 1 to wake up chip

struct *ulp_insn*::[anonymous] **end**

Format of END instruction with wakeup

struct *ulp_insn*::[anonymous] **macro**

Format of tokens used by LABEL and BRANCH macros

Macros

R0

general purpose register 0

R1

general purpose register 1

R2

general purpose register 2

R3

general purpose register 3

OPCODE_WR_REG

Instruction: write peripheral register (RTC_CNTL/RTC_IO/SARADC) (not implemented yet)

OPCODE_RD_REG

Instruction: read peripheral register (RTC_CNTL/RTC_IO/SARADC) (not implemented yet)

RD_REG_PERIPH_RTC_CNTL

Identifier of RTC_CNTL peripheral for RD_REG and WR_REG instructions

RD_REG_PERIPH_RTC_IO

Identifier of RTC_IO peripheral for RD_REG and WR_REG instructions

RD_REG_PERIPH_SENS

Identifier of SARADC peripheral for RD_REG and WR_REG instructions

RD_REG_PERIPH_RTC_I2C

Identifier of RTC_I2C peripheral for RD_REG and WR_REG instructions

OPCODE_I2C

Instruction: read/write I2C (not implemented yet)

OPCODE_DELAY

Instruction: delay (nop) for a given number of cycles

OPCODE_ADC

Instruction: SAR ADC measurement (not implemented yet)

OPCODE_ST

Instruction: store indirect to RTC memory

SUB_OPCODE_ST_AUTO

Automatic Storage Mode - Access continuous addresses. Use SUB_OPCODE_ST_OFFSET to configure the initial address before using this instruction.

SUB_OPCODE_ST_OFFSET

Automatic Storage Mode - Configure the initial address.

SUB_OPCODE_ST

Manual Storage Mode. Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

OPCODE_ALU

Arithmetic instructions

SUB_OPCODE_ALU_REG

Arithmetic instruction, both source values are in register

SUB_OPCODE_ALU_IMM

Arithmetic instruction, one source value is an immediate

SUB_OPCODE_ALU_CNT

Arithmetic instruction between counter register and an immediate (not implemented yet)

ALU_SEL_ADD

Addition

ALU_SEL_SUB

Subtraction

ALU_SEL_AND

Logical AND

ALU_SEL_OR

Logical OR

ALU_SEL_MOV

Copy value (immediate to destination register or source register to destination register)

ALU_SEL_LSH

Shift left by given number of bits

ALU_SEL_RSH

Shift right by given number of bits

ALU_SEL_STAGE_INC

Increment stage count register

ALU_SEL_STAGE_DEC

Decrement stage count register

ALU_SEL_STAGE_RST

Reset stage count register

OPCODE_BRANCH

Branch instructions

SUB_OPCODE_B

Branch to a relative offset

SUB_OPCODE_BX

Branch to absolute PC (immediate or in register)

SUB_OPCODE_BS

Branch to a relative offset by comparing the stage_cnt register

BX_JUMP_TYPE_DIRECT

Unconditional jump

BX_JUMP_TYPE_ZERO

Branch if last ALU result is zero

BX_JUMP_TYPE_OVF

Branch if last ALU operation caused an overflow

B_CMP_L

Branch if R0 is less than an immediate

B_CMP_G

Branch if R0 is greater than an immediate

B_CMP_E

Branch if R0 is equal to an immediate

BS_CMP_L

Branch if stage_cnt is less than an immediate

BS_CMP_GE

Branch if stage_cnt is greater than or equal to an immediate

BS_CMP_LE

Branch if stage_cnt is less than or equal to an immediate

OPCODE_END

Stop executing the program

SUB_OPCODE_END

Stop executing the program and optionally wake up the chip

SUB_OPCODE_SLEEP

Stop executing the program and run it again after selected interval

OPCODE_TSENS

Instruction: temperature sensor measurement (not implemented yet)

OPCODE_HALT

Halt the coprocessor

OPCODE_LD

Indirect load lower 16 bits from RTC memory

OPCODE_MACRO

Not a real opcode. Used to identify labels and branches in the program

SUB_OPCODE_MACRO_LABEL

Label macro

SUB_OPCODE_MACRO_BRANCH

Branch macro

SUB_OPCODE_MACRO_LABELPC

Label pointer macro

I_DELAY (cycles_)

Delay (nop) for a given number of cycles

I_HALT ()

Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

I_WR_REG (reg, low_bit, high_bit, val)

Write literal value to a peripheral register

reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_RD_REG (reg, low_bit, high_bit)

Read from peripheral register into R0

R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

incremented with `I_STI()` is called twice. Refer `I_ST_AUTO()` for detailed explanation.

I_STI_LABEL (reg_val, reg_addr, label_)

Store value from register `reg_val` with label to 32 bit word of the RTC memory address.

This instruction is equivalent to calling `I_ST_AUTO()` instruction with `label = label_` and `wr_way = 1`. The data in `reg_val` will be either written to the lower half-word or the upper half-word of the RTC memory address depending on the count of the number of times the `I_STI_LABEL()` instruction is called. The initial offset is automatically incremented with `I_STI_LABEL()` is called twice. Refer `I_ST_AUTO()` for detailed explanation.

I_STI32 (reg_val, reg_addr, label_)

Store value from register `reg_val` to full 32 bit word of the RTC memory address.

This instruction is equivalent to calling `I_ST_AUTO()` instruction with `label = label_` and `wr_way = 0`. The data in `reg_val` will be written to the RTC memory address along with the label and the PC. The initial offset is automatically incremented each time the `I_STI32()` instruction is called. Refer `I_ST_AUTO()` for detailed explanation.

I_LD_MANUAL (reg_dest, reg_addr, offset_, rd_upper_)

Load lower half-word, upper half-word or full-word data from RTC memory address into the register `reg_dest`.

This instruction reads the lower half-word or upper half-word of the RTC memory address depending on the value of `rd_upper_`. The following table summarizes the loading method:

| | | |
|----------------------|---|-------|
| * ----- ----- ----- | | |
| ↪----- | | |
| * rd_upper | data | |
| ↪operation | | |
| * ----- ----- ----- | | |
| ↪----- | | |
| * | | Read_ |
| ↪lower half-word of | | |
| * 0 | <code>reg_dest{15:0} = RTC_SLOW_MEM[addr + offset_]{31:16}</code> | the_ |
| ↪memory | | |
| * ----- ----- ----- | | |
| ↪----- | | |
| * | | Read_ |
| ↪upper half-word of | | |
| * 1 | <code>reg_dest{15:0} = RTC_SLOW_MEM[addr + offset_]{15:0}</code> | the_ |
| ↪memory | | |
| * ----- ----- ----- | | |
| ↪----- | | |
| * | | |

I_LD (reg_dest, reg_addr, offset_)

Load lower 16 bits value from RTC memory into `reg_dest` register.

Loads 16 LSBs (`rd_upper = 1`) from RTC memory word given by the sum of value in `reg_addr` and value of `offset_`. `I_LD()` instruction provides backward compatibility for code written for `esp32` to be run on `esp32s2`.

I_LDL (reg_dest, reg_addr, offset_)

Load lower 16 bits value from RTC memory into `reg_dest` register.

`I_LDL()` instruction and `I_LD()` instruction can be used interchangeably.

I_LDH (reg_dest, reg_addr, offset_)

Load upper 16 bits value from RTC memory into `reg_dest` register.

Loads 16 MSBs (`rd_upper = 0`) from RTC memory word given by the sum of value in `reg_addr` and value of `offset_`.

I_BL (pc_offset, imm_value)

Branch relative if R0 register less than the immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BG (pc_offset, imm_value)

Branch relative if R0 register greater than the immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BE (pc_offset, imm_value)

Branch relative if R0 register is equal to the immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BXR (reg_pc)

Unconditional branch to absolute PC, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXI (imm_pc)

Unconditional branch to absolute PC, immediate address.

Address imm_pc is expressed in 32-bit words.

I_BXZR (reg_pc)

Branch to absolute PC if ALU result is zero, address in register.

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXZI (imm_pc)

Branch to absolute PC if ALU result is zero, immediate address.

Address imm_pc is expressed in 32-bit words.

I_BXFR (reg_pc)

Branch to absolute PC if ALU overflow, address in register

reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXFI (imm_pc)

Branch to absolute PC if ALU overflow, immediate address

Address imm_pc is expressed in 32-bit words.

I_BSLE (pc_offset, imm_value)

Branch relative if stage_cnt is less than or equal to the immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BSGE (pc_offset, imm_value)

Branch relative if stage_cnt register is greater than or equal to the immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BSL (pc_offset, imm_value)

Branch relative if stage_cnt register is less than the immediate value.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_ADDR (reg_dest, reg_src1, reg_src2)

Addition: dest = src1 + src2

I_SUBR (reg_dest, reg_src1, reg_src2)

Subtraction: dest = src1 - src2

I_ANDR (reg_dest, reg_src1, reg_src2)

Logical AND: dest = src1 & src2

I_ORR (reg_dest, reg_src1, reg_src2)

Logical OR: dest = src1 | src2

I_MOVR (reg_dest, reg_src)

Copy: dest = src

I_LSHR (reg_dest, reg_src, reg_shift)

Logical shift left: dest = src « shift

I_RSHR (reg_dest, reg_src, reg_shift)

Logical shift right: dest = src » shift

I_ADDI (reg_dest, reg_src, imm_)

Add register and an immediate value: dest = src1 + imm

I_SUBI (reg_dest, reg_src, imm_)

Subtract register and an immediate value: dest = src - imm

I_ANDI (reg_dest, reg_src, imm_)

Logical AND register and an immediate value: dest = src & imm

I_ORI (reg_dest, reg_src, imm_)

Logical OR register and an immediate value: dest = src | imm

I_MOVI (reg_dest, imm_)

Copy an immediate value into register: dest = imm

I_LSHI (reg_dest, reg_src, imm_)

Logical shift left register value by an immediate: dest = src « imm

I_RSHI (reg_dest, reg_src, imm_)

Logical shift right register value by an immediate: dest = val » imm

I_STAGE_INC (reg_dest, reg_src, imm_)

Increment stage_cnt register by an immediate: stage_cnt = stage_cnt + imm

I_STAGE_DEC (reg_dest, reg_src, imm_)

Decrement stage_cnt register by an immediate: stage_cnt = stage_cnt - imm

I_STAGE_RST (reg_dest, reg_src, imm_)

Reset stage_cnt register by an immediate: stage_cnt = 0

M_LABEL (label_num)

Define a label with number label_num.

This is a macro which doesn't generate a real instruction. The token generated by this macro is removed by `ulp_process_macros_and_load` function. Label defined using this macro can be used in branch macros defined below.

M_BRANCH (label_num)

Token macro used by `M_B` and `M_BX` macros. Not to be used directly.

M_BL (label_num, imm_value)

Macro: branch to label label_num if R0 is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BG (label_num, imm_value)

Macro: branch to label label_num if R0 is greater than immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BE (label_num, imm_value)

Macro: branch to label label_num if R0 equal to the immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BX (label_num)

Macro: unconditional branch to label

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXZ (label_num)

Macro: branch to label if ALU result is zero

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXF (label_num)

Macro: branch to label if ALU overflow

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

编译 ULP 代码

若需要将 ULP FSM 代码编译为某组件的一部分，则必须执行以下步骤：

1. 用汇编语言编写的 ULP FSM 代码必须导入到一个或多个 .s 扩展文件中，且这些文件必须放在组件目录中一个独立的目录中，例如 ulp/。

备注：在注册组件（通过 idf_component_register）时，不应将该目录添加到 SRC_DIRS 参数中。因为 ESP-IDF 构建系统将基于文件扩展名编译在 SRC_DIRS 中搜索到的文件。对于 .S 文件，使用的是 xtensa-esp32s2-elf-as 汇编器。但这并不适用于 ULP FSM 程序集文件，因此体现这种区别最简单的方式就是将 ULP FSM 程序集文件放到单独的目录中。同样，ULP FSM 程序集源文件也 **不应该** 添加到 SRCS 中。请参考如下步骤，查看如何正确添加 ULP FSM 程序集源文件。

2. 注册后从组件 CMakeLists.txt 中调用 ulp_embed_binary 示例如下：

```
...
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
```

(下页继续)

(续上页)

```

set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}")

```

`ulp_embed_binary` 的第一个参数为 ULP 二进制文件命名。指定的此名称也用于生成的其他文件，如：ELF 文件、`.map` 文件、头文件和链接器导出文件。第二个参数指定 ULP FSM 程序集源文件。最后，第三个参数指定组件源文件列表，其中包括被生成的头文件。此列表用以建立正确的依赖项，并确保在编译这些文件之前先创建生成的头文件。有关 ULP FSM 应用程序生成的头文件等相关概念，请参考下文。

3. 使用常规方法（例如 `idf.py app`）编译应用程序。

在内部，构建系统将按照以下步骤编译 ULP FSM 程序：

1. **通过 C 预处理器运行每个程序集文件 (foo.S)**。此步骤在组件编译目录中生成预处理的程序集文件 (`foo.ulp.S`)，同时生成依赖文件 (`foo.ulp.d`)。
2. **通过汇编器运行预处理过的汇编源码**。此步骤会生成目标文件 (`foo.ulp.o`) 和清单 (`foo.ulp.lst`)。清单文件仅用于调试，不用于编译进程的后续步骤。
3. **通过 C 预处理器运行链接器脚本模板**。模板位于 `components/ulp/ld` 目录中。
4. **将目标文件链接到 ELF 输出文件 (ulp_app_name.elf)**。此步骤生成的 `.map` 文件 (`ulp_app_name.map`) 默认用于调试。
5. **将 ELF 文件中的内容转储为二进制文件 (ulp_app_name.bin)**，以便嵌入到应用程序中。
6. 使用 `esp32ulp-elf-nm` 在 ELF 文件中生成全局符号列表 (`ulp_app_name.sym`)。
7. **创建 LD 导出脚本和头文件 (ulp_app_name.ld 和 ulp_app_name.h)**，包含来自 `ulp_app_name.sym` 的符号。此步骤可借助 `esp32ulp_mapgen.py` 工具来完成。
8. **将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。**

访问 ULP FSM 程序变量

在 ULP FSM 程序中定义的全局符号也可以在主程序中使用。

例如，ULP FSM 程序可以定义 `measurement_count` 变量，此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数：

```

.global measurement_count
measurement_count:
    .long 0

    // later, use measurement_count
    move r3, measurement_count
    ld r3, r3, 0

```

主程序需要在启动 ULP 程序之前初始化 `measurement_count` 变量，构建系统通过生成定义 ULP 编程中全局符号的 `${ULP_APP_NAME}.h` 和 `${ULP_APP_NAME}.ld` 文件实现上述操作。这些文件包含了在 ULP 程序中定义的所有全局符号，文件以 `ulp_` 开头。

头文件包含对此类符号的声明：

```
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 `uint32_t`。对于函数和数组，先获取符号地址，然后转换为适当的类型。

生成的链接器脚本文件定义了 `RTC_SLOW_MEM` 中的符号位置：

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

如果要从主程序访问 ULP 程序变量，应先使用 `include` 语句包含生成的头文件，这样，就可以像访问常规变量一样访问 `ulp` 程序变量。操作如下：

```
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

启动 ULP FSM 程序

要运行 ULP FSM 程序，主应用程序需要调用 `ulp_load_binary()` 函数将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_run()` 函数，启动 ULP 程序。

注意，在 `menuconfig` 中必须启用 Enable Ultra Low Power (ULP) Coprocessor 选项，以便正常运行 ULP，并且必须设置 ULP Co-processor type 选项，以便选择要使用的 ULP 类型。RTC slow memory reserved for coprocessor 选项设置的值必须足够储存 ULP 代码和数据。如果应用程序组件包含多个 ULP 程序，则 RTC 内存必须足以容纳最大的程序。

每个 ULP 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULP_APP_NAME` 已被定义为 `ulp_app_name`）：

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[]   asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK(ulp_load_binary(
        0 // load address, set to 0 when using default linker scripts
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t) ));
}
```

一旦上述程序加载到 RTC 内存后，应用程序即可启动此程序，并将入口点的地址传递给 `ulp_run` 函数：

```
ESP_ERROR_CHECK(ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

上述生成的头文件 `_${ULP_APP_NAME}.h` 声明了入口点符号。在 ULP 应用程序的汇编源代码中，此符号必须标记为 `.global`：

```
.global entry
entry:
    // code starts here
```

ESP32-S2 ULP 程序流

ESP32-S2 ULP 协处理器由定时器启动，调用 `ulp_run()` 则可启动此定时器。定时器为 `RTC_SLOW_CLK` 的 Tick 事件计数（默认情况下，Tick 由内部 90 KHz RC 振荡器生成）。使用 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器设置 Tick 数值。

此应用程序可以调用 `ulp_set_wakeup_period()` 函数来设置 ULP 定时器周期值。

一旦定时器计数到 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器设定的 Tick 数值，ULP 协处理器就会启动，并调用 `ulp_run()` 的入口点开始运行程序。

程序保持运行，直到遇到 `halt` 指令或非法指令。一旦程序停止，ULP 协处理器电源关闭，定时器再次启动。

如果想禁用定时器（有效防止 ULP 程序再次运行），可在 ULP 代码或主程序中清除 `RTC_CNTL_ULP_CP_TIMER_REG` 寄存器中的 `RTC_CNTL_ULP_CP_SLIP_TIMER_EN` 位。

应用示例

- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器对 IO 脉冲进行计数：[system/ulp/ulp_fsm/ulp](#)。
- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器轮询 ADC：[system/ulp/ulp_fsm/ulp_adc](#)。

API 参考

Header File

- [components/ulp/ulp_fsm/include/ulp_fsm_common.h](#)
- This header file can be included with:

```
#include "ulp_fsm_common.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

esp_err_t **ulp_isr_register** (*intr_handler_t* fn, void *arg)

Register ULP wakeup signal ISR.

备注: The ISR routine will only be active if the main CPU is not in deepsleep

参数

- **fn** -- ISR callback function
- **arg** -- ISR callback function arguments

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if callback function is `NULL`
- `ESP_ERR_NO_MEM` if heap memory cannot be allocated for the interrupt

esp_err_t **ulp_isr_deregister** (*intr_handler_t* fn, void *arg)

Deregister ULP wakeup signal ISR.

参数

- **fn** -- ISR callback function
- **arg** -- ISR callback function arguments

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if callback function is `NULL`
- `ESP_ERR_INVALID_STATE` if a handler matching both callback function and its arguments isn't registered

esp_err_t **ulp_process_macros_and_load** (*uint32_t* load_addr, const *ulp_insn_t* *program, *size_t* *psize)

Resolve all macro references in a program and load it into RTC memory.

参数

- **load_addr** -- address where the program should be loaded, expressed in 32-bit words
- **program** -- `ulp_insn_t` array with the program
- **psize** -- size of the program, expressed in 32-bit words

返回

- `ESP_OK` on success

- ESP_ERR_NO_MEM if auxiliary temporary structure can not be allocated
- one of ESP_ERR_ULP_XXX if program is not valid or can not be loaded

esp_err_t **ulp_load_binary** (uint32_t load_addr, const uint8_t *program_binary, size_t program_size)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

- MAGIC, (value 0x00706c75, 4 bytes)
- TEXT_OFFSET, offset of .text section from binary start (2 bytes)
- TEXT_SIZE, size of .text section (2 bytes)
- DATA_SIZE, size of .data section (2 bytes)
- BSS_SIZE, size of .bss section (2 bytes)
- (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
- .text section
- .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

参数

- **load_addr** -- address where the program should be loaded, expressed in 32-bit words
- **program_binary** -- pointer to program binary
- **program_size** -- size of the program binary

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn't match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

esp_err_t **ulp_run** (uint32_t entry_point)

Run the program loaded into RTC memory.

参数 **entry_point** -- entry point, expressed in 32-bit words

返回 ESP_OK on success

Macros

ESP_ERR_ULP_BASE

Offset for ULP-related error codes

ESP_ERR_ULP_SIZE_TOO_BIG

Program doesn't fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR

Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL

More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL

Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE

Branch target is out of range of B instruction (try replacing with BX)

Type Definitions

```
typedef union ulp_insn ulp_insn_t
```

Header File

- `components/ulp/ulp_common/include/ulp_common.h`
- This header file can be included with:

```
#include "ulp_common.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

esp_err_t **ulp_set_wakeup_period** (*size_t* period_index, *uint32_t* period_us)

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into `SENS_ULP_CP_SLEEP_CYCx_REG` registers, $x = 0..4$ for ESP32, and one period value which can be programmed into `RTC_CNTL_ULP_CP_TIMER_1_REG` register for ESP32-S2/S3. By default, for ESP32, wakeup timer will use the period set into `SENS_ULP_CP_SLEEP_CYC0_REG`, i.e. period number 0. ULP program code can use `SLEEP` instruction to select which of the `SENS_ULP_CP_SLEEP_CYCx_REG` should be used for subsequent wakeups.

However, please note that `SLEEP` instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-S2/S3 the `SLEEP` instruction not exist. Instead a `WAKE` instruction will be used.

备注: The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

参数

- **period_index** -- wakeup period setting number (0 - 4)
- **period_us** -- wakeup period, us

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `period_index` is out of range

void **ulp_timer_stop** (void)

Stop the ULP timer.

备注: This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

```
void ulp_timer_resume (void)
```

Resume the ULP timer.

备注: This will resume an already configured timer, but does no other configuration

2.9.33 ULP RISC-V 协处理器编程

ULP RISC-V 协处理器是 ULP 的一种变体，用于 ESP32-S2。与 ULP FSM 类似，ULP RISC-V 协处理器可以在主 CPU 处于低功耗模式时执行传感器读数等任务。其与 ULP FSM 的主要区别在于，ULP RISC-V 可以通过标准 GNU 工具使用 C 语言进行编程。ULP RISC-V 可以访问 RTC_SLOW_MEM 内存区域及 RTC_CNTL、RTC_IO、SARADC 等外设的寄存器。RISC-V 处理器是一种 32 位定点处理器，指令集基于 RV32IMC，包括硬件乘除法和压缩指令。

安装 ULP RISC-V 工具链

ULP RISC-V 协处理器代码以 C 语言（或汇编语言）编写，使用基于 GCC 的 RISC-V 工具链进行编译。

如果依照[快速入门指南](#)中的介绍安装好了 ESP-IDF 及其 CMake 构建系统，那么 ULP RISC-V 工具链已经被默认安装到了你的开发环境中。

备注: 在早期版本的 ESP-IDF 中，RISC-V 工具链具有不同的名称：riscv-none-embed-gcc。

编译 ULP RISC-V 代码

要将 ULP RISC-V 代码编译为某组件的一部分，必须执行以下步骤：

1. ULP RISC-V 代码以 C 语言或汇编语言编写（必须使用 .s 扩展名），必须放在组件目录中一个独立的目录中，例如 ulp/。

备注: 当注册组件时（通过 `idf_component_register`），该目录不应被添加至 `SRC_DIRS` 参数，因为目前该步骤需用于 ULP FSM。如何正确添加 ULP 源文件，请见以下步骤。

2. 注册后从组件 `CMakeLists.txt` 中调用 `ulp_embed_binary` 示例如下：

```
...
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_sources "ulp/ulp_c_source_file.c" "ulp/ulp_assembly_source_file.S")
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_sources}" "${ulp_exp_dep_srcs}")
```

`ulp_embed_binary` 的第一个参数指定生成的 ULP 二进制文件名。生成的其他文件，如 ELF 文件、.map 文件、头文件和链接器导出文件等也可使用此名称。第二个参数指定 ULP 源文件。最后，第三个参数指定组件源文件列表，其中包括生成的头文件。此列表用以正确构建依赖，并确保在构建过程中先生成后编译包含头文件的源文件。请参考下文，查看为 ULP 应用程序生成的头文件等相关概念。

3. 使用常规方法（例如 `idf.py app`）编译应用程序。在内部，构建系统将按照以下步骤编译 ULP 程序：

1. 通过 C 编译器和汇编器运行每个源文件。此步骤在组件编译目录中生成目标文件 (.obj.c 或 .obj.S, 取决于处理的源文件)。
2. 通过 C 预处理器运行链接器脚本模版。模版位于 components/ulp/ld 目录中。
3. 将目标文件链接到 ELF 输出文件 (ulp_app_name.elf)。此步骤生成的.map 文件默认用于调试 (ulp_app_name.map)。
4. 将 ELF 文件中的内容转储为二进制文件 (ulp_app_name.bin), 以便嵌入到应用程序中。
5. 使用 riscv32-esp-elf-nm 在 ELF 文件中生成全局符号列表 (ulp_app_name.sym)。
6. 创建 LD 导出脚本和头文件 (ulp_app_name.ld 和 ulp_app_name.h), 包含来自 ulp_app_name.sym 的符号。此步骤可借助 esp32ulp_mapgen.py 工具来完成。
7. 将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。

访问 ULP RISC-V 程序变量

在 ULP RISC-V 程序中定义的全局符号也可以在主程序中使用。

例如, ULP RISC-V 程序可以定义 measurement_count 变量, 此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数。

```
volatile int measurement_count;

int some_function()
{
    //读取测量计数, 后续需使用
    int temp = measurement_count;

    ...do something.
}
```

构建系统生成定义 ULP 编程中全局符号的 \${ULP_APP_NAME}.h 和 \${ULP_APP_NAME}.ld 文件, 使主程序能够访问全局 ULP RISC-V 程序变量。上述两个文件包含 ULP RISC-V 程序中定义的所有全局符号, 且这些符号均以 ulp_ 开头。

头文件包含对此类符号的声明:

```
extern uint32_t ulp_measurement_count;
```

注意, 所有符号 (包括变量、数组、函数) 均被声明为 uint32_t。函数和数组需要先获取符号地址, 再转换为适当的类型。

生成的链接器文本定义了符号在 RTC_SLOW_MEM 中的位置:

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

要从主程序访问 ULP RISC-V 程序变量, 需使用 include 语句包含生成的头文件。这样, 就可以像访问常规变量一样访问 ULP RISC-V 程序变量。

```
#include "ulp_app_name.h"

void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

互斥 如果想要互斥地访问被主程序和 ULP 程序共享的变量, 则可以通过 ULP RISC-V Lock API 来实现:

- `ulp_riscv_lock_acquire()`
- `ulp_riscv_lock_release()`

ULP 中的所有硬件指令都不支持互斥, 所以 Lock API 需通过一种软件算法 ([Peterson 算法](#)) 来实现互斥。注意, 只能从主程序的单个线程中调用这些锁, 如果多个线程同时调用, 将无法启用互斥功能。

启动 ULP RISC-V 程序

要运行 ULP RISC-V 程序，主程序需要调用 `ulp_riscv_load_binary()` 函数，将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_riscv_run()` 函数，启动 ULP RISC-V 程序。

注意，必须在 `menuconfig` 中启用 `CONFIG_ULTP_COPROC_ENABLED` 和 `CONFIG_ULTP_COPROC_TYPE_RISCV` 选项，以便正常运行 ULP RISC-V 程序。RTC slow memory reserved for coprocessor 选项设置的值必须足够存储 ULP RISC-V 代码和数据。如果应用程序组件包含多个 ULP 程序，RTC 内存必须足以容纳最大的程序。

每个 ULP RISC-V 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULTP_APP_NAME` 已被定义为 `ulp_app_name`）：

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[]   asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK(ulp_riscv_load_binary(bin_start,
        (bin_end - bin_start)));
}
```

一旦上述程序加载到 RTC 内存后，应用程序即可调用 `ulp_riscv_run()` 函数启动此程序：

```
ESP_ERROR_CHECK(ulp_riscv_run());
```

ULP RISC-V 程序流

ULP RISC-V 协处理器由定时器启动，调用 `ulp_riscv_run()` 即可启动定时器。定时器为 `RTC_SLOW_CLK` 的 Tick 事件计数（默认情况下，Tick 由内部 90 kHz RC 振荡器产生）。Tick 数值使用 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器设置。启用 ULP 时，使用 `RTC_CNTL_ULP_CP_TIMER_1_REG` 设置定时器 Tick 数值。

此应用程序可以调用 `ulp_set_wakeup_period()` 函数来设置 ULP 定时器周期值（`RTC_CNTL_ULP_CP_TIMER_1_REG`）。

一旦定时器数到 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器中设置的 Tick 数，ULP RISC-V 协处理器就会启动，并调用 `ulp_riscv_run()` 的入口点开始运行程序。

程序保持运行，直至 `RTC_CNTL_COCPU_CTRL_REG` 寄存器中的 `RTC_CNTL_COCPU_DONE` 字段被置位或因非法处理器状态出现陷阱。一旦程序停止，ULP RISC-V 协处理器会关闭电源，定时器再次启动。

如需禁用定时器（有效防止 ULP 程序再次运行），请清除 `RTC_CNTL_STATE0_REG` 寄存器中的 `RTC_CNTL_ULP_CP_SLP_TIMER_EN` 位，此项操作可在 ULP 代码或主程序中进行。

ULP RISC-V 外设支持

为了增强性能，ULP RISC-V 协处理器可以访问在低功耗 (RTC) 电源域中运行的外设。当主 CPU 处于睡眠模式时，ULP RISC-V 协处理器可与这些外设进行交互，并在满足唤醒条件时唤醒主 CPU。以下为所支持的外设类型。

RTC I2C RTC I2C 控制器提供了在 RTC 电源域中作为 I2C 主机的功能。ULP RISC-V 协处理器可以使用该控制器对 I2C 从机设备进行读写操作。如要使用 RTC I2C 外设，需在初始化 ULP RISC-V 内核并在其进入睡眠模式之前，先在主内核上运行的应用程序中调用 `ulp_riscv_i2c_master_init()` 函数。

初始化 RTC I2C 控制器之后，请务必先用 `ulp_riscv_i2c_master_set_slave_addr()` API 将 I2C 从机设备地址编入程序，再执行读写操作。

备注：RTC I2C 外设首先将检查 `ulp_riscv_i2c_master_set_slave_reg_addr()` API 是否将从机子寄存器地址编入程序。如未编入，I2C 外设将以 `SENS_SAR_I2C_CTRL_REG[18:11]` 作为后续读

写操作的子寄存器地址。这可能会导致 RTC I2C 外设与某些无需对子寄存器进行配置的 I2C 设备或传感器不兼容。

备注：在主 CPU 访问 RTC I2C 外设和 ULP RISC-V 内核访问 RTC I2C 外设之间，未提供硬件原子操作的正确性保护，因此请勿让两个内核同时访问外设。

如果基于 RTC I2C 的 ULP RISC-V 程序未按预期运行，可以进行以下完整性检查排查问题：

- SDA/SCL 管脚选择问题：SDA 管脚只能配置为 GPIO1 或 GPIO3，SCL 管脚只能配置为 GPIO0 或 GPIO2。请确保管脚配置正确。
- I2C 时序参数问题：RTC I2C 总线时序配置受到 I2C 标准总线规范限制，任何违反标准 I2C 总线规范的时序参数都会导致错误。了解有关时序参数的详细信息，请阅读 [标准 I2C 总线规范](#)。
- 如果 I2C 从机设备或传感器不需要子寄存器地址进行配置，它可能与 RTC I2C 外设不兼容。请参考前文注意事项。
- 如果 RTC 驱动程序在主 CPU 上运行时出现 Write Failed! 或 Read Failed! 的错误日志，检查是否出现以下情况：
 - I2C 从机设备或传感器与乐鑫 SoC 上的标准 I2C 主机设备一起正常工作，说明 I2C 从机设备本身没有问题。
 - 如果 RTC I2C 中断状态日志报告 TIMEOUT 错误或 ACK 错误，则通常表示 I2C 设备未响应 RTC I2C 控制器发出的 START 条件。如果 I2C 从机设备未正确连接到控制器管脚或处于异常状态，则可能会发生这种情况。在进行后续操作之前，请确保 I2C 从机设备状态良好且连接正确。
 - 如果 RTC I2C 中断日志没有报告任何错误状态，则可能表示驱动程序接收 I2C 从机设备数据时速度较慢。这可能是由于 RTC I2C 控制器没有 TX/RX FIFO 来存储多字节数据，而是依赖于使用中断状态轮询机制来进行单字节传输。通过在外设的初始化配置参数中设置 SCL 低周期和 SCL 高周期，可以尽量提高外设 SCL 时钟的运行速度，在一定程度上缓解这一问题。
- 调试问题的方法还包括确保 RTC I2C 控制器 **仅**在主 CPU 上运行，**没有** ULP RISC-V 代码干扰，并且没有激活 **任何**睡眠模式。这是确保 RTC I2C 外设正常工作的基本配置。通过这种方式，可以排除由 ULP 或睡眠模式可能引起的任何潜在问题。

ULP RISC-V 中断处理

ULP RISC-V 内核支持来自特定内部和外部事件的中断处理。设计上，ULP RISC-V 内核可以处理以下来源的中断：

表 11: ULP RISC-V 中断源

| 中断源 | 类型 | IRQ |
|--------------------|------|-----|
| 内部定时器中断 | 内部中断 | 0 |
| EBREAK、ECALL 或非法指令 | 内部中断 | 1 |
| 非对齐内存访问 | 内部中断 | 2 |
| RTC 外设中断源 | 外部中断 | 31 |

可通过特殊的 32 位寄存器 Q0-Q3 和自定义的 R-type 指令启用中断处理。更多信息，请参阅 [ESP32-S2 技术参考手册 > 超低功耗协处理器 > ULP-RISC-V > ULP-RISC-V 中断 \[PDF\]](#)。

系统启动时，默认启用所有中断。触发中断时，处理器将跳转到 IRQ 向量。IRQ 向量随即保存寄存器上下文，并调用全局中断分发器。ULP RISC-V 驱动程序实现了一个弱中断分发器 `_ulp_riscv_interrupt_handler()`，充当处理所有中断的中心点。该全局分发器用于调用由 `ulp_riscv_intr_alloc()` 分配的相应中断处理程序。

ULP RISC-V 的中断处理尚在开发中，还不支持针对内部中断源的中断处理。目前支持两个 RTC 外设中断源，即软件触发的中断和 RTC IO 触发的中断，不支持嵌套中断。如果需要自定义中断处理，可以通过定义 `_ulp_riscv_interrupt_handler()` 来覆盖默认的全局中断调度器。

调试 ULP RISC-V 程序

在对 ULP RISC-V 进行配置时，若程序未按预期运行，有时很难找出的原因。因为其内核的简单性，许多标准的调试方法如 JTAG 或 `printf` 无法使用。

以下方法可以调试 ULP RISC-V 程序：

- 通过共享变量查看程序状态：如访问 [ULP RISC-V 程序变量](#) 中所述，主 CPU 以及 ULP 内核都可以轻松访问 RTC 内存中的全局变量。通过 ULP 向该变量中写入状态信息，然后通过主 CPU 读取状态信息，有助于了解 ULP 内核的状态。该方法的缺点在于它要求主 CPU 一直处于唤醒状态，但现实情况可能并非如此。有时，保持主 CPU 处于唤醒状态还可能会掩盖一些问题，因为某些问题可能仅在特定电源域断电时才会出现。
- 使用 bit-banged UART 驱动程序打印：ULP RISC-V 组件中有一个低速 bit-banged UART TX 驱动程序，可用于打印独立于主 CPU 状态的信息。有关如何使用此驱动程序的示例，请参阅 [system/ulp/ulp_riscv/uart_print](#)。
- 陷阱信号：ULP RISC-V 有一个硬件陷阱，将在特定条件下触发，例如非法指令。这将导致主 CPU 被 `ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG` 唤醒。

应用示例

- 主 CPU 处于 Deep-sleep 状态时，ULP RISC-V 协处理器轮询 GPIO：[system/ulp/ulp_riscv/gpio](#)。
- ULP RISC-V 协处理器使用 bit-banged UART 驱动程序打印：[system/ulp/ulp_riscv/uart_print](#)。
- 主 CPU 处于 Deep-sleep 状态时，ULP RISC-V 协处理器读取外部温度传感器：[system/ulp/ulp_riscv/ds18b20_owewire](#)。
- 主 CPU 处于 Deep-sleep 状态时，ULP RISC-V 协处理器读取外部 I2C 温度和湿度传感器 (BMP180)，达到阈值时唤醒主 CPU：[system/ulp/ulp_riscv/i2c](#)。
- 使用 ULP RISC-V 协处理器处理软件中断和 RTC IO 中断：[system/ulp/ulp_riscv/interrupts](#)。

API 参考

Header File

- [components/ulp/ulp_riscv/include/ulp_riscv.h](#)
- This header file can be included with:

```
#include "ulp_riscv.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

`esp_err_t ulp_riscv_isr_register (intr_handler_t fn, void *arg, uint32_t mask)`

Register ULP signal ISR.

备注： The ISR routine will only be active if the main CPU is not in deepsleep

参数

- **fn** -- ISR callback function
- **arg** -- ISR callback function arguments
- **mask** -- Bit mask to enable the required ULP RISC-V interrupt signals

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if callback function is NULL or if the interrupt bits are invalid
- ESP_ERR_NO_MEM if heap memory cannot be allocated for the interrupt
- other errors returned by esp_intr_alloc

esp_err_t **ulp_riscv_isr_deregister** (*intr_handler_t* fn, void *arg, uint32_t mask)

Deregister ULP signal ISR.

参数

- **fn** -- ISR callback function
- **arg** -- ISR callback function arguments
- **mask** -- Bit mask to enable the required ULP RISC-V interrupt signals

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if callback function is NULL or if the interrupt bits are invalid
- ESP_ERR_INVALID_STATE if a handler matching both callback function and its arguments isn't registered

esp_err_t **ulp_riscv_config_and_run** (*ulp_riscv_cfg_t* *cfg)

Configure the ULP and run the program loaded into RTC memory.

参数 **cfg** -- pointer to the config struct

返回 ESP_OK on success

esp_err_t **ulp_riscv_run** (void)

Configure the ULP with default settings and run the program loaded into RTC memory.

返回 ESP_OK on success

esp_err_t **ulp_riscv_load_binary** (const uint8_t *program_binary, size_t program_size_bytes)

Load ULP-RISC-V program binary into RTC memory.

Different than ULP FSM, the binary program has no special format, it is the ELF file generated by RISC-V toolchain converted to binary format using objcopy.

Linker script in components/ulp/ld/ulp_riscv.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

参数

- **program_binary** -- pointer to program binary
- **program_size_bytes** -- size of the program binary

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if program_size_bytes is more than 8KiB

void **ulp_riscv_timer_stop** (void)

Stop the ULP timer.

备注: This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

void **ulp_riscv_timer_resume** (void)

Resumes the ULP timer.

备注: This will resume an already configured timer, but does no other configuration

void **ulp_riscv_halt** (void)

Halts the program currently running on the ULP-RISC-V.

备注: Program will restart at the next ULP timer trigger if timer is still running. If you want to stop the ULP from waking up then call `ulp_riscv_timer_stop()` first.

void **ulp_riscv_reset** (void)

Resets the ULP-RISC-V core from the main CPU.

备注: This will reset the ULP core from the main CPU. It is intended to be used when the ULP is in a bad state and cannot run as intended due to a corrupt firmware or any other reason. The main core can reset the ULP core with this API and then re-initialize the ULP.

Structures

struct **ulp_riscv_cfg_t**

ULP riscv init parameters.

Public Members

[*ulp_riscv_wakeup_source_t*](#) **wakeup_source**

ULP wakeup source

Macros

ULP_RISCV_DEFAULT_CONFIG ()

ULP_RISCV_SW_INT

ULP_RISCV_TRAP_INT

Enumerations

enum **ulp_riscv_wakeup_source_t**

Values:

enumerator **ULP_RISCV_WAKEUP_SOURCE_TIMER**

enumerator **ULP_RISCV_WAKEUP_SOURCE_GPIO**

Header File

- [components/ulp/ulp_riscv/shared/include/ulp_riscv_lock_shared.h](#)
- This header file can be included with:

```
#include "ulp_riscv_lock_shared.h"
```

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Structures

struct **ulp_riscv_lock_t**

Structure representing a lock shared between ULP and main CPU.

Public Members

bool **critical_section_flag_ulp**

ULP wants to enter the critical sections

bool **critical_section_flag_main_cpu**

Main CPU wants to enter the critical sections

ulp_riscv_lock_turn_t **turn**

Which CPU is allowed to enter the critical section

Enumerations

enum **ulp_riscv_lock_turn_t**

Enum representing which processor is allowed to enter the critical section.

Values:

enumerator **ULP_RISCV_LOCK_TURN_ULP**

ULP's turn to enter the critical section

enumerator **ULP_RISCV_LOCK_TURN_MAIN_CPU**

Main CPU's turn to enter the critical section

Header File

- [components/ulp/ulp_riscv/include/ulp_riscv_lock.h](#)
- This header file can be included with:

```
#include "ulp_riscv_lock.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

void **ulp_riscv_lock_acquire** (*ulp_riscv_lock_t* *lock)

Locks are based on the Peterson's algorithm, https://en.wikipedia.org/wiki/Peterson%27s_algorithm.

Acquire the lock, preventing the ULP from taking until released. Spins until lock is acquired.

备注: The lock is only designed for being used by a single thread on the main CPU, it is not safe to try to acquire it from multiple threads.

参数 lock -- Pointer to lock struct, shared with ULP

void **ulp_riscv_lock_release** (*ulp_riscv_lock_t* *lock)

Release the lock.

参数 lock -- Pointer to lock struct, shared with ULP

Header File

- [components/ulp/ulp_riscv/include/ulp_riscv_i2c.h](#)
- This header file can be included with:

```
#include "ulp_riscv_i2c.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

void **ulp_riscv_i2c_master_set_slave_addr** (uint8_t slave_addr)

Set the I2C slave device address.

参数 slave_addr -- I2C slave address (7 bit)

void **ulp_riscv_i2c_master_set_slave_reg_addr** (uint8_t slave_reg_addr)

Set the I2C slave device sub register address.

备注: The RTC I2C peripheral always expects a slave sub register address to be programmed. If it is not, the I2C peripheral uses the `SENS_SAR_I2C_CTRL_REG[18:11]` as the sub register address for the subsequent read or write operation.

参数 slave_reg_addr -- I2C slave sub register address

void **ulp_riscv_i2c_master_read_from_device** (uint8_t *data_rd, size_t size)

Read from I2C slave device.

备注: The I2C slave device address must be configured at least once before invoking this API.

参数

- **data_rd** -- Buffer to hold data to be read
- **size** -- Size of data to be read in bytes

void **ulp_riscv_i2c_master_write_to_device** (uint8_t *data_wr, size_t size)

Write to I2C slave device.

备注: The I2C slave device address must be configured at least once before invoking this API.

参数

- **data_wr** -- Buffer which holds the data to be written
- **size** -- Size of data to be written in bytes

esp_err_t **ulp_riscv_i2c_master_init** (const *ulp_riscv_i2c_cfg_t* *cfg)

Initialize and configure the RTC I2C for use by ULP RISC-V. Currently RTC I2C can only be used in master mode.

参数 **cfg** -- Configuration parameters

返回 *esp_err_t* ESP_OK when successful

Structures

struct **ulp_riscv_i2c_pin_cfg_t**

ULP RISC-V RTC I2C pin config.

Public Members

uint32_t **sda_io_num**

GPIO pin for SDA signal. Only GPIO#1 or GPIO#3 can be used as the SDA pin.

uint32_t **scl_io_num**

GPIO pin for SCL signal. Only GPIO#0 or GPIO#2 can be used as the SCL pin.

bool **sda_pullup_en**

SDA line enable internal pullup. Can be configured if external pullup is not used.

bool **scl_pullup_en**

SCL line enable internal pullup. Can be configured if external pullup is not used.

struct **ulp_riscv_i2c_timing_cfg_t**

ULP RISC-V RTC I2C timing config.

Public Members

float **scl_low_period**

SCL low period in micro seconds

float **scl_high_period**

SCL high period in micro seconds

float **sda_duty_period**

Period between the SDA switch and the falling edge of SCL in micro seconds

float **scl_start_period**

Waiting time after the START condition in micro seconds

float **scl_stop_period**

Waiting time before the END condition in micro seconds

float **i2c_trans_timeout**

I2C transaction timeout in micro seconds

struct **ulp_riscv_i2c_cfg_t**

ULP RISC-V RTC I2C init parameters.

Public Members

2.9.34 看门狗

概述

ESP-IDF 支持以下类型的看门狗定时器：

- 硬件看门狗定时器
- 中断看门狗定时器 (IWDT)
- 任务看门狗定时器 (TWDT)
- XTAL32K 看门狗定时器 (Crystal 32K 看门狗定时器，即 XTWDT)

中断看门狗负责确保 ISR（中断服务程序）不被长时间阻塞，TWDT 负责检测任务长时间运行而不让步的情况。

通过[项目配置菜单](#)可启用各种看门狗定时器。其中，TWDT 也可以在程序运行时启用。

硬件看门狗定时器

芯片有两组看门狗定时器：

- 主系统看门狗定时器 (MWDT_WDT) - 用于中断看门狗定时器 (IWDT) 和任务看门狗定时器 (TWDT)。
- RTC 看门狗定时器 (RTC_WDT) - 用于跟踪从上电到执行用户主函数的启动时间（默认情况下，RTC 看门狗在执行用户主函数之前会被立即禁用）。

请参阅[看门狗](#)小节，了解如何在引导加载程序中使用看门狗。

用户可以调整应用程序行为，使 RTC 看门狗在应用程序启动后保持启用状态。应用程序需要显式重置（即喂狗）或禁用看门狗，以避免芯片重置。具体而言，用户可设置 `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` 选项，根据需要修改应用程序并重新编译。此过程中应使用以下 API：

- `wdt_hal_disable()`：参考[禁用 RTC_WDT](#)
- `wdt_hal_feed()`：参考[重置 RTC_WDT 计数器](#)
- `rtc_wdt_feed()`
- `rtc_wdt_disable()`

如果未能及时重置或禁用 RTC_WDT，芯片将自动重置。请参阅[RTC 看门狗超时](#)了解更多信息。

中断看门狗定时器 (IWDT)

IWDT 的目的是，确保中断服务例程 (ISR) 运行不会受到长时间阻塞（即 IWDT 超时）。阻塞 ISR 及时运行会增加 ISR 延迟，也会阻止任务切换（因为任务切换是从 ISR 执行的）。阻止 ISR 运行的事项包括：

- 禁用中断
- 临界区（也会禁用中断）
- 其他相同或更高优先级的 ISR，在完成前会阻止相同或较低优先级的 ISR

IWDT 利用定时器组 1 中的 MWDT_WDT 看门狗定时器作为其底层硬件定时器，并在每个 CPU 上使用 FreeRTOS 时钟滴答中断，即 tick 中断。如果某个 CPU 上的 tick 中断没有在 IWDT 超时前运行，就表明该 CPU 上的 ISR 运行受阻（参见上文原因列表）。

当 IWDT 超时后，默认操作是调用紧急处理程序 (Panic Handler)，并显示出错原因 (Interrupt wdt timeout on CPU0 或 Interrupt wdt timeout on CPU1，视情况而定)。根据紧急处理程序的配置行为（参见[CONFIG_ESP_SYSTEM_PANIC](#)），用户可通过回溯、OpenOCD、gdbstub 等来调试 IWDT 超时问题，也可以重置芯片（这在生产环境中可能是首选）。

如果出于某种原因，IWDT 超时后紧急处理程序无法运行，IWDT 还可以通过其二阶段超时来硬重置芯片（即系统重置）。

配置

- IWDT 默认通过 `CONFIG_ESP_INT_WDT` 选项启用。
- 通过 `CONFIG_ESP_INT_WDT_TIMEOUT_MS` 选项设置 IWDT 超时。
 - 注意，如果启用了 PSRAM 支持，那么默认的超时时间会更长，因为在某些情况下，临界区或中断例程访问大量 PSRAM 需要更长时间。
 - 超时时间至少应是 FreeRTOS tick 周期的两倍时长（参见[CONFIG_FREERTOS_HZ](#)）。

调优 如果 IWDT 超时是中断或临界区运行超时导致的，可以考虑重写代码：

- 临界区应尽可能短。任何非关键的代码或计算都应放在临界区外。
- 中断处理程序也应尽可能减少计算量。考虑让 ISR 使用队列向任务推送数据，从而将计算推迟到任务中进行。

临界区或中断处理程序都不应阻塞其他事件。如果不能或不希望通过更改代码减少处理时间，可以通过设置 `CONFIG_ESP_INT_WDT_TIMEOUT_MS` 延长超时时间。

任务看门狗定时器 (TWDT)

任务看门狗定时器 (TWDT) 用于监视特定任务，确保任务在配置的超时时间内执行。TWDT 主要监视每个 CPU 的空闲任务，但其他任务也可以订阅 TWDT 监视。通过监视每个 CPU 的空闲任务，TWDT 可以检测到任务长时间运行没有让出的情况。这可能表明代码编写不当，在外设上自旋循环，或者任务陷入了无限循环。

TWDT 是基于定时器组 0 中的 MWDT_WDT 看门狗定时器构建的。超时发生时触发中断。

可以在用户代码中定义函数 `esp_task_wdt_isr_user_handler` 来接收超时事件，并扩展默认行为。

使用 调用以下函数，用 TWDT 监视任务：

- `esp_task_wdt_init()` 初始化 TWDT 并订阅空闲任务。
- `esp_task_wdt_add()` 为其他任务订阅 TWDT。
- 订阅后，应从任务中调用 `esp_task_wdt_reset()` 来喂 TWDT。
- `esp_task_wdt_delete()` 可以取消之前订阅的任务。
- `esp_task_wdt_deinit()` 取消订阅空闲任务并反初始化 TWDT。

在需要更细粒度级别监视的情况下（即确保调用特定的函数、存根、代码路径），TWDT 允许订阅 users。

- `esp_task_wdt_add_user()` 订阅 TWDT 的任意用户。此函数返回添加用户的用户句柄。
- 必须使用用户句柄调用 `esp_task_wdt_reset_user()`，防止 TWDT 超时。
- `esp_task_wdt_delete_user()` 取消订阅 TWDT 的任意用户。

配置 TWDT 的默认超时时间可以通过 `CONFIG_ESP_TASK_WDT_TIMEOUT_S` 配置项进行设置，并应至少设置为任何单个任务预计需要独占 CPU 的时长，例如某应用程序将进行长时间的密集计算且不让位给其他任务时的预计时长。也可以调用 `esp_task_wdt_init()`，在运行时更改此时间。

备注： 擦除较大的 flash 区域可能会非常耗时，并可能导致任务连续运行，触发 TWDT 超时。以下两种方法可以避免这种情况：

- 在 `menuconfig` 中增加 `CONFIG_ESP_TASK_WDT_TIMEOUT_S`，延长看门狗超时时间。
- 在擦除 flash 区域前，调用 `esp_task_wdt_init()` 增加看门狗超时时间。

如需了解更多信息，请参考 [SPI flash API](#)。

以下配置选项控制 TWDT 配置，默认情况下全部启用：

- `CONFIG_ESP_TASK_WDT_EN` - 启用 TWDT 功能。如果禁用此选项，TWDT 即使运行时已初始化也无法使用。
- `CONFIG_ESP_TASK_WDT_INIT` - TWDT 在启动期间自动初始化。禁用此选项时，仍可以调用 `esp_task_wdt_init()` 在运行时初始化 TWDT。
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - 空闲任务在启动时订阅了 TWDT。如果此选项被禁用，仍可以调用 `esp_task_wdt_init()` 再次订阅。

备注： 如果 TWDT 超时，会默认在继续运行应用程序前打印警告和回溯。如希望超时触发系统严重错误和系统重置，可以通过 `CONFIG_ESP_TASK_WDT_PANIC` 进行配置。

XTAL32K 看门狗定时器 (XTWDT)

ESP32-S2 的一个可选时钟输入是外部 32 kHz 无源晶振 (XTAL32K)，它常用作各种子系统（如 RTC）的时钟源 (XTAL32K_CLK)。

XTWDT 是一个专用看门狗定时器，用于确保 XTAL32K 正常工作。如果 XTAL32K_CLK 是 RTC_SLOW_CLK 的时钟源，当它停止振荡时，XTWDT 会检测到并生成中断。XTWDT 还具有切换振荡器功能，可以自动切换到内部振荡器（准确度较低）作为 RTC_SLOW_CLK 的时钟源。

由于切换到备用时钟是在硬件中完成的，因此切换也可以在 Deep-sleep 期间发生。这也说明，即使在芯片处于 Deep-sleep 并等待定时器超时，XTAL32K_CLK 停止工作，芯片还是能按计划唤醒。

如果 XTAL32K_CLK 重新开始正常工作，则可以调用 `esp_xt_wdt_restore_clk` 切换回时钟源，重新启用看门狗定时器。

配置

- 选择外部 32 KHz 晶体或振荡器时 (`CONFIG_RTC_CLK_SRC`)，通过 `CONFIG_ESP_XT_WDT` 配置选项启用 XTWDT。
- 设置 `CONFIG_ESP_XT_WDT_TIMEOUT` 选项来配置超时时间。
- 通过 `CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE` 配置选项启用自动切换备用时钟功能。

JTAG & 看门狗

在使用 OpenOCD 进行调试时，CPU 会在每次达到断点时停止运行。然而，如果遇到断点后看门狗定时器继续运行，就会最终触发复位，为调试代码带来巨大的困难。因此，OpenOCD 会在每个断点处禁用中断和任务的看门狗的硬件定时器。此外，在离开断点时，OpenOCD 也不会重新启用定时器，也就是说，中断看门狗和任务看门狗实际上被禁用。当 ESP32-S2 通过 JTAG 连接到 OpenOCD 时，看门狗不会打印任何警告或出现严重错误。

API 参考

任务看门狗 在 ESP-IDF 中使用任务看门狗的完整示例：[system/task_watchdog](#)

Header File

- `components/esp_system/include/esp_task_wdt.h`
- This header file can be included with:

```
#include "esp_task_wdt.h"
```

Functions

`esp_err_t esp_task_wdt_init` (const `esp_task_wdt_config_t` *config)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. This function will subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using `esp_task_wdt_add()` or `esp_task_wdt_add_user()`. This function won't start the timer if no task have been registered yet.

备注： `esp_task_wdt_init()` must only be called after the scheduler is started. Moreover, it must not be called by multiple tasks simultaneously.

参数 `config` -- [in] Configuration structure

返回

- ESP_OK: Initialization was successful

- ESP_ERR_INVALID_STATE: Already initialized
- Other: Failed to initialize TWDT

esp_err_t **esp_task_wdt_reconfigure** (const *esp_task_wdt_config_t* *config)

Reconfigure the Task Watchdog Timer (TWDT)

The function reconfigures the running TWDT. It must already be initialized when this function is called.

备注: esp_task_wdt_reconfigure() must not be called by multiple tasks simultaneously.

参数 config -- [in] Configuration structure

返回

- ESP_OK: Reconfiguring was successful
- ESP_ERR_INVALID_STATE: TWDT not initialized yet
- Other: Failed to initialize TWDT

esp_err_t **esp_task_wdt_deinit** (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

备注: esp_task_wdt_deinit() must not be called by multiple tasks simultaneously.

返回

- ESP_OK: TWDT successfully deinitialized
- Other: Failed to deinitialize TWDT

esp_err_t **esp_task_wdt_add** (*TaskHandle_t* task_handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call esp_task_wdt_reset() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

参数 task_handle -- Handle of the task. Input NULL to subscribe the current running task to the TWDT

返回

- ESP_OK: Successfully subscribed the task to the TWDT
- Other: Failed to subscribe task

esp_err_t **esp_task_wdt_add_user** (const char *user_name, *esp_task_wdt_user_handle_t* *user_handle_ret)

Subscribe a user to the Task Watchdog Timer (TWDT)

This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call esp_task_wdt_reset_user() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

参数

- **user_name** -- [in] String to identify the user
- **user_handle_ret** -- [out] Handle of the user

返回

- ESP_OK: Successfully subscribed the user to the TWDT
- Other: Failed to subscribe user

esp_err_t esp_task_wdt_reset (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

返回

- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- Other: Failed to reset

esp_err_t esp_task_wdt_reset_user (*esp_task_wdt_user_handle_t* user_handle)

Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

参数 user_handle -- [in] User handle

- ESP_OK: Successfully reset the TWDT on behalf of the user
- Other: Failed to reset

esp_err_t esp_task_wdt_delete (*TaskHandle_t* task_handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset().

参数 task_handle -- [in] Handle of the task. Input NULL to unsubscribe the current running task.**返回**

- ESP_OK: Successfully unsubscribed the task from the TWDT
- Other: Failed to unsubscribe task

esp_err_t esp_task_wdt_delete_user (*esp_task_wdt_user_handle_t* user_handle)

Unsubscribes a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call esp_task_wdt_reset_user().

参数 user_handle -- [in] User handle**返回**

- ESP_OK: Successfully unsubscribed the user from the TWDT
- Other: Failed to unsubscribe user

esp_err_t esp_task_wdt_status (*TaskHandle_t* task_handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

参数 task_handle -- [in] Handle of the task. Input NULL to query the current running task.**返回 :**

- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is not subscribed
- ESP_ERR_INVALID_STATE: TWDT was never initialized

void esp_task_wdt_isr_user_handler (void)

User ISR callback placeholder.

This function is called by task_wdt_isr function (ISR for when TWDT times out). It can be defined in user code to handle TWDT events.

备注: It has the same limitations as the interrupt function. Do not use ESP_LOGx functions inside.

`esp_err_t esp_task_wdt_print_triggered_tasks` (*task_wdt_msg_handler* msg_handler, void *opaque, int *cpus_fail)

Prints or retrieves information about tasks/users that triggered the Task Watchdog Timeout.

This function provides various operations to handle tasks/users that did not reset the Task Watchdog in time. It can print detailed information about these tasks/users, such as their names, associated CPUs, and whether they have been reset. Additionally, it can retrieve the total length of the printed information or the CPU affinity of the failing tasks.

备注:

- If `msg_handler` is not provided, the information will be printed to console using `ESP_EARLY_LOGE`.
 - If `msg_handler` is provided, the function will send the printed information to the provided message handler function.
 - If `cpus_fail` is provided, the function will store the CPU affinity of the failing tasks in the provided integer.
 - During the execution of this function, logging is allowed in critical sections, as TWDT timeouts are considered fatal errors.
-

参数

- **msg_handler** -- [in] Optional message handler function that will be called for each printed line.
- **opaque** -- [in] Optional pointer to opaque data that will be passed to the message handler function.
- **cpus_fail** -- [out] Optional pointer to an integer where the CPU affinity of the failing tasks will be stored.

返回

- `ESP_OK`: The function executed successfully.
- `ESP_FAIL`: No triggered tasks were found, and thus no information was printed or retrieved.

Structures

struct **esp_task_wdt_config_t**

Task Watchdog Timer (TWDT) configuration structure.

Public Members

uint32_t **timeout_ms**

TWDT timeout duration in milliseconds

uint32_t **idle_core_mask**

Bitmask of the core whose idle task should be subscribed on initialization where $1 \ll i$ means that core i 's idle task will be monitored by the TWDT

bool **trigger_panic**

Trigger panic when timeout occurs

Type Definitions

typedef struct esp_task_wdt_user_handle_s ***esp_task_wdt_user_handle_t**

Task Watchdog Timer (TWDT) user handle.

```
typedef void (*task_wdt_msg_handler)(void *opaque, const char *msg)
```

此部分 API 代码示例存放在 ESP-IDF 示例项目的 [system](#) 目录下。

Chapter 4

API 指南

4.1 应用层跟踪库

4.1.1 概述

ESP-IDF 中提供了应用层跟踪功能，用于分析应用程序的行为。这一功能在相应的库中实现，可以通过 `menuconfig` 开启。此功能允许用户在程序运行开销很小的前提下，通过 JTAG、UART 或 USB 接口在主机和 ESP32-S2 之间传输任意数据。用户也可同时使用 JTAG 和 UART 接口。UART 接口主要用于连接 SEGGER SystemView 工具（参见 [SystemView](#)）。

开发人员可以使用这一功能库将应用程序的运行状态发送给主机，在运行时接收来自主机的命令或者其他类型的信息。该库的主要使用场景有：

1. 收集来自特定应用程序的数据。具体请参阅[特定应用程序的跟踪](#)。
2. 记录到主机的轻量级日志。具体请参阅[记录日志到主机](#)。
3. 系统行为分析。具体请参阅[基于 SEGGER SystemView 的系统行为分析](#)。
4. 获取源代码覆盖率。具体请参阅[Gcov（源代码覆盖）](#)。

使用 JTAG 接口的跟踪组件工作示意图如下所示：

4.1.2 运行模式

该库支持两种运行模式：

后验模式：后验模式为默认模式，该模式不需要和主机进行交互。在这种模式下，跟踪模块不会检查主机是否已经从 `HW UP BUFFER` 缓冲区读走所有数据，而是直接使用新数据覆盖旧数据。如果用户仅对最新的跟踪数据感兴趣，例如想要分析程序在崩溃之前的行为，则推荐使用该模式。主机可以稍后根据用户的请求来读取数据，例如在使用 JTAG 接口的情况下，通过特殊的 `OpenOCD` 命令进行读取。

流模式：当主机连接到 ESP32-S2 时，跟踪模块会进入此模式。在这种模式下，跟踪模块在新数据写入 `HW UP BUFFER` 之前会检查其中是否有足够的空间，并在必要的时候等待主机读取数据并释放足够的内存。最大等待时间是由用户传递给相应 API 函数的超时时间参数决定的。因此当应用程序尝试使用有限的最大等待时间值来将数据写入跟踪缓冲区时，这些数据可能会被丢弃。尤其需要注意的是，如果在对时效要求严格的代码中（如中断处理函数、操作系统调度等）指定了无限的超时时间，将会导致系统故障。为了避免丢失此类关键数据，开发人员可以在 `menuconfig` 中开启 `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX` 选项，以启用额外的数据缓冲区。此宏还指定了在上述条件下可以缓冲的数据大小，它有助于缓解由于 USB 总线拥塞等原因导致的向主机传输数据间歇性减缓的状况。但是，当跟踪数据流的平均比特率超出硬件接口的能力时，该选项无法发挥作用。

图 1: 使用 JTAG 接口的跟踪组件

4.1.3 配置选项与依赖项

使用此功能需要在主机端和目标端进行以下配置：

1. **主机端：**应用程序跟踪通过 JTAG 来完成，因此需要在主机上安装并运行 OpenOCD。详细信息请参阅 [JTAG 调试](#)。
2. **目标端：**在 `menuconfig` 中开启应用程序跟踪功能。前往 `Component config > Application Level Tracing` 菜单，选择跟踪数据的传输目标（具体用于传输的硬件接口：JTAG 和/或 UART），选择任一非 `None` 的目标都会自动开启 `CONFIG_APPTRACE_ENABLE` 这个选项。对于 UART 接口，用户必须定义波特率、TX 和 RX 管脚及其他相关参数。

备注：为了实现更高的数据速率并降低丢包率，建议优化 JTAG 的时钟频率，使其达到能够稳定运行的最大值。详细信息请参阅 [优化 JTAG 的速度](#)。

以下为前述未提及的另外两个 `menuconfig` 选项：

1. *Threshold for flushing last trace data to host on panic* (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`)。使用 JTAG 接口时，此选项是必选项。在该模式下，跟踪数据以 16 KB 数据块的形式暴露给主机。在后验模式中，一个块被填充后会被暴露给主机，同时之前的块不再可用。也就是说，跟踪数据以 16 KB 的粒度进行覆盖。发生 Panic 时，当前输入块的最新数据将会被暴露给主机，主机可以读取数据以进行后续分析。如果系统发生 Panic 时，仍有少量数据还没来得及暴露给主机，那么之前收集的 16 KB 数据将丢失，主机只能获取少部分的最新跟踪数据，从而可能无法诊断问题。此 `menuconfig` 选项有助于避免此类情况，它可以控制发生 Panic 时刷新数据的阈值。例如，用户可以设置需要不少于 512 字节的最新跟踪数据，如果在发生 Panic 时待处理的数据少于 512 字节，则数据不会被刷新，也不会覆盖之前的 16 KB 数据。该选项仅在后验模式和使用 JTAG 工作时可发挥作用。
2. *Timeout for flushing last trace data to host on panic* (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`)。该选项仅在流模式下才可发挥作用，它可用于控制跟踪模块在发生 Panic 时等待主机读取最新数据的最长时间。
3. *UART RX/TX ring buffer size* (`CONFIG_APPTRACE_UART_TX_BUFF_SIZE`)。缓冲区的大小取决于通过 UART 传输的数据量。

4. *UART TX message size* (: `ref:CONFIG_APPTRACE_UART_TX_MSG_size`)。要传输的单条消息的最大尺寸。

4.1.4 如何使用此库

该库提供了用于在主机和 ESP32-S2 之间传输任意数据的 API。在 `menuconfig` 中启用该库后，目标应用程序的跟踪模块会在系统启动时自动初始化。因此，用户需要做的就是调用相应的 API 来发送、接收或者刷新数据。

特定应用程序的跟踪

通常，用户需要决定在每个方向上待传输数据的类型以及如何解析（处理）这些数据。要想在目标和主机之间传输数据，则需执行以下几个步骤：

1. 在目标端，用户需要实现将跟踪数据写入主机的算法。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_appttrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
↳ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_appttrace_write()` 函数使用 `memcpy` 把用户数据复制到内部缓存中。在某些情况下，使用 `esp_appttrace_buffer_get()` 和 `esp_appttrace_buffer_put()` 函数会更加理想，它们允许开发人员自行分配缓冲区并填充。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_appttrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
↳*tmo in us*);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_appttrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo.
↳in us*);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

另外，根据实际项目的需要，用户可能希望从主机接收数据。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_appttrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
```

(下页继续)

```

esp_err_t res = esp_appttrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not
↳wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}

```

esp_appttrace_read() 函数使用 memcopy 把主机端的数据复制到用户缓存区。在某些情况下, 使用 esp_appttrace_down_buffer_get() 和 esp_appttrace_down_buffer_put() 函数可能更为理想。它们允许开发人员占用一块读缓冲区并就地地进行有关处理操作。下面的代码片段展示了如何执行此操作。

```

#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_appttrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_appttrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz,
↳100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_appttrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
↳*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}

```

2. 下一步是编译应用程序的镜像, 并将其下载到目标板上。这一步可以参考文档[构建并烧写](#)。
3. 运行 OpenOCD (参见[JTAG 调试](#))。
4. 连接到 OpenOCD 的 telnet 服务器。用户可在终端执行命令 telnet <oocd_host> 4444。如果用户是在运行 OpenOCD 的同一台机器上打开 telnet 会话, 可以使用 localhost 替换上面命令中的 <oocd_host>。
5. 使用特殊的 OpenOCD 命令开始收集待跟踪的命令。此命令将传输跟踪数据并将其重定向到指定的文件或套接字 (当前仅支持文件作为跟踪数据目标)。相关命令的说明, 请参阅[启动调试器](#)。
6. 最后, 处理接收到的数据。由于数据格式由用户自己定义, 本文档中省略数据处理的具体流程。数据处理的范例可以参考位于 \$IDF_PATH/tools/esp_app_trace 下的 Python 脚本 apptrace_proc.py (用于功能测试) 和 logtrace_proc.py (请参阅[记录日志到主机](#)章节中的详细信息)。

OpenOCD 应用程序跟踪命令 HW UP BUFFER 在用户数据块之间共享, 并且会代替 API 调用者 (在任务或者中断上下文中) 填充分配到的内存。在多线程环境中, 正在填充缓冲区的任务/中断可能会被另一个高优先级的任务/中断抢占, 因此主机可能会读取到还未准备好的用户数据。对此, 跟踪模块在所有用户数据块之前添加一个数据头, 其中包含有分配的用户缓冲区的大小 (2 字节) 和实际写入的数据长度

(2 字节)，也就是说数据头总共长 4 字节。负责读取跟踪数据的 OpenOCD 命令在读取到不完整的用户数据块时会报错，但是无论如何，它都会将整个用户数据块（包括还未填充的区域）的内容放到输出文件中。

下文介绍了如何使用 OpenOCD 应用程序跟踪命令。

备注：目前，OpenOCD 还不支持将任意用户数据发送到目标的命令。

命令用法：

```
esp appttrace [start <options>] | [stop] | [status] | [dump <cores_num>
<outfile>]
```

子命令：

start 开始跟踪（连续流模式）。
stop 停止跟踪。
status 获取跟踪状态。
dump 转储所有后验模式的数据。

Start 子命令的语法：

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt
[skip_size]]]]]
```

outfile 用于保存来自两个 CPU 的数据文件的路径，该参数需要具有以下格式：file://path/to/file。

poll_period 轮询跟踪数据的周期（单位：毫秒），如果大于 0 则以非阻塞模式运行。默认为 1 毫秒。

trace_size 最多要收集的数据量（单位：字节），接收到指定数量的数据后将会停止跟踪。默认为 -1（禁用跟踪大小停止触发器）。

stop_tmo 空闲超时（单位：秒），如果指定的时间段内都没有数据就会停止跟踪。默认为 -1（禁用跟踪超时停止触发器）。还可以将其设置为比目标跟踪命令之间的最长暂停值更长的值（可选）。

wait4halt 如果设置为 0 则立即开始跟踪，否则命令会先等待目标停止（复位、打断点等），然后对其进行自动恢复并开始跟踪。默认值为 0。

skip_size 开始时要跳过的字节数，默认为 0。

备注：如果 poll_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令将不可用。必须通过复位电路板或者在 OpenOCD 的窗口中（非 telnet 会话窗口）使用快捷键 Ctrl+C。另一种选择是设置 trace_size 并等待，当收集到指定数据量时，跟踪会自动停止。

命令使用示例：

1. 将 2048 个字节的跟踪数据收集到 trace.log 文件中，该文件将保存在 openocd-esp32 目录中。

```
esp appttrace start file://trace.log 1 2048 5 0 0
```

跟踪数据会被检索并以非阻塞的模式保存到文件中，如果收集满 2048 字节的数据或者在 5 秒内都没有新的数据，那么该过程就会停止。

.. note::

在将数据提供给 OpenOCD 之前，会对其进行缓冲。如果看到 “Data timeout!” 的消息，则表示目标可能在超时之前没有向 OpenOCD 发送足够的数以清空缓冲区。要解决这个问题，可以增加超时时间或者使用函数 `esp_appttrace_flush()` 以特定间隔刷新数据。

2. 在非阻塞模式下无限地检索跟踪数据。

```
esp appttrace start file://trace.log 1 -1 -1 0 0
```

对收集数据的大小没有限制，也不设置超时时间。要停止此过程，可以在 OpenOCD 的 telnet 会话窗口中发送 `esp appttrace stop` 命令，或者在 OpenOCD 窗口中使用快捷键 Ctrl+C。

(下页继续)

3. 检索跟踪数据并无限期保存。

```
esp apptrace start file://trace.log 0 -1 -1 0 0
```

在跟踪停止之前，OpenOCD 的 telnet 会话窗口将不可用。要停止跟踪，请在 OpenOCD 的窗口中使用快捷键 Ctrl+C。

4. 等待目标停止，然后恢复目标的操作并开始检索数据。当收集满 2048 字节的数据后就停止：

```
esp apptrace start file://trace.log 0 2048 -1 1 0
```

想要复位后立即开始跟踪，请使用 OpenOCD 的 ``reset halt`` 命令。

记录日志到主机

记录日志到主机是 ESP-IDF 中一个非常实用的功能：通过应用层跟踪库将日志保存到主机端。某种程度上，这也算是一种半主机 (semihosting) 机制，相较于调用 ESP_LOGx 将待打印的字符串发送到 UART 的日志记录方式，此功能将大部分工作转移到了主机端，从而减少了本地工作量。

ESP-IDF 的日志库会默认使用类 vprintf 的函数将格式化的字符串输出到专用的 UART，一般来说涉及以下几个步骤：

1. 解析格式字符串以获取每个参数的类型。
2. 根据其类型，将每个参数都转换为字符串。
3. 格式字符串与转换后的参数一起发送到 UART。

虽然可以对类 vprintf 函数进行一定程度的优化，但由于在任何情况下都必须执行上述步骤，并且每个步骤都会消耗一定的时间（尤其是步骤 3），所以经常会发生以下这种情况：向程序中添加额外的打印信息以诊断问题，却改变了应用程序的行为，使得问题无法复现。在最严重的情况下，程序无法正常工作，最终导致报错甚至挂起。

想要解决此类问题，可以使用更高的波特率或者其他更快的接口，并将字符串格式化的工作转移到主机端。

通过应用层跟踪库的 esp_appttrace_vprintf 函数，可以将日志信息发送到主机，该函数不执行格式字符串和参数的完全解析，而仅仅计算传递参数的数量，并将它们与格式字符串地址一起发送给主机。主机端会通过一个特殊的 Python 脚本来处理并打印接收到的日志数据。

局限 目前通过 JTAG 实现记录日志还存在以下几点局限：

1. 不支持使用 ESP_EARLY_LOGx 宏进行跟踪。
2. 不支持大小超过 4 字节的 printf 参数（例如 double 和 uint64_t）。
3. 仅支持 .rodata 段中的格式字符串和参数。
4. 最多支持 256 个 printf 参数。

如何使用 为了使用跟踪模块来记录日志，用户需要执行以下步骤：

1. 在目标端，需要安装特殊的类 vprintf 函数 esp_appttrace_vprintf()，该函数负责将日志数据发送给主机，使用方法为 esp_log_set_vprintf(esp_appttrace_vprintf);。如需将日志数据再次重定向给 UART，请使用 esp_log_set_vprintf(vprintf);。
2. 按照特定应用程序的跟踪 章节中的第 2-5 步进行操作。
3. 打印接收到的日志记录，请在终端运行以下命令：\$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file。

Log Trace Processor 命令选项 命令用法：

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

位置参数 (必要)：

trace_file 日志跟踪文件的路径。

elf_file 程序 ELF 文件的路径。

可选参数：

-h, --help 显示此帮助信息并退出。

--no-errors, -n 不打印错误信息。

基于 SEGGER SystemView 的系统行为分析

ESP-IDF 中另一个基于应用层跟踪库的实用功能是系统级跟踪，它会生成与 SEGGER SystemView 工具相兼容的跟踪信息。SEGGER SystemView 是一款实时记录和可视化工具，用来分析应用程序运行时的行为，可通过 UART 接口实时查看事件。

如何使用 若需使用这个功能，需要在 menuconfig 中开启 `CONFIG_APPTRACE_SV_ENABLE` 选项，具体路径为 Component config > Application Level Tracing > FreeRTOS SystemView Tracing。同一菜单栏下还开启了其它几个选项：

1. *SystemView destination*。选择需要使用的接口：JTAG 或 UART。使用 UART 接口时，可以将 SystemView 应用程序直接连接到 ESP32-S2 并实时接收数据。
2. *ESP32-S2 timer to use as SystemView timestamp source* (`CONFIG_APPTRACE_SV_TS_SOURCE`)。选择 SystemView 事件使用的时间戳来源。在单核模式下，使用 ESP32-S2 内部的循环计数器生成时间戳，其最大的工作频率是 240 MHz（时间戳粒度大约为 4 ns）。在双核模式下，使用工作在 40 MHz 的外部定时器，因此时间戳粒度为 25 ns。
3. 可以单独启用或禁用的 SystemView 事件集合 (`CONFIG_APPTRACE_SV_EVT_XXX`):
 - Trace Buffer Overflow Event
 - ISR Enter Event
 - ISR Exit Event
 - ISR Exit to Scheduler Event
 - Task Start Execution Event
 - Task Stop Execution Event
 - Task Start Ready State Event
 - Task Stop Ready State Event
 - Task Create Event
 - Task Terminate Event
 - System Idle Event
 - Timer Enter Event
 - Timer Exit Event

ESP-IDF 中已经包含了所有用于生成兼容 SystemView 跟踪信息的代码，用户只需配置必要的项目选项（如上所示），然后构建、烧写映像到目标板，接着参照前面的介绍，使用 OpenOCD 收集数据。

4. 想要通过 UART 接口进行实时跟踪，请在菜单配置选项 Component config > Application Level Tracing > FreeRTOS SystemView Tracing 中选择 Pro 或 App CPU。

OpenOCD SystemView 跟踪命令选项 命令用法：

```
esp sysview [start <options>] | [stop] | [status]
```

子命令：

start 开启跟踪（连续流模式）。

stop 停止跟踪。

status 获取跟踪状态。

Start 子命令语法：

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

outfile1 保存 PRO CPU 数据的文件路径。此参数需要具有如下格式：file://path/to/file。

outfile2 保存 APP CPU 数据的文件路径。此参数需要具有如下格式：file://path/to/file。

poll_period 跟踪数据的轮询周期（单位：毫秒）。如果该值大于 0，则命令以非阻塞的模式运行。默认为 1 毫秒。

trace_size 最多要收集的数据量（单位：字节）。当收到指定数量的数据后，将停止跟踪。默认值是 -1（禁用跟踪大小停止触发器）。

stop_tmo 空闲超时（单位：秒）。如果指定的时间内没有数据，将停止跟踪。默认值是 -1（禁用跟踪超时停止触发器）。

备注： 如果 `poll_period` 为 0，则在跟踪停止之前，OpenOCD 的 `telnet` 命令行将不可用。你需要复位板卡，或者在 OpenOCD 的窗口（非 `telnet` 会话窗口）输入 `Ctrl+C` 命令，手动停止跟踪。另一个办法是设置 `trace_size`，等到收集满指定数量的数据后自动停止跟踪。

命令使用示例：

1. 将 SystemView 跟踪数据收集到文件 `pro-cpu.SVdat` 和 `app-cpu.SVdat` 中。这些文件会被保存在 `openocd-esp32` 目录中。

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat
```

跟踪数据被检索并以非阻塞的方式保存。要停止此过程，需要在 OpenOCD 的 `telnet` 会话窗口输入 `esp sysview stop` 命令，也可以在 OpenOCD 窗口中按下快捷键 `Ctrl+C`。

2. 检索跟踪数据并无限保存。

```
esp32 sysview start file://pro-cpu.SVdat file://app-cpu.SVdat 0 -1 -1
```

OpenOCD 的 `telnet` 命令行在跟踪停止前会无法使用，要停止跟踪，请在 OpenOCD 窗口使用 `Ctrl+C` 快捷键。

数据可视化 收集到跟踪数据后，用户可以使用特殊的工具对结果进行可视化并分析程序行为。

在工具中单独分析每个核的跟踪数据是比较棘手的，但是 Eclipse 提供了 *Impulse* 插件，该插件可以加载多个跟踪文件，并且可以在同一视图中检查来自两个内核的事件。此外，与免费版的 SystemView 相比，此插件没有 1,000,000 个事件的限制。

关于如何安装、配置 *Impulse* 并使用它来可视化来自单个核心的跟踪数据，请参阅 [官方教程](#)。

备注： ESP-IDF 使用自己的 SystemView FreeRTOS 事件 ID 映射，因此用户需要将 `$(SYSVIEW_INSTALL_DIR)/Description/SYSVIEW_FreeRTOS.txt` 替换成 `$(IDF_PATH)/tools/esp_app_trace/SYSVIEW_FreeRTOS.txt`。在使用上述链接配置 SystemView 序列化程序时，也应该使用该特定文件的内容。

Gcov（源代码覆盖）

Gcov 和 Gcovr 简介 源代码覆盖率显示程序运行时间内执行的每一条程序执行路径的数量和频率。**Gcov** 是一款 GCC 工具，与编译器协同使用时，可生成日志文件，显示源文件每行的执行次数。**Gcovr** 是管理 Gcov 和生成代码覆盖率总结的工具。

一般来说，使用 Gcov 在主机上编译和运行程序会经过以下步骤：

1. 使用 GCC 以及 `--coverage` 选项编译源代码。编译器会在编译过程中生成一个 `.gcno` 注释文件，该文件包含重建执行路径块图以及将每个块映射到源代码行号等信息。每个用 `--coverage` 选项编译的源文件都会生成自己的同名 `.gcno` 文件（如 `main.c` 在编译时会生成 `main.gcno`）。
2. 执行程序。在执行过程中，程序会生成 `.gcda` 数据文件。这些数据文件包含了执行路径的计数统计。程序将为每个用 `--coverage` 选项编译的源文件生成一个 `.gcda` 文件（如 `main.c` 将生成 `main.gcda`）。
3. Gcov 或 Gcovr 可用于生成基于 `.gcno`、`.gcda` 和源文件的代码覆盖。Gcov 将以 `.gcov` 文件的形式为每个源文件生成基于文本的覆盖报告，而 Gcovr 将以 HTML 格式生成覆盖报告。

ESP-IDF 中的 Gcov 和 Gcovr 应用 在 ESP-IDF 中使用 Gcov 的过程比较复杂，因为程序不在主机上运行，而在目标机上运行。代码覆盖率数据（即 .gcda 文件）最初存储在目标机上，OpenOCD 在运行时通过 JTAG 将代码覆盖率数据从目标机转储到主机上。在 ESP-IDF 中使用 Gcov 可以分为以下几个步骤：

1. 为 Gcov 设置项目
2. 转储代码覆盖数据
3. 生成代码覆盖报告

为 Gcov 设置项目

编译器选项 为了获取项目中的代码覆盖率数据，必须用 `--coverage` 选项编译项目中的一个或多个源文件。在 ESP-IDF 中，这可以在组件级或单个源文件级实现：

- 在组件的 `CMakeLists.txt` 文件中添加 `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` 可确保使用 `--coverage` 选项编译组件中的所有源文件。
- 在组件的 `CMakeLists.txt` 文件中添加 `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` 可确保使用 `--coverage` 选项编译同一组件中选定的某些源文件（如 `source1.c` 和 `source2.c`）。

当一个源文件用 `--coverage` 选项编译时（例如 `gcov_example.c`），编译器会在项目的构建目录下生成 `gcov_example.gcno` 文件。

项目配置 在构建有源代码覆盖的项目之前，请运行 `idf.py menuconfig` 以启用以下项目配置选项。

- 通过 `CONFIG_APPTRACE_DESTINATION1` 选项选择 `Trace Memory` 来启用应用程序跟踪模块。
- 通过 `CONFIG_APPTRACE_GCOV_ENABLE` 选项启用 Gcov 主机。

转储代码覆盖数据 一旦项目使用 `--coverage` 选项编译并烧录到目标机上，在应用程序运行时，代码覆盖数据将存储在目标机内部（即在跟踪存储器中）。将代码覆盖率数据从目标机转移到主机上的过程称为转储。

覆盖率数据的转储通过 OpenOCD 进行（关于如何设置和运行 OpenOCD，请参考 [JTAG 调试](#)）。由于该过程需要通过向 OpenOCD 发出命令来触发转储，因此必须打开 telnet 会话，以向 OpenOCD 发出这些命令（运行 `telnet localhost 4444`）。GDB 也可以代替 telnet 来向 OpenOCD 发出命令，但是所有从 GDB 发出的命令都需要以 `mon <ocd_command>` 为前缀。

当目标机转储代码覆盖数据时，.gcda 文件存储在项目的构建目录中。例如，如果 main 组件的 `gcov_example_main.c` 在编译时使用了 `--coverage` 选项，那么转储代码覆盖数据将在 `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda` 中生成 `gcov_example_main.gcda` 文件。注意，编译过程中产生的 .gcno 文件也放在同一目录下。

代码覆盖数据的转储可以在应用程序的整个生命周期内多次进行。每次转储都会用最新的代码覆盖信息更新 .gcda 文件。代码覆盖数据是累积的，因此最新的数据将包含应用程序整个生命周期中每个代码路径的总执行次数。

ESP-IDF 支持两种将代码覆盖数据从目标机转储到主机的方法：

- 运行中实时转储
- 硬编码转储

运行中实时转储 通过 telnet 会话调用 OpenOCD 命令 `ESP32-S2 gcov` 来触发运行时的实时转储。一旦被调用，OpenOCD 将立即抢占 ESP32-S2 的当前状态，并执行内置的 ESP-IDF Gcov 调试存根函数。调试存根函数将数据转储到主机。完成后，ESP32-S2 将恢复当前状态。

硬编码转储 硬编码转储是由应用程序本身从程序内部调用 `esp_gcov_dump()` 函数触发的。在调用时，应用程序将停止并等待 OpenOCD 连接，同时检索代码覆盖数据。一旦 `esp_gcov_dump()` 函数被调用，主机将通过 telnet 会话执行 `esp gcov dump` OpenOCD 命令，该命令会将 OpenOCD 连接到 ESP32-S2，

检索代码覆盖数据，然后断开与 ESP32-S2 的连接，从而恢复应用程序。在应用程序的生命周期中可多次触发硬编码转储。

在必要时（如应用程序初始化后或是应用程序主循环的每次迭代期间）放置 `esp_gcov_dump()`，当应用程序在生命周期的某刻需要代码覆盖率数据时，硬编码转储会非常有用。

GDB 可以用来在 `esp_gcov_dump()` 上设置断点，然后使用 `gdbinit` 脚本自动调用 `mon esp gcov dump`（关于 GDB 的使用可参考[使用命令行调试](#)）。

以下 GDB 脚本将在 `esp_gcov_dump()` 处添加一个断点，然后调用 `mon esp gcov dump OpenOCD` 命令。

```
b esp_gcov_dump
commands
mon esp gcov dump
end
```

备注：注意，所有的 OpenOCD 命令都应该在 GDB 中以 `mon <occd_command>` 方式调用。

生成代码覆盖报告 一旦代码覆盖数据被转储，`.gcno`、`.gcda` 和源文件可以用来生成代码覆盖报告。该报告会显示源文件中每行被执行的次数。

`Gcov` 和 `Gcovr` 都可以用来生成代码覆盖报告。安装 Xtensa 工具链时会一起安装 `Gcov`，但 `Gcovr` 可能需要单独安装。关于如何使用 `Gcov` 或 `Gcovr`，请参考[Gcov 文档](#)和[Gcovr 文档](#)。

在工程中添加 Gcovr 构建目标 用户可以在自己的工程中定义额外的构建目标，从而通过一个简单的构建命令即可更方便地生成报告。

请在工程的 `CMakeLists.txt` 文件中添加以下内容：

```
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

可使用以下命令：

- `cmake --build build/ --target gcovr-report:` 在 `$(BUILD_DIR_BASE)/coverage_report/html` 目录下生成 HTML 格式代码覆盖报告。
- `cmake --build build/ --target cov-data-clean:` 删除所有代码覆盖数据文件。

4.2 应用程序的启动流程

本文将介绍 ESP32-S2 从上电到运行 `app_main` 函数中间所经历的步骤（即启动流程）。

宏观上，该启动流程可以分为如下 3 个步骤：

1. **一级引导程序** 被固化在了 ESP32-S2 内部的 ROM 中，它会从 flash 的 0x1000 偏移地址处加载二级引导程序至 RAM (IRAM & DRAM) 中。
2. **二级引导程序** 从 flash 中加载分区表和主程序镜像至内存中，主程序中包含了 RAM 段和通过 flash 高速缓存映射的只读段。
3. **应用程序启动阶段** 运行，这时第二个 CPU 和 RTOS 的调度器启动。

下面会对上述过程进行更为详细的阐述。

4.2.1 一级引导程序

SoC 复位后，CPU 会立即开始运行，执行所有的初始化操作。复位向量代码位于 ESP32-S2 芯片掩膜 ROM 处，且不能被修改。

复位向量调用的启动代码会根据 GPIO_STRAP_REG 寄存器的值来确定 ESP32-S2 的启动模式，该寄存器保存着复位后 bootstrap 引脚的电平状态。根据不同的复位原因，程序会执行如下操作：

1. 从深度睡眠模式复位：如果 RTC_CNTL_STORE6_REG 寄存器的值非零，且 RTC_CNTL_STORE7_REG 寄存器中的 RTC 内存的 CRC 校验值有效，那么程序会使用 RTC_CNTL_STORE6_REG 寄存器的值作为入口地址，并立即跳转到该地址运行。如果 RTC_CNTL_STORE6_REG 的值为零，或 RTC_CNTL_STORE7_REG 中的 CRC 校验值无效，又或通过 RTC_CNTL_STORE6_REG 调用的代码返回，那么则像上电复位一样继续启动。**注意：**如果想在这里运行自定义的代码，可以参考[深度睡眠](#)文档里面介绍的深度睡眠存根机制方法。
2. 上电复位、软件 SoC 复位、看门狗 SoC 复位：检查 GPIO_STRAP_REG 寄存器，判断是否请求自定义启动模式，如 UART 下载模式。如果是，ROM 会执行此自定义加载模式，否则会像软件 CPU 复位一样继续启动。请参考 ESP32-S2 技术规格书了解 SoC 启动模式以及具体执行过程。
3. 软件 CPU 复位、看门狗 CPU 复位：根据 EFUSE 中的值配置 SPI flash，然后尝试从 flash 中加载代码，这部分将会在后面一小节详细介绍。

备注：正常启动模式下会使能 RTC 看门狗，因此，如果进程中断或停止，看门狗将自动重置 SOC 并重新启动过程。如果 strapping GPIOs 已更改，则可能导致 SoC 陷入新的启动模式。

二级引导程序二进制镜像会从 flash 的 0x1000 偏移地址处加载。该地址前面的 flash 4 kB 扇区未使用。

4.2.2 二级引导程序

在 ESP-IDF 中，存放在 flash 的 0x1000 偏移地址处的二进制镜像就是二级引导程序。二级引导程序的源码可以在 ESP-IDF 的 [components/bootloader](#) 目录下找到。ESP-IDF 使用二级引导程序可以增加 flash 分区的灵活性（使用分区表），并且方便实现 flash 加密，安全引导和空中升级 (OTA) 等功能。

当一级引导程序校验并加载完二级引导程序后，它会从二进制镜像的头部找到二级引导程序的入口点，并跳转过去运行。

二级引导程序默认从 flash 的 0x8000 偏移地址处（[可配置的值](#)）读取分区表。请参考[分区表](#)获取详细信息。引导程序会寻找工厂分区和 OTA 应用程序分区。如果在分区表中找到了 OTA 应用程序分区，引导程序将查询 otadata 分区以确定应引导哪个分区。更多信息请参考[空中升级 \(OTA\)](#)。

关于 ESP-IDF 引导程序可用的配置选项，请参考[引导加载程序 \(Bootloader\)](#)。

对于选定的分区，二级引导程序将从 flash 逐段读取二进制镜像：

- 对于在内部 *IRAM*（指令 RAM）或 *DRAM*（数据 RAM）中具有加载地址的段，将把数据从 flash 复制到它们的加载地址处。
- 对于一些加载地址位于 *DROM*（数据存储在 flash 中）或 *IROM*（代码从 flash 中运行）区域的段，通过配置 flash MMU，可为从 flash 到加载地址提供正确的映射。

一旦处理完所有段（即加载了代码并设置了 flash MMU），二级引导程序将验证应用程序的完整性，并从二进制镜像文件的头部寻找入口地址，然后跳转到该地址处运行。

4.2.3 应用程序启动阶段

应用程序启动包含了从应用程序开始执行到 app_main 函数在任务内部运行前的所有过程。可分为三个阶段：

- 硬件和基本 C 语言运行环境的端口初始化。
- 软件服务和 FreeRTOS 的系统初始化。
- 运行主任务并调用 app_main。

备注：通常不需要了解 ESP-IDF 应用程序初始化的所有阶段。如果需要仅从应用程序开发人员的角度了解初始化，请跳至[运行主任务](#)。

端口初始化

ESP-IDF 应用程序的入口是 `components/esp_system/port/cpu_start.c` 文件中的 `call_start_cpu0` 函数。这个函数由二级引导加载程序执行，并且从不返回。

该端口层的初始化功能会初始化基本的 C 运行环境 (“CRT”)，并对 SoC 的内部硬件进行了初始配置。

- 为应用程序重新配置 CPU 异常（允许应用程序中断处理程序运行，并使用为应用程序配置的选项来处理**严重错误**，而不是使用 ROM 提供的简易版错误处理程序处理）。
- 如果没有设置选项 `CONFIG_BOOTLOADER_WDT_ENABLE`，则不使能 RTC 看门狗定时器。
- 初始化内部存储器（数据和 bss）。
- 完成 MMU 高速缓存配置。
- 如果配置了 PSRAM，则使能 PSRAM。
- 将 CPU 时钟设置为项目配置的频率。
- 如果配置了内存保护，则初始化内存保护。

`call_start_cpu0` 完成运行后，将调用在 `components/esp_system/startup.c` 中找到的“系统层”初始化函数 `start_cpu0`。

系统初始化

主要的系统初始化函数是 `start_cpu0`。默认情况下，这个函数与 `start_cpu0_default` 函数弱链接。这意味着可以覆盖这个函数，增加一些额外的初始化步骤。

主要的系统初始化阶段包括：

- 如果默认的日志级别允许，则记录该应用程序的相关信息（项目名称、[应用程序版本](#)等）。
- 初始化堆分配器（在这之前，所有分配必须是静态的或在堆栈上）。
- 初始化 `newlib` 组件的系统调用和时间函数。
- 配置断电检测器。
- 根据[串行控制台配置](#)设置 `libc` `stdin`、`stdout`、和 `stderr`。
- 执行与安全有关的检查，包括为该配置烧录 `efuse`（包括[永久限制 ROM 下载模式](#)）。
- 初始化 SPI flash API 支持。
- 调用全局 C++ 构造函数和任何标有 `__attribute__((constructor))` 的 C 函数。

二级系统初始化允许单个组件被初始化。如果一个组件有一个用 `ESP_SYSTEM_INIT_FN` 宏注释的初始化函数，它将作为二级初始化的一部分被调用。

运行主任务

在所有其他组件都初始化后，主任务会被创建，FreeRTOS 调度器开始运行。

做完一些初始化任务后（需要启动调度器），主任务在固件中运行应用程序提供的函数 `app_main`。

运行 `app_main` 的主任务有一个固定的 RTOS 优先级（比最小值高）和一个可配置的堆栈大小。

与普通的 FreeRTOS 任务（或嵌入式 C 的 `main` 函数）不同，`app_main` 任务可以返回。如果 `app_main` 函数返回，那么主任务将会被删除。系统将继续运行其他的 RTOS 任务。因此可以将 `app_main` 实现为一个创建其他应用任务然后返回的函数，或主应用任务本身。

4.3 引导加载程序 (Bootloader)

ESP-IDF 软件引导加载程序 (Bootloader) 主要执行以下任务：

1. 内部模块的最小化初始配置；
2. 如果配置了 *flash 加密* 和/或 *Secure*，则对其进行初始化。
3. 根据分区表和 *ota_data*（如果存在）选择需要引导的应用程序 (app) 分区；
4. 将此应用程序镜像加载到 RAM (IRAM 和 DRAM) 中，最后把控制权转交给此应用程序。

引导加载程序位于 flash 的 0x1000 偏移地址处。

关于启动过程以及 ESP-IDF 引导加载程序的更多信息，请参考[应用程序的启动流程](#)。

4.3.1 引导加载程序兼容性

建议使用最新发布的 *ESP-IDF* 版本。OTA（空中升级）更新可以在现场烧录新的应用程序，但不能烧录一个新的引导加载程序。因此，引导加载程序支持引导从 ESP-IDF 新版本中构建的应用程序。

但不支持引导从 ESP-IDF 旧版本中构建的程序。如果现有产品可能需要将应用程序降级到旧版本，那么在手动更新 ESP-IDF 时，请继续使用旧版本 ESP-IDF 引导加载程序的二进制文件。

备注：如果在生产中测试现有产品的 OTA 更新，请确保测试中使用的 ESP-IDF 引导加载程序二进制文件与生产中部署的相同。

配置 SPI flash

每个 ESP-IDF 应用程序或引导加载程序的二进制文件中都包含一个文件头，其中内置了 *CONFIG_ESPTOOLPY_FLASHMODE*、*CONFIG_ESPTOOLPY_FLASHFREQ*、和 *CONFIG_ESPTOOLPY_FLASHSIZE*。这些是用于在启动时配置 SPI flash。

ROM 中的一级引导程序从 flash 中读取二级引导程序文件头中的配置信息，并使用这些信息来加载剩余的二级引导程序。然而，此时系统的时钟速度低于其被配置的速度，并且在这个阶段，只支持部分 flash 模式。因此，当二级引导程序运行时，它会从当前应用程序的二进制文件头中读取数据（而不是从引导加载程序的文件头中读取数据），并使用这些数据重新配置 flash。这样的配置流程可让 OTA 更新去更改当前使用的 SPI flash 的配置。

4.3.2 日志级别

引导加载程序日志的级别默认为“Info”。通过设置 *CONFIG_BOOTLOADER_LOG_LEVEL* 选项，可以增加或减少这个等级。这个日志级别与应用程序中使用的日志级别是分开的（见[日志库](#)）。

降低引导加载程序日志的详细程度可以稍微缩短整个项目的启动时间。

4.3.3 恢复出厂设置

在更新出现问题时，最好能有一种方法让设备回到已知的正常状态，这时可选择恢复出厂设置。

要回到原始出厂设置并清除所有用户设置，请在引导加载程序中配置 *CONFIG_BOOTLOADER_FACTORY_RESET*。

以下两种方式可以将设备恢复出厂设置。

- 清除一个或多个数据分区。 *CONFIG_BOOTLOADER_DATA_FACTORY_RESET* 选项允许用户选择哪些数据分区在恢复出厂设置时需要被擦除。用户可以使用以逗号分隔的列表形式指定分区的名称，为了提高可读性，可以选择添加空格（如： *nvs*, *phy_init*, *nvs_custom*）。

请确保选项里指定的分区名称和分区表中的名称相同。此处不能指定“app”类型的分区。

- 从“工厂”应用分区启动。当启用 `CONFIG_BOOTLOADER_OTA_DATA_ERASE` 选项，恢复出厂设置后，设备将从默认的“工厂”应用分区启动（如果分区表中没有“工厂”应用分区，则从默认的 OTA 应用分区启动）。这个恢复过程是通过擦除 OTA 数据分区来完成的，OTA 数据分区中保存了当前选择的 OTA 分区槽。“工厂”应用分区槽（如果存在）永远不会通过 OTA 更新，因此重置为从“工厂”应用分区启动则意味着让固件应用程序恢复正常状态。

这两个配置选项都可以独立启用。

此外，以下配置选项用于配置触发恢复出厂设置的条件：

- `CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET` - 输入管脚 (GPIO) 的编号，该管脚用于触发恢复出厂设置。必须在重置时将此管脚拉低或拉高（可配置）才能触发出厂重置事件。
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - 管脚电平保持时间（默认为 5 秒）。设备重置后，管脚电平必须保持该设定的时间，才能执行恢复出厂设置或引导测试分区（如适用）。
- `CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL` - 设置管脚电平高低。设备重置后，根据此设置将管脚拉高或拉低，才能触发出厂重置事件。如果管脚具有内部上拉，则上拉会在管脚采样前生效。有关管脚内部上拉的详细信息，请参考 ESP32-S2 的技术规格书。

如果应用程序需要知道设备是否触发了出厂重置，可以通过调用 `bootloader_common_get_rtc_retain_mem_factory_reset_state()` 函数来确定：

- 如果读取到设备出厂重置状态为 `true`，会返回状态 `true`，说明设备已经触发出厂重置。此后会重置状态为 `false`，以便后续的出厂重置触发判断。
- 如果读取到设备出厂重置状态为 `false`，会返回状态 `false`，说明设备并未触发出厂重置，或者保存此状态的内存区域已失效。

同时需要注意该功能需要占用部分 RTC FAST 内存（占用的内存与 `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` 大小相同）。

4.3.4 从测试固件启动

用户可以编写特殊固件用于生产环境中测试，并在需要的时候运行。此时需要在项目分区表中专门申请一块分区用于保存该测试固件，其类型为 `app`，子类型为 `test`（详情请参考分区表）。

实现该测试应用固件需要为测试应用创建一个完全独立的 ESP-IDF 项目（ESP-IDF 中的每个项目仅构建一个应用）。该测试应用可以独立于主项目进行开发和测试，然后在生成测试时作为一个预编译 `.bin` 文件集成到主项目的测试应用程序分区的地址。

要在主项目的引导加载程序中支持这个功能，请设置 `CONFIG_BOOTLOADER_APP_TEST` 并配置以下三个选项：

- `CONFIG_BOOTLOADER_NUM_PIN_APP_TEST` - 设置启动 TEST 分区的管脚编号，该管脚将被配置为输入并启用内部上拉。要触发测试应用，必须在重置时将此管脚拉低或拉高（可配置）。
释放管脚输入并重启设备后，将重新启用默认的启动顺序，即启动工厂分区或任意 OTA 应用分区槽。
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - 设置 GPIO 电平保持的时间，默认为 5 秒。设备重置后，管脚电平必须保持该设定的时间，才能执行恢复出厂设置或引导测试分区（如适用）。
- `CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL` - 配置应在 GPIO 的高电平还是低电平上触发测试分区启动。若 GPIO 有内部上拉，则该功能在采样管脚前就会被启用。关于管脚内部上拉的详细信息，请参考 ESP32-S2 数据规格书。

4.3.5 回滚

回滚和反回滚功能也必须在引导程序中配置。

请参考 [OTA API 参考文档](#) 中的 [应用程序回滚](#) 和 [防回滚](#) 章节。

4.3.6 看门狗

芯片配备两组看门狗定时器：主系统看门狗定时器 (MWDT_WDT) 和 RTC 看门狗定时器 (RTC_WDT)。芯片上电时，两组看门狗定时器都会被启用，但在引导加载程序中，两组看门狗定时器都会被禁用。设置 `CONFIG_BOOTLOADER_WDT_ENABLE`（默认设置）可以重新启用 RTC 看门狗定时器，用于跟踪从启用引导加载程序到调用用户主函数的时间。此期间内 RTC 看门狗定时器始终可用，并且如果在 9 秒内没有应用程序成功启动，则 RTC 看门狗定时器会自动重置芯片。这一功能可以有效防止启动过程中由于电源不稳定而导致的死机。

- 可以通过设置 `CONFIG_BOOTLOADER_WDT_TIME_MS` 并重新编译引导加载程序来调整超时时间。
- 通过禁用 `CONFIG_BOOTLOADER_WDT_ENABLE` 设置并重新编译引导加载程序，可以在引导加载程序中禁用 RTC 看门狗，但并不建议这样做。
- 请参阅 [硬件看门狗定时器](#)，了解如何在应用程序中使用 RTC_WDT。

4.3.7 引导加载程序大小

当需要启用额外的引导加载程序功能，包括 [flash 加密](#) 或安全启动，尤其是设置高级别 `CONFIG_BOOTLOADER_LOG_LEVEL` 时，监控引导加载程序 .bin 文件的大小变得非常重要。

当使用默认的 `CONFIG_PARTITION_TABLE_OFFSET` 值 0x8000 时，二进制文件最大可为 0x8000 字节。

如果引导加载程序二进制文件过大，则引导加载程序会构建将失败并显示“Bootloader binary size [..] is too large for partition table offset”的错误。如果此二进制文件已经被烧录，那么 ESP32-S2 将无法启动 - 日志中将记录无效分区表或无效引导加载程序校验和的错误。

可以使用如下方法解决此问题：

- 将 [bootloader 编译器优化](#) 重新设置回默认值 “Size”。
- 降低 [引导加载程序日志级别](#)。将日志级别设置为 Warning, Error 或 None 都会显著减少最终二进制文件的大小（但也可能会让调试变得更加困难）。
- 将 `CONFIG_PARTITION_TABLE_OFFSET` 设置为高于 0x8000 的值，以便稍后将分区表放置在 flash 中，这样可以增加引导加载程序的可用空间。如果 [分区表](#) 的 CSV 文件包含明确的分区偏移量，则需要修改这些偏移量，从而保证没有分区的偏移量低于 `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`。（这包括随 ESP-IDF 提供的默认分区 CSV 文件）

当启用 Secure Boot V2 时，由于引导加载程序最先加载到固定大小的缓冲区中进行验证，对二进制文件大小的绝对限制为 64 KB (0x10000 bytes)（不包括 4 KB 签名）。

4.3.8 从深度睡眠中快速启动

引导加载程序有 `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` 选项，可以减少从深度睡眠中唤醒的时间（有利于降低功耗）。当 `CONFIG_SECURE_BOOT` 选项禁用时，该选项可用。由于无需镜像校验，唤醒时间减少。在第一次启动时，引导加载程序将启动的应用程序的地址存储在 RTC FAST 存储器中。而在唤醒过程中，这个地址用于启动而无需任何检查，从而实现了快速加载。

4.3.9 自定义引导加载程序

用户可以扩展或修改当前的引导加载程序，具体有两种方法：使用钩子实现或重写覆盖当前程序。这两种方法在 ESP-IDF 示例的 `custom_bootloader` 文件夹中都有呈现。

- `bootloader_hooks` 介绍了如何将钩子与引导加载程序初始化连接。
- `bootloader_override` 介绍了如何覆盖引导加载程序的实现。

在引导加载程序的代码中，用户不能使用其他组件提供的驱动和函数，如果确实需要，请将该功能的实现部分放在项目的 `bootloader_components` 目录中（注意，这会增加引导加载程序的大小）。

如果引导加载程序过大，则可能与内存中的分区表重叠，分区表默认烧录在偏移量 0x8000 处。增加 [分区表偏移量](#)，将分区表放在 flash 中靠后的区域，这样可以增加引导程序的可用空间。

4.4 构建系统

本文档主要介绍 ESP-IDF 构建系统的实现原理以及 组件等相关概念。如需了解如何组织和构建新的 ESP-IDF 项目或组件，请阅读本文档。

4.4.1 概述

一个 ESP-IDF 项目可以看作是多个不同组件的集合，例如一个显示当前湿度的网页服务器会包含以下组件：

- ESP-IDF 基础库，包括 `libc`、`ROM bindings` 等
- Wi-Fi 驱动
- TCP/IP 协议栈
- FreeRTOS 操作系统
- 网页服务器
- 湿度传感器的驱动
- 负责将上述组件整合到一起的主程序

ESP-IDF 可以显式地指定和配置每个组件。在构建项目的时候，构建系统会前往 ESP-IDF 目录、项目目录和用户自定义组件目录（可选）中查找所有组件，允许用户通过文本菜单系统配置 ESP-IDF 项目中用到的每个组件。在所有组件配置结束后，构建系统开始编译整个项目。

概念

- 项目特指一个目录，其中包含了构建可执行应用程序所需的全部文件和配置，以及其他支持型文件，例如分区表、数据/文件系统分区和引导程序。
- 项目配置保存在项目根目录下名为 `sdkconfig` 的文件中，可以通过 `idf.py menuconfig` 进行修改，且一个项目只能包含一个项目配置。
- 应用程序是由 ESP-IDF 构建得到的可执行文件。一个项目通常会构建两个应用程序：项目应用程序（可执行的主文件，即用户自定义的固件）和引导程序（启动并初始化项目应用程序）。
- 组件是模块化且独立的代码，会被编译成静态库（.a 文件）并链接到应用程序。部分组件由 ESP-IDF 官方提供，其他组件则来源于其它开源项目。
- 目标特指运行构建后应用程序的硬件设备。运行 `idf.py --list-targets` 可以查看当前 ESP-IDF 版本中支持目标的完整列表。

请注意，以下内容并不属于项目的组成部分：

- ESP-IDF 并不是项目的一部分，它独立于项目，通过 `IDF_PATH` 环境变量（保存 `esp-idf` 目录的路径）链接到项目，从而将 IDF 框架与项目分离。
- 交叉编译工具链并不是项目的组成部分，它应该被安装在系统 `PATH` 环境变量中。

4.4.2 使用构建系统

idf.py

`idf.py` 命令行工具提供了一个前端，可以帮助你轻松管理项目的构建过程，它管理了以下工具：

- `CMake`，配置待构建的项目
- `Ninja`，用于构建项目
- `esptool.py`，烧录目标硬件设备

可通过 `idf.py` 配置构建系统，具体可参考[相关文档](#)。

直接使用 CMake

为了方便，`idf.py` 已经封装了 CMake 命令，但是你愿意，也可以直接调用 CMake。

当 `idf.py` 在执行某些操作时，它会打印出其运行的每条命令以便参考。例如运行 `idf.py build` 命令与在 `bash shell`（或者 Windows Command Prompt）中运行以下命令是相同的：

```
mkdir -p build
cd build
cmake .. -G Ninja # 或者 'Unix Makefiles'
ninja
```

在上面的命令列表中，`cmake` 命令对项目进行配置，并生成用于最终构建工具的构建文件。在这个例子中，最终构建工具是 **Ninja**：运行 `ninja` 来构建项目。

没有必要多次运行 `cmake`。第一次构建后，往后每次只需运行 `ninja` 即可。如果项目需要重新配置，`ninja` 会自动重新调用 `cmake`。

若在 CMake 中使用 `ninja` 或 `make`，则多数 `idf.py` 子命令也会有其对应的目标，例如在构建目录下运行 `make menuconfig` 或 `ninja menuconfig` 与运行 `idf.py menuconfig` 是相同的。

备注：如果你已经熟悉了 CMake，那么可能会发现 ESP-IDF 的 CMake 构建系统不同寻常，为了减少样板文件，该系统封装了 CMake 的许多功能。请参考 [编写纯 CMake 组件](#) 以编写更多“CMake 风格”的组件。

使用 Ninja/Make 来烧录 可以直接使用 `ninja` 或 `make` 运行如下命令来构建项目并烧录：

```
ninja flash
```

或：

```
make app-flash
```

可用的目标还包括：`flash`、`app-flash`（仅用于 `app`）、`bootloader-flash`（仅用于 `bootloader`）。

以这种方式烧录时，可以通过设置 `ESPPORT` 和 `ESPBAUD` 环境变量来指定串口设备和波特率。可以在操作系统或 IDE 项目中设置该环境变量，或者直接在命令行中进行设置：

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

备注：在命令的开头为环境变量赋值属于 Bash shell 的语法，可在 Linux、macOS 和 Windows 的类 Bash shell 中运行，但在 Windows Command Prompt 中无法运行。

或：

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

备注：在命令末尾为变量赋值属于 `make` 的语法，适用于所有平台的 `make`。

在 IDE 中使用 CMake

还可以使用集成了 CMake 的 IDE，仅需将项目 `CMakeLists.txt` 文件的路径告诉 IDE 即可。集成 CMake 的 IDE 通常会有自己的构建工具（CMake 称之为“生成器”），它是组成 IDE 的一部分，用来构建源文件。

向 IDE 中添加除 `build` 目标以外的自定义目标（如添加“`flash`”目标到 IDE）时，建议调用 `idf.py` 命令来执行这些“特殊”的操作。

有关将 ESP-IDF 同 CMake 集成到 IDE 中的详细信息，请参阅[构建系统的元数据](#)。

设置 Python 解释器

ESP-IDF 适用于 Python 3.8 以上版本。

`idf.py` 和其他的 Python 脚本会使用默认的 Python 解释器运行，如 `python`。你可以通过 `python3 $IDF_PATH/tools/idf.py ...` 命令切换到别的 Python 解释器，或者通过设置 `shell` 别名或其他脚本来简化该命令。

如果直接使用 CMake，运行 `cmake -D PYTHON=python3 ...`，CMake 会使用传入的值覆盖默认的 Python 解释器。

如果使用集成 CMake 的 IDE，可以在 IDE 的图形用户界面中给名为 `PYTHON` 的 CMake cache 变量设置新的值来覆盖默认的 Python 解释器。

如果想在命令行中更优雅地管理 Python 的各个版本，请查看 [pyenv](#) 或 [virtualenv](#) 工具，它们会帮助你更改默认的 `python` 版本。

4.4.3 示例项目

示例项目的目录树结构可能如下所示：

```

- myProject/
  - CMakeLists.txt
  - sdkconfig
  - bootloader_components/ - boot_component/ - CMakeLists.txt
                                - Kconfig
                                - src1.c
  - components/ - component1/ - CMakeLists.txt
                                - Kconfig
                                - src1.c
                                - component2/ - CMakeLists.txt
                                                - Kconfig
                                                - src1.c
                                                - include/ - component2.h
  - main/ - CMakeLists.txt
            - src1.c
            - src2.c
  - build/

```

该示例项目“myProject”包含以下组成部分：

- 顶层项目 `CMakeLists.txt` 文件，这是 CMake 用于学习如何构建项目的主要文件，可以在这个文件中设置项目全局的 CMake 变量。顶层项目 `CMakeLists.txt` 文件会导入 `/tools/cmake/project.cmake` 文件，由它负责实现构建系统的其余部分。该文件最后会设置项目的名称，并定义该项目。
- “`sdkconfig`”项目配置文件，执行 `idf.py menuconfig` 时会创建或更新此文件，文件中保存了项目中所有组件（包括 ESP-IDF 本身）的配置信息。`sdkconfig` 文件可能会也可能不会被添加到项目的源码管理系统中。
- 可选的“`bootloader_components`”目录中包含了需要在引导加载项目中进行编译和链接的组件。并不是每个项目都需要这种自定义组件，但此类组件在引导加载程序需要修改以嵌入新功能时可能很有用。
- 可选的“`components`”目录中包含了项目的部分自定义组件，并不是每个项目都需要这种自定义组件，但它有助于构建可复用的代码或者导入第三方（不属于 ESP-IDF）的组件。或者，你也可以在顶层 `CMakeLists.txt` 中设置 `EXTRA_COMPONENT_DIRS` 变量以查找其他指定位置处的组件。
- “`main`”目录是一个特殊的组件，它包含项目本身的源代码。“`main`”是默认名称，CMake 变量 `COMPONENT_DIRS` 默认包含此组件，但你可以修改此变量。有关详细信息，请参阅[重命名 main 组件](#)。如果项目中源文件较多，建议将其归于组件中，而不是全部放在“`main`”中。

- “build” 目录是存放构建输出的地方，如果没有此目录，idf.py 会自动创建。CMake 会配置项目，并在此目录下生成临时的构建文件。随后，在主构建进程的运行期间，该目录还会保存临时目标文件、库文件以及最终输出的二进制文件。此目录通常不会添加到项目的源码管理系统中，也不会随项目源码一同发布。

每个组件目录都包含一个 CMakeLists.txt 文件，里面会定义一些变量以控制该组件的构建过程，以及其与整个项目的集成。更多详细信息请参阅[组件 CMakeLists 文件](#)。

每个组件还可以包含一个 Kconfig 文件，它用于定义 menuconfig 时展示的[组件配置](#)选项。某些组件可能还会包含 Kconfig.projbuild 和 project_include.cmake 特殊文件，它们用于[覆盖项目的部分设置](#)。

4.4.4 项目 CMakeLists 文件

每个项目都有一个顶层 CMakeLists.txt 文件，包含整个项目的构建设置。默认情况下，项目 CMakeLists 文件会非常小。

最小 CMakeLists 文件示例

最小项目：

```
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

必要部分

每个项目都要按照上面显示的顺序添加上述三行代码：

- cmake_minimum_required(VERSION 3.16) 必须放在 CMakeLists.txt 文件的第一行，它会告诉 CMake 构建该项目所需的最小版本号。ESP-IDF 支持 CMake 3.16 或更高的版本。
- include(\$ENV{IDF_PATH}/tools/cmake/project.cmake) 会导入 CMake 的其余功能来完成配置项目、检索组件等任务。
- project(myProject) 会创建项目本身，并指定项目名称。该名称会作为最终输出的二进制文件的名称，即 myProject.elf 和 myProject.bin。每个 CMakeLists 文件只能定义一个项目。

可选的项目变量

以下这些变量都有默认值，用户可以覆盖这些变量值以自定义构建行为。更多实现细节，请参阅[tools/cmake/project.cmake](#) 文件。

- COMPONENT_DIRS: 组件的搜索目录，默认为 IDF_PATH/components、PROJECT_DIR/components、和 EXTRA_COMPONENT_DIRS。如果你不想在这些位置搜索组件，请覆盖此变量。
- EXTRA_COMPONENT_DIRS: 用于搜索组件的其它可选目录列表。路径可以是相对于项目目录的相对路径，也可以是绝对路径。
- COMPONENTS: 要构建进项目中的组件名称列表，默认为 COMPONENT_DIRS 目录下检索到的所有组件。使用此变量可以“精简”项目以缩短构建时间。请注意，如果一个组件通过 COMPONENT_REQUIRES 指定了它依赖的另一个组件，则会自动将其添加到 COMPONENTS 中，所以 COMPONENTS 列表可能会非常短。
- BOOTLOADER_IGNORE_EXTRA_COMPONENT: 引导加载程序编译时应忽略的组件列表，位于 bootloader_components/ 目录中。使用这一变量可以将一个组件有条件地包含在项目中。

以上变量中的路径可以是绝对路径，或者是相对于项目目录的相对路径。

请使用 `cmake` 中的 `set` 命令来设置这些变量，如 `set(VARIABLE "VALUE")`。请注意，`set()` 命令需放在 `include(...)` 之前，`cmake_minimum(...)` 之后。

重命名 main 组件

构建系统会对 main 组件进行特殊处理。假如 main 组件位于预期的位置（即 `${PROJECT_PATH}/main`），那么它会被自动添加到构建系统中。其他组件也会作为其依赖项被添加到构建系统中，这使用户免于处理依赖关系，并提供即时可用的构建功能。重命名 main 组件会减轻上述这些幕后工作量，但要求用户指定重命名后的组件位置，并手动为其添加依赖项。重命名 main 组件的步骤如下：

1. 重命名 main 目录。
2. 在项目 `CMakeLists.txt` 文件中设置 `EXTRA_COMPONENT_DIRS`，并添加重命名后的 main 目录。
3. 在组件的 `CMakeLists.txt` 文件中设置 `COMPONENT_REQUIRES` 或 `COMPONENT_PRIV_REQUIRES` 以指定依赖项。

覆盖默认的构建规范

构建系统设置了一些全局的构建规范（编译标志、定义等），这些规范可用于编译来自所有组件的所有源文件。

例如，其中一个默认的构建规范是编译选项 `Wextra`。假设一个用户想用 `Wno-extra` 来覆盖这个选项，应在 `project()` 之后进行：

```
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILER_OPTIONS "-Wno-error" APPEND)
```

这确保了用户设置的编译选项不会被默认的构建规范所覆盖，因为默认的构建规范是在 `project()` 内设置的。

4.4.5 组件 CMakeLists 文件

每个项目都包含一个或多个组件，这些组件可以是 ESP-IDF 的一部分，可以是项目自身组件目录的一部分，也可以从自定义组件目录添加（见上文）。

组件是 `COMPONENT_DIRS` 列表中包含 `CMakeLists.txt` 文件的任何目录。

搜索组件

搜索 `COMPONENT_DIRS` 中的目录列表以查找项目的组件，此列表中的目录可以是组件自身（即包含 `CMakeLists.txt` 文件的目录），也可以是子目录为组件的顶级目录。

当 CMake 运行项目配置时，它会记录本次构建包含的组件列表，它可用于调试某些组件的添加/排除。

同名组件

ESP-IDF 在搜索所有待构建的组件时，会按照 `COMPONENT_DIRS` 指定的顺序依次进行，这意味着在默认情况下，首先搜索 ESP-IDF 内部组件（`IDF_PATH/components`），然后是 `EXTRA_COMPONENT_DIRS` 中的组件，最后是项目组件（`PROJECT_DIR/components`）。如果这些目录中的两个或者多个包含具有相同名字的组件，则使用搜索到的最后一个位置的组件。这就允许将组件复制到项目目录中再修改以覆盖 ESP-IDF 组件，如果使用这种方式，ESP-IDF 目录本身可以保持不变。

备注：如果在现有项目中通过将组件移动到一个新位置来覆盖它，项目不会自动看到新组件的路径。请运行 `idf.py reconfigure` 命令后（或删除项目构建文件夹）再重新构建。

最小组件 CMakeLists 文件

最小组件 CMakeLists.txt 文件通过使用 `idf_component_register` 将组件添加到构建系统中。

```
idf_component_register(SRCS "foo.c" "bar.c" INCLUDE_DIRS "include" REQUIRES mbedtls)
```

- SRCS 是源文件列表 (*.c、*.cpp、*.cc、*.s)，里面所有的源文件都将会编译进组件库中。
- INCLUDE_DIRS 是目录列表，里面的路径会被添加到所有需要该组件的组件（包括 main 组件）全局 include 搜索路径中。
- REQUIRES 实际上并不是必需的，但通常需要它来声明该组件需要使用哪些其它组件，请参考[组件依赖](#)。

上述命令会构建生成与组件同名的库，并最终被链接到应用程序中。

上述目录通常设置为相对于 CMakeLists.txt 文件的相对路径，当然也可以设置为绝对路径。

还有其它参数可以传递给 `idf_component_register`，具体可参考[here](#)。

有关更完整的 CMakeLists.txt 示例，请参阅[组件依赖示例](#)和[组件 CMakeLists 示例](#)。

预设的组件变量

以下专用于组件的变量可以在组件 CMakeLists 中使用，但不建议修改：

- COMPONENT_DIR: 组件目录，即包含 CMakeLists.txt 文件的绝对路径，它与 CMAKE_CURRENT_SOURCE_DIR 变量一样，路径中不能包含空格。
- COMPONENT_NAME: 组件名，与组件目录名相同。
- COMPONENT_ALIAS: 库别名，由构建系统在内部为组件创建。
- COMPONENT_LIB: 库名，由构建系统在内部为组件创建。

以下变量在项目级别中被设置，但可在组件 CMakeLists 中使用：

- CONFIG_*: 项目配置中的每个值在 `cmake` 中都对应一个以 CONFIG_ 开头的变量。更多详细信息请参阅[Kconfig](#)。
- ESP_PLATFORM: ESP-IDF 构建系统处理 CMake 文件时，其值设为 1。

构建/项目变量

以下是可作为构建属性的构建/项目变量，可通过组件 CMakeLists.txt 中的 `idf_build_get_property` 查询其变量值。

- PROJECT_NAME: 项目名，在项目 CMakeLists.txt 文件中设置。
- PROJECT_DIR: 项目目录（包含项目 CMakeLists 文件）的绝对路径，与 CMAKE_SOURCE_DIR 变量相同。
- COMPONENTS: 此次构建中包含的所有组件的名称，具体格式为用分号分隔的 CMake 列表。
- IDF_VER: ESP-IDF 的 git 版本号，由 `git describe` 命令生成。
- IDF_VERSION_MAJOR、IDF_VERSION_MINOR、IDF_VERSION_PATCH: ESP-IDF 的组件版本，可用于条件表达式。请注意这些信息的精确度不如 IDF_VER 变量，版本号 v4.0-dev-*, v4.0-beta1, v4.0-rc1 和 v4.0 对应的 IDF_VERSION_* 变量值是相同的，但是 IDF_VER 的值是不同的。
- IDF_TARGET: 项目的硬件目标名称。
- PROJECT_VER: 项目版本号。
 - 如果设置 `CONFIG_APP_PROJECT_VER_FROM_CONFIG` 选项，将会使用 `CONFIG_APP_PROJECT_VER` 的值。
 - 或者，如果在项目 CMakeLists.txt 文件中设置了 PROJECT_VER 变量，则该变量值可以使用。
 - 或者，如果 PROJECT_DIR/version.txt 文件存在，其内容会用作 PROJECT_VER 的值。
 - 或者，如果在 CMakeLists.txt 文件中将 VERSION 参数传递给 `project()` 调用，形式为 `project(... VERSION x.y.z.w)`，那么 VERSION 参数将用作为 PROJECT_VER 的值。VERSION 参数必须符合 [cmake 标准](#)。
 - 或者，如果项目位于某个 Git 仓库中，则使用 `git describe` 命令的输出作为 PROJECT_VER 的值。

- 否则，PROJECT_VER 的值为 1。
- EXTRA_PARTITION_SUBTYPES: CMake 列表，用于创建额外的分区子类型。子类型的描述由字符串组成，以逗号为分隔，格式为 `type_name, subtype_name, numeric_value`。组件可通过此列表，添加新的子类型。

其它与构建属性有关的信息请参考[这里](#)。

组件编译控制

在编译特定组件的源文件时，可以使用 `target_compile_options` 函数来传递编译器选项：

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

如果给单个源文件指定编译器标志，可以使用 CMake 的 `set_source_files_properties` 命令：

```
set_source_files_properties(mysrc.c
    PROPERTIES COMPILE_FLAGS
        -Wno-unused-variable
)
```

如果上游代码在编译的时候发出了警告，那这么做可能会很有效。

备注： 如已借助 `idf_component_register` 中的 `SRC_DIRS` 变量填充源文件，CMake `set_source_files_properties` 命令将无法使用，详情请参考[文件通配 & 增量构建](#)。

请注意，上述两条命令只能在组件 CMakeLists 文件的 `idf_component_register` 命令之后调用。

4.4.6 组件配置

每个组件都可以包含一个 Kconfig 文件，和 CMakeLists.txt 放在同一目录下。Kconfig 文件中包含要添加到该组件配置菜单中的一些配置设置信息。

运行 `menuconfig` 时，可以在 Component Settings 菜单栏下找到这些设置。

创建一个组件的 Kconfig 文件，最简单的方法就是使用 ESP-IDF 中现有的 Kconfig 文件作为模板，在此基础上进行修改。

有关示例请参阅[添加条件配置](#)。

4.4.7 预处理器定义

ESP-IDF 构建系统会在命令行中添加以下 C 预处理器定义：

- ESP_PLATFORM: 可以用来检测在 ESP-IDF 内发生了构建行为。
- IDF_VER: 定义 git 版本字符串，例如: `v2.0` 用于标记已发布的版本，`v1.0-275-g0efaa4f` 则用于标记任意某次的提交记录。

4.4.8 组件依赖

编译各个组件时，ESP-IDF 系统会递归评估其依赖项。这意味着每个组件都需要声明它所依赖的组件，即 “requires”。

编写组件

```
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- REQUIRES 需要包含所有在当前组件的公共头文件里 `#include` 的头文件所在的组件。
- PRIV_REQUIRES 需要包含被当前组件的源文件 `#include` 的头文件所在的组件（除非已经被设置在了 REQUIRES 中）。以及是当前组件正常工作必须要链接的组件。
- REQUIRES 和 PRIV_REQUIRES 的值不能依赖于任何配置选项（CONFIG_XXX 宏）。这是因为在配置加载之前，依赖关系就已经被展开。其它组件变量（比如包含路径或源文件）可以依赖配置选择。
- 如果当前组件除了通用组件依赖项中设置的通用组件（比如 RTOS、libc 等）外，并不依赖其它组件，那么对于上述两个 REQUIRES 变量，可以选择其中一个或是两个都不设置。

如果组件仅支持某些硬件目标（IDF_TARGET 的值），则可以在 `idf_component_register` 中指定 `REQUIRED_IDF_TARGETS` 来声明这个需求。在这种情况下，如果构建系统导入了不支持当前硬件目标的组件时就会报错。

备注：在 CMake 中，REQUIRES 和 PRIV_REQUIRES 是 CMake 函数 `target_link_libraries(... PUBLIC ...)` 和 `target_link_libraries(... PRIVATE ...)` 的近似包装。

组件依赖示例

假设现在有一个 car 组件，它需要使用 engine 组件，而 engine 组件需要使用 spark_plug 组件：

```
- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
                    - car.c
                    - car.h
  - engine/ - CMakeLists.txt
                - engine.c
                - include/ - engine.h
  - spark_plug/ - CMakeLists.txt
                    - spark_plug.c
                    - spark_plug.h
```

Car 组件 car.h 头文件是 car 组件的公共接口。该头文件直接包含了 engine.h，这是因为它需要使用 engine.h 中的一些声明：

```
/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

同时 car.c 也包含了 car.h：

```
/* car.c */
#include "car.h"
```

这代表文件 car/CMakeLists.txt 需要声明 car 需要 engine：

```
idf_component_register(SRCS "car.c"
    INCLUDE_DIRS "."
    REQUIRES engine)
```

- SRCS 提供 car 组件中源文件列表。

- INCLUDE_DIRS 提供该组件公共头文件目录列表，由于 car.h 是公共接口，所以这里列出了所有包含了 car.h 的目录。
- REQUIRES 给出该组件的公共接口所需的组件列表。由于 car.h 是一个公共头文件并且包含了来自 engine 的头文件，所以我们这里包含 engine。这样可以确保任何包含 car.h 的其他组件也能递归地包含所需的 engine.h。

Engine 组件 engine 组件也有一个公共头文件 include/engine.h，但这个头文件更为简单：

```
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);
```

在 engine.c 中执行：

```
/* engine.c */
#include "engine.h"
#include "spark_plug.h"

...
```

在该组件中，engine 依赖于 spark_plug，但这是私有依赖关系。编译 engine.c 需要 spark_plug.h 但不需要包含 engine.h。

这代表文件 engine/CMakeLists.txt 可以使用 PRIV_REQUIRES：

```
idf_component_register(SRCS "engine.c"
                      INCLUDE_DIRS "include"
                      PRIV_REQUIRES spark_plug)
```

因此，car 组件中的源文件不需要在编译器搜索路径中添加 spark_plug include 目录。这可以加快编译速度，避免编译器命令行过于的冗长。

Spark Plug 组件 spark_plug 组件没有依赖项，它有一个公共头文件 spark_plug.h，但不包含其他组件的头文件。

这代表 spark_plug/CMakeLists.txt 文件不需要任何 REQUIRES 或 PRIV_REQUIRES：

```
idf_component_register(SRCS "spark_plug.c"
                      INCLUDE_DIRS ".")
```

源文件 Include 目录

每个组件的源文件都是用这些 Include 路径目录编译的，这些路径在传递给 idf_component_register 的参数中指定：

```
idf_component_register(..
                      INCLUDE_DIRS "include"
                      PRIV_INCLUDE_DIRS "other")
```

- 当前组件的 INCLUDE_DIRS 和 PRIV_INCLUDE_DIRS。
- REQUIRES 和 PRIV_REQUIRES 参数指定的所有其他组件（即当前组件的所有公共和私有依赖项）所设置的 INCLUDE_DIRS。
- 递归列出所有组件 REQUIRES 列表中 INCLUDE_DIRS 目录（如递归展开这个组件的所有公共依赖项）。

主要组件依赖项

main 组件比较特别，因为它在构建过程中自动依赖所有其他组件。所以不需要向这个组件传递 REQUIRES 或 PRIV_REQUIRES。有关不再使用 main 组件时需要更改哪些内容，请参考[重命名 main 组件](#)。

通用组件依赖项

为避免重复性工作，各组件都用自动依赖一些“通用”IDF 组件，即使它们没有被明确提及。这些组件的头文件会一直包含在构建系统中。

通用组件包括：cxx、newlib、freertos、esp_hw_support、heap、log、soc、hal、esp_rom、esp_common、esp_system。

在构建中导入组件

- 默认情况下，每个组件都会包含在构建系统中。
- 如果将 COMPONENTS 变量设置为项目直接使用的最小组件列表，那么构建系统会扩展到包含所有组件。完整的组件列表为：
 - COMPONENTS 中明确提及的组件。
 - 这些组件的依赖项（以及递归运算后的组件）。
 - 每个组件都依赖的通用组件。
- 将 COMPONENTS 设置为所需组件的最小列表，可以显著减少项目的构建时间。

循环依赖

一个项目中可能包含组件 A 和组件 B，而组件 A 依赖（REQUIRES 或 PRIV_REQUIRES）组件 B，组件 B 又依赖组件 A。这就是所谓的依赖循环或循环依赖。

CMake 通常会在链接器命令行上重复两次组件库名称来自动处理循环依赖。然而这种方法并不总是有效，还是可能构建失败并出现关于“Undefined reference to ...”的链接器错误，这通常是由于引用了循环依赖中某一组件中定义的符号。如果存在较大的循环依赖关系，即 A->B->C->D->A，这种情况极有可能发生。

最好的解决办法是重构组件以消除循环依赖关系。在大多数情况下，没有循环依赖的软件架构具有模块化和分层清晰的特性，并且从长远来看更容易维护。然而，移除循环依赖关系并不容易做到。

要绕过由循环依赖引起的链接器错误，最简单的解决方法是增加其中一个组件库的 CMake LINK_INTERFACE_MULTIPLICITY 属性。这会让 CMake 在链接器命令行上对此库及其依赖项重复两次以上。

例如：

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- 这一行应该放在组件 CMakeLists.txt 文件 idf_component_register 之后。
- 可以的话，将此行放置在因依赖其他组件而造成循环依赖的组件中。实际上，该行可以放在循环内的任何一个组件中，但建议将其放置在拥有链接器错误提示信息中显示的源文件的组件中，或是放置在定义了链接器错误提示信息中所提到的符号的组件，先从这些组件开始是个不错的选择。
- 通常将值增加到 3（默认值是 2）就足够了，但如果不起作用，可以尝试逐步增加这个数字。
- 注意，增加这个选项会使链接器的命令行变长，链接阶段变慢。

高级解决方法：未定义符号 如果只有一两个符号导致循环依赖，而所有其他依赖都是线性的，那么有一种替代方法可以避免链接器错误：在链接时将“反向”依赖所需的特定符号指定为未定义符号。

例如，如果组件 A 依赖于组件 B，但组件 B 也需要引用组件 A 的 reverse_ops（但不依赖组件 A 中的其他内容），那么你可以在组件 B 的 CMakeLists.txt 中添加如下一行，以在链接时避免这出现循环。

```
# 该符号是由“组件 A”在链接时提供
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- `-u` 参数意味着链接器将始终在链接中包含此符号，而不管依赖项顺序如何。
- 该行应该放在组件 `CMakeLists.txt` 文件中的 `idf_component_register` 之后。
- 如果“组件 B”不需要访问“组件 A”的任何头文件，只需链接几个符号，那么这一行可以用来代替 B 对 A 的任何“REQUIRES”。这样则进一步简化了构建系统中的组件结构。

请参考 [target_link_libraries](#) 文档以了解更多关于此 CMake 函数的信息。

构建系统中依赖处理的实现细节

- 在 CMake 配置进程的早期阶段会运行 `expand_requirements.cmake` 脚本。该脚本会对所有组件的 `CMakeLists.txt` 文件进行局部的运算，得到一张组件依赖关系图（此图可能会有闭环）。此图用于在构建目录中生成 `component_depends.cmake` 文件。
- CMake 主进程会导入该文件，并以此来确定要包含到构建系统中的组件列表（内部使用的 `BUILD_COMPONENTS` 变量）。`BUILD_COMPONENTS` 变量已排好序，依赖组件会排在前面。由于组件依赖关系图中可能存在闭环，因此不能保证每个组件都满足该排序规则。如果给定相同的组件集和依赖关系，那么最终的排序结果应该是确定的。
- CMake 会将 `BUILD_COMPONENTS` 的值以“Component names:”的形式打印出来。
- 然后执行构建系统中包含的每个组件的配置。
- 每个组件都被正常包含在构建系统中，然后再次执行 `CMakeLists.txt` 文件，将组件库加入构建系统。

组件依赖顺序 `BUILD_COMPONENTS` 变量中组件的顺序决定了构建过程中的其它顺序，包括：

- 项目导入 `project_include.cmake` 文件的顺序。
- 生成用于编译（通过 `-I` 参数）的头文件路径列表的顺序。请注意，对于给定组件的源文件，仅需将该组件的依赖组件的头文件路径告知编译器。

添加链接时依赖项 ESP-IDF 的 CMake 辅助函数 `idf_component_add_link_dependency` 可以在组件之间添加仅作用于链接时的依赖关系。绝大多数情况下，我们都建议你使用 `idf_component_register` 中的 `PRIV_REQUIRES` 功能来构建依赖关系。然而在某些情况下，还是有必要添加另一个组件对当前组件的链接时依赖，即反转 `PRIV_REQUIRES` 中的依赖关系（参考示例：[Overriding Default Chip Drivers](#)）。

要使另一个组件在链接时依赖于这个组件：

```
idf_component_add_link_dependency (FROM other_component)
```

请将上述行置于 `idf_component_register` 行之后。

也可以通过名称指定两个组件：

```
idf_component_add_link_dependency (FROM other_component TO that_component)
```

4.4.9 覆盖项目的部分设置

`project_include.cmake`

如果组件的某些构建行为需要在组件 `CMakeLists` 文件之前被执行，你可以在组件目录下创建名为 `project_include.cmake` 的文件，`project.cmake` 在运行过程中会导入此 CMake 文件。

`project_include.cmake` 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 `esptool.py` 的命令行参数和 `bootloader` 这个特殊的应用程序。

与组件 `CMakeLists.txt` 文件有所不同，在导入 `project_include.cmake` 文件的时候，当前源文件目录（即 `CMAKE_CURRENT_SOURCE_DIR` 和工作目录）为项目目录。如果想获得当前组件的绝对路径，可以使用 `COMPONENT_PATH` 变量。

请注意，`project_include.cmake` 对于大多数常见的组件并不是必需的。例如给项目添加 `include` 搜索目录，给最终的链接步骤添加 `LDFLAGS` 选项等等都可以通过 `CMakeLists.txt` 文件来自定义。详细信息请参考[可选的项目变量](#)。

`project_include.cmake` 文件会按照 `BUILD_COMPONENTS` 变量中组件的顺序（由 CMake 记录）依次导入。即只有在当前组件所有依赖组件的 `project_include.cmake` 文件都被导入后，当前组件的 `project_include.cmake` 文件才会被导入，除非两个组件在同一个依赖闭环中。如果某个 `project_include.cmake` 文件依赖于另一组件设置的变量，则要特别注意上述情况。更多详情请参阅[构建系统中依赖处理的实现细节](#)。

在 `project_include.cmake` 文件中设置变量或目标时要格外小心，这些值被包含在项目的顶层 CMake 文件中，因此他们会影响或破坏所有组件的功能。

KConfig.projbuild

与 `project_include.cmake` 类似，也可以为组件定义一个 KConfig 文件以实现全局的[组件配置](#)。如果要在 `menuconfig` 的顶层添加配置选项，而不是在“Component Configuration”子菜单中，则可以在 `CMakeLists.txt` 文件所在目录的 `KConfig.projbuild` 文件中定义这些选项。

在此文件中添加配置时要小心，因为这些配置会包含在整个项目配置中。在可能的情况下，请为[组件配置](#)创建 KConfig 文件。

通过封装对现有函数进行重新定义或扩展

链接器具有封装功能，可以重新定义或扩展现有 ESP-IDF 函数的行为。如需封装函数，你需要在项目的 `CMakeLists.txt` 文件中提供以下 CMake 声明：

```
target_link_libraries(${COMPONENT_LIB} INTERFACE "-Wl,--wrap=function_to_redefine")
```

其中，`function_to_redefine` 为需要被重新定义或扩展的函数名称。启用此选项后，链接器将把二进制库中所有对 `function_to_redefine` 函数的调用改为对 `__wrap_function_to_redefine` 函数的调用。因此，你必须在应用程序中定义这一符号。

链接器会提供一个名为 `__real_function_to_redefine` 的新符号，指向将被重新定义的函数的原有实现。由此，可以从新的实现中调用该函数，从而对原有实现进行扩展。

请参考 [build_system/wrappers](#) 示例，了解其详细原理。更多细节请参阅 [examples/build_system/wrappers/README.md](#)。

覆盖默认引导加载程序

由于 ESP-IDF 中存在可选目录 `bootloader_components`，因此可以覆盖默认的 ESP-IDF 引导加载程序。覆盖前，应定义一个 `bootloader_components/main` 组件，使项目目录如下所示：

- **myProject/**
 - CMakeLists.txt
 - sdkconfig
 - **bootloader_components/ - main/ - CMakeLists.txt**
 - * Kconfig
 - * my_bootloader.c
 - **main/ - CMakeLists.txt**
 - * app_main.c
 - build/

此处的 `my_bootloader.c` 文件会成为新引导加载程序的源代码，这意味着它需要执行所有必要的操作来设置并从 `flash` 中加载 `main` 应用程序。

还可以根据特定的条件来替换引导加载程序，例如替换指定目标芯片的引导加载程序。这可以通过 `BOOTLOADER_IGNORE_EXTRA_COMPONENT` CMake 变量实现，该列表会让 ESP-IDF 引导加载项目忽略 `bootloader_components` 中的指定组件，不对其进行编译。例如，如果希望使用 ESP32 目标芯片的默认引导加载程序，`myProject/CMakeLists.txt` 应如下所示：

```
include($ENV{IDF_PATH}/tools/cmake/project.cmake)

if(${IDF_TARGET} STREQUAL "esp32")
    set(BOOTLOADER_IGNORE_EXTRA_COMPONENT "main")
endif()

project(main)
```

值得注意的是，这还可以用于除 main 之外的其他引导加载程序组件。在任何情况下，都不能指定前缀 `bootloader_component`。

请参考 [custom_bootloader/bootloader_override](#) 查看覆盖默认引导加载程序的示例。

4.4.10 仅配置组件

仅配置组件是一类不包含源文件的特殊组件，仅包含 `Kconfig.projbuild`、`KConfig` 和 `CMakeLists.txt` 文件，该 `CMakeLists.txt` 文件仅有一行代码，调用了 `idf_component_register()` 函数。此函数会将组件导入到项目构建中，但不会构建任何库，也不会将头文件添加到任何 `include` 搜索路径中。

4.4.11 CMake 调试

请查看 [CMake v3.16 官方文档](#) 获取更多关于 `CMake` 和 `CMake` 命令的信息。

调试 ESP-IDF `CMake` 构建系统的一些技巧：

- `CMake` 运行时，会打印大量诊断信息，包括组件列表和组件路径。
- 运行 `cmake -DDEBUG=1`，IDF 构建系统会生成更详细的诊断输出。
- 运行 `cmake` 时指定 `--trace` 或 `--trace-expand` 选项会提供大量有关控制流信息。详情请参考 [CMake 命令行文档](#)。

当从项目 `CMakeLists` 文件导入时，`project.cmake` 文件会定义工具模块和全局变量，并在系统环境中没有设置 `IDF_PATH` 时设置 `IDF_PATH`。

同时还定义了一个自定义版本的内置 `CMake` `project` 函数，这个函数被覆盖，以添加所有 ESP-IDF 特定的项目功能。

警告未定义的变量

默认情况下，警告未定义的变量这一功能是关闭的。

可通过将 `--warn-uninitialized` 标志传递给 `CMake` 或通过向 `idf.py` 传递 `--cmake-warn-uninitialized` 来使能这一功能。这样，如果在构建的过程中引用了未定义的变量，`CMake` 会打印警告。这对查找有错误的 `CMake` 文件非常有用。

更多信息，请参考文件 `/tools/cmake/project.cmake` 以及 `/tools/cmake/` 中支持的函数。

4.4.12 组件 CMakeLists 示例

因为构建环境试图设置大多数情况都能工作的合理默认值，所以组件 `CMakeLists.txt` 文件可能非常小，甚至是空的，请参考 [最小组件 CMakeLists 文件](#)。但有些功能往往需要覆盖预设的组件变量才能实现。

以下是组件 `CMakeLists` 文件的更高级的示例。

添加条件配置

配置系统可用于根据项目配置中选择的选项有条件地编译某些文件。

Kconfig:

```
config FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")

if(CONFIG_FOO_ENABLE_BAR)
    list(APPEND srcs "bar.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

上述示例使用了 CMake 的 `if` 函数和 `list APPEND` 函数。

也可用于选择或删除某一实现，如下所示：

Kconfig:

```
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
    bool "Output temperature plots to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
    set(srcs lcd-real.c lcd-spi.c)
else()
    set(srcs lcd-dummy.c)
endif()

# 如果启用了控制台或绘图功能，则需要加入字体
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
    list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

硬件目标的条件判断

CMake 文件可以使用 `IDF_TARGET` 变量来获取当前的硬件目标。

此外，如果当前的硬件目标是 `xyz`（即 `IDF_TARGET=xyz`），那么 `Kconfig` 变量 `CONFIG_IDF_TARGET_XYZ` 同样也会被设置。

请注意，组件可以依赖 `IDF_TARGET` 变量，但不能依赖这个 `Kconfig` 变量。同样也不可在 CMake 文件的 `include` 语句中使用 `Kconfig` 变量，在这种上下文中可以使用 `IDF_TARGET`。

生成源代码

有些组件的源文件可能并不是由组件本身提供，而必须从另外的文件生成。假设组件需要一个头文件，该文件由 BMP 文件转换后（使用 `bmp2h` 工具）的二进制数据组成，然后将头文件包含在名为 `graphics_lib.c` 的文件中：

```
add_custom_command(OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)

add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)

set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
    ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

这个示例改编自 [CMake 的一则 FAQ](#)，其中还包含了一些同样适用于 ESP-IDF 构建系统的示例。

这个示例会在当前目录（构建目录）中生成 `logo.h` 文件，而 `logo.bmp` 会随组件一起提供在组件目录中。因为 `logo.h` 是一个新生成的文件，一旦项目需要清理，该文件也应该要被清除。因此，要将该文件添加到 `ADDITIONAL_MAKE_CLEAN_FILES` 属性中。

备注： 如果需要生成文件作为项目 `CMakeLists.txt` 的一部分，而不是作为组件 `CMakeLists.txt` 的一部分，此时需要使用 `${PROJECT_PATH}` 替代 `${COMPONENT_DIR}`，使用 `${PROJECT_NAME}.elf` 替代 `${COMPONENT_LIB}`。

如果某个源文件是从其他组件中生成，且包含 `logo.h` 文件，则需要调用 `add_dependencies`，在这两个组件之间添加一个依赖项，以确保组件源文件按照正确顺序进行编译。

嵌入二进制数据

有时你的组件希望使用一个二进制文件或者文本文件，但是你不希望将它们重新格式化为 C 源文件。

这时，你可以在组件注册中指定 `EMBED_FILES` 参数，用空格分隔要嵌入的文件名称：

```
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

或者，如果文件是字符串，则可以使用 `EMBED_TXTFILES` 变量，把文件的内容转成以 `null` 结尾的字符串嵌入：

```
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

文件的内容会被添加到 `flash` 的 `.rodata` 段，用户可以通过符号名来访问，如下所示：

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
↪pem_start");
extern const uint8_t server_root_cert_pem_end[]   asm("_binary_server_root_cert_
↪pem_end");
```

符号名会根据文件全名生成，如 `EMBED_FILES` 中所示，字符 `/`、`.` 等都会被下划线替代。符号名称中的 `_binary` 前缀由 `objcopy` 命令添加，对文本文件和二进制文件都是如此。

如果要文件嵌入到项目中，而非组件中，可以调用 `target_add_binary_data` 函数：

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

并将这行代码放在项目 `CMakeLists.txt` 的 `project()` 命令之后，修改 `myproject.elf` 为你自己的项目名。如果最后一个参数是 `TEXT`，那么构建系统会嵌入以 `null` 结尾的字符串，如果最后一个参数被设置为 `BINARY`，则将文件内容按照原样嵌入。

有关使用此技术的示例，请查看 `file_serving` 示例 `protocols/http_server/file_serving/main/CMakeLists.txt` 中的 `main` 组件，两个文件会在编译时加载并链接到固件中。

也可以嵌入生成的文件：

```
add_custom_command(OUTPUT my_processed_file.bin
                    COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

上述示例中，`my_processed_file.bin` 是通过命令 `my_process_file_cmd` 从文件 `my_unprocessed_file.bin` 中生成，然后嵌入到目标中。

使用 `DEPENDS` 参数来指明对目标的依赖性：

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

`target_add_binary_data` 的 `DEPENDS` 参数确保目标首先执行。

代码和数据的存放

ESP-IDF 还支持自动生成链接脚本，它允许组件通过链接片段文件定义其代码和数据在内存中的存放位置。构建系统会处理这些链接片段文件，并将处理后的结果扩充进链接脚本，从而指导应用程序二进制文件的链接过程。更多详细信息与快速上手指南，请参阅[链接脚本生成机制](#)。

完全覆盖组件的构建过程

当然，在有些情况下，上面提到的方法不一定够用。如果组件封装了另一个第三方组件，而这个第三方组件并不能直接在 ESP-IDF 的构建系统中工作，在这种情况下，就需要放弃 ESP-IDF 的构建系统，改为使用 CMake 的 `ExternalProject` 功能。组件 CMakeLists 示例如下：

```
# 用于 quirc 的外部构建过程，在源目录中运行
# 并生成 libquirc.a
externalproject_add(quirc_build
    PREFIX ${COMPONENT_DIR}
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND ""
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND ""
)

# 将 libquirc.a 添加到构建系统中
add_library(quirc STATIC IMPORTED GLOBAL)
```

(下页继续)

```

add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)

set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")

```

(上述 CMakeLists.txt 可用于创建名为 quirc 的组件，该组件使用自己的 Makefile 构建 quirc 项目。)

- `externalproject_add` 定义了一个外部构建系统。
 - 设置 `SOURCE_DIR`、`CONFIGURE_COMMAND`、`BUILD_COMMAND` 和 `INSTALL_COMMAND`。如果外部构建系统没有配置这一步骤，可以将 `CONFIGURE_COMMAND` 设置为空字符串。在 ESP-IDF 的构建系统中，一般会将 `INSTALL_COMMAND` 变量设置为空。
 - 设置 `BUILD_IN_SOURCE`，即构建目录与源目录相同。否则，你也可以设置 `BUILD_DIR` 变量。
 - 有关 `externalproject_add()` 命令的详细信息，请参阅 [ExternalProject](#)。
- 第二组命令添加了一个目标库，指向外部构建系统生成的库文件。为了添加 `include` 目录，并告知 CMake 该文件的位置，需要再设置一些属性。
- 最后，生成的库被添加到 `ADDITIONAL_MAKE_CLEAN_FILES` 中。即执行 `make clean` 后会删除该库。请注意，构建系统中的其他目标文件不会被删除。

ExternalProject 的依赖与构建清理 对于外部项目的构建，CMake 会有一些不同寻常的行为：

- `ADDITIONAL_MAKE_CLEAN_FILES` 仅在使用 `Make` 或 `Ninja` 构建系统时有效。如果使用 IDE 自带的构建系统，执行项目清理时，这些文件不会被删除。
- `ExternalProject` 会在 `clean` 运行后自动重新运行配置和构建命令。
- 可以采用以下两种方法来配置外部构建命令：
 1. 将外部 `BUILD_COMMAND` 命令设置为对所有源代码完整的重新编译。如果传递给 `externalproject_add` 命令的 `DEPENDS` 的依赖项发生了改变，或者当前执行的是项目清理操作（即运行了 `idf.py clean`、`ninja clean` 或者 `make clean`），那么就会执行该命令。
 2. 将外部 `BUILD_COMMAND` 命令设置为增量式构建命令，并给 `externalproject_add` 传递 `BUILD_ALWAYS 1` 参数。即不管实际的依赖情况，每次构建时，都会构建外部项目。这种方式仅当外部构建系统具备增量式构建的能力，且运行时间不会很长时才推荐。

构建外部项目的最佳方法取决于项目本身、其构建系统，以及是否需要频繁重新编译项目。

4.4.13 自定义 sdkconfig 的默认值

对于示例工程或者其他你不想指定完整 `sdkconfig` 配置的项目，但是你确实希望覆盖 ESP-IDF 默认值中的某些键值，则可以在项目中创建 `sdkconfig.defaults` 文件。重新创建新配置时将会用到此文件，另外在 `sdkconfig` 没有设置新配置值时，上述文件也会被用到。

如若需要覆盖此文件的名称或指定多个文件，请设置 `SDKCONFIG_DEFAULTS` 环境变量或在顶层 `CMakeLists.txt` 文件中设置 `SDKCONFIG_DEFAULTS`。非绝对路径的文件名将以当前项目的相对路径来解析。

在指定多个文件时，使用分号作为分隔符。先列出的文件将会先应用。如果某个键值在多个文件里定义，后面文件的定义会覆盖前面文件的定义。

一些 IDF 示例中包含了 `sdkconfig.ci` 文件。该文件是 CI（持续集成）测试框架的一部分，在正常构建过程中会被忽略。

依赖于硬件目标的 sdkconfig 默认值

当且仅当 `sdkconfig.defaults` 文件存在时，构建系统还将尝试从 `sdkconfig.defaults.TARGET_NAME` 文件中加载默认值，其中 `IDF_TARGET` 的值为 `TARGET_NAME`。例如，对于 `esp32` 这个目标芯片，`sdkconfig` 的默认值会首先从 `sdkconfig.defaults` 获取，然后再从 `sdkconfig.defaults.esp32` 获取。当没有通用的默认设置时，仍需创建一个空的 `sdkconfig.defaults` 文件，以便构建系统可以识别任何其他与目标芯片相关的 `sdkconfig.defaults.TARGET_NAME` 文件。

如果使用 `SDKCONFIG_DEFAULTS` 覆盖默认文件的名称，则硬件目标的默认文件名也会从 `SDKCONFIG_DEFAULTS` 值中派生。如果 `SDKCONFIG_DEFAULTS` 中有多个文件，硬件目标文件会在引入该硬件目标文件的文件之后应用，而 `SDKCONFIG_DEFAULTS` 中所有其它后续文件则会在硬件目标文件之后应用。

例如，如果 `SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1"`，并且在同一文件夹中有一个 `sdkconfig.defaults.esp32` 文件，那么这些文件将按以下顺序应用：(1) `sdkconfig.defaults` (2) `sdkconfig.defaults.esp32` (3) `sdkconfig_devkit1`。

4.4.14 flash 参数

有些情况下，我们希望在没有 IDF 时也能烧写目标板，为此，我们希望可以保存已构建的二进制文件、`esptool.py` 和 `esptool write_flash` 命令的参数。可以通过编写一段简单的脚本来保存二进制文件和 `esptool.py`。

运行项目构建之后，构建目录将包含项目二进制输出文件（.bin 文件），同时也包含以下烧录数据文件：

- `flash_project_args` 包含烧录整个项目的参数，包括应用程序 (app)、引导程序 (bootloader)、分区表，如果设置了 PHY 数据，也会包含此数据。
- `flash_app_args` 只包含烧录应用程序的参数。
- `flash_bootloader_args` 只包含烧录引导程序的参数。

你可以参照如下命令将任意烧录参数文件传递给 `esptool.py`：

```
python esptool.py --chip esp32s2 write_flash @build/flash_project_args
```

也可以手动复制参数文件中的数据到命令行中执行。

构建目录中还包含生成的 `flasher_args.json` 文件，此文件包含 JSON 格式的项目烧录信息，可用于 `idf.py` 和其它需要项目构建信息的工具。

4.4.15 构建 Bootloader

引导程序是 `/components/bootloader/subproject` 内部独特的“子项目”，它有自己的项目 `CMakeLists.txt` 文件，能够构建独立于主项目的 .ELF 和 .BIN 文件，同时它又与主项目共享配置和构建目录。

子项目通过 `/components/bootloader/project_include.cmake` 文件作为外部项目插入到项目的顶层，主构建进程会运行子项目的 CMake，包括查找组件（主项目使用的组件的子集），生成引导程序专用的配置文件（从主 `sdkconfig` 文件中派生）。

4.4.16 编写纯 CMake 组件

ESP-IDF 构建系统用“组件”的概念“封装”了 CMake，并提供了很多帮助函数来自动将这些组件集成到项目构建当中。

然而，“组件”概念的背后是一个完整的 CMake 构建系统，因此可以制作纯 CMake 组件。

下面是使用纯 CMake 语法为 json 组件编写的最小 `CMakeLists` 文件的示例：

```
add_library(json STATIC
cJSON/cJSON.c
cJSON/cJSON_Utils.c)
```

(下页继续)

```
target_include_directories(json PUBLIC cJSON)
```

- 这实际上与 IDF 中的 `json` 组件是等效的。
- 因为组件中的源文件不多，所以这个 `CMakeLists` 文件非常简单。对于具有大量源文件的组件而言，ESP-IDF 支持的组件通配符，可以简化组件 `CMakeLists` 的样式。
- 每当组件中新增一个与组件同名的库目标时，ESP-IDF 构建系统会自动将其添加到构建中，并公开公共的 `include` 目录。如果组件想要添加一个与组件不同名的库目标，就需要使用 `CMake` 命令手动添加依赖关系。

4.4.17 组件中使用第三方 CMake 项目

`CMake` 在许多开源的 C/C++ 项目中广泛使用，用户可以在自己的应用程序中使用开源代码。`CMake` 构建系统的一大好处就是可以导入这些第三方的项目，有时候甚至不用做任何改动。这就允许用户使用当前 ESP-IDF 组件尚未提供的功能，或者使用其它库来实现相同的功能。

假设 `main` 组件需要导入一个假想库 `foo`，相应的组件 `CMakeLists` 文件如下所示：

```
# 注册组件
idf_component_register(...)

# 设置 `foo` 项目中的一些 CMake 变量，以控制 `foo` 的构建过程
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# 创建并导入第三方库目标
add_subdirectory(foo)

# 将 `foo` 目标公开链接至 `main` 组件
target_link_libraries(main PUBLIC foo)
```

实际的案例请参考 [build_system/cmake/import_lib](#)。请注意，导入第三方库所需要做的工作可能会因库的不同而有所差异。建议仔细阅读第三方库的文档，了解如何将其导入到其它项目中。阅读第三方库的 `CMakeLists.txt` 文件以及构建结构也会有所帮助。

用这种方式还可以将第三方库封装成 ESP-IDF 的组件。例如 `mbdts` 组件就是封装了 `mbdts` 项目得到的。详情请参考 [mbdts 组件的 CMakeLists.txt 文件](#)。

每当使用 ESP-IDF 构建系统时，`CMake` 变量 `ESP_PLATFORM` 都会被设置为 1。如果要在通用的 `CMake` 代码加入 IDF 特定的代码时，可以采用 `if (ESP_PLATFORM)` 的形式加以分隔。

外部库中使用 ESP-IDF 组件

上述示例中假设的是外部库 `foo`（或 `import_lib` 示例中的 `tinyclib` 库）除了常见的 API 如 `libc`、`libstdc++` 等外不需要使用其它 ESP-IDF API。如果外部库需要使用其它 ESP-IDF 组件提供的 API，则需要在外部 `CMakeLists.txt` 文件中通过添加对库目标 `idf::<componentname>` 的依赖关系。

例如，在 `foo/CMakeLists.txt` 文件：

```
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
  # 在 ESP-IDF 中，bar.c 需要包含 spi_flash 组件中的 esp_flash.h
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

4.4.18 组件中使用预建库

还有一种情况是你有一个由其它构建过程生成预建静态库（.a 文件）。

ESP-IDF 构建系统为用户提供了一个实用函数 `add_prebuilt_library`，能够轻松导入并使用预建库：

```
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES_
→req1 req2 ...])
```

其中：

- `target_name`- 用于引用导入库的名称，如链接到其它目标时
- `lib_path`- 预建库的路径，可以是绝对路径或是相对于组件目录的相对路径

可选参数 `REQUIRES` 和 `PRIV_REQUIRES` 指定对其它组件的依赖性。这些参数与 `idf_component_register` 的参数的意义相同。

注意预建库的编译目标需与目前的项目相同。预建库的相关参数也要匹配。如果不特别注意，这两个因素可能会导致应用程序中出现 `bug`。

请查看示例 `build_system/cmake/import_prebuilt`。

4.4.19 在自定义 CMake 项目中使用 ESP-IDF

ESP-IDF 提供了一个模板 CMake 项目，可以基于此轻松创建应用程序。然而在有些情况下，用户可能已有一个现成的 CMake 项目，或者想自己创建一个 CMake 项目，此时就希望将 IDF 中的组件以库的形式链接到用户目标（库/可执行文件）。

可以通过 `tools/cmake/idf.cmake` 提供的 *build system APIs* 实现该目标。例如：

```
cmake_minimum_required(VERSION 3.16)
project(my_custom_app C)

# 导入提供 ESP-IDF CMake 构建系统 API 的 CMake 文件
include(${ENV{IDF_PATH}}/tools/cmake/idf.cmake)

# 在构建中导入 ESP-IDF 组件，可以视作等同 add_subdirectory()
# 但为 ESP-IDF 构建增加额外的构建过程
# 具体构建过程
idf_build_process(esp32)

# 创建项目可执行文件
# 使用其别名 idf::newlib 将其链接到 newlib 组件
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# 让构建系统知道项目到可执行文件是什么，从而添加更多的目标以及依赖关系等
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

`build_system/cmake/idf_as_lib` 中的示例演示了如何在自定义的 CMake 项目创建一个类似于 `Hello World` 的应用程序。

4.4.20 ESP-IDF CMake 构建系统 API

ESP-IDF 构建命令

```
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

检索一个构建属性 *property*，并将其存储在当前作用域可访问的 `var` 中。特定 `GENERATOR_EXPRESSION` 将检索该属性的生成器表达式字符串（不是实际值），它可与支持生成器表达式的 CMake 命令一起使用。

```
idf_build_set_property(property val [APPEND])
```

设置构建属性 *property* 的值为 *val*。特定 *APPEND* 将把指定的值附加到属性当前值之后。如果该属性之前不存在或当前为空，则指定的值将变为第一个元素/成员。

```
idf_build_component(component_dir)
```

向构建系统提交一个包含组件的 *component_dir* 目录。相对路径会被转换为相对于当前目录的绝对路径。所有对该命令的调用必须在 `idf_build_process` 之前执行。

该命令并不保证组件在构建过程中会被处理（参见 *idf_build_process* 中 *COMPONENTS* 参数说明）

```
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

为导入 ESP-IDF 组件执行大量的幕后工作，包括组件配置、库创建、依赖性扩展和解析。在这些功能中，对于用户最重要的可能是通过调用每个组件的 `idf_component_register` 来创建库。该命令为每个组件创建库，这些库可以使用别名来访问，其形式为 `idf::component_name`。这些别名可以用来将组件链接到用户自己的目标、库或可执行文件上。

该调用要求用 *target* 参数指定目标芯片。调用的可选参数包括：

- **PROJECT_DIR** - 项目目录，默认为 `CMAKE_SOURCE_DIR`。
- **PROJECT_NAME** - 项目名称，默认为 `CMAKE_PROJECT_NAME`。
- **PROJECT_VER** - 项目的版本/版本号，默认为“1”。
- **SDKCONFIG** - 生成的 `sdkconfig` 文件的输出路径，根据是否设置 **PROJECT_DIR**，默认为 `PROJECT_DIR/sdkconfig` 或 `CMAKE_SOURCE_DIR/sdkconfig`。
- **SDKCONFIG_DEFAULTS** - 包含默认配置的文件列表（列表中必须包含完整的路径），默认为空；对于列表中的每个值 *filename*，如果存在的话，也会加载文件 *filename.target* 中的配置。对于列表中的 *filename* 的每一个值，也会加载文件 *filename.target*（如果存在的话）中的配置。
- **BUILD_DIR** - 用于放置 ESP-IDF 构建相关工具的目录，如生成的二进制文件、文本文件、组件；默认为 `CMAKE_BINARY_DIR`。
- **COMPONENTS** - 从构建系统已知的组件中选择要处理的组件（通过 `idf_build_component` 添加）。这个参数用于精简构建过程。如果在依赖链中需要其它组件，则会自动添加，即自动添加这个列表中组件的公共和私有依赖项，进而添加这些依赖项的公共和私有依赖，以此类推。如果不指定，则会处理构建系统已知的所有组件。

```
idf_build_executable(executable)
```

指定 ESP-IDF 构建的可执行文件 *executable*。这将添加额外的目标，如与 `flash` 相关的依赖关系，生成额外的二进制文件等。应在 `idf_build_process` 之后调用。

```
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

获取指定配置的值。就像构建属性一样，特定 *GENERATOR_EXPRESSION* 将检索该配置的生成器表达式字符串，而不是实际值，即可以与支持生成器表达式的 CMake 命令一起使用。然而，实际的配置值只有在调用 `idf_build_process` 后才能知道。

ESP-IDF 构建属性

可以通过使用构建命令 `idf_build_get_property` 来获取构建属性的值。例如，以下命令可以获取构建过程中使用的 Python 解释器的相关信息。

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- **BUILD_DIR** - 构建目录; 由 `idf_build_process` 的 **BUILD_DIR** 参数设置。
- **BUILD_COMPONENTS** - 包含在构建中的组件列表; 由 `idf_build_process` 设置。
- **BUILD_COMPONENT_ALIASES** - 包含在构建中的组件的库别名列表; 由 `idf_build_process` 设置。
- **C_COMPILE_OPTIONS** - 适用于所有组件的 C 源代码文件的编译选项。
- **COMPILE_OPTIONS** - 适用于所有组件的源文件 (无论是 C 还是 C++) 的编译选项。
- **COMPILE_DEFINITIONS** - 适用于所有组件源文件的编译定义。
- **CXX_COMPILE_OPTIONS** - 适用于所有组件的 C++ 源文件的编译选项。
- **EXECUTABLE** - 项目可执行文件; 通过调用 `idf_build_executable` 设置。
- **DEPENDENCIES_LOCK** - 组件管理器使用的依赖关系锁定文件的路径。默认值为项目路径下的 `dependencies.lock`。
- **EXECUTABLE_NAME** - 不含扩展名的项目可执行文件的名称; 通过调用 `idf_build_executable` 设置。
- **EXECUTABLE_DIR** - 输出的可执行文件的路径
- **IDF_COMPONENT_MANAGER** - 默认启用组件管理器, 但如果设置这个属性为 0, 则会被 **IDF_COMPONENT_MANAGER** 环境变量禁用。
- **IDF_PATH** - ESP-IDF 路径; 由 **IDF_PATH** 环境变量设置, 或者从 `idf.cmake` 的位置推断。
- **IDF_TARGET** - 构建的目标芯片; 由 `idf_build_process` 的目标参数设置。
- **IDF_VER** - ESP-IDF 版本; 由版本文件或 **IDF_PATH** 仓库的 Git 版本设置。
- **INCLUDE_DIRECTORIES** - 包含所有组件源文件的目录。
- **KCONFIGS** - 构建过程中组件里的 **Kconfig** 文件的列表; 由 `idf_build_process` 设置。
- **KCONFIG_PROJBUILDS** - 构建过程中组件中的 **Kconfig.projbuild** 文件的列表; 由 `idf_build_process` 设置。
- **PROJECT_NAME** - 项目名称; 由 `idf_build_process` 的 **PROJECT_NAME** 参数设置。
- **PROJECT_DIR** - 项目的目录; 由 `idf_build_process` 的 **PROJECT_DIR** 参数设置。
- **PROJECT_VER** - 项目的版本; 由 `idf_build_process` 的 **PROJECT_VER** 参数设置。
- **PYTHON** - 用于构建的 Python 解释器; 如果有则从 **PYTHON** 环境变量中设置, 如果没有, 则使用 "python"。
- **SDKCONFIG** - 输出的配置文件的完整路径; 由 `idf_build_process` **SDKCONFIG** 参数设置。
- **SDKCONFIG_DEFAULTS** - 包含默认配置的文件列表; 由 `idf_build_process` **SDKCONFIG_DEFAULTS** 参数设置。
- **SDKCONFIG_HEADER** - 包含组件配置的 C/C++ 头文件的完整路径; 由 `idf_build_process` 设置。
- **SDKCONFIG_CMAKE** - 包含组件配置的 CMake 文件的完整路径; 由 `idf_build_process` 设置。
- **SDKCONFIG_JSON** - 包含组件配置的 JSON 文件的完整路径; 由 `idf_build_process` 设置。
- **SDKCONFIG_JSON_MENUS** - 包含配置菜单的 JSON 文件的完整路径; 由 `idf_build_process` 设置。

ESP-IDF 组件命令

```
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

检索一个指定的 *component* 的 **组件属性** *property*, 并将其存储在当前作用域可访问的 *var* 中。指定 **GENERATOR_EXPRESSION** 将检索该属性的生成器表达式字符串 (不是实际值), 它可以在支持生成器表达式的 CMake 命令中使用。

```
idf_component_set_property(component property val [APPEND])
```

设置指定的 *component* 的 **组件属性**, *property* 的值为 *val*。特定 **APPEND** 将把指定的值追加到属性的当前值后。如果该属性之前不存在或当前为空, 指定的值将成为第一个元素/成员。

```
idf_component_register([[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...] [EXCLUDE_
↪SRCS src1 src2 ...]]
                        [INCLUDE_DIRS dir1 dir2 ...]]
```

(下页继续)

```
[PRIV_INCLUDE_DIRS dir1 dir2 ...]
[REQUIRES component1 component2 ...]
[PRIV_REQUIRES component1 component2 ...]
[LDFRAGMENTS ldfragment1 ldfragment2 ...]
[REQUIRED_IDF_TARGETS target1 target2 ...]
[EMBED_FILES file1 file2 ...]
[EMBED_TXTFILES file1 file2 ...]
[KCONFIG kconfig]
[KCONFIG_PROJBUILD kconfig_projbuild]
[WHOLE_ARCHIVE])
```

将一个组件注册到构建系统中。就像 `project()` CMake 命令一样，该命令应该直接从组件的 `CMakeLists.txt` 中调用（而不是通过函数或宏），且建议在其他命令之前调用该命令。下面是一些关于在 `idf_component_register` 之前不能调用哪些命令的指南：

- 在 CMake 脚本模式下无效的命令。
- 在 `project_include.cmake` 中定义的自定义命令。
- 除了 `idf_build_get_property` 之外，构建系统的 API 命令；但要考虑该属性是否有被设置。

对变量进行设置和操作的命令，一般可在 `idf_component_register` 之前调用。

`idf_component_register` 的参数包括：

- **SRCS** - 组件的源文件，用于为组件创建静态库；如果没有指定，组件将被视为仅配置组件，从而创建接口库。
- **SRC_DIRS**、**EXCLUDE_SRCS** - 用于通过指定目录来 `glob` 源文件 (.c、.cpp、.S)，而不是通过 **SRCS** 手动指定源文件。请注意，这受 *CMake* 中通配符的限制。在 **EXCLUDE_SRCS** 中指定的源文件会从被 `glob` 的文件中移除。
- **INCLUDE_DIRS** - 相对于组件目录的路径，该路径将被添加到需要当前组件的所有其他组件的 `include` 搜索路径中。
- **PRIV_INCLUDE_DIRS** - 必须是相对于组件目录的目录路径，它仅被添加到这个组件源文件的 `include` 搜索路径中。
- **REQUIRES** - 组件的公共组件依赖项。
- **PRIV_REQUIRES** - 组件的私有组件依赖项；在仅用于配置的组件上会被忽略。
- **LDFRAGMENTS** - 组件链接器片段文件。
- **REQUIRED_IDF_TARGETS** - 指定该组件唯一支持的目标。
- **KCONFIG** - 覆盖默认的 `Kconfig` 文件。
- **KCONFIG_PROJBUILD** - 覆盖默认的 `Kconfig.projbuild` 文件。
- **WHOLE_ARCHIVE** - 如果指定了此参数，链接时会在组件库的前后分别添加 `-Wl,--whole-archive` 和 `-Wl,--no-whole-archive`。这与设置 **WHOLE_ARCHIVE** 组件属性的效果一致。

以下内容用于将数据嵌入到组件中，并在确定组件是否仅用于配置时被视为源文件。这意味着，即使组件没有指定源文件，如果组件指定了以下其中之一，仍然会在内部为组件创建一个静态库。

- **EMBED_FILES** - 嵌入组件的二进制文件
- **EMBED_TXTFILES** - 嵌入组件的文本文件

ESP-IDF 组件属性

组件的属性值可以通过使用构建命令 `idf_component_get_property` 来获取。例如，以下命令可以获取 `freertos` 组件的目录。

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- **COMPONENT_ALIAS** - **COMPONENT_LIB** 的别名，用于将组件链接到外部目标；由 `idf_build_component` 设置，别名库本身由 `idf_component_register` 创建。
- **COMPONENT_DIR** - 组件目录；由 `idf_build_component` 设置。
- **COMPONENT_OVERRIDEN_DIR** - 如果这个组件覆盖了另一个组件，则包含原组件的目录。

- `COMPONENT_LIB` - 所创建的组件静态/接口库的名称；由 `idf_build_component` 设置，库本身由 `idf_component_register` 创建。
- `COMPONENT_NAME` - 组件的名称；由 `idf_build_component` 根据组件的目录名设置。
- `COMPONENT_TYPE` - 组件的类型 (`LIBRARY` 或 `CONFIG_ONLY`)。如果一个组件指定了源文件或嵌入了一个文件，那么它的类型就是 `LIBRARY`。
- `EMBED_FILES` - 要嵌入组件的文件列表；由 `idf_component_register` `EMBED_FILES` 参数设置。
- `EMBED_TXTFILES` - 要嵌入组件的文本文件列表；由 `idf_component_register` `EMBED_TXTFILES` 参数设置。
- `INCLUDE_DIRS` - 组件 `include` 目录列表；由 `idf_component_register` `INCLUDE_DIRS` 参数设置。
- `KCONFIG` - 组件 `Kconfig` 文件；由 `idf_build_component` 设置。
- `KCONFIG_PROJBUILD` - 组件 `Kconfig.projbuild`；由 `idf_build_component` 设置。
- `LDFRAGMENTS` - 组件链接器片段文件列表；由 `idf_component_register` `LDFRAGMENTS` 参数设置。
- `MANAGED_PRIV_REQUIRES` - IDF 组件管理器从 `idf_component.yml` 清单文件中的依赖关系中添加的私有组件依赖关系列表。
- `MANAGED_REQUIRES` - IDF 组件管理器从 `idf_component.yml` 清单文件的依赖关系中添加的公共组件依赖关系列表。
- `PRIV_INCLUDE_DIRS` - 组件私有 `include` 目录列表；在 `LIBRARY` 类型的组件 `idf_component_register` `PRIV_INCLUDE_DIRS` 参数中设置。
- `PRIV_REQUIRES` - 私有组件依赖关系列表；根据 `idf_component_register` `PRIV_REQUIRES` 参数的值以及 `idf_component.yml` 清单文件中的依赖关系设置。
- `REQUIRED_IDF_TARGETS` - 组件支持的目标列表；由 `idf_component_register` `REQUIRED_IDF_TARGETS` 参数设置。
- `REQUIRES` - 公共组件依赖关系列表；根据 `idf_component_register` `REQUIRES` 参数的值以及 `idf_component.yml` 清单文件中的依赖关系设置。
- `SRCES` - 组件源文件列表；由 `idf_component_register` 的 `SRCES` 或 `SRC_DIRS/EXCLUDE_SRCES` 参数设置。
- `WHOLE_ARCHIVE` - 如果该属性被设置为 `TRUE` (或是其他 CMake 布尔“真”值: `1`, `ON`, `YES`, `Y` 等), 链接时会在组件库的前后分别添加 `-Wl,--whole-archive` 和 `-Wl,--no-whole-archive` 选项。这可以强制链接器将每个目标文件包含到可执行文件中, 即使该目标文件没有解析来自应用程序其余部分的任何引用。当组件中包含依赖链接时注册的插件或模块时, 通常会使用该方法。默认情况下, 此属性为 `FALSE`。可以从组件的 `CMakeLists.txt` 文件中将其设置为 `TRUE`。

4.4.21 文件通配 & 增量构建

在 ESP-IDF 组件中添加源文件的首选方法是在 `COMPONENT_SRCES` 中手动列出它们:

```
idf_component_register(SRCES library/a.c library/b.c platform/platform.c
    ...)
```

这是在 CMake 中手动列出源文件的 **最佳实践**。然而, 当有许多源文件都需要添加到构建中时, 这种方法就会很不方便。ESP-IDF 构建系统因此提供了另一种替代方法, 即使用 `SRC_DIRS` 来指定源文件:

```
idf_component_register(SRC_DIRS library platform
    ...)
```

后台会使用通配符在指定的目录中查找源文件。但是请注意, 在使用这种方法的时候, 如果组件中添加了一个新的源文件, CMake 并不知道重新运行配置, 最终该文件也没有被加入构建中。

如果是自己添加的源文件, 这种折衷还是可以接受的, 因为用户可以触发一次干净的构建, 或者运行 `idf.py reconfigure` 来手动重启 CMake。但是, 如果你需要与其他使用 Git 等版本控制工具的开发人员共享项目时, 问题就会变得更加困难, 因为开发人员有可能会拉取新的版本。

ESP-IDF 中的组件使用了第三方的 Git CMake 集成模块 (`/tools/cmake/third_party/GetGitRevisionDescription.cmake`), 任何时候源码仓库的提交记录发生了改变, 该模块就会自动重新运行 CMake。即只要拉取了新的 ESP-IDF 版本, CMake 就会重新运行。

对于不属于 ESP-IDF 的项目组件, 有以下几个选项供参考:

- 如果项目文件保存在 Git 中，ESP-IDF 会自动跟踪 Git 修订版本，并在它发生变化时重新运行 CMake。
- 如果一些组件保存在第三方 Git 仓库中（不在项目仓库或 ESP-IDF 仓库），则可以在组件 CMakeLists 文件中调用 `git_describe` 函数，以便在 Git 修订版本发生变化时自动重启 CMake。
- 如果没有使用 Git，请记住在源文件发生变化时手动运行 `idf.py reconfigure`。
- 使用 `idf_component_register` 的 `SRCS` 参数来列出项目组件中的所有源文件则可以完全避免这一问题。

具体选择哪一方式，就要取决于项目本身，以及项目用户。

4.4.22 构建系统的元数据

为了将 ESP-IDF 集成到 IDE 或者其它构建系统中，CMake 在构建的过程中会在 `build/` 目录下生成大量元数据文件。运行 `cmake` 或 `idf.py reconfigure`（或任何其它 `idf.py` 构建命令），可以重新生成这些元数据文件。

- `compile_commands.json` 是标准格式的 JSON 文件，它描述了在项目中参与编译的每个源文件。CMake 其中的一个功能就是生成此文件，许多 IDE 都知道如何解析此文件。
- `project_description.json` 包含有关 ESP-IDF 项目、已配置路径等的一些常规信息。
- `flasher_args.json` 包含 `esptool.py` 工具用于烧录项目二进制文件的参数，此外还有 `flash_*_args` 文件，可直接与 `esptool.py` 一起使用。更多详细信息请参阅 [flash 参数](#)。
- `CMakeCache.txt` 是 CMake 的缓存文件，包含 CMake 进程、工具链等其它信息。
- `config/sdkconfig.json` 包含 JSON 格式的项目配置结果。
- `config/kconfig_menus.json` 是在 `menuconfig` 中显示菜单的 JSON 格式版本，用于外部 IDE 的 UI。

JSON 配置服务器

`kconfserver` 工具可以帮助 IDE 轻松地与配置系统的逻辑进行集成，它运行在后台，通过使用 `stdin` 和 `stdout` 读写 JSON 文件的方式与调用进程交互。

你可以通过 `idf.py confserver` 或 `ninja kconfserver` 从项目中运行 `kconfserver`，也可以使用不同的构建生成器来触发类似的目标。

有关 `kconfserver` 的更多信息，请参阅 [esp-idf-kconfig 文档](#)。

4.4.23 构建系统内部

构建脚本

ESP-IDF 构建系统的列表文件位于 `/tools/cmake` 中。实现构建系统核心功能的模块如下

- `build.cmake` - 构建相关命令，即构建初始化、检索/设置构建属性、构建处理。
- `component.cmake` - 组件相关的命令，如添加组件、检索/设置组件属性、注册组件。
- `kconfig.cmake` - 从 `Kconfig` 文件中生成配置文件（`sdkconfig`、`sdkconfig.h`、`sdkconfig.cmake` 等）。
- `ldgen.cmake` - 从链接器片段文件生成最终链接器脚本。
- `target.cmake` - 设置构建目标和工具链文件。
- `utilities.cmake` - 其它帮助命令。

除了这些文件，还有两个重要的 CMake 脚本在 `/tools/cmake` 中：

- `idf.cmake` - 设置构建参数并导入上面列出的核心模块。之所以包括在 CMake 项目中，是为了方便访问 ESP-IDF 构建系统功能。
- `project.cmake` - 导入 `idf.cmake`，并提供了一个自定义的 `project()` 命令，该命令负责处理建立可执行文件时所有的繁重工作。包含在标准 ESP-IDF 项目的顶层 `CMakeLists.txt` 中。

`/tools/cmake` 中的其它文件都是构建过程中的支持性文件或第三方脚本。

构建过程

本节介绍了标准的 ESP-IDF 应用构建过程。构建过程可以大致分为四个阶段：

图 2: ESP-IDF Build System Process

初始化

该阶段为构建设置必要的参数。

- 在将 `idf.cmake` 导入 `project.cmake` 后，将执行以下步骤：
 - 在环境变量中设置 `IDF_PATH` 或从顶层 `CMakeLists.txt` 中包含的 `project.cmake` 路径推断相对路径。
 - 将 `/tools/cmake` 添加到 `CMAKE_MODULE_PATH` 中，并导入核心模块和各种辅助/第三方脚本。
 - 设置构建工具/可执行文件，如默认的 Python 解释器。
 - 获取 ESP-IDF git 修订版，并存储为 `IDF_VER`。
 - 设置全局构建参数，即编译选项、编译定义、包括所有组件的 `include` 目录。
 - 将 `components` 中的组件添加到构建中。
- 自定义 `project()` 命令的初始部分执行以下步骤：
 - 在环境变量或 CMake 缓存中设置 `IDF_TARGET` 以及设置相应要使用的 `CMAKE_TOOLCHAIN_FILE`。
 - 添加 `EXTRA_COMPONENT_DIRS` 中的组件至构建中
 - 从 `COMPONENTS/` `EXCLUDE_COMPONENTS`、`SDKCONFIG`、`SDKCONFIG_DEFAULTS` 等变量中为调用命令 `idf_build_process()` 准备参数。

调用 `idf_build_process()` 命令标志着这个阶段的结束。

枚举

这个阶段会建立一个需要在构建过程中处理的组件列表，该阶段在 `idf_build_process()` 的前半部分进行。

- 检索每个组件的公共和私有依赖。创建一个子进程，以脚本模式执行每个组件的 `CMakeLists.txt`。`idf_component_register` `REQUIRES` 和 `PRIV_REQUIRES` 参数的值会返回给父进程。这就是所谓的早期扩展。在这一步中定义变量 `CMAKE_BUILD_EARLY_EXPANSION`。
- 根据公共和私有的依赖关系，递归地导入各个组件。

处理

该阶段处理构建中的组件，是 `idf_build_process()` 的后半部分。

- 从 `sdkconfig` 文件中加载项目配置，并生成 `sdkconfig.cmake` 和 `sdkconfig.h` 头文件。这两个文件分别定义了可以从构建脚本和 C/C++ 源文件/头文件中访问的配置变量/宏。
- 导入各组件的 `project_include.cmake`。
- 将每个组件添加为一个子目录，处理其 `CMakeLists.txt`。组件 `CMakeLists.txt` 调用注册命令 `idf_component_register` 添加源文件、导入目录、创建组件库、链接依赖关系等。

完成

该阶段是 `idf_build_process()` 剩余的步骤。

- 创建可执行文件并将其链接到组件库中。
- 生成 `project_description.json` 等项目元数据文件并且显示所建项目等相关信息。

请参考 </tools/cmake/project.cmake> 获取更多信息。

4.4.24 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统

ESP-IDF CMake 构建系统与旧版的 GNU Make 构建系统在某些方面非常相似，开发者都需要提供 `include` 目录、源文件等。然而，有一个语法上的区别，即对于 ESP-IDF CMake 构建系统，开发者需要将这些作为参数传递给注册命令 `idf_component_register`。

自动转换工具

在 ESP-IDF v4.x 版本中，`tools/cmake/convert_to_cmake.py` 提供了项目自动转换工具。由于该脚本依赖于 `make` 构建系统，所以 v5.0 版本中不包含该脚本。

CMake 中不可用的功能

有些功能已从 CMake 构建系统中移除，或者已经发生很大改变。GNU Make 构建系统中的以下变量已从 CMake 构建系统中删除：

- `COMPONENT_BUILD_DIR`：由 `CMAKE_CURRENT_BINARY_DIR` 替代。
- `COMPONENT_LIBRARY`：默认为 `$(COMPONENT_NAME).a` 但是库名可以被组件覆盖。在 CMake 构建系统中，组件库名称不可再被组件覆盖。
- `CC`、`LD`、`AR`、`OBJCOPY`：`gcc xtensa` 交叉工具链中每个工具的完整路径。CMake 使用 `CMAKE_C_COMPILER`、`CMAKE_C_LINK_EXECUTABLE` 和 `CMAKE_OBJCOPY` 进行替代。完整列表请参阅 [CMake 语言变量](#)。
- `HOSTCC`、`HOSTLD`、`HOSTAR`：宿主机本地工具链中每个工具的全名。CMake 系统不再提供此变量，外部项目需要手动检测所需的宿主机工具链。
- `COMPONENT_ADD_LDFLAGS`：用于覆盖链接标志。CMake 中使用 `target_link_libraries` 命令替代。
- `COMPONENT_ADD_LINKER_DEPS`：链接过程依赖的文件列表。`target_link_libraries` 通常会推断这些依赖。对于链接脚本，可以使用自定义的 CMake 函数 `target_linker_scripts`。
- `COMPONENT_SUBMODULES`：不再使用。CMake 会自动枚举 ESP-IDF 仓库中所有的子模块。
- `COMPONENT_EXTRA_INCLUDES`：曾是 `COMPONENT_PRIV_INCLUDEDIRS` 变量的替代版本，仅支持绝对路径。CMake 系统中统一使用 `COMPONENT_PRIV_INCLUDEDIRS`（可以是相对路径，也可以是绝对路径）。
- `COMPONENT_OBJS`：以前，可以以目标文件列表的方式指定组件源，现在，可以通过 `COMPONENT_SRCS` 以源文件列表的形式指定组件源。
- `COMPONENT_OBJEXCLUDE`：已被 `COMPONENT_SRC_EXCLUDE` 替换。用于指定源文件（绝对路径或组件目录的相对路径）。
- `COMPONENT_EXTRA_CLEAN`：已被 `ADDITIONAL_MAKE_CLEAN_FILES` 属性取代，注意，[CMake 对此项功能有部分限制](#)。
- `COMPONENT_OWN_BUILDTARGET` & `COMPONENT_OWN_CLEANTARGET`：已被 CMake 外部项目 `<ExternalProject>` 替代，详细内容请参阅 [完全覆盖组件的构建过程](#)。
- `COMPONENT_CONFIG_ONLY`：已被 `register_config_only_component()` 函数替代，请参阅 [仅配置组件](#)。
- `CFLAGS`、`CPPFLAGS`、`CXXFLAGS`：已被相应的 CMake 命令替代，请参阅 [组件编译控制](#)。

无默认值的变量

以下变量不再具有默认值：

- 源目录 (Make 中的 COMPONENT_SRCDIRS 变量, CMake 中 idf_component_register 的 SRC_DIRS 参数)
- include 目录 (Make 中的 COMPONENT_ADD_INCLUDEDIRS 变量, CMake 中 idf_component_register 的 INCLUDE_DIRS 参数)

不再需要的变量

在 CMake 构建系统中, 如果设置了 COMPONENT_SRCS, 就不需要再设置 COMPONENT_SRCDIRS。实际上, CMake 构建系统中如果设置了 COMPONENT_SRCDIRS, 那么 COMPONENT_SRCS 就会被忽略。

从 Make 中烧录

仍然可以使用 `make flash` 或者类似的目标来构建和烧录, 但是项目 `sdkconfig` 不能再用来指定串口和波特率。可以使用环境变量来覆盖串口和波特率的设置, 详情请参阅[使用 Ninja/Make 来烧录](#)。

4.5 C Support

ESP-IDF is primarily written in C and provides C APIs. [Newlib](#) is used as standard C library (the Newlib version can be found in [newlib/sbom.yml](#)). In general, all C features supported by the compiler, currently GCC, should be available in ESP-IDF, unless specified in [Unsupported C Features](#) below.

4.5.1 C Version

GNU dialect of ISO C17 (`--std=gnu17`) is the current default C version in ESP-IDF.

To compile the source code of a certain component using a different language standard, set the desired compiler flag in the component's `CMakeLists.txt` file:

```
idf_component_register( ... )
target_compile_options(${COMPONENT_LIB} PRIVATE -std=gnu11)
```

If the public header files of the component also need to be compiled with the same language standard, replace the flag `PRIVATE` with `PUBLIC`.

4.5.2 Unsupported C Features

The following features are not supported in ESP-IDF.

Nested Function Pointers

The **GNU dialect of ISO C17** supports [nested functions](#). However, they do not work in ESP-IDF when referenced as function pointer because the compiler generates a trampoline on the stack, while the stack is not executable in ESP-IDF. Hence, do not use function pointers to nested functions.

4.6 C++ 支持

ESP-IDF 主要使用 C 语言编写, 并提供 C 语言 API。但 ESP-IDF 也支持使用 C++ 开发应用程序, 与 C++ 开发相关的各种主题在本文档中列出。

ESP-IDF 支持以下 C++ 功能：

- 异常处理
- 多线程
- 运行时类型信息 (RTTI)
- 线程局部存储 (thread_local 关键字)
- 除部分限制，所有由 GCC 实现的 C++ 功能均受支持。有关由 GCC 所实现功能的详细信息，请参阅 [GCC 文档](#)。

4.6.1 esp-idf-cxx 组件

esp-idf-cxx 组件为一些 ESP-IDF 中的功能提供了更高级别的 C++ API，该组件可以从 [ESP-IDF 组件注册表](#) 中获取。

4.6.2 C++ 语言标准

默认情况下，ESP-IDF 使用 C++23 语言标准和 GNU 扩展 (-std=gnu++23) 编译 C++ 代码。

要使用其他语言标准编译特定组件的源代码，请按以下步骤，在组件的 CMakeLists.txt 文件中设置所需的编译器标志：

```
idf_component_register( ... )
target_compile_options(${COMPONENT_LIB} PRIVATE -std=gnu++11)
```

如果组件的公共头文件也需要以该语言标准编译，请使用 PUBLIC 而非 PRIVATE。

4.6.3 多线程

支持 C++ 线程，互斥锁和条件变量。C++ 线程基于 pthread 构建，而 pthread 封装了 FreeRTOS 任务。

有关在 C++ 中创建线程的示例，请参阅 [cxx/pthread](#)。

备注： std::jthread 的析构函数只能从 [线程 API](#) 或 [C++ 线程库 API](#) 创建的任务中安全地调用。

4.6.4 异常处理

ESP-IDF 默认禁用对 C++ 异常处理的支持，可以用 [CONFIG_COMPILER_CXX_EXCEPTIONS](#) 选项启用该支持。

如果抛出了异常处理，却没有相应的 catch 块，程序将由 abort 函数终止，并打印回溯信息。有关回溯信息的更多信息，请参见 [严重错误](#)。

C++ 异常处理应 **仅**应用于异常情况，即意外情况及罕见情况，如发生频率低于 1% 的事件。**请勿**将 C++ 异常处理用于流程控制，详情请参阅下文的资源使用部分。有关使用 C++ 异常处理的更多详情，请参阅 [ISO C++ FAQ](#) 和 [CPP 核心指南](#)。

有关 C++ 异常处理的示例，请参阅 [cxx/exceptions](#)。

C++ 异常处理及所需资源

启用异常处理后，应用程序的二进制文件通常会增加几个 KB。

此外，可能需要为异常处理应急内存池保留一部分 RAM。如果无法从堆内存中分配异常处理对象，则会使用该池中的内存。

使用 [CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE](#) 变量可以设置异常处理应急内存池的内存量。

当且仅当 C++ 异常抛出时，会使用额外的栈内存（约 200 字节），从而从栈内存顶部调用函数，启动异常处理。

使用 C++ 异常处理的代码的运行时间取决于运行时实际发生的情况。

- 如果没有抛出异常，则异常处理的代码运行速度会更快，因为无需检查错误代码。
- 如果抛出异常，异常处理代码的运行时间会比返回错误代码的代码长几个数量级。

如果抛出异常，解开栈代码的速度要比返回错误代码慢好几个数量级。所增加的运行时长取决于应用程序的要求和错误处理的实现方式（例如，是否需要用户输入或发送消息到云端）。因此，在实时关键的代码路径中，不应使用会抛出异常的代码。

4.6.5 运行时类型信息 (RTTI)

ESP-IDF 默认禁用对 RTTI 的支持，可以用 `CONFIG_COMPILER_CXX_RTTI` 选项启用该支持。

启用此选项，将以启用了 RTTI 支持的方式编译所有的 C++ 文件，并支持使用 `dynamic_cast` 转换和 `typeid` 运算符。启用此选项通常会增加几十 KB 的二进制文件大小。

有关在 ESP-IDF 中使用 RTTI 的示例，请参阅 [cxx/rtti](#)。

4.6.6 在 C++ 中进行开发

以下部分提供了在 C++ 中开发 ESP-IDF 应用程序的一些技巧。

组合 C 和 C++ 代码

当应用程序的不同部分使用 C 和 C++ 开发时，理解 [语言链接性](#) 的概念非常重要。

为了能够从 C 代码中调用 C++ 函数，该 C++ 函数必须使用 C 链接 (`extern "C"`) 进行 **声明和定义**：

```
// 在 .h 文件中声明：
#ifdef __cplusplus
extern "C" {
#endif

void my_cpp_func(void);

#ifdef __cplusplus
}
#endif

// 在 .cpp 文件中进行定义：
extern "C" void my_cpp_func(void) {
    // ...
}
```

为了能够从 C++ 中调用 C 函数，该 C 函数必须使用 C 链接 **声明**：

```
// 在 .h 文件中声明：
#ifdef __cplusplus
extern "C" {
#endif

void my_c_func(void);

#ifdef __cplusplus
}
#endif
```

(下页继续)

```
// 在 .c 文件中进行定义:  
void my_c_func(void) {  
    // ...  
}
```

在 C++ 中定义 app_main

ESP-IDF 希望应用程序入口点 `app_main` 以 C 链接定义。当 `app_main` 在 `.cpp` 源文件中定义时，必须以 `extern "C"` 标识：

```
extern "C" void app_main()  
{  
}
```

指定初始化器

许多 ESP-IDF 组件会以 [配置结构体](#) 作为初始化函数的参数。用 C 编写的 ESP-IDF 示例通常使用 [指定初始化器](#)，以可读且可维护的方式填充有关结构体。

C 和 C++ 语言对于指定初始化器有不同的规则。例如，C++23（当前在 ESP-IDF 中默认使用）不支持无序指定初始化、嵌套指定初始化、混合使用指定初始化器和常规初始化器，而对数组进行指定初始化。因此，当将 ESP-IDF 的 C 示例移植到 C++ 时，可能需要对结构体初始化器进行一些更改。详细信息请参阅 [C++ aggregate initialization reference](#)。

iostream

ESP-IDF 支持 `iostream` 功能，但应注意：

1. ESP-IDF 在构建过程中通常会删除未使用的代码。然而，在使用 `iostreams` 的情况下，仅在其中一个源文件包含 `<iostream>` 头文件就会使二进制文件增加大约 200 kB。
2. ESP-IDF 默认使用简单的非阻塞机制来处理标准输入流 (`stdin`)。要获得 `std::cin` 的常规行为，应用程序必须初始化 UART 驱动程序，并启用阻塞模式，详情请参阅 [common_components/protocol_examples_common/stdin_out.c](#)。

4.6.7 限制

- 链接脚本生成器不支持将具有 C++ 链接的函数单独放置在内存的特定位置。
- 当与模板函数一起使用时，会忽略各种节属性（例如 `IRAM_ATTR`）。
- `vtable` 位于 flash 中，在禁用 flash 缓存时无法访问。因此，在 [IRAM 安全中断处理程序](#) 中应避免调用虚拟函数。目前尚无法使用链接器脚本生成器调整 `vtable` 的放置位置。
- 不支持 C++ 文件系统 (`std::filesystem`) 功能。

4.6.8 注意事项

请勿在 C++ 中使用 `setjmp/longjmp`。`longjmp` 会在不调用任何析构函数的情况下盲目跳出堆栈，容易引起未定义的行为和内存泄漏。请改用 C++ 异常处理，这类程序可以确保正确调用析构函数。如果无法使用 C++ 异常处理，请使用其他替代方案（`setjmp/longjmp` 除外），如简单的返回码。

4.7 核心转储

4.7.1 概述

核心转储是软件发生致命错误时，由紧急处理程序自动保存的一组软件状态信息。核心转储有助于对故障进行事后分析，了解软件状态。ESP-IDF 支持生成核心转储。

核心转储包含了系统中所有任务在发生故障时的快照，每个快照都包括任务的控制块 (TCB) 和栈信息。通过分析任务快照，可以确定是哪个任务、在哪个指令（代码行），以及该任务的哪个调用栈导致了系统崩溃。如果将某些变量赋予特殊的核心转储属性，还可以转储这些变量的内容。

核心转储数据会按照特定格式保存在核心转储文件中，详情请参阅[核心转储镜像文件详解](#)。然而，ESP-IDF 的 `idf.py` 命令提供了专门的子命令，用于解码和分析核心转储文件。

4.7.2 配置

目标

选项 `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART` 可以启用或禁用核心转储，并在启用时选择核心转储的目标。发生崩溃时，生成的核心转储文件可以保存到 flash 中，也可以通过 UART 输出到连接的主机上。

格式和大小

选项 `CONFIG_ESP_COREDUMP_DATA_FORMAT` 控制核心转储文件格式，即 ELF 格式或二进制格式。

ELF 格式具备扩展特性，支持在发生崩溃时保存更多关于错误任务和崩溃软件的信息，但使用 ELF 格式会使核心转储文件变大。建议在新的软件设计中使用此格式，该格式足够灵活，可以在未来的修订版本中进行扩展，保存更多信息。

出于兼容性考虑，核心转储文件保留二进制格式。二进制格式的核心转储文件更小，性能更优。

选项 `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM` 配置核心转储保存的任务快照数量。

通过 `Components > Core dump > Core dump data integrity check` 选项可进行核心转储数据完整性检查。

保留栈大小

核心转储例程需要解析并保存所有其他任务的栈，因此会从单独的栈中运行。选项 `CONFIG_ESP_COREDUMP_STACK_SIZE` 控制核心转储栈大小，以字节数表示。

将此选项设置为 0 字节将使核心转储例程从 ISR 栈中运行，从而节省内存。将选项设置为大于零的值将创建一个独立的栈。

备注： 如果使用了独立的栈，建议栈大小应大于 1300 字节，确保核心转储例程本身不会导致栈溢出。

核心转储内存区域

核心转储默认保存 CPU 寄存器、任务数据和崩溃原因。选择 `CONFIG_ESP_COREDUMP_CAPTURE_DRAM` 选项后，`.bss` 段和 `.data` 段以及 heap 数据也将保存到转储中。

推荐将上面提到的几个数据段都保存到核心转储中，以方便调试。但这会导致核心转储文件变大，具体所需的额外存储空间取决于应用程序使用的 DRAM 大小。

备注： 除了崩溃任务的 TCB 和栈外，位于外部 RAM 中的数据不会保存到核心转储文件中，包括使用 `EXT_RAM_BSS_ATTR` 或 `EXT_RAM_NOINIT_ATTR` 属性定义的变量，以及存储在 `extram_bss` 段中的任何数据。

备注： 该功能仅在使用 ELF 文件格式时可用。

4.7.3 将核心转储保存到 flash

将核心转储文件保存至 flash 时，这些文件会保存到 flash 上的特殊分区。指定核心转储分区可以在 flash 芯片上预留空间来存储核心转储文件。

使用 ESP-IDF 提供的默认分区表时，核心转储分区会自动声明。但使用自定义分区表时，请按如下示例进行核心转储分区声明：

```
# 名称,      类型, 子类型,      偏移量,      大小
# 注意：如果增加了引导加载程序大小，请及时更新偏移量，避免产生重叠
nvs,        data, nvs,          0x9000,      0x6000
phy_init,   data, phy,          0xf000,      0x1000
factory,    app,  factory, 0x10000,     1M
coredump,   data, coredump,,      64K
```

重要： 如果设备启用了 *flash 加密*，请在核心转储分区中添加 encrypted 标志。请注意，使用 `idf.py coredump-info` 或 `idf.py coredump-debug` 命令无法从加密分区读取核心转储。建议使用 `idf.py coredump-info -c <path-to-core-dump>` 命令从 ESP 设备侧读取核心转储，ESP 设备会自动解密分区并发送到相应位置用于分析。

```
coredump, data, coredump,,      64K, encrypted
```

分区命名没有特殊要求，可以根据应用程序的需要选择。但分区类型应为 data，子类型应为 coredump。此外，在选择分区大小时需注意，核心转储的数据结构会产生 20 字节的固定开销和 12 字节的单任务开销，此开销不包括每个任务的 TCB 和栈的大小。因此，分区大小应至少为 $20 + \text{最大任务数} \times (12 + \text{TCB 大小} + \text{最大任务栈大小})$ 字节。

用于分析 flash 中核心转储的常用命令，可参考以下示例：

```
idf.py coredump-info
```

或

```
idf.py coredump-debug
```

备注： `idf.py coredump-info` 命令和 `idf.py coredump-debug` 命令对 *esp-coredump* 工具进行了封装，可以在 ESP-IDF 环境中轻松使用。更多信息，请参考 [核心转储命令](#)。

4.7.4 将核心转储保存到 UART

当核心转储文件输出到 UART 时，输出文件会以 Base64 编码方式呈现。通过 `CONFIG_ESP_COREDUMP_DECODE` 选项，可以选择 ESP-IDF 监视器对输出文件自动解码，或保持编码状态等待手动解码。

自动解码

如果设置 `CONFIG_ESP_COREDUMP_DECODE`，使其自动解码 UART 核心转储文件，ESP-IDF 监视器会自动解码数据，将所有函数地址转换为源代码行，并在监视器中显示相应信息。ESP-IDF 监视器会输出类似以下内容：

此外，选项 `CONFIG_ESP_COREDUMP_UART_DELAY` 支持在将核心转储文件输出到 UART 前添加延迟。

```

=====

===== ESP32 CORE DUMP END =====
=====

```

手动解码

如果设置 `CONFIG_ESP_COREDUMP_DECODE` 为不解码，则在以下 UART 输出的页眉和页脚之间，将输出核心转储的原始 Base64 编码正文：

```
===== CORE DUMP START =====
<将 Base64 编码的核心转储内容解码，并将其保存到磁盘文件中>
===== CORE DUMP END =====
```

建议将核心转储文本主体手动保存到文件，`CORE DUMP START` 和 `CORE DUMP END` 行不应包含在核心转储文本文件中。随后，可以使用以下命令解码保存的文本：

```
idf.py coredump-info -c </path/to/saved/base64/text>
```

或

```
idf.py coredump-debug -c </path/to/saved/base64/text>
```

4.7.5 核心转储命令

ESP-IDF 提供了一些特殊命令，有助于检索和分析核心转储：

- `idf.py coredump-info` - 打印崩溃任务的寄存器、调用栈、系统可用任务列表、内存区域以及核心转储中存储的内存内容（包括 TCB 和栈）。
- `idf.py coredump-debug` - 创建核心转储 ELF 文件，并使用该文件运行 GDB 调试会话。你可以手动检查内存、变量和任务状态。请注意，由于并未将所有内存保存在核心转储中，因此只有在栈上分配的变量的值才有意义。

高阶用户如果需要传递额外参数或使用自定义 ELF 文件，可直接使用 `esp-coredump` 工具。如果在 ESP-IDF 环境中使用该工具，可运行如下命令查询更多信息：

```
esp-coredump --help
```

4.7.6 回溯中的 ROM 函数

程序崩溃时，某些任务和/或崩溃任务本身的调用栈中可能包含一或多个 ROM 函数。由于 ROM 不是程序 ELF 的一部分，而 GDB 需要分析函数序言来解码回溯，因此 GDB 无法解析这些调用栈。因此，在遇到第一个 ROM 函数时，调用栈解析将中断并报错。

为解决这一问题，ESP-IDF 监视器会根据目标芯片及其修订版本自动加载乐鑫提供的 ROM ELF。有关 ROM ELF 的详细信息，请参阅 `esp-rom-elfs`。

4.7.7 按需转储变量

通过读取变量的最后一个值，可以了解崩溃发生的根本原因。核心转储支持通过为已声明的变量添加特殊标记，在 GDB 上检索变量数据。

支持的标记和 RAM 区域

- `COREDUMP_DRAM_ATTR` 将变量放置在 DRAM 区域，该区域包含在转储中。
- `COREDUMP_RTC_ATTR` 将变量放置在 RTC 区域，该区域包含在转储中。
- `COREDUMP_RTC_FAST_ATTR` 将变量放置在 RTC_FAST 区域，该区域包含在转储中。

示例

1. 在**项目配置菜单**中启用 `COREDUMP_TO_FLASH`，随后保存并退出。
2. 在项目中，创建如下全局变量，放置在 **DRAM** 区域：

```
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. 在主应用程序中，将该变量设置为任意值，并以 `assert(0)` 引发崩溃。

```
global_var = 25;
assert(0);
```

4. 在目标设备上构建、烧写并运行应用程序，等待转储信息。
5. 运行以下命令，在 **GDB** 中开始核心转储，其中 `PORT` 是设备的 **USB** 端口：

```
idf.py coredump-debug
```

6. 在 **GDB shell** 中，输入 `p global_var` 获取变量内容：

```
(gdb) p global_var
$1 = 25 '\031'
```

4.7.8 运行 `idf.py coredump-info` 和 `idf.py coredump-debug`

要获取更多有关使用方法的详情，请运行 `idf.py coredump-info --help` 和 `idf.py coredump-debug --help` 命令。

相关文档

核心转储镜像文件详解

核心转储文件的格式可以配置为使用 **ELF** 格式或传统的二进制格式。建议在所有新设计中使用 **ELF** 格式，该格式在发生崩溃时会提供更多关于软件状态的信息，例如 **CPU** 寄存器和内存内容。

内存状态包含程序内存空间中映射的所有任务的快照；**CPU** 状态包含核心转储生成时的寄存器值。核心转储文件使用 **ELF** 结构的子集注册这些信息。

可加载的 **ELF** 段用于存储进程的内存状态，**ELF** 注释 (`ELF.PT_NOTE`) 用于存储进程的元数据（如 `pid`、寄存器、信号等）。**CPU** 状态则存储在一个具有特殊名称 (`CORE`) 和类型 (`NT_PRSTATUS type`) 的注释中。

下图展示了核心转储的结构：

备注： 上图仅展示当前版本镜像的文件格式，在未来的发布版本中可能会发生变化。

核心转储实现 下图展示了核心转储实现的基本情况：

备注： 上图隐藏了部分细节，仅展示当前版本的核心转储实现，在未来的发布版本中可能会发生变化。

4.8 Current Consumption Measurement of Modules

You may want to know the current consumption of a [module](#) in deep-sleep mode, *other power-saving modes*, and active mode to develop some applications sensitive to power consumption. This section introduces how to measure the current consumption of a module running such an application.

4.8.1 Notes to Measurement

Can We Use a Development Board?

For ESP32-S2, using a development board directly to measure current consumption of the corresponding module is not recommended, as some circuits still consume power on the board even when you flash the chip with the [deep_sleep](#) example. Therefore, you need to cut off the power supply circuit to the module to measure the module's current. This method is inconvenient and increases measurement costs.

How to Choose an Appropriate Ammeter?

In the [deep_sleep](#) example, the module will be woken up every 20 seconds. In deep-sleep mode, the current in the module is just several microamps (μA), while in active mode, the current is in the order of milliamps (mA). The high dynamic current range makes accurate measurement difficult. Ordinary ammeters cannot dynamically switch the measurement range fast enough.

Additionally, ordinary ammeters have a relatively high internal resistance, resulting in a significant voltage drop. This may cause the module to enter an unstable state, as it is powered by a voltage smaller than the minimum required voltage supply.

Therefore, an ammeter suitable for measuring current in deep-sleep mode should have low internal resistance and, ideally, switch current ranges dynamically. We recommend two options: the [Joulescope ammeter](#) and the [Power Profiler Kit II from Nordic](#).

Joulescope Ammeter The Joulescope ammeter combines high-speed sampling and rapid dynamic current range switching to provide accurate and seamless current and energy measurements, even for devices with rapidly varying current consumption. Joulescope accurately measures electrical current over nine orders of magnitude from amps down to nanoamps. This wide range allows for accurate and precise current measurements for devices. Additionally, Joulescope has a total voltage drop of 25 mV at 1 A, which keeps the module running normally. These two features make Joulescope a perfect option for measuring the module switching between deep-sleep mode and wake-up mode.

Joulescope has no display screen. You need to connect it to a PC to visualize the current waveforms of the measured module. For specific instructions, please follow the documentation provided by the manufacturer.

Nordic Power Profiler Kit II The Nordic Power Profiler Kit II has an advanced analog measurement unit with a high dynamic measurement range. This allows for accurate power consumption measurements for the entire range typically seen in low-power embedded applications, all the way from single μA s to 1 A. The resolution varies between 100 nA and 1 mA, depending on the measurement range, and is high enough to detect small spikes often seen in low-power optimized systems.

4.8.2 Hardware Connection

To measure the power consumption of a bare module, you need an [ESP-Prog](#) to flash the [deep_sleep](#) example to the module and power the module during measurement, a suitable ammeter (here we use the Joulescope ammeter), a computer, and of course a bare module with necessary jumper wires. For the connection, please refer to the following figure.

Please connect the pins of **UART TX**, **UART RX**, **SPI Boot**, **Enable**, and **Ground** on the measured module with corresponding pins on ESP-Prog, and connect the **VPROG** pin on ESP-Prog with the **IN+** port on the Joulescope ammeter and connect its **OUT+** port with the **Power supply (3V3)** pin on the measured module. For the specific names of these pins in different modules, please refer to the list below.

表 1: Pin Names of Modules Based on ESP32-S2 Chip

| Function of Module Pin | Pin Name |
|------------------------|----------|
| UART TX | TXD0 |
| UART RX | RXD0 |
| SPI Boot | IO0 |
| Enable | EN |
| Power Supply | 3V3 |
| Ground | GND |

For details of the pin names, please refer to the [datasheet of specific module](#).

4.8.3 Measurement Steps

ESP32-S3-WROOM-1 is used as an example in the measurement, and other modules can be measured similarly. For the specific current consumption of chips in different modes, please refer to the Current Consumption subsection in the corresponding [chip datasheet](#).

You can refer to the following steps to measure the current in deep-sleep mode.

- Connect the aforementioned devices according to the hardware connection.
- Flash the [deep_sleep](#) example to the module. For details, please refer to [Start a Project on Linux and macOS](#) for a computer with Linux or macOS system or [Start a Project on Windows](#) for a computer with Windows system.

图 6: Hardware Connection (click to enlarge)

Please note that when you configure the example by running `idf.py menuconfig`, you need to disable Enable touch wake up in the Example Configuration to reduce the bottom current.

- By default, the module will be woken up every 20 seconds (you can change the timing by modifying the code of this example). To check if the example runs as expected, you can monitor the module operation by running `idf.py -p PORT monitor` (please replace PORT with your serial port name).
- Open the Joulescope software to see the current waveform as shown in the image below.

From the waveforms, you can obtain that the current of the module in deep-sleep mode is 8.14 μA . In addition, you can also see the current of the module in active mode, which is about 23.88 mA. The waveforms also show that the average power consumption during deep-sleep mode is 26.85 μW , and the average power consumption during active mode is 78.32 mW.

图 7: Current Waveform of ESP32-S3-WROOM-1 (click to enlarge)

The figure below shows the total power consumption of one cycle is 6.37 mW.

By referring to these power consumption in different modes, you can estimate the power consumption of your applications and choose the appropriate power source.

4.9 Deep Sleep Wake Stubs

图 8: Power Consumption of ESP32-S3-WROOM-1 (click to enlarge)

4.9.1 Introduction

The wakeup time from Deep-sleep mode is much longer, compared to Light-sleep and Modem-sleep modes as ROM and RAM are both powered down in this case, and the CPU needs more time for SPI booting. However, ESP32-S2 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialization, bootloader, or ESP-IDF code has run.

Specifically, after waking up from Deep-sleep mode, ESP32-S2 starts partial initialization. Then RTC fast memory will be validated with CRC. If validation passes, the wake stub code will be executed.

As ESP32-S2 has just woken up from deep sleep, most of the peripherals are in the reset state. The SPI flash has not been mapped. Thus, wake stub code can only call functions implemented in ROM or loaded into RTC fast memory, which retains content during deep sleep.

From the above, utilizing the wake stub functionality in an application you can quickly run some code when waking up from Deep-sleep mode, without having to wait for the whole boot-up process. However, the stub size is restricted by the size of RTC fast memory.

ESP32-S2 supports RTC memory, including both RTC fast memory and RTC slow memory. The wake stub code should be loaded into RTC fast memory, with data utilized by the code being stored in RTC fast or RTC slow memory.

Next we will introduce how to implement the wake stub code in an application.

4.9.2 Implement wake stub

The wake stub in esp-idf is realized by the function `esp_wake_deep_sleep()`. This function is executed whenever the SoC wakes from deep sleep. As this function is weakly-linked to the default function `esp_default_wake_deep_sleep()`, if your application contains a function with the name `esp_wake_deep_sleep()`, the default version `esp_default_wake_deep_sleep()` in esp-idf will be overridden.

Please note that implementing the function `esp_wake_deep_sleep()` in your application is not mandatory for utilizing the deep sleep functionality. It becomes necessary only if you want to introduce certain behavior immediately upon the SoC's wake-up.

When you develop a customized wake stub, the first step it should do is to call the default function `esp_default_wake_deep_sleep()`.

In addition, you can switch between different wake stubs by calling the function `esp_set_deep_sleep_wake_stub()` during runtime.

Implementing the wake stub function in your application includes the following steps:

- Loading wake stub code into RTC fast memory
- Loading data into RTC memory

Load Wake Stub Code into RTC Fast Memory

The wake stub code can only call functions present in ROM or loaded into RTC fast memory. All other RAM locations are uninitialized and contain random data. While the wake stub code can use other RAM areas for temporary storage, the contents of these areas will be overwritten either upon returning to deep sleep mode or upon initiating esp-idf.

Wake stub code is a part of the main esp-idf application. During regular execution of esp-idf, functions can call the wake stub code or access RTC memory, treating them as a regular part of the application.

Wake stub code must reside in RTC fast memory. This can be realized in two ways.

- Employ the attribute `RTC_IRAM_ATTR` to place `esp_wake_deep_sleep()` into RTC fast memory:

```
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The first approach is suitable for short and simple code segments or for source files including both "normal" and "RTC" code.

- Place the function `esp_wake_deep_sleep()` into any source file with name starting with `rtc_wake_stub`. For files with such names `rtc_wake_stub*`, their contents can be automatically put into RTC fast memory by the linker.

The second method is preferable when writing longer code segments in RTC fast memory.

However, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

- Place the data into any source file with name starting with `rtc_wake_stub`, as demonstrated in the example source file `system/deep_sleep_wake_stub/main/rtc_wake_stub_example.c`.

```
if (s_count >= s_max_count) {
    // Reset s_count
    s_count = 0;

    // Set the default wake stub.
    // There is a default version of this function provided in esp-idf.
    esp_default_wake_deep_sleep();

    // Return from the wake stub function to continue
    // booting the firmware.
    return;
}
```

The second approach is advisable when incorporating strings or more complex code segments.

You can enable the Kconfig option `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` to reduce wake-up time. See more information in [Fast boot from Deep Sleep](#).

All of the above functions are declared in `esp_hw_support/include/esp_sleep.h`.

Load Wake Stub Data into RTC memory

RTC memory must include read-only data used by the wake stub code. Data in RTC memory is initialized whenever the SoC restarts, except when waking from deep sleep. In such cases, the data retained before entering to deep sleep are kept. Data used by the wake stub code must be resident in RTC memory, i.e. RTC fast memory or in RTC slow memory.

The data can be specified in the following two methods:

- Utilize attributes `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify writable or read-only data, respectively.

```
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count++);
}
```

The RTC memory area where the data will be placed can be configured via the menuconfig option `CONFIG_ESP32S2_RTCDATA_IN_FAST_MEM`. This option allows keeping slow memory area for ULP programs. Once it is enabled, the data marked with `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` are placed in the RTC fast

memory segment; otherwise, it goes to RTC slow memory (the default option). This option depends on the `CONFIG_FREERTOS_UNICORE` option because RTC fast memory can be accessed only by PRO_CPU.

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that is forcefully placed into RTC fast memory and RTC slow memory, respectively.

4.9.3 Example

ESP-IDF provides an example to show how to implement the deep sleep wake stub.

- [system/deep_sleep_wake_stub](#)

4.10 通过 USB 升级设备固件

一般情况下，ESP32-S2 的固件是通过芯片的串口烧录。但是，通过串口烧录 ESP32-S2 需要连接 USB 转串口转换器（如 CP210x 或 FTDI），详细信息可参阅[与 ESP32-S2 创建串口连接](#)。ESP32-S2 包含一个 USB OTG 外设，使其可以通过 USB 将 ESP32-S2 直接连接到主机，即不需要 USB 转串口转换器也可完成烧录。

设备固件升级 (DFU) 是一种通过通用串行总线 (USB) 升级设备固件的机制。但是，启用安全启动 (Secure Boot) 或 flash 加密会禁用 ROM 中的 USB-OTG USB 堆栈，则无法通过该端口上的模拟串口或 DFU 进行更新。

- 入门指南中的[软件](#)：介绍了 DFU 的软件要求。
- [构建 DFU 镜像](#) 章节介绍了如何使用 ESP-IDF 构建固件。
- [烧录 DFU 镜像](#) 章节介绍了如何烧录固件。

4.10.1 USB 连接

ESP32-S2 的内部 USB PHY（收发器）与 GPIO 的连接如下表所示：

| GPIO | USB |
|------|---------|
| 20 | D+（绿色） |
| 19 | D-（白色） |
| GND | GND（黑色） |
| +5V | +5V（红色） |

警告：一些连接线采用非标准颜色连接，有时调换下 D+ 和 D- 的连接，驱动程序就能正常工作。如果无法检测到你的设备，请尝试下调换 D+ 和 D- 的连接线。

备注：ESP32-S2 芯片需要处于引导加载程序模式才能被检测为 DFU 设备并烧录。可以通过下拉 GPIO0（例如按下 BOOT 按钮）、拉低 RESET 片刻并释放 GPIO0 来实现。

4.10.2 构建 DFU 镜像

可以通过运行以下命令构建 DFU 镜像，该命令会在工程的 `build` 目录下生成 `dfu.bin` 文件：

```
idf.py dfu
```

备注： 在运行 `idf.py dfu` 命令前，请记得通过 `idf.py set-target` 命令设置目标芯片。否则，你创建的镜像可能不是针对目标芯片，或者收到类似 `unknown target 'dfu'` 的错误消息。

4.10.3 烧录 DFU 镜像

运行以下命令将 DFU 镜像下载到 ESP32-S2 中：

```
idf.py dfu-flash
```

该命令依赖于 `dfu-util`。关于如何安装 `dfu-util`，请参考[软件：](#)。对于 Windows 和 Linux 用户，`dfu-util` 还需进行额外设置。Windows 用户请参考[USB 驱动（仅限 Windows）](#)，Linux 用户请参考[Udev 规则（仅限 Linux）](#)。macOS 用户无需额外设置即可使用 `dfu-util`。

如果连接了不止一个开发板，且这些开发板使用的芯片相同，则可以使用 `idf.py dfu-list` 列出所有可用设备，例如：

```
Found Runtime: [303a:0002] ver=0723, devnum=4, cfg=1, intf=2, path="1-10", alt=0,
↳name="UNKNOWN", serial="0"
Found Runtime: [303a:0002] ver=0723, devnum=6, cfg=1, intf=2, path="1-2", alt=0,
↳name="UNKNOWN", serial="0"
```

然后，可以通过 `--path` 参数选择所需的设备进行烧录。例如，以上设备可以通过下面的命令分别进行烧录：

```
idf.py dfu-flash --path 1-10
idf.py dfu-flash --path 1-2
```

备注： 供应商和产品标识符的设置是基于使用 `idf.py set-target` 命令时所选的目标芯片，在调用 `idf.py dfu-flash` 时无法选择。

请参考[常见错误及已知问题](#)及其解决方案。

4.10.4 Udev 规则（仅限 Linux）

Udev 是 Linux 内核的设备管理器，允许用户在没有 `sudo` 的情况下运行 `dfu-util`（和 `idf.py dfu-flash`）从而访问芯片。

创建文件 `/etc/udev/rules.d/40-dfuse.rules`，并在文件中添加如下内容：

```
SUBSYSTEMS=="usb", ATTRS{idVendor}=="303a", ATTRS{idProduct}=="00??", GROUP=
↳"plugdev", MODE="0666"
```

备注： 请检查 `groups` 命令的输出。用户必须是上面指定的 *GROUP* 的成员。你可以为此使用其他现有的组（例如，在某些系统上使用 `uucp` 而不是 `plugdev`）或为此创建一个新的组。

你可以选择重启计算机使之前的设置生效，或者手动运行 `sudo udevadm trigger`，强制 Udev 触发新规则。

4.10.5 USB 驱动（仅限 Windows）

`dfu-util` 使用 `libusb` 来访问设备。你需要在 Windows 上使用 `WinUSB` 驱动程序注册设备。

更多详细信息，请参考 [libusb wiki](#)。

可以通过 [Zadig 工具](#) 安装驱动程序。请确保在运行该工具之前设备处于下载模式，并确保在安装驱动程序之前检测到 ESP32-S2 设备。Zadig 工具可能会检测到 ESP32-S2 的多个 USB 接口。请只为没有安装驱动力的接口（可能是接口 2）安装 WinUSB 驱动，不要重新安装其他接口驱动。

警告： 不建议在 Windows 的设备管理器中手动安装驱动程序，可能会造成无法正常烧录。

4.10.6 常见错误及已知问题

- 出现 `dfu-util: command not found` 错误可能是因为该工具尚未安装或是无法在终端使用。检查是否已经安装该工具的一种简单方法是运行 `dfu-util --version` 命令。请参考[软件：安装 dfu-util](#)。
- 出现 `No DFU capable USB device available` 错误的原因可能是在 Windows 上没有正确安装 USB 驱动程序（请参考[USB 驱动（仅限 Windows）](#)），或是未在 Linux 上设置 Udev 规则（请参考[Udev 规则（仅限 Linux）](#)），或是设备未处于引导加载程序模式。
- 在 Windows 上使用 `dfu-util` 第一次烧录失败，并出现 `Lost device after RESET?` 错误信息。出现此问题时，请重新烧录一次，再次烧录应该会成功。

4.10.7 安全下载模式

启用安全下载模式后，DFU 不再可用。请参见[flash 加密](#)，了解详细信息。

4.11 错误处理

4.11.1 概述

在应用程序开发中，及时发现并处理在运行时期的错误，对于保证应用程序的健壮性非常重要。常见的运行时错误有如下几种：

- 可恢复的错误：
 - 通过函数的返回值（错误码）表示的错误
 - 使用 `throw` 关键字抛出的 C++ 异常
- 不可恢复（严重）的错误：
 - 断言失败（使用 `assert` 宏或者其它类似方法，可参考[Assertions](#)）或者直接调用 `abort()` 函数造成的错误
 - CPU 异常：访问受保护的内存区域、非法指令等
 - 系统级检查：看门狗超时、缓存访问错误、堆栈溢出、堆栈粉碎、堆栈损坏等

本文将介绍 ESP-IDF 中针对可恢复错误的错误处理机制，并提供一些常见错误的处理模式。

关于如何处理不可恢复的错误，请查阅[不可恢复错误](#)。

4.11.2 错误码

ESP-IDF 中大多数函数会返回 `esp_err_t` 类型的错误码，`esp_err_t` 实质上是带符号的整型，`ESP_OK` 代表成功（没有错误），具体值定义为 0。

在 ESP-IDF 中，许多头文件都会使用预处理器，定义可能出现的错误代码。这些错误代码通常均以 `ESP_ERR_` 前缀开头，一些常见错误（比如内存不足、超时、无效参数等）的错误代码则已经在 `esp_err.h` 文件中定义好了。此外，ESP-IDF 中的各种组件（component）也都可以针对具体情况，自行定义更多错误代码。

完整错误代码列表，请见[错误代码参考](#)中查看完整的错误列表。

4.11.3 错误码到错误消息

错误代码并不直观，因此 ESP-IDF 还可以使用 `esp_err_to_name()` 或者 `esp_err_to_name_r()` 函数，将错误代码转换为具体的错误消息。例如，我们可以向 `esp_err_to_name()` 函数传递错误代码 `0x101`，可以得到返回字符串“ESP_ERR_NO_MEM”。这样一来，我们可以在日志中输出更加直观的错误消息，而不是简单的错误码，从而帮助研发人员更快理解发生了何种错误。

此外，如果出现找不到匹配的 `ESP_ERR_` 值的情况，函数 `esp_err_to_name_r()` 则会尝试将错误码作为一种 **标准 POSIX 错误代码** 进行解释。具体过程为：POSIX 错误代码（例如 `ENOENT`，`ENOMEM`）定义在 `errno.h` 文件中，可以通过 `errno` 变量获得，进而调用 `strerror_r` 函数实现。在 ESP-IDF 中，`errno` 是一个基于线程的局部变量，即每个 FreeRTOS 任务都有自己的 `errno` 副本，通过函数修改 `errno` 也只会作用于当前任务中的 `errno` 变量值。

该功能（即在无法匹配 `ESP_ERR_` 值时，尝试用标准 POSIX 解释错误码）默认启用。用户也可以禁用该功能，从而减小应用程序的二进制文件大小，详情可见 [CONFIG_ESP_ERR_TO_NAME_LOOKUP](#)。注意，该功能对禁用并不影响 `esp_err_to_name()` 和 `esp_err_to_name_r()` 函数的定义，用户仍可调用这两个函数转化错误码。在这种情况下，`esp_err_to_name()` 函数在遇到无法匹配错误码的情况会返回 `UNKNOWN ERROR`，而 `esp_err_to_name_r()` 函数会返回 `Unknown error 0xXXXX(YYYY)`，其中 `0xXXXX` 和 `YYYY` 分别代表错误代码的十六进制和十进制表示。

4.11.4 ESP_ERROR_CHECK 宏

宏 `ESP_ERROR_CHECK` 的功能和 `assert` 类似，不同之处在于：这个宏会检查 `esp_err_t` 的值，而非判断 `bool` 条件。如果传给 `ESP_ERROR_CHECK` 的参数不等于 `ESP_OK`，则会在控制台上打印错误消息，然后调用 `abort()` 函数。

错误消息通常如下所示：

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf

file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)

Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030_
↳0x400d0816:0x3ffb5050
```

备注： 如果使用 [IDF 监视器](#)，则最后一行回溯结果中的地址将会被自动解析为相应的文件名和行号。

- 第一行打印错误代码的十六进制表示，及该错误在源代码中的标识符。这个标识符取决于 [CONFIG_ESP_ERR_TO_NAME_LOOKUP](#) 选项的设定。最后，第一行还会打印程序中该错误发生的具体位置。
- 下面几行显示了程序中调用 `ESP_ERROR_CHECK` 宏的具体位置，以及传递给该宏的参数。
- 最后一行打印回溯结果。对于所有不可恢复错误，这里在应急处理程序中打印的内容都是一样的。更多有关回溯结果的详细信息，请参阅 [不可恢复错误](#)。

4.11.5 ESP_ERROR_CHECK_WITHOUT_ABORT 宏

宏 `ESP_ERROR_CHECK_WITHOUT_ABORT` 的功能和 `ESP_ERROR_CHECK` 类似，不同之处在于它不会调用 `abort()`。

4.11.6 ESP_RETURN_ON_ERROR 宏

宏 `ESP_RETURN_ON_ERROR` 用于错误码检查，如果错误码不等于 `ESP_OK`，该宏会打印错误信息，并使原函数立刻返回。

4.11.7 ESP_GOTO_ON_ERROR 宏

宏 `ESP_GOTO_ON_ERROR` 用于错误码检查, 如果错误码不等于 `ESP_OK`, 该宏会打印错误信息, 将局部变量 `ret` 赋值为该错误码, 并使原函数跳转至给定的 `goto_tag`.

4.11.8 ESP_RETURN_ON_FALSE 宏

宏 `ESP_RETURN_ON_FALSE` 用于条件检查, 如果给定条件不等于 `true`, 该宏会打印错误信息, 并使原函数立刻返回, 返回值为给定的 `err_code`.

4.11.9 ESP_GOTO_ON_FALSE 宏

宏 `ESP_GOTO_ON_FALSE` 用于条件检查, 如果给定条件不等于 `true`, 该宏会打印错误信息, 将局部变量 `ret` 赋值为给定的 `err_code`, 并使原函数跳转至给定的 `goto_tag`.

4.11.10 CHECK 宏使用示例

示例:

```
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message_
    ↪printed if `x` is not `ESP_OK`, and then `abort()`.
    ESP_ERROR_CHECK_WITHOUT_ABORT(x); // err message_
    ↪printed if `x` is not `ESP_OK`, without `abort()`.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message_
    ↪printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2"); // err message_
    ↪printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message_
    ↪printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message_
    ↪printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to_
    ↪`err`.

err:
    // clean up
    return ret;
}
```

备注: 如果 Kconfig 中的 `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` 选项被打开, `CHECK` 宏将不会打印错误信息, 其他功能不变。

`ESP_RETURN_XX` 和 `ESP_GOTO_XX` 宏不可以在中断服务程序里被调用。如需要在中断中使用类似功能, 请使用 `XX_ISR` 宏, 如 `ESP_RETURN_ON_ERROR_ISR` 等。

4.11.11 错误处理模式

1. 尝试恢复。根据具体情况不同, 我们具体可以:
 - 在一段时间后, 重新调用该函数;
 - 尝试删除该驱动, 然后重新进行“初始化”;

- 采用其他带外机制，修改导致错误发生的条件（例如，对一直没有响应的外设进行复位等）。
- 示例:

```
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // 如果发送队列已满就不断重试
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // 处理其他错误
}
```

2. 将错误传递回调用程序。在某些中间件组件中，采用此类处理模式代表函数必须以相同的错误码退出，这样才能确保所有分配的资源都能得到释放。
- 示例:

```
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // 释放内存
    free(card);
    // 将错误码传递给上层（例如通知用户）
    // 或者，应用程序可以自定义错误代码并返回
    return err;
}
```

3. 转为不可恢复错误，比如使用 `ESP_ERROR_CHECK`。详情请见 [ESP_ERROR_CHECK 宏](#) 章节。对于中间件组件而言，通常并不希望在发生错误时中止应用程序。不过，有时在应用程序级别，这种做法是可以接受的。在 ESP-IDF 的示例代码中，很多都会使用 `ESP_ERROR_CHECK` 来处理各种 API 引发的错误，虽然这不是应用程序的最佳做法，但可以让示例代码看起来更加简洁。
- 示例:

```
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

4.11.12 C++ 异常

请参考[异常处理](#)。

4.12 ESP-WIFI-MESH

本指南提供有关 ESP-WIFI-MESH 协议的介绍。更多有关 API 使用的信息，请见[ESP-WIFI-MESH API 参考](#)。

4.12.1 概述

ESP-WIFI-MESH 是一套建立在 Wi-Fi 协议之上的网络协议。ESP-WIFI-MESH 允许分布在大范围区域内（室内和室外）的大量设备（下文称节点）在同一个 WLAN（无线局域网）中相互连接。ESP-WIFI-MESH 具有自组网和自修复的特性，也就是说 mesh 网络可以自主地构建和维护。

本 ESP-WIFI-MESH 指南分为以下几个部分：

1. 简介
2. [ESP-WIFI-MESH 概念](#)

3. 建立网络
4. 管理网络
5. 数据传输
6. 信道切换
7. 性能
8. 更多注意事项

4.12.2 简介

图 9: 传统 Wi-Fi 网络架构

传统基础设施 Wi-Fi 网络是一个“单点对多点”的网络。这种网络架构的中心节点为接入点 (AP)，其他节点 (station) 均与 AP 直接相连。其中，AP 负责各个 station 之间的仲裁和转发，一些 AP 还会通过路由器与外部 IP 网络交换数据。在传统 Wi-Fi 网络架构中，1) 由于所有 station 均需与 AP 直接相连，不能距离 AP 太远，因此覆盖区域相对有限；2) 受到 AP 容量的限制，因此网络中允许的 station 数量相对有限，很容易超载。

ESP-WIFI-MESH 与传统 Wi-Fi 网络的不同之处在于：网络中的节点不需要连接到中心节点，而是可以与相邻节点连接。各节点均负责相连节点的数据中继。由于无需受限于距离中心节点的位置，所有节点仍可互连，因此 ESP-WIFI-MESH 网络的覆盖区域更广。类似地，由于不再受限于中心节点的容量限制，ESP-WIFI-MESH 允许更多节点接入，也不易于超载。

4.12.3 ESP-WIFI-MESH 概念

图 10: ESP-WIFI-MESH 网络架构示意图

术语

| 术语 | 描述 |
|--------|---|
| 节点 | 任何 属于或可以成为 ESP-WIFI-MESH 网络一部分的设备 |
| 根节点 | 网络顶部的节点 |
| 子节点 | 如节点 X 连接至节点 Y，且 X 相较 Y 与根节点的距离更远（跨越的连接数量更多），则称 X 为 Y 的子节点。 |
| 父节点 | 与子节点对应的概念 |
| 后裔节点 | 任何可以从根节点追溯到的节点 |
| 兄弟节点 | 连接至同一个父节点的所有节点 |
| 连接 | AP 和 station 之间的传统 Wi-Fi 关联。ESP-WIFI-MESH 中的节点使用 station 接口与另一个节点的 SoftAP 接口产生关联，进而形成连接。连接包括 Wi-Fi 网络中的身份验证和关联过程。 |
| 上行连接 | 从节点到其父节点的连接 |
| 下行连接 | 从父节点到其一个子节点的连接 |
| 无线 hop | 源节点和目标节点间无线连接路径中的一部分。 单跳 指遍历单个连接的数据包， 多跳 指遍历多个连接的数据包。 |
| 子网 | 子网指 ESP-WIFI-MESH 网络的一部分，包括一个节点及其所有后代节点。因此，根节点的子网包括 ESP-WIFI-MESH 网络中的所有节点。 |
| MAC 地址 | 在 ESP-WIFI-MESH 网络中用于区别每个节点或路由器的唯一地址 |
| DS | 分布式系统（外部 IP 网络） |

树型拓扑

ESP-WIFI-MESH 建立在传统 Wi-Fi 协议之上，可被视为一种将多个独立 Wi-Fi 网络组合为一个单一 WLAN 网络的组网协议。在 Wi-Fi 网络中，station 在任何时候都仅限于与 AP 建立单个连接（上行连接），而 AP 则可以同时连接到多个 station（下行连接）。然而，ESP-WIFI-MESH 网络则允许节点同时充当 station 和 AP。因此，ESP-WIFI-MESH 中的节点可以使用其 **SoftAP 接口建立多个下行连接**，同时使用其 **station 接口建立一个上行连接**。这将自然产生一个由多层父子结构组成的树型网络拓扑结构。

ESP-WIFI-MESH 是一个多跳网络，也就是说网络中的节点可以通过单跳或多跳向网络中的其他节点传递数据包。因此，ESP-WIFI-MESH 中的节点不仅传输自己的数据包，而且同时充当其他节点的中继。假设 ESP-WIFI-MESH 网络中的任意两个节点存在物理层上连接（通过单跳或多跳），则这两个节点可以进行通信。

图 11: ESP-WIFI-MESH 树型拓扑

备注: ESP-WIFI-MESH 网络中的大小（节点总数）取决于网络中允许的最大层级，以及每个节点可以具有的最大下行连接数。因此，这两个变量可用于配置 ESP-WIFI-MESH 网络的大小。

节点类型

根节点: 指网络顶部的节点，是 ESP-WIFI-MESH 网络和外部 IP 网络之间的唯一接口。根节点直接连接至传统的 Wi-Fi 路由器，并在 ESP-WIFI-MESH 网络的节点和外部 IP 网络之间中继数据包。**ESP-WIFI-MESH 网络中只能有一个根节点**，且根节点的上行连接只能是路由器。如上图所示，节点 A 即为该 ESP-WIFI-MESH 网络的根节点。

叶子节点: 指不允许拥有任何子节点（即无下行连接）的节点。因此，叶子节点只能传输或接收自己的数据包，但不能转发其他节点的数据包。如果节点处于 ESP-WIFI-MESH 网络的最大允许层级，则该节点将成为叶子节点。叶子节点不会再产生下行连接，这可以防止节点继续生成下行连接，从而确保网络层级不会超出限制。由于建立下行连接必须使用 SoftAP 接口，因此一些没有 SoftAP 接口的节点（仅有 station 接口）也将被分配为叶子节点。如上图所示，位于网络最外层的 L/M/N 节点即为叶子节点。

中间父节点: 既不是属于根节点也不属于叶子节点的节点即为中间父节点。中间父节点必须有且仅有一个上行连接（即一个父节点），但可以具有 0 个或多个下行连接（即 0 个或多个子节点）。因此，中间父节点可以发送和接收自己的数据包，也可以转发其上行和下行连接的数据包。如上图所示，节点 B 到 J 即为中间父节点。**注意，E/F/G/I/J 等没有下行连接的中间父节点并不等同于叶子节点**，原因在于这些节点仍允许形成下行连接。

空闲节点: 尚未加入网络的节点即为空闲节点。空闲节点将尝试与中间父节点形成上行连接，或者在有条件的情况下（参见[自动根节点选择](#)）成为一个根节点。如上图所示，K 和 O 节点即为空闲节点。

信标帧和 RSSI 阈值

ESP-WIFI-MESH 中能够形成下行连接的每个节点（即具有 SoftAP 接口）都会定期传输 Wi-Fi 信标帧。节点可以通过信标帧让其他节点检测自己的存在和状态。空闲节点将侦听信标帧以生成一个潜在父节点列表，并与其中一个潜在父节点形成上行连接。ESP-WIFI-MESH 使用“供应商信息元素”来存储元数据，例如：

- 节点类型（根节点、中间父节点、叶子节点、空闲节点）
- 节点当前所处的层级

图 12: ESP-WIFI-MESH 节点类型

- 网络中允许的最大层级
- 当前子节点数量
- 可接受的最大下行连接数量

潜在上行连接的信号强度可由潜在父节点信标帧的 RSSI 表示。为了防止节点形成弱上行连接，ESP-WIFI-MESH 采用了针对信标帧的 RSSI 阈值控制机制。如果节点检测到某节点的信标帧 RSSI 过低（即低于预设阈值），则会在尝试形成上行连接时忽略该节点。

上图 (A 侧) 展示了 RSSI 阈值将如何影响空闲节点的候选父节点数量。

上图 (B 侧) 展示了 RF 屏蔽物将如何降低潜在父节点的 RSSI。由于存在 RF 屏蔽物，节点 X 的 RSSI 高于阈值的区域显著减小。这会导致空闲节点忽略节点 X，即使从地理位置上看 X 就在空闲节点附近。相反，该空闲节点将从更远的地方找到一个 RSSI 更强的节点 Y 形成上行连接。

备注：事实上，ESP-WIFI-MESH 网络中的节点在 MAC 层仍可以接收所有的信标帧，但 RSSI 阈值控制功能可以过滤掉所有 RSSI 低于预设阈值的信标帧。

首选父节点

当一个空闲节点有多个候选父节点（潜在父节点）时，空闲节点将与其中的 **首选父节点** 形成上行连接。首选父节点基于以下条件确定：

- 候选父节点所处的层级
- 候选父节点当前具有的下行连接（子节点）数量

在网络中所处层级较浅的候选父节点（包括根节点）将优先成为首选父节点。这有助于在形成上行连接时控制 ESP-WIFI-MESH 网络中的总层级使之最小。例如，在位于第二层和第三层的候选父节点间选择时，位于第二层的候选父节点将始终优先成为首选父节点。

如果同一层上存在多个候选父节点，则子节点最少的候选父节点将优先成为首选父节点。这有助于平衡同一层节点的下行连接数量。

图 13: RSSI 閾值的影响

图 14: 首选父节点选择

上图 (A 侧) 展示了空闲节点 G 如何在 B/C/D/E/F 五个候选父节点中选择首选父节点：首先，B/C 节点优于 D/E/F 节点，因为这两个节点所处的层级更浅。其次，C 节点优于 B 节点，因为 C 节点的下行连接数量（子节点数量）更少。

上图 (B 侧) 展示了空闲节点 G 如何在根节点 A 和其他候选父节点中选择首选父节点，此时根节点 A 处于空闲节点 G 范围之内（即空闲节点 G 接收到的根节点 A 信标帧 RSSI 强度高于预设阈值）：由于根节点 A 处于网络中最浅的层，因此将成为首选父节点。

备注： 用户还可以自行定义首选父节点的选择规则，也可以直接指定某个节点为首选父节点（见 [Mesh 手动配网示例](#)）。

路由表

ESP-WIFI-MESH 网络中的每个节点均会维护自己的路由表，并按路由表将数据包（请见 [ESP-WIFI-MESH 数据包](#)）沿正确的路线发送至正确的目标节点。某个特定节点的路由表将包含 **该节点的子网中所有节点的 MAC 地址**，也包括该节点自己的 MAC 地址。每个路由表会划分为多个子路由表，与每个子节点的子网对应。

图 15: ESP-WIFI-MESH 路由表示例

以上图为例，节点 B 的路由表中将包含节点 B 到节点 I 的 MAC 地址（即相当于节点 B 的子网）。节点 B 的路由表可划分为节点 C 和 G 的子路由表，分别包含节点 C 到节点 F 的 MAC 地址、节点 G 到节点 I 的 MAC 地址。

ESP-WIFI-MESH 利用路由表来使用以下规则进行转发，确定 ESP-WIFI-MESH 数据包应根据向上行转发还是向下行转发。

1. 如果数据包的目标 MAC 地址处于当前节点的路由表中且不是当前节点本身，则选择包含目标 MAC 地址的子路由表，并将数据包向下转发给子路由表对应的子节点。
2. 如果数据包的目标 MAC 地址不在当前节点的路由表内，则将数据包向上转发给当前节点的父节点，并重复执行该操作直至数据包达到目标地址。此步骤可重复至根节点（根节点包含整个网络的全部节点）。

备注： 用户可以通过调用 `esp_mesh_get_routing_table()` 获取一个节点的路由表，调用 `esp_mesh_get_routing_table_size()` 获取一个路由表的大小，也可

通过调用 `esp_mesh_get_subnet_nodes_list()` 获取某个子节点的子路由表，调用 `esp_mesh_get_subnet_nodes_num()` 获取子路由表的大小。

4.12.4 建立网络

一般过程

警告： ESP-WIFI-MESH 正式开始构建网络前，必须确保网络中所有节点具有相同的配置（见 `mesh_cfg_t`）。每个节点必须配置 **相同 MESH 网络 ID、路由器配置和 SoftAP 配置**。

ESP-WIFI-MESH 网络将首先选择根节点，然后逐层形成下行连接，直到所有节点均加入网络。网络的布局可能取决于诸如根节点选择、父节点选择和异步上电复位等因素。但简单来说，一个 ESP-WIFI-MESH 网络的构建过程可以概括为以下步骤：

图 16: ESP-WIFI-MESH 网络构建过程

1. 根节点选择 根节点直接进行指定（见 [用户指定根节点](#)）或通过选举由信号强度最强的节点担任（见 [自动根节点选择](#)）。一旦选定，根节点将与路由器连接，并开始允许下行连接形成。如上图所示，节点 A 被选为根节点，因此节点 A 上行连接到路由器。

2. 第二层形成 一旦根节点连接到路由器，根节点范围内的空闲节点将开始与根节点连接，从而形成第二层网络。一旦连接，第二层节点成为中间父节点（假设最大允许层级大于 2 层），并进而形成下一层。如上图所示，节点 B 到节点 D 都在根节点的连接范围内。因此，节点 B 到节点 D 将与根节点形成上行连接，并成为中间父节点。

3. 其余层形成 剩余的空闲节点将与所处范围内的中间父节点连接，并形成新的层。一旦连接，根据网络的最大允许层级，空闲节点成为中间父节点或叶子节点。此后重复该步骤，直到网络中的所有空闲节点均加入网络或达到网络最大允许层级。如上图所示，节点 E/F/G 分别与节点 B/C/D 连接，并成为中间父节点。

4. 限制树深度 为了防止网络超过最大允许层级，最大允许层级上的节点将在完成连接后成为叶子节点。这样一来，其他空闲节点将无法与这些最大允许层上的叶子节点形成连接，因此不会超过最大允许层级。然而，如果空闲节点无法找到其他潜在父节点，则将无限期地保持空闲状态。如上图所示，网络的最大允许层级为四。因此，节点 H 在完成连接后将成为叶子节点，以防止任何下行连接的形成。

自动根节点选择

在自动模式下，根节点的选择取决于相对于路由器的信号强度。每个空闲节点将通过 Wi-Fi 信标帧发送自己的 MAC 地址和路由器 RSSI 值。**MAC 地址可以表示网络中的唯一节点**，而 **路由器 RSSI 值** 代表相对于路由器的信号强度。

此后，每个节点将同时扫描来自其他空闲节点的信标帧。如果节点检测到具有更强的路由器 RSSI 的信标帧，则节点将开始传输该信标帧的内容（相当于为这个节点投票）。经过最小迭代次数（可预先设置，默认为 10 次）将选举出路由器 RSSI 值最强的信标帧。

在达到预设迭代次数后，每个节点将单独检查其 **得票百分比**（得票数 / 总票数）以确定它是否应该成为根节点。**如果节点的得票百分比大于预设的阈值（默认为 90%），则该节点将成为根节点。**

下图展示了在 ESP-WIFI-MESH 网络中，根节点的自动选择过程。

图 17: 根节点选举示例

1. 上电复位时，每个节点开始传输自己的信标帧（包括 MAC 地址和路由器 RSSI 值）。
2. 在多次传输和扫描迭代中，路由器 RSSI 最强的信标帧将在整个网络中传播。节点 C 具有最强的路由器 RSSI 值 (-10 dB)，因此它的信标帧将在整个网络中传播。所有参与选举的节点均给节点 C 投票，因此节点 C 的得票百分比为 100%。因此，节点 C 成为根节点，并与路由器连接。
3. 一旦节点 C 与路由器连接，节点 C 将成为节点 A/B/D/E 的首选父节点（即最浅的节点），并与这些节点连接。节点 A/B/D/E 将形成网络的第二层。
4. 节点 F 和节点 G 分别连接节点 D 和节点 E，并完成网络构建过程。

备注: 用户可以通过 `esp_mesh_set_attempts()` 配置选举的最小迭代次数。用户应根据网络内的节点数量配置迭代次数（即 mesh 网络越大，所需的迭代次数越高）。

警告： 得票百分比阈值也可以使用 `esp_mesh_set_vote_percentage()` 进行配置。得票百分比阈值过低 可能导致同一 mesh 网络中两个或多个节点成为根节点，进而分化为多个 mesh 网络。如果发生这种情况，ESP-WIFI-MESH 具有内部机制，可自主解决 **根节点冲突**。这些具有多个根节点的网络将围绕一个根节点形成一个网络。然而，两个或多个路由器 SSID 相同但路由器 BSSID 不同的根节点冲突尚无法解决。

用户指定根节点

根节点也可以由用户指定，即直接让指定的根节点与路由器连接，并放弃选举过程。当根节点指定后，网络内的所有其他节点也必须放弃选举过程，以防止根节点冲突的发生。下图展示了在 ESP-WIFI-MESH 网络中，根节点的手动选择过程。

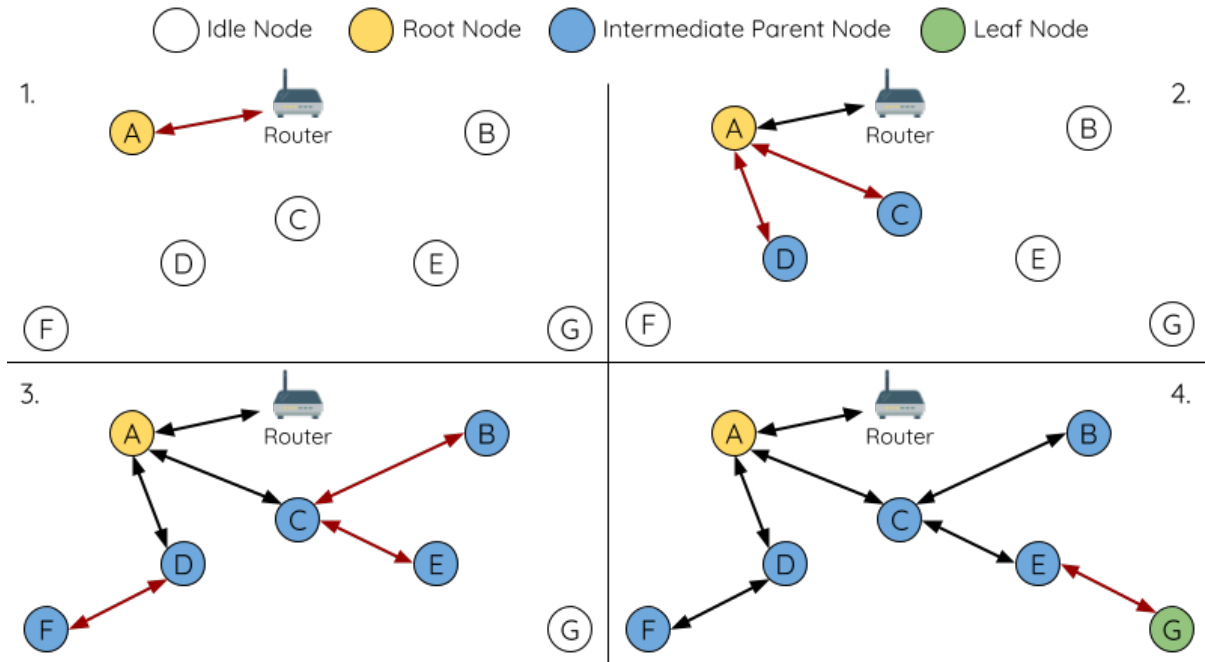

图 18: 根节点指定示例 (根节点 = A, 最大层级 = 4)

1. 节点 A 是由用户指定的根节点，因此直接与路由器连接。此时，所有其他节点放弃选举过程。
2. 节点 C 和节点 D 将节点 A 选为自己的首选父节点，并与其形成连接。这两个节点将形成网络的第二层。
3. 类似地，节点 B 和节点 E 将与节点 C 连接，节点 F 将与节点 D 连接。这三个节点将形成网络的第三层。
4. 节点 G 将与节点 E 连接，形成网络的第四层。然而，由于该网络的最大允许层级已配置为 4，因此节点 G 将成为叶子节点，以防止形成任何新层。

备注： 一旦指定根节点，该根节点应调用 `esp_mesh_set_parent()` 使其直接与路由器连接。类似地，所有其他节点都应该调用 `esp_mesh_fix_root()` 放弃选举过程。

选择父节点

默认情况下，ESP-WIFI-MESH 具有可以自组网的特点，也就是每个节点都可以自主选择与其形成上行连接的潜在父节点。自主选择出的父节点被称为首选父节点。用于选择首选父节点的标准旨在减少 ESP-WIFI-MESH 网络的层级，并平衡各个潜在父节点的下行连接数（参见 [首选父节点](#)）。

不过，ESP-WIFI-MESH 也允许用户禁用自组网功能，即允许用户自己定义父节点选择标准，或直接指定某个节点为父节点（见：[Mesh 手动组网示例](#)）。

异步上电复位

ESP-WIFI-MESH 网络构建可能会受到节点上电顺序的影响。如果网络中的某些节点为异步上电（即相隔几分钟上电），网络的最终结构可能与所有节点同步上电时的理想情况不同。延迟上电的节点将遵循以下规则：

规则 1： 如果网络中已存在根节点，则延迟节点不会尝试选举成为新的根节点，即使自身的路由器 RSSI 更强。相反，延迟节点与任何其他空闲节点无异，将通过与首选父节点连接来加入网络。如果该延迟节点为用户指定的根节点，则网络中的所有其他节点将保持空闲状态，直到延迟节点完成上电。

规则 2： 如果延迟节点形成上行连接，并成为中间父节点，则后续也可能成为其他节点（即其他更浅的节点）的新首选父节点。此时，其他节点切换上行连接至该延迟节点（见[父节点切换](#)）。

规则 3： 如果空闲节点的指定父节点上电延迟了，则该空闲节点在没有找到指定父节点前不会尝试形成任何上行连接。空闲节点将无限期地保持空闲，直到其指定的父节点上电完成。

下方示例展示了异步上电对网络构建的影响。

图 19: 网络构建（异步电源）示例

1. 节点 A/C/D/F/G/H 同步上电，并通过广播其 MAC 地址和路由器 RSSI 开始选举根节点。节点 A 的 RSSI 最强，因此当选为根节点。

2. 一旦节点 A 成为根节点，其余的节点就开始与其首选父节点逐层形成上行连接，并最终形成一个具有五层的网络。

3. 节点 B/E 由于存在上电延迟，因此即使路由器 RSSI 比节点 A 更强（-20 dB 和 -10 dB）也不会尝试成为根节点。相反，这两个上电延迟节点均将与对应的首选父节点 A 和 C 形成上行连接。加入网络后，节

点 B/E 均将成为中间父节点。

4. 节点 B 由于所处层级变化（现为第二层）而成为新的首选父节点，因此节点 D/G 将切换其上行连接从而选择新的首选父节点。由于切换的发生，最终的网络层级从原来的五层减少至三层。

同步上电：如果所有节点均同步上电，节点 E (-10 dB) 由于路由器 RSSI 最强而成为根节点。此时形成的网络结构将与异步上电的情况截然不同。**但是，如果用户手动切换根节点，则仍可以达到同步上电的网络结构**（请见 `esp_mesh_waive_root()`）。

备注：从某种程度上，ESP-WIFI-MESH 可以自动修复部分因异步上电引起的父节点选择的偏差（请见 [父节点切换](#)）

环路避免、检测和处理

环路是指特定节点与其后代节点（特定节点子网中的节点）形成上行连接的情况。因此产生的循环连接路径将打破 mesh 网络的树型拓扑结构。ESP-WIFI-MESH 的节点在选择父节点时将主动排除路由表（见 [路由表](#)）中的节点，从而避免与其子网中的节点建立上行连接并形成环路。

在存在环路的情况下，ESP-WIFI-MESH 可利用路径验证机制和能量传递机制来检测环路的产生。因与子节点建立上行连接而导致环路形成的父节点将通知子节点环路的产生，并主动断开连接。

4.12.5 管理网络

作为一个自修复网络，ESP-WIFI-MESH 可以检测并修正网络路由中的故障。当具有一个或多个子节点的父节点断开或父节点与其子节点之间的连接不稳定时，会发生故障。ESP-WIFI-MESH 中的子节点将自主选择一个新的父节点，并与其形成上行连接，以维持网络互连。ESP-WIFI-MESH 可以处理根节点故障和中间父节点故障。

根节点故障

如果根节点断开，则与其连接的节点（第二层节点）将及时检测到该根节点故障。第二层节点将主动尝试与根节点重连。但是在多次尝试失败后，第二层节点将启动新一轮的根节点选举。**第二层中 RSSI 最强的节点将当选为新的根节点**，而剩余的第二层节点将与新的根节点（如果不在范围内的话，也可与相邻父节点连接）形成上行连接。

如果根节点和下面多层的节点（例如根节点、第二层节点和第三层节点）同时断开，则位于最浅层的仍在正常工作的节点将发起根节点选举。下方示例展示了网络从根节点断开故障中进行自修复。

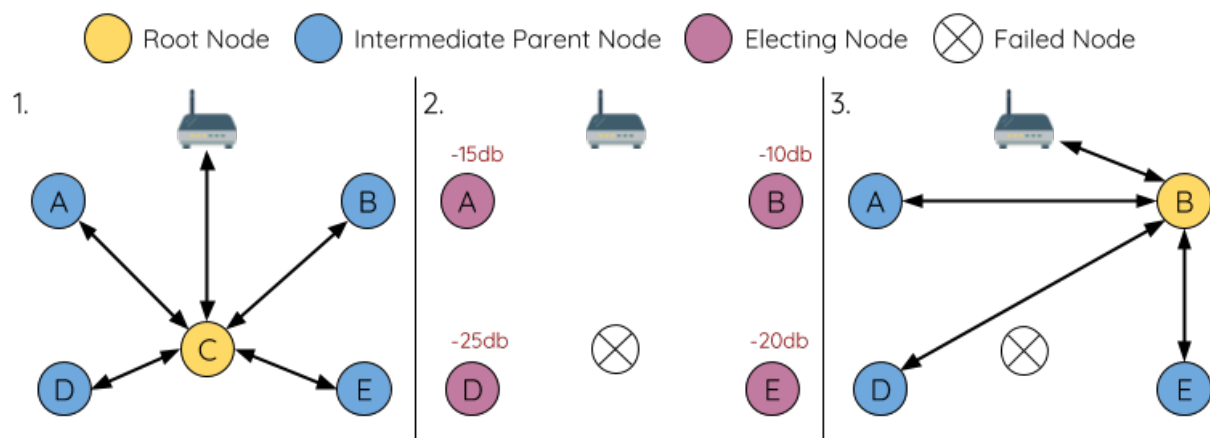

图 20: 根节点故障的自修复示意

1. 节点 C 是网络的根节点。节点 A/B/D/E 是连接到节点 C 的第二层节点。

- 节点 C 断开。在多次重连尝试失败后，第二层节点开始通过广播其路由器 RSSI 开始新一轮的选举。此时，节点 B 的路由器 RSSI 最强。
- 节点 B 被选为根节点，并开始接受下行连接。剩余的第三层节点 A/D/E 形成与节点 B 的上行连接，因此网络已经恢复，并且可以继续正常运行。

备注：如果是手动指定的根节点断开，则无法进行自动修复。任何节点不会在存在指定根节点的情况下开始选举过程。

中间父节点故障

如果中间父节点断开，则与之断开的子节点将主动尝试与该父节点重连。在多次重连尝试失败后，每个子节点开始扫描潜在父节点（请见信标帧和 RSSI 阈值）。

如果存在其他可用的潜在父节点，每个子节点将分别给自己选择一个新的首选父节点（请见首选父节点），并与它形成上行连接。如果特定子节点没有其他潜在的父节点，则将无限期地保持空闲状态。

下方示例展示了网络从中间父节点断开故障中进行自修复。

图 21: 中间父节点故障的自修复

- 网络中存在节点 A 至 G。
- 节点 C 断开。节点 F/G 检测到节点 C 的断开故障，并尝试与节点 C 重新连接。在多次重连尝试失败后，节点 F/G 将开始选择新的首选父节点。
- 节点 G 因其范围内不存在任何父节点而暂时保持空闲。节点 F 的范围中有 B 和 E 两个节点，但节点 B 因为所处层级更浅而当选新的父节点。节点 F 将与节点 B 连接后，并成为中间父节点，节点 G 将于节点 F 相连。这样一来，网络已经恢复了，但结构发生了变化（网络层级增加了 1 层）。

备注：如果子节点的父节点已被指定，则子节点不会尝试与其他潜在父节点连接。此时，该子节点将无限期地保持空闲状态。

根节点切换

除非根节点断开，否则 ESP-WIFI-MESH 不会自动切换根节点。即使根节点的路由器 RSSI 降低至必须断开的情况，根节点也将保持不变。根节点切换是指明确启动新选举过程的行为，即具有更强路由器 RSSI 的节点选为新的根节点。这可以用于应对根节点性能降低的情况。

要触发根节点切换，当前根节点必须明确调用 `esp_mesh_waive_root()` 以触发新的选举。当下根节点将指示网络中的所有节点开始发送并扫描信标帧（见自动根节点选择），但与此同时一直保持联网（即

不会变为空闲节点)。如果另一个节点收到的票数超过当前根节点，则将启动根节点切换过程，**否则根节点将保持不变**。

新选出的根节点向当前的根节点发送 **切换请求**，而原先的根节点将返回一个应答通知，表示已经准备好切换。一旦接收到应答，新选出的根节点将与其父节点断开连接，并迅速与路由器形成上行连接，进而成为网络的新根节点。原先的根节点将断开与路由器的连接，**并与此同时保持其所有下行连接**并进入空闲状态。之前的根节点将开始扫描潜在的父节点并选择首选父节点。

下图说明了根节点切换的示例。

切换根节点示例

1. 节点 C 是当前的根节点，但路由器 RSSI 值 (-85 dB) 降低至较低水平。此时，新的选举过程被触发了。所有节点开始传输和扫描信标帧（**此时仍保持连接**）。
2. 经过多轮传输和扫描后，节点 B 被选为新的根节点。节点 B 向节点 C 发送了一个 **切换请求**，节点 C 回复一个应答。
3. 节点 B 与其父节点断开连接，并与路由器连接，成为网络中的新根节点。节点 C 与路由器断开连接，进入空闲状态，并开始扫描并选择新的首选父节点。**节点 C 在整个过程中仍保持其所有的下行连接**。
4. 节点 C 选择节点 B 作为其的首选父节点，与之形成上行连接，并成为第二层节点。由于节点 C 仍保持相同的子网，因此根节点切换后的网络结构没有变化。然后，由于切换的发生，节点 C 子网中每个节点的所处层级均增加了一层。如果根节点切换过程中产生了新的根节点，则**父节点切换**可以随后调整网络结构。

备注：根节点切换必须要求选举，因此只有在使用自组网 ESP-WIFI-MESH 网络时才支持。换句话说，如果使用指定的根节点，则不能进行根节点切换。

父节点切换

父节点切换是指一个子节点将其上行连接切换到更浅一层的另一个父节点。**父节点切换是自动的**，这意味着如果较浅层出现了可用的潜在父节点（因“异步上电复位”产生），子节点将自动更改其上行连接。

所有潜在的父节点将定期发送信标帧（参见**信标帧**和**RSSI 阈值**），从而允许子节点扫描较浅层的父节点的可用性。由于父节点切换，自组网 ESP-WIFI-MESH 网络可以动态调整其网络结构，以确保每个连接均具有良好的 RSSI 值，并且网络中的层级最小。

4.12.6 数据传输

ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 网络使用 ESP-WIFI-MESH 数据包传输数据。ESP-WIFI-MESH 数据包 **完全包含在 Wi-Fi 数据帧** 中。ESP-WIFI-MESH 网络中的多跳数据传输将涉及通过不同 Wi-Fi 数据帧在每个无线跳上传输的单个 ESP-WIFI-MESH 数据包。

下图显示了 ESP-WIFI-MESH 数据包的结构及其与 Wi-Fi 数据帧的关系。

图 22: ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 数据包的 **报头** 包含源节点和目标节点的 MAC 地址。**选项 (option)** 字段包含有关特殊类型 ESP-WIFI-MESH 数据包的信息，例如组传输或来自外部 IP 网络的数据包（请参阅 `MESH_OPT_SEND_GROUP` 和 `MESH_OPT_RECV_DS_ADDR`）。

ESP-WIFI-MESH 数据包的有效载荷包含实际的应用数据。该数据可以为原始二进制数据，也可以是使用 HTTP、MQTT 和 JSON 等应用层协议的编码数据（请见：`mesh_proto_t`）。

备注：当向外部 IP 网络发送 ESP-WIFI-MESH 数据包时，报头的目标地址字段将包含目标服务器的 IP 地址和端口号，而不是节点的 MAC 地址（请见：`mesh_addr_t`）。此外，根节点将处理外发 TCP/IP 数据包的形成。

组控制和组播

组播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的多个节点。ESP-WIFI-MESH 中的组播可以通过“指定一个目标节点列表”或“预配置一个节点组”来实现。这两种组播方式均需调用 `esp_mesh_send()` 实现。

如果通过“指定目标节点列表”实现组播，用户必须首先将 ESP-WIFI-MESH 数据包的目标地址设置为 **组播组地址**（比如 `01:00:5E:xx:xx:xx`）。这表明 ESP-WIFI-MESH 数据包是一个拥有一组地址的组播数据包，且该地址应该从报头选项中获得。然后，用户必须将目标节点的 MAC 地址列为选项（请见：`mesh_opt_t` 和 `MESH_OPT_SEND_GROUP`）。这种组播方法不需要进行提前设置，但由于每个目标节点的 MAC 地址均需列为报头的选项字段，因此会产生大量开销数据。

分组组播允许 ESP-WIFI-MESH 数据包被发送到一个预先配置的节点组。每个分组都有一个具有唯一性的 ID 标识。用户可通过 `esp_mesh_set_group_id()` 将节点加入一个组。分组组播需要将 ESP-WIFI-MESH 数据包的目标地址设置为目标组的 ID，还必须设置 `MESH_DATA_GROUP` 标志位。分组组播产生的开销更小，但必须提前将节点加入分组中。

备注：在组播期间，网络中的所有节点在 MAC 层都会收到 ESP-WIFI-MESH 数据包。然而，不包括在 MAC 地址列表或目标组中的节点将简单地过滤掉这些数据包。

广播

广播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的所有节点。每个节点可以将一个广播包转发至其所有上行和下行连接，使得数据包尽可能快地在整个网络中传播。但是，ESP-WIFI-MESH 利用以下方法来避免在广播期间浪费带宽。

1. 当中间父节点收到来自其父节点的广播包时，它会将该数据包转发给自己的各个子节点，同时为自己保存一份数据包的副本。
2. 当中间父节点是广播的源节点时，它会将该数据包向上发送至其父节点，并向下发送给自己的各个子节点。
3. 当中间父节点接收到一个来自其子节点的广播包时，它会将该数据包转发给其父节点和其余子节点，同时为自己保存一份数据包的副本。
4. 当叶子节点是广播的源节点时，它会直接将该数据包发送至其父节点。
5. 当根节点是广播的源节点时，它会将该数据包发送至自己的所有子节点。
6. 当根节点收到来自其子节点的广播包时，它会将该数据包转发给其余子节点，同时为自己保存一份数据包的副本。
7. 当节点接收到一个源地址与自身 MAC 地址匹配的广播包时，它会将该广播包丢弃。
8. 当中间父节点收到一个来自其父节点的广播包时（该数据包最初来自该父节点的一个子节点），它会将该广播包丢弃。

上行流量控制

ESP-WIFI-MESH 依赖父节点来控制其直接子节点的上行数据流。为了防止父节点的消息缓冲因上行传输过载而溢出，父节点将为每个子节点分配一个称为 **接收窗口** 的上行传输配额。**每个子节点均必须申请接收窗口才允许进行上行传输**。接收窗口的大小可以动态调整。完成从子节点到父节点的上行传输包括以下步骤：

1. 在每次传输之前，子节点向其父节点发送窗口请求。窗口请求中包括一个序号，与子节点的待传输数据包相对应。
2. 父节点接收窗口请求，并将序号与子节点发送的前一个数据包的序号进行比较，用于计算返回给子节点的接收窗口大小。
3. 子节点根据父节点指定的窗口大小发送数据包。如果子节点的接收窗口耗尽，它必须通过发送请求获得另一个接收窗口，然后才允许继续发送。

备注：ESP-WIFI-MESH 不支持任何下行流量控制。

警告：由于父节点切换，数据包可能会在上行传输期间丢失。

由于根节点是通向外部 IP 网络的唯一接口，因此下行节点必须了解根节点与外部 IP 网络的连接状态。否则，节点可能会尝试向一个已经与 IP 网络断开连接的根节点发送数据，从而造成不必要的传输和数据包丢失。ESP-WIFI-MESH 可以基于监测根节点和外部 IP 网络的连接状态，提供一种稳定外发数据吞吐量的机制。根节点可以通过调用 `esp_mesh_post_toDS_state()` 将自身与外部 IP 网络的连接状态广播给所有其他节点。

双向数据流

下图展示了 ESP-WIFI-MESH 双向数据流涉及的各种网络层。

由于使用路由表，ESP-WIFI-MESH 能够在 mesh 层中完全处理数据包的转发。TCP/IP 层仅与 mesh 网络的根节点有关，可帮助根节点与外部 IP 网络的数据包传送。

图 23: ESP-WIFI-MESH 双向数据流

4.12.7 信道切换

背景

在传统的 Wi-Fi 网络中，**信道**代表预设的频率范围。在基础设施基本服务集 (BSS) 中，工作 AP 及与之相连的 station 必须处于传输信标的工作信道（1 到 14）中。物理上相邻的 BSS 使用相同的工作信道会导致干扰产生和性能下降。

为了允许 BSS 适应不断变化的物理层条件并保持性能，Wi-Fi 网络中增加了 **网络信道切换**的机制。网络信道切换是将 BSS 移至新的工作信道，并同时最大限度地减少期间对 BSS 的影响。然而，我们应该认识到，网络信道切换可能不会成功，无法将原信道中的所有 station 均移动至新的信道。

在基础设施 Wi-Fi 网络中，网络信道切换由 AP 触发，目的是将该 AP 及与之相连的所有 station 同步切换到新的信道。网络信道切换是通过在 AP 的周期性发送信标帧内嵌入一个 **信道切换公告 (CSA)** 元素来实现的。在网络信号切换前，该 CSA 元素用于向所有连接的 station 广播有关即将发生的网络信道切换，并且将包含在多个信标帧中。

一个 CSA 元素包含有关 **新信道号**和 **信道切换计数**的信息。其中，**信道切换计数**指示在网络信道切换之前剩余的信标帧间隔 (TBTT) 数量。因此，**信道切换计数**依每个信标帧递减，并且允许与之连接的 station 与 AP 同步进行信道切换。

ESP-WIFI-MESH 网络信道切换

ESP-WIFI-MESH 网络信道切换还利用包含 CSA 元素的信标帧。然而，ESP-WIFI-MESH 作为一个多跳网络，其信标帧可能无法到达网络中的所有节点（这点与单跳网络不同），因此信道切换过程更加复杂。因此，ESP-WIFI-MESH 网络依赖于通过节点转发 CSA 元素，从而实现在整个网络中的传播。

当具有一个或多个子节点的中间父节点接收到包含 CSA 元素的信标帧时，该节点会将该元素包含在其下一个发送的信标帧（即具有相同的 **新信道号**和 **信道切换计数**）中，从而实现该 CSA 元素的转发。鉴于 ESP-WIFI-MESH 网络中的所有节点都接收到相同的 CSA 元素，这些节点可以使用 **信道切换计数**来同步其信道切换，但也会经历因 CSA 元素转发造成的延迟。

ESP-WIFI-MESH 网络信道切换可以由路由器或根节点触发。

根节点触发 由根节点触发的信道切换只能在 ESP-WIFI-MESH 网络未连接到路由器时才会发生。通过调用 `esp_mesh_switch_channel()`，根节点将设置一个初始 **信道切换计数**值，并开始在其信标帧中包含 CSA 元素。接着，每个 CSA 元素将抵达第二层节点，并通过第二层节点自己的信标帧继续进行向下转发。

路由器触发 当 ESP-WIFI-MESH 网络连接到路由器时，整个网络必须与路由器采用同一个信道。因此，根节点在连接到路由器时无法触发信道切换。

当根节点从路由器接收到包含 CSA 元素的信标帧时，根节点将 CSA 元素中的信道切换计数值设置为自定义值，然后再通过信标帧继续向下转发。此后，该信道切换计数将依转发次数相对于自定义值依次递减。该自定义值可以基于诸如网络层级、当前节点数等因素。

ESP-WIFI-MESH 网络及其路由器可能具有不同且变化的信标间隔，因此需要将信道切换计数值设置为自定义值。也就是说，路由器提供的信道切换计数值与 ESP-WIFI-MESH 网络无关。通过使用自定义值，ESP-WIFI-MESH 网络中的节点能够相对于 ESP-WIFI-MESH 网络的信标间隔同步切换信道。也正因如此，ESP-WIFI-MESH 网络也会出现信道与路由器及其连接 station 的信道切换不同步的情况。

网络信道切换的影响

- 由于 ESP-WIFI-MESH 网络信道切换与路由器的信道切换不同步，ESP-WIFI-MESH 网络和路由器之间会出现临时信道差异。
 - ESP-WIFI-MESH 网络的信道切换时间取决于 ESP-WIFI-MESH 网络的信标间隔和根节点的自定义信道切换计数。
 - 在 ESP-WIFI-MESH 网络切换期间，信道差异将阻止根节点和路由器之间的任何数据交换。
 - 在 ESP-WIFI-MESH 网络中，根节点和中间父节点将请求与其连接的子节点停止传输，直至信道切换发生（通过将 CSA 元素的信道切换模式字段置为 1）。
 - 频繁的路由器触发网络信道切换可能会降低 ESP-WIFI-MESH 网络的性能。请注意，这可能是由 ESP-WIFI-MESH 网络本身造成的（例如由于 ESP-WIFI-MESH 网络的无线介质争用等原因）。此时，用户应该禁用路由器触发的自主信道切换，并直接指定一个信道。
- 当存在临时信道差异时，根节点从技术上来说仍保持连接至路由器。
 - 如果根节点经过一定数量信标间隔仍无法接到信标帧或探测来自路由器的响应，则会断开连接。
 - 断开连接时，根节点将自动重新扫描所有信道以确定是否存在路由器。
- 如果根节点无法接收任何路由器的 CSA 信标帧（例如短暂的路由器切换时间），则路由器将在没有 ESP-WIFI-MESH 网络的情况下继续运行。
 - 在路由器切换信道后，根节点将不再能够接收路由器的信标帧和探测响应，并导致在一定数量的信标间隔后断开连接。
 - 在断开连接后，根节点将重新所有信道，寻找路由器。
 - 根节点将在整个过程中维护与之相连的下行连接。

备注：虽然 ESP-WIFI-MESH 网络信道切换的目的是将网络内的所有节点移动到新的工作信道，但也应该认识到，信道切换可能无法成功移动所有节点（比如由于节点故障等原因）。

信道和路由器切换配置

ESP-WIFI-MESH 允许通过配置启用或禁用自主信道切换。同样，也可以通过配置启用或禁用自主路由器切换（即当根节点自主连接到另一个路由器时）。自主信道切换和自主路由器切换取决于以下配置参数和运行时间条件。

允许信道切换：本参数决定是否允许 ESP-WIFI-MESH 网络进行自主信道切换，具体可通过 `mesh_cfg_t` 结构体中的 `allow_channel_switch` 字段进行配置。

预设信道：ESP-WIFI-MESH 网络可以将 `mesh_cfg_t` 结构体中的 `channel` 字段设置为相应的信道号，而具备一个预设信道。如果未设置此字段，则 `allow_channel_switch` 的设置将被覆盖，即始终允许信道切换。

允许路由器切换：本参数决定是否允许 ESP-WIFI-MESH 网络进行自主路由器切换，具体可通过 `mesh_router_t` 结构体中的 `allow_router_switch` 字段进行配置。

预设路由器 BSSID：ESP-WIFI-MESH 网络可以将 `mesh_router_t` 结构体的 `bssid` 字段设置为目标路由器的 BSSID，而预设一个路由器。如果未设置此字段，则 `allow_router_switch` 的设置将被覆盖，即始终允许路由器切换。

存在根节点：根节点的存在也会影响是否允许信道或路由器切换。

下表说明了在不同参数/条件组合下是否允许信道切换和路由器切换。请注意，X 代表参数“不关心”。

| 预设信道 | 允许信道切换 | 预置路由器 BSSID | 允许路由器切换 | 存在根节点 | 允许切换？ |
|------|--------|-------------|---------|-------|--------|
| N | X | N | X | X | 信道与路由器 |
| N | X | Y | N | X | 仅信道 |
| N | X | Y | Y | X | 信道与路由器 |
| Y | Y | N | X | X | 信道与路由器 |
| Y | N | N | X | N | 仅路由器 |
| Y | N | N | X | Y | 信道与路由器 |
| Y | Y | Y | N | X | 仅信道 |
| Y | N | Y | N | N | 无 |
| Y | N | Y | N | Y | 仅信道 |
| Y | Y | Y | Y | X | 信道与路由器 |
| Y | N | Y | Y | N | 仅路由器 |
| Y | N | Y | Y | Y | 信道与路由器 |

4.12.8 性能

ESP-WIFI-MESH 网络的性能可以基于以下多个指标进行评估：

组网时长：从头开始构建 ESP-WIFI-MESH 网络所需的总时长。

修复时间：从网络检测到节点断开到执行适当操作（例如生成新的根节点或形成新的连接等）以修复网络所需的时间。

每跳延迟：数据每经过一次无线 hop 而经历的延迟，即从父节点向子节点（或从子节点向父节点）发送一个数据包所需的时间。

网络节点容量：ESP-WIFI-MESH 网络可以同时支持的节点总数。该指标取决于节点可以接受到的最大下行连接数和网络中允许的最大层级。

ESP-WIFI-MESH 网络的常见性能指标如下表所示：

- 组网时长：< 60 秒
- 修复时间
 - 根节点断开：< 10 秒
 - 子节点断开：< 5 秒
- 每条延迟：10 到 30 毫秒

备注：上述性能指标的测试条件见下。

- 测试设备数量：**100**
- 最大允许下行连接数量：**6**
- 最大允许层级：**6**

备注：吞吐量取决于数据包错误率和 hop 数量。

备注：根节点访问外部 IP 网络的吞吐量直接受到 ESP-WIFI-MESH 网络中节点数量和路由器带宽的影响。

备注：用户应注意，ESP-WIFI-MESH 网络的性能与网络配置和工作环境密切相关。

4.12.9 更多注意事项

- 数据传输使用 Wi-Fi WPA2-PSK 加密
- Mesh 网络 IE 使用 AES 加密

本文图片中使用的路由器与互联网图标来自 www.flaticon.com 的 Smashicons。

4.13 片外 RAM

4.13.1 简介

ESP32-S2 提供了好几百 KB 的片上 RAM，可以满足大部分需求。但有些场景可能需要更多 RAM，因此 ESP32-S2 另外提供了高达 10.5 MB 的虚拟地址，供片外 PSRAM（伪静态随机存储器）存储器使用。片外 RAM 已经集成到内存映射中，在某些范围内与片上 RAM 使用方式相同。

4.13.2 硬件

ESP32-S2 支持与 SPI flash 芯片并联的 PSRAM。虽然 ESP32-S2 支持多种类型的 RAM 芯片，但 ESP-IDF 当前仅支持乐鑫品牌的 PSRAM 芯片，如 ESP-PSRAM32、ESP-PSRAM64 等。

备注： PSRAM 芯片的工作电压分为 1.8 V 和 3.3 V。其工作电压必须与 flash 的工作电压匹配。请查询相应 PSRAM 芯片以及 ESP32-S2 的技术规格书获取准确的工作电压。对于 1.8 V 的 PSRAM 芯片，请确保在启动时将 MTDI 管脚设置为高电平，或者将 ESP32-S2 中的 eFuses 设置为始终使用 1.8 V 的 VDD_SIO 电平，否则有可能会损坏 PSRAM 和/或 flash 芯片。

备注： 乐鑫同时提供模组和系统级封装芯片，集成了兼容的 PSRAM 和 flash，可直接用于终端产品 PCB 中。如需了解更多信息，请前往乐鑫官网。注意，ESP-IDF SDK 可能与定制的 PSRAM 芯片不兼容。

有关将 SoC 或模组管脚连接到片外 PSRAM 芯片的具体细节，请查阅 SoC 或模组技术规格书。

4.13.3 配置片外 RAM

ESP-IDF 完全支持将片外 RAM 集成到你的应用程序中。在启动并完成片外 RAM 初始化后，可以将 ESP-IDF 配置为用多种方式处理片外 RAM：

- 集成片外 RAM 到 ESP32-S2 内存映射
- 添加片外 RAM 到堆内存分配器
- 调用 `malloc()` 分配片外 RAM (default)
- 允许 .bss 段放入片外存储器
- 在 PSRAM 中直接执行代码

集成片外 RAM 到 ESP32-S2 内存映射

在 `CONFIG_SPIRAM_USE` 中选择 Integrate RAM into memory map 选项，以集成片外 RAM 到 ESP32-S2 内存映射。

这是集成片外 RAM 最基础的设置选项，大多数用户需要用到其他更高级的选项。

ESP-IDF 启动过程中，片外 RAM 被映射到数据虚拟地址空间，该地址空间是动态分配的，其长度为 PSRAM 大小和可用数据虚拟地址空间大小之间的最小值。

应用程序可以创建指向该区域的指针，手动将数据放入片外存储器，并全权负责管理片外 RAM，包括协调缓存占用、防止发生损坏等。

建议通过 ESP-IDF 堆内存分配器访问 PSRAM（见下一小节）。

添加片外 RAM 到堆内存分配器

在 `CONFIG_SPIRAM_USE` 中选择 `Make RAM allocatable using heap_caps_malloc(..., MALLOC_CAP_SPIRAM)` 选项。

启用上述选项后，片外 RAM 被映射到数据虚拟地址空间，并将这个区域添加到携带 `MALLOC_CAP_SPIRAM` 标志的堆内存分配器。

程序如果想从片外存储器分配存储空间，则需要调用 `heap_caps_malloc(size, MALLOC_CAP_SPIRAM)`，之后可以调用 `free()` 函数释放这部分存储空间。

调用 `malloc()` 分配片外 RAM

在 `CONFIG_SPIRAM_USE` 中选择 `Make RAM allocatable using malloc() as well` 选项，该选项为默认选项。

启用此选项后，片外存储器将被添加到内存分配程序（与上一选项相同），同时也将被添加到由标准 `malloc()` 函数返回的 RAM 中。

应用程序因此可以使用片外 RAM，无需重写代码就能使用 `heap_caps_malloc(..., MALLOC_CAP_SPIRAM)`。

如果某次内存分配偏向于片外存储器，也可以使用 `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL` 设置分配空间的大小阈值，控制分配结果：

- 如果分配的空间小于或等于阈值，分配程序将首先选择内部存储器。
- 如果分配的空间大于阈值，分配程序将首先选择外部存储器。

如果优先考虑的内部或外部存储器中没有可用的存储块，分配程序则会选择其他类型存储。

由于有些内存缓冲器仅可在内部存储器中分配，因此需要使用第二个配置项 `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL` 定义一个内部内存池，仅限显式的内部存储器分配使用（例如用于 DMA 的存储器）。常规 `malloc()` 将不会从该池中分配，但可以使用 `MALLOC_CAP_DMA` 和 `MALLOC_CAP_INTERNAL` 标志从该池中分配存储器。

允许 .bss 段放入片外存储器

通过勾选 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY` 启用该选项。

启用该选项后，PSRAM 被映射到的数据虚拟地址空间将用于存储来自 `lwip`、`net80211`、`libpp`、`wpa_supplicant` 和 `bluedroid` ESP-IDF 库中零初始化的数据（BSS 段）。

通过将宏 `EXT_RAM_BSS_ATTR` 应用于任何静态声明（未初始化为非零值），可以将附加数据从内部 BSS 段移到片外 RAM。

也可以使用链接器片段方案 `extram_bss` 将组件或库的 BSS 段放到片外 RAM 中。

启用此选项可以减少 BSS 段占用的内部静态存储。

剩余的片外 RAM 也可以通过上述方法添加到堆分配器中。

将 flash 中的指令移至 PSRAM 启用 `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` 选项后, flash 中 `.text` 部分的数据 (用于指令) 将被放入 PSRAM。

启用 `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` 选项后:

- flash `.text` 部分中的指令将在系统启动时移至 PSRAM。
- 上述指令对应的虚拟内存范围也将重新映射至 PSRAM。

将 flash 中的只读数据移至 PSRAM 启用 `CONFIG_SPIRAM_RODATA` 选项后, flash 中 `.rodata` 部分的数据 (用于只读数据) 将被放入 PSRAM。

启用 `CONFIG_SPIRAM_RODATA` 选项后:

- flash `.rodata` 部分中的指令将在系统启动时移至 PSRAM。
- 上述只读数据对应的虚拟内存范围也将重新映射至 PSRAM。

在 PSRAM 中直接执行代码 启用 `CONFIG_SPIRAM_XIP_FROM_PSRAM` 选项后, 可同时指定 `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` 和 `CONFIG_SPIRAM_RODATA` 选项。

在 PSRAM 中直接执行代码的好处包括:

- PSRAM 访问速度快于 flash, 因此性能更好。
- 在进行 SPI1 flash 操作期间, cache 仍然保持启用状态, 这样可以优化代码执行性能。由于无需把中断服务程序 (ISR)、ISR 回调和在此期间可能被访问的数据放置在片上 RAM 中, 片上 RAM 可用于其他用途, 从而提高了使用效率。这个特性适用于需要处理大量数据的高吞吐量外设应用, 能显著提高 SPI1 flash 操作期间的性能。

4.13.4 片外 RAM 使用限制

使用片外 RAM 有下面一些限制:

- flash cache 禁用时 (比如, 正在写入 flash), 片外 RAM 将无法访问; 同样, 对片外 RAM 的读写操作也将导致 cache 访问异常。因此, ESP-IDF 不会在片外 RAM 中分配任务堆栈 (详见下文)。
- 片外 RAM 不能用于存储 DMA 事务描述符, 也不能用作 DMA 传输读写信息的 buffer。因此, 当启用片外 RAM 时, 任何与 DMA 结合使用的 buffer 必须使用 `heap_caps_malloc(size, MALLOC_CAP_DMA | MALLOC_CAP_INTERNAL)` 进行分配, 之后调用标准的 `free()` 来释放。注意, 尽管 ESP32-S2 具有与外部 RAM 进行 DMA 传输的硬件支持, 但在 ESP-IDF 中, 尚未提供软件支持。
- 片外 RAM 与片外 flash 使用相同的 cache 区域, 这意味着频繁在片外 RAM 访问的变量可以像在片上 RAM 中一样快速读取和修改。但访问大块数据时 (大于 32 KB), cache 空间可能会不足, 访问速度将降低到片外 RAM 的访问速度。此外, 访问大块数据会挤出 flash cache, 可能在之后降低代码的执行速度。
- 一般来说, 片外 RAM 不会用作任务堆栈存储器。`xTaskCreate()` 及类似函数始终会为堆栈和任务 TCB 分配片上存储器。

可以使用 `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` 选项将任务堆栈放入片外存储器。这时, 必须使用 `xTaskCreateStatic()` 指定从片外存储器分配的任务堆栈缓冲区, 否则任务堆栈将仍从片上存储器分配。

4.13.5 初始化失败

默认情况下, 片外 RAM 初始化失败将终止 ESP-IDF 启动。如果想禁用此功能, 可启用 `CONFIG_SPIRAM_IGNORE_NOTFOUND` 配置选项。

如果启用 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`, 忽略失败的选项将无法使用, 这是因为在链接时, 链接器已经向片外存储器分配标志符。

4.13.6 加密

可以为存储在外部 RAM 中的数据启用自动加密功能。启用该功能后，通过缓存读写的任何数据将被外部存储器加密硬件自动加密、解密。

只要启用了 flash 加密功能，就会启用这个功能。关于如何启用 flash 加密以及其工作原理，请参考[flash 加密](#)。

4.14 严重错误

4.14.1 概述

在某些情况下，程序并不会按照我们的预期运行，在 ESP-IDF 中，这些情况包括：

- CPU 异常：非法指令，加载/存储时的内存对齐错误，加载/存储时的访问权限错误，双重异常。
- 系统级检查错误：
 - 中断看门狗 超时
 - 任务看门狗 超时（只有开启 `CONFIG_ESP_TASK_WDT_PANIC` 后才会触发严重错误）
 - 高速缓存访问错误
 - 内存保护故障
 - 掉电检测事件
 - 堆栈溢出
 - 堆栈粉碎保护检查
 - 堆完整性检查
 - 未定义行为清理器 (UBSAN) 检查
- 使用 `assert`、`configASSERT` 等类似的宏断言失败。

本指南会介绍 ESP-IDF 中这类错误的处理流程，并给出对应的解决建议。

4.14.2 紧急处理程序

概述 中列举的所有错误都会由紧急处理程序 (*Panic Handler*) 负责处理。

紧急处理程序首先会将出错原因打印到控制台，例如 CPU 异常的错误信息通常会类似于

```
Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was
↳unhandled.
```

对于一些系统级检查错误（如中断看门狗超时，高速缓存访问错误等），错误信息会类似于

```
Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory
↳region accessed). Exception was unhandled.
```

不管哪种情况，错误原因都会被打印在括号中。请参阅[Guru Meditation 错误](#)以查看所有可能的出错原因。

紧急处理程序接下来的行为将取决于 `CONFIG_ESP_SYSTEM_PANIC` 的设置，支持的选项包括：

- 打印 CPU 寄存器，然后重启 (`CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT`) - 默认选项
打印系统发生异常时 CPU 寄存器的值，打印回溯，最后重启芯片。
- 打印 CPU 寄存器，然后暂停 (`CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT`)
与上一个选项类似，但不会重启，而是选择暂停程序的运行。重启程序需要外部执行复位操作。
- 静默重启 (`CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT`)
不打印 CPU 寄存器的值，也不打印回溯，立即重启芯片。
- 调用 GDB Stub (`CONFIG_ESP_SYSTEM_PANIC_GDBSTUB`)
启动 GDB 服务器，通过控制台 UART 接口与 GDB 进行通信。该选项只提供只读调试或者事后调试，详细信息请参阅[GDB Stub](#)。

备注： 仅当构建中包含组件 `esp_gdbstub` 时，配置选项 `CONFIG_ESP_SYSTEM_PANIC` 中的 `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` 选项可用。

紧急处理程序的行为还受到另外两个配置项的影响：

- 如果使能了 `CONFIG_ESP_DEBUG_OCDAWARE`（默认），紧急处理程序会检测 ESP32-S2 是否已经连接 JTAG 调试器。如果检测成功，程序会暂停运行，并将控制权交给调试器。在这种情况下，寄存器和回溯不会被打印到控制台，并且也不会使用 GDB Stub 和 Core Dump 的功能。
- 如果使能了内核转储功能，系统状态（任务堆栈和寄存器）会被转储到 flash 或者 UART 以供后续分析。
- 如果 `CONFIG_ESP_PANIC_HANDLER_IRAM` 被禁用（默认情况下禁用），紧急处理程序的代码会放置在 flash 而不是 IRAM 中。这意味着，如果 ESP-IDF 在 flash 高速缓存禁用时崩溃，在运行 GDB Stub 和内核转储之前紧急处理程序会自动重新使能 flash 高速缓存。如果 flash 高速缓存也崩溃了，这样做会增加一些小风险。
如果使能了该选项，紧急处理程序的代码（包括所需的 UART 函数）会放置在 IRAM 中，导致 SRAM 中的可用内存空间变小。当禁用 flash 高速缓存（如写入 SPI flash）时或触发异常导致 flash 高速缓存崩溃时，可用此选项调试一些复杂的崩溃问题。
- 如果启用 `CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`（默认为禁用）并将其配置为大于 0 的数字，紧急处理程序将基于该数字延迟重启的时间，单位为秒。如果用于监测串行输出的工具不支持停止和检查串行输出，可启用该选项。在这种情况下，借助延迟重启，用户可以在延迟期间检查和调试紧急处理程序的输出（例如回溯）。延迟结束后，设备将重新启动，并记录重置原因。

下图展示了紧急处理程序的行为：

4.14.3 寄存器转储与回溯

除非启用了 `CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT` 否则紧急处理程序会将 CPU 寄存器和回溯打印到控制台

```
Core 0 register dump:
PC      : 0x400e14ed  PS      : 0x00060030  A0      : 0x800d0805  A1      : _
↳0x3ffb5030
A2      : 0x00000000  A3      : 0x00000001  A4      : 0x00000001  A5      : _
↳0x3ffb50dc
A6      : 0x00000000  A7      : 0x00000001  A8      : 0x00000000  A9      : _
↳0x3ffb5000
A10     : 0x00000000  A11     : 0x3ffb2bac  A12     : 0x40082d1c  A13     : _
↳0x06ff1ff8
A14     : 0x3ffb7078  A15     : 0x00000000  SAR     : 0x00000014  EXCCAUSE: _
↳0x0000001d
EXCVADDR: 0x00000000  LBEG    : 0x4000c46c  LEND    : 0x4000c477  LCOUNT : _
↳0xffffffff

Backtrace: 0x400e14ed:0x3ffb5030 0x400d0802:0x3ffb5050
```

仅会打印异常帧中 CPU 寄存器的值，即引发 CPU 异常或者其它严重错误时刻的值。

紧急处理程序如果是因 `abort()` 而调用，则不会打印寄存器转储。

在某些情况下，例如中断看门狗超时，紧急处理程序会额外打印 CPU 寄存器 (EPC1-EPC4) 的值，以及另一个 CPU 的寄存器值和代码回溯。

回溯行包含了当前任务中每个堆栈帧的 PC:SP 对 (PC 是程序计数器，SP 是堆栈指针)。如果在 ISR 中发生了严重错误，回溯会同时包括被中断任务的 PC:SP 对，以及 ISR 中的 PC:SP 对。

如果使用了 [IDF 监视器](#)，该工具会将程序计数器的值转换为对应的代码位置（函数名，文件名，行号），并加以注释：

```
Core 0 register dump:
PC      : 0x400e14ed  PS      : 0x00060030  A0      : 0x800d0805  A1      : _
↳0x3ffb5030
```

(下页继续)

Backtrace: 0x400e14ed:0x3ffb5030 0x400d0802:0x3ffb5050
0x400e14ed: app_main at /Users/user/esp/example/main/main.cpp:36

0x400d0802: main_task at /Users/user/esp/esp-idf/components/esp32s2/cpu_start.c:470

```

若要查找发生严重错误的代码位置，请查看“Backtrace”的后面几行，发生严重错误的代码显示在顶行，后续几行显示的是调用堆栈。

4.14.4 GDB Stub

如果启用了 `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` 选项，在发生严重错误时，紧急处理程序不会复位芯片，相反，它将启动 GDB 远程协议服务器，通常称为 GDB Stub。发生这种情况时，可以让主机上运行的 GDB 实例通过 UART 端口连接到 ESP32。

如果使用了 *IDF 监视器*，该工具会在 UART 端口检测到 GDB Stub 提示符后自动启动 GDB，输出会类似于：

```

Entering gdb stub now.
$T0b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law. Type "show copying"
and "show warranty" for details.
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa-
↳esp32s2-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
<http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at:
<http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
    at /Users/user/esp/example/main/main.cpp:36
36      *((int*) 0) = 0;
(gdb)

```

在 GDB 会话中，我们可以检查 CPU 寄存器，本地和静态变量以及内存中任意位置的值。但是不支持设置断点，改变 PC 值或者恢复程序的运行。若要复位程序，请退出 GDB 会话，在 IDF 监视器中连续输入 Ctrl-T Ctrl-R，或者按下开发板上的复位按键也可以重新运行程序。

4.14.5 RTC 看门狗超时

RTC 看门狗在启动代码中用于跟踪执行时间，也有助于防止由于电源不稳定引起的锁定。RTC 看门狗默认启用，参见 `CONFIG_BOOTLOADER_WDT_ENABLE`。如果执行时间超时，RTC 看门狗将自动重启系统。此时，ROM 引导加载程序将打印消息 `RTC Watchdog Timeout` 说明重启原因。

```
rst:0x10 (RTCWDT_RTC_RST)
```

RTC 看门狗涵盖了从一级引导程序（ROM 引导程序）到应用程序启动的执行时间，最初在 ROM 引导程序中设置，而后在引导程序中使用 `CONFIG_BOOTLOADER_WDT_TIME_MS` 选项进行配置（默认 9000 ms）。在应用初始化阶段，由于慢速时钟源可能已更改，RTC 看门狗将被重新配置，最后在调用 `app_main()` 之前被禁用。可以使用选项 `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` 以保证 RTC 看门狗在调用 `app_main` 之前不被禁用，而是保持运行状态，用户需要在应用代码中定期“喂狗”。

4.14.6 Guru Meditation 错误

本节将对打印在 `Guru Meditation Error: Core panic'ed` 后面括号中的致错原因进行逐一解释。

备注： 想要了解“Guru Meditation”的历史渊源，请参阅 [维基百科](#)。

IllegalInstruction

此 CPU 异常表示当前执行的指令不是有效指令，引起此错误的常见原因包括：

- FreeRTOS 中的任务函数已返回。在 FreeRTOS 中，如果想终止任务函数，需要调用 `vTaskDelete()` 函数释放当前任务的资源，而不是直接返回。
- 无法从 SPI flash 中读取下一条指令，这通常发生在：
 - 应用程序将 SPI flash 的管脚重新配置为其它功能（如 GPIO、UART 等）。有关 SPI flash 管脚的详细信息，请参阅硬件设计指南和芯片/模组的数据手册。
 - 某些外部设备意外连接到 SPI flash 的管脚上，干扰了 ESP32-S2 和 SPI flash 之间的通信。
- 在 C++ 代码中，退出 `non-void` 函数而无返回值被认为是未定义的行为。启用优化后，编译器通常会忽略此类函数的结尾，导致 `IllegalInstruction` 异常。默认情况下，ESP-IDF 构建系统启用 `-Werror=return-type`，这意味着缺少返回语句会被视为编译时错误。但是，如果应用程序项目禁用了编译器警告，可能就无法检测到该问题，在运行时就会出现 `IllegalInstruction` 异常。

InstrFetchProhibited

此 CPU 异常表示 CPU 无法读取指令，因为指令的地址不在 IRAM 或者 IROM 中的有效区域中。

通常这意味着代码中调用了并不指向有效代码块的函数指针。这种情况下，可以查看 PC（程序计数器）寄存器的值并做进一步判断：若为 0 或者其它非法值（即只要不是 `0x4xxxxxxx` 的情况），则证实确实是该原因。

LoadProhibited, StoreProhibited

当应用程序尝试读取或写入无效的内存位置时，会发生此类 CPU 异常。此类无效内存地址可以在寄存器转储的 `EXCVADDR` 中找到。如果该地址为零，通常意味着应用程序正尝试解引用一个 NULL 指针。如果该地址接近于零，则通常意味着应用程序尝试访问某个结构体的成员，但是该结构体的指针为 NULL。如果该地址是其它非法值（不在 `0x3fxxxxxx - 0x6xxxxxx` 的范围内），则可能意味着用于访问数据的指针未初始化或者已经损坏。

IntegerDivideByZero

应用程序尝试将整数除以零。

LoadStoreAlignment

应用程序尝试读取/写入的内存位置不符合加载/存储指令对字节对齐大小的要求，例如，32 位读取指令只能访问 4 字节对齐的内存地址，而 16 位写入指令只能访问 2 字节对齐的内存地址。

LoadStoreError

这类异常通常发生于以下几种场合：

- 应用程序尝试从仅支持 32 位读取/写入的内存区域执行 8 位或 16 位加载/存储操作，例如，解引用一个指向指令内存区域（比如 IRAM 或者 IROM）的 char* 指针就会触发这个错误。
- 应用程序尝试写入数据到只读的内存区域（比如 IROM 或者 DROM）也会触发这个错误。

Unhandled debug exception

执行指令 BREAK 时，会发生此 CPU 异常。

Interrupt wdt timeout on CPU0 / CPU1

这表示发生了中断看门狗超时，详细信息请查阅[看门狗](#) 文档。

Cache disabled but cached memory region accessed

在某些情况下，ESP-IDF 会暂时禁止通过高速缓存访问外部 SPI flash 和 SPI RAM，例如在使用 spi_flash API 读取/写入/擦除/映射 SPI flash 的时候。在这些情况下，任务会被挂起，并且未使用 ESP_INTR_FLAG_IRAM 注册的中断处理程序会被禁用。请确保任何使用此标志注册的中断处理程序所访问的代码和数据分别位于 IRAM 和 DRAM 中。更多详细信息请参阅[SPI flash API 文档](#)。

Memory protection fault

ESP-IDF 中使用 ESP32-S2 的权限控制功能来防止以下类型的内存访问：

- 程序加载后向指令 RAM 写入代码
- 从数据 RAM（用于堆、静态 .data 和 .bss 区域）执行代码

该类操作对于大多数程序来说并不必要，禁止此类操作往往使软件漏洞更难被利用。依赖动态加载或自修改代码的应用程序可以使用 `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE` 选项来禁用此项保护。

发生故障时，紧急处理程序会报告故障的地址和引起故障的内存访问的类型。

4.14.7 其他严重错误

掉电

ESP32-S2 内部集成掉电检测电路，并且会默认启用。如果电源电压低于安全值，掉电检测器可以触发系统复位。掉电检测器可以使用 `CONFIG_ESP_BROWNOUT_DET` 和 `CONFIG_ESP_BROWNOUT_DET_LVL_SEL` 这两个选项进行设置。

当掉电检测器被触发时，会打印如下信息：

```
Brownout detector was triggered
```

芯片会在该打印信息结束后复位。

请注意，如果电源电压快速下降，则只能在控制台上看到部分打印信息。

堆不完整

ESP-IDF 堆的实现包含许多运行时的堆结构检查，可以在 `menuconfig` 中开启额外的检查（“Heap Poisoning”）。如果其中的某项检查失败，则会打印类似如下信息：

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/
↳multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

更多详细信息，请查阅[堆内存调试](#)文档。

堆栈溢出

FreeRTOS 任务堆栈末尾监视点 ESP-IDF 支持基于监视点的 FreeRTOS 堆栈溢出检测机制。每次 FreeRTOS 切换任务上下文时，都会设置一个监视点，用于监视堆栈的最后 32 字节。

通常，该设置会提前触发监视点，触发点可能会比预期提前多达 28 字节。基于 FreeRTOS 中堆栈金丝雀的大小为 20 字节，故将观察范围设置为 32 字节，确保可以在堆栈金丝雀遭到破坏前及时触发监测点。

备注：并非每次堆栈溢出都能触发监视点。如果任务绕过堆栈金丝雀的位置访问堆栈，则无法触发监视点。

监视点触发后，将打印类似如下信息：

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

可以通过 `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 选项启用该功能。

FreeRTOS 堆栈检查 请参见 `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`。

堆栈粉碎

堆栈粉碎保护（基于 GCC `-fstack-protector*` 标志）可以通过 ESP-IDF 中的 `CONFIG_COMPILER_STACK_CHECK_MODE` 选项来开启。如果检测到堆栈粉碎，则会打印类似如下信息：

```
Stack smashing protect failure!

abort() was called at PC 0x400d2138 on core 0

Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffc17a0 0x400d2138:0x3ffc17c0_
↳0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffc1840 0x400e79df:0x3ffc18a0_
↳0x400e2235:0x3ffc18c0 0x400e1916:0x3ffc18f0 0x400e19cd:0x3ffc1910_
↳0x400e1a11:0x3ffc1930 0x400e1bb2:0x3ffc1950 0x400d2c44:0x3ffc1a80
0
```

回溯信息会指明发生堆栈粉碎的函数，建议检查函数中是否有代码访问局部数组时发生了越界。

未定义行为清理器 (UBSAN) 检查

未定义行为清理器 (UBSAN) 是一种编译器功能，它会为可能不正确的操作添加运行时检查，例如：

- 溢出（乘法溢出、有符号整数溢出）
- 移位基数或指数错误（如移位超过 32 位）
- 整数转换错误

请参考 [GCC 文档](#) 中的 `-fsanitize=undefined` 选项，查看支持检查的完整列表。

使能 UBSAN 默认情况下未启用 UBSAN。可以通过在构建系统中添加编译器选项 `-fsanitize=undefined` 在文件、组件或项目级别上使能 UBSAN。

在对使用 SoC 硬件寄存器头文件 (`soc/xxx_reg.h`) 的代码使能 UBSAN 时，建议使用 `-fno-sanitize=shift-base` 选项禁用移位基数清理器。这是由于 ESP-IDF 寄存器头文件目前包含的模式会对这个特定的清理器选项造成误报。

要在项目级使能 UBSAN，请在项目 `CMakeLists.txt` 文件的末尾添加以下内容：

```
idf_build_set_property(COMPILER_OPTIONS "-fsanitize=undefined" "-fno-sanitize=shift-
↪base" APPEND)
```

或者，通过 `EXTRA_CFLAGS` 和 `EXTRA_CXXFLAGS` 环境变量来传递这些选项。

使能 UBSAN 会明显增加代码量和数据大小。当为整个应用程序使能 UBSAN 时，微控制器的可用 RAM 无法容纳大多数应用程序（除了一些小程序）。因此，建议为特定的待测组件使能 UBSAN。

要为项目 `CMakeLists.txt` 文件中的特定组件 (`component_name`) 启用 UBSAN，请在文件末尾添加以下内容：

```
idf_component_get_property(lib component_name COMPONENT_LIB)
target_compile_options(${lib} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-
↪base")
```

注意： 关于 [构建属性](#) 和 [组件属性](#) 的更多信息，请查看构建系统文档。

要为同一组件的 `CMakeLists.txt` 中的特定组件 (`component_name`) 使能 UBSAN，在文件末尾添加以下内容：

```
target_compile_options(${COMPONENT_LIB} PRIVATE "-fsanitize=undefined" "-fno-
↪sanitize=shift-base")
```

UBSAN 输出 当 UBSAN 检测到一个错误时，会打印一个信息和回溯，例如：

```
Undefined behavior of type out_of_bounds

Backtrace:0x4008b383:0x3ffcd8b0 0x4008c791:0x3ffcd8d0 0x4008c587:0x3ffcd8f0_
↪0x4008c6be:0x3ffcd950 0x400db74f:0x3ffcd970 0x400db99c:0x3ffcd9a0
```

当使用 [IDF 监视器](#) 时，回溯会被解码为函数名以及源代码位置，并指向问题发生的位置（这里是 `main.c:128`）：

```
0x4008b383: panic_abort at /path/to/esp-idf/components/esp_system/panic.c:367

0x4008c791: esp_system_abort at /path/to/esp-idf/components/esp_system/system_api.
↪c:106

0x4008c587: __ubsan_default_handler at /path/to/esp-idf/components/esp_system/
↪ubsan.c:152
```

(下页继续)

```

0x4008c6be: __ubsan_handle_out_of_bounds at /path/to/esp-idf/components/esp_system/
↳ubsan.c:223

0x400db74f: test_ub at main.c:128

0x400db99c: app_main at main.c:56 (discriminator 1)

```

UBSAN 报告的错误类型为以下几种：

| 名称 | 含义 |
|--|----------------------------------|
| type_mismatch、 type_mismatch_v1 | 指针值不正确：空、未对齐、或与给定类型不兼容 |
| add_overflow、sub_overflow、 mul_overflow、negate_overflow | 加法、减法、乘法、求反过程中的整数溢出 |
| divrem_overflow | 整数除以 0 或 INT_MIN |
| shift_out_of_bounds | 左移或右移运算符导致的溢出 |
| out_of_bounds | 访问超出数组范围 |
| unreachable | 执行无法访问的代码 |
| missing_return | Non-void 函数已结束而没有返回值（仅限 C++） |
| vla_bound_not_positive | 可变长度数组的大小不是正数 |
| load_invalid_value | bool 或 enum（仅 C++）变量的值无效（超出范围） |
| nonnull_arg | 对于 nonnull 属性的函数，传递给函数的参数为空 |
| nonnull_return | 对于 returns_nonnull 属性的函数，函数返回值为空 |
| builtin_unreachable | 调用 __builtin_unreachable 函数 |
| pointer_overflow | 指针运算过程中的溢出 |

4.15 硬件抽象

ESP-IDF 提供了一组用于硬件抽象的 API，支持以不同抽象级别控制外设，相比仅使用 ESP-IDF 驱动程序与硬件进行交互，使用更加灵活。ESP-IDF 硬件抽象适用于编写高性能裸机驱动程序，或尝试将 ESP 芯片移植到另一个平台。

本指南分为以下三个小节：

1. 架构
2. LL 层（低级层）
3. HAL（硬件抽象层）

警告：硬件抽象 API（不包括驱动程序和 xxx_types.h）尚处于试验阶段，因此不能算作公共 API。硬件抽象 API 不遵守 ESP-IDF 版本控制方案的 API 名称更改规范。换言之，非主要 ESP-IDF 版本迭代时，硬件抽象 API 的名称可能会更改。

备注：尽管本文档主要关注外设的硬件抽象，如 UART、SPI、I2C 等，但硬件抽象可以扩展到外设以外的其他硬件部分，如某些 CPU 功能也进行了部分抽象。

4.15.1 架构

ESP-IDF 的硬件抽象由以下层级各组成，从接近硬件的低层级抽象，到远离硬件的高层级抽象。

- 低级层 (LL)
- 硬件抽象层 (HAL)
- 驱动层

LL 层和 HAL 完全包含在 hal 组件中，每一层都依赖于其下方的层级，即驱动层依赖于 HAL 层，HAL 层依赖于 LL 层，LL 层依赖于寄存器头文件。

对于特定外设 xxx，其硬件抽象通常由下表中的头文件组成。其中 **特定目标** 指的是文件对于不同目标（即芯片）有不同的实现。然而，对于不同的目标，`#include` 指令相同，构建系统会自动包含正确版本的头文件和源文件。

表 2: 硬件抽象头文件

| 包含指令 | 特定目标 | 描述 |
|---|------|--|
| <code>#include 'soc/xxx_caps.h'</code> | 是 | 此头文件包含了 C 宏列表，指明 ESP32-S2 外设 xxx 的各种功能。外设的硬件功能包括通道数量、DMA 支持、硬件 FIFO/缓冲区长度等。 |
| <code>#include "soc/xxx_struct.h"</code> <code>#include "soc/xxx_reg.h"</code> | 是 | 这两个头文件分别以 C 结构体和 C 宏的形式表示外设寄存器，支持通过其中任一头文件，在寄存器级别上操作外设。 |
| <code>#include "soc/xxx_pins.h"</code> | 是 | 如果某些外设的信号映射到 ESP32-S2 的特定管脚上，则该头文件中以 C 宏的形式定义了它们的映射关系。 |
| <code>#include "soc/xxx_periph.h"</code> | 否 | 此头文件主要是为了方便，可以自动包含 <code>xxx_caps.h</code> 、 <code>xxx_struct.h</code> 和 <code>xxx_reg.h</code> 。 |
| <code>#include "hal/xxx_types.h"</code> | 否 | 此头文件包含了在 LL、HAL 和驱动层间共享的类型定义和宏。此外，作为公共 API，该头文件可以包含在应用层中。共享的类型和定义通常与具体的实现无关，例如： <ul style="list-style-type: none"> • 协议相关的类型/宏，如帧、模式、常见总线速度等。 • xxx 外设可能存在的特性/特点，可能存在于任何实现上（与实现无关），例如通道、工作模式、信号放大或衰减强度等。 |
| <code>#include "hal/xxx_ll.h"</code> | 是 | 此头文件包含了硬件抽象的 LL 层。LL 层 API 主要用于将寄存器操作抽象成可读的函数。 |
| <code>#include "hal/xxx_hal.h"</code> | 是 | HAL 层用于将外设操作步骤抽象成函数，如读取缓冲区、启动传输、处理事件等。HAL 层构建在 LL 层之上。 |
| <code>#include "driver/xxx.h"</code> | 否 | 驱动层是 ESP-IDF 硬件抽象的最高级别。驱动层 API 旨在从 ESP-IDF 应用程序中调用，并在内部使用操作系统的基本功能。因此，驱动层 API 由事件驱动，并可在多线程环境中使用。 |

4.15.2 LL 层（低级层）

LL 层主要目的是将寄存器字段访问抽象为更容易理解的函数。LL 函数本质是将各种输入/输出参数转换为外设寄存器的寄存器字段，并以获取/设置函数的形式呈现。所有必要的位移、掩码、偏移和寄存器字段的字节顺序都应由 LL 函数处理。

```
//在 xxx_ll.h 内

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
                                       xxx_ll_clk_src_t clock_source,
                                       uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_
↔FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // 设置时钟选择字段
    hw->clk_div_reg.divider = clock_divider >> 4;
}
```

(下页继续)

```

// 设置时钟分频器字段
hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}

static inline uint32_t xxx_ll_get_rx_byte_count(xxx_dev_t *hw) {
    return hw->status_reg.rx_cnt;
}

```

以上代码片段展示了外设 xxx 的典型 LL 函数。LL 函数通常具有以下特点：

- 所有 LL 函数均定义为 `static inline`，因此，由于编译器优化而调用这些函数时，开销最小。这些函数不保证由编译器内联，因此在禁用缓存时（例如从 IRAM ISR 上下文调用）调用的任何 LL 函数都应标记为 `__attribute__((always_inline))`。
- 第一个参数应为指向 `xxx_dev_t` 类型的指针。`xxx_dev_t` 类型表示外设寄存器的结构体，因此第一个参数始终是指向外设寄存器起始地址的指针。请注意，在某些情况下，如果外设具有多个相同寄存器布局的通道，`xxx_dev_t *hw` 可能指向特定通道的寄存器。
- LL 函数应尽可能简短，并且在大多数情况下是确定性的。换句话说，在最糟糕的情况下，LL 函数的运行时间可以在编译时确定。因此，LL 函数中的任何循环都应该是有限的；然而，目前也存在一些例外。
- LL 函数并非线程安全，其上层（驱动层）有责任确保不会同时访问寄存器和寄存器字段。

4.15.3 HAL（硬件抽象层）

HAL 将外设的操作过程建模成一组通用步骤，其中每个步骤都有一个相关联的函数。对于每个步骤，HAL 隐藏（抽象）了外设寄存器的实现细节（即需要设置/读取的寄存器）。通过将外设操作过程建模为一组功能步骤，HAL 可以抽象化（即透明处理）不同目标或芯片版本间的微小硬件实现差异。换句话说，特定外设的 HAL API 在多个目标/芯片版本之间基本保持相同。

以下 HAL 函数示例选自看门狗定时器 (WDT) HAL，每个函数都映射到了 WDT 操作生命周期的某个步骤，从而展示了 HAL 如何将外设的操作抽象为功能步骤。

```

// 初始化某个 WDT
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler,
↳bool enable_intr);

// 配置 WDT 的特定超时阶段
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t
↳timeout, wdt_stage_action_t behavior);

// 启动 WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// 喂养（即重置）WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// 处理 WDT 超时
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// 停止 WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// 去初始化 WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);

```

禁用 RTC_WDT

```
wdt_hal_context_t rtc_wdt_ctx = RWDT_HAL_CONTEXT_DEFAULT();
wdt_hal_write_protect_disable(&rtc_wdt_ctx);
wdt_hal_disable(&rtc_wdt_ctx);
wdt_hal_write_protect_enable(&rtc_wdt_ctx);
```

重置 RTC_WDT 计数器

```
wdt_hal_context_t rtc_wdt_ctx = RWDT_HAL_CONTEXT_DEFAULT();
wdt_hal_write_protect_disable(&rtc_wdt_ctx);
wdt_hal_feed(&rtc_wdt_ctx);
wdt_hal_write_protect_enable(&rtc_wdt_ctx);
```

HAL 函数通常具有以下特点：

- HAL 函数的第一个参数是 `xxx_hal_context_t *` 类型。HAL 上下文类型用于存储信息，这些信息与特定外设实例（即上下文实例）相关。HAL 上下文通过 `xxx_hal_init()` 函数初始化，可以存储以下信息：
 - 该实例的通道编号
 - 指向外设（或通道）寄存器的指针（即 `xxx_dev_t *` 类型）
 - 进行中的事务的信息（例如使用中的 DMA 描述符列表的指针）
 - 实例的一些配置值（例如通道配置）
 - 维护实例状态信息的变量（例如表明实例是否正在等待事务完成的标志）
- HAL 函数不应包含任何操作系统原语，如队列、信号量、互斥锁等。所有同步/并发操作应在更高层次（如驱动程序）处理。
- 某些外设的某些步骤可能无法由 HAL 进一步抽象，因此最终成为对 LL 函数的直接封装（或宏）。
- 某些 HAL 函数可能会放置在 IRAM 中，因此可能带有 `IRAM_ATTR` 或放置在单独的 `xxx_hal_iram.c` 源文件中。

4.16 高优先级中断处理程序

Xtensa 架构支持 32 个中断处理程序，这些中断分为从 1 到 7 的 7 个优先级，其中优先级 7 是非可屏蔽中断 (NMI)。此外，该架构也支持处理其他异常情况。在 ESP32-S2 上，[中断分配](#) 可以通过中断复用器，将大多数中断源路由到上述中断上。通常中断由 C 语言编写，但 ESP-IDF 支持使用汇编语言编写高优先级中断，从而尽可能消除中断延迟。

4.16.1 中断处理程序优先级

| 优先级 | 符号 | 备注 |
|-----|--------------------------------|--|
| 1 | N/A | 异常和低优先级中断，由 ESP-IDF 处理。 |
| 2-3 | N/A | 中等优先级中断，由 ESP-IDF 处理。 |
| 4 | <code>xt_highint4</code> | 通常由 ESP-IDF 的调试逻辑使用。 |
| 5 | <code>xt_highint5</code> | 高优先级中断，可供自由使用。 |
| NMI | <code>xt_nmi</code> | 非可屏蔽中断，可供自由使用。 |
| dbg | <code>xt_debugexception</code> | 调试异常情况，例如在执行 <code>BREAK</code> 指令时调用。 |

要使用这些符号，需要创建一个后缀为 `.s` 的汇编文件，并定义命名的符号，如下所示：

```
.section .iram1,"ax"
.global xt_highint4
.type xt_highint4,@function
.align 4
xt_highint5:
```

(下页继续)

```
... your code here
rsr      a0, EXCSAVE_5
rfi      5
```

实际应用示例请参阅 `esp_system/port/soc/esp32s2/highint_hdl.S`，该示例使用了紧急处理程序。

4.16.2 注意事项

- 请勿从高级中断中调用 C 代码，因为这些中断在临界区域运行，从高级中断调用 C 代码可能会导致目标系统崩溃。注意，尽管紧急处理程序会调用常见的 C 代码，但由于该处理程序不会返回，即在紧急处理程序之后，应用程序不会继续运行，因此中断 C 代码的执行流程不会造成问题。
- 请确保所用汇编代码成功链接。由于可自由使用的符号声明为弱符号，链接器可能会丢弃包含此类符号的文件。如果用户文件中定义或使用的唯一符号是可自由使用的符号 `xt_*`，则会发生上述情况。为了避免这种情况，应在包含 `xt_*` 符号的汇编文件中定义另一个符号，例如：

```
.global ld_include_my_isr_file
ld_include_my_isr_file:
```

此处符号名称为 `ld_include_my_isr_file`，但只要该符号未在项目的其他位置定义，也可使用任意名称。

随后，在组件的 `CMakeLists.txt` 文件中，将该名称作为未解析符号，添加到 `ld` 命令行参数中：

```
target_link_libraries(${COMPONENT_TARGET} "-u ld_include_my_isr_file")
```

这能够确保链接器始终包含定义 `ld_include_my_isr_file` 的文件，从而保持 `ISR` 与项目的链接。

- 使用 `esp_intr_alloc()` 和相关函数可以路由和处理高级中断，但传递给 `esp_intr_alloc()` 的处理程序和程序参数必须为 `NULL`。
- 中等优先级的中断理论上也可以通过上述方式处理，但 `ESP-IDF` 尚不支持此功能。
- 要检查 Xtensa 指令集架构 (ISA)，请参阅 [Xtensa ISA 摘要](#)。

4.17 JTAG 调试

本文将介绍如何安装 ESP32-S2 的 OpenOCD 调试环境，以及如何使用 GDB 来调试 ESP32-S2 的应用程序。

备注：也可以使用 `idf.py monitor` 来调试 ESP32-S2，免于设置 JTAG 或 OpenOCD。请参阅 [IDF 监视器](#) 和 [CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME](#)。

本文档结构如下：

引言 介绍本指南主旨。

工作原理 介绍 ESP32-S2、JTAG (Joint Test Action Group) 接口、OpenOCD 和 GDB 如何相互连接，从而实现 ESP32-S2 的调试功能。

选择 JTAG 适配器 介绍有关 JTAG 硬件适配器的选择及参照标准。

安装 OpenOCD 介绍如何安装官方预编译好的 OpenOCD 软件包并验证是否安装成功。

配置 ESP32-S2 目标板 介绍如何设置 OpenOCD 软件并安装 JTAG 硬件，两项共同构成调试目标。

启动调试器 介绍如何从 [Eclipse 集成开发环境](#) 和 [命令行终端](#) 启动 GDB 调试会话。

调试范例 如果你不熟悉 GDB，请查看此小节以获取 [Eclipse 集成开发环境](#) 以及 [命令行终端](#) 提供的调试示例。

从源码构建 OpenOCD 介绍如何在 [Windows](#)、[Linux](#) 和 [macOS](#) 操作系统上从源码构建 OpenOCD。

注意事项和补充内容 介绍使用 OpenOCD 和 GDB 通过 JTAG 接口调试 ESP32-S2 时的注意事项和补充内容。

4.17.1 引言

乐鑫已完成 OpenOCD 移植，以支持 ESP32-S2 处理器和多核 FreeRTOS 架构（大多数 ESP32-S2 应用程序的基础）。此外，乐鑫还提供了一些 OpenOCD 本身并不支持的工具，以进一步丰富调试功能。

本文将介绍如何在 Linux、Windows 和 macOS 环境下为 ESP32-S2 安装 OpenOCD，并使用 GDB 进行软件调试。除部分安装流程有所不同外，所有操作系统的软件用户界面和使用流程都是相同的。

备注： 本文使用的图片素材来自于 Ubuntu 16.04 LTS 上 Eclipse Neon 3 软件的截图，不同的操作系统 (Windows、macOS 或 Linux) 或不同的 Eclipse 软件版本在用户界面上可能会有细微差别。

4.17.2 工作原理

通过 JTAG (Joint Test Action Group) 接口使用 OpenOCD 调试 ESP32-S2 时所需要的关键软件和硬件包括 **xtensa-esp32s2-elf-gdb** 调试器、**OpenOCD** 片上调试器和连接到 **ESP32-S2** 目标的 **JTAG 适配器**，如下图“Application Loading and Monitoring”标志所示。

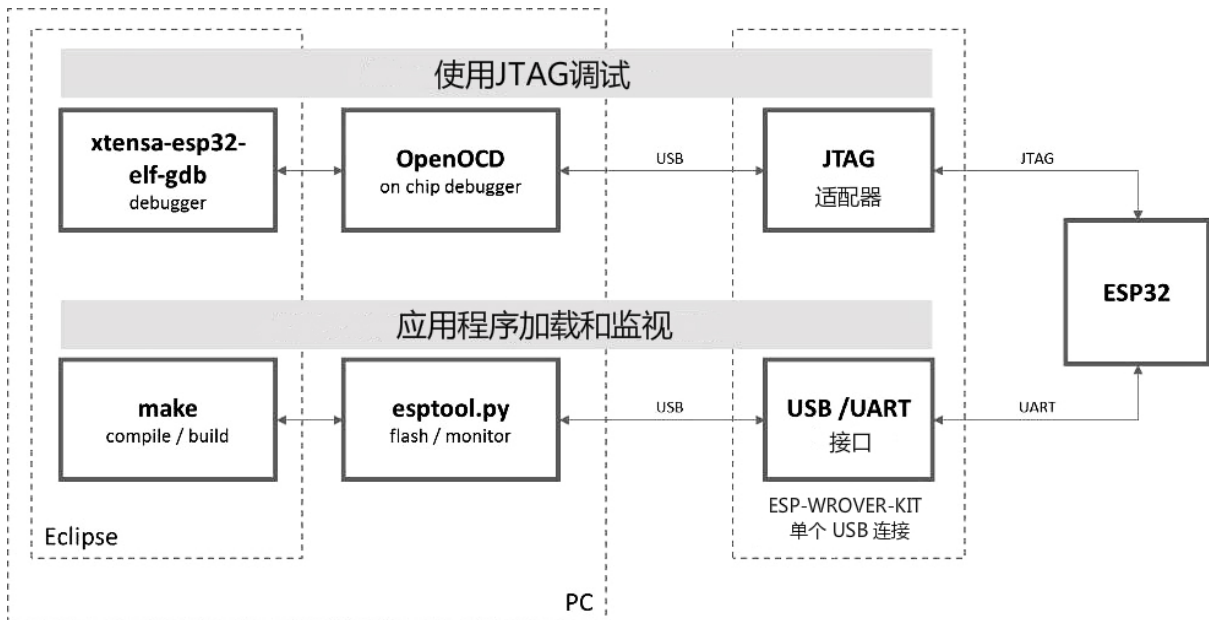

图 25: JTAG 调试 - 概述图

“Application Loading and Monitoring”标志显示一组关键的软件和硬件组件，可用于编译、构建和烧写应用程序到 ESP32-S2 上，以及监视来自 ESP32-S2 的运行诊断信息。

Eclipse 环境集成了 JTAG 调试和应用程序加载、监视的功能，使得软件从编写、编译、加载到调试的迭代过程变得更加快速简单。Eclipse IDE 及其集成的调试软件均适用于 Windows、Linux 和 macOS 平台。根据用户喜好，除了使用 Eclipse 集成开发环境，还可以直接在命令行终端运行 *debugger* 和 *idf.py build*。

若使用 *ESP-S2-Kaluga-1*，由于其板载 FT232H 芯片，仅需一根 USB 线即可连接 PC 与 ESP32-S2。FT232H 提供了两路 USB 通道，一路连接到 JTAG，另一路连接到 UART。

4.17.3 选择 JTAG 适配器

上手 JTAG 最快速便捷的方式是使用 *ESP-S2-Kaluga-1*，因为它板载了 JTAG 调试接口，无需使用外部 JTAG 硬件适配器和额外线缆来连接 JTAG 与 ESP32-S2。ESP-S2-Kaluga-1 采用 FT232H 提供的 JTAG 接口，可以稳定运行在 20 MHz 的时钟频率，外接的适配器很难达到这个速度。

如果想使用单独的 JTAG 适配器，请确保其与 ESP32-S2 的电平电压和 OpenOCD 软件都兼容。ESP32-S2 使用的是业界标准的 JTAG 接口，它未使用（实际上也并不需要）TRST 信号脚。JTAG 使用的 IO 管脚由 VDD_3P3_RTC 电源管脚供电（通常连接到外部 3.3 V 的电源轨），因此 JTAG 硬件适配器的管脚需要能够在该电压范围内正常工作。

在软件方面，OpenOCD 支持相当多数量的 JTAG 适配器，请参阅 [OpenOCD 支持的适配器列表](#)（请注意这一列表并不完整），其中还列出了兼容 SWD 接口的适配器，但请注意，ESP32-S2 目前并不支持 SWD。此外，硬编码为只支持特定产品线的 JTAG 适配器也无法在 ESP32-S2 上工作，例如仅针对 STM32 系列产品的 ST-LINK 适配器。

保证 JTAG 正常工作需要连接的信号线包括：TDI、TDO、TCK、TMS 和 GND。一些 JTAG 适配器还需要 ESP32-S2 提供一路电源到适配器的某个管脚上（比如 Vtar），用于设置适配器的工作电压。也可以选择将 SRST 信号线连接到 ESP32-S2 的 CH_PD 管脚上，但请注意，目前 OpenOCD 对该信号线提供的支持相当有限。

ESP-Prog 中展示了使用外部电路板进行调试的实例，方法是将其连接到 ESP32-S2 的 JTAG 管脚上。

4.17.4 安装 OpenOCD

如果已经按照[快速入门](#)完成了 ESP-IDF 及其 CMake 构建系统的安装，那么 OpenOCD 已经被默认安装到了你的开发系统中。在[设置开发环境](#)结束后，应该能够在终端中运行如下 OpenOCD 命令：

```
openocd --version
```

终端会输出以下信息（实际版本号可能会更新）：

```
Open On-Chip Debugger v0.12.0-esp32-20240318 (2024-03-18-18:25)
Licensed under GNU GPL v2
For bug reports, read
    http://openocd.org/doc/doxygen/bugs.html
```

你还可以检查 OPENOCD_SCRIPTS 环境变量的值，以确认 OpenOCD 配置文件的路径，Linux 和 macOS 用户可以在终端输入 `echo $OPENOCD_SCRIPTS`，Windows 用户需要输入 `echo %OPENOCD_SCRIPTS%`。如果终端输出了有效路径，则表明已经正确安装 OpenOCD。

如果无法执行上述步骤，请再次阅读快速入门手册，Linux 和 macOS 用户请参考[设置安装工具](#)章节，Windows 用户请参考[ESP-IDF 工具安装器](#)。

备注：另外也可以从源代码编译 OpenOCD 工具，详细信息请参阅[从源码构建 OpenOCD](#)章节。

4.17.5 配置 ESP32-S2 目标板

OpenOCD 安装完成后就可以配置 ESP32-S2 目标（即带 JTAG 接口的 ESP32-S2 板），具体分为以下三个步骤：

- [配置并连接 JTAG 接口](#)
- [运行 OpenOCD](#)
- [上传待调试的应用程序](#)

配置并连接 JTAG 接口

此步骤取决于使用的 JTAG 和 ESP32-S2 板，请参考以下两种情况。

配置 ESP-S2-Kaluga-1 上的 JTAG 接口

所有版本的 ESP-S2-Kaluga-1 板子都内置了 JTAG 调试功能，要使其正常工作，还需要设置相关跳帽来启用 JTAG 功能，设置 SPI 闪存电压和配置 USB 驱动程序。具体步骤请参考以下说明。

配置硬件

- 开箱即用，ESP32-S2-Kaluga-1 不需要任何其他硬件配置即可进行 JTAG 调试。但是，如果遇到问题，请检查标有 TCK、TDO、TDI、TMS 的“JTAG” DIP 开关（原理图中的 SW5）是否在“ON”位置。
- 检查 ESP32-S2 上用于 JTAG 通信的引脚是否被接到了其它硬件上，这可能会影响 JTAG 的工作。

表 3: ESP32-S2 管脚和 JTAG 接口信号

| ESP32-S2 管脚 | JTAG 信号 |
|---------------|---------|
| MTDO / GPIO40 | TDO |
| MTDI / GPIO41 | TDI |
| MTCK / GPIO39 | TCK |
| MTMS / GPIO42 | TMS |

配置 USB 驱动 安装和配置 USB 驱动，这样 OpenOCD 才能够与 ESP-S2-Kaluga-1 板上的 JTAG 接口通信，并且使用 UART 接口上传待烧写的镜像文件。请根据你的操作系统按照以下步骤进行安装配置。

备注： ESP-S2-Kaluga-1 使用了 FT2232 芯片实现了 JTAG 适配器，所以以下说明同样适用于其他基于 FT2232 的 JTAG 适配器。

Windows

1. 使用标准 USB A/micro USB B 线将 ESP-S2-Kaluga-1 与计算机相连接，并打开板子的电源。
2. 等待 Windows 识别出 ESP-S2-Kaluga-1 并且为其安装驱动。如果驱动没有被自动安装，请前往 [官网](#) 下载并手动安装。
3. 从 [Zadig 官网](#) 下载 Zadig 工具 (Zadig_X.X.exe) 并运行。
4. 在 Zadig 工具中，进入“Options”菜单中选中“List All Devices”。
5. 检查设备列表，其中应该包含两条与 ESP-S2-Kaluga-1 相关的条目：“Dual RS232-HS (Interface 0)”和“Dual RS232-HS (Interface 1)”。驱动的名字应该是“FTDIBUS (vxxxx)”并且 USB ID 为：0403 6010。

图 26: 在 Zadig 工具中配置 JTAG USB 驱动

6. 第一个设备“Dual RS232-HS (Interface 0)”连接到了 ESP32-S2 的 JTAG 端口，此设备原来的“FTDIBUS (vxxxx)”驱动需要替换成“WinUSB (v6xxxx)”。为此，请选择“Dual RS232-HS (Interface 0)”并将驱动重新安装为“WinUSB (v6xxxx)”，具体可以参考上图。

备注： 请勿更改第二个设备“Dual RS232-HS (Interface 1)”的驱动，它被连接到 ESP32-S2 的串口 (UART)，用于上传应用程序映像给 ESP32-S2 进行烧写。

现在，ESP-S2-Kaluga-1 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往[运行 OpenOCD](#) 章节。

Linux

1. 使用标准 USB A/micro USB B 线将 ESP-S2-Kaluga-1 与计算机相连接，并打开板子的电源。
2. 打开终端，输入 `ls -l /dev/ttyUSB*` 命令检查操作系统是否能够识别板子的 USB 端口。类似识别结果如下：

```
user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
```

3. 设置 OpenOCD 所支持 USB 设备的访问权限，请将 [udev 规则文件](#) 复制到 `/etc/udev/rules.d` 目录中。
4. 注销并重新登录 Linux 系统，然后重新插拔板子的电源使之前的改动生效。在终端再次输入 `ls -l /dev/ttyUSB*` 命令进行验证，查看这两个设备的组所有者是否已经从 `dialout` 更改为 `plugdev`：

```
user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw-r-- 1 root plugdev 188, 0 Jul 10 19:07 /dev/ttyUSB0
crw-rw-r-- 1 root plugdev 188, 1 Jul 10 19:07 /dev/ttyUSB1
```

如果看到类似的输出结果，并且你也是 `plugdev` 组的成员，那么设置工作就完成了。具有较低编号的 `/dev/ttyUSBn` 接口用于 JTAG 通信，另一路接口被连接到 ESP32-S2 的串口 (UART)，用于上传应用程序映像给 ESP32-S2 进行烧写。

现在，ESP-S2-Kaluga-1 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往[运行 OpenOCD](#) 章节。

MacOS 在 macOS 上，同时使用 FT2232 的 JTAG 接口和串口还需另外进行其它操作。当操作系统加载 FTDI 串口驱动的时候，它会对 FT2232 芯片的两个通道做相同的操作。但是，这两个通道中只有一个是被用作串口，而另一个用于 JTAG，如果操作系统已经为用于 JTAG 的通道加载了 FTDI 串口驱动的话，OpenOCD 将无法连接到芯片。有两个方法可以解决这个问题：

1. 在启动 OpenOCD 之前手动卸载 FTDI 串口驱动程序，然后启动 OpenOCD，再加载串口驱动程序。
2. 修改 FTDI 驱动程序的配置，使其不会为 FT2232 芯片的通道 A 进行自我加载，该通道用于 ESP-S2-Kaluga-1 板上的 JTAG 通道。

手动卸载驱动程序

1. 从 [FTDI 官网](#) 安装驱动。
2. 使用 USB 线连接 ESP-S2-Kaluga-1。
3. 卸载串口驱动

```
sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
```

有时，你可能还需要卸载苹果的 FTDI 驱动：

- macOS < 10.15:

```
sudo kextunload -b com.apple.driver.AppleUSBFTDI
```

- macOS 10.15:

```
sudo kextunload -b com.apple.DriverKit-AppleUSBFTDI
```

警告：对于 FTDI 驱动，如果使用串口的通道不正确，则可能会导致内核崩溃。ESP-WROVER-KIT 将通道 A 用于 JTAG，通道 B 用于串口。

4. 运行 OpenOCD:

```
.. include:: esp32s2.inc
   :start-after: run-openocd
   :end-before: ---
```

5. 在另一个终端窗口，再一次加载 FTDI 串口驱动:

```
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
```

备注: 如果你需要重启 OpenOCD，则无需再次卸载 FTDI 驱动程序，只需停止 OpenOCD 并再次启动它。只有在重新连接 ESP-S2-Kaluga-1 或者切换了电源的情况下才需要再次卸载驱动。

你也可以根据自身需求，将此过程包装进 shell 脚本中。

修改 FTDI 驱动 简而言之，这种方法需要修改 FTDI 驱动程序的配置文件，这样可以防止为 FT2232H 的通道 B 自动加载串口驱动。

备注: 其他板子可能将通道 A 用于 JTAG，因此请谨慎使用此选项。

警告: 此方法还需要操作系统禁止对驱动进行签名验证，因此可能无法被所有的用户所接受。

1. 使用文本编辑器打开 FTDI 驱动器的配置文件（注意 sudo）：

```
sudo nano /Library/Extensions/FTDIUSBSerialDriver.kext/Contents/Info.plist
```

2. 找到并删除以下几行:

```
<key>FT2232H_B</key>
<dict>
  <key>CFBundleIdentifier</key>
  <string>com.FTDI.driver.FTDIUSBSerialDriver</string>
  <key>IOClass</key>
  <string>FTDIUSBSerialDriver</string>
  <key>IOProviderClass</key>
  <string>IOUSBInterface</string>
  <key>bConfigurationValue</key>
  <integer>1</integer>
  <key>bInterfaceNumber</key>
  <integer>1</integer>
  <key>bcdDevice</key>
  <integer>1792</integer>
  <key>idProduct</key>
  <integer>24592</integer>
  <key>idVendor</key>
  <integer>1027</integer>
</dict>
```

3. 保存并关闭文件
4. 禁用驱动的签名认证:
 1. 点击苹果的 logo，选择“Restart...”
 2. 重启后当听到响铃时，立即按下键盘上的 CMD+R 组合键
 3. 进入恢复模式后，打开终端
 4. 运行命令:

```
csrutil enable --without kext
```

5. 再一次重启系统

完成这些步骤后，可以同时使用串口和 JTAG 接口了。

想要进一步设置调试环境，请前往[运行 OpenOCD](#) 章节。

配置其他 JTAG 接口

关于适配 OpenOCD 和 ESP32-S2 的 JTAG 接口选择问题，请参考[选择 JTAG 适配器](#) 章节。然后按照以下步骤进行设置，使其正常工作。

配置硬件

1. 找到 JTAG 接口和 ESP32-S2 板上需要相互连接并建立通信的所有管脚或信号。

表 4: ESP32-S2 管脚和 JTAG 接口信号

| ESP32-S2 管脚 | JTAG 信号 |
|---------------|---------|
| MTDO / GPIO40 | TDO |
| MTDI / GPIO41 | TDI |
| MTCK / GPIO39 | TCK |
| MTMS / GPIO42 | TMS |

2. 检查 ESP32-S2 上用于 JTAG 通信的管脚是否被连接到了其它硬件上，这可能会影响 JTAG 的工作。
3. 连接 ESP32-S2 和 JTAG 接口上的管脚或信号。

配置驱动 你可能还需要安装软件驱动，才能使 JTAG 在计算机上正常工作，请参阅你所使用的 JTAG 适配器的有关文档，获取相关详细信息。

在 Linux 中，请务必将 [udev 规则文件](#) 复制到 `/etc/udev/rules.d` 目录中，以添加 OpenOCD udev 规则。

连接 将 JTAG 接口连接到计算机，打开 ESP32-S2 和 JTAG 接口板上的电源，然后检查计算机是否可以识别到 JTAG 接口。

如需继续设置调试环境，请前往[运行 OpenOCD](#) 章节。

运行 OpenOCD

配置完目标并将其连接到电脑后，即可启动 OpenOCD。

打开终端，按照快速入门指南中的[设置好开发环境](#) 章节进行操作，然后运行如下命令，以启动 OpenOCD (该命令适用于 Windows、Linux 和 macOS)：

```
openocd -f board/esp32s2-kaluga-1.cfg
```

备注： 上述命令中 `-f` 选项后跟的配置文件专用于 ESP32-S2-Kaluga-1 开发板。基于具体使用的硬件，你可能需要选择不同的配置文件，具体内容请参阅[根据目标芯片配置 OpenOCD](#)。

现在应该可以看到如下输出（此日志来自 ESP32-S2-Kaluga-1 开发板）：

```
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32s2-kaluga-1.cfg
Open On-Chip Debugger v0.10.0-esp32-20200420 (2020-04-20-16:15)
Licensed under GNU GPL v2
For bug reports, read
    http://openocd.org/doc/doxygen/bugs.html
none separate
adapter speed: 20000 kHz
force hard breakpoints
Info : ftdi: if you experience problems at higher adapter clocks, try the command
↪ "ftdi_tdo_sample_edge falling"
```

(下页继续)

```
Info : clock speed 20000 kHz
Info : JTAG tap: esp32s2.cpu0 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
↪ part: 0x2003, ver: 0x1)
Info : esp32s2: Debug controller was reset (pwrstat=0x5F, after clear 0x0F).
Info : esp32s2: Core was reset (pwrstat=0x5F, after clear 0x0F).
```

- 如果出现指示权限问题的错误，请打开 `~/esp/openocd-esp32` 目录，参阅 `OpenOCD README` 文件中关于“Permissions delegation”的说明。
- 如果遇到无法找到配置文件的错误，例如 `Can't find board/esp32s2-kaluga-1.cfg`，请检查 `OPENOCD_SCRIPTS` 环境变量是否设置正确，`OpenOCD` 根据此变量来查找 `-f` 指定的文件，详见安装 `OpenOCD`。此外，还需要检查配置文件是否确实位于该路径下。
- 如果出现 `JTAG` 错误（例如输出为 `...all ones` 或 `...all zeroes`），请检查硬件连接是否正确，除了 `ESP32-S2` 的管脚之外是否还有其他信号连接到了 `JTAG`，并查看是否所有器件都已经上电。

上传待调试的应用程序

按照正常步骤构建并上传 `ESP32-S2` 应用程序，具体请参阅 [第五步：开始使用 `ESP-IDF` 吧](#) 章节。

除此以外，还可以使用 `OpenOCD` 通过 `JTAG` 接口将应用程序镜像烧写到 `flash` 中，命令如下：

```
openocd -f board/esp32s2-kaluga-1.cfg -c "program_esp filename.bin 0x10000 verify_
↪exit"
```

其中 `OpenOCD` 的烧写命令 `program_esp` 格式如下：

```
program_esp <image_file> <offset> [verify] [reset] [exit] [compress]
[encrypt]
```

- `image_file` - 程序镜像文件存放的路径
- `offset` - 镜像烧写到 `flash` 中的偏移地址
- `verify` - 烧写完成后校验 `flash` 中的内容（可选）
- `reset` - 烧写完成后重启目标（可选）
- `exit` - 烧写完成后退出 `OpenOCD`（可选）
- `compress` - 烧写开始前压缩镜像文件（可选）
- `encrypt` - 烧写到 `flash` 前加密二进制文件，与 `idf.py encrypted-flash` 功能相同（可选）

现在可以调试应用程序了，请按照以下章节中的步骤进行操作。

4.17.6 启动调试器

`ESP32-S2` 的工具链中带有 `GNU` 调试器（简称 `GDB`），它和其它工具链软件共同存放于 `xtensa-esp32s2-elf-gdb` 中。除了直接在命令行终端中调用并操作 `GDB` 外，也可以在 `IDE`（例如 `Eclipse`、`Visual Studio Code` 等）中进行调用，使用图形用户界面间接操作 `GDB`，这一方法无需在终端中输入任何命令。

关于调试器的使用方法，详见以下链接。

- [使用 `Eclipse` 调试](#)
- [使用命令行调试](#)
- [使用 `VS Code` 调试](#)

建议首先检查调试器能否在 [命令行终端](#) 下正常工作，然后再使用 `Eclipse` [集成开发环境](#) 进行调试工作。

4.17.7 调试范例

本节适用于不熟悉 `GDB` 的用户，下文将使用 `get-started/blink` 下简单的应用程序来演示 [调试会话的工作流程](#)，同时会介绍以下常用的调试操作：

1. [浏览代码，查看堆栈和线程](#)

2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

此外还会提供在在命令行终端进行调试 下使用 GDB 调试的案例。

备注： 调试 *FreeRTOS* 对象 目前仅适用于命令行调试。

在演示之前，请完成 ESP32-S2 目标板设置并加载 [get-started/blink](#) 至 ESP32-S2 中。

4.17.8 从源码构建 OpenOCD

以下文档分别介绍了如何在各操作系统平台上从源码构建 OpenOCD。

Windows 环境下从源码编译 OpenOCD

备注： 本文介绍了如何从 OpenOCD 源文件构建二进制文件。如果你想要更快速地构建，也可以从 [乐鑫 GitHub](#) 直接下载 OpenOCD 的预构建二进制文件，而无需自己编译（详细信息，请参阅[安装 OpenOCD](#)）。

备注： 本文涉及的命令行操作均在装有 MINGW32 子系统的 MSYS2 shell 环境中进行了验证。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包：

```
pacman -S --noconfirm --needed autoconf automake git make \
mingw-w64-i686-gcc \
mingw-w64-i686-toolchain \
mingw-w64-i686-libtool \
mingw-w64-i686-pkg-config \
mingw-w64-cross-winpthreads-git \
p7zip
```

下载 OpenOCD 源码 支持 ESP32-S2 的 OpenOCD 源码可以从乐鑫官方 GitHub 获取，网址为 <https://github.com/espressif/openocd-esp32>。你可以在 Git 中使用以下命令来拉取源代码：

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码保存在 ~/esp/openocd-esp32 目录下。

下载 libusb 构建 OpenOCD 需使用 libusb 库。请执行以下命令来下载特定版本的 libusb，并将其解压至当前目录。

```
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
```

现在需要导出以下变量，以便将 libusb 库与 OpenOCD 构建相关联。

```
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"
export LDFLAGS="$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"
```

构建 OpenOCD 配置和构建 OpenOCD，请参考以下命令：

```
cd ~/esp/openocd-esp32
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↪$CFLAGS -Wno-error"
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
↪build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

构建完成后，OpenOCD 的二进制文件将被保存于 ~/esp/openocd-esp32/src/ 目录下。

你也可以调用 `make install`，将其复制到指定位置。

- 你可以在配置 OpenOCD 时指定这一位置，也可以在调用 `make install` 前设置 `export DESTDIR="/custom/install/dir"`。
- 如果你已经安装过其他开发平台的 OpenOCD，请跳过此步骤，否则原来的 OpenOCD 可能会被覆盖。

备注：

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果你的设备信息未显示在日志中，请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README.Windows`。
- 请记得将 `libusb-1.0.dll` 和 `libwinpthread-1.dll` 从 `~/esp/openocd-esp32/src` 复制到 `OCD_INSTALLDIR/bin`。

一旦 `make` 过程完成，OpenOCD 的可执行文件会被保存到 `~/esp/openocd-esp32/src/openocd` 目录下。

完整编译过程 OpenOCD 编译过程中所调用的所有命令都已包含在以下代码片段中，你可以将其复制到 shell 脚本中，以便快速执行：

```
pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-
↪w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-
↪cross-winpthreads-git p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git

wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"; export LDFLAGS="
↪$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"

export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↪$CFLAGS -Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
```

(下页继续)

(续上页)

```
./configure --disable-doxxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --  
↪build=i686-w64-mingw32 --host=i686-w64-mingw32  
make  
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src  
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src  
  
# # optional  
# export DESTDIR="$PWD"  
# make install  
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin  
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin
```

下一步 想要进一步配置调试环境，请前往配置 [ESP32-S2 目标板](#) 章节。

Linux 环境下从源码编译 OpenOCD

除了从 [Espressif 官方](#) 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往 [安装 OpenOCD](#) 章节查阅。

下载 OpenOCD 源码 支持 ESP32-S2 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 <https://github.com/espressif/openocd-esp32>。请使用以下命令来下载源代码：

```
cd ~/esp  
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包。

备注：依次安装以下软件包，检查安装是否成功，然后继续下一个软件包的安装。在进行下一步操作之前，要先解决当前报告的问题。

```
sudo apt-get install make  
sudo apt-get install libtool  
sudo apt-get install pkg-config  
sudo apt-get install autoconf  
sudo apt-get install automake  
sudo apt-get install texinfo  
sudo apt-get install libusb-1.0
```

备注：

- pkg-config 应为 0.2.3 或以上的版本。
- autoconf 应为 2.6.4 或以上的版本。
- automake 应为 1.9 或以上的版本。
- 当使用 USB-Blaster, ASIX Presto, OpenJTAG 和 FT2232 作为适配器时，需要下载安装 libFTDI 和 FTD2XX 的驱动。
- 当使用 CMSIS-DAP 时，需要安装 HIDAPI。

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

备注:

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果你的设备信息未显示在日志中，请根据 `./openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README`。

一旦 `make` 过程成功结束，OpenOCD 的可执行文件会被保存到 `~/openocd-esp32/bin` 目录中。

下一步 想要进一步配置调试环境，请前往[配置 ESP32-S2 目标板](#) 章节。

MacOS 环境下从源码编译 OpenOCD

除了从 [Espressif 官方](#) 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往[安装 OpenOCD](#) 章节查阅。

下载 OpenOCD 源码 支持 ESP32-S2 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 <https://github.com/espressif/openocd-esp32>。请使用以下命令来下载源代码:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 `~/esp/openocd-esp32` 目录中。

安装依赖的软件包 使用 Homebrew 安装编译 OpenOCD 所需的软件包:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

备注:

- 如果发生错误，请解决后再次尝试编译，直到 make 成功为止。
- 发生 Unknown command 'raggedright' 错误可能是因为安装的 texinfo 版本不对，或是由于没有将其添加到 PATH 路径。为了解决该问题，在运行 ./bootstrap 前，请先运行如下命令确保安装合适版本的 texinfo 并将其添加到 PATH 路径：

```
brew install texinfo
export PATH=/usr/local/opt/texinfo/bin:$PATH
```

- 如果 OpenOCD 存在子模块问题，请 cd 到 openocd-esp32 目录，并输入 git submodule update --init 命令。
- 如果 ./configure 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果你的设备信息未显示在日志中，请根据 ../openocd-esp32/doc/INSTALL.txt 文中的描述使用 ./configure 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README.OSX。

一旦 make 过程成功结束，OpenOCD 的可执行文件会被保存到 ~/esp/openocd-esp32/src/openocd 目录中。

下一步 想要进一步配置调试环境，请前往[配置 ESP32-S2 目标板](#) 章节。

本文档在演示中所使用的 OpenOCD 是预编译好的二进制发行版，在[安装 OpenOCD](#) 章节中有所介绍。

如果要使用本地从源代码编译的 OpenOCD 程序，需要将相应可执行文件的路径修改为 src/openocd，并设置 OPENOCD_SCRIPTS 环境变量，使得 OpenOCD 能够找到配置文件。Linux 和 macOS 用户可以执行：

```
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

Windows 用户可以执行：

```
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

针对 Linux 和 macOS 用户，运行本地编译的 OpenOCD 的示例：

```
src/openocd -f board/esp32s2-kaluga-1.cfg
```

Windows 用户的示例如下：

```
src\openocd -f board/esp32s2-kaluga-1.cfg
```

4.17.9 注意事项和补充内容

本节列出了上文中提到的所有注意事项和补充内容的链接。

注意事项和补充内容

本节提供了本指南中各部分提到的一些注意事项和补充内容。

可用的断点和观察点 ESP32-S2 调试器支持 2 个硬件断点和 64 个软件断点。硬件断点是由 ESP32-S2 芯片内部的逻辑电路实现的，能够设置在代码的任何位置：flash 或者 IRAM 的代码区域。除此以外，OpenOCD 实现了两种软件断点：flash 断点（最多 32 个）和 IRAM 断点（最多 32 个）。目前 GDB 无法在 flash 中设置软件断点，因此除非解决此限制，否则这些断点只能由 OpenOCD 模拟为硬件断点（详细信息可以参阅[下文](#)）。ESP32-S2 还支持 2 个观察点，所以可以观察 2 个变量的变化或者通过 GDB 命令 watch myVariable

来读取变量的值。请注意 `menuconfig` 中的 `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 选项会使用最后一个观察点，如果你想在 OpenOCD 或者 GDB 中再次尝试使用这个观察点，可能不会得到预期的结果。详情请查看 `menuconfig` 中的帮助文档。

关于断点的补充知识 使用软件 flash 模拟部分硬件断点的意思就是当使用 GDB 命令 `hb myFunction` 给某个函数设置硬件断点时，如果该函数位于 flash 中，并且此时还有可用的硬件断点，那调试器就会使用硬件断点，否则就使用 32 个软件 flash 断点中的一个来模拟。这个规则同样适用于 `b myFunction` 之类的命令，在这种情况下，GDB 会自己决定该使用哪种类型的断点。如果 `myFunction` 位于可写区域 (IRAM)，那就会使用软件 IRAM 断点，否则就会像处理 `hb` 命令一样使用硬件断点或者软件 flash 断点。

flash 映射 vs 软件 flash 断点 为了在 flash 中设置或者清除软件断点，OpenOCD 需要知道它们在 flash 中的地址。为了完成从 ESP32-S2 的地址空间到 flash 地址的转换，OpenOCD 使用 flash 中程序代码区域的映射。这些映射被保存在程序映像的头部，位于二进制数据（代码段和数据段）之前，并且特定于写入 flash 的每一个应用程序的映像。因此，为了支持软件 flash 断点，OpenOCD 需要知道待调试的应用程序映像的位置。默认情况下，OpenOCD 会在 0x8000 处读取分区表并使用第一个找到的应用程序映像的映射，但是也可能存在无法工作的情况，比如分区表不在标准的 flash 位置，甚至可能有多个映像：一个出厂映像和两个 OTA 映像，你可能想要调试其中的任意一个。为了涵盖所有可能的调试情况，OpenOCD 支持特殊的命令，用于指定待调试的应用程序映像位置。该命令具有以下格式：

```
esp appimage_offset <offset>
```

偏移量应为十六进制格式，如果要恢复默认行为，可以将偏移地址设置为 -1。

备注：由于 GDB 在连接 OpenOCD 时仅仅请求一次内存映射，所以可以在 TCL 配置文件中指定该命令，或者通过命令行传递给 OpenOCD。对于后者，命令行示例如下：

```
openocd -f board/esp32s2-kaluga-1.cfg -c "init; halt; esp appimage_offset 0x210000"
```

另外还可以通过 OpenOCD 的 telnet 会话执行该命令，然后再连接 GDB，不过这种方式似乎没有那么便捷。

“next”命令无法跳过子程序的原因 当使用 `next` 命令单步执行代码时，GDB 会在子程序的前面设置一个断点，这样就可以跳过进入子程序内部的细节。如果 2 个断点都已经设置好，那么 `next` 命令将不起作用。在这种情况下，请删掉其他断点以使其中一个变得可用。当所有断点都被使用时，`next` 命令会像 `step` 命令一样工作，调试器就会进入子程序内部。

OpenOCD 支持的编译时的选项 ESP-IDF 有一些针对 OpenOCD 调试功能的选项可以在编译时进行设置：

- `CONFIG_ESP_DEBUG_OCDAWARE` 默认会被使能。如果程序抛出了不可修复或者未处理的异常，并且此时已经连接上了 JTAG 调试器（即 OpenOCD 正在运行），那么 ESP-IDF 将会进入调试器工作模式。
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 默认没有使能。在所有任务堆栈的末尾设置观察点，从 1 号开始索引。这是调试任务堆栈溢出的最准确的方式。

更多有关设置编译时的选项的信息，请参阅[项目配置菜单](#)。

支持 FreeRTOS OpenOCD 完全支持 ESP-IDF 自带的 FreeRTOS 操作系统，GDB 会将 FreeRTOS 中的任务当做线程。使用 GDB 命令 `i threads` 可以查看所有的线程，使用命令 `thread n` 可以切换到某个具体任务的堆栈，其中 `n` 是线程的编号。检测 FreeRTOS 的功能可以在配置目标时被禁用。更多详细信息，请参阅[根据目标芯片配置 OpenOCD](#)。

GDB 具有 FreeRTOS 支持的 Python 扩展模块。在系统要求满足的情况下，通过 `idf.py gdb` 命令，ESP-IDF 会将该模块自动加载到 GDB 中。详细信息请参考[调试 FreeRTOS 对象](#)。

优化 JTAG 的速度 为了实现更高的数据通信速率同时最小化丢包数，建议优化 JTAG 时钟频率的设置，使其达到 JTAG 能稳定运行的最大值。为此，请参考以下建议。

1. 如果 CPU 以 80 MHz 运行，则 JTAG 时钟频率的上限为 20 MHz；如果 CPU 以 160 MHz 或者 240 MHz 运行，则上限为 26 MHz。
2. 根据特定的 JTAG 适配器和连接线缆的长度，你可能需要将 JTAG 的工作频率降低至 20 MHz 或 26 MHz 以下。
3. 在某些特殊情况下，如果你看到 DSR/DIR 错误（并且它并不是由 OpenOCD 试图从一个没有物理存储器映射的地址空间读取数据而导致的），请降低 JTAG 的工作频率。
4. ESP-WROVER-KIT 能够稳定运行在 20 MHz 或 26 MHz 频率下。

调试器的启动命令的含义 在启动时，调试器发出一系列命令来复位芯片并使其在特定的代码行停止运行。这个命令序列（如下所示）支持自定义，用户可以选择在最方便合适的代码行开始调试工作。

- `set remote hardware-watchpoint-limit 2` — 限制 GDB 使用芯片支持的硬件观察点数量，ESP32-S2 支持 2 个观察点。更多详细信息，请查阅 [GDB 配置远程目标](#)。
- `mon reset halt` — 复位芯片并使 CPU 停止运行。
- `maintenance flush register-cache` — `monitor (mon)` 命令无法通知 GDB 目标状态已经更改，GDB 会假设在 `mon reset halt` 之前所有的任务堆栈仍然有效。实际上，复位后目标状态将发生变化。执行 `maintenance flush register-cache` 是一种强制 GDB 从目标获取最新状态的方法。
- `thb app_main` — 在 `app_main` 处插入一个临时的硬件断点，如果有需要，可以将其替换为其他函数名。
- `c` — 恢复程序运行，它将会在 `app_main` 的断点处停止运行。

根据目标芯片配置 OpenOCD OpenOCD 有很多种配置文件 (*.cfg)，它们位于 OpenOCD 安装目录的 `share/openocd/scripts` 子目录中（或者在 OpenOCD 源码目录的 `tcl/scripts` 目录中）。本文主要介绍 `board`，`interface` 和 `target` 这三个目录。

- `interface` 包含了例如 ESPProg、J-Link 这些 JTAG 适配器的配置文件。
- `target` 包含了目标芯片或者模组的配置文件。
- `board` 包含有内置了 JTAG 适配器的开发板的配置文件，这些配置文件会根据实际的 JTAG 适配器和芯片/模组来导入某个具体的 `interface` 和 `target` 的配置。

ESP32-S2 可以使用的配置文件如下表所示：

表 5: ESP32-S2 相关的 OpenOCD 配置文件

| 名字 | 描述 |
|---|--|
| <code>board/esp32s2-kaluga-1.cfg</code> | ESP32-S2-Kaluga-1 开发板配置文件，包含 ESP32-S2 目标配置和 JTAG 适配器配置 |
| <code>target/esp32s2.cfg</code> | ESP32-S2 目标配置文件，可以和某个 <code>interface/</code> 下的配置文件一同使用 |
| <code>interface/ftdi/esp32s2_kaluga_v1.cfg</code> | 适用于 ESP32-S2-Kaluga-1 开发板的 JTAG 适配器配置文件 |
| <code>interface/ftdi/esp32_devkitj_v1.cfg</code> | 适用于 ESP-Prog 板的 JTAG 适配器配置文件 |

如果你使用的开发板已经有了一份预定义好的配置文件，你只须将该文件通过 `-f` 参数告诉 OpenOCD。

如果你的开发板不在上述列表中，你需要使用多个 `-f` 参数来告诉 OpenOCD 你选择的 `interface` 和 `target` 配置文件。

自定义配置文件 OpenOCD 的配置文件是用 TCL 语言编写的，包含了定制和编写脚本的各种选项。这在非标准调试的场景中非常有用，更多关于 TCL 脚本的内容请参考 [OpenOCD 参考手册](#)。

OpenOCD 中的配置变量 你还可以视情况在导入 target 配置文件之前，设定如下变量的值。可以写在自定义配置文件中，或者通过命令行传递。

TCL 语言中为变量赋值的语法是：

```
set VARIABLE_NAME value
```

在命令行中为变量赋值请参考如下示例（请把.cfg 配置文件替换成你自己的开发板配置）：

```
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

请切记，一定要在导入配置文件之前设置这些变量，否则变量的值将不会生效。为多个变量赋值需要重复多次 -c 选项。

表 6: 通用的 ESP 相关的 OpenOCD 变量

| 变量名 | 描述 |
|--------------------|---|
| ESP_RTOS | 设置成 none 可以关闭 OpenOCD 对 RTOS 的支持，这样的话，你将无法在 GDB 中查看到线程列表。这个功能在调试 FreeRTOS 本身的时候会很有用，可以单步调试调度器的代码。 |
| ESP_FLASH_SIZE | 设置成 0 可以关闭对 flash 断点的支持。 |
| ESP_SEMIHOST_BASED | 设置 semihosting 在主机端的默认目录。 |

复位 ESP32-S2 通过在 GDB 中输入 `mon reset` 或者 `mon reset halt` 来复位板子。

JTAG 管脚是否能用于其他功能 如果除了 ESP32-S2 模组和 JTAG 适配器之外的其他硬件也连接到了 JTAG 管脚，那么 JTAG 的操作可能会受到干扰。ESP32-S2 JTAG 使用以下管脚：

表 7: ESP32-S2 管脚和 JTAG 接口信号

| ESP32-S2 管脚 | JTAG 信号 |
|---------------|---------|
| MTDO / GPIO40 | TDO |
| MTDI / GPIO41 | TDI |
| MTCK / GPIO39 | TCK |
| MTMS / GPIO42 | TMS |

如果用户应用程序更改了 JTAG 管脚的配置，JTAG 通信可能会失败。如果 OpenOCD 正确初始化（检测到芯片全部 CPU 内核），但在程序运行期间失去了同步并报出大量 DTR/DIR 错误，原因可能是应用程序将 JTAG 管脚重新配置为其他功能或者用户忘记将 Vtar 连接到 JTAG 适配器。

JTAG 与 flash 加密和安全引导 默认情况下，开启了 flash 加密和（或者）安全引导后，系统在首次启动时，引导程序会烧写 eFuse 的某个比特，从而将 JTAG 永久关闭。

请注意，一旦 JTAG 被永久禁用，就无法重新启用以访问 JTAG。但是我们也提供了暂时禁用 (soft disable) JTAG 的选项。有关如何暂时禁用以及重新启用 JTAG，请参考 [HMAC 启用 JTAG 接口](#)。

Kconfig 配置项 `CONFIG_SECURE_BOOT_ALLOW_JTAG` 可以改变这个默认行为，使得用户即使开启了安全引导或者 flash 加密，仍会保留 JTAG 的功能。

然而，因为设置软件断点的需要，OpenOCD 会尝试自动读写 flash 中的内容，这会带来两个问题：

- 软件断点和 flash 加密是不兼容的，目前 OpenOCD 尚不支持对 flash 中的内容进行加密和解密。
- 如果开启了安全引导功能，设置软件断点会改变被签名的程序的摘要，从而使得签名失效。这也意味着，如果设置了软件断点，系统会在下次重启时的签名验证阶段失败，导致无法启动。

关闭 JTAG 的软件断点功能，可以在启动 OpenOCD 时在命令行额外加一项配置参数 `-c 'set ESP_FLASH_SIZE 0'`，请参考 [OpenOCD 中的配置变量](#)。

备注：同样地，当启用该选项，并且在调试过程中设置了软件断点，引导程序将无法校验通过应用程序的签名。

报告 OpenOCD/GDB 的问题 如果你遇到 OpenOCD 或者 GDB 程序本身的问题，并且在网上没有找到可用的解决方案，请前往 <https://github.com/espressif/openocd-esp32/issues> 新建一个议题。

1. 请在问题报告中提供你使用的配置的详细信息：
 - a. JTAG 适配器类型。
 - b. 用于编译和加载正在调试的应用程序的 ESP-IDF 版本号。
 - c. 用于调试的操作系统的相关信息。
 - d. 操作系统是在本地计算机运行还是在虚拟机上运行？
2. 创建一个能够演示问题的简单示例工程，描述复现该问题的步骤。且这个调试示例不能受到 Wi-Fi 协议栈引入的非确定性行为的影响，这样再次遇到同样问题时，更容易复现。
3. 在启动命令中添加额外的参数来输出调试日志。

OpenOCD 端：

```
openocd -l openocd_log.txt -d3 -f board/esp32s2-kaluga-1.cfg
```

这种方式会将日志输出到文件，但是它会阻止调试信息打印在终端上。当有大量信息需要输出的时候（比如调试等级提高到 -d3）这是个不错的选择。如果你仍然希望在屏幕上看到调试日志，请改用以下命令：

```
openocd -d3 -f board/esp32s2-kaluga-1.cfg 2>&1 | tee openocd.log
```

Debugger 端：

```
xtensa-esp32s2-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
```

也可以将命令 `remlotlogfile gdb_log.txt` 添加到 `gdbinit` 文件中。

4. 请将 `openocd_log.txt` 和 `gdb_log.txt` 文件附在你的问题报告中。

4.17.10 相关文档

使用调试器

本节介绍以下几种配置和运行调试器的方法：

- [使用 Eclipse 调试](#)
- [使用命令行调试](#)
- [使用 `idf.py` 进行调试](#)

关于如何使用 VS Code 进行调试，请参阅文档 [使用 VS Code 调试](#)。

使用 Eclipse 调试

备注：建议首先通过 [idf.py](#) 或 [命令行](#) 检查调试器是否正常工作，然后再转到使用 [Eclipse](#) 平台。

作为一款集成开发环境 (IDE)，Eclipse 提供了一套强大的工具，用于开发和调试软件应用程序。对于 ESP-IDF 应用程序，[IDF Eclipse 插件](#) 提供了两种调试方式：

1. [ESP-IDF GDB OpenOCD 调试](#)
2. [GDB 硬件调试](#)

默认情况下，Eclipse 通过 GDB 硬件调试插件支持 OpenOCD 调试。该调试方式需要从命令行启动 OpenOCD 服务器，并在 Eclipse 中配置 GDB 客户端，整个过程耗时且容易出错。

为了使调试过程更加容易，[IDF Eclipse 插件](#) 提供了定制的 ESP-IDF GDB OpenOCD 调试功能，支持在 Eclipse 内部配置好 OpenOCD 服务器和 GDB 客户端。该插件已经设置好所有必需的配置参数，点击一个按钮即可开始调试。

因此，建议通过 [IDF Eclipse 插件](#) 进行 ESP-IDF GDB OpenOCD 调试。

GDB 硬件调试

备注：只有在无法使用 [ESP-IDF GDB OpenOCD 调试](#) 的情况下，才建议使用 GDB 硬件调试。

首先，打开 Eclipse，选择 Help > Install New Software 来安装 GDB Hardware Debugging 插件。

安装完成后，按照以下步骤配置调试会话。请注意，一些配置参数是通用的，有些则针对特定项目。我们会通过配置“blink”示例项目的调试环境来进行展示，请先按照 [Eclipse Plugin](#) 介绍的方法将该示例项目添加到 Eclipse 的工作空间。示例项目 [get-started/blink](#) 的源代码可以在 ESP-IDF 仓库的 [examples](#) 目录下找到。

1. 在 Eclipse 中，进入 Run > Debug Configuration，会出现一个新的窗口。在窗口的左侧窗格中，双击 GDB Hardware Debugging（或者选择 GDB Hardware Debugging 然后按下 New 按钮）来新建一个配置。
 2. 在右边显示的表单中，Name：一栏中输入配置的名称，例如：“Blink checking”。
 3. 在下面的 Main 选项卡中，点击 Project：边上的 Browse 按钮，然后选择当前的 blink 项目。
 4. 在下一行的 C/C++ Application：中，点击 Browse 按钮，选择 blink.elf 文件。如果 blink.elf 文件不存在，那么很有可能该项目还没有编译，请参考 [Eclipse Plugin](#) 指南中的介绍。
 5. 最后，在 Build (if required) before launching 下面点击 Disable auto build。
- 上述步骤 1 - 5 的示例输入如下图所示。

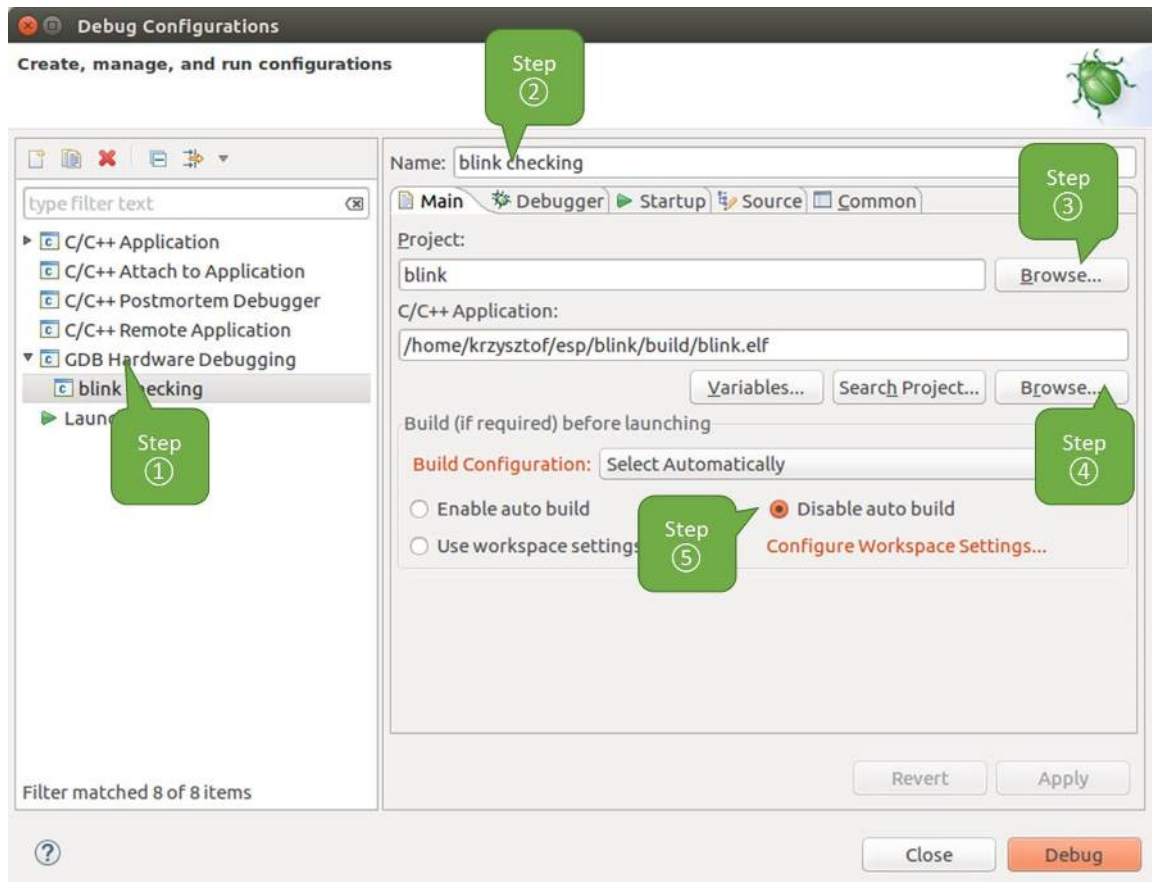

图 27: GDB 硬件调试的配置 - Main 选项卡

6. 点击 Debugger 选项卡，在 GDB Command 栏中输入 `xtensa-esp32s2-elf-gdb` 来调用调试器。
 7. 更改 Remote host 的默认配置，在 Port number 下面输入 3333。
- 上述步骤 6 - 7 的示例输入如下图所示。

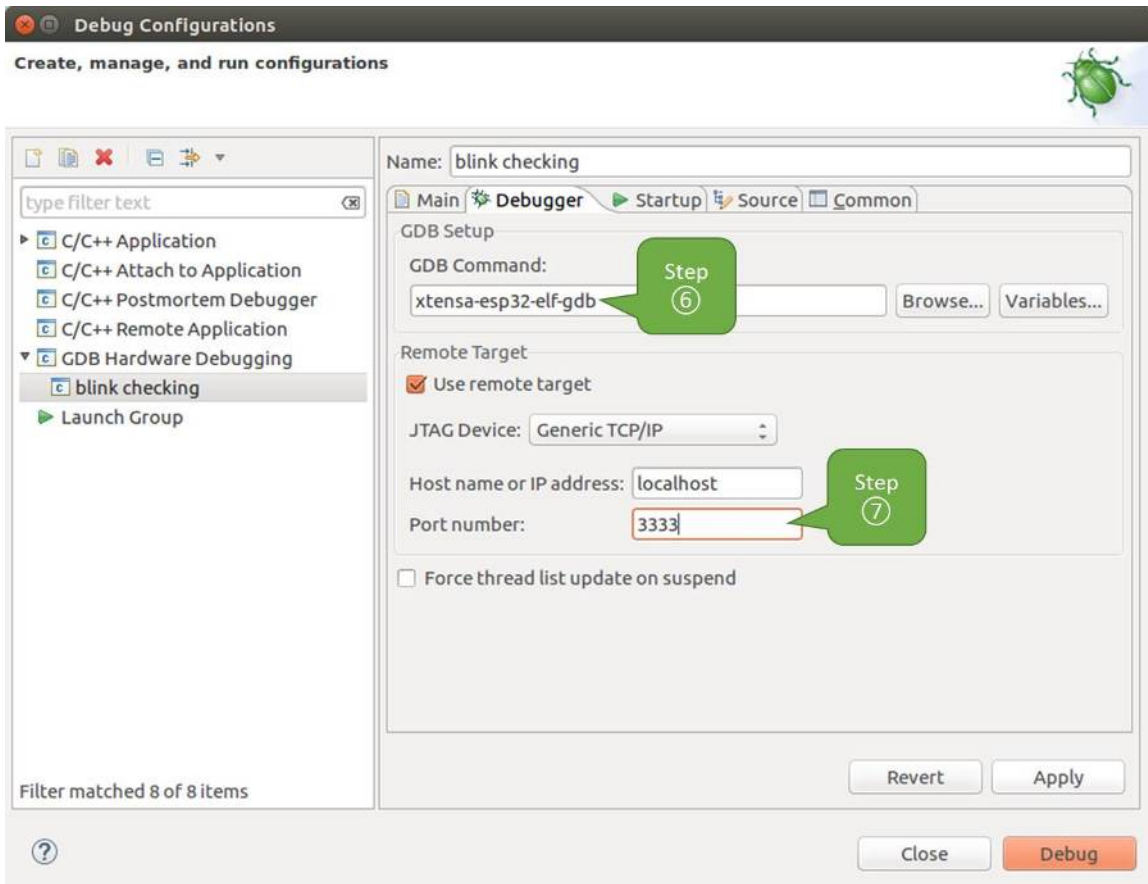

图 28: GDB 硬件调试的配置 - Debugger 选项卡

8. 最后一个需要更改默认配置的选项卡是 Startup 选项卡。在 Initialization Commands 下，取消选中 Reset and Delay (seconds) 和 Halt，然后在下面一栏中输入以下命令：

```
mon reset halt
maintenance flush register-cache
set remote hardware-watchpoint-limit 2
```

备注： 如果想在启动新的调试会话之前自动更新闪存中的镜像，请在 Initialization Commands 文本框的开头添加以下命令行：

```
mon reset halt
mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify
```

有关 `program_esp` 命令的说明请参考[上传待调试的应用程序](#) 章节。

9. 在 Load Image and Symbols 下，取消选中 Load image 选项。
10. 在同一个选项卡中继续往下浏览，建立一个初始断点用来在调试器复位后暂停 CPU。插件会根据 Set break point at: 一栏中输入的函数名，在该函数的开头设置断点。选中这一选项，并在相应的字段中输入 `app_main`。
11. 选中 Resume 选项，这会使得程序在每次调用步骤 8 中的 `mon reset halt` 后恢复，然后在 `app_main` 的断点处停止。

上述步骤 8 - 11 的示例输入如下图所示。

上面的启动序列看起来有些复杂，如果你对其中的初始化命令不太熟悉，请查阅[调试器的启动命令的含义](#) 章节获取更多说明。

图 29: GDB 硬件调试的配置 - Startup 选项卡

- 如果前面已经完成配置 [ESP32-S2 目标板](#) 中介绍的步骤，目标正在运行并准备好与调试器进行对话，那么点击 **Debug** 按钮直接进行调试。如果尚未完成前面步骤，请点击 **Apply** 按钮保存配置，返回 [配置 ESP32-S2 目标板](#) 章节进行配置，最后再回到这里开始调试。

一旦所有 1-12 的配置步骤都已经完成，Eclipse 就会打开 Debug 视图，如下图所示。

图 30: Eclipse 中的调试视图

如果不太了解 GDB 的常用方法，请查阅[使用 Eclipse 的调试示例](#)文章中的调试示例章节调试范例。

使用命令行调试

- 为了能够启动调试会话，需要先启动并运行目标，如果还没有完成，请按照[配置 ESP32-S2 目标板](#)中的介绍进行操作。
- 打开一个新的终端会话并前往待调试的项目目录，比如：

```
cd ~/esp/blink
```

- 当启动调试器时，通常需要提供几个配置参数和命令，为了避免每次都在命令行中逐行输入这些命令，你可以新建一个配置文件，并将其命名为 `gdbinit`：

```
target remote :3333
set remote hardware-watchpoint-limit 2
mon reset halt
maintenance flush register-cache
thb app_main
c
```

将此文件保存在当前目录中。

有关 `gdbinit` 文件内部的更多详细信息，请参阅[调试器的启动命令的含义](#)章节。

- 准备好启动 GDB，请在终端中输入以下内容：

```
xtensa-esp32s2-elf-gdb -x gdbinit build/blink.elf
```

5. 如果前面的步骤已经正确完成，你会看到如下所示的输出日志，在日志的最后会出现 (gdb) 提示符：

```
user-name@computer-name:~/esp/blink$ xtensa-esp32s2-elf-gdb -x gdbinit build/
↳blink.elf

Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.
↳c:43
43     xTaskCreate(&blink_task, "blink_task", 512, NULL, 5, NULL);
(gdb)
```

注意上面日志的倒数第三行显示了调试器已经在 `app_main()` 函数的断点处停止，该断点在 `gdbinit` 文件中设定。由于处理器已经暂停运行，LED 不会再闪烁。如果你的 LED 也停止了闪烁，则可以开始调试。

如果不太了解 GDB 的常用方法，请查阅[使用命令行的调试示例](#)文章中的调试示例章节[调试范例](#)。

使用 `idf.py` 进行调试 你还可以使用 `idf.py` 更方便地执行上述提到的调试命令，可以使用以下命令：

1. `idf.py openocd`

在终端中运行 **OpenOCD**，其配置信息来源于环境变量或者命令行。默认会使用 `OPENOCD_SCRIPTS` 环境变量中指定的脚本路径，它是由 **ESP-IDF** 项目仓库中的导出脚本 (`export.sh` or `export.bat`) 添加到系统环境变量中的。当然，你可以在命令行中通过 `--openocd-scripts` 参数来覆盖这个变量的值。

至于当前开发板的 **JTAG** 配置，请使用环境变量 `OPENOCD_COMMANDS` 或命令行参数 `--openocd-commands`。如果这两者都没有被定义，那么 **OpenOCD** 会使用 `-f board/esp32s2-kaluga-1.cfg` 参数来启动。

2. `idf.py gdb`

根据当前项目的 `elf` 文件自动生成 **GDB** 启动脚本，然后会按照 [使用命令行调试](#) 中所描述的步骤启动 **GDB**。

3. `idf.py gdbtui`

和步骤 2 相同，但是会在启动 **GDB** 的时候传递 `tui` 参数，这样可以方便在调试过程中查看源代码。

4. `idf.py gdbgui`

启动 **gdbgui**，在浏览器中打开调试器的前端界面。请在运行安装脚本时添加 `--enable-gdbgui` 参数，即运行 `install.sh --enable-gdbgui`，从而确保支持 `gdbgui` 选项。

上述这些命令也可以合并到一起使用，`idf.py` 会自动将后台进程（比如 `openocd`）最先运行，交互式进程（比如 **GDB**，`monitor`）最后运行。

常用的组合命令如下所示：

```
idf.py openocd gdbgui monitor
```

上述命令会将 **OpenOCD** 运行至后台，然后启动 **gdbgui** 打开一个浏览器窗口，显示调试器的前端界面，最后在活动终端打开串口监视器。

调试示例

本节将介绍如何在 [Eclipse](#) 和 [命令行](#) 中使用 **GDB** 进行调试的示例。

使用 Eclipse 的调试示例 请检查目标板是否已经准备好，并加载了 [get-started/blink](#) 示例代码，然后按照 [使用 Eclipse 调试](#) 中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止。

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

浏览代码，查看堆栈和线程 当目标暂停时，调试器会在“**Debug**”窗口中显示线程的列表，程序暂停的代码行在下面的另一个窗口中被高亮显示，如下图所示。此时板子上的 **LED** 停止了闪烁。

暂停的程序所在线程也会被展开，显示函数调用的堆栈，它表示直到目标暂停所在代码行（下图高亮处）为止的相关函数的调用关系。1 号线程下函数调用堆栈的第一行包含了最后一个调用的函数 `app_main()`，根据下一行显示，它又是在函数 `main_task()` 中被调用的。堆栈的每一行还包含调用函数的文件名和行号。通过单击每个堆栈的条目，在下面的窗口中，你将看到此文件的内容。

通过展开线程，你可以浏览整个应用程序。展开 5 号线程，它包含了更长的函数调用堆栈，你可以看到函数调用旁边的数字，比如 `0x4000000c`，它们代表未以源码形式提供的二进制代码所在的内存地址。

无论项目是以源代码还是仅以二进制形式提供，在右边一个窗口中，都可以看到反汇编后的机器代码。

图 31: Eclipse 中的 Debug 视图

图 32: 调试时目标停止

图 33: 浏览函数调用堆栈

回到 1 号线程中的 `app_main()` 函数所在的 `blink.c` 源码文件，下面的示例将会以该文件为例介绍调试的常用功能。调试器可以轻松浏览整个应用程序的代码，这给单步调试代码和设置断点带来了很大的便利，下面将一一展开讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。按住键盘上的“Control”键，双击 `blink.c` 文件中的行号 33，并在弹出的对话框中点击“OK”按钮进行确定。如果你不想看到此对话框，双击行号即可。执行同样操作，在第 36 行设置另外一个断点。

图 34: 设置断点

断点的数量和位置信息会显示在右上角的“断点”窗口中。单击“Show Breakpoints Supported by Selected Target”图标可以刷新此列表。除了刚才设置的两个断点外，列表中可能还包含在调试器启动时设置在 `app_main()` 函数处的临时断点。由于最多只允许设置两个断点（详细信息请参阅[可用的断点和观察点](#)），你需要将其删除，否则调试会失败。

单击“Resume”（如果“Resume”按钮是灰色的，请先单击 8 号线程的 `blink_task()` 函数）后处理器将开始继续运行，并在断点处停止。再一次单击“Resume”按钮，使程序再次运行，然后停在第二个断点处，依次类推。

每次单击“Resume”按钮恢复程序运行后，都会看到 LED 切换状态。

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

手动暂停目标 在调试时，你可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。后者，如果想要返回调试模式，可以通过单击“Suspend”按钮来手动中断程序的运行。

图 35: 设置了三个断点 / 最多允许两个断点

在此之前，请删除所有的断点，然后单击“Resume”按钮。接着单击“Suspend”按钮，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器将展开线程并高亮显示停止的代码行。

图 36: 手动暂停目标

在上图所示的情况中，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在你可以通过单击“Resume”按钮再次将其恢复运行或者进行下面要介绍的调试工作。

单步执行代码 我们还可以使用“Step Into (F5)”和“Step Over (F6)”命令单步执行代码，这两者之间的区别是执行“Step Into (F5)”命令会进入调用的子程序，而执行“Step Over (F6)”命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请参照上文所述确保目前只在 `blink.c` 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下“Step Over (F6)”按钮，观察调试器是如何单步执行一行代码的。

如果你改用“Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅“[next](#)”命令无法跳过子程序的原因 文档以了解 `next` 命令的潜在局限。

查看并设置内存 要显示或者设置内存的内容，请使用“调试”视图中位于底部的“Memory”选项卡。

在“Memory”选项卡下，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 *ESP32-S2 技术参考手册 > IO MUX 和 GPIO Matrix (GPIO, IO_MUX) [PDF]* 章节。

图 37: 使用“Step Over (F6)”单步执行代码

图 38: 使用 “Step Into (F5)” 单步执行代码

同样在 blink.c 项目文件中，在两个 gpio_set_level 语句的后面各设置一个断点，单击“Memory”选项卡，然后单击“Add Memory Monitor”按钮，在弹出的对话框中输入 0x3FF44004。

按下 F8 按键恢复程序运行，并观察“Monitor”选项卡。

图 39: 观察内存地址 0x3FF44004 处的某个比特被置高

每按一下 F8，你就会看到在内存 0x3FF44004 地址处的一个比特位被翻转（并且 LED 会改变状态）。

图 40: 观察内存地址 0x3FF44004 处的某个比特被置低

要修改内存的数值，请在“Monitor”选项卡中找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将立即看到 LED 的状态发生了改变。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-S2 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，在代码 i++ 处添加一个断点。

下一步，在“Breakpoints”所在的窗口中，选择“Expressions”选项卡。如果该选项卡不存在，请在顶部菜单栏的 Window > Show View > Expressions 中添加这一选项卡。然后在该选项卡中单击“Add new expression”，并输入 i。

按下 F8 继续运行程序，每次程序停止时，都会看到变量 i 的值在递增。

图 41: 观察程序变量 “i”

如想更改 `i` 的值，可以在“Value”一栏中输入新的数值。按下“Resume (F8)”后，程序将从新输入的数字开始递增 `i`。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择“Breakpoint Properties”，将“Type:”改选为“Hardware”然后在“Condition:”一栏中输入条件表达式，例如 `i == 2`。

图 42: 设置条件断点

如果当前 `i` 的值小于 2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处。

使用命令行的调试示例 请检查你的目标板是否已经准备好，并加载了 [get-started/blink](#) 示例代码，然后按照[使用命令行调试](#)中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43      xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5,
↳NULL);
(gdb)
```

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存

6. 观察和设置程序变量
7. 设置条件断点
8. 调试 *FreeRTOS* 对象

浏览代码，查看堆栈和线程 当看到 (gdb) 提示符的时候，应用程序已停止运行，LED 也停止闪烁。

要找到代码暂停的位置，输入 `l` 或者 `list` 命令，调试器会打印出暂停点 (`blink.c` 代码文件的第 43 行) 附近的几行代码

```
(gdb) l
38     }
39   }
40
41 void app_main()
42 {
43     xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, ↵
↵NULL);
44 }
(gdb)
```

也可以通过输入 `l 30, 40` 等命令来查看特定行号范围内的代码。

使用 `bt` 或者 `backtrace` 来查看哪些函数最终导致了此代码被调用:

```
(gdb) bt
#0 app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↵esp32s2/./cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 `app_main ()`。`app_main ()` 又被位于 `cpu_start.c` 文件第 339 行的 `main_task` 函数调用。

想查看 `cpu_start.c` 文件中 `main_task` 函数的上下文，需要输入 `frame N`，其中 `N=1`，因为根据前面的输出，`main_task` 位于 #1 下:

```
(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↵esp32s2/./cpu_start.c:339
339     app_main();
(gdb)
```

输入 `l` 将显示一段名为 `app_main()` 的代码 (在第 339 行):

```
(gdb) l
334     ;
335   }
336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 `main_task` 函数:

```
(gdb) l 326, 341
326 static void main_task(void* args)
327 {
328     // Now that the application is about to start, disable boot watchdogs
```

(下页继续)

(续上页)

```

329     REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
330     REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331 #if !CONFIG_FREERTOS_UNICORE
332     // Wait for FreeRTOS initialization to finish on APP CPU, before replacing
↳its startup stack
333     while (port_xSchedulerRunning[1] == 0) {
334         ;
335     }
336 #endif
337 //Enable allocation in region where the startup stacks were located.
338 heap_caps_enable_nonos_stack_heaps();
339 app_main();
340 vTaskDelete(NULL);
341 }
(gdb)

```

如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表：

```

(gdb) i threads
  Id  Target Id      Frame
   8  Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
↳<optimized out>)
      at /home/user-name/esp/esp-idf/components/esp32s2/./dport_access.c:170
   7  Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
↳pvBuffer=0x0, xTicksToWait=1644638200,
      xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.
↳c:1452
   6  Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
   5  Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
   4  Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
      at /home/user-name/esp/esp-idf/components/esp32s2/./dport_access.c:150
   3  Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
   2  Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
*  1  Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
↳main/./blink.c:43
(gdb)

```

线程列表显示了每个线程最后一个被调用的函数以及所在的 C 源文件名（如果存在的话）。

你可以通过输入 `thread N` 进入特定的线程，其中 `N` 是线程 ID。我们进入 5 号线程来看一下它是如何工作的：

```

(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0  0x4000bfea in ?? ()
(gdb)

```

然后查看回溯：

```

(gdb) bt
#0  0x4000bfea in ?? ()
#1  0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
↳esp/esp-idf/components/freertos/./port.c:415
#2  0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
↳freertos/./tasks.c:2846
#3  0x4008532b in _frxt_dispatch ()
#4  0x4008395c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
↳freertos/./port.c:222

```

(下页继续)

(续上页)

```
#5 0x4000000c in ?? ()
#6 0x4000000c in ?? ()
#7 0x4000000c in ?? ()
#8 0x4000000c in ?? ()
(gdb)
```

如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 ?? 替代，这表示该函数是以二进制格式提供的。像 0x4000bfea 这样的值是被调用函数所在的内存地址。

使用诸如 `bt`, `i threads`, `thread N` 和 `list` 命令可以浏览整个应用程序的代码。这给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 `break M` 设置断点，其中 `M` 是具体的代码行：

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

输入命令 `c`，处理器将运行并在断点处停止。再次输入 `c` 将使其再次运行，并在第二个断点处停止，依此类推：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active)    APP_CPU: PC=0x400D10D8

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:33
33      gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active)    APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active)    APP_CPU: PC=0x400D10D8

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:36
36      gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

只有在输入命令 `c` 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 `info break`：

```
(gdb) info break
Num      Type          Disp Enb Address          What
2        breakpoint    keep y  0x400db6f6 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:33
         breakpoint already hit 1 time
3        breakpoint    keep y  0x400db704 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:36
         breakpoint already hit 1 time
(gdb)
```

请注意，断点序号（在 Num 栏列出）从 2 开始，这是因为在调试器启动时执行 `thb app_main` 命令已经在 `app_main()` 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。

要删除一个断点，请输入 `delete N` 命令（或者简写成 `d N`），其中 `N` 代表断点序号：

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

暂停和恢复应用程序的运行 在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过输入 `Ctrl+C` 手动中断程序的运行。

在此之前，请删除所有的断点，然后输入 `c` 恢复程序运行。接着输入 `Ctrl+C`，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器会打印如下信息：

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00          APP_CPU: PC=0x400D0C00 (active)
[New Thread 107343352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
↳components/esp32s2/./freertos_hooks.c:52
52         asm("waiti 0");
(gdb)
```

在上图所示的情况下，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在你可以通过输入 `c` 再次将其恢复运行或者进行如下所述的一些调试工作。

单步执行代码 我们还可以使用 `step` 和 `next` 命令（可以简写成 `s` 和 `n`）单步执行代码，这两者之间的区别是执行“`step`”命令会进入调用的子程序内部，而执行“`next`”命令则会直接将子程序看成单个源代码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 `break` 和 `delete` 命令，确保目前只在 `blink.c` 文件的第 36 行设置了一个断点：

```
(gdb) info break
Num      Type           Disp Enb Address      What
3        breakpoint      keep y   0x400db704 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
         breakpoint already hit 1 time
(gdb)
```

输入 `c` 恢复程序运行然后等它在断点处停止运行：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active)   APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36         gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

然后输入 `n` 多次，观察调试器是如何单步执行一行代码的：

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)   APP_CPU: PC=0x400D1128
```

(下页继续)

(续上页)

```

Target halted. PRO_CPU: PC=0x400DB75B (active)   APP_CPU: PC=0x400D1128
37          vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active)   APP_CPU: PC=0x400D1128
33          gpio_set_level(BLINK_GPIO, 0);
(gdb)

```

如果你输入 `s`，那么调试器将进入子程序：

```

(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active)   APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
↳components/esp_driver_gpio/src/gpio.c:183
183      GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
↳", ESP_ERR_INVALID_ARG);
(gdb)

```

上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅 [“next”命令无法跳过于程序的原因](#) 文档以了解 `next` 命令的潜在局限。

查看并设置内存 使用命令 `x` 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 `help x` 可以查看更多相关细节。与 `x` 命令配合使用的命令是 `set`，它允许你将值写入内存。

为了演示 `x` 和 `set` 的使用，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 `GPIO` 的电平。

关于该寄存器的更多详细信息，请参阅 [ESP32-S2 技术参考手册 > IO MUX 和 GPIO Matrix \(GPIO, IO_MUX\) \[PDF\]](#) 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点。输入两次 `c` 命令后停止在断点处，然后输入 `x /1wx 0x3FF44004` 来显示 `GPIO_OUT_REG` 寄存器的值：

```

(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active)   APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:34
34          vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)   APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:37
37          vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)

```

如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转：

```
0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010
```

现在，当 LED 熄灭时，与之对应地会显示 0x3ff44004: 0x00000000，尝试使用 set 命令向相同的内存地址写入 0x00000010 来将该比特置高：

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

在输入 set {unsigned int}0x3FF44004=0x000010 命令后，你会立即看到 LED 亮起。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了能够演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-S2 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 watch i：

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

这会在所有变量 i 发生改变的代码处插入所谓的“观察点”。现在输入 continue 命令来恢复应用程序的运行并观察它停止：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:33
33      i++;
(gdb)
```

多次恢复程序运行后，变量 i 的值会增加，现在你可以输入 print i（简写 p i）来查看当前 i 的值：

```
(gdb) p i
$1 = 3
(gdb)
```

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出来查看是否确已修改）：

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)
```

最多可以使用两个观察点，详细信息请参阅[可用的断点和观察点](#)。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令：

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)
```

以上命令在 `blink.c` 文件的 34 处设置了一个条件断点，当 `i == 2` 条件满足时，程序会停止运行。

如果当前 `i` 的值小于 2 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处：

```
(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:34
34      gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

调试 FreeRTOS 对象 该部分内容或许可以帮助你调试 FreeRTOS 任务交互。

需要调试 FreeRTOS 任务交互的用户可使用 GDB 命令 `freertos`。该命令并非 GDB 原生命令，而是来自于 Python 扩展模块 `freertos-gdb`，其包含一系列子命令：

```
(gdb) freertos
"freertos" 后面必须紧随子命令的名称
freertos 子命令如下：

freertos queue -- 打印当前队列信息
freertos semaphore -- 打印当前信号量信息
freertos task -- 打印当前任务及其状态
freertos timer -- 打印当前定时器信息
```

点击 <https://pypi.org/project/freertos-gdb> 链接了解此扩展模块的详细信息。

备注：ESP-IDF 在安装 Python 包时会自动安装 `freertos-gdb` Python 模块，详情请参考 [第三步：设置工具](#)。

如果使用 `idf.py gdb` 命令运行 GDB，FreeRTOS 扩展会自动加载。也可以使用 GDB 内部命令 `python import freertos_gdb` 使能该模块。

请保证使用 Python 3.6 及以上版本，该版本具有 Python 共享库。

获得命令的帮助信息 目前所介绍的都是些非常基础的命令，目的在于让你快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 (gdb) 提示符下输入 `help` 和命令名：

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)
```

只需输入 `help` 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 <https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf>。虽然不是所有命令都适用于嵌入式环境，但还是会有所裨益。

结束调试会话 输入命令 `q` 可以退出调试器:

```
(gdb) q
A debugging session is active.

    Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

4.18 链接器脚本生成机制

4.18.1 概述

ESP32-S2 中有多个用于存放代码和数据的**内存区域**。代码和只读数据默认存放在 `flash` 中，可写数据存放在 `RAM` 中。不过有时，用户必须更改默认存放区域。

例如:

- 将关键代码存放到 `RAM` 中以提高性能;
- 将可执行代码存放到 `IRAM` 中，以便在缓存被禁用时运行这些代码;
- 将代码存放到 `RTC` 存储器中，以便在 `wake stub` 中使用;
- 将代码存放到 `RTC` 内存中，以便 `ULP` 协处理器使用。

链接器脚本生成机制可以让用户指定代码和数据在 `ESP-IDF` 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理；生成的存放规则用于链接应用程序。

4.18.2 快速上手

本段将指导如何使用 `ESP-IDF` 的即用方案，快速将代码和数据放入 `RAM` 和 `RTC` 存储器中。

假设用户有:

```
components
├── my_component
│   ├── CMakeLists.txt
│   ├── Kconfig
│   ├── src/
│   │   ├── my_src1.c
│   │   ├── my_src2.c
│   │   └── my_src3.c
│   └── my_linker_fragment_file.lf
```

- 名为 `my_component` 的组件，在构建过程中存储为 `libmy_component.a` 库文件
- 库文件包含的三个源文件: `my_src1.c`、`my_src2.c` 和 `my_src3.c`，编译后分别为 `my_src1.o`、`my_src2.o` 和 `my_src3.o`

- 在 `my_src1.o` 中定义 `my_function1` 功能；在 `my_src2.o` 中定义 `my_function2` 功能
- 在 `my_component` 下 `Kconfig` 中存在布尔类型配置 `PERFORMANCE_MODE (y/n)` 和整数类型配置 `PERFORMANCE_LEVEL (范围是 0-3)`

创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 `.lf` 的文本文件，想要存放的位置信息会写入该文件内。文件创建成功后，需要将其呈现在构建系统中。ESP-IDF 支持的构建系统指南如下：

在组件目录的 `CMakeLists.txt` 文件中，指定 `idf_component_register` 调用引数 `LDFRAGMENTS` 的值。`LDFRAGMENTS` 可以为绝对路径，也可为组件目录的相对路径，指向已创建的链接器片段文件。

```
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register(...
    LDFRAGMENTS "path/to/linker_fragment_file.1f" "path/to/
→another_linker_fragment_file.1f"
    ...
)
```

指定存放区域

可以按照下列粒度指定存放区域：

- 目标文件 (`.obj` 或 `.o` 文件)
- 符号 (函数/变量)
- 库 (`.a` 文件)

存放目标文件 假设整个 `my_src1.o` 目标文件对性能至关重要，所以最好把该文件放在 `RAM` 中。另外，`my_src2.o` 目标文件包含从深度睡眠唤醒所需的符号，因此需要将其存放到 `RTC` 存储器中。

在链接器片段文件中可以写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)      # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
    my_src2 (rtc)         # 将所有 my_src2 代码、数据和只读数据存放到 RTC 快速 RAM
→和 RTC 慢速 RAM 中
```

那么 `my_src3.o` 放在哪里呢？由于未指定存放区域，`my_src3.o` 会存放到默认区域。更多关于默认存放区域的信息，请查看[这里](#)。

存放符号 继续上文的例子，假设 `object1.o` 目标文件定义的功能中，只有 `my_function1` 影响到性能；`object2.o` 目标文件中只有 `my_function2` 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1:my_function1 (noflash)
    my_src2:my_function2 (rtc)
```

`my_src1.o` 和 `my_src2.o` 中的其他函数以及整个 `object3.o` 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如：

```
my_src1:my_variable (noflash)
```

注意：按照符号粒度存放代码和数据有一定的局限。为确保存放区域合适，您也可以将相关代码和数据集中在源文件中，参考[使用目标文件的存放规则](#)。

存放整个库 在这个例子中，假设整个组件库都需存放到 RAM 中，可以写入以下内容存放整个库：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (rtc)
```

根据具体配置存放 假设只有在某个条件为真时，比如 `CONFIG_PERFORMANCE_MODE == y` 时，整个组件库才有特定存放区域，可以写入以下内容实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE = y:
        * (noflash)
    else:
        * (default)
```

来看一种更复杂的情况。假设 `CONFIG_PERFORMANCE_LEVEL == 1` 时，只有 `object1.o` 存放到 RAM 中；`CONFIG_PERFORMANCE_LEVEL == 2` 时，`object1.o` 和 `object2.o` 会存放到 RAM 中；`CONFIG_PERFORMANCE_LEVEL == 3` 时，库中的所有目标文件都会存放到 RAM 中。以上三个条件为假时，整个库会存放到 RTC 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL = 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL = 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL = 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
        if PERFORMANCE_LEVEL >= 2:
            object2 (noflash)
```

(下页继续)

```

        if PERFORMANCE_LEVEL >= 3:
            object2 (noflash)
else:
    * (rtc)

```

默认存放区域

到目前为止，“默认存放区域”在未指定 `rtc` 和 `noflash` 存放规则时才会作为备选方案使用。需要注意的是，`noflash` 或者 `rtc` 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是[协议](#)。

与 `rtc` 和 `noflash` 类似，还有一个默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通常存放的区域，即代码和常量存放在 `flash` 中，变量存放在 `RAM` 中。更多关于默认协议的信息，请见[这里](#)。

备注： 使用链接器脚本生成机制的 IDF 组件示例，请参阅 [freertos/CMakeLists.txt](#)。为了提高性能，`freertos` 使用链接器脚本生成机制，将其目标文件存放到 `RAM` 中。

快速入门指南到此结束，下文将详述这个机制的内核，有助于创建自定义存放区域或修改默认方式。

4.18.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换成可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的[链接器片段文件](#)和 (2) [链接器脚本模板](#) 动态生成。

备注： 执行链接器脚本生成机制的工具存放在 `tools/ldgen` 之下。

链接器片段文件

如快速入门指南所述，片段文件是拓展名为 `.lf` 的简单文本文件，内含想要存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是[段](#)、[协议](#)和[映射](#)。

语法 三种片段类型使用同一种语法：

```

[type:name]
key: value
key:
    value
    value
    value
    ...

```

- 类型：片段类型，可以为段、协议或映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。
 - 在[段](#)和[协议](#)中，仅支持 `entries` 键。
 - 在[映射](#)中，支持 `archive` 和 `entries` 键。

备注： 多个片段的类型和名称相同时会引发异常。

备注： 片段名称和键值只能使用字母、数字和下划线。

条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 `kconfiglib` 脚本的 `eval_string`，遵循该脚本要求的语法和局限性，支持：

- **比较**
 - 小于 <
 - 小于等于 <=
 - 大于 >
 - 大于等于 >=
 - 等于 =
 - 不等于 !=
- **逻辑**
 - 或 ||
 - 和 &&
 - 取反 !
- **分组**
 - 圆括号 ()

条件检查和其他语言中的 `if...elseif/elif...else` 块作用一样。键值和完整片段都可以进行条件检查。以下两个示例效果相同：

```
# 键值取决于配置
[type:name]
key_1:
    if CONDITION = y:
        value_1
    else:
        value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b
```

```
# 完整片段的定义取决于配置
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_a
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

注释

链接器片段文件中的注释以 `#` 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

类型 段

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 `.text`、`.data`），也可以是用户通过 `__attribute__` 关键字定义的段。

'+' 表示段列表开始，且当前段为列表中的第一个段。这种表达方式更加推荐。

```
[sections:name]
entries:
  .section+
  .section
  ...
```

示例：

```
# 不推荐的方式
[sections:text]
entries:
  .text
  .text.*
  .literal
  .literal.*

# 推荐的方式，效果与上面等同
[sections:text]
entries:
  .text+           # 即 .text 和 .text.*
  .literal+       # 即 .literal 和 .literal.*
```

协议

协议定义了每个段对应的目标。

```
[scheme:name]
entries:
  sections -> target
  sections -> target
  ...
```

示例：

```
[scheme:noflash]
entries:
  text -> iram0_text           # text 段下的所有条目均归入 iram0_text
  rodata -> dram0_data       # rodata 段下的所有条目均归入 dram0_data
```

默认协议

注意，有一个默认的协议很特殊，特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着，如果该协议有一条条目是 `text -> flash_text`，则将为目标 `flash_text` 生成如下的存放规则：

```
*(.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定映射规则的情况。

默认协议在 [esp_system/app.lf](#) 文件中定义。快速上手指南中提到的内置 `noflash` 协议和 `rtc` 协议也在该文件中定义。

映射

映射定义了可映射实体（即目标文件、函数名、变量名和库）对应的协议。

```
[mapping]
archive: archive           # 构建后输出的库文件名称（即 libxxx.a）
entries:
  object:symbol (scheme)  # 符号
  object (scheme)         # 目标
  * (scheme)              # 库
```

有三种存放粒度：

- 符号：指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标：只指定目标文件名称。
- 库：指定 `*`，即某个库下面所有目标文件的简化表达法。

为了更好地理解条目的含义，请看一个按目标存放的例子。

```
object (scheme)
```

根据条目定义，将这个协议展开：

```
object (sections -> target,
        sections -> target,
        ...)
```

再根据条目定义，将这个段展开：

```
object (.section,
        .section,
        ... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置

        .section,
        .section,
        ... -> target, # 同样的方法指定其他段

        ...)          # 直至所有段均已展开
```

示例：

```
[mapping:map]
archive: libfreertos.a
entries:
    * (noflash)
```

除了实体和协议，条目中也支持指定如下标志：（注：<> = 参数名称，[] = 可选参数）

1. ALIGN(<alignment>[pre, post])

根据 `alignment` 中指定的数字对齐存放区域，根据是否指定 `pre` 和 `post`，或两者都指定，在输入段描述（生成于映射条目）的前面和/或后面生成：

2. SORT([<sort_by_first>, <sort_by_second>])

在输入段描述中输出 `SORT_BY_NAME`，`SORT_BY_ALIGNMENT`，`SORT_BY_INIT_PRIORITY` 或 `SORT`。

`sort_by_first` 和 `sort_by_second` 的值可以是：`name`、`alignment`、`init_priority`。

如果既没指定 `sort_by_first` 也没指定 `sort_by_second`，则输入段会按照名称排序，如果两者都指定了，那么嵌套排序会遵循 <https://sourceware.org/binutils/docs/ld/Input-Section-Wildcards.html> 中的规则。

3. KEEP()

用 `KEEP` 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 <https://sourceware.org/binutils/docs/ld/Input-Section-Keep.html>

4. SURROUND(<name>)

在存放区域的前面和后面生成符号，生成的符号遵循 `_<name>_start` 和 `_<name>_end` 的命名方式，例如，如果 `name == sym1`

在添加标志时，协议中需要指定具体的 `section -> target`。对于多个 `section -> target`，使用逗号作为分隔符，例如：

```
# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 条目中定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
```

(下页继续)

```
section1 -> target1 KEEP() ALIGN(4, pre, post),
section2 -> target2 SURROUND(sym) ALIGN(4, post) SORT()
```

合并后，如下的映射：

```
[mapping:name]
archive: lib1.a
entries:
  obj1 (noflash);
    rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出：

```
. = ALIGN(8)
_my_sym_start = ABSOLUTE(.)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

注意，正如在 `flag` 描述中提到的，`ALIGN` 和 `SURROUND` 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成：

```
_my_sym_start = ABSOLUTE(.)
. = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

按符号存放 按符号存放可通过编译器标志 `-ffunction-sections` 和 `-ffdata-sections` 实现。`ESP-IDF` 默认用这些标志编译。用户若选择移除标志，便不能按符号存放。另外，即便有标志，也会其他限制，具体取决于编译器输出的段。

比如，使用 `-ffunction-sections`，针对每个功能会输出单独的段。段的名称可以预测，即 `.text.{func_name}` 和 `.literal.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `-ffdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`；因此类型 `I` 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

链接器脚本模板

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法：

```
mapping[target]
```

示例：

以下示例是某个链接器脚本本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `iram0_text` 的标记。

```
.iram0.text :
{
  /* 标记 IRAM 空间不足 */
  _iram_text_start = ABSOLUTE(.);

  /* 引用 iram0_text */
  mapping[iram0_text]
```

(下页继续)

```

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

假设链接器脚本生成器收集到了以下片段定义：

```

[sections:text]
    .text+
    .literal+

[sections:iram]
    .iram1+

[scheme:default]
entries:
    text -> flash_text
    iram -> iram0_text

[scheme:noflash]
entries:
    text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
    * (noflash)

```

然后生成的链接器脚本的相应摘录如下：

```

.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);

    /* 处理片段生成的存放规则，存放在模板标记的位置处 */
    *(.iram1 .iram1.*)
    *libfreertos.a:(.literal .text .literal.* .text.*)

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

```
*libfreertos.a:(.literal .text .literal.* .text.*)
```

这是根据 freertos 映射的 * (noflash) 条目生成的规则。libfreertos.a 库下所有目标文件的所有 text 段会收集到 iram0_text 目标下（按照 noflash 协议），并放在模板中被 iram0_text 标记的地方。

```
*(.iram1 .iram1.*)
```

这是根据默认协议条目 iram -> iram0_text 生成的规则。默认协议指定了 iram -> iram0_text 条目，因此生成的规则同样也放在被 iram0_text 标记的地方。由于该规则是根据默认协议生成的，因此在同一目标下收集的所有规则下排在第一位。

目前使用的链接器脚本模板是 [esp_system/ld/esp32s2/sections.ld.in](#)，生成的脚本存放在构建目录下。

4.19 lwIP

ESP-IDF 使用开源的 [lwIP](#) 轻量级 TCP/IP 协议栈，该版 lwIP ([esp-lwip](#)) 相对上游项目做了修改和增补。

4.19.1 支持的 API

ESP-IDF 支持以下 lwIP TCP/IP 协议栈功能：

- [BSD 套接字 API](#)
- [Netconn API](#) 已启用，但暂无对 ESP-IDF 应用程序的官方支持

适配的 API

警告： 在使用除 [BSD 套接字 API](#) 外的任意 lwIP API 时，请确保所用 API 为线程安全。请启用 [CONFIG_LWIP_CHECK_THREAD_SAFETY](#) 配置选项并运行应用程序，检查所用 API 是否线程安全。此时，lwIP 断言 TCP/IP 核心功能可以正确访问。如果未能从正确的 [lwIP FreeRTOS 任务](#) 访问，或没有正确锁定，则执行中止。建议使用 [ESP-NETIF](#) 组件与 lwIP 交互。

ESP-IDF 间接支持以下常见的 lwIP 应用程序 API：

- 动态主机设置协议 (DHCP) 服务器和客户端，由 [ESP-NETIF](#) 功能间接支持。
- 域名系统 (DNS)；获取 DHCP 地址时，可以自动分配 DNS 服务器，也可以通过 [ESP-NETIF](#) API 手动配置。

备注： lwIP 中的 DNS 服务器配置为全局配置，而非针对特定接口的配置。如需同时使用不同 DNS 服务器的多个网络接口，在从一个接口获取 DHCP 租约时，请注意避免意外覆盖另一个接口的 DNS 设置。

- 简单网络时间协议 (SNTP)，由 [ESP-NETIF](#) 功能间接支持，或通过 [lwip/include/apps/esp_sntp.h](#) 中的函数直接支持。该函数还为 [lwip/lwip/src/include/lwip/apps/sntp.h](#) 函数提供了线程安全的 API，请参阅 [SNTP 时间同步](#)。
- ICMP Ping，由 lwIP ping API 的变体支持，请参阅 [ICMP 回显](#)。
- ICMPv6 Ping，由 lwIP 的 ICMPv6 Echo API 支持，用于测试 IPv6 网络连接情况。有关详细信息，请参阅 [protocols/sockets/icmpv6_ping](#)。
- NetBIOS 查找，由标准的 lwIP API 支持，[protocols/http_server/restful_server](#) 示例中提供了使用 NetBIOS 在局域网中查找主机的选项。
- mDNS 与 lwIP 的默认 mDNS 使用不同实现方式，请参阅 [mDNS 服务](#)。但启用 [CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES](#) 设置项后，lwIP 可以使用 `gethostbyname()` 等标准 API 和 `hostname.local` 约定查找 mDNS 主机。
- lwIP 中的 PPP 实现可用于在 ESP-IDF 中创建 PPPoS (串行 PPP) 接口。请参阅 [ESP-NETIF](#) 组件文档，使用 [esp_netif/include/esp_netif_defaults.h](#) 中定义的 `ESP_NETIF_DEFAULT_PPP()` 宏创建并配置 PPP 网络接口。[esp_netif/include/esp_netif_ppp.h](#) 中提供了其他的运行时设置。PPPoS 接口通常用于与 NB-IoT/GSM/LTE 调制解调器交互。[esp_modem](#) 仓库还支持更多应用层友好的 API，该仓库内部使用了上述 PPP lwIP 模块。

4.19.2 BSD 套接字 API

BSD 套接字 API 是一种常见的跨平台 TCP/IP 套接字 API，最初源于 UNIX 操作系统的伯克利标准发行版，现已标准化为 POSIX 规范的一部分。BSD 套接字有时也称 POSIX 套接字，或伯克利套接字。

在 ESP-IDF 中，lwIP 支持 BSD 套接字 API 的所有常见用法。

参考

BSD 套接字的相关参考资料十分丰富，包括但不限于：

- [单一 UNIX 规范 - BSD 套接字](#)
- [伯克利套接字 - 维基百科](#)

示例

以下为 ESP-IDF 中使用 BSD 套接字 API 的部分示例：

- [protocols/sockets/tcp_server](#)
- [protocols/sockets/tcp_client](#)
- [protocols/sockets/udp_server](#)
- [protocols/sockets/udp_client](#)
- [protocols/sockets/udp_multicast](#)
- [protocols/http_request](#)：此简化示例使用 TCP 套接字发送 HTTP 请求，但更推荐使用 [ESP HTTP 客户端](#) 发送 HTTP 请求

支持的函数

在 ESP-IDF 中，lwIP 支持以下 BSD 套接字 API 函数，详情请参阅 [lwip/lwip/src/include/lwip/sockets.h](#)。

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`
- `getsockopt()` 和 `setsockopt()`：请参阅[套接字选项](#)
- `close()`：通过[虚拟文件系统组件](#)调用
- `read()`、`readv()`、`write()`、`writenv()`：通过[虚拟文件系统组件](#)调用
- `recv()`、`recvmsg()`、`recvfrom()`
- `send()`、`sendmsg()`、`sendto()`
- `select()`：通过[虚拟文件系统组件](#)调用
- `poll()`：ESP-IDF 通过在内部调用 `select()` 实现 `poll()`，因此，建议直接调用 `select()`
- `fcntl()`：请参阅[fcntl\(\)](#)

非标准函数：

- `ioctl()`：请参阅[ioctl\(\)](#)

备注：部分 lwIP 应用程序示例代码使用了带前缀的 BSD API，如 `lwip_socket()`，而非标准 `socket()`。ESP-IDF 支持使用以上两种形式，但更建议使用标准名称。

套接字错误处理

要使套接字应用程序保持稳定，BSD 套接字错误处理代码至关重要。套接字错误处理通常涉及以下几个方面：

- 错误检测
- 获取错误原因代码
- 根据错误原因代码处理错误

在 lwIP 中，处理套接字错误分以下两种情况：

- 套接字 API 返回错误，请参阅[套接字 API 错误](#)。
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` 包含异常描述符，表示套接字出现错误，详情请参阅[select\(\) 错误](#)。

套接字 API 错误 错误检测

- 根据返回值判断套接字 API 是否出错。

获取错误原因代码

- 套接字 API 出错时，其返回值不包含失败原因，可以通过应用程序访问 `errno` 获取错误原因代码。不同返回值具有不同含义，详情请参阅[套接字错误原因代码](#)。

示例：

```
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // 从 errno 获取错误代码
    err = errno;
    return err;
}
```

select () 错误 错误检测

- `select ()` 包含异常描述符时的套接字错误。

获取错误原因代码

- 如果 `select ()` 报告套接字错误，访问 `errno` 无法获取错误原因代码，此时，应调用 `getsockopt ()`。因为当 `select ()` 包含异常描述符时，错误代码不会直接赋值给 `errno`。

备注： `getsockopt ()` 函数具有以下原型：`int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`。原型可以获取任意类型、任意状态套接字选项的当前值，并将结果存储在 `optval` 中。例如，要在套接字上获取错误代码，可以通过 `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)` 实现。

示例：

```
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // 使用 getsockopt() 获取 select() 异常集
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

套接字错误原因代码 以下是常见错误代码列表。有关标准 POSIX/C 错误代码的详细列表，请参阅 [newlib errno.h](#) 和特定平台扩展 [newlib/platform_include/errno.h](#)。

| 错误代码 | 描述 |
|-----------------|----------|
| ECONNREFUSED | 拒绝连接 |
| EADDRINUSE | 地址已在使用中 |
| ECONNABORTED | 软件导致连接中断 |
| ENETUNREACH | 网络不可达 |
| ENETDOWN | 未配置网络接口 |
| ETIMEDOUT | 连接超时 |
| EHOSTDOWN | 主机已关闭 |
| EHOSTUNREACH | 主机不可达 |
| EINPROGRESS | 连接已在进行中 |
| EALREADY | 套接字已连接 |
| EDESTADDRREQ | 需要目标地址 |
| EPROTONOSUPPORT | 未知协议 |

套接字选项

`getsockopt()` 支持获取套接字选项，`setsockopt()` 支持设置套接字选项。

在 ESP-IDF 中，lwIP 并不支持所有标准套接字选项。以下套接字选项受 lwIP 支持：

常见选项 与级别参数 `SOL_SOCKET` 一起使用。

- `SO_REUSEADDR`：如果 `CONFIG_LWIP_SO_REUSE` 已启用，则该选项可用，可以设置 `CONFIG_LWIP_SO_REUSE_RXTOALL` 自定义其行为
- `SO_KEEPAVIVE`
- `SO_BROADCAST`
- `SO_ACCEPTCONN`
- `SO_RCVBUF`：如果 `CONFIG_LWIP_SO_RCVBUF` 已启用，则该选项可用
- `SO_SNDTIMEO / SO_RCVTIMEO`
- `SO_ERROR`：此选项仅支持与 `select()` 一起使用，请参阅[套接字错误处理](#)
- `SO_TYPE`
- `SO_NO_CHECK`：仅适用于 UDP 套接字

IP 选项 与级别参数 `IPPROTO_IP` 一起使用。

- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO`：如果 `CONFIG_LWIP_NETBUF_RECVINFO` 已启用，则该选项可用

对于组播 UDP 套接字：

- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

TCP 选项 只适用于 TCP 套接字，与级别参数 `IPPROTO_TCP` 一起使用。

- `TCP_NODELAY`

与 TCP 保活探测相关的选项：

- `TCP_KEEPAVIVE`：整数值，以毫秒为单位，设置 TCP 保活探测周期
- `TCP_KEEPIDLE`：整数值，以秒为单位，与 `TCP_KEEPAVIVE` 相同
- `TCP_KEEPINTVL`：整数值，以秒为单位，设置保活探测间隔
- `TCP_KEEPCNT`：整数值，设置超时前进行的保活探测次数

IPv6 选项 只适用于 IPv6 套接字，与级别参数 `IPPROTO_IPV6` 一起使用。

- `IPV6_CHECKSUM`
- `IPV6_V6ONLY`

对于组播 IPv6 UDP 套接字：

- `IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP`
- `IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP`
- `IPV6_MULTICAST_IF`
- `IPV6_MULTICAST_HOPS`
- `IPV6_MULTICAST_LOOP`

`fcntl()`

`fcntl()` 函数是设置与文件描述符相关选项的标准 API。在 ESP-IDF 中，使用[虚拟文件系统组件](#)层实现该函数。

当文件描述符为套接字时，仅支持以下 `fcntl()` 值：

- `O_NONBLOCK` 用于置位或清除非阻塞 I/O 模式。`O_NDELAY` 也受支持，与前者功能相同。
- `O_RDONLY`、`O_WRONLY`、`O_RDWR` 标志用于不同的读或写模式，只能用 `F_GETFL` 读取，且无法用 `F_SETFL` 设置。根据连接状况，即两端开启或任一端关闭，TCP 套接字会返回不同模式，而 UDP 套接字始终返回 `O_RDWR`。

`ioctl()`

`ioctl()` 函数以半标准的方式访问 TCP/IP 协议栈的部分内部功能。ESP-IDF 通过[虚拟文件系统组件](#)层实现此函数。

当文件描述符为套接字时，仅支持以下 `ioctl()` 值：

- `FIONREAD` 返回套接字网络 buffer 中接收的待处理字节数。
- `FIONBIO` 和 `fcntl(fd, F_SETFL, O_NONBLOCK, ...)` 相同，也可置位或清除套接字非阻塞 I/O 状态。

4.19.3 Netconn API

lwIP 支持两种较低级别的 API 和 BSD 套接字 API，即 Netconn API 和 Raw API。

lwIP Raw API 适用于单线程设备，无法在 ESP-IDF 中使用。

Netconn API 用于在 lwIP 内部使用 BSD 套接字 API，支持直接从 ESP-IDF 的应用程序调用。相较于 BSD 套接字 API，该 API 占用资源更少。无需提前将数据复制到内部 lwIP buffer，即可使用 Netconn API 发送和接收数据。

重要：乐鑫尚未在 ESP-IDF 中测试 Netconn API，因此**此功能已启用，但尚无官方支持**。对于某些功能，可能只有在从 BSD 套接字 API 中使用时才能正常运作。

有关 Netconn API 的更多信息，请参阅 [lwip/lwip/src/include/lwip/api.h](#) 和 [lwIP 应用程序 **非官方** 开发手册的一部分](#)。

4.19.4 lwIP FreeRTOS 任务

lwIP 创建了专用的 TCP/IP FreeRTOS 任务，处理来自其他任务的套接字 API 请求。

以下配置项可用于修改任务，并调整向 TCP/IP 任务发送数据和从 TCP/IP 任务接收数据的队列（邮箱）：

- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`

- [CONFIG_LWIP_TCPIP_TASK_STACK_SIZE](#)
- [CONFIG_LWIP_TCPIP_TASK_AFFINITY](#)

4.19.5 IPv6 支持

系统支持 IPv4 和 IPv6 的双栈功能，并默认启用这两种协议。如无需要，可将其禁用，请参阅[最小内存使用](#)。

在 ESP-IDF 中，IPv6 支持仅限 **无状态自动配置**，不支持 **有状态配置**，上游的 lwIP 也不支持 **有状态配置**。

IPv6 地址配置通过以下协议或服务定义：

- 支持 **SLAAC IPv6** 无状态地址配置 (RFC-2462)
- 支持 **DHCPv6 IPv6** 动态主机配置协议 (RFC-8415)

以上两种地址配置默认处于禁用状态，设备仅使用链路本地地址或静态定义的地址。

无状态自动配置流程

要通过路由器通告协议启用地址自动配置，请启用此配置选项：

- [CONFIG_LWIP_IPV6_AUTOCONFIG](#)

该配置选项启用了所有网络接口的 IPv6 自动配置。而在上游 lwIP 中，需要设置 `netif->ip6_autoconfig_enabled=1`，针对每个 netif 明确启用自动配置。

DHCPv6

lwIP 中的 DHCPv6 非常简单，仅支持无状态配置，可通过以下配置选项启用：

- [CONFIG_LWIP_IPV6_DHCP6](#)

由于 DHCPv6 仅在无状态配置下工作，因此还需要通过[CONFIG_LWIP_IPV6_AUTOCONFIG](#) 启用[无状态自动配置流程](#)。

此外，还需要使用以下语句，在应用程序代码中明确启用 DHCPv6：

```
dhcp6_enable_stateless(netif);
```

IPv6 自动配置中的 DNS 服务器

要自动配置 DNS 服务器，尤其是在仅使用 IPv6 的网络中配置，可使用以下两种选项：

- 递归域名系统 (DNS)，属于邻居发现协议 (NDP) 的一部分，可使用[无状态自动配置流程](#)。
DNS 服务器的数量必须设置为[CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS](#)，该选项默认禁用，即置位为 0。
- DHCPv6 无状态配置，使用[DHCPv6](#) 配置 DNS 服务器。注意，此配置假设 IPv6 路由通告标志 (RFC-5175) 进行了如下设置
 - 管理地址配置标志 (Managed Address Configuration Flag) = 0
 - 其他配置标志 (Other Configuration Flag) = 1

4.19.6 ESP-lwIP 自定义修改

补充内容

以下代码均为新增代码，尚未包含至上游 lwIP 版本：

线程安全的套接字 调用 `close()` 可以从不同于创建套接字的线程中关闭该套接字。该调用持续阻塞，直至其他任务中使用该套接字的函数调用返回。

然而，任务处于主动等待 `select()` 或 `poll()` API 的状态时，无法删除该任务。销毁任务前，这些 API 必须先退出，否则可能会破坏内部数据结构，并导致后续 lwIP 崩溃。这些 API 在栈上分配了全局引用的回调指针，因此，在未完全卸载栈的情况下删除任务时，lwIP 仍可以持有指向已删除栈的指针。

按需定时器 lwIP 中的 IGMP 和 MLD6 功能都会初始化一个定时器，以便在特定时间触发超时事件。

即便没有活动的超时事件，lwIP 也会默认始终启用这些定时器，增加自动 Light-sleep 模式下的 CPU 使用率和功耗。ESP-LWIP 则默认将各定时器设置为按需使用，即只有在有待处理事件时启用。

如果要返回默认 lwIP 设置，即始终启用定时器，请禁用 `CONFIG_LWIP_TIMERS_ONDEMAND`。

lwIP 定时器 API 不使用 Wi-Fi 时，可以通过 API 关闭 lwIP 定时器，减少功耗。

以下 API 函数均受支持，详情请参阅 `lwip/lwip/src/include/lwip/timeouts.h`。

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`

附加套接字选项

- 目前已实现部分标准 IPv4 和 IPv6 组播套接字选项，详情请参阅 [套接字选项](#)。
- 使用 `IPV6_V6ONLY` 套接字选项，可以设置仅使用 IPv6 的 UDP 和 TCP 套接字，而 lwIP 一般只支持 TCP 套接字。

IP 层特性

- IPv4 源地址基础路由实现不同
- 支持 IPv4 映射 IPv6 地址

NAPT 和端口转发 支持 IPv4 网络地址端口转换 (NAPT) 和端口转发。然而，仅限于单个接口启用 NAPT。

- 要在两个接口之间使用 NAPT 转发数据包，必须在连接到目标网络的接口上启用 NAPT。例如，为了通过 Wi-Fi 接口为以太网流量启用互联网访问，必须在以太网接口上启用 NAPT。
- NAPT 的使用示例可参考 [network/vlan_support](#)。

自定义 lwIP 钩子 原始 lwIP 支持通过 `LWIP_HOOK_FILENAME` 实现自定义的编译时修改。ESP-IDF 端口层已使用该文件，但仍支持通过由宏 `ESP_IDF_LWIP_HOOK_FILENAME` 定义的头文件，在 ESP-IDF 中包含并实现自定义添加。以下示例展示了向构建过程添加自定义钩子文件的过程，其中钩子文件名为 `my_hook.h`，位于项目的主文件夹中：

```
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_options(${lwip} PRIVATE "-I${PROJECT_DIR}/main")
target_compile_definitions(${lwip} PRIVATE "-DESP_IDF_LWIP_HOOK_FILENAME=\"my_hook.h\"")
```

使用 ESP-IDF 构建系统自定义 lwIP 选项 组件配置菜单可以配置常见的 lwIP 选项，但是一些自定义选项需要通过命令行添加。CMake 函数 `target_compile_definitions()` 可以用于定义宏，示例如下：

```
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_definitions(${lwip} PRIVATE "-DETHARP_SUPPORT_VLAN=1")
```

使用这种方法可能无法定义函数式宏。虽然 GCC 支持此类定义，但是未必所有编译器都会接受。为了解决这一限制，可以使用 `add_definitions()` 函数为整个项目定义宏，例如 `add_definitions("-DFALLBACK_DNS_SERVER_ADDRESS(addr)=\"IP_ADDR4((addr), 8, 8, 8, 8)\")`。

另一种方法是在头文件中定义函数式宏，该头文件将预先包含在 lwIP 钩子文件中，请参考[自定义 lwIP 钩子](#)。

限制

如[适配的 API](#)所述，ESP-IDF 中的 lwIP 扩展功能仍然受到全局 DNS 限制的影响。为了在应用程序代码中解决这一限制，可以使用 `FALLBACK_DNS_SERVER_ADDRESS()` 宏定义所有接口能够访问的全局 DNS 备用服务器，或者单独维护每个接口的 DNS 服务器，并在默认接口更改时重新配置。

在 UDP 套接字上重复调用 `send()` 或 `sendto()` 最终可能会导致错误。此时 `errno` 报错为 `ENOMEM`，错误原因是底层网络接口驱动程序中的 `buffer` 大小有限。当所有驱动程序的传输 `buffer` 已满时，UDP 传输事务失败。如果应用程序需要发送大量 UDP 数据报，且不希望发送方丢弃数据报，建议检查错误代码，采用短延迟的重传机制。

在 [Wi-Fi](#) 项目配置中适当增加传输 `buffer` 数量，或许可以缓解此情况。

4.19.7 性能优化

影响 TCP/IP 性能因素较多，可以从多方面进行优化。经调整，ESP-IDF 的默认设置已在 TCP/IP 的吞吐量、响应时间和内存使用间达到平衡。

最大吞吐量

乐鑫使用 `iperf` 测试应用程序 <https://iperf.fi/> 测试了 ESP-IDF 的 TCP/IP 吞吐量。关于实际测试和优化配置的更多信息，请参考[提高网络速度](#)。

重要： 建议逐步应用更改，并在每次更改后，通过特定应用程序的工作负载检查性能。

- 如果系统中有许多任务抢占 CPU 时间，可以考虑调整 lwIP 任务的 CPU 亲和性 (`CONFIG_LWIP_TCPIP_TASK_AFFINITY`)，并以固定优先级 (18, `ESP_TASK_TCPIP_PRIO`) 运行。为优化 CPU 使用，可以考虑将竞争任务分配给不同核心，或将其优先级调整至较低值。有关内置任务优先级的更多详情，请参阅[内置任务优先级](#)。
- 如果使用仅带有套接字参数的 `select()` 函数，禁用 `CONFIG_VFS_SUPPORT_SELECT` 可以更快地调用 `select()`。
- 如果有足够的空闲 IRAM，可以选择 `CONFIG_LWIP_IRAM_OPTIMIZATION` 和 `CONFIG_LWIP_EXTRA_IRAM_OPTIMIZATION`，提高 TX/RX 吞吐量。

如果使用 Wi-Fi 网络接口，请参阅[Wi-Fi 缓冲区使用情况](#)。

最低延迟

除增加 `buffer` 大小外，大多数增加吞吐量的设置会减少 lwIP 函数占用 CPU 的时间，进而降低延迟，缩短响应时间。

- 对于 TCP 套接字，lwIP 支持设置标准的 `TCP_NODELAY` 标记以禁用 Nagle 算法。

最小内存使用

由于 RAM 按需从堆中分配，多数 lwIP 的 RAM 使用也按需分配。因此，更改 lwIP 设置减少 RAM 使用时，或许不会改变空闲时的 RAM 使用量，但可以改变高峰期的 RAM 使用量。

- 减少 `CONFIG_LWIP_MAX_SOCKETS` 可以减少系统中的最大套接字数量。更改此设置，会让处于 `WAIT_CLOSE` 状态的 TCP 套接字在需要打开新套接字时更快地关闭和复用，进一步降低峰值 RAM 使用量。
- 减少 `CONFIG_LWIP_TCP_RECVMBOX_SIZE`、`CONFIG_LWIP_TCP_RECVMBOX_SIZE` 和 `CONFIG_LWIP_UDP_RECVMBOX_SIZE` 可以减少 RAM 使用量，但会影响吞吐量，具体取决于使用情况。
- 减少 `CONFIG_LWIP_TCP_ACCEPTMBOX_SIZE` 可以通过限制同时接受的连接数来减少 RAM 使用量。
- 减少 `CONFIG_LWIP_TCP_MSL` 和 `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT` 可以减少系统中的最大分段寿命，同时会使处于 `TIME_WAIT` 和 `FIN_WAIT_2` 状态的 TCP 套接字能更快地关闭和复用。
- 禁用 `CONFIG_LWIP_IPV6` 可以在系统启动时节省大约 39 KB 的固件大小和 2 KB 的 RAM，并在运行 TCP/IP 栈时节省 7 KB 的 RAM。如果无需支持 IPv6，可以禁用 IPv6，减少 flash 和 RAM 占用。
- 禁用 `CONFIG_LWIP_IPV4` 可以在系统启动时节省大约 26 KB 的固件大小和 600 B 的 RAM，并在运行 TCP/IP 栈时节省 6 KB 的 RAM。如果本地网络仅支持 IPv6 配置，可以禁用 IPv4，减少 flash 和 RAM 占用。

如果使用 Wi-Fi，请参阅 [Wi-Fi 缓冲区使用情况](#)。

最大 buffer 使用 lwIP 消耗的最大堆内存即 lwIP 驱动程序理论上可能消耗的最大内存，通常取决于以下因素：

- 创建 UDP 连接所需的内存： `lwip_udp_conn`
- 创建 TCP 连接所需的内存： `lwip_tcp_conn`
- 应用程序拥有的 UDP 连接数量： `lwip_udp_con_num`
- 应用程序拥有的 TCP 连接数量： `lwip_tcp_con_num`
- TCP 的 TX 窗口大小： `lwip_tcp_tx_win_size`
- TCP 的 RX 窗口大小： `lwip_tcp_rx_win_size`

因此，lwIP 消耗的最大堆内存可以用以下公式计算：
$$\text{lwip_dynamic_peek_memory} = (\text{lwip_udp_con_num} * \text{lwip_udp_conn}) + (\text{lwip_tcp_con_num} * (\text{lwip_tcp_tx_win_size} + \text{lwip_tcp_rx_win_size} + \text{lwip_tcp_conn}))$$

某些基于 TCP 的应用程序只需要一个 TCP 连接。然而，当出现错误（如发送失败）时，应用程序可能会关闭此 TCP 连接，并创建一个新的连接。根据 TCP 状态机和 RFC793，关闭 TCP 连接可能需要很长时间，这可能导致系统中同时存在多个 TCP 连接。

4.20 存储器类型

ESP32-S2 芯片具有不同类型的存储器和灵活的存储器映射特性，本小节将介绍 ESP-IDF 默认如何使用这些功能。

ESP-IDF 区分了指令总线（IRAM、IROM、RTC FAST memory）和数据总线（DRAM、DROM）。指令存储器是可执行的，只能通过 4 字节对齐字读取或写入。数据存储器不可执行，可以通过单独的字节操作访问。有关总线的更多信息，请参阅 [ESP32-S2 技术参考手册 > 系统和存储器 \[PDF\]](#)。

4.20.1 DRAM（数据 RAM）

非常量静态数据（.data 段）和零初始化数据（.bss 段）由链接器放入内部 SRAM 作为数据存储。此区域中的剩余空间可在程序运行时用作堆。

通过应用 `EXT_RAM_BSS_ATTR` 宏，零初始化数据也可以放入外部 RAM。使用这个宏需要启用 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`。详情请见 [允许 .bss 段放入片外存储器](#)。

备注：静态分配的 DRAM 的最大值也会因编译应用程序的 *IRAM（指令 RAM）* 大小而减小。运行时可用的堆内存会因应用程序的总静态 IROM 和 DRAM 使用而减少。

常量数据也可能被放入 DRAM，例如当它被用于 non-flash-safe ISR 时（具体请参考[如何将代码放入 IRAM](#)）。

”noinit” DRAM

可以将 `__NOINIT_ATTR` 宏用作属性，从而将数据放入 `.noinit` 部分。放入该部分的值在启动时不会被初始化，在软件重启后也会保持值不变。

示例：

```
__NOINIT_ATTR uint32_t noinit_data;
```

4.20.2 IRAM (指令 RAM)

ESP-IDF 将内部 SRAM 的部分区域分配为指令 RAM。可在 [ESP32-S2 技术参考手册 > 系统和存储器 > 内部存储器 \[PDF\]](#) 中查看 IRAM 区域的定义。该内存中第一个块（最多 32 KB）用于 MMU 缓存，其余部分用于存储需要从 RAM 运行的应用程序部分。

备注：内部 SRAM 中不用于指令 RAM 的部分都会作为 *DRAM (数据 RAM)* 供静态数据和动态分配（堆）使用。

何时需要将代码放入 IRAM

以下情况时应将部分应用程序放入 IRAM：

- 如果在注册中断处理程序时使用了 `ESP_INTR_FLAG_IRAM`，则中断处理程序必须要放入 IRAM。更多信息可参考[IRAM 安全中断处理程序](#)。
- 可将一些时序关键代码放入 IRAM，以减少从 flash 中加载代码造成的相关损失。ESP32-S2 通过 MMU 缓存从 flash 中读取代码和数据。在某些情况下，将函数放入 IRAM 可以减少由缓存未命中造成的延迟，从而显著提高函数的性能。

如何将代码放入 IRAM

借助链接器脚本，一些代码会被自动放入 IRAM 区域中。

如果需要将某些特定的应用程序代码放入 IRAM，可以使用[链接器脚本生成机制](#)功能并在组件中添加链接器脚本片段文件，在该片段文件中，可以给整个目标源文件或其中的个别函数打上 `noflash` 标签。更多信息可参考[链接器脚本生成机制](#)。

或者，也可以通过使用 `IRAM_ATTR` 宏在源代码中指定需要放入 IRAM 的代码：

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

放入 IRAM 后可能会导致 IRAM 安全中断处理程序出现问题：

- `IRAM_ATTR` 函数中的字符串或常量可能没有自动放入 RAM 中，这时可以使用 `DRAM_ATTR` 属性进行标记，或者也可以使用链接器脚本方法将它们自动放入 RAM 中。

```

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}

```

注意，具体哪些数据需要被标记为 `DRAM_ATTR` 可能很难确定。如果没有被标记为 `DRAM_ATTR`，某些变量或表达式有时会被编译器别为常量（即使它们没有被标记为 `const`）并将其放入 `flash` 中。

- GCC 的优化会自动生成跳转表或 `switch/case` 查找表，并将这些表放在 `flash` 中。IDF 默认在编译所有文件时使用 `-fno-jump-tables -fno-tree-switch-conversion` 标志来避免这种情况。

可以为不需要放置在 `IRAM` 中的单个源文件重新启用跳转表优化。关于如何在编译单个源文件时添加 `-fno-jump-tables -fno-tree-switch-conversion` 选项，请参考[组件编译控制](#)。

4.20.3 IROM (代码从 flash 中运行)

如果一个函数没有被显式地声明放在 `IRAM` 或者 `RTC` 存储器中，则它会放在 `flash` 中。由于 `IRAM` 空间有限，应用程序的大部分二进制代码都需要放入 `IROM` 中。

在启动过程中，从 `IRAM` 中运行的引导加载程序配置 MMU `flash` 缓存，将应用程序的指令代码区域映射到指令空间。通过 MMU 访问的 `flash` 使用一些内部 `SRAM` 进行缓存，访问缓存的 `flash` 数据与访问其他类型的内部存储器一样快。

4.20.4 DROM (数据存储在 flash 中)

默认情况下，链接器将常量数据放入一个映射到 MMU `flash` 缓存的区域中。这与 *IROM (代码从 flash 中运行)* 部分相同，但此处用于只读数据而不是可执行代码。

唯一没有默认放入 `DROM` 的常量数据是被编译器嵌入到应用程序代码中的字面常量。这些被放置在周围函数的可执行指令中。

`DRAM_ATTR` 属性可以用来强制将常量从 `DROM` 放入 *DRAM (数据 RAM)* 部分（见上文）。

4.20.5 RTC Slow memory (RTC 慢速存储器)

从 `RTC` 存储器运行的代码中使用的全局和静态变量必须放入 `RTC Slow memory` 中。例如 *深度睡眠* 变量可以放在 `RTC Slow memory` 中，而不是 `RTC FAST memory`，或者也可以放入由 *ULP 协处理器编程* 访问的代码和变量。

`RTC_NOINIT_ATTR` 属性宏可以用来将数据放入 `RTC Slow memory`。放入此类型存储器的值从深度睡眠模式中醒来后会保持值不变。

示例:

```
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

4.20.6 RTC FAST memory (RTC 快速存储器)

`RTC FAST memory` 的同一区域既可以作为指令存储器也可以作为数据存储器进行访问。从深度睡眠模式唤醒后必须要运行的代码要放在 `RTC` 存储器中，更多信息请查阅文档 *深度睡眠*。

除非禁用 `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` 选项，否则剩余的 `RTC FAST memory` 会被添加到堆中。该部分内存可以和 *DRAM (数据 RAM)* 互换使用，但是访问速度稍慢一点。

4.20.7 具备 DMA 功能

大多数的 DMA 控制器（比如 SPI、sdmmc 等）都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量而不是堆栈中。使用 DMA_ATTR 宏可以声明该全局/本地的静态变量具备 DMA 功能，例如：

```
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

或者：

```
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

也可以通过使用 `MALLOC_CAP_DMA` 标志来动态分配具备 DMA 能力的内存缓冲区。

4.20.8 在堆栈中放置 DMA 缓冲区

可以在堆栈中放置 DMA 缓冲区，但建议尽量避免。如果实在有需要的话，请注意以下几点：

- 如果堆栈在 PSRAM 中，则不建议将 DRAM 缓冲区放在堆栈上。如果任务堆栈在 PSRAM 中，则必须执行片外 RAM 中描述的几个步骤。
- 在函数中使用 `WORD_ALIGNED_ATTR` 宏来修饰变量，将其放在适当的位置上，比如：

```
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something"; //否则_
    ↪buffer 会被存储在 stuff 变量后面
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

4.21 OpenThread

OpenThread 是在 802.15.4 MAC 层上运行的 IP 协议栈，支持 mesh 网络，具有低功耗特性。

4.21.1 OpenThread 协议栈运行模式

在乐鑫的芯片上，OpenThread 可按以下模式运行：

独立节点模式

在此模式下，完整的 OpenThread 协议栈及其应用层在同一芯片上运行，适用于支持 15.4 无线通信协议的芯片，如 ESP32-H2, ESP32-C6。

无线协处理器 (RCP) 模式

在此模式下，芯片通过连接到运行 OpenThread IP 协议栈的另一个主机，代表主机发送和接收 15.4 数据包。该模式适用于支持 15.4 无线通信协议的芯片，如 ESP32-H2, ESP32-C6。对于芯片和主机之间的通信方式，目前 ESP-IDF 支持 SPI 或 UART。考虑到传输延迟，建议使用 SPI。

OpenThread 主机模式

在此模式下，不支持 15.4 无线通信协议的芯片可以连接到 RCP，并在主机模式下运行 OpenThread。这种模式支持在 Wi-Fi 芯片上（如 ESP32、ESP32-S2、ESP32-S3 和 ESP32-C3 等）运行 OpenThread。下图展示了设备在不同模式下的工作方式：

图 43: OpenThread 设备模式

4.21.2 编写 OpenThread 应用程序

要学习编写 OpenThread 应用程序，可以从 OpenThread 应用示例 [openthread/ot_cli](#) 开始。该示例中展示了简单的 OpenThread 网络组网流程，以及在 OpenThread 网络上，如何实现基于套接字的服务器和客户端之间的简单通信。

初始化 OpenThread 协议栈所需的准备

- s1.1: 主任务调用 `esp_vfs_eventfd_register()`, 初始化 eventfd 虚拟文件系统。eventfd 文件系统用于实现 OpenThread 协议栈中的任务通知。
- s1.2: 主任务调用 `nvs_flash_init()` 初始化 NVS, 即 Thread 网络数据的存储位置。
- s1.3: **可选**。主任务调用 `esp_netif_init()`, 为 Thread 创建网络接口。
- s1.4: 主任务调用 `esp_event_loop_create()` 创建系统事件任务, 并初始化应用程序事件的回调函数。

OpenThread 协议栈初始化

- s2.1: 调用 `esp_openthread_init()` 初始化 OpenThread 协议栈。

OpenThread 网络接口初始化

以下为 **可选**步骤, 仅在应用程序需为 Thread 创建网络接口时使用。

- s3.1: 使用 `ESP_NETIF_DEFAULT_OPENTHREAD` 调用 `esp_netif_new()`, 创建网络接口。
- s3.2: 调用 `esp_openthread_netif_glue_init()`, 创建 OpenThread 网络接口处理程序。
- s3.3: 调用 `esp_netif_attach()` 将处理程序附加到网络接口。

OpenThread 主循环

- s4.3: 调用 `esp_openthread_launch_mainloop()` 启动 OpenThread 主循环。注意, OpenThread 主循环属于忙等循环, 仅在 OpenThread 协议栈终止后返回。

调用 OpenThread API

OpenThread API 非线程安全。当从其他任务中调用 OpenThread API 时, 请确保以 `esp_openthread_lock_acquire()` 获取锁, 并在之后以 `esp_openthread_lock_release()` 释放锁。

卸载 OpenThread 协议栈

要在应用程序中卸载 OpenThread 协议栈, 请遵循以下步骤:

- 如果创建了 OpenThread 网络接口, 请调用 `esp_netif_destroy()` 和 `esp_openthread_netif_glue_deinit()` 卸载 OpenThread 协议栈。
- 调用 `esp_openthread_deinit()` 卸载 OpenThread 协议栈。

4.21.3 OpenThread 边界路由器

OpenThread 边界路由器连接了 Thread 网络和其他 IP 网络, 提供 IPv6 连通性、服务注册和委托功能。

要在 ESP 芯片上启用 OpenThread 边界路由器, 需要将 RCP 连接到具备 Wi-Fi 功能的芯片上, 如 ESP32。

在初始化过程中, 调用 `esp_openthread_border_router_init()` 会启用所有边界路由功能。

要了解更多有关边界路由器的详细信息, 请参阅 `openthread/ot_br` 示例和其中的 README 文件。

4.22 分区表

4.22.1 概述

每片 ESP32-S2 的 flash 可以包含多个应用程序，以及多种不同类型的数据（例如校准数据、文件系统数据、参数存储数据等）。因此，我们在 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0xC00 字节，最多可以保存 95 条分区表条目。MD5 校验和附加在分区表之后，用于在运行时验证分区表的完整性。分区表占据了整个 flash 扇区，大小为 0x1000 (4 KB)。因此，它后面的任何分区至少需要位于 (默认偏移地址) + 0x1000 处。

分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app、data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单 (idf.py menuconfig) ，并在 `CONFIG_PARTITION_TABLE_TYPE` 下选择一个预定义的分区表：

- "Single factory app, no OTA"
- "Factory app, two OTA definitions"

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 `idf.py partition-table` ，即可以打印当前使用分区表的信息摘要。

4.22.2 内置分区表

以下是 "Single factory app, no OTA" 选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为 "factory" 的二进制应用程序，且启动加载器将默认加载这个应用程序。
- 分区表中还定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是 "Factory app, two OTA definitions" 选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为 "app"，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序 (factory)，其余两个为 OTA 应用程序 (ota_0, ota_1)。
- 新增了一个名为 "otadata" 的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果 "otadata" 分区为空，则会执行出厂程序。

4.22.3 创建自定义分区表

如果在 menuconfig 中选择了 "Custom partition table CSV"，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是在 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件：

| # | Name, | Type, | SubType, | Offset, | Size, | Flags |
|---|-----------|-------|-----------|----------|--------|-------|
| | nvs, | data, | nvs, | 0x9000, | 0x4000 | |
| | otadata, | data, | ota, | 0xd000, | 0x2000 | |
| | phy_init, | data, | phy, | 0xf000, | 0x1000 | |
| | factory, | app, | factory, | 0x10000, | 1M | |
| | ota_0, | app, | ota_0, | , | 1M | |
| | ota_1, | app, | ota_1, | , | 1M | |
| | nvs_key, | data, | nvs_keys, | , | 0x1000 | |

- 字段之间的空格会被忽略，任何以 # 开头的行（注释）也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 Offset 字段可以为空，gen_esp32part.py 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字节，其中包括一个空字节（之后的内容将被截断）。该字段对 ESP32-S2 并不是特别重要。

Type 字段

Type 字段可以指定为 app (0x00) 或者 data (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE）。注意，0x00-0x3F 不得使用（预留给 esp-idf 的核心功能）。

如果你的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考 [esp_partition_type_t](#) 关于 app 和 data 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分区类型，需要在 [esp_partition_type_t](#) 中使用整数，从而与分区 API 一起使用。例如：

```
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

注意，启动加载器将忽略 app (0x00) 和 data (0x01) 以外的其他分区类型。

SubType 字段

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，esp-idf 仅仅规定了“app”和“data”两种分区类型的子类型含义。

参考 [esp_partition_subtype_t](#)，以了解 ESP-IDF 定义的全部子类型列表，包括：

- 当 Type 定义为 app 时，SubType 字段可以指定为 factory (0x00)、ota_0 (0x10) … ota_15 (0x1F) 或者 test (0x20)。
 - factory (0x00) 是默认的 app 分区。启动加载器将默认加载该应用程序。但如果存在类型为 data/ota 分区，则启动加载器将加载 data/ota 分区中的数据，进而判断启动哪个 OTA 镜像文件。
 - * OTA 升级永远都不会更新 factory 分区中的内容。
 - * 如果你希望在 OTA 项目中预留更多 flash，可以删除 factory 分区，转而使用 ota_0 分区。
 - ota_0 (0x10) … ota_15 (0x1F) 为 OTA 应用程序分区，启动加载器将根据 OTA 数据分区中的数据来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序应至少拥有 2 个 OTA 应用程序分区 (ota_0 和 ota_1)。更多详细信息，请参考 [OTA 文档](#)。
 - test (0x20) 为预留的子类型，用于工厂测试流程。如果没有其他有效 app 分区，test 将作为备选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。详细信息请查阅 [从测试固件启动](#)。
- 当 Type 定义为 data 时，SubType 字段可以指定为 ota (0x00)、phy (0x01)、nvs (0x02)、nvs_keys (0x04) 或者其他组件特定的子类型（请参考 [子类型枚举](#)）。

- ota (0) 即 *OTA 数据分区*，用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000。更多详细信息，请参考 *OTA 文档*。
- phy (1) 分区用于存放 PHY 初始化数据，从而保证可以为每个设备单独配置 PHY，而非必须采用固件中的统一 PHY 初始化数据。
 - * 默认配置下，phy 分区并不启用，而是直接将 phy 初始化数据编译至应用程序中，从而节省分区表空间（直接将此分区删掉）。
 - * 如果需要从此分区加载 phy 初始化数据，请打开项目配置菜单 (idf.py menuconfig)，并且使能 *CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION* 选项。此时，还需要手动将 phy 初始化数据烧至设备 flash (esp-idf 编译系统并不会自动完成该操作)。
- nvs (2) 是专门给 *非易失性存储 (NVS) API* 使用的分区。
 - * 用于存储每台设备的 PHY 校准数据（注意，并不是 PHY 初始化数据）。
 - * 用于存储 Wi-Fi 数据（如果使用了 *esp_wifi_set_storage(WIFI_STORAGE_FLASH)* 初始化函数）。
 - * NVS API 还可以用于其他应用程序数据。
 - * 强烈建议为 NVS 分区分配至少 0x3000 字节空间。
 - * 如果使用 NVS API 存储大量数据，请增加 NVS 分区的大小（默认是 0x6000 字节）。
- nvs_keys (4) 是 NVS 密钥分区。详细信息，请参考 *非易失性存储 (NVS) API* 文档。
 - * 用于存储加密密钥（如果启用了 NVS 加密功能）。
 - * 此分区应至少设定为 4096 字节。
- ESP-IDF 还支持其他用于数据存储的预定义子类型，包括：
 - * coredump (0x03) 用于在使用自定义分区表 CSV 文件时存储核心转储，详情请参阅 *核心转储*。
 - * efuse (0x05) 使用 *虚拟 eFuse* 模拟 eFuse 位。
 - * undefined (0x06) 隐式用于未指定子类型（即子类型为 空）的数据分区，但也可显式将其标记为未定义。
 - * fat (0x81) 用于 *FAT 文件系统*。
 - * spiffs (0x82) 用于 *SPIFFS 文件系统*。
 - * littlefs (0x83) 用于 *LittleFS 文件系统*，详情可参阅 *storage/littlefs* 示例。
- 如果分区类型是由应用程序定义的任意值 (0x40-0xFE)，那么 subtype 字段可以是由应用程序选择的任何值 (0x00-0xFE)。

请注意，如果用 C++ 编写，应用程序定义的子类型值需要转换为 *esp_partition_type_t*，从而与 *分区 API* 一起使用。

额外分区 SubType 字段

组件可以通过设置 EXTRA_PARTITION_SUBTYPES 属性来定义额外的分区子类型。EXTRA_PARTITION_SUBTYPES 是一个 CMake 列表，其中的每个条目由字符串组成，以逗号为分隔，格式为 <type>, <subtype>, <value>。构建系统通过该属性会自动添加额外的子类型，并在 *esp_partition_subtype_t* 中插入名为 ESP_PARTITION_SUBTYPE_<type>_<subtype> 的字段。项目可以使用这个子类型来定义分区表 CSV 文件中的分区，并使用 *esp_partition_subtype_t* 中的新字段。

偏移地址 (Offset) 和大小 (Size) 字段

- 偏移地址表示 SPI flash 中的分区地址，扇区大小为 0x1000 (4 KB)。因此，偏移地址必须是 4 KB 的倍数。
- 若 CSV 文件中的分区偏移地址为空，则该分区会接在前一个分区之后；若为首个分区，则将接在分区表之后。
- app 分区的偏移地址必须与 0x10000 (64 KB) 对齐。如果偏移字段留空，则 gen_esp32part.py 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64 KB) 对齐，则该工具会报错。
- app 分区的大小必须与 flash 扇区大小对齐。为 app 分区指定未对齐的大小将返回错误。
- app 分区的大小和偏移地址可以采用十进制数或是以 0x 为前缀的十六进制数，且支持 K 或 M 的倍数单位（K 和 M 分别代表 1024 和 1024*1024 字节）。

如果你希望允许分区表中的分区采用任意起始偏移量 (`CONFIG_PARTITION_TABLE_OFFSET`)，请将分区表 (CSV 文件) 中所有分区的偏移字段都留空。注意，此时，如果你更改了分区表中任意分区的偏移地址，则其他分区的偏移地址也会跟着改变。这种情况下，如果你之前还曾设定某个分区采用固定偏移地址，则可能造成分区表冲突，从而导致报错。

Flags 字段

目前支持 `encrypted` 和 `readonly` 标记：

- 如果 Flags 字段设置为 `encrypted`，且已启用 [flash 加密](#) 功能，则该分区将会被加密。

备注： 无论是否设置 Flags 字段，app 分区都将保持加密。

- 如果 Flags 字段设置为 `readonly`，则该分区为只读分区。`readonly` 标记仅支持除 `ota` 和 `coredump` 子类型外的 `data` 分区。使用该标记，防止意外写入如出厂数据分区等包含关键设备特定配置数据的分区。

备注： 在任何写入模式下 (`w`、`w+`、`a`、`a+`、`r+`)，尝试通过 C 文件 I/O API 打开文件 (`fopen`) 的操作都将失败并返回 `NULL`。除 `O_RDONLY` 外，`open` 与任何标志一同使用都将失败并返回 `-1`，全局变量 `errno` 也将设置为 `EROFS`。上述情况同样适用于通过其他 POSIX 系统调用函数执行写入或擦除的操作。在只读分区上，以读写模式打开 NVS 的句柄将失败并返回 `ESP_ERR_NOT_ALLOWED` 错误代码，使用 `esp_partition` 或 `spi_flash` 等较低级别的 API 进行写入操作也将返回 `ESP_ERR_NOT_ALLOWED` 错误代码。

可以使用冒号连接不同的标记，来同时指定多个标记，如 `encrypted:readonly`。

4.22.4 生成二进制分区表

烧写到 ESP32-S2 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，[partition_table/gen_esp32part.py](#) 工具可以实现 CSV 和二进制文件之间的转换。

如果你在项目配置菜单 (`idf.py menuconfig`) 中设置了分区表 CSV 文件的名称，然后构建项目或执行 `idf.py partition-table`。这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件：

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件：

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

在标准输出 (`stdout`) 上，打印二进制分区表的内容（运行 `idf.py partition-table` 时展示的信息摘要也是这样生成的）：

```
python gen_esp32part.py binary_partitions.bin
```

4.22.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查：

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考 [引导加载程序大小](#)。

- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

备注：即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

MD5 校验和

二进制格式的分区表中含有一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 `gen_esp32part.py` 的 `--disable-md5sum` 选项或者 `CONFIG_PARTITION_TABLE_MD5` 选项关闭 MD5 校验。

4.2.2.6 烧写分区表

- `idf.py partition-table-flash`：使用 `esptool.py` 工具烧写分区表。
- `idf.py flash`：会烧写所有内容，包括分区表。

在执行 `idf.py partition-table` 命令时，手动烧写分区表的命令也将打印在终端上。

备注：分区表的更新并不会擦除根据旧分区表存储的数据。此时，可以使用 `idf.py erase-flash` 命令或者 `esptool.py erase_flash` 命令来擦除 flash 中的所有内容。

4.2.2.7 分区工具 (`parttool.py`)

`partition_table` 组件中有分区工具 `parttool.py`，可以在目标设备上完成分区相关操作。该工具有如下用途：

- 读取分区，将内容存储到文件中 (`read_partition`)
- 将文件中的内容写至分区 (`write_partition`)
- 擦除分区 (`erase_partition`)
- 检索特定分区的名称、偏移、大小和 flag（“加密”）标志等信息 (`get_partition_info`)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API

首先请确保已导入 `parttool` 模块。

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table") # parttool.
↳py 位于 $IDF_PATH/components/partition_table 下

sys.path.append(parttool_dir) # 使能 Python 寻找 parttool 模块
from parttool import * # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 `ParttoolTarget`：

```
# 创建 parttool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 *ParttoolTarget* 在目标设备上完成操作：

```
# 擦除名为 'storage' 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存至文件 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 'factory.bin' 文件的内容写至 'factory' 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 *PartitionName*、*PartitionType* 或 *PARTITION_BOOT_DEFAULT* 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。

命令行界面

parttool.py 的命令行界面具有如下结构：

```
parttool.py [command-args] [subcommand] [subcommand-args]
```

- command-args - 执行主命令 (*parttool.py*) 所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数

```
# 擦除名为 'storage' 的分区
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存到 'spiffs.bin' 文件
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
↳subtype=spiffs --output "spiffs.bin"

# 将 'factory.bin' 文件中的内容写入到 'factory' 分区
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
↳"factory.bin"

# 打印默认启动分区的大小
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --
↳info size
```

更多信息可用 *--help* 指令查看：

```
# 显示可用的子命令和主命令描述
parttool.py --help

# 显示子命令的描述
parttool.py [subcommand] --help
```

4.23 性能

ESP-IDF 预设了默认设置，旨在性能、资源使用和可用功能之间进行权衡。

本指南详述了如何优化固件应用程序，以提高特定方面的性能。这一过程通常涉及到性能之间的权衡，例如限制部分可用功能，或者牺牲某性能以满足另一性能的要求，例如通过使用更多内存换取更快的运行速度。

4.23.1 如何优化性能

1. 确定应用程序的关键性能要求，例如控制某个网络操作的响应时间、控制启动时间、或在某个外设中实现特定的数据吞吐量。
2. 确定衡量该性能的方法（下文指南中概述了一些方法）。
3. 修改代码和项目配置，比较新旧测量结果。
4. 重复第三步，直到性能达到第一步中设定的要求为止。

4.23.2 指南

速度优化

概述 提高代码执行速度是提升软件性能的关键要素，该优化也可能带来其他积极影响，比如降低总体功耗。然而，提高代码执行速度可能会牺牲其他性能，如[最小化二进制文件大小](#)。

决定优化目标 如果应用程序固件中的某个函数仅每周在后台执行一次，其执行时间是 10 ms 还是 100 ms 对整体性能的影响或可忽略不计。但如果某个函数以 10 Hz 的频率持续执行，其执行时间是 10 ms 还是 100 ms 就会对系统性能产生显著影响。

大多数应用程序固件中，只有一小部分函数需要优化性能，例如频繁执行的函数，或者必须满足应用程序对延迟或吞吐量的要求的函数。应针对这些特定函数优化其执行速度。

测量性能 想要提升某方面性能，首先要对其进行测量。

基本性能测量方法 可以直接测量与外部交互的性能，例如，测量一般网络性能可以参考 [wifi/iperf](#) 和 [ethernet/iperf](#)，或者使用示波器或逻辑分析仪来测量与设备外设的交互时间。

此外，另一种测量性能的方法是在代码中添加计时测量：

```
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();

    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // 需要测量的代码
    }

    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %llu milliseconds (%llu microseconds per_
↪invocation)\n",
           MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

通过多次执行目标代码可以降低其他因素的影响，例如实时操作系统 (RTOS) 的上下文切换、测量的开销等。

- 使用 `esp_timer_get_time()` 可以生成微秒级精度的“墙钟”时间戳，但每次调用计时函数都会产生适量开销。
- 也可以使用标准 Unix 函数 `gettimeofday()` 和 `utime()` 来进行计时测量，尽管其开销略高一些。
- 此外，代码中包含 `hal/cpu_hal.h` 头文件，并调用 HAL 函数 `cpu_hal_get_cycle_count()` 可以返回已执行的 CPU 循环数。该函数开销较低，适用于高精度测量执行时间极短的代码。
- 在执行“微基准测试”时（即仅对运行时间不到 1-2 ms 的小代码段进行基准测试），二进制文件会影响 flash 缓存的性能，进而可能会导致计时测量出现较大差异。这是因为二进制布局可能会导致在特定的执行顺序中产生不同模式的缓存缺失。执行较大测试代码通常可以抵消这种影响。在基准测试时多次执行一个小函数可以减少 flash 缓存缺失的影响。另外，将该代码移到 IRAM 中（参见[针对性优化](#)）也可以解决这个问题。

外部跟踪 [应用层跟踪库](#) 可以在几乎不影响代码执行的情况下测量其执行速度。

任务 如果启用了选项 `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`，则可以使用 FreeRTOS API `vTaskGetRunTimeStats()` 来获取各个 FreeRTOS 任务运行时占用处理器的时间。

[SEGGER SystemView](#) 是一款出色的工具，可将任务执行情况可视化，也可用于排查系统整体的性能问题或改进方向。

提高整体速度 以下优化措施将提高几乎所有代码的执行效果，包括启动时间、吞吐量、延迟等：

- 设置 `CONFIG_ESPTOOLPY_FLASHMODE` 为 QIO 或 QOUT 模式（四线 I/O 模式）。相较于默认的 DIO 模式，在这两种模式下，从 flash 加载或执行代码的速度几乎翻倍。如果两种模式都支持，QIO 会稍微快于 QOUT。请注意，flash 芯片以及 ESP32-S2 与 flash 芯片之间的电气连接都必须支持四线 I/O 模式，否则 SoC 将无法正常工作。
- 设置 `CONFIG_COMPILER_OPTIMIZATION` 为 Optimize for performance (-O2)。相较于默认设置，这可能会略微增加二进制文件大小，但几乎必然会提高某些代码的性能。请注意，如果代码包含 C 或 C++ 的未定义行为，提高编译器优化级别可能会暴露出原本未发现的错误。
- 避免使用浮点运算 `float`。ESP32-S2 通过软件模拟进行浮点运算，因此速度非常慢。可以考虑使用不同的整数表示方法进行运算，如定点表示法，或者将部分计算用整数运算后再切换为浮点运算。
- 避免使用双精度浮点运算 `double`。ESP32-S2 通过软件模拟进行双精度浮点运算，因此速度非常慢。可以考虑使用基于整数的表示方法或单精度浮点数。

更改 cache 大小 在 ESP32-S2 上，通过下面列出的 Kconfig 选项增加 cache 的大小，“cache 缺失”的频率可能会降低，从而在一定程度上提高整体速度。

- `CONFIG_ESP32S2_INSTRUCTION_CACHE_SIZE`.
- `CONFIG_ESP32S2_DATA_CACHE_SIZE`.

备注：增加 cache 大小也将导致可用 RAM 的减少。

减少日志开销 尽管标准输出会先存储在缓冲区中，但缓冲区缺少可用空间时，应用程序将数据输出到日志的速度可能会受限。这点在程序启动并输出大量日志时尤为明显，但也可能随时发生。为解决这一问题，可以采取以下几种方法：

- 通过调低应用日志默认等级 `CONFIG_LOG_DEFAULT_LEVEL`（引导加载程序日志等级的相应配置为 `CONFIG_BOOTLOADER_LOG_LEVEL`）来减少日志输出量。这样做不仅可以减小二进制文件大小，还可以节省一些 CPU 用于格式化字符串的时间。

- 增加 `CONFIG_ESP_CONSOLE_UART_BAUDRATE`，可以提高日志输出速度。如果使用内置 USB-CDC 作为串口控制台，那么串口传输速率不会受配置的波特率影响。

不建议的选项 以下选项也可以提高执行速度，但不建议使用，因为它们会降低固件应用程序的可调试性，并可能导致出现更严重的 bug。

- 禁用 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`。这也会略微减小固件二进制文件大小。然而，它可能导致出现更严重的 bug，甚至出现安全性 bug。如果为了优化特定函数而必须禁用该选项，可以考虑在该源文件的顶部单独添加 `#define NDEBUG`。

针对性优化 以下更改将提高固件应用程序特定部分的速度：

- 将频繁执行的代码移至 IRAM。应用程序中的所有代码都默认从 flash 中执行。这意味着缓存缺失时，CPU 需要等待从 flash 加载后续指令。如果将函数复制到 IRAM 中，则仅需要在启动时加载一次，然后始终以全速执行。IRAM 资源有限，使用更多的 IRAM 可能会减少可用的 DRAM。因此，将代码移动到 IRAM 需要有所取舍。更多信息参见 [IRAM \(指令 RAM\)](#)。
- 针对不需要放置在 IRAM 中的单个源文件，可以重新启用跳转表优化。这将提高大型 switch cases 代码中的热路径性能。关于如何在编译单个源文件时添加 `-fjump-tables -ftree-switch-conversion` 选项，参见 [组件编译控制](#)。

减少启动时间 除了上述提高整体性能的方法外，还可以微调以下选项来专门减少启动时间：

- 最小化 `CONFIG_LOG_DEFAULT_LEVEL` 和 `CONFIG_BOOTLOADER_LOG_LEVEL` 可以大幅减少启动时间。如要在应用程序启动后获取更多日志，可以设置 `CONFIG_LOG_MAXIMUM_LEVEL`，然后调用 `esp_log_level_set()` 来恢复更高级别的日志输出。示例 [system/startup_time](#) 的主函数展示了如何实现这一点。
- 如果使用 Deep-sleep 模式，启用 `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` 可以加快从睡眠中唤醒的速度。请注意，启用该选项后在唤醒时将不会执行安全启动验证，需要考量安全风险。
- 设置 `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON` 可以在每次上电复位启动时跳过二进制文件验证，节省的时间取决于二进制文件大小和 flash 设置。请注意，如果 flash 意外损坏，此设置将有一定风险。更多关于使用该选项的解释和建议，参见 [项目配置](#)。
- 禁用 RTC 慢速时钟校准可以节省一小部分启动时间。设置 `CONFIG_RTC_CLK_CAL_CYCLES` 为 0 可以实现该操作。设置后，以 RTC 慢速时钟为时钟源的固件部分精确度将降低。
- 使用外部内存（启用 `CONFIG_SPIRAM`）时，启用外部内存 (`CONFIG_SPIRAM_MEMTEST`) 测试可能会大大增加启动时间（每测试 4 MB 的内存大约增加 1 秒）。禁用内存测试将减少启动时间，但将无法对外部存储器进行测试。
- 使用外部内存（启用 `CONFIG_SPIRAM`）时，所有用作堆的内存（包括外部内存）都将被设为默认值，所以启用全面的 poisoning 将增加启动时间（每设置 4 MiB 的内存大约增加 300 毫秒）。

示例项目 [system/startup_time](#) 预配了优化启动时间的设置，文件 [system/startup_time/sdkconfig.defaults](#) 包含了所有相关设置。可以将这些设置追加到项目中 `sdkconfig` 文件的末尾并合并，但请事先阅读每个设置的相关说明。

任务优先级 ESP-IDF FreeRTOS 是实时操作系统，因此需确保高吞吐量或低延迟的任务获得更高优先级，以便立即运行。调用 `xTaskCreate()` 或 `xTaskCreatePinnedToCore()` 会设定优先级，并且可以在运行时调用 `vTaskPrioritySet()` 进行更改。

此外，还需确保任务适时释放 CPU（通过调用 `vTaskDelay()` 或 `sleep()`，或在信号量、队列、任务通知等方面进行阻塞），以避免低优先级任务饥饿并造成系统性问题。[任务看门狗定时器 \(TWDT\)](#) 提供任务饥饿自动检测机制，但请注意，正确的固件操作有时需要长时间运算，因此任务看门狗定时器超时并不总意味着存在问题。在这些情况下，可能需要微调超时时限，甚至禁用任务看门狗定时器。

内置任务优先级 ESP-IDF 启动的系统任务预设了固定优先级。启动时，一些任务会自动启动，而另一些仅在应用程序固件初始化特定功能时启动。为优化性能，请合理设置应用程序任务优先级，以确保它们不会被系统任务阻塞，同时需确保系统任务不会饥饿进而影响其他系统功能。

为此，可能需要分解特定任务。例如，可以在高优先级任务或中断处理程序中执行实时操作，并在较低优先级任务中处理非实时操作。

头文件 `components/esp_system/include/esp_task.h` 包含了用于设置 ESP-IDF 内置任务系统优先级的宏定义。更多系统任务详情，参见 [后台任务](#)。

常见优先级包括：

- [运行主任务](#) 中执行 `app_main` 函数的主任务优先级最低 (1)。
- 系统任务 [ESP 定时器](#) 用于管理定时器事件并执行回调函数，优先级较高 (22, `ESP_TASK_TIMER_PRIO`)。
- FreeRTOS 初始化调度器时会创建定时器任务，用于处理 FreeRTOS 定时器的回调函数，优先级最低 (1, [可配置](#))。
- 系统任务 [事件循环库](#) 用于管理默认的系统事件循环并执行回调函数，优先级较高 (20, `ESP_TASK_EVENT_PRIO`)。仅在应用程序调用 `esp_event_loop_create_default()` 时使用此配置。可以调用 `esp_event_loop_create()` 添加自定义任务配置。
- [lwIP TCP/IP](#) 任务优先级较高 (18, `ESP_TASK_TCPIP_PRIO`)。
- [Wi-Fi 驱动程序](#) 任务优先级较高 (23)。
- 使用 Wi-Fi Protected Setup (WPS)、WPA2 EAP-TLS、Device Provisioning Protocol (DPP) 或 BSS Transition Management (BTM) 等功能时，Wi-Fi `wpa_supplicant` 组件可能会创建优先级较低的专用任务 (2)。
- 以太网驱动程序会创建一个 MAC 任务，用于接收以太网帧。如果使用默认配置 `ETH_MAC_DEFAULT_CONFIG`，则该任务为中高优先级 (15)。可以在以太网 MAC 初始化时输入自定义 `eth_mac_config_t` 结构体来更改此设置。
- 如果使用 [ESP-MQTT](#) 组件，它会创建优先级默认为 5 的任务 ([可配置](#))，可通过 [CONFIG_MQTT_USE_CUSTOM_CONFIG](#) 调整，也可以在运行时通过 `esp_mqtt_client_config_t` 结构体中的 `task_prio` 字段调整。
- 关于 mDNS 服务的任务优先级，参见 [性能优化](#)。

设定应用程序任务优先级 一般情况下，不建议将任务优先级设置得比内置的 Wi-Fi 操作更高，因为这样可能会使 CPU 被长时间占用，导致系统不稳定。

对于非常短、对时序要求严格且不涉及网络的操作，可以使用中断服务程序或是限制运行时间的最高优先级 (24) 任务。

将特定任务优先级设为 19，则较低层级的 Wi-Fi 功能可以无延迟运行，且仍然会抢占 [lwIP TCP/IP](#) 堆栈以及其他非实时内部功能，这对于不执行网络操作的实时任务而言是最佳选项。

[lwIP TCP/IP](#) 任务优先级 (18) 应高于所有执行 TCP/IP 网络操作的任务，从而避免优先级反转的问题。

默认配置下，除了个别例外，尤其是 [lwIP TCP/IP](#) 任务，大多数内置任务都固定在核 0 上执行。因此，应用程序可以方便地将高优先级任务放置在核 1 上执行。优先级大于等于 19 的应用程序任务在核 1 上运行时可以确保不会被任何内置任务抢占。为了进一步隔离各个 CPU 上运行的任务，配置 [lwIP 任务](#)，可以使 [lwIP](#) 任务仅在核 0 上运行，而非其他内核，这可能会根据其他任务的运行情况减少总 TCP/IP 吞吐量。

一般情况下，不建议将核 0 上的任务优先级设置得比内置的 Wi-Fi 操作更高，因为这样可能会使 CPU 被长时间占用，导致系统不稳定。选择优先级为 19 并在核 0 上运行可以使底层 Wi-Fi 功能运行无延迟，但仍会抢占 [lwIP TCP/IP](#) 栈和其他不太关键的内部功能。这对于无需执行网络操作且时序要求高的任务来说是一个选择。执行 TCP/IP 网络操作的任何任务都应该以低于 [lwIP TCP/IP](#) 任务 (18) 的优先级运行，以避免优先级反转问题。

备注： 如果要想特定任务始终先于 ESP-IDF 内置任务运行，并不需要将其固定在核 1 上。将该任务优先级设置为小于等于 17，则无需与内核绑定，那么核 0 上没有执行较高优先级的内置任务时，该任务也可以选择核 0 上执行。使用未固定的任务可以提高整体 CPU 利用率，但这会增加任务调度的复杂性。

备注：对内置 SPI flash 芯片进行写入操作时，任务会完全暂停执行。只有 *IRAM 安全中断处理程序* 会继续执行。

提高中断性能 ESP-IDF 支持动态 *中断分配* 和中断抢占。系统中每个中断都有相应优先级，较高优先级的中断将优先执行。

只要其他任务不在临界区内，中断处理程序将优先于所有其他任务执行。因此，尽量减少中断处理程序的执行时间十分重要。

要以最佳性能执行特定中断处理程序，可以考虑：

- 调用 `esp_intr_alloc()` 时使用 `ESP_INTR_FLAG_LEVEL2` 或 `ESP_INTR_FLAG_LEVEL3` 等标志，可以为更重要的中断设定更高优先级。
- 如果确定整个中断处理程序可以在 *IRAM* 中运行（参见 *IRAM 安全中断处理程序*），那么在调用 `esp_intr_alloc()` 分配中断时，请设置 `ESP_INTR_FLAG_IRAM` 标志，这样可以防止在应用程序固件写入内置 SPI flash 时临时禁用中断。
- 即使是非 *IRAM* 安全的中断处理程序，如果需要频繁执行，可以考虑将处理程序的函数移到 *IRAM* 中，从而尽可能规避执行中断代码时发生 flash 缓存缺失的可能性（参见 *针对性优化*）。如果可以确保只有部分处理程序位于 *IRAM* 中，则无需添加 `ESP_INTR_FLAG_IRAM` 标志将程序标记为 *IRAM* 安全。

提高网络速度

- 关于提高 Wi-Fi 网速，参见 *如何提高 Wi-Fi 性能* 和 *Wi-Fi 缓冲区使用情况*。
- 关于提高 lwIP TCP/IP 网速，参见 *性能优化*。
- 示例 `wifi/iperf` 中的配置针对 Wi-Fi TCP/IP 吞吐量进行了大量优化，但该配置会占用更多 RAM。将文件 `wifi/iperf/sdkconfig.defaults`、`wifi/iperf/sdkconfig.defaults.esp32s2` 和 `wifi/iperf/sdkconfig.ci.99` 的内容追加到项目的 `sdkconfig` 文件中，即可添加所有相关选项。请注意，部分选项可能会导致可调试性降低、固件大小增加、内存使用增加或其他功能的性能降低等影响。为了获得最佳结果，请阅读上述链接文档，并据此确定哪些选项最适合当前应用程序。

提高 I/O 性能 使用标准 C 库函数，如 `fread` 和 `fwrite` 时，相较于使用平台特定的不带缓冲系统调用，I/O 性能可能更慢，如 `read` 和 `write`。标准 C 库函数是为可移植性而设计的，它们会在执行时会引入一定开销和缓冲延迟，因此并不适用需要较高执行速度的场景。

FAT 文件系统 具体信息和提示如下：

- 读取/写入请求的最大大小等于 FatFS 簇大小（分配单元大小）。
- 使用 `read` 和 `write` 而非 `fread` 和 `fwrite` 可以提高性能。
- 要提高诸如 `fread` 和 `fgets` 等缓冲读取函数的执行速度，可以增加文件缓冲区的大小（Newlib 的默认值为 128 字节），例如 4096、8192 或 16384 字节。为此，可以在特定文件的指针上使用 `setvbuf` 函数进行局部更改，或者修改 `CONFIG_FATFS_VFS_FSTAT_BLKSIZE` 实现全局应用。

备注：增加缓冲区的大小会增加堆内存的使用量。

最小化二进制文件大小

ESP-IDF 构建系统会编译项目和 ESP-IDF 中所有源文件，但只有程序实际引用的函数和变量才会链接到最终的二进制文件中。在某些情况下，需要减小固件二进制文件的总大小，例如，为使固件适配 flash 分区大小。

要减小固件二进制文件总大小，首先要找到导致其大小增加的原因。

测量静态数据大小 为了优化固件二进制文件大小和内存使用，需要测量项目中静态分配的 RAM (data, bss)，代码 (text) 和只读数据 (rodata)。

使用 `idf.py` 的子命令 `size`，`size-components` 和 `size-files` 可以输出项目使用内存概况：

备注：添加 `-DOUTPUT_FORMAT=csv` 或 `-DOUTPUT_FORMAT=json`，即可用 CSV 或 JSON 格式输出文件。

数据大小概况 `idf.py size`

```
$ idf.py size
[...]
Total sizes:
Used stat D/IRAM: 53743 bytes ( 122385 remain, 30.5% used)
    .data size: 6504 bytes
    .bss size: 1984 bytes
    .text size: 44228 bytes
    .vectors size: 1027 bytes
Used Flash size : 118879 bytes
    .text: 83467 bytes
    .rodata: 35156 bytes
Total image size: 170638 bytes (.bin may be padded larger)
```

该输出结果细分了固件二进制文件中所有静态内存区域的大小：

```
$ idf.py size
[...]
Total sizes:
Used stat D/IRAM: 53743 bytes ( 122385 remain, 30.5% used)
    .data size: 6504 bytes
    .bss size: 1984 bytes
    .text size: 44228 bytes
    .vectors size: 1027 bytes
Used Flash size : 118879 bytes
    .text: 83467 bytes
    .rodata: 35156 bytes
Total image size: 170638 bytes (.bin may be padded larger)
```

- **Used stat D/IRAM:** 编译时使用的 D/IRAM 大小。remain 表示在运行时可用作堆内存的 D/IRAM 余量。请注意，由于元数据开销、实现限制和启动时的堆分配，实际的 DRAM 堆会更小。
 - **.data size:** 编译时为 .data（即所有初始化为非零值的静态变量）分配的 D/IRAM 大小。.data 还在二进制映像中占用空间来存储非零初始化值。
 - **.bss size:** 编译时为 .bss（即所有初始化为零的静态变量）分配的 D/IRAM 大小。.bss 不会在 flash 中占用额外空间。
 - **.text size:** 用于 .text 的 D/IRAM 大小（即所有从内部 RAM 执行的代码）。由于代码最初存储在 .text 中，在启动时才会复制到 D/IRAM，因此 .text 在二进制映像中也会占用空间。
- **Used Flash size:** 使用的 flash 总大小（不包括 D/IRAM 的使用量）。
 - **.text:** 用于 .text（即通过 flash 缓存执行的所有代码，请参阅 [IROM](#)）的 flash 大小。
 - **.rodata:** 用于 .rodata（即通过 flash 缓存加载的只读数据，参阅 [DROM](#)）的 flash 大小。
- **Total image size is the estimated total size of the binary file.**

组件使用概况 `idf.py size-components` `idf.py size` 的输出结果不够详细，无法找出导致二进制文件过大的主要原因。要进行更详细的分析，请使用 `idf.py size-components`。

```

$ idf.py size-components
[...]
    Total sizes:
    DRAM .data size:  14956 bytes
    DRAM .bss size:  15808 bytes
Used static DRAM:  30764 bytes ( 149972 available, 17.0% used)
Used static IRAM:  83918 bytes ( 47154 available, 64.0% used)
    Flash code:  559943 bytes
    Flash rodata: 176736 bytes

```

`idf.py size-components` 输出的前几行与 `idf.py size` 相同，此外还会输出 Per-archive contributions to ELF file 表格，显示每个静态库对最终二进制文件大小的贡献程度。

通常，每个组件都会构建一个静态库归档文件，尽管部分是由特定组件包含的二进制库，例如，`esp_wifi` 组件包含了 `libnet80211.a`。此外，这里还列出了一些工具链库，例如 `libc.a` 和 `libgcc.a`，用于提供 C/C++ 标准库和工具链内置功能。

对于只有一个 `main` 组件的简单项目，可在 `libmain.a` 目录下找到所有项目代码。若项目包含其特有组件（参阅[构建系统](#)），则每个组件将单独在一行中显示。

该表格按静态库归档文件对最终二进制文件大小的贡献程度降序排序。

各列含义如下：

- DRAM `.data` & `.bss` & `other-.data` 和 `.bss` 分别与上方显示的总数相同。两者都是静态变量，且都会减少运行时的可用 RAM，但 `.bss` 不会增加二进制文件大小。`other` 列指任何会增加 RAM 大小的自定义数据段，该值通常为 0。
- IRAM - 与上方显示的总数相同，表示链接到从 IRAM 执行的代码，这些代码占用二进制文件空间，并且会减少运行时可用作堆内存的 DRAM 空间。
- Flash code & rodata - 这些值与上方显示总数相同，指通过 flash 缓存访问的 IROM 和 DROM 空间，对二进制文件大小的贡献。

源文件使用概况 `idf.py size-files` 要了解更多详情，请运行 `idf.py size-files`，获取每个目标文件对最终二进制文件大小的贡献概况。每个目标文件对应一个单独的源文件。

```
$ idf.py size-files
[...]
Total sizes:
  DRAM .data size: 14956 bytes
  DRAM .bss size: 15808 bytes
  Used static DRAM: 30764 bytes ( 149972 available, 17.0% used)

文件总大小概况下方会显示 Per-file contributions to ELF file 表格。

该表格的列与上文运行 `idf.py size-components` 显示的列相同，但该表格的粒度更细，展示了每个目标文件对二进制文件大小的贡献。

例如，文件 `x509_crt_bundle.S.o` 对总固件大小贡献了 64,212 字节，全都存储在 flash 中的 `.rodata` 区域。由此可以推知，该应用程序正在使用 [ESP x509 证书包](#) 功能。如果不使用该功能，固件大小至少可以减少 64,212 字节。

某些目标文件从二进制库中链接至此，因此无法找到对应源文件。要确定一个源文件属于哪个组件，通常可以在 [ESP-IDF 源代码树](#) 中搜索，或者在 [链接器映射文件](#) 中查找完整路径。

比较两个二进制文件 如果某些改动影响了二进制文件大小，可以使用 ESP-IDF 工具来详细分析文件大小的确切差异。

该操作不是通过运行 `idf.py` 进行的，而是需要直接运行 Python 工具 `esp_idf_size`。

执行该操作，首先需要在构建目录中找到链接器映射文件 `PROJECTNAME.map`。`esp_idf_size` 工具会基于链接器映射文件的输出结果分析文件大小差异。

要与另一个二进制文件进行比较，还需要保存该文件对应的 `.map` 文件，该文件位于构建目录中。

例如，要比较两个构建文件，其中一个使用默认的 `CONFIG_COMPILER_OPTIMIZATION` Debug (`-Og`) 配置，而另一个使用 `Optimize for size` (`-Os`) 配置：

```
$ python -m esp_idf_size --diff build_Og/https_request.map build_Os/https_request.
↔map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means
↔that <CURRENT> is larger.
```

(下页继续)

(续上页)

```

Total sizes of <CURRENT>:
↪<REFERENCE>      Difference
DRAM .data size:   14516 bytes
↪14956             -440
DRAM .bss size:    15792 bytes
↪15808             -16
Used static DRAM:  30308 bytes ( 150428 available, 16.8% used)
↪30764             -456 ( +456 available, +0 total)
Used static IRAM:  78498 bytes ( 52574 available, 59.9% used)
↪83918             -5420 ( +5420 available, +0 total)
    Flash code:    509183 bytes
↪559943            -50760
    Flash rodata:  170592 bytes
↪176736            -6144
Total image size: ~ 772789 bytes (.bin may be padded larger)
↪835553            -62764

```

从 Difference 列可以看出，改变该设置导致整个二进制文件减小了 60 KB 以上，并且可用的 RAM 增加了 5 KB 以上。

还可以使用 diff 模式来输出表格，显示组件级（静态库）的差异：

备注：运行 esp_idf_size 时可以使用 --format 选项输出 JSON 或 CSV 格式的结果。

```
python -m esp_idf_size --archives --diff build_Og/https_request.map build_Oshttps_
↪request.map
```

同样适用于比较单个源文件级的差异：

```
python -m esp_idf_size --files --diff build_Og/https_request.map build_Oshttps_
↪request.map
```

了解将输出写入文件等其他选项，可以输入 --help 查看完整列表。

链接器失败时显示文件大小 如果被分配的静态内存大小超越上限，链接器会失败并显示错误信息，例如 DRAM segment data does not fit 和 region `iram0_0_seg' overflowed by 44 bytes 等。

在这些情况下，idf.py size 也无法成功执行。然而，通过手动运行 esp_idf_size，可以查看 **部分静态内存使用情况**。内存使用情况将不包含无法链接的变量，因此仍然会显示有部分可用空间。

映射文件参数为构建目录下的 <projectname>.map 文件。

```
python -m esp_idf_size build/project_name.map
```

还可以查看类似于 size-components 或 size-files 输出的内容：

```
python -m esp_idf_size --archives build/project_name.map
python -m esp_idf_size --files build/project_name.map
```

链接器映射文件

备注：这是一种非常有用的进阶分析方法。可以先跳转到[减小总体文件大小](#)，以后再详阅这一部分。

分析工具 idf.py size 通过解析 GNU binutils 的“链接器映射文件”来输出结果，该文件囊括了链接器在创建（即链接到）最终固件二进制文件时的所有操作。

链接器映射文件本身是纯文本文件，因此可以进行读取并准确了解链接器的操作，但这些文件非常复杂冗长，通常有 100,000 行甚至更多。

映射文件分为多个部分，每个部分各有标题，包括：

- Archive member included to satisfy reference by file (symbol)
 - 该列表显示了链接器链接各个目标文件时所搜寻的特定符号（函数或变量）。
 - 要了解二进制文件包含特定目标文件的原因，可以查看该列表以及文件末尾的 Cross Reference Table。

备注： 请注意，并非每个显示在该列表中的目标文件最后都会出现在最终二进制文件中，有些目标文件可能会列在 Discarded input sections 中。

- Allocating common symbols
 - 该列表显示了部分全局变量及其大小。常见符号在 ELF 二进制文件中具有特定含义，但 ESP-IDF 并未广泛使用这些符号。
- Discarded input sections
 - 在链接器读取目标文件时，会将一些输入段作为文件的一部分读取并准备链接到最终的二进制文件中，但由于没有其他部分引用这些输入段，这些段最终会被丢弃。
 - 对于 ESP-IDF 项目来说，这个列表可能会非常长，因为我们将每个函数和静态变量都编译到一个独立的段中，以最小化最终二进制文件的大小。具体而言，ESP-IDF 将使用编译器选项 `-ffunction-sections` `-fdata-sections` 和链接器选项 `--gc-sections`。
 - 在这个列表中出现的条目 **不会**对最终的二进制文件大小产生影响。
- Memory Configuration 和 Linker script and memory map
 - 这两部分相互关联。输出结果的一部分来自由 [构建系统](#) 提供的链接器命令行和链接脚本，部分链接脚本由 ESP-IDF 项目通过 [链接器脚本生成机制](#) 功能生成。
 - 在 map 文件的 Linker script and memory map 输出中，会显示链接到最终二进制文件中的每个符号（函数或静态变量）及其地址（以 16 位十六进制数字表示）和长度（也以十六进制表示），还有链接的库和目标文件（可以用于确定组件和源文件）。
 - 在所有占用最终 .bin 文件的输出段之后，memory map 还会显示一些 ELF 文件中用于调试的段，如 `.debug_*` 等。这些段不会对最终的二进制文件大小产生影响，且这些符号的地址数值很小，从 `0x0000000000000000` 开始递增。
- Cross Reference Table
 - 该表格显示了引用了各个符号（函数或静态变量）的目标文件。了解二进制文件包含某个特定符号的原因，可参考该表格以确定引用特定符号的目标文件。

备注： Cross Reference Table 不仅包含最终二进制文件中的符号，还包含已丢弃的段内符号。因此，某个符号出现在该表中并不意味着最终二进制文件包含这一符号，需要单独检查。

备注： 链接器映射文件由 GNU binutils 的链接器 `ld` 而非由 ESP-IDF 生成。本快速概览专从 ESP-IDF 构建系统的角度编写而成，建议自行搜索更多关于链接器映射文件格式的信息。

减小总体文件大小 可以通过以下配置选项减小几乎所有 ESP-IDF 项目最终二进制文件的大小：

- 将 `CONFIG_COMPILER_OPTIMIZATION` 设置为 Optimize for size (`-Os`)。在某些情况下，相较于默认设置，Optimize for size (`-Os`) 也可以减小二进制文件的大小。请注意，若代码包含 C 或 C++ 的未定义行为，提高编译器优化级别可能会暴露出原本不存在的错误。
- 通过降低应用程序的 `CONFIG_LOG_DEFAULT_LEVEL`，可以减少编译时的日志输出。如果改变 `CONFIG_LOG_MAXIMUM_LEVEL` 的默认选项，则可以控制二进制文件的大小。减少编译时的日志输出可以减少二进制文件中的字符串数量，并减小调用日志函数的代码大小。
- 将 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 设置为 `Silent`，可以避免为所有可能失败的断言编译专门的断言字符串和源文件名。尽管如此，仍可以通过查看断言失败时的内存地址以在代码中找到失败断言。
- 除 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 外，还可以通过设置 `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` 单独禁用或静默 HAL 组件的断言。请注意，即使将 `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` 设置为 `full-assertion` 级别，ESP-IDF 在引导加载

程序中也会把 HAL 断言级别降为 `silent`，以减小引导加载程序的大小。

- 设置 `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` 会移除针对 ESP-IDF 内部错误检查宏的特定错误消息。错误消息移除后，通过阅读日志输出来调试某些错误条件可能变得更加困难。
- 不要启用 `CONFIG_COMPILER_CXX_EXCEPTIONS` 或 `CONFIG_COMPILER_CXX_RTTI`，也不要将 `CONFIG_COMPILER_STACK_CHECK_MODE` 设置为 `Overall`。这些选项已默认禁用，启用这些选项会大幅增加二进制文件的大小。
- 禁用 `CONFIG_ESP_ERR_TO_NAME_LOOKUP` 将会移除查找表，该表用于将错误日志中的错误值转换成用户友好名称（参阅[错误处理](#)）。这样做可以减小二进制文件的大小，但错误值将只以整数形式输出。
- 将 `CONFIG_ESP_SYSTEM_PANIC` 设置为 `Silent reboot` 可以减小一小部分二进制文件的大小，但此操作 **仅**建议在没有任何开发者使用 UART 输出来调试设备时进行。
- 如果应用程序的二进制文件只使用 `protocomm` 组件的某个安全版本，取消对其他版本的支持可以减小部分代码大小。请通过 `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`、`CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1` 或者 `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2` 方式，取消对应版本的支持。

备注：除了上述众多配置项之外，还有一些配置选项在更改为非默认设置时会增加二进制文件的大小，这些选项未在此列出。配置项的帮助文本中通常会阐明显著增加二进制文件大小的设置。

针对性优化 以下二进制文件大小优化适用于特定的组件或函数：

Wi-Fi

- 如果不需要启用 WPA3 支持，禁用 `CONFIG_ESP_WIFI_ENABLE_WPA3_SAE` 可以减小 Wi-Fi 二进制文件的大小。请注意，WPA3 支持是目前认证新 Wi-Fi 设备的必要标准。
- 如果不需要启用 soft-AP 支持，禁用 `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` 可以减小 Wi-Fi 二进制文件的大小。
- 如不需要启用企业支持，禁用 `CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT` 可以减小 Wi-Fi 二进制文件的大小。

lwIP IPv6

- 将 `CONFIG_LWIP_IPV6` 设置为 `false` 可以减小 lwIP TCP/IP 堆栈的大小，但将仅支持 IPv4。

备注：如果禁用 IPv6，[ASIO 端口](#) 等组件将无法使用。

lwIP IPv4

- 如果不需要 IPv4 连接功能，将 `CONFIG_LWIP_IPV4` 设置为 `false` 可以减小 lwIP 的大小，使其成为仅支持 IPv6 的 TCP/IP 堆栈。

备注：在禁用 IPv4 支持之前，请注意，仅支持 IPv6 的网络环境尚未普及，必须在本地网络中提供支持，例如，由互联网服务提供商提供支持，或使用受限制的本地网络设置。

Newlib Nano 格式化 ESP-IDF 的 I/O 函数（`printf()` 和 `scanf()` 等）默认使用 Newlib 的“完整”格式化功能。

启用配置选项 `CONFIG_NEWLIB_NANO_FORMAT` 将使 Newlib 切换到 Nano 格式化模式。这种模式的代码量更小，并且大部分内容被编译到了 ESP32-S2 的 ROM 中，因此不需要将其添加至二进制文件中。

具体的二进制文件大小差异取决于固件使用的功能，但通常为 25 KB 到 50 KB。

启用 Nano 格式化会减少调用 `printf()` 或其他字符串格式化函数的堆栈使用量，参阅[栈内存大小优化](#)。

“Nano” 格式化不支持 64 位整数或 C99 格式化功能。请在 [Newlib README 文件](#) 中搜索 `--enable-newlib-nano-formatted-io` 来获取完整的限制列表。

MbedTLS 功能 在 **Component Config > mbedTLS** 下有多个默认启用的 mbedTLS 功能，如果不需要，可以禁用相应功能以减小代码大小。

这些功能包括：

- [CONFIG_MBEDTLS_HAVE_TIME](#)
- [CONFIG_MBEDTLS_ECDSA_DETERMINISTIC](#)
- [CONFIG_MBEDTLS_SHA512_C](#)
- [CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS](#)
- [CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS](#)
- [CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION](#)
- [CONFIG_MBEDTLS_SSL_ALPN](#)
- [CONFIG_MBEDTLS_SSL_RENEGOTIATION](#)
- [CONFIG_MBEDTLS_CCM_C](#)
- [CONFIG_MBEDTLS_GCM_C](#)
- [CONFIG_MBEDTLS_ECP_C](#)（或者：启用此选项，但在子菜单中禁用部分椭圆曲线）
- [CONFIG_MBEDTLS_ECP_NIST_OPTIM](#)
- [CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM](#)
- 如果不需要 mbedTLS 的服务器和客户端功能，可以修改 [CONFIG_MBEDTLS_TLS_MODE](#)
- 可以考虑禁用在 TLS Key Exchange Methods 子菜单中列出的一些密码套件（例如 [CONFIG_MBEDTLS_KEY_EXCHANGE_RSA](#)），以减小代码大小。

每个选项的帮助文本中都有更多信息可供参考。

重要：强烈建议不要禁用所有 mbedTLS 选项。 仅在理解功能用途，并确定在应用程序中不需要此功能时，方可禁用相应选项。请特别注意以下两点：

- 确保设备连接的任何 TLS 服务器仍然可用。如果服务器由第三方或云服务控制，建议确保固件至少支持两种 TLS 密码套件，以防未来某次更新禁用了其中一种。
- 确保连接设备的任何 TLS 客户端仍然可以使用支持/推荐的密码套件进行连接。请注意，未来版本的客户端操作系统可能会移除对某些功能的支持，因此建议启用多个支持的密码套件或算法以实现冗余。

如果依赖于第三方客户端或服务器，请密切关注其有关支持的 TLS 功能的公告和变更。否则，当所支持功能变更时，ESP32-S2 设备可能无法访问。

备注：ESP-IDF 并未测试所有 mbedTLS 编译配置组合。如果发现某个组合无法编译或无法按预期执行，请在 [GitHub](#) 上报告详细信息。

虚拟文件系统 (VFS) 在 ESP-IDF 中，[虚拟文件系统组件](#) 功能允许使用标准的 I/O 函数（如 `open`、`read`、`write` 等）和 C 库函数（如 `fopen`、`fread`、`fwrite` 等）来访问多个文件系统驱动程序和类似文件的外设驱动程序。当应用程序中不需要文件系统或类似文件的外设驱动功能时，可以部分或完全禁用该功能。VFS 组件提供以下配置选项：

- [CONFIG_VFS_SUPPORT_TERMIOS](#) — 如果应用程序不使用 `termios` 函数族，可以禁用此选项。目前，这些函数仅在 UART VFS 驱动程序中实现，大多数应用程序可以禁用此选项。禁用后可以减小约 1.8 KB 代码大小。
- [CONFIG_VFS_SUPPORT_SELECT](#) — 如果应用程序不使用 `select` 函数处理文件描述符，可以禁用此选项。目前，只有 UART 和 `eventfd` VFS 驱动程序支持 `select` 函数。请注意，当禁用该选项时，仍然可以使用 `select` 处理套接字文件描述符。禁用此选项将减小约 2.7 KB 代码大小。
- [CONFIG_VFS_SUPPORT_DIR](#) — 如果应用程序不使用与目录相关的函数，例如 `readdir`（参阅此选项的描述以获取完整列表），可以禁用此选项。如果应用程序只需打开、读取和写入特定文件，而不需要枚举或创建目录，可以禁用此选项，从而减少超过 0.5 KB 代码大小，具体减小多少取决于使用的文件系统驱动程序。

- [CONFIG_VFS_SUPPORT_IO](#) —如果应用程序不使用文件系统或类似文件的外设驱动程序，可以禁用此选项，这将禁用所有 VFS 功能，包括上述三个选项。当禁用此选项时，无法使用[控制台终端](#)。请注意，当禁用此选项时，应用程序仍然可以使用标准 I/O 函数处理套接字文件描述符。相较于默认配置，禁用此选项可以减小约 9.4 KB 代码大小。

引导加载程序大小 本文档仅涉及 ESP-IDF 应用程序的二进制文件大小，而不涉及 ESP-IDF [二级引导程序](#)。

关于 ESP-IDF 引导加载程序二进制文件大小的讨论，参阅[引导加载程序大小](#)。

IRAM 二进制文件大小 如果二进制文件的 IRAM 部分过大，可以通过减少 IRAM 使用来解决这个问题，参阅[IRAM 优化](#)。

内存优化

固件应用程序的可用 RAM 在某些情况下可能处于低水平，甚至完全耗尽。为此，应调整这些情况下固件应用程序的内存使用情况。

固件应用程序通常需要为内部 RAM 保留备用空间，用于应对非常规情况，或在后续版本的更新中，适应 RAM 使用需求的变化。

背景 在进行 ESP-IDF 的内存优化前，应了解有关 ESP32-S2 内存类型的基础知识、C 语言中静态和动态内存使用的区别、以及 ESP-IDF 中栈和堆的使用方式。以上信息均可参阅[堆内存分配](#)。

测量静态内存使用情况 [idf.py](#) 工具可用于生成应用程序静态内存的使用情况报告，请参阅[测量静态数据大小](#)。

测量动态内存使用情况 ESP-IDF 包含一系列堆 API，可以在运行时测量空闲堆内存，请参阅[堆内存调试](#)。

备注：在嵌入式系统中，除 RAM 使用总量外，也应重点关注堆碎片化问题。堆测量 API 提供了一些方法，可以测量最大空闲内存块。通过监测最大空闲内存块和总空闲字节数，可以快速了解是否存在堆碎片化问题。

静态内存优化

- 降低应用程序的静态内存使用，会增加运行时堆的可用 RAM 空间，反之亦然。
- 优化静态内存使用通常需要监测 `.data` 和 `.bss` 的大小，有关工具请参阅[测量静态数据大小](#)。
- 在 C 语言中，ESP-IDF 内部函数不会占用大量静态 RAM。在多数情况下（例如 Wi-Fi 库），静态缓冲区仍从堆中分配。然而，这些分配只在功能初始化阶段进行一次，并在功能去初始化时释放，从而在应用程序生命周期中，优化不同阶段的可用内存。

要实现静态内存优化，请执行以下操作：

- 由于常量数据可以存储在 flash 中，不占用 RAM，建议尽量将结构体、缓冲区或其他变量声明为 `const`。为此，可能需要修改固件参数，使其接收 `const *` 参数而非可变指针参数。以上更改还可以减少某些函数的栈内存使用。
- 若使用 OpenThread，请设置 [CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT](#) 选项，OpenThread 将从外部 PSRAM 中分配消息池缓冲区，从而减少对内部静态内存的使用。

栈内存大小优化 在 FreeRTOS 操作系统中，任务栈通常从堆中分配。每个任务的栈大小固定，且会作为参数传递给 `xTaskCreate()`。每个任务可用的栈内存不得超过为其分配的栈内存大小，否则将导致栈内存溢出或堆内存损坏，使原本可用的程序崩溃。

因此，确定每个任务栈内存的最佳大小、最小化每个任务栈内存大小、以及最小化任务栈内存的整体数量，都可以大幅减少 RAM 的使用。

要确定特定任务栈内存的最佳大小，请执行以下操作：

- 程序运行时，如你认为某任务有未使用的栈内存，可通过其任务句柄调用 `uxTaskGetStackHighWaterMark()`。该函数将以字节为单位，返回任务中生命周期最短的空闲栈内存。
 - 从任务本身内部调用 `uxTaskGetStackHighWaterMark()` 是调用该函数最容易的方式：在任务达到其栈内存使用峰值后，调用 `uxTaskGetStackHighWaterMark(NULL)` 获取当前任务的高水位标记，换言之，如果有主循环，请多次执行主循环来覆盖各种状态，随后调用 `uxTaskGetStackHighWaterMark()`。
 - 通常可以用任务的栈内存总大小减去调用 `uxTaskGetStackHighWaterMark()` 的返回值，计算任务实际使用的栈内存大小，但应留出一定的安全余量，应对运行时栈内存使用量的小幅意外增长。
- 程序运行时，调用 `uxTaskGetSystemState()` 获取系统中所有任务的摘要，包括各栈内存的高水位标记值。
- 在未使用调试器的监视点时，可以设置 `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 选项。启用此选项时，系统会使用一个观察点，监视每个任务栈的最后一个字节。如果有新的数据覆盖了该字节（例如发生栈溢出），将立即触发 `panic`。相比默认 `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` 选项的 `Check using canary bytes`，这种方式更可靠，因其能够立即触发 `panic`，而不是在下次 RTOS 上下文切换时触发。然而，两种选项都存在缺点，有时栈指针可能会跳过监视点或 `canary` 字节，损坏 RAM 的其他区域。

要减少特定任务栈内存大小，请执行以下操作：

- 避免占用过多栈内存的函数。字符串格式化函数（如 `printf()`）会使用大量栈内存，如果任务不调用这类函数，通常可以减小其占用的栈内存。
 - 启用 `Newlib Nano 格式化`，可以在任务调用 `printf()` 或其他 C 语言字符串格式化函数时，减少这类任务的栈内存使用量。
- 避免在栈上分配大型变量。在 C 语言声明的默认作用域中，任何分配为自动变量的大型结构体或数组都会占用栈内存。要优化这些变量占用的栈内存大小，可以使用静态分配，或仅在需要时从堆中动态分配。
- 避免调用深度递归函数。尽管调用单个递归函数并不一定会占用大量栈内存，但若每个函数都包含大量基于栈的变量，那么调用这些函数的开销将会很高。

要减少任务的整体数量，请执行以下操作：

- 合并任务。如果从未创建某个特定任务，就不会分配该任务的栈内存，从而极大减少 RAM 使用。如果某些任务可以与另一个任务合并，通常可以将不必要的任务删除。在应用程序中，如果满足以下条件，通常可以合并或删除任务：
 - 任务所执行的内容可以按顺序分解为多个函数调用。
 - 任务所执行的内容可以分解为较小的工作，这些工作可以通过 FreeRTOS 队列或类似机制串行化，并由工作任务执行。

内部任务栈内存大小 为进行系统维护，或操作系统功能，ESP-IDF 分配了许多内部任务，一部分在启动过程中创建，一部分在初始化特定功能时创建。

为了确保支持所有常见的使用模式，这些任务栈内存的默认设置值较大。ESP-IDF 支持配置栈内存大小，因此可以减小任务栈内存，匹配其实际运行时的栈内存使用情况。

重要： 如果内部任务的栈内存设置得过小，可能会导致 ESP-IDF 发生无法预测的崩溃。即使任务栈内存溢出是导致崩溃的根本原因，在调试过程中也很难确定具体原因。因此，建议特别关注任务在负载高时的高水位标记，在必要情况下，谨慎减小内部任务的栈内存大小。如果在减小内部任务堆内存大小后，仍遇到问题，请在报告中提供以下信息，以及正在使用的具体配置。

- 运行主任务的栈内存大小为`CONFIG_ESP_MAIN_TASK_STACK_SIZE`。
- 系统任务ESP定时器用于执行回调函数，其栈内存大小为`CONFIG_ESP_TIMER_TASK_STACK_SIZE`。
- 部分 FreeRTOS 定时器任务用于处理 FreeRTOS 定时器回调，其栈内存大小为`CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`。
- 系统任务事件循环库用于执行默认系统事件循环回调，其栈内存大小为`CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`。
- TCP/IP 任务lwIP的栈内存大小为`CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`。
- 以太网驱动程序会创建任务，用于使 MAC 接收以太网帧，在默认配置 `ETH_MAC_DEFAULT_CONFIG` 下，任务栈内存大小为 4 KB。在初始化以太网 MAC 时，传递自定义 `eth_mac_config_t` 结构体可以更改此设置。
- FreeRTOS 空闲任务栈内存大小由`CONFIG_FREERTOS_IDLE_TASK_STACKSIZE` 配置。
- 使用ESP-MQTT 组件时会创建一个任务，其栈内存大小由`CONFIG_MQTT_TASK_STACK_SIZE` 配置。MQTT 栈内存大小也可以使用 `esp_mqtt_client_config_t` 结构体中的 `task_stack` 字段配置。
- 有关使用 mDNS 时内存优化的详细信息，请参阅 [优化内存使用](#)。

备注：除 ESP 定时器等内置系统功能外，若固件应用程序没有初始化 ESP-IDF 中特定功能，则不会创建相关任务。此时，相关任务的栈内存使用量为零，而这些功能没有与之关联的任务，因此无需考虑其栈内存大小配置。

堆内存优化 有关分析运行时堆内存使用的函数，请参阅[堆内存调试](#)。

通常，堆内存优化包含以下几个方面：分析堆内存使用情况、撤回未使用的 `malloc()` 调用、缩小相应的内存使用大小、或提早释放先前分配的缓冲区。

以下是一些 ESP-IDF 配置选项，有助于在运行时实现堆内存优化：

- lwIP 文档中的有关章节介绍了如何配置[最小内存使用](#)。
- [Wi-Fi 缓冲区使用情况](#) 中介绍了一些选项，这些选项可以减少对静态缓冲区的使用，或减少运行时动态缓冲区的最大数量，从而最小化内存使用，但可能会影响性能。注意，Wi-Fi 初始化时，仍会从堆中分配静态 Wi-Fi 缓冲区，并在 Wi-Fi 去初始化时释放这些缓冲区。
- 部分 Mbed TLS 配置选项也可用于堆内存优化，详情请参阅[减少内存使用](#) 的 Mbed TLS 部分。

备注：如果将某些配置选项更改为非默认值，也会增加运行时的堆内存使用。这类选项未在上文中列出，但配置选项的帮助文档中给出了相应说明。

IRAM 优化 程序运行时，由于使用了静态 IRAM，用于堆内存使用的 DRAM 会相应减少。反之，可以通过减少 IRAM 使用，增加可用 DRAM。

如果应用程序分配的静态 IRAM 超过可用上限，应用程序将无法构建，并出现链接器错误，如 `section '.iram0.text' will not fit in region 'iram0_0_seg'`、`IRAM0 segment data does not fit` 以及 `region 'iram0_0_seg' overflowed by 84-bytes`。如果发生这种情况，应找到减少静态 IRAM 使用的方法，链接应用程序。

要分析固件应用程序二进制文件中的 IRAM 使用情况，请使用[测量静态数据大小](#)。如果固件应用程序链接失败，请参阅[链接器失败时显示文件大小](#) 中的步骤，分析失败原因。

要对某些 ESP-IDF 功能进行 IRAM 优化，请使用以下选项：

- 启用`CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`。只要没有从 ISR 中错误地调用这些函数，就可以在所有配置中安全启用此选项。
- 启用`CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`。只要没有从 ISR 中错误地调用这些函数，就可以在所有配置中安全启用此选项。

- 启用 `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`。如果从 IRAM 中的中断上下文中使用 ISR ringbuf 函数，例如启用了 `CONFIG_UART_ISR_IN_IRAM`，则无法安全使用此选项。在此情况下，安装 ESP-IDF 相关驱动程序时，将在运行时报错。
- 禁用 Wi-Fi 选项 `CONFIG_ESP_WIFI_IRAM_OPT` 和/或 `CONFIG_ESP_WIFI_RX_IRAM_OPT` 会释放可用 IRAM，但会牺牲部分 Wi-Fi 性能。
- 禁用 `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR` 可以防止从 IRAM 安全中断处理程序中发布 esp_event 事件，节省 IRAM 空间。
- 禁用 `CONFIG_SPI_MASTER_ISR_IN_IRAM` 可以防止在写入 flash 时发生 spi_master 中断，节省 IRAM 空间，但可能影响 spi_master 的性能。
- 禁用 `CONFIG_SPI_SLAVE_ISR_IN_IRAM` 可以防止在写入 flash 时发生 spi_slave 中断，节省 IRAM 空间。
- 设置 `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` 为禁用 HAL 组件的断言，可以节省 IRAM 空间，对于经常调用 HAL_ASSERT 且位于 IRAM 中的 HAL 代码尤为如此。
- 要禁用不需要的 flash 驱动程序，节省 IRAM 空间，请参阅 sdkconfig 菜单中的 Auto-detect Flash chips 选项。
- 启用 `CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH`。只要未启用 `CONFIG_SPI_MASTER_ISR_IN_IRAM` 选项，且没有从 ISR 中错误地调用堆函数，就可以在所有配置中安全启用此选项。

备注： 将常用函数从 IRAM 移动到 flash，可能会增加函数的执行时间。

备注： 部分配置选项可以将一些功能移动到 IRAM 中，从而提高性能，但这类选项默认不进行配置，因此未在此列出。了解启用上述选项对 IRAM 大小造成的影响，请参阅配置项的帮助文本。

改变 cache 大小 ESP32-S2 RAM 内存可用大小取决于 cache 的大小。在下面列出的 Kconfig 选项中减少 cache 大小将会增加可用的 RAM。

- `CONFIG_ESP32S2_INSTRUCTION_CACHE_SIZE`
- `CONFIG_ESP32S2_DATA_CACHE_SIZE`

4.24 Reproducible Builds

4.24.1 Introduction

ESP-IDF build system has support for [reproducible builds](#).

When reproducible builds are enabled, the application built with ESP-IDF does not depend on the build environment. Both the .elf file and .bin files of the application remains exactly the same, even if the following variables change:

- Directory where the project is located
- Directory where ESP-IDF is located (`IDF_PATH`)
- Build time

4.24.2 Reasons for Non-Reproducible Builds

There are several reasons why an application may depend on the build environment, even when the same source code and tools versions are used.

- In C code, `__FILE__` preprocessor macro is expanded to the full path of the source file.
- `__DATE__` and `__TIME__` preprocessor macros are expanded to compilation date and time.

- When the compiler generates object files, it adds sections with debug information. These sections help debuggers, like GDB, to locate the source code which corresponds to a particular location in the machine code. These sections typically contain paths of relevant source files. These paths may be absolute, and will include the path to ESP-IDF or to the project.

There are also other possible reasons, such as unstable order of inputs and non-determinism in the build system.

4.24.3 Enabling Reproducible Builds in ESP-IDF

Reproducible builds can be enabled in ESP-IDF using `CONFIG_APP_REPRODUCIBLE_BUILD` option.

This option is disabled by default. It can be enabled in `menuconfig`.

The option may also be added into `sdkconfig.defaults`. If adding the option into `sdkconfig.defaults`, delete the `sdkconfig` file and run the build again. See [自定义 `sdkconfig` 的默认值](#) for more information.

4.24.4 How Reproducible Builds Are Achieved

ESP-IDF achieves reproducible builds using the following measures:

- In ESP-IDF source code, `__DATE__` and `__TIME__` macros are not used when reproducible builds are enabled. Note, if the application source code uses these macros, the build will not be reproducible.
- ESP-IDF build system passes a set of `-fmacro-prefix-map` and `-fdebug-prefix-map` flags to replace base paths with placeholders:
 - Path to ESP-IDF is replaced with `/IDF`
 - Path to the project is replaced with `/IDF_PROJECT`
 - Path to the build directory is replaced with `/IDF_BUILD`
 - Paths to components are replaced with `/COMPONENT_NAME_DIR` (where `NAME` is the name of the component)
- Build date and time are not included into the *application metadata structure* and *bootloader metadata structure* if `CONFIG_APP_REPRODUCIBLE_BUILD` is enabled.
- ESP-IDF build system ensures that source file lists, component lists and other sequences are sorted before passing them to CMake. Various other parts of the build system, such as the linker script generator also perform sorting to ensure that same output is produced regardless of the environment.

4.24.5 Reproducible Builds and Debugging

When reproducible builds are enabled, file names included in debug information sections are altered as shown in the previous section. Due to this fact, the debugger (GDB) is not able to locate the source files for the given code location.

This issue can be solved using GDB `set substitute-path` command. For example, by adding the following command to GDB init script, the altered paths can be reverted to the original ones:

```
set substitute-path /COMPONENT_FREERTOS_DIR /home/user/esp/esp-idf/components/
↳freertos
```

ESP-IDF build system generates a file with the list of such `set substitute-path` commands automatically during the build process. The file is called `prefix_map_gdbinit` and is located in the project `build` directory.

When `idf.py gdb` is used to start debugging, this additional `gdbinit` file is automatically passed to GDB. When launching GDB manually or from an IDE, please pass this additional `gdbinit` script to GDB using `-x build/prefix_map_gdbinit` argument.

4.24.6 Factors Which Still Affect Reproducible Builds

Note that the built application still depends on:

- ESP-IDF version

- Versions of the build tools (CMake, Ninja) and the cross-compiler

IDF Docker 镜像 can be used to ensure that these factors do not affect the build.

4.25 RF 校准

ESP32-S2 在 RF 初始化过程中支持以下三种 RF 校准：

1. 部分校准
2. 全面校准
3. 不校准

4.25.1 部分校准

在 RF 初始化期间，默认使用部分校准，该方法基于存储在 NVS 中的完全校准数据实现。要使用此校准方法，请前往 `menuconfig` 并启用 `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`。

4.25.2 全面校准

在以下几种情况下，使用全面校准：

1. NVS 不存在。
2. 存储校准数据的 NVS 分区已擦除。
3. 硬件 MAC 地址变更。
4. PHY 库版本变更。
5. 从 NVS 分区加载的 RF 校准数据损坏。

全面校准耗时比部分校准长约 100 ms。当启动时长的重要性不高时，建议使用全面校准。要切换到全面校准，请前往 `menuconfig` 并禁用 `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`。如果使用了默认的部分校准，作为最后补救措施，可以使用以下两种方法添加函数，触发全面校准：

1. 如果不介意擦除 NVS 分区中的所有数据，那么擦除 NVS 分区是最简单的方法。
2. 在初始化 Wi-Fi 和 Bluetooth®/Bluetooth Low Energy 前，根据某些条件（例如，在某些诊断模式下提供的选项）调用 API `esp_phy_erase_cal_data_in_nvs()`，此时仅会擦除 NVS 分区的 PHY 命名空间。

4.25.3 不校准

设备从 Deep-sleep 模式中唤醒时，可以不校准。

4.25.4 PHY 初始化数据

PHY 初始化数据用于 RF 校准，通过以下两种方法，可以获取 PHY 初始化数据。

一是使用默认初始化数据，该数据位于头文件 `components/esp_phy/esp32s2/include/phy_init_data.h` 中。默认初始化数据会在编译后嵌入到应用程序的二进制文件，然后存储在只读存储器 (DROM) 中。要使用默认的初始化数据，请前往 `menuconfig` 并禁用 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`。

二是将初始化数据存储于 PHY 数据分区中。默认的分表已经包含了 PHY 数据分区，但是使用自定义分区表时，请确保在自定义分区表中包含一个 PHY 数据分区（类型：data，子类型：phy）。无论使用自定义分区表还是默认分区表，只要初始化数据存储于分区中，就需要将其烧录到相应的分区中，否则运行时可能会出现错误。如果想要使用存储在分区中的初始化数据，请前往 `menuconfig` 并启用选项 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`。

4.25.5 API 参考

Header File

- `components/esp_phy/include/esp_phy_init.h`
- This header file can be included with:

```
#include "esp_phy_init.h"
```

- This header file is a part of the API provided by the `esp_phy` component. To declare that your component depends on `esp_phy`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_phy
```

or

```
PRIV_REQUIRES esp_phy
```

Functions

const *esp_phy_init_data_t* ***esp_phy_get_init_data** (void)

Get PHY init data.

If "Use a partition to store PHY init data" option is set in menuconfig, This function will load PHY init data from a partition. Otherwise, PHY init data will be compiled into the application itself, and this function will return a pointer to PHY init data located in read-only memory (DROM).

If "Use a partition to store PHY init data" option is enabled, this function may return NULL if the data loaded from flash is not valid.

备注: Call `esp_phy_release_init_data` to release the pointer obtained using this function after the call to `esp_wifi_init`.

返回 pointer to PHY init data structure

void **esp_phy_release_init_data** (const *esp_phy_init_data_t* *data)

Release PHY init data.

参数 `data` -- pointer to PHY init data structure obtained from `esp_phy_get_init_data` function

esp_err_t **esp_phy_load_cal_data_from_nvs** (*esp_phy_calibration_data_t* *out_cal_data)

Function called by `esp_phy_load_cal_and_init` to load PHY calibration data.

This is a convenience function which can be used to load PHY calibration data from NVS. Data can be stored to NVS using `esp_phy_store_cal_data_to_nvs` function.

If calibration data is not present in the NVS, or data is not valid (was obtained for a chip with a different MAC address, or obtained for a different version of software), this function will return an error.

参数 `out_cal_data` -- pointer to calibration data structure to be filled with loaded data.

返回 ESP_OK on success

esp_err_t **esp_phy_store_cal_data_to_nvs** (const *esp_phy_calibration_data_t* *cal_data)

Function called by `esp_phy_load_cal_and_init` to store PHY calibration data.

This is a convenience function which can be used to store PHY calibration data to the NVS. Calibration data is returned by `esp_phy_load_cal_and_init` function. Data saved using this function to the NVS can later be loaded using `esp_phy_store_cal_data_to_nvs` function.

参数 `cal_data` -- pointer to calibration data which has to be saved.

返回 ESP_OK on success

esp_err_t **esp_phy_erase_cal_data_in_nvs** (void)

Erase PHY calibration data which is stored in the NVS.

This is a function which can be used to trigger full calibration as a last-resort remedy if partial calibration is used. It can be called in the application based on some conditions (e.g. an option provided in some diagnostic mode).

返回 ESP_OK on success

返回 others on fail. Please refer to NVS API return value error number.

void **esp_phy_enable** (*esp_phy_modem_t* modem)

Enable PHY and RF module.

PHY and RF module should be enabled in order to use WiFi or BT. Now PHY and RF enabling job is done automatically when start WiFi or BT. Users should not call this API in their application.

参数 **modem** -- the modem to call the phy enable.

void **esp_phy_disable** (*esp_phy_modem_t* modem)

Disable PHY and RF module.

PHY module should be disabled in order to shutdown WiFi or BT. Now PHY and RF disabling job is done automatically when stop WiFi or BT. Users should not call this API in their application.

参数 **modem** -- the modem to call the phy disable.

void **esp_btbb_enable** (void)

Enable BTBB module.

BTBB module should be enabled in order to use IEEE802154 or BT. Now BTBB enabling job is done automatically when start IEEE802154 or BT. Users should not call this API in their application.

void **esp_btbb_disable** (void)

Disable BTBB module.

Disable BTBB module, used by IEEE802154 or Bluetooth. Users should not call this API in their application.

void **esp_phy_load_cal_and_init** (void)

Load calibration data from NVS and initialize PHY and RF module.

void **esp_phy_modem_init** (void)

Initialize backup memory for Phy power up/down.

void **esp_phy_modem_deinit** (void)

Deinitialize backup memory for Phy power up/down Set phy_init_flag if all modems deinit on ESP32C3.

void **esp_phy_common_clock_enable** (void)

Enable WiFi/BT common clock.

void **esp_phy_common_clock_disable** (void)

Disable WiFi/BT common clock.

int64_t **esp_phy_rf_get_on_ts** (void)

Get the time stamp when PHY/RF was switched on.

返回 return 0 if PHY/RF is never switched on. Otherwise return time in microsecond since boot when phy/rf was last switched on

esp_err_t **esp_phy_update_country_info** (const char *country)

Update the corresponding PHY init type according to the country code of Wi-Fi.

参数 **country** -- country code

返回 ESP_OK on success.

返回 esp_err_t code describing the error on fail

char ***get_phy_version_str** (void)

Get PHY lib version.

返回 PHY lib version.

void **phy_init_param_set** (uint8_t param)

Set PHY init parameters.

参数 **param** -- is 1 means combo module

void **phy_wifi_enable_set** (uint8_t enable)

Wi-Fi RX enable.

参数 **enable** -- True for enable wifi receiving mode as default, false for closing wifi receiving mode as default.

Structures

struct **esp_phy_init_data_t**

Structure holding PHY init parameters.

Public Members

uint8_t **params**[128]

opaque PHY initialization parameters

struct **esp_phy_calibration_data_t**

Opaque PHY calibration data.

Public Members

uint8_t **version**[4]

PHY version

uint8_t **mac**[6]

The MAC address of the station

uint8_t **opaque**[1894]

calibration data

Enumerations

enum **esp_phy_modem_t**

PHY enable or disable modem.

Values:

enumerator **PHY_MODEM_WIFI**

PHY modem WIFI

enumerator **PHY_MODEM_BT**

PHY modem BT

enumerator **PHY_MODEM_IEEE802154**

PHY modem IEEE802154

enum **esp_phy_calibration_mode_t**

PHY calibration mode.

Values:

enumerator **PHY_RF_CAL_PARTIAL**

Do part of RF calibration. This should be used after power-on reset.

enumerator **PHY_RF_CAL_NONE**

Don't do any RF calibration. This mode is only suggested to be used after deep sleep reset.

enumerator **PHY_RF_CAL_FULL**

Do full RF calibration. Produces best results, but also consumes a lot of time and current. Suggested to be used once.

Header File

- [components/esp_phy/include/esp_phy_cert_test.h](#)
- This header file can be included with:

```
#include "esp_phy_cert_test.h"
```

- This header file is a part of the API provided by the `esp_phy` component. To declare that your component depends on `esp_phy`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_phy
```

or

```
PRIV_REQUIRES esp_phy
```

Functions

void **esp_wifi_power_domain_on** (void)

Wifi power domain power on.

void **esp_wifi_power_domain_off** (void)

Wifi power domain power off.

void **esp_phy_rftest_config** (uint8_t conf)

Environment variable configuration.

参数 conf -- Set to 1 to enter RF test mode.

void **esp_phy_rftest_init** (void)

RF initialization configuration.

void **esp_phy_tx_contin_en** (bool contin_en)

TX Continuous mode.

参数 contin_en -- Set to true for continuous packet sending, which can be used for certification testing; Set to false to cancel continuous mode, which is the default mode and can be used for WLAN tester.

void **esp_phy_cbw40m_en** (bool en)

HT40/HT20 mode selection.

参数 en -- Set to false to enter 11n HT20 mode; Set to true to enter 11n HT40 mode;

void **esp_phy_wifi_tx** (uint32_t chan, *esp_phy_wifi_rate_t* rate, int8_t backoff, uint32_t length_byte, uint32_t packet_delay, uint32_t packet_num)

Wi-Fi TX command.

参数

- **chan** -- channel setting, 1~14;
- **rate** -- rate setting;
- **backoff** -- Transmit power attenuation, unit is 0.25dB. For example, 4 means that the power is attenuated by 1dB;
- **length_byte** -- TX packet length configuration, indicating PSDU Length, unit is byte;
- **packet_delay** -- TX packet interval configuration, unit is us;
- **packet_num** -- The number of packets sent, 0 means sending packets continuously, other values represent the number of packets to send.

void **esp_phy_test_start_stop** (uint8_t value)

Test start/stop command, used to stop transmitting or receiving state.

参数 value -- Value should be set to 3 before TX/RX. Set value to 0 to end TX/RX state.

void **esp_phy_wifi_rx** (uint32_t chan, *esp_phy_wifi_rate_t* rate)

Wi-Fi RX command.

参数

- **chan** -- channel setting, 1~14;
- **rate** -- rate setting;

void **esp_phy_wifi_tx_tone** (uint32_t start, uint32_t chan, uint32_t backoff)

Wi-Fi Carrier Wave(CW) TX command.

参数

- **start** -- enable CW, 1 means transmit, 0 means stop transmitting;
- **chan** -- CW channel setting, 1~14;
- **backoff** -- CW power attenuation parameter, unit is 0.25dB. 4 indicates the power is attenuated by 1dB.

void **esp_phy_ble_tx** (uint32_t txpwr, uint32_t chan, uint32_t len, *esp_phy_ble_type_t* data_type, uint32_t syncw, *esp_phy_ble_rate_t* rate, uint32_t tx_num_in)

BLE TX command.

参数

- **txpwr** -- Transmit power level. Tx power is about (level-8)*3 dBm, step is 3dB. Level 8 is around 0 dBm;
- **chan** -- channel setting, range is 0~39, corresponding frequency = 2402+chan*2;
- **len** -- Payload length setting, range is 0-255, unit is byte, 37 bytes is employed generally;
- **data_type** -- Data type setting;
- **syncw** -- Packet identification (need to be provided by the packet generator or instrument manufacturer), 0x71764129 is employed generally;
- **rate** -- rate setting;
- **tx_num_in** -- The number of packets sent, 0 means sending packets continuously, other values represent the number of packets to send.

void **esp_phy_ble_rx** (uint32_t chan, uint32_t syncw, *esp_phy_ble_rate_t* rate)

BLE RX command.

参数

- **chan** -- channel selection, range is 0-39; Channels 0, 1, 2~10 correspond to 2404MHz, 2406MHz, 2408MHz~2424MHz respectively; Channels 11, 12, 13~36 correspond to 2428MHz, 2430MHz, 2432MHz~2478MHz respectively; Channel 37: 2402MHz, Channel 38: 2426MHz, Channel 39: 2480MHz;
- **syncw** -- Packet identification (need to be provided by the packet generator or instrument manufacturer), 0x71764129 is employed generally;
- **rate** -- rate setting;

void **esp_phy_bt_tx_tone** (uint32_t start, uint32_t chan, uint32_t power)

BLE Carrier Wave(CW) TX command.

参数

- **start** -- enable CW, 1 means transmit, 0 means stop transmitting;
- **chan** -- Single carrier transmission channel selection, range is 0~39, corresponding frequency $\text{freq} = 2402 + \text{chan} * 2$;
- **power** -- CW power attenuation parameter, unit is 0.25dB. 4 indicates the power is attenuated by 1dB.

void **esp_phy_get_rx_result** (*esp_phy_rx_result_t* *rx_result)

Get some RX information.

参数 **rx_result** -- This struct for storing RX information;

Structures

struct **esp_phy_rx_result_t**

Structure holding PHY RX result.

Public Members

uint32_t **phy_rx_correct_count**

The number of desired packets received

int **phy_rx_rssi**

Average RSSI of desired packets

uint32_t **phy_rx_total_count**

The number of total packets received

uint32_t **phy_rx_result_flag**

0 means no RX info; 1 means the latest Wi-Fi RX info; 2 means the latest BLE RX info.

Enumerations

enum **esp_phy_wifi_rate_t**

Values:

enumerator **PHY_RATE_1M**

enumerator **PHY_RATE_2M**

enumerator **PHY_RATE_5M5**

enumerator **PHY_RATE_11M**

enumerator **PHY_RATE_6M**

enumerator **PHY_RATE_9M**

enumerator **PHY_RATE_12M**

enumerator **PHY_RATE_18M**

enumerator **PHY_RATE_24M**

enumerator **PHY_RATE_36M**

enumerator **PHY_RATE_48M**

enumerator **PHY_RATE_54M**

enumerator **PHY_RATE_MCS0**

enumerator **PHY_RATE_MCS1**

enumerator **PHY_RATE_MCS2**

enumerator **PHY_RATE_MCS3**

enumerator **PHY_RATE_MCS4**

enumerator **PHY_RATE_MCS5**

enumerator **PHY_RATE_MCS6**

enumerator **PHY_RATE_MCS7**

enumerator **PHY_WIFI_RATE_MAX**

enum **esp_phy_ble_rate_t**

Values:

enumerator **PHY_BLE_RATE_1M**

enumerator `PHY_BLE_RATE_2M`

enumerator `PHY_BLE_RATE_125K`

enumerator `PHY_BLE_RATE_500k`

enumerator `PHY_BLE_RATE_MAX`

enum `esp_phy_ble_type_t`

Values:

enumerator `PHY_BLE_TYPE_1010`

enumerator `PHY_BLE_TYPE_00001111`

enumerator `PHY_BLE_TYPE_prbs9`

enumerator `PHY_BLE_TYPE_00111100`

enumerator `PHY_BLE_TYPE_MAX`

4.26 线程局部存储

4.26.1 概述

线程局部存储 (TLS) 机制可以分配变量，使每个现有的线程都有相应变量实例。ESP-IDF 提供了以下三种方法，支持使用此类变量：

- *FreeRTOS 原生 API*：ESP-IDF FreeRTOS 原生 API。
- *Pthread API*：ESP-IDF pthread API。
- *C11 标准*：C11 标准引入了特殊关键字，将变量声明为线程局部变量。

4.26.2 FreeRTOS 原生 API

ESP-IDF FreeRTOS 提供以下 API，用于管理线程局部变量：

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

此时，可以分配的最大变量数量受 `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` 限制。变量保存在任务控制块 (TCB) 中，并由其索引访问。注意，索引 0 保留，供 ESP-IDF 内部使用。

通过使用上述 API，你可以分配任意大小的线程局部变量，并将其分配给任意数量的任务。不同任务可以拥有不同的 TLS 变量集。

如果变量大小超过 4 个字节，你需要负责为其分配/释放内存。在任务删除时，FreeRTOS 会释放变量，但必须提供回调函数来适当清理。

4.26.3 Pthread API

ESP-IDF 提供以下 *POSIX Thread*，用于管理线程局部变量：

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

Pthread API 具备 FreeRTOS 原生 API 的所有优点，并突破了 FreeRTOS 原生 API 的部分限制，如变量数量仅受堆上可用内存大小的限制。然而由于 Pthread API 具备动态性质，与原生 API 相比，这个 API 引入了额外的性能开销。

4.26.4 C11 标准

ESP-IDF FreeRTOS 支持基于 C11 标准的线程局部变量，使用 `__thread` 关键字指定。要了解 GCC 功能详情，请参阅 [GCC 文档](#)。

这类变量的存储空间分配在任务栈上。请注意，即使任务根本不使用这些变量，程序中所有这类变量的存储区域都会在系统中每个任务的栈上分配。例如，ESP-IDF 系统任务（如 `ipc`、`timer` 任务等）也有额外的栈空间分配。因此，使用这个特性时，需要谨慎考虑。

在使用 C11 线程局部变量时，可以针对以下特点进行权衡：在编程中使用 C11 线程局部变量非常方便，使用最少的 CPU 指令即可访问，但这一优势的代价是系统中所有任务都会额外使用栈。由于变量分配的静态性质，系统中的所有任务具有一组相同的 C11 线程局部变量。

4.27 工具

4.27.1 IDF 前端工具 - `idf.py`

`idf.py` 命令行工具提供了一个前端界面，管理工程构建、工程部署及工程调试等操作。该前端界面使用多项工具，如：

- `CMake` 用于配置要构建的工程。
- `Ninja` 用于构建工程。
- `esptool.py` 用于烧录目标芯片。

第五步：开始使用 ESP-IDF 吧 简要介绍了设置 `idf.py` 以配置、构建及烧录工程的操作流程。

重要： `idf.py` 应在 ESP-IDF 工程目录下运行，即包含 `CMakeLists.txt` 文件的目录。旧版本工程，即包含 `Makefile` 的目录，与 `idf.py` 不兼容。

常用命令

创建新工程：`create-project`

```
idf.py create-project <project name>
```

此命令将创建一个新的 ESP-IDF 工程。此外，使用 `--path` 选项可指定工程创建路径。

创建新组件：`create-component`

```
idf.py create-component <component name>
```

此命令将创建一个新的组件，包含构建所需的最基本文件集。使用 `-C` 选项可指定组件创建目录。有关组件的更多信息，请参阅 [组件 CMakeLists 文件](#)。

选择目标芯片: set-target ESP-IDF 支持多个目标芯片, 运行 `idf.py --list-targets` 查看当前 ESP-IDF 版本支持的所有目标芯片。

```
idf.py set-target <target>
```

此命令将设置当前工程的目标芯片。

重要: `idf.py set-target` 将清除构建目录, 并重新生成 `sdkconfig` 文件, 原来的 `sdkconfig` 文件保存为 `sdkconfig.old`。

备注: `idf.py set-target` 命令与以下操作效果相同:

1. 清除构建目录 (`idf.py fullclean`)
2. 删除 `sdkconfig` 文件 (`mv sdkconfig sdkconfig.old`)
3. 使用新的目标芯片重新配置工程 (`idf.py -DIDF_TARGET=esp32 reconfigure`)

所需的 `IDF_TARGET` 还可以作为环境变量 (如 `export IDF_TARGET=esp32s2`) 或 CMake 变量 (如将 `-DIDF_TARGET=esp32s2` 作为 CMake 或 `idf.py` 的参数) 传递。在经常使用同类芯片的情况下, 设置环境变量将使操作更加便利。

要给指定工程设定 `IDF_TARGET` 的默认值, 请将 `CONFIG_IDF_TARGET` 选项添加到该工程的 `sdkconfig.defaults` 文件 (如 `CONFIG_IDF_TARGET="esp32s2"`)。若未通过使用环境变量、CMake 变量或 `idf.py set-target` 命令等方法指定 `IDF_TARGET`, 则默认使用该选项的值。

若未通过以上任一方法设置目标芯片, 构建系统将默认使用 `esp32`。

启动图形配置工具: menuconfig

```
idf.py menuconfig
```

构建工程: build

```
idf.py build
```

此命令将构建当前目录下的工程, 具体步骤如下:

- 若有需要, 创建构建子目录 `build` 保存构建输出文件, 使用 `-B` 选项可改变子目录的路径。
- 必要时运行 CMake 配置工程, 并为主要构建工具生成构建文件。
- 运行主要构建工具 ([Ninja](#) 或 GNU Make)。默认情况下, 构建工具会完成自动检测, 也可通过将 `-G` 选项传递给 `idf.py` 来显式设置构建工具。

构建是增量行为, 因此若上次构建结束后, 源文件或配置并未发生更改, 则不会执行任何操作。

此外, 使用 `app`、`bootloader` 或 `partition-table` 参数运行此命令, 可选择仅构建应用程序、引导加载程序或分区表。

清除构建输出: clean

```
idf.py clean
```

此命令可清除构建目录中的构建输出文件, 下次构建时, 工程将完全重新构建。注意, 使用此选项不会删除构建文件夹内的 CMake 配置输出。

删除所有构建内容: fullclean

```
idf.py fullclean
```

此命令将删除所有 `build` 子目录内容, 包括 CMake 配置输出。下次构建时, CMake 将重新配置其输出。注意, 此命令将递归删除构建目录下的所有文件 (工程配置将保留), 请谨慎使用。

烧录工程: flash

```
idf.py flash
```

此命令将在需要时自动构建工程，随后将其烧录到目标芯片。使用 `-p` 和 `-b` 选项可分别设置串口名称和烧录程序的波特率。

备注：环境变量 `ESPPORT` 和 `ESPBAUD` 可分别设置 `-p` 和 `-b` 选项的默认值，在命令行上设置这些选项的参数可覆盖默认值。

与 `build` 命令类似，使用 `app`、`bootloader` 或 `partition-table` 参数运行此命令，可选择仅烧录应用程序、引导加载程序或分区表。

错误处理提示

`idf.py` 使用存储在 `tools/idf_py_actions/hints.yml` 中的提示数据库，当找到与给定错误相匹配的提示时，`idf.py` 会打印该提示以尝试提供解决方案。目前，错误处理提示不支持 `menuconfig` 对象。

若无需该功能，可以通过 `idf.py` 的 `--no-hints` 参数关闭提示。

重要提示

多个 `idf.py` 命令可以在同一行命令中组合使用。例如，`idf.py -p COM4 clean flash monitor` 可以清除源代码树、编译工程、并将其烧录到目标芯片，随后运行串行监视器。

在同一调用中，多个 `idf.py` 命令的顺序并不重要，它们将自动以正确的程序执行，以使全部操作生效（例如先构建后烧录、先擦除后烧录）。

`idf.py` 会尝试将未知命令作为构建系统目标执行。

命令 `idf.py` 支持 `bash`、`zsh` 和 `fish shell` 的 `shell` 自动补全。

调用命令 `export` 为 `idf.py` 启用自动补全（[第四步：设置环境变量](#)），按 `TAB` 键启动自动补全。输入 `idf.py -` 并按 `TAB` 键以自动补全选项。

预计未来版本将支持 `PowerShell` 自动补全。

高级命令

打开文档: docs

```
idf.py docs
```

此命令将在浏览器中打开工程目标芯片和 `ESP-IDF` 版本对应的文档。

显示大小: Size

```
idf.py size
```

此命令将显示应用程序大小，包括占用的 `RAM` 和 `flash` 及各部分（如 `bss`）的大小。

```
idf.py size-components
```

此命令将显示工程中各个组件的应用程序大小。

```
idf.py size-files
```

该命令将显示工程中每个源文件的大小。

选项

- `--format` 指定输出格式，可输出 `text`、`csv`、`json` 格式，默认格式为 `text`。
- `--output-file` 可选参数，可以指定命令输出文件的文件名，而非标准输出。

重新配置工程: `reconfigure`

```
idf.py reconfigure
```

此命令将重新运行 **CMake**。正常情况下并不会用到该命令，因为一般无需重新运行 **CMake**，但如果从源代码树中添加或删除了文件，或需要修改 **CMake** 缓存变量时，将有必要使用该命令。例如，`idf.py -DNAME='VALUE' reconfigure` 可将变量 `NAME` 在 **CMake** 缓存中设置为值 `VALUE`。

清除 Python 字节码: `python-clean`

```
idf.py python-clean
```

此命令将从 **ESP-IDF** 目录中删除生成的 Python 字节码。字节码在切换 **ESP-IDF** 和 Python 版本时可能会引起问题，建议在切换 Python 版本后运行此命令。

生成 UF2 二进制文件: `uf2`

```
idf.py uf2
```

此命令将在构建目录中生成一个 **UF2 (USB 烧录格式)** 二进制文件 `uf2.bin`，该文件包含所有烧录目标芯片所必需的二进制文件，即引导加载程序、应用程序和分区表。

在 **ESP** 芯片上运行 **ESP USB Bridge** 项目将创建一个 **USB** 大容量存储设备，用户可以将生成的 **UF2** 文件复制到该 **USB** 设备中，桥接 **MCU** 将使用该文件来烧录目标 **MCU**。这一操作十分简单，只需将文件复制（或“拖放”）到文件资源管理器访问的公开磁盘中即可。

如需仅为应用程序生成 **UF2** 二进制文件，即不包含加载引导程序和分区表，请使用 `uf2-app` 命令。

```
idf.py uf2-app
```

读取 Otadata 分区: `read-otadata`

```
idf.py read-otadata
```

此命令将打印 `otadata` 分区的内容，该分区存储当前所选 **OTA** 应用程序分区的信息。有关 `otadata` 分区的更多信息，请参阅[空中升级 \(OTA\)](#)。

全局选项

运行 `idf.py --help` 列出所有可用的根级别选项。要列出特定子命令的选项，请运行 `idf.py <command> --help`，如 `idf.py monitor --help`。部分常用选项如下：

- `-C <dir>` 支持从默认当前工作目录覆盖工程目录。
- `-B <dir>` 支持从工程目录的默认 `build` 子目录覆盖构建目录。
- `--ccache` 可以在安装了 **CCache** 工具的前提下，在构建源文件时启用 **CCache**，减少部分构建耗时。

重要： 注意，某些旧版本 **CCache** 在某些平台上存在 `bug`，因此如果文件没有按预期重新构建，可禁用 **CCache** 并重新构建。可以通过将环境变量 `IDF_CCACHE_ENABLE` 设置为非零值来默认启用 **CCache**。

- `-v` 会使 `idf.py` 和构建系统生成详细的构建输出，有助于调试构建错误。
- `--cmake-warn-uninitialized`（或 `-w`）将使 **CMake** 只显示在工程目录中发现的变量未初始化的警告，该选项仅控制 **CMake** 内部的 **CMake** 变量警告，不控制其他类型的构建警告。将环境变量 `IDF_CMAKE_WARN_UNINITIALIZED` 设置为非零值，可永久启用该选项。

- `--no-hints` 用于禁用有关错误处理的提示并禁用捕获输出。

通过 @file 传递参数 可以通过文件向 `idf.py` 传递多个参数。该文件或文件路径须在开头使用 `@` 进行标注。文件中的参数支持通过换行或空格分隔，并按其在 `idf.py` 命令行中的顺序扩展。

例如，当前有文件 `custom_flash.txt`：

```
flash --baud 115200
```

运行命令：`idf.py @custom_flash.txt monitor`

文件中的参数可以与额外的命令行参数结合使用，也支持同时使用带有 `@` 标注的多个文件。例如，另有一个文件 `another_config.txt`，此时，可以通过指定 `idf.py @custom_flash.txt @another_config.txt monitor` 同时使用两个文件。

关于参数文件的更多示例，如通过 `@filename` 创建配置文件概要，请参阅 [多个构建配置示例](#)。

4.27.2 IDF 监视器

IDF 监视器是一个串行终端程序，使用了 `esp-idf-monitor` 包，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 ESP-IDF 的其他特性。

在 ESP-IDF 中调用 `idf.py monitor` 可以启用此监视器。

操作快捷键

为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。这些快捷键可以自定义，请查看 [配置文件](#) 章节了解详情。

| 快捷键 | 操作 | 描述 |
|----------------------|--------------------------------------|--|
| Ctrl +] | 退出监视器程序 | |
| Ctrl + T | 菜单退出键 | 按下如下给出的任意键之一，并按指示操作。 |
| • Ctrl + T | 将菜单字符发送至远程 | |
| • Ctrl +] | 将 exit 字符发送至远程 | |
| • Ctrl + P | 重置目标设备，进入引导加载程序，通过 RTS 和 DTR 线暂停应用程序 | 重置目标设备，通过 RTS 和 DTR 线（如已连接）进入引导加载程序。这会阻止开发板运行任何程序，在等待其他设备启动时可以使用此操作。更多详细信息，请参考 复位目标到引导加载程序 。 |
| • Ctrl + R | 通过 RTS 线重置目标设备 | 重置设备，并通过 RTS 线（如已连接）重新启动应用程序。 |
| • Ctrl + F | 编译并烧录此项目 | 暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。 |
| • Ctrl + A (或者 A) | 仅编译及烧录应用程序 | 暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。 |
| • Ctrl + Y | 停止/恢复在屏幕上打印日志输出 | 激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。 |
| • Ctrl + L | 停止/恢复向文件写入日志输出 | 在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）。 |
| • Ctrl + I (或者 I) | 停止/恢复打印时间标记 | IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 <code>--timestamp-format</code> 命令行参数来改变。 |
| • Ctrl + H (或者 H) | 显示所有快捷键 | |
| • Ctrl + X (或者 X) | 退出监视器程序 | |
| Ctrl + C | 中断正在运行的应用程序 | 暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启用 <code>ref: CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME</code> 选项。 |

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

兼具 ESP-IDF 特性

自动解码地址 每当芯片输出指向可执行代码的十六进制地址时，IDF 监视器将查找该地址在源代码中的位置（文件名和行号），并在下一行用黄色打印出该位置。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:
PC      : 0x400f360d  PS      : 0x00060330  A0      : 0x800dbf56  A1      :

IDF 监视器在后台运行以下命令, 解码各地址:

```
xtensa-esp32s2-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

如果在应用程序源代码中找不到匹配的地址, IDF 监视器还会检查 ROM 代码。此时不会打印源文件名和行号, 只显示函数名 in ROM:

```

abort() was called at PC 0x40007c69 on core 0
0x40007c69: ets_write_char in ROM

Backtrace: 0x40081656:0x3ffb4ac0 0x40085729:0x3ffb4ae0 0x4008a7ce:0x3ffb4b00

↳FreeRTOS-Kernel/portable/xtensa/port.c:162
.....

```

ROMELF 文件会根据 `IDF_PATH` 和 `ESP_ROM_ELF_DIR` 环境变量的路径自动加载。如需覆盖此行为, 可以通过调用 `esp_idf_monitor` 并指定特定的 ROMELF 文件路径: `python -m esp_idf_monitor --rom-elf-file [ROM ELF 文件的路径]`。

备注: 将环境变量 `ESP_MONITOR_DECODE` 设置为 0 或者调用 `esp_idf_monitor` 的特定命令行选项 `python -m esp_idf_monitor --disable-address-decoding` 来禁止地址解码。

连接时复位目标芯片 默认情况下, IDF 监视器会在目标芯片连接时通过 DTR 和 RTS 串行线自动复位芯片。要防止 IDF 监视器在连接时自动复位, 请在调用 IDF 监视器时加上选项 `--no-reset`, 如 `idf.py monitor --no-reset`, 或者将环境变量 `ESP_IDF_MONITOR_NO_RESET` 设置成 1。

备注: `--no-reset` 选项在 IDF 监视器连接到特定端口时可以实现同样的效果, 如 `idf.py monitor --no-reset -p [PORT]`。

复位目标到引导加载程序 IDF 监视器可以通过预定义的复位序列将芯片复位到引导加载程序, 该序列已经经过调整, 可以在大多数环境中正常工作。此外, 用户可以设置自定义复位序列。通过对复位序列进行微调, 使其适应各种情况。

使用预定义的复位序列 IDF 监视器的默认复位序列可在大多数环境中使用。使用默认序列复位芯片到引导加载程序中, 无需进行额外配置。

自定义复位序列 对于高级用户或特定用例, IDF 监视器支持使用[配置文件](#)配置自定义复位序列。这在默认序列可能不足的极端情况下特别有用。

复位序列可通过以下格式的字符串定义:

- 各个命令由 | 分隔 (例如 `R0|D1|W0.5`)。
- 命令 (例如 `R0`) 由代码 (R) 和参数 (0) 定义。

| 代码 | 操作 | 参数 |
|----|-----------------------------------|---------------------|
| D | 设置 DTR 控制线 | 1/0 |
| R | 设置 RTS 控制线 | 1/0 |
| U | 同时设置 DTR 和 RTS 控制线（仅适用于类 Unix 系统） | 0, 0/0, 1/1, 0/1, 1 |
| W | 等待 N 秒（其中 N 为浮点数） | N |

示例：

```
[esp-idf-monitor]
custom_reset_sequence = U0,1|W0.1|D1|R0|W0.5|D0
```

有关更多详细信息，请参阅 Esptool 文档中 [custom reset sequence](#) 章节。请注意，IDF 监视器只使用了 Esptool 配置中的 `custom_reset_sequence` 值，其他值会被 IDF 监视器忽略。

IDF 监视器和 Esptool 之间共享配置 自定义复位序列的配置可以在 IDF 监视器和 Esptool 之间的共享配置文件中指定。在这种情况下，为了使两个工具都能识别配置文件，其名称应为 `setup.cfg` 或 `tox.ini`。

共享配置文件的示例：

```
[esp-idf-monitor]
menu_key = T
skip_menu_key = True

[esptool]
custom_reset_sequence = U0,1|W0.1|D1|R0|W0.5|D0
```

备注： 当在 `[esp-idf-monitor]` 部分和 `[esptool]` 部分都使用 `custom_reset_sequence` 参数时，IDF 监视器会优先使用 `[esp-idf-monitor]` 部分的配置。`[esptool]` 部分中任何与之冲突的配置都将被忽略。

当配置分散在多个文件中时，此优先规则也适用。全局 `esp-idf-monitor` 配置将优先于本地 `esptool` 配置。

配置 GDBStub 以启用 GDB GDBStub 支持在运行时进行调试。GDBStub 在目标上运行，并通过串口连接到主机从而接收调试命令。GDBStub 支持读取内存和变量、检查调用堆栈帧等命令。虽然没有 JTAG 调试通用，但由于 GDBStub 完全通过串行端口完成通信，故不需要使用特殊硬件（如 JTAG/USB 桥接器）。

通过设置 `CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME`，可以将目标配置为在后台运行 GDBStub。GDBStub 将保持在后台运行，直到通过串行端口发送 `Ctrl+C` 导致应用程序中断（即停止程序执行），从而让 GDBStub 处理调试命令。

此外，还可以通过设置 `CONFIG_ESP_SYSTEM_PANIC` 为 `GDBStub on panic` 来配置 `panic` 处理程序，使其在发生 `crash` 事件时运行 GDBStub。当 `crash` 发生时，GDBStub 将通过串口输出特殊的字符串模式，表示 GDBStub 正在运行。

无论是通过发送 `Ctrl+C` 还是收到特殊字符串模式，IDF 监视器都会自动启动 GDB，从而让用户发送调试命令。GDB 退出后，通过 RTS 串口线复位目标。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

备注： IDF 监视器在后台运行如下命令启用 GDB：

```
xtensa-esp32s2-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↳ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

输出筛选 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，即打印所有内容。支持使用环境变量 `ESP_IDF_MONITOR_PRINT_FILTER` 调整筛选设置。

备注：同时使用环境变量 `ESP_IDF_MONITOR_PRINT_FILTER` 和参数 `--print-filter` 时，通过命令行输入的 CLI 参数 `--print-filter` 优先级更高。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 {N, E, W, I, D, V, *} 集合中的一个字母，指的是 **日志** 级别。

例如，`--print_filter="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

备注：编译时，可以使用主日志在 **日志库** 中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 `*`、冒号 `:`，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- `*` 可用于匹配任何类型标签。但 `--print_filter="*:I tag1:E"` 打印关于 `tag1` 的输出时会报错，这是因为 `tag1` 规则比 `*` 规则的优先级高。
- 默认规则（空）等价于 `*:V`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `*:N` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 **Info** 详细度级别或更低级别打印 `tag1`，在 **Warning** 详细度级别或更低级别打印 `tag2`。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 `tag3:N` 指定 `tag3` 不打印。
- `tag3:N` 在规则 `"tag1:I tag2:W tag3:N *:V"` 中更有意义，这是因为如果没有 `tag3:N`，`tag3` 信息就可能打印出来了；`tag1` 和 `tag2` 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

高级筛选规则示例 如下日志是在没有设置任何筛选选项的情况下获得的：

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

`--print_filter="wifi esp_image:E light_driver:I"` 筛选选项捕获的输出如下所示：

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

--print_filter="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V" 选项的输出如下:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

配置文件

esp-idf-monitor 使用 **C0 控制字符** 与控制台进行交互。配置文件中的字符会被转换为对应的 C0 控制代码。可用字符包括英文字母 (A-Z) 和特殊符号: [、]、\、^、和 _。

警告: 注意, 一些字符可能无法在所有平台通用, 或被保留作为其他用途的快捷键。请谨慎使用此功能。

文件位置 配置文件的默认名称为 esp-idf-monitor.cfg。首先, 在 esp-idf-monitor 路径中检测配置文件并运行。

如果此目录中没有检测到配置文件, 则检查当前用户操作系统的配置目录:

- **Linux:** /home/<user>/.config/esp-idf-monitor/
- **MacOS** /Users/<user>/.config/esp-idf-monitor/
- **Windows:** c:\Users\<user>\AppData\Local\esp-idf-monitor\

如仍未检测到配置文件, 会最后再检查主目录:

- **Linux:** /home/<user>/
- **MacOS** /Users/<user>/
- **Windows:** c:\Users\<user>\

在 Windows 中, 可以使用 HOME 或 USERPROFILE 环境变量设置主目录, 因此, Windows 配置目录的位置也取决于这些变量。

还可以使用 ESP_IDF_MONITOR_CFGFILE 环境变量为配置文件指定一个不同的位置, 例如 ESP_IDF_MONITOR_CFGFILE = ~/custom_config.cfg。这一设置的检测优先级高于上述所有位置检测的优先级。

如果没有使用其他配置文件, esp-idf-monitor 会从其他常用的配置文件中读取设置。如果存在 setup.cfg 或 tox.ini 文件, esp-idf-monitor 会自动从这些文件中读取设置。

配置选项 下表列出了可用的配置选项:

| 选项名称 | 描述 | 默认值 |
|---------------------------|---------------------|-------|
| menu_key | 访问主菜单 | T |
| exit_key | 退出监视器 |] |
| chip_reset_key | 初始化芯片重置 | R |
| recompile_upload_key | 重新编译并上传 | F |
| recompile_upload_app_key | 仅重新编译并上传应用程序 | A |
| toggle_output_key | 切换输出显示 | Y |
| toggle_log_key | 切换日志功能 | L |
| toggle_timestamp_key | 切换时间戳显示 | I |
| chip_reset_bootloader_key | 将芯片重置为引导加载模式 | P |
| exit_menu_key | 从菜单中退出监视器 | X |
| skip_menu_key | 设置使用菜单命令时无需按下主菜单键 | False |
| custom_reset_sequence | 复位目标到引导加载程序的自定义复位序列 | 无默认值 |

语法 配置文件为.ini 文件格式，必须以 [esp-idf-monitor] 标头引入才能被识别为有效文件。以下语法以“配置名称 = 配置值”形式列出。以 # 或 ; 开头的行是注释，将被忽略。

```
# esp-idf-monitor.cfg file to configure internal settings of esp-idf-monitor
[esp-idf-monitor]
menu_key = T
exit_key = ]
chip_reset_key = R
recompile_upload_key = F
recompile_upload_app_key = A
toggle_output_key = Y
toggle_log_key = L
toggle_timestamp_key = I
chip_reset_bootloader_key = P
exit_menu_key = X
skip_menu_key = False
```

IDF 监视器已知问题

如果在使用 IDF 监视器过程中遇到任何问题，请查看我们的 [GitHub 仓库](#) 以获取已知问题列表及其当前状态。如果遇到的问题没有相关记录，请创建一个新的问题报告。

4.27.3 IDF Docker 镜像

IDF Docker 镜像 (espressif/idf) 为使用特定版本的 ESP-IDF 自动化构建应用程序和库而设计。

该镜像包含以下内容：

- 常见的实用工具，如 git、wget、curl 和 zip。
- Python 3.8 或更高版本。
- 特定版本 ESP-IDF 的副本。有关版本信息，请参阅下文。该副本中设置了 IDF_PATH 环境变量，并指向容器中 ESP-IDF 的位置。
- 构建特定版本 ESP-IDF 所需工具：CMake、Ninja、交叉编译器工具链等。
- ESP-IDF 需要的所有 Python 软件包。这些软件包均已安装在虚拟环境中。

镜像 ENTRYPOINT 会设置 PATH 环境变量，指向正确版本的工具，并激活 Python 虚拟环境。此时，环境已经准备好，可以使用 ESP-IDF 构建系统。

如需使用其他工具，可用该镜像作为基础自定义镜像。

标签

该镜像维护了以下多个标签：

- latest：跟踪 ESP-IDF 的 master 分支
- vX.Y：对应 ESP-IDF 的版本 vX.Y
- release-vX.Y：跟踪 ESP-IDF 的 release/vX.Y 分支

备注：在引入镜像功能前发布的 ESP-IDF 版本没有对应的 Docker 镜像版本。要查找最新可用标签列表，请参阅 <https://hub.docker.com/r/espressif/idf/tags>。

使用 Docker

设置 Docker 在本地使用 espressif/idf Docker 镜像前，请确保已安装 Docker。如果本地未安装 Docker，请按 <https://docs.docker.com/install/> 提供的说明完成安装。

如果在 CI 环境中使用该镜像，请参阅 CI 服务说明文档，了解如何指定用于构建的镜像。

使用 CMake 构建项目 在项目目录下，运行以下命令：

```
docker run --rm -v $PWD:/project -w /project -u $UID -e HOME=/tmp espressif/idf_
↳idf.py build
```

该命令具体内容如下：

- docker run：运行 Docker 镜像。此为 docker container run 命令的缩写形式。
- --rm：构建完成后删除相应容器。
- -v \$PWD:/project：将主机当前目录(\$PWD)挂载为容器中的 /project 目录。
- -w /project：使 /project 成为当前命令的工作目录。
- -u \$UID：以当前用户的 ID 运行命令，使文件以当前用户而非 root 用户的身份创建。
- -e HOME=/tmp：为用户提供一个主目录，用于将 idf.py 创建的临时文件保存在 ~/.cache 中。
- espressif/idf：使用标签为 latest 的 Docker 镜像 espressif/idf。未指定标签时，Docker 会隐式添加 latest 标签。
- idf.py build：在容器内运行此命令。

备注：如果挂载目录 /project 包含的 git 仓库的用户 (UID) 不同于运行 Docker 容器的用户，在 /project 中执行 git 命令可能会失败，并显示错误信息 fatal: detected dubious ownership in repository at '/project'。如需解决此问题，可以在启动 Docker 容器时设置 IDF_GIT_SAFE_DIR 环境变量，将 /project 目录指定为安全目录。例如，可以将 -e IDF_GIT_SAFE_DIR='/project' 作为参数包含，还可以使用分隔符：指定多个目录，或使用 * 完全禁用此项 git 安全检查。

要以特定 Docker 镜像标签进行构建，请将其指定为 espressif/idf:TAG，示例如下：

```
docker run --rm -v $PWD:/project -w /project -u $UID -e HOME=/tmp espressif/
↳idf:release-v4.4 idf.py build
```

要查看最新可用标签列表，请参阅 <https://hub.docker.com/r/espressif/idf/tags>。

交互使用镜像 Docker 也支持以交互方式进行构建，以调试构建问题或测试自动构建脚本。请使用 -i -t 标志启动容器，示例如下：

```
docker run --rm -v $PWD:/project -w /project -u $UID -e HOME=/tmp -it espressif/idf
```

接着在容器内部照常使用 idf.py：

```
idf.py menuconfig
idf.py build
```

备注：若未将串行接口传递到容器中，则 `idf.py flash` 和 `idf.py monitor` 等与开发板通信的命令在容器中无法正常工作。对于 Linux 系统，可以使用 [设备选项](#) 将串行接口传递到容器中。然而，目前 Windows 系统 (<https://github.com/docker/for-win/issues/1018>) 和 Mac 系统 (<https://github.com/docker/for-mac/issues/900>) 中 Docker 不支持此功能。可以使用 [远程串行接口](#) 克服此限制。有关如何执行此操作，请参阅 [以下使用远程串行接口](#) 章节。

备注：对于 Linux 系统，如果使用 `--device` 或 `--privileged` 等选项将主机的串行接口设备添加到容器，并使用 `-u $UID` 以特定用户启动容器时，请确保此用户对设备具有读/写访问权限。使用 `--group-add` 选项可以将容器用户添加到分配给主机设备的组 ID 中。例如，如果主机设备被分配到 `dialout` 组，你可以使用 `--group-add $(getent group dialout | cut -d':' -f3)` 将容器用户添加到主机的 `dialout` 组。

使用远程串行接口 [RFC2217](#) (Telnet) 协议可用于远程连接到串行接口，详情请参阅 ESP 工具项目的 [远程串行接口](#) 文档。如果无法直接访问 Docker 容器内的串行接口，也可使用该协议进行访问。以下示例展示了如何从 Docker 容器内部使用烧写命令。

在主机上安装并启动 `esp_rfc2217_server`：

- 在 Windows 系统中，该软件包以一个文件的形式提供，这个文件是由 `pyinstaller` 创建的可执行文件，可以从 [ESP 工具版本](#) 页面以 ZIP 压缩文件的形式与其他 ESP 工具一起下载：

```
esp_rfc2217_server -v -p 4000 COM3
```

- 在 Linux 或 macOS 系统中，该软件包是 `esptool` 的组成部分，可以在 [ESP-IDF 环境](#) 中找到，或使用以下 `pip` 命令安装：

```
pip install esptool
```

随后执行以下命令启动服务器：

```
esp_rfc2217_server.py -v -p 4000 /dev/ttyUSB0
```

此时，便可使用以下命令，从 Docker 容器内部烧写连接到主机的设备：

```
docker run --rm -v <host_path>:<container_path> -w /<container_path> espressif/
↪idf idf.py --port 'rfc2217://host.docker.internal:4000?ign_set_control' flash
```

请确保将 `<host_path>` 正确设置为主机上的项目路径，并使用 `-w` 选项将 `<container_path>` 设置为容器内的工作目录。`host.docker.internal` 为特殊的 Docker DNS 名称，用于访问主机。如有需要，可以将其替换为主机的 IP 地址。

构建自定义镜像

ESP-IDF 库中的 Docker 文件提供了以下构建参数，可用于构建自定义 Docker 镜像：

- `IDF_CLONE_URL`：克隆 ESP-IDF 存储库的 URL。在使用 ESP-IDF 分支时，可以将该参数设置为自定义 URL，默认值为 `https://github.com/espressif/esp-idf.git`。
- `IDF_CLONE_BRANCH_OR_TAG`：克隆 ESP-IDF 时使用的 git 分支或标签的名称。该参数将作为 `git clone` 命令的 `--branch` 参数传递，默认值为 `master`。
- `IDF_CHECKOUT_REF`：如果将此参数设置为非空值，在克隆之后会执行 `git checkout $IDF_CHECKOUT_REF` 命令。可以将此参数设置为特定 commit 的 SHA 值，以便切换到所需的版本分支或 commit。例如，在希望使用特定版本分支上的某个 commit 时，就可以将此参数设置为该 commit 的 SHA 值。

- `IDF_CLONE_SHALLOW`: 如果将此参数设置为非空值, 则会在执行 `git clone` 时使用 `--depth=1 --shallow-submodules` 参数。浅克隆的深度可以使用 `IDF_CLONE_SHALLOW_DEPTH` 设置。浅克隆可以极大减少下载的数据量及生成的 Docker 镜像大小。然而, 如果需要切换到此类“浅层”存储库中的其他分支, 必须先执行额外的 `git fetch origin <branch>` 命令。
- `IDF_CLONE_SHALLOW_DEPTH`: 此参数指定进行浅克隆时要使用的深度值。如未设置, 将使用 `--depth=1`。此参数仅在使用 `IDF_CLONE_SHALLOW` 时有效。如果要为分支构建 Docker 镜像, 并且该镜像必须包含该分支上的最新标签, 则需使用此参数。要确定所需的深度, 请在特定的分支运行 `git describe` 命令, 并注意偏移值。将偏移值加 1 后即可将其用作 `IDF_CLONE_SHALLOW_DEPTH` 参数的值。此过程将确保生成的镜像包含分支上的最新标签, 且 Docker 镜像内部的 `git describe` 命令也会按预期工作。
- `IDF_INSTALL_TARGETS`: 以逗号分隔的 ESP-IDF 目标列表, 用于安装工具链, 或者使用 `all` 安装所有目标的工具链。选择特定目标可以减少下载的数据量和生成的 Docker 镜像的大小。该参数默认值为 `all`。

要使用以上参数, 请通过 `--build-arg` 命令行选项传递。例如, 以下命令使用 ESP-IDF v4.4.1 的浅克隆以及仅适用于 ESP32-C3 的工具链构建了 Docker 镜像:

```
docker build -t idf-custom:v4.4.1-esp32c3 \
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
  --build-arg IDF_CLONE_SHALLOW=1 \
  --build-arg IDF_INSTALL_TARGETS=esp32c3 \
  tools/docker
```

4.27.4 IDF Windows 安装程序

命令行参数

IDF Windows 安装程序 `esp-idf-tools-setup` 提供以下命令行参数:

- `/CONFIG=[PATH]` - 指定 ini 配置文件的路径, 覆盖安装程序的默认配置。默认值: `config.ini`。
- `/GITCLEAN=[yes|no]` - 在以离线模式安装时, 执行 `git clean` 命令, 并删除未跟踪的目录。默认值: `yes`。
- `/GITRECURSIVE=[yes|no]` - 递归克隆所有 Git 仓库子模块。默认值: `yes`。
- `/GITREPO=[URL|PATH]` - 指定克隆 ESP-IDF 仓库的 URL。默认值: `https://github.com/espressif/esp-idf.git`。
- `/GITRESET=[yes|no]` - 在安装过程中, 启用或禁用对仓库的 `git reset` 操作。默认值: `yes`。
- `/HELP` - 显示 Inno Setup 安装程序提供的命令行选项。
- `/IDFDIR=[PATH]` - 指定安装目录的路径。默认值: `{userdesktop}\esp-idf`。
- `/IDFVERSION=[v4.3|v4.1|master]` - 使用指定的 ESP-IDF 版本, 如 `v4.1`、`v4.2`、`master`。默认值: `empty`, 选取列表中的第一个版本。
- `/IDFVERSIONSURL=[URL]` - 使用 URL 下载 ESP-IDF 版本列表。默认值: `https://dl.espressif.com/dl/esp-idf/idf_versions.txt`。
- `/LOG=[PATH]` - 在指定目录中存储安装日志文件。默认值: `empty`。
- `/OFFLINE=[yes|no]` - 在离线模式下, 使用 `pip` 执行。通过设置环境变量 `PIP_NO_INDEX`, 也可在离线模式下安装 Python 软件包。默认值: `no`。
- `/USEEMBEDDEDPYTHON=[yes|no]` - 使用嵌入式 Python 版本完成安装。将此参数设置为 `no`, 可以在安装程序中选择 Python 版本。默认值: `yes`。
- `/PYTHONNOUSERSITE=[yes|no]` - 在启动任意 Python 命令前, 设置 `PYTHONNOUSERSITE` 变量, 避免从 `AppDataRoaming` 加载 Python 软件包。默认值: `yes`。
- `/PYTHONWHEELSURL=[URL]` - 指定 PyPi 存储库的 URL, 以解析二进制 Python Wheel 依赖关系。设置环境变量 `PIP_EXTRA_INDEX_URL` 可以实现相同效果。默认值: `https://dl.espressif.com/pypi`。
- `/SKIPSYSTEMCHECK=[yes|no]` - 跳过系统检查页面。默认值: `no`。
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - 执行静默安装。

静默安装

通过设置以下命令行参数，可以静默安装 ESP-IDF：

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

在命令行中运行安装程序时，它会在后台启动一个独立的进程执行安装操作，而不会阻塞命令行的使用。通过以下 PowerShell 脚本可以等待安装程序完成：

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

自定义 Python 版本及 Python Wheel 位置

IDF 安装程序默认使用嵌入的 Python 版本，并参考预定义的 Python Wheel 镜像获取所需软件包。

以下参数支持自定义 Python 版本及 Python Wheel 位置：

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↳org/simple/
```

4.27.5 IDF 组件管理器

IDF 组件管理器工具用于下载 ESP-IDF CMake 项目的依赖项，该下载在 CMake 运行期间自动完成。IDF 组件管理器可以从 [组件注册表](#) 或 Git 仓库获取组件。

要获取组件列表，请参阅 <https://components.espressif.com/>。

有关 IDF 组件管理器的详细信息，请参阅 [IDF 组件管理器及 ESP 组件注册表文档](#)。

在项目中使用 IDF 组件管理器

项目中各组件的依赖项定义在单独的清单文件中，命名为 `idf_component.yml`，位于组件根目录。运行 `idf.py create-manifest` 可以为组件创建清单文件模板。默认情况下将为 `main` 组件创建清单文件。使用 `--path` 选项，可以显式指定创建清单文件的目录路径。使用 `--component=my_component` 选项可以指定组件名称，这样系统将会在 `components` 文件夹下为该组件创建清单文件。`create-manifest` 命令支持以下运行方式：

- `idf.py create-manifest` 为 `main` 组件创建清单文件
- `idf.py create-manifest --component=my_component` 在 `components` 目录下，为组件 `my_component` 创建清单文件
- `idf.py create-manifest --path="../../my_component"` 在 `my_component` 目录下，为组件 `my_component` 创建清单文件

在向项目的某个组件添加新的清单时，必须先运行 `idf.py reconfigure`，手动重新配置项目。随后，构建过程将跟踪 `idf_component.yml` 清单的变更，并在必要时自动触发 CMake。

要为 ESP-IDF 项目中的组件（如 `my_component`）添加依赖项，可以运行命令 `idf.py add-dependency DEPENDENCY`。DEPENDENCY 参数代表一个由 IDF 组件管理器管理的额外组件，而 `my_component` 也依赖于这个组件。DEPENDENCY 参数的格式为 `namespace/name=1.0.0`，`namespace/name` 代表组件名称，`=1.0.0` 是组件的版本范围，详情请参阅 [版本文档](#)。默认情况下，依赖项会添加到 `main` 组件。通过使用 `--path` 选项，可以显式指定包含清单的目录，也可以使用 `--component=my_component`，在 `components` 文件夹中指定组件。`add-dependency` 命令支持以下运行方式：

- `idf.py add-dependency example/cmp` 为 `main` 组件添加依赖项，依赖项为 `example/cmp` 的最新版本

- `idf.py add-dependency --component=my_component example/cmp<=3.3.3` 将依赖项添加到位于 `components` 目录下名为 `my_component` 的组件中，依赖项为版本号 `<=3.3.3` 的 `example/cmp`
- `idf.py add-dependency --path="../../my_component" example/cmp^3.3.3` 将依赖项添加到位于目录 `my_component` 下名为 `my_component` 的组件中，依赖项为版本号 `^3.3.3` 的 `example/cmp`

备注： `add-dependency` 命令会从 [乐鑫组件注册表](#) 将依赖项显式添加到你的项目中。

要更新 ESP-IDF 项目的依赖项，请运行命令 `idf.py update-dependencies`。你也可以使用 `--project-dir PATH` 选项，指定项目目录的路径。

应用程序示例 [build_system/cmake/component_manager](#) 使用了由组件管理器安装的组件。

对于不需要受管理依赖项的组件，则无需提供清单文件。

在 CMake 配置项目（如 `idf.py reconfigure`）时，组件管理器会执行以下操作：

- 处理项目中每个组件的 `idf_component.yml` 清单，并递归解析依赖项。
- 在项目根目录中创建 `dependencies.lock` 文件，包含完整的依赖项列表。
- 将所有依赖项下载至 `managed_components` 目录。

请勿更改 `dependencies.lock` 锁文件和 `managed_components` 目录的内容。组件管理器运行时，会始终确保这些文件处于最新状态。如果意外修改了这些文件，可以通过使用 `idf.py reconfigure` 触发 CMake，重新运行组件管理器。

设置构建属性 `DEPENDENCIES_LOCK` 可以指定顶层 `CMakeLists.txt` 文件中的锁文件路径。例如，在 `project(PROJECT_NAME)` 前添加 `idf_build_set_property(DEPENDENCIES_LOCK dependencies.lock.${IDF_TARGET})`，可以为不同目标生成不同锁文件。

从示例创建项目

组件注册表中，部分组件包含示例项目。要从示例创建一个新项目，可以运行命令 `idf.py create-project-from-example EXAMPLE`。EXAMPLE 参数格式为 `namespace/name=1.0.0:example`，`namespace/name` 代表组件名称，`=1.0.0` 是组件的版本范围（详情请参阅 [版本文档](#)），而 `example` 代表示例名称。在 [乐鑫组件注册表](#) 中，可以找到各组件的示例列表，以及启动组件示例的相应命令。

在清单文件中定义依赖项

通过在文本编辑器直接编辑，你可以轻松定义清单文件 `idf_component.yml` 中的依赖项。以下是有关定义依赖项的简单示例：

你可以通过指定组件名称和版本范围，定义来自注册表的依赖项：

```
dependencies:
# 定义来自注册表 (https://components.espressif.com/component/example/cmp)
↪ 的依赖项
example/cmp: ">=1.0.0"
```

要从 Git 仓库定义依赖关系，请提供组件在仓库中的路径和仓库的 URL：

```
dependencies:
# 从 Git 仓库定义依赖项
test_component:
  path: test_component
  git: ssh://git@gitlab.com/user/components.git
```

在开发组件时，可以通过指定相对或绝对路径，使用本地目录中的组件：

```
dependencies:  
# 通过相对路径定义本地依赖项  
some_local_component:  
  path: ../../projects/component
```

有关清单文件格式的详细信息，请参阅 [清单文件格式文档](#)。

禁用组件管理器

将环境变量 `IDF_COMPONENT_MANAGER` 设置为 0，可以显式禁用组件管理器。

4.27.6 IDF clang-tidy

IDF clang-tidy 是使用 [clang-tidy](#) 对当前应用程序进行静态分析的工具。

警告： IDF clang-tidy 的功能及其依赖的工具链尚在开发中，最终版本发布前可能有重大变更。
目前仅支持基于 clang 的工具链。在配置项目前，必须在环境变量或 CMake 缓存中设置 `IDF_TOOLCHAIN=clang` 进行激活。

准备工作

初次运行此工具时，请按照以下步骤准备该工具：

1. 运行 `idf_tools.py install esp-clang` 安装 clang-tidy 所需的二进制文件。

备注： 该工具链尚在开发中，最终版本发布后，将无需手动安装工具链。

2. 再次运行导出脚本（如 `export.sh`、`export.bat` 等），刷新环境变量。

其他命令

clang-check 运行 `idf.py clang-check` 可以重新生成编译数据库，并在当前项目文件夹下运行 clang-tidy，所得输出写入 `<project_dir>/warnings.txt`。

运行 `idf.py clang-check --help` 查看完整文档。

clang-html-report

1. 运行 `pip install codereport` 安装附加依赖关系。
2. 运行 `idf.py clang-html-report` 会根据 `warnings.txt` 在 `<project_dir>/html_report` 文件夹内生成 HTML 报告。请在浏览器中打开 `<project_dir>/html_report/index.html` 查看报告。

错误报告

此工具托管在 [espressif/clang-tidy-runner](#)。如遇到任何错误，或有任何功能请求，请通过 [Github issues](#) 提交报告。

4.27.7 可下载的 ESP-IDF 工具

构建过程中，ESP-IDF 依赖许多工具，如交叉编译工具链、CMake 构建系统等。

如[快速入门](#)所述，若所需工具版本可用，首选使用当前操作系统的软件包管理器（如 apt、yum、brew 等）安装相关工具。例如，在 Linux 和 macOS 系统中，建议用 Linux 和 macOS 系统的软件包管理器安装 CMake。

但部分 ESP-IDF 的特定工具在操作系统软件包存储库中不可用，且不同版本的 ESP-IDF 需相应使用不同版本的工具运行。为解决以上两个问题，ESP-IDF 提供了一组脚本，可以下载和安装正确的工具版本，并设置相应运行环境。

下文中，这类可下载的工具简称为“工具”。除此类工具外，ESP-IDF 还使用以下工具：

- ESP-IDF 捆绑的 Python 脚本，如 `idf.py`
- 从 PyPI 安装的 Python 软件包

以下各小节介绍了可下载工具的安装方法，并提供了在不同平台上安装的工具列表。

备注： 本文档面向需要自定义其安装过程的高级用户、希望了解安装过程的用户以及 ESP-IDF 开发人员。要了解如何安装 ESP-IDF 工具，请参阅[快速入门](#)。

工具元数据文件

各平台所需工具及工具版本列表存放在 `tools/tools.json` 文件中，`tools/tools_schema.json` 定义了该文件的模式。

在安装工具或设置环境变量时，`tools/idf_tools.py` 脚本将使用上述文件。

工具安装目录

IDF_TOOLS_PATH 环境变量指定下载及安装工具的位置。若未设置该变量，Linux 和 macOS 系统的默认下载安装位置为 `HOME/.espressif`，Windows 系统的默认下载安装位置为 `%USER_PROFILE%\espressif`。

在 IDF_TOOLS_PATH 目录下，工具安装脚本会创建以下子目录和文件：

- `dist` — 工具存档下载位置。
- `tools` — 工具解压缩位置。工具会解压缩到子目录 `tools/TOOL_NAME/VERSION/` 中，该操作支持同时安装不同版本的工具。
- `idf-env.json` — “目标 (target)” 和 “功能 (feature)” 等用户安装选项均存储在此文件中。“目标”为选择需要安装和保持更新的工具的芯片目标；“功能”则决定应安装哪些 Python 软件包。有关用户安装选项的详情，请参阅下文。
- `python_env` — 与工具无关；虚拟 Python 环境安装在其子目录中。注意，设置 `IDF_PYTHON_ENV_PATH` 环境变量可以将 Python 环境目录放置到其他位置。
- `espidf.constraints.*.txt` — 每个 ESP-IDF 版本都有的约束文件，包含 Python 包版本要求。

GitHub 资源镜像

工具下载器下载的工具大多属于 GitHub 发布的资源，即在 GitHub 上伴随软件发布的文件。

如果无法访问 GitHub 下载或访问速度较慢，可以配置一个 GitHub 资源镜像。

要使用乐鑫下载服务器，请将环境变量 `IDF_GITHUB_ASSETS` 设置为 `dl.espressif.com/github_assets`，在国内下载时，也可设置为 `dl.espressif.cn/github_assets` 加快下载速度。安装过程中，当从 `github.com` 下载工具时，URL 将重写为使用乐鑫下载服务器。

只要 URL 与 `github.com` 的下载 URL 格式匹配, 任何镜像服务器均可使用, 安装过程中下载的 GitHub 资源 URL 将把 `https://github.com` 替换为 `https://${IDF_GITHUB_ASSETS}`。

备注: 目前, 乐鑫下载服务器不会镜像 GitHub 上的所有内容, 只镜像部分发布版本的附件资源文件及源文件。

idf_tools.py 脚本

ESP-IDF 随附的 `tools/idf_tools.py` 脚本具备以下功能:

- `install`: 将工具下载到 `${IDF_TOOLS_PATH}/dist` 目录, 并解压缩到 `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`。
`install` 命令接收 `TOOL_NAME` 或 `TOOL_NAME@VERSION` 格式的安装工具列表。如果给定参数 `all`, 则会安装列表上的所有工具, 包括必须项和可选项。如果没有给定参数, 或给定参数为 `required`, 则只安装必须项。
- `download`: 与 `install` 类似, 但不会解压缩工具。使用可选项 `--platform` 可下载特定平台的工具。
- `export`: 列出使用已安装工具前应设置的环境变量。对多数工具而言, 只需要设置环境变量 `PATH`, 但也有些工具需要设置额外的环境变量。
环境变量可以以 `shell` 或 `key-value` 格式列出, 使用 `--format` 参数设置该选项。

- `export` 可选参数:

* `--unset`: 该参数可用于创建语句, 取消特定全局变量设置, 使环境恢复到调用 `export`。
{`sh/fish`} 前的状态。

* `--add_paths_extras`: 该参数将 `$PATH` 中与 ESP-IDF 相关的额外路径添加到 `${IDF_TOOLS_PATH}/esp-idf.json` 中, 以保证在退出当前 ESP-IDF 环境时删除全局变量。例如, 在运行 `export`。`{sh/fish}` 脚本时, 如果在全局变量 `$PATH` 中添加了新的路径, 在命令中添加该参数可以将这些新路径保存到 `${IDF_TOOLS_PATH}/esp-idf.json` 文件中。

- `shell`: 生成适合在 `shell` 中执行的输出, 例如, 在 Linux 和 macOS 上生成以下输出

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

在 Windows 上生成以下输出

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

备注: 当前不支持以 Powershell 格式导出环境变量, 可以用 `key-value` 格式代替。

如果 `shell` 支持, 则该命令的输出可用于更新环境变量。例如

```
eval $(${IDF_PATH}/tools/idf_tools.py export)
```

- `key-value`: 以 `VARIABLE=VALUE` 格式生成输出, 以便其他脚本解析

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

注意, 用于处理此输出的脚本必须对输出中的 `$VAR` 或 `%VAR%` 模式进行扩展, 即解析成对应变量。

- `list`: 列出已知的工具版本, 并指示哪些版本已安装。
以下选项可用于自定义输出。
 - `--outdated`: 仅列出安装在 `IDF_TOOLS_PATH` 中的过时版本工具。
- `check`: 检查每个工具是否在系统路径和 `IDF_TOOLS_PATH` 中可用。
- `install-python-env`: 在 `${IDF_TOOLS_PATH}/python_env` 目录或直接在 `IDF_PYTHON_ENV_PATH` 环境变量设置的目录中创建 Python 虚拟环境, 并在其中安装所需的 Python 软件包。
 - 参数 `--features` 为可选项, 用于指定要添加或删除的功能列表, 功能之间用逗号分隔。
 1. 该参数将删除以 `-` 开头的功能, 添加以 `+` 开头或无符号标记的功能。例如, 要删除功能 `XY`, 示例语法为 `--features=-XY`; 要添加功能 `XY`, 示例语法为 `--features=+XY` 或 `--features=XY`。如果为同一功能同时提供了删除和添加选项, 则不执行任何操作。

2. 每个功能都必须有依赖文件。例如，只有当 `${IDF_PATH}/tools/requirements/requirements.XY.txt` 文件已存在，并包含要安装的 Python 包列表时，功能 XY 才有效。
3. `core` 功能为必须项，确保 ESP-IDF 的核心功能，如控制台中的构建、烧录、监视器、调试等。
4. 用户可选择任意数量的可选功能，已选功能列表存储在 `idf-env.json` 中。
5. 依赖文件中存储了需要安装的 Python 包以及 `espidf.constraints.*.txt` 文件，该约束文件从 <https://dl.espressif.com> 下载，并存储在 `${IDF_TOOLS_PATH}` 目录，包含了针对特定 ESP-IDF 版本的安装包版本要求。

备注： 可以通过使用 `--no-constraints` 参数或将环境变量 `IDF_PYTHON_CHECK_CONSTRAINTS` 设置为 `no`，禁用约束文件的下载和使用，但 **并不建议此做法**。

- `check-python-dependencies`: 检查所有必需的 Python 包是否均已安装。该命令会对比检查由 `idf-env.json` 功能列表从 `${IDF_PATH}/tools/requirements/requirements.*.txt` 所选择的软件包与 `espidf.constraints.*.txt` 文件指定的软件包版本是否一致。

备注： 约束文件可通过 `install-python-env` 命令下载。与 `install-python-env` 命令类似，可以通过使用 `--no-constraints` 参数或将环境变量 `IDF_PYTHON_CHECK_CONSTRAINTS` 设置为 `no`，禁止使用约束文件。

- `uninstall`: 打印并删除当前 ESP-IDF 版本未使用的工具。
 - `--dry-run` 打印已安装但未使用的工具。
 - `--remove-archives` 删除过去下载的所有旧版本软件安装包。

安装脚本

ESP-IDF 的根目录中提供了针对不同 shell 的用户安装脚本，包括：

- `install.bat` 适用于 Windows 命令提示符
- `install.ps1` 适用于 Powershell
- `install.sh` 适用于 Bash
- `install.fish` 适用于 Fish

这些脚本除了下载和安装 `IDF_TOOLS_PATH` 中的工具外，还会准备一个 Python 虚拟环境，并在此虚拟环境中安装所需软件包。

为启用相应功能，这些脚本可以选择性地接受一组以逗号分隔的芯片目标列表及 `--enable-*` 参数，这类参数会传递给 `idf_tools.py` 脚本，并由该脚本将这类参数存储在 `idf-env.json` 中，从而逐步启用芯片目标及功能。

要为所有芯片目标安装工具，请在不使用任何可选参数的情况下，运行 `idf_tools.py install --targets=all`。要安装具备 ESP-IDF 核心功能的 Python 软件包，请运行 `idf_tools.py install-python-env --features=core`。

也可为特定芯片安装工具，例如，运行 `install.sh esp32` 可以只为 ESP32 安装工具。更多相关示例，请参阅 [第三步：设置工具](#)。

运行 `idf_tools.py install-python-env --features=core,XY, install.sh --enable-XY` 可以启用 XY 功能。

导出脚本

由于安装好的工具并非永久添加到用户或系统的 `PATH` 环境变量中，因此，要在命令行中使用这些工具，还需要额外步骤。以下脚本会修改当前 shell 的环境变量，从而使用正确版本的工具：

- `export.bat` 适用于 Windows 命令提示符
- `export.ps1` 适用于 Powershell
- `export.sh` 适用于 Bash

- `export.fish` 适用于 Fish

备注: 在 Bash 中修改 shell 环境时, 必须使用 `./export.sh` 命令加载 `export.sh`, 注意添加前面的点和空格。

`export.sh` 可以在除了 Bash 外的其他 shell (如 zsh) 中使用。但在这种情况下, 必须在运行脚本前设置 `IDF_PATH` 环境变量。在 Bash 中使用时, 脚本会从当前目录猜测 `IDF_PATH` 的值。

除了调用 `idf_tools.py`, 这些脚本还会列出已经添加到 `PATH` 的目录。

其他安装方法

为适用于不同环境, ESP-IDF 提供了更多用户友好的 `idf_tools.py` 包装工具:

- [ESP-IDF 工具安装器](#) 支持下载和安装工具, 其内部使用 `idf_tools.py` 实现功能。
- [ESP-IDF Eclipse 插件](#) 包括了一个用于设置工具的菜单项, 该插件内部调用 `idf_tools.py`。
- [VSCode ESP-IDF 扩展](#) 提供了设置工具的入门流程。尽管此扩展包不依赖 `idf_tools.py`, 但安装方法相同。

自定义安装

推荐用户使用上述方法安装 ESP-IDF 工具, 但也可以选择其他方式来构建 ESP-IDF 应用程序。自定义安装时, 用户需将所有必要的工具都安装在某个位置, 并在 `PATH` 中定义, 以保证 ESP-IDF 构建系统可用。

卸载 ESP-IDF

卸载 ESP-IDF 需要删除安装过程中配置的工具和环境变量。

- 使用 [Windows ESP-IDF 工具安装器](#) 的 Windows 用户可以直接运行卸载向导卸载 ESP-IDF。
- [工具安装目录](#) 下包含了已下载及安装的工具, 删除该目录即可删除此前通过运行 [安装脚本](#) 安装的内容。通过 [导出脚本](#) 设置的环境变量不具备永久性, 新环境中不会存在此类环境变量。
- 如在安装过程中进行了自定义设置, 除删除上述工具外, 可能还涉及手动恢复此前为适用 ESP-IDF 工具而修改的环境变量及系统路径, 例如 `IDF_PYTHON_ENV_PATH` 或 `IDF_TOOLS_PATH`。如存在通过手动复制安装的工具, 则也需手动追踪并删除相关文件。
- 如安装了 [ESP-IDF Eclipse](#) 或 [VSCode ESP-IDF 扩展程序](#) 等插件, 则需按照对应插件文档中的特定卸载说明进行操作。

备注: 卸载 ESP-IDF 工具不会删除任何项目文件或用户代码。为防止意外丢失其他文件, 请在删除文件时谨慎操作。如果对某个步骤的操作有所疑问, 请参考前述安装说明。

上述卸载指南默认需卸载的工具是按本文档中的步骤进行安装的。如果使用了自定义安装, 可能需要进行相应调整。

4.28 ESP32-S2 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是基于目标的测试，该测试使用运行在 esp32s2 上的中央单元测试应用程序。这些测试使用的是基于 [Unity](#) 的单元测试框架。通过把测试用例放在组件的 `test` 子目录，可以将其集成到 ESP-IDF 组件中。本文档主要介绍这种基于目标的测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，暂且只有一小部分 ESP-IDF 组件支持 Mock，具体请参考[基于 Linux 主机的单元测试](#)。

4.28.1 添加常规测试用例

单元测试被添加在相应组件的 `test` 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 `unity.h` 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]")
{
    // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数是用方括号括起来的标识符。标识符用来对相关测试或具有特定属性的测试进行分组。

备注： 没有必要在每个测试用例中使用 `UNITY_BEGIN()` 和 `UNITY_END()` 来声明主函数的区域，`unity_platform.c` 会自动调用 `UNITY_BEGIN()`，然后运行测试用例，最后调用 `UNITY_END()`。

`test` 子目录应包含组件 `CMakeLists.txt`，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 [Unity](#) 测试框架，位于 `unity` 组件里。因此，每个测试组件都需要通过 `REQUIRES` 参数将 `unity` 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 `SRC_DIRS` 用于 `idf_component_register`。

总的来说，test 子目录下最小的 CMakeLists.txt 文件可能如下所示：

```
idf_component_register(SRC_DIRS "."
                      INCLUDE_DIRS "."
                      REQUIRES unity)
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 <http://www.throwtheswitch.org/unity>。

4.28.2 添加多设备测试用例

常规测试用例会在一个在试设备 (Device Under Test, DUT) 上执行。但是，由于要求互相通信的组件（比如 GPIO、SPI）需要与其他设备进行通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 运行测试。

以下是一个多设备测试用例：

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

宏 TEST_CASE_MULTIPLE_DEVICES 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例需要相互之间进行同步。可以通过 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数使用 UART 进行同步操作。上例的场景中，slave 应该在 master 设置好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1 (master) 终端：

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) 终端：

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号，你需要在 DUT1 的终端按回车键，然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞，并开始更改 GPIO 的电平。

4.28.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码。例如，在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，可以通过定义多阶段测试用例来将这些测试函数组合在一起：

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32s2]", trigger_
↪deepsleep, check_deepsleep_reset_reason);
```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

4.28.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）不支持在所有的芯片上执行。请参照本节，让你的单元测试只在其中一部分芯片上执行。

1. 使用宏 `!(TEMPORARY_)DISABLED_FOR_TARGETS()` 包装你的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例：

```
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[ ]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

如果要将其中某个测试在特定芯片上编译，只需要修改禁止的芯片列表。推荐使用一些能在 `soc_caps.h` 中被清楚描述的通用概念来禁止某些单元测试。如果已经进行上述操作，但一些测试在芯片中的调试暂未通过，请同时使用上述两种方法，当调试完成后再移除 `!(TEMPORARY_)DISABLED_FOR_TARGETS()`。例：

```
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. 对于某些你确定不会支持的测试（例如，芯片根本没有该外设），使用 `DISABLED_FOR_TARGETS` 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 runner 资源等），使用 `TEMPORARY_DISABLED_FOR_TARGETS` 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 `test/target` 目录下并用 `CMakeLists.txt` 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果你将一些代码放在 `test/esp32` 目录下避免 `esp32s2` 芯片执行它，一旦你需要在新的芯片（比如 `esp32s3`）中启用该测试，这种结构很难保持代码整洁。

- 请勿继续使用 `CONFIG_IDF_TARGET_XXX` 宏来禁用测试。这种方法会让被禁用的测试项目难以追踪和重新打开。并且，相比于白名单式的 `#if CONFIG_IDF_TARGET_XXX`，黑名单式的 `#if !disabled` 不会导致在新芯片引入时这些测试被自动禁用。但对于测试实现，仍可使用 `#if CONFIG_IDF_TARGET_XXX` 给不同芯片版本选择实现代码。测试项目和测试实现区分如下：
 - 测试项目：那些会在一些芯片上执行，而在另外一些上跳过的项目，例如：
 - 有三个测试项目 `SD 1-bit`、`SD 4-bit` 和 `SDSPI`。对于不支持 `SD Host` 外设的 `ESP32-S2` 芯片，只有 `SDSPI` 一个项目需要被执行。
 - 测试实现：一些始终会发生的代码，但采取的实现方式不同。例如：
 - `ESP8266` 芯片没有 `SDIO_PKT_LEN` 寄存器。如果在测试过程中需要从 `slave` 设备的数据长度，你可以用不同方式读取的 `#if CONFIG_IDF_TARGET_` 宏来保护不同的实现代码。但请注意避免使用 `#else` 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

4.28.5 编译单元测试程序

按照 `esp-idf` 顶层目录的 `README` 文件中的说明进行操作，请确保 `IDF_PATH` 环境变量已经被设置指向了 `esp-idf` 的顶层目录。

切换到 `tools/unit-test-app` 目录下进行配置和编译：

- `idf.py menuconfig` - 配置单元测试程序。
- `idf.py -T all build` - 编译单元测试程序，测试每个组件 `test` 子目录下的用例。
- `idf.py -T "xxx yyy" build` - 编译单元测试程序，对以空格分隔的特定组件进行测试（如 `idf.py -T heap build` - 仅对 `heap` 组件目录下的单元测试程序进行编译）。
- `idf.py -T all -E "xxx yyy" build` - 编译单元测试程序，测试除指定组件之外的所有组件（例如 `idf.py -T all -E "ulp mbedt1s" build` - 编译所有的单元测试，不包括 `ulp` 和 `mbedt1s` 组件。）。

备注：由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：`idf.py -T xxx -T yyy build` 或者在 `PowerShell` 中使用 `idf.py -T \"xxx yyy\" build`，在 Windows 命令提示符中使用 `idf.py -T \"^\"ssd1306 hts221\"^\" build`。

当编译完成时，它会打印出烧写芯片的指令。你只需要运行 `idf.py flash` 即可烧写所有编译输出的文件。

你还可以运行 `idf.py -T all flash` 或者 `idf.py -T xxx flash` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。更多信息，见 <tools/unit-test-app/README.md>。

4.28.6 运行单元测试

备注：我们还提供基于 `pytest` 的框架 `pytest-embedded`，以便更方便、高效地运行单元测试。如需在 `CI` 中运行测试或连续运行多个测试，不妨尝试这一框架。了解更多信息，请查看 [pytest-embedded 文档](#) 和 [ESP-IDF pytest 指南](#)。

烧写完成后重启 `ESP32-S2`，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

```
Here is the test menu, pick your combo:
(1)  "esp_ota_begin() verifies arguments" [ota]
(2)  "esp_ota_get_next_update_partition logic" [ota]
(3)  "Verify bootloader image in flash" [bootloader_support]
(4)  "Verify unit test app image" [bootloader_support]
(5)  "can use new and delete" [cxx]
```

(下页继续)

```

(6)    "can call virtual functions" [cxx]
(7)    "can use static initializers for non-POD types" [cxx]
(8)    "can use std::vector" [cxx]
(9)    "static initialization guards work as expected" [cxx]
(10)   "global initializers run in the correct order" [cxx]
(11)   "before scheduler has started, static initializers work correctly" [cxx]
(12)   "adc2 work with wifi" [adc]
(13)   "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"
(14)   "SPI Master clockdiv calculation routines" [spi]
(15)   "SPI Master test" [spi][ignore]
(16)   "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)   "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)" ↪
↪[spi]
(18)   "SPI Master DMA test, TX and RX in different regions" [spi]
(19)   "SPI Master DMA test: length, start, not aligned" [spi]
(20)   "reset reason check for deepsleep" [esp32s2][test_env=UT_T2_1][multi_stage]
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"

```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi_device] 和 [multi_stage] 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 TEST_CASE_MULTIPLE_STAGES 和 TEST_CASE_MULTIPLE_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```

Running gpio master/slave test example...
gpio master/slave test example
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"

```

你需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```

Running reset reason check for deepsleep...
reset reason check for deepsleep
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"

```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

4.28.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部存储器中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞，从而导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即最大限度地减少缓存缺失）。理论上，这会影响执行速度，但这些因素通常无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行时间和构建时的测量时间可能会有所差异，减少差异的方法之一是将代码和数据分别放在指令或数据 RAM (IRAM/DRAM) 中。CPU 可以直接访问 IRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是上述方法的替代方法，该计时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 `ccomp_timer_start`，使调度器进入睡眠状态，唤醒并在另一个内核上重新调度，那么对应的 `ccomp_timer_stop` 将无效。

4.28.8 Mocks

备注：目前，只有一些特定的组件在 Linux 主机上运行时才能 Mock。未来我们计划，无论是在 Linux 主机上运行还是在目标芯片 ESP32-S2 上运行，ESP-IDF 所有重要的组件都可以实现 Mock。

嵌入式系统中单元测试的最大问题之一是对硬件依赖性极强。直接在 ESP32-S2 上运行单元测试对于上层组件来说存在极大的困难，原因如下：

- 受下层组件和/或硬件设置的影响，测试可靠性降低。
- 由于下层组件和/或硬件设置的限制，测试边缘案例的难度提高。
- 由于数量庞大的依赖关系影响了行为，识别根本原因的难度提高。

当测试一个特定的组件（即被测组件）时，通过软件进行 Mock 能让所有被测组件的依赖在软件中被完全替换（即 Mock）。为了实现该功能，ESP-IDF 集成了 CMock 的 Mock 框架作为组件。通过在 ESP-IDF 的构建系统中添加一些 CMake 函数，可以方便地 Mock 整个（或部分）ESP-IDF 组件。

理想情况下，被测组件所依赖的所有组件都应该被 Mock，从而让测试环境完全控制与被测组件之间的所有交互。然而，如果 Mock 所有的组件过于复杂或冗长（例如需要模拟过多的函数调用），以下做法可能会有帮助：

- 在测试代码中包含更多“真正”（非模拟）代码。这样做可能有效，但同时也会增加对“真正”代码行为的依赖。此外，一旦测试失败，很难判断失败原因是因为实际测试代码还是“真正”的 ESP-IDF 代码。
- 重新评估被测代码的设计，尝试将被测代码划分为更易于管理的组件来减少其依赖性。这可能看起来很麻烦，但众所周知，单元测试经常暴露软件设计的弱点。修复设计上的弱点不仅在短期内有助于进行单元测试，而且还有助于长期的代码维护。

请参考 [cmock/CMock/docs/CMock_Summary.md](#) 了解 CMock 工作原理以及如何创建和使用 Mock。

要求

目前 Mock 只支持基于 Linux 主机的单元测试。生成 Mock 需要满足如下要求：

- 已安装 ESP-IDF 及使用 ESP-IDF 的所有依赖项
- 满足系统软件包需求 (libbsd、libbsd-dev)
- Linux 或 macOS 和 GCC 编译器已更新至足够新的版本
- 应用程序所依赖的所有组件必须受 Linux 目标 (Linux/POSIX 模拟器) 支持，或可进行模拟

对于在 Linux 目标上运行的应用程序，需要在应用程序根目录的 CMakeLists.txt 文件中，设置 COMPONENTS 变量为 main，具体操作如下：

```
set (COMPONENTS main)
```

为方便起见，应用程序会在构建过程中，自动包含 ESP-IDF 的所有组件，执行上述代码则可以防止此类情况。

对组件进行 Mock

如果 ESP-IDF 中已对组件进行 Mock (也称为 组件模拟)，那么只要满足要求，该版本即可立即投入使用。已进行 Mock 的组件列表，可参考[组件 Linux/Mock 支持情况概述](#)。具体组件模拟的使用方法，请参考[修改单元测试文件](#)。

如果 ESP-IDF 尚未提供任何组件模拟，则需要创建组件的 Mock 版本，以特定方式覆盖组件。覆盖组件时，需要创建一个与原始组件名称完全相同的组件，让构建系统先发现原始组件，再发现这个具有相同名称的新组件。具体可参考[同名组件](#)。

在组件模拟中需要指定如下部分：

- 头文件，头文件中提供了需要生成模拟的函数
- 上述头文件的路径
- 模拟组件的依赖 (如果头文件中包含了其他组件的文件，那么这点非常必要)

以上这些部分都需要使用 ESP-IDF 构建系统函数 `idf_component_mock` 指定。你可以使用 ESP-IDF 构建系统函数 `idf_component_get_property`，并加上标签 `COMPONENT_OVERRIDEN_DIR` 来访问原始组件的组件目录，然后使用 `idf_component_mock` 注册模拟组件。

```
idf_component_get_property(original_component_dir <original-component-name>_
↳COMPONENT_OVERRIDEN_DIR)
...
idf_component_mock(INCLUDE_DIRS "${original_component_dir}/include"
  REQUIRES freertos
  MOCK_HEADER_FILES ${original_component_dir}/include/header_containing_
↳functions_to_mock.h)
```

组件模拟还需要一个单独的 mock 目录，里面包含一个 `mock_config.yaml` 文件用于配置 CMock。以下是一份简单的 `mock_config.yaml` 文件：

```
:cmock:
  :plugins:
    - expect
    - expect_any_args
```

更多关于 CMock yaml 类型配置文件的详细信息，请查看 [cmock/CMock/docs/CMock_Summary.md](#)。

请注意，组件模拟不一定要对原始组件进行整体模拟。只要组件模拟满足测试项目的依赖以及其他代码对原始组件的依赖，部分模拟就足够了。事实上，ESP-IDF 中 `tools/mocks` 中的大多数组件模拟都只是部分地模拟了原始组件。

可在 ESP-IDF 目录的 `tools/mocks` 下找到组件模拟的示例。有关如何覆盖 ESP-IDF 组件，可查看[同名组件](#)。

- [NVS 页面类的单元测试](#)。
- [esp_event 的单元测试](#)。
- [mqtt 的单元测试](#)。

修改单元测试文件

单元测试需要通知 `cmake` 构建系统对依赖的组件进行模拟（即用模拟组件来覆盖原始组件）。这可以通过将组件模拟放到项目的 `components` 目录，或者在项目的根目录 `CMakeLists.txt` 文件中使用以下代码来添加模拟组件的目录来实现：

```
list(APPEND EXTRA_COMPONENT_DIRS "<mock_component_dir>")
```

这两种方法都会让组件模拟覆盖 ESP-IDF 中的现有组件。如果你使用的是 ESP-IDF 提供的组件模拟，则第二个方法更加方便。

可参考 `esp_event` 基于主机的单元测试及其 `esp_event/host_test/esp_event_unit_test/CMakeLists.txt` 作为组件模拟的示例。

4.29 在主机上运行 ESP-IDF 应用程序

备注：在主机上运行 ESP-IDF 应用程序的功能仍处于试验阶段，无法保证 API 的稳定性。欢迎用户通过 [ESP-IDF GitHub 仓库](#) 或 [ESP32 论坛](#) 提供反馈意见，助力未来 ESP-IDF 基于主机的应用程序设计。

本文档概述了在 Linux 上运行 ESP-IDF 应用程序的方法，并介绍了可以在 Linux 上运行的常见 ESP-IDF 应用程序类型。

4.29.1 介绍

ESP-IDF 应用程序通常在主机上进行构建（交叉编译），然后上传（即烧录）到 ESP 芯片上运行，并由主机通过 UART/USB 端口监控。然而，在 ESP 芯片上运行 ESP-IDF 应用程序在各种开发/使用/测试场景下可能存在限制。

因此，ESP-IDF 支持在同一台 Linux 主机上构建和运行其应用程序。在主机上运行 ESP-IDF 应用程序具有以下几个优点：

- 无需上传到目标芯片。
- 应用程序在主机上的运行速度比在 ESP 芯片上快。
- 除主机本身外，无特定硬件要求。
- 更易进行软件测试的自动化和设置。
- 提供大量用于代码和运行分析的工具，如 `Valgrind`。

许多 ESP-IDF 组件依赖支持特定芯片的硬件，因此在主机上运行应用程序时，必须对这些硬件依赖文件进行模拟或仿真。目前，ESP-IDF 支持以下模拟和仿真方法：

1. 使用 [FreeRTOS POSIX/Linux 模拟器](#) 可以模拟 FreeRTOS 调度。在此模拟的基础上，在主机上运行应用程序时也会模拟或使用其他 API。
2. 使用 [CMock](#) 可以模拟所有依赖文件，并在完全独立的情况下运行代码。

原则上，这两种方法（POSIX/Linux 模拟器和使用 CMock 模拟）可以混用，但此功能在 ESP-IDF 中尚未实现。注意，尽管名称中包含 POSIX/Linux，但目前的 FreeRTOS POSIX/Linux 模拟器也支持在 macOS 系统中运行。在主机上运行 ESP-IDF 应用程序通常用于测试，但模拟环境和模拟依赖文件并不能完全代表目标设备。因此，仍然需要在目标设备上测试，此时测试的侧重点通常在集成和系统测试上。

备注：在主机上运行应用程序的另一方法是使用 QEMU 模拟器，但 ESP-IDF 的 QEMU 模拟器仍在开发中，尚未发布相关文档。

基于 CMock 的模拟

该方法使用 CMock 框架解决缺少硬件和软件依赖文件的问题。在主机上运行基于 CMock 的应用程序具备一大优势：在主机上运行的应用程序通常只编译必要代码，即模拟了最主要代码的依赖文件，而非编译整个系统。有关 Mocks 的总体介绍及其在 ESP-IDF 的配置和使用，请参阅 [Mocks](#)。

POSIX/Linux 模拟器的模拟

ESP-IDF 已支持使用 [FreeRTOS POSIX/Linux 模拟器](#) 预览应用程序在目标芯片上的运行效果。使用该模拟器可以在主机上运行 ESP-IDF 组件，并使这类组件可用于在主机上运行的 ESP-IDF 应用程序。目前，只有一部分组件可以在 Linux 上构建。此外，各组件移植到 Linux 上后，其功能可能也会受到限制，或与在芯片目标上构建该组件的功能有所不同。有关所需组件在 Linux 上是否受支持的更多信息，请参阅 [组件 Linux/Mock 支持情况概述](#)。

备注：FreeRTOS POSIX/Linux 模拟器支持配置 [Amazon SMP FreeRTOS](#) 版本，但模拟仍在单核模式下运行。支持 Amazon SMP FreeRTOS 主要是为给 Amazon SMP FreeRTOS 编写的 ESP-IDF 应用程序提供 API 兼容性。

4.29.2 使用模拟器的前提

- 已安装 ESP-IDF 及使用 ESP-IDF 的所有依赖项
- 满足系统软件包需求 (libbsd、libbsd-dev)
- Linux 或 macOS 和 GCC 编译器已更新至足够新的版本
- 应用程序所依赖的所有组件必须受 Linux 目标 (Linux/POSIX 模拟器) 支持，或可进行模拟

对于在 Linux 目标上运行的应用程序，需要在应用程序根目录的 CMakeLists.txt 文件中，设置 COMPONENTS 变量为 main，具体操作如下：

```
set(COMPONENTS main)
```

为方便起见，应用程序会在构建过程中，自动包含 ESP-IDF 的所有组件，执行上述代码则可以防止此类情况。

如果使用了任意模拟器，则应设置变量 Ruby。

4.29.3 构建和运行

要在 Linux 上构建并运行应用程序，需要将目标芯片设置为 linux：

```
idf.py --preview set-target linux
idf.py build
idf.py monitor
```

4.29.4 组件 Linux/Mock 支持情况概述

注意，下表中的“是”并不代表完全实现或模拟，它也可以表示功能的部分实现或模拟。实现或模拟通常只进行到可以提供足够功能、可以构建和运行测试应用程序的程度。

| 组件 | 模拟 | 仿真 |
|------------|----|----|
| cmock | 否 | 是 |
| driver | 是 | 否 |
| esp_common | 否 | 是 |
| esp_event | 是 | 是 |

下页继续

表 8 - 续上页

| 组件 | 模拟 | 仿真 |
|------------------|----|----|
| esp_http_client | 否 | 是 |
| esp_http_server | 否 | 是 |
| esp_https_server | 否 | 是 |
| esp_hw_support | 是 | 是 |

| unity | 否 | 是 |

4.30 USB OTG Console

On chips with an integrated USB peripheral, it is possible to use USB Communication Device Class (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-S2 ROM code contains a USB CDC implementation, which supports for some basic functionality without requiring the application to include the USB stack:

- Bidirectional serial console, which can be used with *IDF Monitor* or another serial monitor
- Flashing using `esptool.py` and `idf.py flash`.
- *Device Firmware Update (DFU)* interface for flashing the device using `dfu-util` and `idf.py dfu`.

备注: At the moment, this "USB Console" feature is incompatible with TinyUSB stack. However, if TinyUSB is used, it can provide its own CDC implementation.

4.30.1 Hardware Requirements

Connect ESP32-S2 to the USB port as follows

| GPIO | USB |
|------|-------------|
| 20 | D+ (green) |
| 19 | D- (white) |
| GND | GND (black) |
| | +5V (red) |

Some development boards may offer a USB connector for the internal USB peripheral—in that case, no extra connections are required.

4.30.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_CDC` option in menuconfig tool (see [CONFIG_ESP_CONSOLE_UART](#)).

Once the option is enabled, build the project as usual.

4.30.3 Uploading the Application

Initial Upload

If the ESP32-S2 is not yet flashed with a program that enables a USB console, an initial upload of the program is required. There are 3 alternative options to perform the initial upload.

Once the initial upload is done, the application will start up and a USB CDC port will appear in the system.

备注: The port name may change after the initial upload, so check the port list again before running `idf.py monitor`.

Initial Upload Using the ROM Download Mode, over USB CDC

- Place ESP32-S2 into download mode. To do this, keep GPIO0 low while toggling reset. On many development boards, the "Boot" button is connected to GPIO0, and you can press "Reset" button while holding "Boot".
- A serial port will appear in the system. On most operating systems (Windows 8 and later, Linux, macOS) driver installation is not required. Find the port name using Device Manager (Windows) or by listing `/dev/ttyACM*` devices on Linux or `/dev/cu*` devices on macOS.
- Run `idf.py flash -p PORT` to upload the application, with `PORT` determined in the previous step.

Initial Upload Using the ROM Download Mode, over USB DFU

- Place ESP32-S2 into download mode. To do this, keep GPIO0 low while toggling reset. On many development boards, the "Boot" button is connected to GPIO0, and you can press "Reset" button while holding "Boot".
- Run `idf.py dfu-flash`.

See [烧录 DFU 镜像](#) for details about DFU flashing.

Initial Upload Using UART On development boards with a USB-UART bridge, upload the application over UART: `idf.py flash -p PORT` where `PORT` is the name of the serial port provided by the USB-UART bridge.

Subsequent Usage

Once the application is uploaded for the first time, you can run `idf.py flash` and `idf.py monitor` as usual.

4.30.4 Limitations

There are several limitations to the USB console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow. Most of these limitations stem from the fact that USB CDC is implemented in software, so the console working over USB CDC is more fragile and complex than a console working over UART.

1. If the application crashes, panic handler output may not be sent over USB CDC in some cases. If the memory used by the CDC driver is corrupted, or there is some other system-level issue, CDC may not work for sending panic handler messages over USB. This does work in many situations, but is not guaranteed to work as reliably as the UART output does. Similarly, if the application enters a boot loop before the USB CDC driver has a chance to start up, there will be no console output.
2. If the application accidentally reconfigures the USB peripheral pins, or disables the USB peripheral, USB CDC device will disappear from the system. After fixing the issue in the application, you will need to follow the *Initial Upload* process to flash the application again.
3. If the application enters light sleep (including automatic light sleep) or deep sleep mode, USB CDC device will disappear from the system.
4. USB CDC driver reserves some amount of RAM and increases application code size. Keep this in mind if trying to optimize application memory usage.
5. By default, the low-level `esp_rom_printf` feature and `ESP_EARLY_LOG` are disabled when USB CDC is used. These can be enabled using `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF` option. With this option enabled, `esp_rom_printf` can be used, at the expense of increased IRAM usage. Keep in mind that the cost of `esp_rom_printf` and `ESP_EARLY_LOG` over USB CDC is significantly higher than over UART. This makes these logging mechanisms much less suitable for "printf debugging", especially in the interrupt handlers.
6. If you are developing an application which uses the USB peripheral with the TinyUSB stack, this USB Console feature can not be used. This is mainly due to the following reasons:
 - This feature relies on a different USB CDC software stack in ESP32-S2 ROM.
 - USB descriptors used by the ROM CDC stack may be different from the descriptors used by TinyUSB.
 - When developing applications which use USB peripheral, it is very likely that USB functionality will not work or will not fully work at some moments during development. This can be due to misconfigured USB descriptors, errors in the USB stack usage, or other reasons. In this case, using the UART console for flashing and monitoring provides a much better development experience.
7. When debugging the application using JTAG, USB CDC may stop working if the CPU is stopped on a breakpoint. USB CDC operation relies on interrupts from the USB peripheral being serviced periodically. If the host computer does not receive valid responses from the USB device side for some time, it may decide to disconnect the device. The actual time depends on the OS and the driver, and ranges from a few hundred milliseconds to a few seconds.

4.31 Wi-Fi 驱动程序

4.31.1 ESP32-S2 Wi-Fi 功能列表

ESP32-S2 支持以下 Wi-Fi 功能：

- 支持 4 个虚拟接口，即 STA、AP、Sniffer 和 reserved。
- 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
- 支持使用 IEEE 802.11b、IEEE 802.11g、IEEE 802.11n 和 API 配置协议模式
- 支持 WPA/WPA2/WPA3/WPA2-企业版/WPA3-企业版/WAPI/WPS 和 DPP
- 支持 AMSDU、AMPDU、HT40、QoS 以及其它主要功能
- 支持 Modem-sleep
- 支持乐鑫专属协议，可实现 **1 km** 数据通信量
- 空中数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
- 支持 Sniffer

- 支持快速扫描和全信道扫描
- 支持多个天线
- 支持获取信道状态信息

4.31.2 如何编写 Wi-Fi 应用程序

准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最高效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果你希望编写一个强健的 Wi-Fi 应用程序，强烈建议在开始之前先阅读本文。**非强制要求，请依个人情况而定。**

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议选择 [一个示例 example](#) 进行参考。

设置 Wi-Fi 编译时选项

请参阅 [Wi-Fi menuconfig](#)。

Wi-Fi 初始化

请参阅 [ESP32-S2 Wi-Fi station 一般情况](#)、[ESP32-S2 Wi-Fi AP 一般情况](#)。

启动/连接 Wi-Fi

请参阅 [ESP32-S2 Wi-Fi station 一般情况](#)、[ESP32-S2 Wi-Fi AP 一般情况](#)。

事件处理

通常，在理想环境下编写代码难度并不大，如 [WIFI_EVENT_STA_START](#)、[WIFI_EVENT_STA_CONNECTED](#) 中所述。难度在于如何在现实的困难环境下编写代码，如 [WIFI_EVENT_STA_DISCONNECTED](#) 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅 [ESP32-S2 Wi-Fi 事件描述](#)、[ESP32-S2 Wi-Fi station 一般情况](#)、[ESP32-S2 Wi-Fi AP 一般情况](#)。另可参阅 ESP-IDF 中的 [事件处理概述](#)。

编写错误恢复程序

除了能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅 [ESP32-S2 Wi-Fi API 错误代码](#)。

4.31.3 ESP32-S2 Wi-Fi API 错误代码

所有 ESP32-S2 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为：

- 无错误，例如：返回值 [ESP_OK](#) 代表 API 成功返回
- 可恢复错误，例如：[ESP_ERR_NO_MEM](#)
- 不可恢复的非关键性错误
- 不可恢复的关键性错误

一个错误是否为关键性取决于其 API 和应用场景，并且由 API 用户定义。

要使用 Wi-Fi API 编写一个强健的应用程序，根本原则便是要时刻检查错误代码并编写相应的错误处理代码。一般来说，错误处理代码可用于解决：

- 可恢复错误，你可以编写一个可恢复错误处理代码解决该类错误。例如，当 `esp_wifi_start()` 返回 `ESP_ERR_NO_MEM` 时，调用可恢复错误处理代码 `vTaskDelay` 可以获取几微秒的重试时间。
- 不可恢复非关键性错误，打印错误代码可以帮助你更好地处理该类错误。
- 不可恢复关键性错误，可使用“assert”语句处理该类错误。例如，如果 `esp_wifi_set_mode()` 返回 `ESP_ERR_WIFI_NOT_INIT` `esp_wifi_init()` 未成功初始化 Wi-Fi 驱动程序。你可以在应用程序开发阶段非常快速地检测到此类错误。

在 `esp_common/include/esp_err.h` 中，`ESP_ERROR_CHECK` 负责检查返回值。这是一个较为常见的错误处理代码，可在应用程序开发阶段作为默认的错误处理代码。但是，我们强烈建议 API 的使用者编写自己的错误处理代码。

4.31.4 初始化 ESP32-S2 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一：

- 设置该参数的所有字段
- 先使用 `get` API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取整个结构这一步至关重要，因为大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将会在该结构中加入更多字段，并将这些字段初始化为 0，确保即使 ESP-IDF 版本升级后，你的应用程序依然能够正常运行。

4.31.5 ESP32-S2 Wi-Fi 编程模型

ESP32-S2 Wi-Fi 编程模型如下图所示：

图 44: Wi-Fi 编程模型

Wi-Fi 驱动程序可以看作是一个无法感知上层代码（如 TCP/IP 堆栈、应用程序任务、事件任务等）的黑匣子。通常，应用程序任务（代码）负责调用 *Wi-Fi 驱动程序 APIs* 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在 `esp_event` 库的基础上进行的。Wi-Fi 驱动程序将事件发送至默认事件循环，应用程序便可以使用 `esp_event_handler_register()` 中的回调函数处理这些事件。除此之外，`esp_netif` 组件也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接至一个 AP 时，`esp_netif` 将自动开启 DHCP 客户端服务（系统默认）。

4.31.6 ESP32-S2 Wi-Fi 事件描述

WIFI_EVENT_WIFI_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

WIFI_EVENT_SCAN_DONE

扫描完成事件，由 `esp_wifi_scan_start()` 函数触发，将在以下情况下产生：

- 扫描已完成，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数 `esp_wifi_scan_stop()` 而终止。
- 在当前扫描完成之前调用了函数 `esp_wifi_scan_start()`。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻止。
- 当前扫描是由函数 `esp_wifi_connect()` 触发的。

接收到此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用 `esp_wifi_scan_get_ap_num()` 和 `esp_wifi_scan_get_ap_records()` 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放在扫描过程中占用的内存空间（**切记该步骤**）。更多详细信息，请参阅 [ESP32-S2 Wi-Fi 扫描](#)。

WIFI_EVENT_STA_START

如果调用函数 `esp_wifi_start()` 后接收到返回值 `ESP_OK`，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (netif)。通常，应用程序的事件回调函数需调用 `esp_wifi_connect()` 来连接已配置的 AP。

WIFI_EVENT_STA_STOP

如果调用函数 `esp_wifi_stop()` 后接收到返回值 `ESP_OK`，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址、终止 DHCP 客户端服务、移除 TCP/UDP 相关连接并清除 LwIP station netif 等动作。此时，应用程序的事件回调函数通常不需做任何响应。

WIFI_EVENT_STA_CONNECTED

如果调用函数 `esp_wifi_connect()` 后接收到返回值 `ESP_OK`，且 station 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果你的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果你的应用程序需基于 LwIP 进行，则还需等待 `got ip` 事件发生后才可开始。

WIFI_EVENT_STA_DISCONNECTED

此事件将在以下情况下产生：

- 调用了函数 `esp_wifi_disconnect()` 或 `esp_wifi_stop()`，且 Wi-Fi station 已成功连接至 AP。
- 调用了函数 `esp_wifi_connect()`，但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP，例如：未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，station 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如：station 连续多次丢失 N beacon、AP 踢掉 station、AP 认证模式改变等。

接收到此事件后，事件任务的默认动作为：

- 关闭 station 的 LwIP netif。
- 通知 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。针对基于套接字编写的应用程序，其回调函数可以在接收到此事件时（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为：调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi。但是，如果此事件是由函数 `esp_wifi_disconnect()` 引发的，则应用程序不应调用 `esp_wifi_connect()` 来重新连接。应用程序须明确区分此事件的引发原因，因为某些情况下应使用其它更好的方式进行重新连接。请参阅 [Wi-Fi 重新连接](#) 和 [连接 Wi-Fi 时扫描](#)。

需要注意的另一点是：接收到此事件后，LwIP 的默认动作是终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能除外。例如：

- 应用程序创建一个了 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被切断并引发了 `WIFI_EVENT_STA_DISCONNECTED` 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层 **不应** 考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因为在应用程序的事件回调函数中调用了 `esp_wifi_connect()`，Wi-Fi 连接恢复。同时，**station 连接至同一个 AP 并获得与之前相同的 IPV4 地址。**
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用程序套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP menuconfig 启动“IP 改变时保持 TCP 连接”的功能。

IP_EVENT_STA_GOT_IP

当 DHCP 客户端成功从 DHCP 服务器获取 IPV4 地址或 IPV4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPV4 地址可能由于以下原因而发生改变：

- DHCP 客户端无法重新获取/绑定 IPV4 地址，且 station 的 IPV4 重置为 0。
- DHCP 客户端重新绑定了其它地址。
- 静态配置的 IPV4 地址已发生改变。

函数 `ip_event_got_ip_t` 中的字段 `ip_change` 说明了 IPV4 地址是否发生改变。

套接字的状态是基于 IPV4 地址的，这意味着，如果 IPV4 地址发生改变，则所有与此 IPV4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPV4 变为有效地址时重新创建应用程序。

IP_EVENT_GOT_IP6

当 IPV6 SLAAC 支持自动为 ESP32-S2 配置一个地址，或 ESP32-S2 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IP_EVENT_STA_LOST_IP

当 IPV4 地址失效时，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPV4 地址丢失计时器，如果 station 在该计时器超时之前成功获取了 IPV4 地址，则不会发生此事件。否则，此事件将在计时器超时时发生。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPV4 地址已丢失。

WIFI_EVENT_AP_START

与 `WIFI_EVENT_STA_START` 事件相似。

WIFI_EVENT_AP_STOP

与 `WIFI_EVENT_STA_STOP` 事件相似。

WIFI_EVENT_AP_STACONNECTED

每当有一个 station 成功连接 ESP32-S2 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应，应用程序的回调函数也可忽略这一事件。但是，你可以在此时进行一些操作，例如：获取已连接 station 的信息等。

WIFI_EVENT_AP_STADISCONNECTED

此事件将在以下情况下发生：

- 应用程序通过调用函数 `esp_wifi_disconnect()` 或 `esp_wifi_deinit_sta()` 手动断开 station 连接。
- Wi-Fi 驱动程序出于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可通过函数 `esp_wifi_set_inactive_time()` 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

WIFI_EVENT_AP_PROBEREQRCVD

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API `esp_wifi_set_event_mask()` 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。

WIFI_EVENT_STA_BEACON_TIMEOUT

如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时，将引发此事件。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START

非连接模块在 *Interval* 开始时触发此事件。请参考[非连接模块功耗管理](#)。

4.31.7 ESP32-S2 Wi-Fi station 一般情况

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

1. Wi-Fi/LwIP 初始化阶段

- s1.1: 主任务通过调用函数 `esp_netif_init()` 创建一个 LwIP 核心任务，并初始化 LwIP 相关工作。
- s1.2: 主任务通过调用函数 `esp_event_loop_create()` 创建一个系统事件任务，并初始化应用程序事件的回调函数。在此情况下，该回调函数唯一的动作就是将事件中继到应用程序任务中。
- s1.3: 主任务通过调用函数 `esp_netif_create_default_wifi_ap()` 或 `esp_netif_create_default_wifi_sta()` 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
- s1.4: 主任务通过调用函数 `esp_wifi_init()` 创建 Wi-Fi 驱动程序任务，并初始化 Wi-Fi 驱动程序。
- s1.5: 主任务通过调用 OS API 创建应用程序任务。

图 45: station 模式下 Wi-Fi 事件场景示例

推荐按照 s1.1 ~ s1.5 的步骤顺序针对基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序 **并非强制**，你可以在第 s1.1 步创建应用程序任务，然后在应用程序任务中进行所有其它初始化操作。不过，如果你的应用程序任务依赖套接字，那么在初始化阶段创建应用程序任务可能并不适用。此时，你可以在接收到 IP 后再进行任务创建。

2. Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后，可以进入到配置阶段。该场景下，Wi-Fi 驱动程序处于 station 模式。因此，首先你需调用函数 `esp_wifi_set_mode()` (WIFI_MODE_STA) 将 Wi-Fi 模式配置为 station 模式。可通过调用其它 `esp_wifi_set_xxx` API 进行更多设置，例如：协议模式、国家代码、带宽等。请参阅 [ESP32-S2 Wi-Fi 配置](#)。

一般情况下，我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序，但这 **并非强制要求**。也就是说，只要 Wi-Fi 驱动程序已成功初始化，你可以在任意阶段进行配置。但是，如果你的 Wi-Fi 在建立连接后不需要更改配置，则应先在此阶段完成配置。因为调用配置 API（例如 `esp_wifi_set_protocol()`）将会导致 Wi-Fi 连接断开，为操作带来不便。

如果 `menuconfig` 已使能 Wi-Fi NVS flash，则不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么，当主板上电/重新启动时，就不需从头开始配置 Wi-Fi 驱动程序，只需调用函数 `esp_wifi_get_xxx` API 获取之前存储的配置信息。当然，如果不想使用之前的配置，你也可以重新配置 Wi-Fi 驱动程序。

3. Wi-Fi 启动阶段

- s3.1: 调用函数 `esp_wifi_start()` 启动 Wi-Fi 驱动程序。
- s3.2: Wi-Fi 驱动程序将事件 `WIFI_EVENT_STA_START` 发布到事件任务中，然后，事件任务将执行一些正常操作并调用应用程序的事件回调函数。
- s3.3: 应用程序的事件回调函数将事件 `WIFI_EVENT_STA_START` 中继到应用程序任务中。此时，推荐调用函数 `esp_wifi_connect()` 进行 Wi-Fi 连接。当然，你也可以等待在 `WIFI_EVENT_STA_START` 事件发生后的其它阶段再调用此函数。

4. Wi-Fi 连接阶段

- s4.1: 调用函数 `esp_wifi_connect()` 后，Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2: 如果内部扫描/连接过程成功，将产生 `WIFI_EVENT_STA_CONNECTED` 事件。然后，事件任务将启动 DHCP 客户端服务，最终触发 DHCP 程序。
- s4.3: 在此情况下，应用程序的事件回调函数会将 `WIFI_EVENT_STA_CONNECTED` 事件中继到应用程序任务中。通常，应用程序不需进行操作，而你可以执行任何动作，例如：打印日志等。

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败，例如：密码错误、未找到 AP 等。这种情况下，将引发 `WIFI_EVENT_STA_DISCONNECTED` 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件，请参阅下文阶段 6 的描述。

5. Wi-Fi 获取 IP 阶段

- s5.1: 一旦步骤 4.2 中的 DHCP 客户端初始化完成，Wi-Fi 驱动程序将进入获取 IP 阶段。
- s5.2: 如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址，则将引发 `IP_EVENT_STA_GOT_IP` 事件，事件任务将执行正常处理。
- s5.3: 应用程序的事件回调函数将事件 `IP_EVENT_STA_GOT_IP` 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序，此事件较为特殊，因为它意味着应用程序已准备就绪，可以开始任务，例如：创建 TCP/UDP 套接字等。此时较为容易犯的一个错误就是在接收到 `IP_EVENT_STA_GOT_IP` 事件之前就初始化套接字。**切忌在接收到 IP 之前启动任何套接字相关操作。**

6. Wi-Fi 断开阶段

- s6.1: 当 Wi-Fi 因为某些原因（例如：AP 掉电、RSSI 较弱等）连接中断时，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。此事件也可能在上文阶段 3 中发生。在这里，事件

任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然后，所有应用程序套接字都将处于错误状态。也就是说，`WIFI_EVENT_STA_DISCONNECTED` 事件发生时，任何套接字都无法正常工作。

- s6.2: 上述情况下，应用程序的事件回调函数会将 `WIFI_EVENT_STA_DISCONNECTED` 事件中继到应用程序任务中。推荐调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi，关闭所有套接字，并在必要时重新创建套接字。请参阅 `WIFI_EVENT_STA_DISCONNECTED`。

7. Wi-Fi IP 更改阶段

- s7.1: 如果 IP 地址发生更改，将引发 `IP_EVENT_STA_GOT_IP` 事件，其中“ip_change”被置为“true”。
- s7.2: 此事件对应用程序至关重要。这一事件发生时，适合关闭所有已创建的套接字并进行重新创建。

8. Wi-Fi 清理阶段

- s8.1: 调用函数 `esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2: 调用函数 `esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3: 调用函数 `esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

4.31.8 ESP32-S2 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景，其中包含不同阶段的具体描述：

4.31.9 ESP32-S2 Wi-Fi 扫描

目前，仅 station 或 station/AP 共存模式支持 `esp_wifi_scan_start()` API。

扫描类型

| 模式 | 描述 |
|--------|--|
| 主动扫描 | 通过发送 probe request 进行扫描。该模式为默认的扫描模式。 |
| 被动扫描 | 不发送 probe request。跳至某一特定信道并等待 beacon。应用程序可通过 <code>wifi_scan_config_t</code> 中的 <code>scan_type</code> 字段使能被动扫描。 |
| 前端扫描 | 在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。 |
| 后端扫描 | 在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。 |
| 全信道扫描 | 扫描所有信道。 <code>wifi_scan_config_t</code> 中的 <code>channel</code> 字段为 0 时，当前模式为全信道扫描。 |
| 特定信道扫描 | 仅扫描特定的信道。 <code>wifi_scan_config_t</code> 中的 <code>channel</code> 字段为 1-14 时，当前模式为特定信道扫描。 |

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式：

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道后端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

图 46: AP 模式下 Wi-Fi 事件场景示例

扫描配置

扫描类型与其他扫描属性通过函数 `esp_wifi_scan_start()` 进行配置。下表详细描述了函数 `wifi_scan_config_t` 各字段信息。

| 字段 | 描述 |
|-------------|--|
| ssid | 如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。 |
| bssid | 如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。 |
| channel | 如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。 |
| show_hidden | 如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。 |
| scan_type | 如果该字段值为 <code>WIFI_SCAN_TYPE_ACTIVE</code> ，则本次扫描为主动扫描；反之，将被视为被动扫描。 |
| scan_time | 该字段用于控制每个信道的扫描时间。 被动扫描时， <code>scan_time.passive</code> 字段负责为每个信道指定扫描时间。 主动扫描时，每个信道的扫描时间如下列表所示。其中， <code>min</code> 代表 <code>scan_time_active_min</code> ， <code>max</code> 代表 <code>scan_time_active_max</code> 。 <ul style="list-style-type: none"> • <code>min=0, max=0</code>: 每个信道的扫描时间为 120 ms。 • <code>min>0, max=0</code>: 每个信道的扫描时间为 120 ms。 • <code>min=0, max>0</code>: 每个信道的扫描时间为 <code>max</code> ms。 • <code>min>0, max>0</code>: 每个信道扫描的最短时间为 <code>min</code> ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这段时间内找到 AP，则该信道的扫描时间为 <code>max</code> ms。 如希望提升 Wi-Fi 扫描性能，则可修改上述两个参数。 |

调用 API `esp_wifi_set_config()` 可全局配置一些扫描属性，请参阅 [station 基本配置](#)。

在所有信道中扫描全部 AP（前端）

场景：

上述场景中描述了全信道前端扫描过程。仅 `station` 模式支持前端扫描，该模式下 `station` 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

详细描述：

扫描配置阶段

- s1.1: 如果默认的国家信息有误，调用函数 `esp_wifi_set_country()` 进行配置。请参阅 [Wi-Fi 国家/地区代码](#)。
- s1.2: 调用函数 `esp_wifi_scan_start()` 配置扫描信息，可参阅 [扫描配置](#)。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

Wi-Fi 驱动程序内部扫描阶段

- s2.1: Wi-Fi 驱动程序切换至信道 1，此时的扫描类型为 `WIFI_SCAN_TYPE_ACTIVE`，同时发送一个 probe request。反之，Wi-Fi 将等待接收 AP beacon。Wi-Fi 驱动程序将在信道 1 停留一段时间。`min/max` 扫描时间中定义了 Wi-Fi 在信道 1 中停留的时间长短，默认为 120 ms。
- s2.2: Wi-Fi 驱动程序跳转至信道 2，并重复进行 s2.1 中的步骤。
- s2.3: Wi-Fi 驱动程序扫描最后的信道 N，N 的具体数值由步骤 s1.1 中配置的国家代码决定。

扫描完成后事件处理阶段

- s3.1: 当所有信道扫描全部完成后，将产生 `WIFI_EVENT_SCAN_DONE` 事件。
- s3.2: 应用程序的事件回调函数告知应用程序任务已接收到 `WIFI_EVENT_SCAN_DONE` 事件。调用函数 `esp_wifi_scan_get_ap_num()` 获取在本次扫描中找到的 AP 数量。然后，分配出足够的事物槽，并调用函数 `esp_wifi_scan_get_ap_records()` 获取 AP 记录。请注意，一旦调

图 47: 所有 Wi-Fi 信道的前端扫描

用 `esp_wifi_scan_get_ap_records()`，Wi-Fi 驱动程序中的 AP 记录将被释放。但是，请不要在单个扫描完成事件中重复调用两次 `esp_wifi_scan_get_ap_records()`。反之，如果扫描完成事件发生后未调用 `esp_wifi_scan_get_ap_records()`，则 Wi-Fi 驱动程序中的 AP 记录不会被释放。因此，请务必确保调用函数 `esp_wifi_scan_get_ap_records()`，且仅调用一次。

在所有信道上扫描全部 AP（后端）

场景：

上述场景为一次全信道后端扫描。与在**所有信道中扫描全部 AP（前端）**相比，全信道后端扫描的不同之处在于：在跳至下一个信道之前，Wi-Fi 驱动程序会先返回主信道停留 30 ms，以便 Wi-Fi 连接有一定的时间发送/接收数据。

在所有信道中扫描特定 AP

场景：

该扫描过程与**在所有信道中扫描全部 AP（前端）**相似。区别在于：

- s1.1: 在步骤 1.2 中，目标 AP 将配置为 SSID/BSSID。
- s2.1 ~ s2.N: 每当 Wi-Fi 驱动程序扫描某个 AP 时，它将检查该 AP 是否为目标 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`，且确认已找到目标 AP，则将产生扫描完成事件，同时结束本次扫描；反之，扫描将继续。请注意，第一个扫描的信道可能不是信道 1，因为 Wi-Fi 驱动程序会优化扫描顺序。

如果有多个匹配目标 AP 信息的 AP，例如：碰巧扫描到两个 SSID 为“ap”的 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`，则仅可找到第一个扫描到的“ap”；如果本次扫描类型为 `WIFI_ALL_CHANNEL_SCAN`，则两个“ap”“都将被找到，且 station 将根据配置规则连接至其需要连接的”ap”，请参阅 [station 基本配置](#)。

你可以在任意信道中扫描某个特定的 AP，或扫描该信道中的所有 AP。这两种扫描过程也较为相似。

在 Wi-Fi 连接模式下扫描

调用函数 `esp_wifi_connect()` 后，Wi-Fi 驱动程序将首先尝试扫描已配置的 AP。Wi-Fi 连接模式下的扫描过程与**在所有信道中扫描特定 AP**过程相同，但连接模式下扫描结束后将不会产生扫描完成事件。如果已找到目标 AP，则 Wi-Fi 驱动程序将开始 Wi-Fi 连接；反之，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。请参阅 [在所有信道中扫描特定 AP](#)。

在禁用模式下扫描

如果函数 `esp_wifi_scan_start()` 中的禁用参数为“true”，则本次扫描为禁用模式下的扫描。在该次扫描完成之前，应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似，不同之处在于，禁用模式下扫描完成之后将不会出现扫描完成事件。

并行扫描

有时，可能会有两个应用程序任务同时调用函数 `esp_wifi_scan_start()`，或者某个应用程序任务在获取扫描完成事件之前再次调用了函数 `esp_wifi_scan_start()`。这两种情况都有可能发生。但是，Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此，应避免上述并行扫描。随着 ESP32-S2 的 Wi-Fi 功能不断提升，未来的版本中可能会增加并行扫描支持。

连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数 `esp_wifi_scan_start()` 后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略为：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

图 48: 所有 Wi-Fi 信道的后端扫描

图 49: 扫描特定的 Wi-Fi 信道

但是，延时重试策略并非万无一失。试想以下场景：

- 如果 station 正在连接一个不存在的 AP，或正在使用错误的密码连接一个 AP，此时将产生事件 `WIFI_EVENT_STA_DISCONNECTED`。
- 接收到断开连接事件后，应用程序调用函数 `esp_wifi_connect()` 进行重新连接。
- 而另一个应用程序任务（如，控制任务）调用了函数 `esp_wifi_scan_start()` 进行扫描。这种情况下，每一次扫描都会立即失败，因为 station 一直处于正在连接状态。
- 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于正在连接过程中。因此，如果你的应用程序也可能发生相似的场景，那么就需要为其配置一个更佳的重新连接策略。例如：

- 应用程序可以定义一个连续重新连接次数的最大值，当重新连接的次数达到这个最大值时，立刻停止重新连接。
- 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延时一段时间后再进行下一次重新连接。

可以给应用程序定义其特殊的重新连接策略，以防止扫描无法成功。请参阅 [Wi-Fi 重新连接](#)。

4.31.10 ESP32-S2 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅 [找到多个 AP 时的 ESP32-S2 Wi-Fi station 连接](#)。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

场景：

扫描阶段

- s1.1: Wi-Fi 驱动程序开始在“Wi-Fi 连接”模式下扫描。详细信息请参阅 [Wi-Fi 连接模式下扫描](#)。
- s1.2: 如果未找到目标 AP，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_NO_AP_FOUND`。请参阅 [Wi-Fi 原因代码](#)。

认证阶段

- s2.1: 发送认证请求数据包并使能认证计时器。
- s1.2: 如果在认证计时器超时之前未接收到认证响应数据包，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_AUTH_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s2.3: 接收到认证响应数据包，且认证计时器终止。
- s2.4: AP 在响应中拒绝认证且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码为 `WIFI_REASON_AUTH_FAIL` 或为 AP 指定的其它原因。请参阅 [Wi-Fi 原因代码](#)。

关联阶段

- s3.1: 发送关联请求并使能关联计时器。
- s3.2: 如果在关联计时器超时之前未接收到关联响应，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_ASSOC_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s3.3: 接收到关联响应，且关联计时器终止。
- s3.4: AP 在响应中拒绝关联且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码将在关联响应中指定。请参阅 [Wi-Fi 原因代码](#)。

图 50: Wi-Fi station 连接过程

四次握手阶段

- s4.1: 使能握手定时器, 定时器终止之前未接收到 1/4 EAPOL, 此时将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件, 且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅 [Wi-Fi 原因代码](#)。
- s4.2: 接收到 1/4 EAPOL。
- s4.3: station 回复 2/4 EAPOL。
- s4.4: 如果在握手定时器终止之前未接收到 3/4 EAPOL, 将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件, 且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅 [Wi-Fi 原因代码](#)。
- s4.5: 接收到 3/4 EAPOL。
- s4.6: station 回复 4/4 EAPOL。
- s4.7: station 产生 `WIFI_EVENT_STA_CONNECTED` 事件。

Wi-Fi 原因代码

下表罗列了 ESP32-S2 中定义的原因代码。其中, 第一列为 `esp_wifi/include/esp_wifi_types.h` 中定义的宏名称。名称中省去了前缀 `WIFI_REASON`, 也就是说, 名称 `UNSPECIFIED` 实际应为 `WIFI_REASON_UNSPECIFIED`, 以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2020 中 9.4.1.7 段的标准值。(更多详细信息, 请参阅前文描述。)最后一列为这一原因的描述。

| 原因代码 | 数值 | 映射值 | 描述 |
|--------------|----|-----|--|
| UNSPECIFIED | 1 | 1 | 出现内部错误, 例如: 内存已满, 内部发送失败, 或该原因已被远端接收等。 |
| AUTH_EXPIRE | | 2 | 先前的 authentication 已失效。 对于 ESP station, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> • authentication 超时; • 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> • 在过去五分钟之内, AP 未从 station 接收到任何数据包; • 由于调用了函数 <code>esp_wifi_stop()</code> 导致 AP 终止; • 由于调用了函数 <code>esp_wifi_deinit_sta()</code> 导致 station 的 authentication 取消。 |
| AUTH_LEAVE | | 3 | authentication 取消, 因为发送 station 正在离开 (或已经离开)。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> • 从 AP 接收到该代码。 |
| ASSOC_EXPIRE | 4 | 4 | 因为 AP 不活跃, association 取消。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> • 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> • 在过去五分钟之内, AP 未从 station 接收到任何数据包; • 由于调用了函数 <code>esp_wifi_stop()</code> 导致 AP 终止; • 由于调用了函数 <code>esp_wifi_deinit_sta()</code> 导致 station 的 authentication 取消。 |

表 9 - 续上页

| 原因代码 | 数值 | 映射值 | 描述 |
|------------------------|----|-----|---|
| AS-SOC_TOOMANY | 5 | 5 | association 取消, 因为 AP 无法同时处理所有当前已关联的 STA。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> 与 AP 相关联的 station 数量已到达 AP 可支持的最大值。 |
| NOT_AUTHED | | 6 | 从一个未认证 station 接收到 class-2 frame。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> AP 从一个未认证 station 接收到数据包。 |
| NOT_ASSOCED | | 7 | 从一个未关联 station 接收到的 class-3 frame。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> AP 从未关联 station 接收到数据包。 |
| AS-SOC_LEAVE | 8 | 8 | association 取消, 因为发送 station 正在离开 (或已经离开) BSS。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 由于调用 <code>esp_wifi_disconnect()</code> 和其它 API, station 断开连接。 |
| AS-SOC_NOT_AUTHED | 9 | 9 | station 的 re(association) 请求未被响应 station 认证。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> AP 从一个已关联, 但未认证的 station 接收到数据包。 |
| DIS-AS-SOC_PWRCAP_BAD | 10 | 10 | association 取消, 因为无法接收功率能力 (Power Capability) 元素中的信息。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| DIS-AS-SOC_SUPCHAN_BAD | 11 | 11 | association 取消, 因为无法接收支持的信道 (Supported Channels) 元素中的信息。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| IE_INVABID | | 13 | 无效元素, 即内容不符合 Wi-Fi 协议中帧格式 (Frame formats) 章节所描述标准的元素。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> AP 解析了一个错误的 WPA 或 RSN IE。 |
| MIC_FAILURE | | 14 | 消息完整性代码 (MIC) 出错。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 |

下页继续

表 9 - 续上页

| 原因代码 | 数值 | 映射值 | 描述 |
|------------------------------|----|-----|--|
| 4WAY_HANDSHAKE_TIMEOUT | | | 四次握手超时。由于某些历史原因，在 ESP 中该原因代码实为 WIFI_REASON_HANDSHAKE_TIMEOUT。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 握手超时。 从 AP 接收到该代码。 |
| GROUP_KEY_UPDATE_TIMEOUT | | | 组密钥 (Group-Key) 握手超时。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| IE_IN_4WAY_DIFFERS | 17 | | 四次握手中产生的元素与 (re-)association 后的 request/probe 以及 response/beacon frame 中的信息不同。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 station 发现四次握手的 IE 与 (re-)association 后的 request/probe 以及 response/beacon frame 中的 IE 不同。 |
| GROUP_CIPHER_INVALID | | | 无效组密文。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| PAIRWISE_CIPHER_INVALID | 19 | 19 | 无效成对密文。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| AKMP_INVALID | | 20 | 无效 AKMP。 对于 ESP station，出现以下情况时报告该代码：- 从 AP 接收到该代码。 |
| UNSUPPORTED_RSN_IE_VERSION | 21 | 21 | 不支持的 RSNE 版本。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| INVALID_RSN_IE_CAP | 22 | 22 | 无效的 RSNE 性能。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| 802_1X_AUTH_FAILED | | 23 | IEEE 802.1X. authentication 失败。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： <ul style="list-style-type: none"> IEEE 802.1X. authentication 失败。 |
| CIPHER_SUITE_REJECTED | 24 | 24 | 因安全策略，安全密钥算法套件 (cipher suite) 被拒。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> 从 AP 接收到该代码。 |
| TDLS_PEER_UNREACHABLE | | | 通过 TDLS 直连无法到达 TDLS 对端 STA，导致 TDLS 直连中断。 |
| TDLS_UNSPECIFIED | | 26 | 不明原因的 TDLS 直连中断。 |
| SSP_REQUESTED_DISSOC | | | association 取消，由于会话被 SSP request 终止。 |
| NO_SSP_ROAMING_AGREEMENT | | | association 取消，由于缺乏 SSP 漫游认证。 |
| BAD_CIPHER_OR_AKM | | | 请求的服务被拒绝，由于 SSP 密码套件或者 AKM 的需求。 |
| NOT_AUTHORIZED_TDLS_LOCATION | | | 请求的服务在此位置未得到授权。 |

下页继续

表 9 - 续上页

| 原因代码 | 数值 | 映射值 | 描述 |
|--|---------|---------|--|
| SERVICE_CHANGE_PRECLUDES_TS | 31 | 31 | TS 被删除, 原因是: BSS 服务特性或者运行模式改变导致 QoS AP 缺少足够的带宽给 QoS STA 使用 (例如: 一个 HT BSS 从 40 MHz 的信道切换到 20 MHz 的信道)。 |
| UNSPECIFIED_QOS | 32 | 32 | association 取消, 由于不明确的 QoS 相关原因。 |
| NOT_ENOUGH_BANDWIDTH | 33 | 33 | association 取消, 由于 QoS AP 缺少足够的带宽给该 QoS STA 使用。 |
| MISSING_ACKS | 34 | 34 | association 取消, 原因是: 大量的帧需要被确认, 但由于 AP 传输或者糟糕的信道条件而没有被确认。 |
| EXCEEDED_TXOP | 35 | 35 | association 取消, 由于 STA 的传输超过了 TXOPs 的限制。 |
| STA_LEAVING | 36 | 36 | 请求 STA 离开了 BSS 或者重置了。 |
| END_BA | 37 | 37 | 请求 STA 不再使用该流或者会话。 |
| UNKNOWN_BA | 38 | 38 | 请求 STA 使用一种尚未完成的机制接收帧。 |
| TIMEOUT | 39 | 39 | 对端 STA 的请求超时。 |
| Reserved | 40 ~ 45 | 40 ~ 45 | 保留 |
| PEER_INITIATED | 46 | 46 | 在 Disassociation 帧中: 已达到授权访问限制。 |
| AP_INITIATED | 47 | 47 | 在 Disassociation 帧中: 外部服务需求。 |
| INVALID_FT_ACTION_FRAME_COUNT | 48 | 48 | 无效的 FT Action 帧计数。 |
| INVALID_PMKID | 49 | 49 | 无效的成对主密钥标识符 (PMKID)。 |
| INVALID_MDE | 50 | 50 | 无效的 MDE。 |
| INVALID_FTE | 51 | 51 | 无效的 FTE。 |
| TRANSMISSION_LINK_ESTABLISHMENT_FAILED | 67 | 67 | 在备用信道中建立传输链路失败。 |
| ALTERNATIVE_CHANNEL_OCCUPIED | 68 | 68 | 备用信道被占用。 |
| BEACON_TIMEOUT | 200 | 保留 | 乐鑫特有的 Wi-Fi 原因代码: 当 station 连续失去 N 个 beacon, 将中断连接并报告该代码。 |
| NO_AP_FOUND | 201 | 保留 | 乐鑫特有的 Wi-Fi 原因代码: 当 station 未扫描到目标 AP 时, 将报告该代码。 |
| AUTH_FAIL | 202 | 保留 | 乐鑫特有的 Wi-Fi 原因代码: authentication 失败, 但并非由超时而引发。 |
| ASSOC_FAIL | 203 | 保留 | 乐鑫特有的 Wi-Fi 原因代码: association 失败, 但并非由 ASSOC_EXPIRE 或 ASSOC_TOOMANY 引发。 |
| HANDSHAKE_TIMEOUT | 204 | 保留 | 乐鑫特有的 Wi-Fi 原因代码: 握手失败, 与 WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT 中失败原因相同。 |
| CONNECTION_FAIL | 205 | 保留 | 乐鑫特有的 Wi-Fi 原因代码: AP 连接失败。 |

与密码错误有关的 Wi-Fi 原因代码

下表罗列了与密码错误相关的 Wi-Fi 原因代码。

| 原因代码 | 数值 | 描述 |
|------------------------|-----|---|
| 4WAY_HANDSHAKE_TIMEOUT | 204 | 四次握手超时。STA 在连接加密的 AP 的时候输入了错误的密码 |
| NO_AP_FOUND | 204 | 密码错误会出现这个原因代码的场景有如下两个： <ul style="list-style-type: none"> STA 在连接加密的 AP 的时候没有输入密码 STA 在连接非加密的 AP 的时候输入了密码 |
| HANDSHAKE_TIMEOUT | 204 | 握手超时。 |

与低 RSSI 有关的 Wi-Fi 原因代码

下表罗列了与低 RSSI 相关的 Wi-Fi 原因代码。

| 原因代码 | 数值 | 描述 |
|-------------------|-----|------------------------------|
| NO_AP_FOUND | 204 | 低 RSSI 导致 station 无法扫描到目标 AP |
| HANDSHAKE_TIMEOUT | 204 | 握手超时。 |

4.31.11 找到多个 AP 时的 ESP32-S2 Wi-Fi station 连接

该场景与 *ESP32-S2 Wi-Fi station 连接场景* 相似，不同之处在于该场景中不会产生 *WIFI_EVENT_STA_DISCONNECTED* 事件，除非 station 无法连接所有找到的 AP。

4.31.12 Wi-Fi 重新连接

出于多种原因，station 可能会断开连接，例如：连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为：在接收到 *WIFI_EVENT_STA_DISCONNECTED* 事件后调用函数 `esp_wifi_connect()`。

但有时，应用程序需要更复杂的方式进行重新连接：

- 如果断开连接事件是由调用函数 `esp_wifi_disconnect()` 引发的，那么应用程序可能不希望进行重新连接。
- 如果 station 随时可能调用函数 `esp_wifi_scan_start()` 开始扫描，此时就需要一个更佳的重新连接方法，请参阅[连接 Wi-Fi 时扫描](#)。

另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

4.31.13 Wi-Fi beacon 超时

ESP32-S2 使用 beacon 超时机制检测 AP 是否活跃。如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request，如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生 *WIFI_EVENT_STA_DISCONNECTED* 事件。

需要注意的是，扫描过程中会重置 beacon 超时所使用的定时器，即扫描过程会影响 *WIFI_EVENT_STA_BEACON_TIMEOUT* 事件的触发。

4.31.14 ESP32-S2 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅 *Wi-Fi NVS Flash*。

Wi-Fi 模式

调用函数 `esp_wifi_set_mode()` 设置 Wi-Fi 模式。

| 模式 | 描述 |
|-----------------|--|
| WIFI_MODE_NULL | NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer，或者你不想通过调用函数 <code>esp_wifi_deinit()</code> 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。 |
| WIFI_MODE_STA | station 模式：此模式下， <code>esp_wifi_start()</code> 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数 <code>esp_wifi_connect()</code> 后，station 将连接到目标 AP。 |
| WIFI_MODE_AP | AP 模式：在此模式下， <code>esp_wifi_start()</code> 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。 |
| WIFI_MODE_APSTA | station/AP 共存模式：在此模式下，函数 <code>esp_wifi_start()</code> 将同时初始化 station 和 AP。该步骤在 station 模式和 AP 模式下完成。请注意 ESP station 所连外部 AP 的信道优先于 ESP AP 信道。 |

station 基本配置

API `esp_wifi_set_config()` 可用于配置 station。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

| 字段 | 描述 |
|-------------|---|
| ssid | station 想要连接的目标 AP 的 SSID。 |
| password | 目标 AP 的密码。 |
| scan_method | WIFI_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WIFI_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WIFI_FAST_SCAN。 |
| bssid_set | 如果 bssid_set 为 0，station 连接 SSID 与“ssid”字段相同的 AP，同时忽略字段“bssid”。其他情况下，station 连接 SSID 与“ssid”字段相同、BSSID 与“bssid”字段也相同的 AP。 |
| bssid | 只有当 bssid_set 为 1 时有效。见字段“bssid_set”。 |
| channel | 该字段为 0 时，station 扫描信道 1 ~ N 寻找目标 AP；否则，station 首先扫描值与“channel”字段相同的信道，再扫描其他信道。比如，当该字段设置为 3 时，扫描顺序为 3, 1, 2, ..., N。如果你不知道目标 AP 在哪个信道，请将该字段设置为 0。 |
| sort_method | 该字段仅用于 WIFI_ALL_CHANNEL_SCAN 模式。 如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信号强度排序，信号最好的 AP 会被首先连接。比如，如果 station 想要连接 ssid 为“apxx”的 AP，且扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -30 dBm，station 首先连接第二个 AP。除非失败，才会连接第一个。 如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 将会按照安全性排序。比如，如果 station 想要连接 ssid 为“apxx”的 AP，并且扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先连接第二个 AP。除非失败，才会连接第一个。 |
| threshold | 该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。 如果 RSSI 设置为 0，则表示默认阈值、默认 RSSI 阈值为 -127 dBm。如果 authmode 阈值设置为 0，则表示默认阈值，默认 authmode 阈值无授权。 |

注意：WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 `authmode` 阈值代替，通过将 `threshold.authmode` 设置为 `WIFI_AUTH_WPA2_PSK` 使用 WPA2 模式

AP 基本配置

API `esp_wifi_set_config()` 可用于配置 AP。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

| 字段 | 描述 |
|------------------------------|---|
| <code>ssid</code> | 指 AP 的 SSID。如果 <code>ssid[0]</code> 和 <code>ssid[1]</code> 均为 <code>0xFF</code> ，AP 默认 SSID 为 <code>ESP_aabbcc</code> ，“ <code>aabbcc</code> ” 是 AP MAC 的最后三个字节。 |
| <code>password</code> | AP 的密码。如果身份验证模式为 <code>WIFI_AUTH_OPEN</code> ，此字段将被忽略。 |
| <code>ssid_len</code> | SSID 的长度。如果 <code>ssid_len</code> 为 0，则检查 SSID 直至出现终止字符。如果 <code>ssid_len</code> 大于 32，请更改为 32，或者根据 <code>ssid_len</code> 设置 SSID 长度。 |
| <code>channel</code> | AP 的信道。如果信道超出范围，Wi-Fi 驱动程序将默认为信道 1。所以，请确保信道在要求的范围内。有关详细信息，请参阅 Wi-Fi 国家/地区代码 。 |
| <code>authmode</code> | ESP AP 的身份验证模式。目前，ESP AP 不支持 <code>AUTH_WEP</code> 。如果 <code>authmode</code> 是一个无效值，AP 默认该值为 <code>WIFI_AUTH_OPEN</code> 。 |
| <code>ssid_hidden</code> | 如果 <code>ssid_hidden</code> 为 1，AP 不广播 SSID。若为其他值，则广播。 |
| <code>max_connection</code> | 允许连接 station 的最大数目，默认值是 10。ESP Wi-Fi 支持 15 (<code>ESP_WIFI_MAX_CONN_NUM</code>) 个 Wi-Fi 连接。请注意，ESP AP 和 ESP-NOW 共享同一块加密硬件 keys，因此 <code>max_connection</code> 参数将受到 <code>CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM</code> 的影响。加密硬件 keys 的总数是 17，如果 <code>CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM</code> 小于等于 2，那么 <code>max_connection</code> 最大可以设置为 15，否则 <code>max_connection</code> 最大可以设置为 $(17 - \text{CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM})$ 。 |
| <code>beacon_interval</code> | beacon 间隔。值为 100 ~ 60000 ms，默认值为 100 ms。如果该值不在上述范围，AP 默认取 100 ms。 |

Wi-Fi 协议模式

目前，IDF 支持以下协议模式：

| 协议模式 | 描述 |
|--------------|--|
| 802.11b | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)</code> , 将 station/AP 设置为仅 802.11b 模式。 |
| 802.11bg | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> , 将 station/AP 设置为 802.11bg 模式。 |
| 802.11g | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> , 将 station/AP 设置为 802.11g 模式。 |
| 802.11bgn | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N)</code> , 将 station/AP 设置为 802.11bgn 模式。 |
| 802.11gn | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> , 将 station/AP 设置为 802.11gn 模式。 |
| 802.11 BGNLR | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N WIFI_PROTOCOL_LR)</code> , 将 station/AP 设置为 802.11bgn 和 LR 模式。 |
| 802.11 LR | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR)</code> , 将 station/AP 设置为 LR 模式。 此模式是乐鑫的专利模式, 可以达到 1 公里视线范围。请确保 station 和 AP 同时连接至 ESP 设备。 |

长距离 (LR)

长距离 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式, 可达到 1 公里视线范围。与传统 802.11b 模式相比, 接收灵敏度更高, 抗干扰能力更强, 传输距离更长。

LR 兼容性 由于 LR 是乐鑫的独有 Wi-Fi 模式, 只有 ESP32 芯片系列设备 (ESP32-C2 除外) 才能传输和接收 LR 数据。也就是说, 如果连接的设备不支持 LR, ESP32 芯片系列设备 (ESP32-C2 除外) 则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使你的应用程序实现这一功能。如果协商的模式支持 LR, ESP32 芯片系列设备 (ESP32-C2 除外) 可能会以 LR 速率传输数据, 否则, ESP32 芯片系列设备 (ESP32-C2 除外) 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商:

| APSTA | BGN | BG | B | BGNLR | BGLR | BLR | LR |
|-------|-----|----|---|-------|------|-----|----|
| BGN | BGN | BG | B | BGN | BG | B | • |
| BG | BG | BG | B | BG | BG | B | • |
| B | B | B | B | B | B | B | • |
| BGNLR | • | • | • | BGNLR | BGLR | BLR | LR |
| BGLR | • | • | • | BGLR | BGLR | BLR | LR |
| BLR | • | • | • | BLR | BLR | BLR | LR |
| LR | • | • | • | LR | LR | LR | LR |

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。”-”表示 AP 和 station 的 Wi-Fi 模式不兼容。根据上表，得出以下结论：

- 对于已使能 LR 的 ESP32-S2 AP，由于以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
- 对于已使能 LR 且并非仅 LR 模式的 ESP32-S2 station，与传统 802.11 模式兼容。
- 如果 station 和 AP 都是 ESP32 芯片系列设备（ESP32-C2 除外），并且两者都使能 LR 模式，则协商的模式支持 LR。

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率，应用程序无需任何操作。

LR 对传统 Wi-Fi 设备的影响 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备，因为：

- LR 模式下的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

LR 传输距离 LR 的接收灵敏度比传统的 802.11b 模式高 4 dB，理论上，传输距离约为 802.11b 的 2 至 2.5 倍。

LR 吞吐量 因为原始 PHY 数据传输速率为 1/2 Mbps 和 1/4 Mbps，LR 的吞吐量有限。

何时使用 LR 通常使用 LR 的场景包括：

- AP 和 station 都是乐鑫设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

Wi-Fi 国家/地区代码

调用 `esp_wifi_set_country()`，设置国家/地区信息。下表详细介绍了各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

| 字段 | 描述 |
|--------|---|
| cc[3] | 国家/地区代码字符串，此属性标识 station/AP 位于的国家/地区或非国家/地区实体。如果是一个国家/地区，该字符串的前两个八位字节是 ISO/IEC3166-1 中规定的国家/地区两位字母代码。第三个八位字节应是下述之一： <ul style="list-style-type: none"> • ASCII 码空格字符，代表 station/AP 所处国家/地区的规定允许当前频段所需的所有环境。 • ASCII 码 ‘O’ 字符，代表 station/AP 所处国家/地区的规定仅允许室外环境。 • ASCII 码 ‘I’ 字符，代表 station/AP 所处国家/地区的规定仅允许室内环境。 • ASCII 码 ‘X’ 字符，代表 station/AP 位于非国家/地区实体。非国家实体的前两个八位字节是两个 ASCII 码 ‘XX’ 字符。 • 当前使用的操作类表编号的二进制形式。见 IEEE Std 802.11-2020 附件 E。 |
| schan | 起始信道，station/AP 所处国家/地区规定的最小信道值。 |
| nchan | 规定的总信道数，比如，如果 schan=1，nchan=13，那么 station/AP 可以从信道 1 至 13 发送数据。 |
| policy | 国家/地区策略，当配置的国家/地区信息与所连 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多策略相关信息，可参见下文。 |

默认国家/地区信息为：

```
wifi_country_t config = {
    .cc = "01",
    .schan = 1,
    .nchan = 11,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同。例如，配置的 station 国家/地区信息为：

```
wifi_country_t config = {
    .cc = "JP",
    .schan = 1,
    .nchan = 14,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

但所连 AP 的国家/地区信息为：

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
};
```

此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区策略下使用的国家/地区信息，并描述了对主动扫描的影响。

| Wi-Fi 模式 | 策略 | 描述 |
|-----------------|----------------------------|---|
| station 模式 | WIFI_COUNTRY_POLICY_AUTO | 如果所连 AP 的 beacon 中有国家/地区的 IE，使用的国家/地区信息为 beacon 中的信息，否则，使用默认信息。 扫描时： 主动扫描信道 1 至信道 11，被动扫描信道 12 至信道 14。 请记住，如果带有隐藏 SSID 的 AP 和 station 被设置在被动扫描信道上，被动扫描将无法找到该 AP。也就是说，如果应用程序希望在每个信道中找到带有隐藏 SSID 的 AP，国家/地区信息应该配置为 WIFI_COUNTRY_POLICY_MANUAL。 |
| station 模式 | WIFI_COUNTRY_POLICY_MANUAL | 总是使用配置的国家/地区信息。 扫描时： 主动扫描信道 schan 至信道 schan+nchan-1。 |
| AP 模式 | WIFI_COUNTRY_POLICY_AUTO | 总是使用配置的国家/地区信息。 |
| AP 模式 | WIFI_COUNTRY_POLICY_MANUAL | 总是使用配置的国家/地区信息。 |
| station/AP 共存模式 | WIFI_COUNTRY_POLICY_AUTO | 该 AP 与 station 模式、WIFI_COUNTRY_POLICY_AUTO 策略下使用的国家/地区信息相同。如果 station 不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。 |
| station/AP 共存模式 | WIFI_COUNTRY_POLICY_MANUAL | 该 AP 与 station 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。该 AP 与 AP 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。 |

主信道 AP 模式下，AP 的信道定义为主信道。station 模式下，station 所连 AP 的信道定义为主信道。station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。比如，初始时，AP 位于信道 6，但 station 连接信道 9 的 AP。因为 station 的主信道具有优先性，该 AP 需要将信道从 6 切换至 9，确保与 station 主信道相同。切换信道时，AP 模式下的 ESP32-S2 将使用信道切换公告 (CSA) 通知连接的 station。支持信道切换的 station 将直接通过，无需与 AP 断连再重新连接。

Wi-Fi 供应商 IE 配置

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32-S2 中，`esp_wifi_set_vendor_ie()` 和 `esp_wifi_set_vendor_ie_cb()` 负责此类任务。

4.31.15 Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™（也称为设备配置协议）是一个安全且标准化的配置协议，用于配置 Wi-Fi 设备。更多信息请参考 [esp_dpp](#)。

WPA2-Enterprise

WPA2-Enterprise 是企业无线网络的安全认证机制。在连接到接入点之前，它使用 RADIUS 服务器对网络用户进行身份验证。身份验证过程基于 802.1X 标准，并有不同的扩展身份验证协议 (EAP) 方法，如 TLS、TTLS、PEAP 等。RADIUS 服务器根据用户的凭据（用户名和密码）、数字证书或两者对用户进行身份验证。当处于 station 模式的 ESP32-S2 尝试连接到企业模式的 AP 时，它会向 AP 发送身份验证请求，AP 会将该请求发送到 RADIUS 服务器以对 station 进行身份验证。根据不同的 EAP 方式，可以通过 `idf.py menuconfig` 打开配置，并在配置中设置参数。ESP32-S2 仅在 station 模式下支持 WPA2_Enterprise。

为了建立安全连接，AP 和 station 协商并就要使用的最佳密码套件达成一致。ESP32-S2 支持 AKM 的 802.1X/EAP (WPA) 方法和 AES-CCM（高级加密标准-带密码块链消息验证码协议的计数器模式）支持的密码套件。如果设置了 `USE_MBEDTLS_CRYPT` 标志，ESP32-S2 也支持 mbedtls 支持的密码套件。

目前，ESP32-S2 支持以下 EAP 方法：

- EAP-TLS：这是基于证书的方法，只需要 SSID 和 EAP-IDF。
- PEAP：这是受保护的 EAP 方法。用户名和密码是必填项。
- EAP-TTLS：这是基于凭据的方法。只有服务器身份验证是强制性的，而用户身份验证是可选的。用户名和密码
 - PAP：密码认证协议
 - CHAP：询问握手身份验证协议
 - MSCHAP 和 MSCHAP-V2
- EAP-FAST：这是一种基于受保护的访问凭据 (PAC) 的认证方法，使用身份验证和密码。目前使用此功能时需要禁用 `USE_MBEDTLS_CRYPT` 标志。

请查看 [wifi/wifi_enterprise](#) 获取关于证书创建以及如何如何在 ESP32-S2 上运行 `wpa2_enterprise` 示例的详细信息。

4.31.16 无线网络管理

无线网络管理让客户端设备能够交换有关网络拓扑结构的信息，包括与射频环境相关的信息。这使每个客户端都能感知网络状况，从而促进无线网络性能的整体改进。这是 802.11v 规范的一部分。它还使客户端能够支持网络辅助漫游。网络辅助漫游让 WLAN 能够向关联的客户端发送消息，从而使客户端与具有更好链路指标的 AP 关联。这对于促进负载均衡以及引导连接不良的客户端都很有用。

目前 802.11v 的实现支持 BSS 过渡管理帧。

4.31.17 无线资源管理

无线电资源测量 (802.11k) 旨在改善网络内流量的分配方式。在无线局域网中，一般情况下，无线设备会连接发射信号最强的接入点 (AP)。根据用户的数量和地理位置，这种分配方式有时会导致某个接入点超负荷而其它接入点利用不足，从而导致整体网络性能下降。在符合 802.11k 规范的网络中，如果信号最强的 AP 已满负荷加载，无线设备则转移到其它未充分利用的 AP。尽管信号可能较弱，但由于更有效地利用了网络资源，总体吞吐量会更大。

目前 802.11k 的实现支持信标测量报告、链路测量报告和邻居请求。

请参考 IDF 示例程序 [examples/wifi/roaming/README.md](#) 来设置和使用这些 API。示例代码只演示了如何使用这些 API，应用程序应根据需要定义自己的算法和案例。

4.31.18 Wi-Fi Location

Wi-Fi Location 将提高 AP 以外设备位置数据的准确性，这有助于创建新的、功能丰富的应用程序和服务，例如地理围栏、网络管理、导航等。用于确定设备相对于接入点的位置的协议之一是精细定时测量 (FTM)，它会计算 Wi-Fi 帧的飞行时间。

精细定时测量 (FTM)

FTM 用于测量 Wi-Fi 往返时间 (Wi-Fi RTT)，即 Wi-Fi 信号从一个设备到另一个设备并返回所需的时间。使用 Wi-Fi RTT，设备之间的距离可以用一个简单的公式 $RTT * c / 2$ 来计算，其中 c 是光速。

对于设备之间交换的帧，FTM 在帧到达或离开时使用时间戳，这个时间戳由 Wi-Fi 接口硬件提供。FTM 发起方 (主要是 station 设备) 发现 FTM 响应方 (可以是 station 或 AP)，并协商启动 FTM 程序。该程序以突发形式发送的多个动作帧及其 ACK 来收集时间戳数据。FTM 发起方最后收集数据以计算平均往返时间。

ESP32-S2 在以下配置中支持 FTM：

- ESP32-S2 在 station 模式下为 FTM 发起方。
- ESP32-S2 在 AP 模式下为 FTM 响应方。

使用 RTT 的距离测量并不准确，RF 干扰、多径传播、天线方向和缺乏校准等因素会增加这些不准确度。为了获得更好的结果，建议在两个 ESP32 芯片系列设备 (ESP32-C2 除外) 之间执行 FTM，这两个设备可分别设置为 station 和 AP 模式。

请参考 ESP-IDF 示例 [examples/wifi/ftm/README.md](#)，了解设置和执行 FTM 的详细步骤。

4.31.19 ESP32-S2 Wi-Fi 节能模式

本小节将简单介绍 Wi-Fi 节能模式相关的概念和使用方式，更加详细的介绍请参考[低功耗模式使用指南](#)。

station 睡眠

目前，ESP32-S2 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 station 模式支持该模式，station 必须先连接到 AP。如果使能了 Modem-sleep 模式，station 将定期在活动状态和睡眠状态之间切换。在睡眠状态下，RF、PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon。广播数据在 DTIM 之后传输，因此不会丢失。但是，由于 DTIM 间隔长短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 期间内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较长，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API `esp_wifi_set_config()` 配置监听间隔。

调用 `esp_wifi_init()` 后，调用 `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` 可启用 Modem-sleep 最小节能模式。调用 `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` 可启用 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 `esp_wifi_set_ps(WIFI_PS_NONE)` 可以完全禁用 Modem-sleep 模式。禁用会增大功耗，但可以最大限度减少实时接收 Wi-Fi 数据的延迟。启用 Modem-sleep 模式时，接收 Wi-Fi 数据的延迟时间可能与 DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。

默认的 Modem-sleep 模式是 `WIFI_PS_MIN_MODEM`。

AP 睡眠

目前，ESP32-S2 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32-S2 AP 所连的 station 已启用节能功能，可能发生组播数据包丢失。

未来，ESP32-S2 AP 将支持所有节能功能。

非连接状态下的休眠

非连接状态指的是 `esp_wifi_start()` 至 `esp_wifi_stop()` 期间内，没有建立 Wi-Fi 连接的阶段。

目前，ESP32-S2 Wi-Fi 支持以 station 模式运行时，在非连接状态下休眠。可以通过选项 `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` 配置该功能。

如果打开配置选项 `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`，则在该阶段内，RF, PHY and BB 将在空闲时被关闭，电流将会等同于 Modem-sleep 模式下的休眠电流。

配置选项 `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` 默认情况下将会被打开，共存模式下被 Menuconfig 强制打开。

非连接模块功耗管理

非连接模块指的是一些不依赖于 Wi-Fi 连接的 Wi-Fi 模块，例如 ESP-NOW，DPP，FTM。这些模块从 `esp_wifi_start()` 开始工作至 `esp_wifi_stop()` 结束。

目前，ESP-NOW 以 station 模式工作时，既支持在连接状态下休眠，也支持在非连接状态下休眠。

非连接模块发包 对于任何非连接模块，在开启了休眠的任何时间点都可以发包，不需要进行任何额外的配置。

此外，`esp_wifi_80211_tx()` 也在休眠时被支持。

非连接模块收包 对于非连接模块，在开启休眠时如果需要进行收包，需要配置两个参数，分别为 *Window* 和 *Interval*。

在每个 *Interval* 开始时，RF, PHY and BB 将会被打开并保持 *Window* 的时间。非连接模块可以在此时间内收包。

Interval

- 全局只有一个 *Interval* 参数，所有非连接模块共享它。其数值由 API `esp_wifi_set_connectionless_interval()` 配置，单位为毫秒。
- *Interval* 的默认值为 `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE`。
- 在 *Interval* 开始时，将会给出 `WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START` 事件，由于 *Window* 将在此时开始，可以在此事件内布置发包动作。
- 在连接状态下，*Interval* 开始的时间点将会与 TBTT 时间点对齐。

Window

- 每个非连接模块在启动后都有其自身的 *Window* 参数，休眠模块将取所有模块 *Window* 的最大值运作。

- 其数值由 API `module_name_set_wake_window()` 配置，单位为毫秒。
- 模块 `Window` 的默认值为最大值。

表 10: 不同 Window 与 Interval 组合下的 RF, PHY and BB 使用情况

| | | Interval | |
|--------|-------------|--|---|
| | | <code>ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE</code> | <code>ESP_WIFI_MAX_FRAME_INTERVAL_MODE</code> |
| Window | 0 | not used | |
| | 1 - maximum | default mode | used periodically (Window < Interval) / used all time (Window ≥ Interval) |

默认模式 当 `Interval` 参数被配置为 `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE`，且有非零的 `Window` 参数时，非连接模块功耗管理将会按默认模式运行。

在没有与非 Wi-Fi 协议共存时，RF、PHY 和 BB 将会在默认模式下被一直打开。

在与非 Wi-Fi 协议共存时，RF、PHY 和 BB 资源被共存模块分时刻划给 Wi-Fi 非连接模块和非 Wi-Fi 协议使用。在默认模式下，Wi-Fi 非连接模块被允许周期性使用 RF、PHY 和 BB，并且具有稳定性能。

推荐在与非 Wi-Fi 协议共存时将非连接模块功耗管理配置为默认模式。

4.31.20 ESP32-S2 Wi-Fi 吞吐量

下表是我们在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。

| 类型/吞吐量 | 实验室空气状况 | 屏蔽箱 | 测试工具 | IDF 版本 (commit ID) |
|-------------------|-----------|-------------------|---------------|--------------------|
| 原始 802.11 数据包接收数据 | N/A | 130 MBit/s | 内部工具 | N/A |
| 原始 802.11 数据包发送数据 | N/A | 130 MBit/s | 内部工具 | N/A |
| UDP 接收数据 | 30 MBit/s | 70 MBit/s | iperf example | 15575346 |
| UDP 发送数据 | 30 MBit/s | 50 MBit/s | iperf example | 15575346 |
| TCP 接收数据 | 20 MBit/s | 32 MBit/s | iperf example | 15575346 |
| TCP 发送数据 | 20 MBit/s | 37 MBit/s | iperf example | 15575346 |

使用 iperf example 测试吞吐量时，`sdkconfig` 是 `examples/wifi/iperf/sdkconfig.defaults.esp32s2`。

4.31.21 Wi-Fi 80211 数据包发送

`esp_wifi_80211_tx()` API 可用于：

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

使用 `esp_wifi_80211_tx()` 的前提条件

- Wi-Fi 模式为 station 模式，AP 模式，或 station/AP 共存模式。

- API `esp_wifi_set_promiscuous(true)` 或 `esp_wifi_start()`，或者二者都返回 `ESP_OK`。这是为确保在调用函数 `esp_wifi_80211_tx()` 前，Wi-Fi 硬件已经初始化。对于 ESP32-S2，`esp_wifi_set_promiscuous(true)` 和 `esp_wifi_start()` 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的 `esp_wifi_80211_tx()` 参数。

传输速率

- 默认传输速率为 1 Mbps。
- 可以通过函数 `esp_wifi_config_80211_tx_rate()` 设置任意速率。
- 可以通过函数 `esp_wifi_set_bandwidth()` 设置任意带宽。

在不同情况下需要避免的副作用

理论上，如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用，可以通过空中发送一个原始的 802.11 数据包，包括任何目的地址的 MAC、任何源地址的 MAC、任何 BSSID、或任何其他类型的数据包。但是，一个具有强健、有用的应用程序应该避免这种副作用。下表针对如何避免 `esp_wifi_80211_tx()` 的副作用提供了一些提示或建议。

| 场景 | 描述 |
|------------|--|
| 无 Wi-Fi 连接 | <p>在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 <code>en_sys_seq==true</code>，则 Wi-Fi 驱动程序负责序列控制。如果 <code>en_sys_seq==false</code>，应用程序需要确保缓冲区的序列正确。</p> <p>理论上，MAC 地址可以是任何地址。但是，这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。</p> <p>例如，AP 模式下，应用程序调用函数 <code>esp_wifi_80211_tx()</code> 发送带有 <code>BSSID == mac_x</code> 的 beacon，但是 <code>mac_x</code> 并非 AP 接口的 MAC。而且，还有另一个 AP（我们称之为“other-AP”）的 <code>bssid</code> 是 <code>mac_x</code>。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 <code>esp_wifi_80211_tx()</code>，就会出现“意外行为”。</p> <p>为了避免上述副作用，我们建议：</p> <ul style="list-style-type: none"> • 如果在 station 模式下调用函数 <code>esp_wifi_80211_tx()</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。 • 如果在 AP 模式下调用函数 <code>esp_wifi_80211_tx()</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。 <p>上述建议仅供避免副作用，在有充分理由的情况下可以忽略。</p> |
| 有 Wi-Fi 连接 | <p>当 Wi-Fi 已连接，且序列由应用程序控制，应用程序可能会影响整个 Wi-Fi 连接的序列控制。因此，<code>en_sys_seq</code> 要为 <code>true</code>，否则将返回 <code>ESP_ERR_INVALID_ARG</code>。</p> <p>“无 Wi-Fi 连接”情况下的 MAC 地址建议也适用于此情况。</p> <p>如果 Wi-Fi 模式是 station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC，那么就称数据包是从 station 发送到 AP。另一方面，如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC，那么就称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法：</p> <ul style="list-style-type: none"> • 如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。 • 如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。 • 如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。 <p>如果任何检查失败，将返回 <code>ESP_ERR_INVALID_ARG</code>。</p> |

4.31.22 Wi-Fi Sniffer 模式

Wi-Fi Sniffer 模式可以通过 `esp_wifi_set_promiscuous()` 使能。如果使能 Sniffer 模式，可以向应用程序转储以下数据包。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧
- 802.11 CRC 错误帧

不可以向应用程序转储以下数据包。

- 802.11 其它错误帧

对于 Sniffer 模式可以转储的帧，应用程序可以另外使用 `esp_wifi_set_promiscuous_filter()` 和 `esp_wifi_set_promiscuous_ctrl_filter()` 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。如果你想要筛选 802.11 控制帧，`esp_wifi_set_promiscuous_filter()` 中的 `filter` 参数需要包含“WIFI_PROMIS_FILTER_MASK_CTRL”类型，如果你想进一步区分 802.11 控制帧，那么调用 `esp_wifi_set_promiscuous_ctrl_filter()`。

可以在 `WIFI_MODE_NULL`、`WIFI_MODE_STA`、`WIFI_MODE_AP`、`WIFI_MODE_APSTA` 等 Wi-Fi 模式下使能 Wi-Fi Sniffer 模式。也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有 **很大影响**。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 `wifi_promiscuous_cb_t` 的使用。该回调将直接在 Wi-Fi 驱动程序任务中进行，所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的工作推迟到应用程序任务中完成。

4.31.23 Wi-Fi 多根天线

具体请参考 [PHY](#)。

4.31.24 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32-S2 中，CSI 由子载波的信道频率响应组成，CSI 从发送端接收数据包时开始估计。每个子载波信道频率响由两个字节的有符号字符记录，第一个字节是虚部，第二个字节是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是 LLTF、HT-LTF 和 STBC-HT-LTF。对于在不同状态的信道上接收到的不同类型的数据包，CSI 的子载波索引和总字节数如下表所示。

| 信道 | 辅助信道 | 下 | | | | | | | | 上 | | | | | |
|-------|-------------|------------|------------|------------|--------|--------|--------|------------|------------|--------|------|--------|------------|------------|--------|
| | | 非 HT | HT | | | 非 HT | HT | | 40 MHz | | | 非 HT | HT | | |
| 数据包信息 | 信号模式 | 非 HT | HT | | | 非 HT | HT | | 40 MHz | | | 非 HT | HT | | |
| | 信道带宽 | 20 MHz | 20 MHz | | | 20 MHz | 20 MHz | | 40 MHz | | | 20 MHz | 20 MHz | | 40 MHz |
| | STBC | 非 STBC | 非 STBC | STBC | 非 STBC | 非 STBC | STBC | 非 STBC | STBC | 非 STBC | STBC | 非 STBC | 非 STBC | STBC | 非 STBC |
| 子载波索引 | LLTF | 0~31, 32~1 | 0~31, 32~1 | 0~31, 32~1 | 0~63 | 0~63 | 0~63 | 0~63 | 0~63 | - | - | - | - | - | |
| | HT-LTF | — | 0~31, 32~1 | 0~31, 32~1 | — | 0~63 | 0~62 | 0~63, 64~1 | 0~60, 60~1 | — | - | - | 0~63, 64~1 | 0~60, 60~1 | |
| | STBC-HT-LTF | — | — | 0~31, 32~1 | — | — | 0~62 | — | 0~60, 60~1 | — | — | - | — | 0~60, 60~1 | |
| 总字节数 | 128 | 256 | 384 | 128 | 256 | 380 | 384 | 612 | 128 | 256 | 376 | 384 | 612 | | |

表中的所有信息可以在 `wifi_csi_info_t` 结构中找到。

- 辅助信道指 `rx_ctrl` 字段的 `secondary_channel` 字段。
- 数据包的信号模式指 `rx_ctrl` 字段的 `sig_mode` 字段。
- 信道带宽指 `rx_ctrl` 字段中的 `cwb` 字段。
- STBC 指 `rx_ctrl` 字段的 `stbc` 字段。
- 总字节数指 `len` 字段。
- 每个长训练字段 (LTF) 类型对应的 CSI 数据存储从 `buf` 字段开始的缓冲区中。每个元素以两个字节的形式存储：虚部和实部。每个元素的顺序与表中的子载波相同。LTF 的顺序是 LLTF、HT-LTF 和 STBC-HT-LTF。但是，根据信道和数据包的信息，3 个 LTF 可能都不存在（见上文）。
- 如果 `wifi_csi_info_t` 的 `first_word_invalid` 字段为 `true`，表示由于 ESP32-S2 的硬件限制，CSI 数据的前四个字节无效。
- 更多信息，如 RSSI，射频频的噪声底，接收时间和天线 `rx_ctrl` 领域。

子载波的虚部和实部的使用请参考下表。

| PHY 标准 | 子载波范围 | 导频子载波 | 子载波个数 (总数/数据子载波) |
|-----------------|------------|------------------------------|-----------------------|
| 802.11a/g | -26 to +26 | -21, -7, +7, +21 | 52 total, 48 usable |
| 802.11n, 20 MHz | -28 to +28 | -21, -7, +7, +21 | 56 total, 52 usable |
| 802.11n, 40 MHz | -57 to +57 | -53, -25, -11, +11, +25, +53 | 114 total, 108 usable |

备注:

- 对于 STBC 数据包，每个空时流都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附加链上的每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF 中只记录第一空时流的 CSD 角度。CSD[10:0] 是 11 位，范围从 $-\pi$ 到 π 。
- 如果调用 API `esp_wifi_set_csi_config()` 没有使能 LLTF、HT-LTF 或 STBC-HT-LTF，则 CSI 数据的总字节数会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当接收到上述条件、HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244 ($(61+60)*2+2=244$ ，结果对齐为四个字节，最后两个字节无效)。

4.31.25 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。

- 在菜单配置中选择 Wi-Fi CSI。方法是 `Menuconfig > Components config > Wi-Fi > Wi-Fi CSI (Channel State Information)`。

- 调用 API `esp_wifi_set_csi_rx_cb()` 设置 CSI 接收回调函数。
- 调用 API `esp_wifi_set_csi_config()` 配置 CSI。
- 调用 API `esp_wifi_set_csi()` 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。可以将需要的数据发布到队列中，并从一个较低优先级的任务中处理。由于 station 在断开连接时不会收到任何数据包，只有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数 `esp_wifi_set_promiscuous()` 使能 Sniffer 模式接收更多 CSI 数据。

4.31.26 Wi-Fi HT20/40

ESP32-S2 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存，调用函数 `esp_wifi_set_bandwidth()` 可改变 station/AP 的默认带宽。ESP32-S2 station 和 AP 的默认带宽为 HT40。

station 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 station 和所连 AP 都支持 HT40 时，带宽才为 HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带宽。

同样，在 AP 模式下，在 AP 与所连 station 协商实际带宽。如果 AP 和其中一个 station 支持 HT40，则为 HT40，否则为 HT20。

在 station/AP 共存模式下，station 和 AP 都可独立配置为 HT20/40。如果 station 和 AP 都协商为 HT40，由于 ESP32-S2 中，station 的优先级总高于 AP，HT40 信道是 station 的信道。例如，AP 的配置带宽为 HT40，配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6、辅助信道为 2，AP 的实际信道将自动更改为主 6 和辅 2。

理论上，HT40 可以获得更大的吞吐量，因为 HT40 的最大原始 PHY 数据速率为 150 Mbps，而 HT20 为 72 Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32-S2 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。

4.31.27 Wi-Fi QoS

ESP32-S2 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32-S2 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC_VO 拥有最高优先级。

| IP 优先级 | Wi-Fi AC | 是否支持 AMPDU |
|--------|---------------------|------------|
| 6, 7 | AC_VO (Voice) | 否 |
| 4, 5 | AC_VI (Video) | 是 |
| 3, 0 | AC_BE (Best Effort) | 是 |
| 1, 2 | AC_BK (Background) | 是 |

应用程序可以通过套接字选项 `IP_TOS` 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例：

```
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此，下面是一些关于如何使用 Wi-Fi QoS 的建议：

- 可以把一些真正重要的应用程序流量放到 AC_VO 队列中。避免通过 AC_VO 队列发送大流量。一方面，AC_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会影响同样使用 AC_VO 队列的管理帧。
- 避免使用 AMPDU 支持的、两个以上的不同优先级，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

4.31.28 Wi-Fi AMSDU

ESP32-S2 支持接收和发送 AMSDU。开启 AMSDU 发送比较消耗内存，默认不开启 AMSDU 发送。可通过选项 `CONFIG_ESP_WIFI_AMSDU_TX_ENABLED` 使能 AMSDU 发送功能，但是使能 AMSDU 发送依赖于 `CONFIG_SPIRAM`。

4.31.29 Wi-Fi 分片

支持 Wi-Fi 接收分片，但不支持 Wi-Fi 发送分片。

4.31.30 WPS 注册

在 Wi-Fi 模式 `WIFI_MODE_STA` 或 `WIFI_MODE_APSTA` 下，ESP32-S2 支持 WPS 注册功能。目前，ESP32-S2 支持的 WPS enrollee 类型有 PBC 和 PIN。

4.31.31 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。

缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32-S2 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，意味着 **LwIP 和 Wi-Fi 都与应用程序共享内存**。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32-S2 出现“未定义行为”。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32-S2 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓存类型是“动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

LwIP 还在 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 [lwIP 文档内存使用和性能部分](#)。

Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考 [Wi-Fi 缓冲区配置](#)）。但本节只介绍 Wi-Fi 动态缓冲的使用方法。Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序 **理论上消耗的最大内存**。通常，该内存峰值取决于：

- b_{rx} 配置的动态接收数据缓冲区数
- b_{tx} 配置的动态发送数据缓冲区数
- m_{rx} Wi-Fi 驱动程序可以接收的最大数据包
- m_{tx} Wi-Fi 驱动程序可以发送的最大数据包

因此，Wi-Fi 驱动程序消耗的内存峰值 (p) 可以用下面的公式计算：

$$p = (b_{rx} * m_{rx}) + (b_{tx} * m_{tx})$$

一般情况下，不需要关心动态发送数据长缓冲区和超长缓冲区，因为它们是管理帧，对系统的影响很小。

4.31.32 如何提高 Wi-Fi 性能

ESP32-S2 Wi-Fi 的性能受许多参数的影响，各参数之间存在相互制约。如果配置地合理，不仅可以提高性能，还可以增加应用程序的可用内存，提高稳定性。

在本节中，我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式，并说明各个参数的作用。我们将推荐几种配置等级，你可以根据使用场景选择合适的等级。

协议栈工作模式

图 51: ESP32-S2 数据路径

ESP32-S2 协议栈分为四层，分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中，硬件将接收到的数据包放入 DMA 缓冲区，然后依次传送到 Wi-Fi 的接收数据缓冲区、LWIP 的接收数据缓冲区进行相关协议处理，最后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说，Wi-Fi 默认将数据包转发到 LWIP 作为参考。
- 在发送过程中，应用程序首先将要发送的消息复制到 LWIP 层的发送数据缓冲区，进行 TCP/IP 封装。然后将消息发送到 Wi-Fi 层的发送数据缓冲区进行 MAC 封装，最后等待发送。

参数

适当增加上述缓冲区的大小或数量，可以提高 Wi-Fi 性能，但同时，会减少应用程序的可用内存。下面我们将介绍你需要配置的参数：

接收数据方向：

- ***CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM*** 该参数表示硬件层的 DMA 缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量，从而提高 Wi-Fi 协议栈处理突发流量的能力。
- ***CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM*** 该参数表示 Wi-Fi 层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与 LWIP 层的接收数据缓冲区大小相匹配。
- ***CONFIG_ESP_WIFI_RX_BA_WIN*** 该参数表示接收端 AMPDU BA 窗口的大小，应配置为 ***CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM*** 和 ***CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM*** 的二倍数值中较小的数值。
- ***CONFIG_LWIP_TCP_WND_DEFAULT*** 该参数表示 LWIP 层用于每个 TCP 流的接收数据缓冲区大小，应配置为 ***WIFI_DYNAMIC_RX_BUFFER_NUM*** (KB) 的值，从而实现高稳定性能。同时，在有多个流的情况下，应相应降低该参数值。

发送数据方向：

- ***CONFIG_ESP_WIFI_TX_BUFFER*** 该参数表示发送数据缓冲区的类型，建议配置为动态缓冲区，该配置可以充分利用内存。
- ***CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM*** 该参数表示 Wi-Fi 层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与 LWIP 层的发送数据缓冲区大小相匹配。
- ***CONFIG_LWIP_TCP_SND_BUF_DEFAULT*** 该参数表示 LWIP 层用于每个 TCP 流的发送数据缓冲区大小，应配置为 ***WIFI_DYNAMIC_TX_BUFFER_NUM*** (KB) 的值，从而实现高稳定性能。在有多个流的情况下，应相应降低该参数值。

通过在 IRAM 中放置代码优化吞吐量：

- ***CONFIG_ESP_WIFI_IRAM_OPT*** 如果使能该选项，一些 Wi-Fi 功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 15 kB。
- ***CONFIG_ESP_WIFI_RX_IRAM_OPT*** 如果使能该选项，一些 Wi-Fi 接收数据功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 16 kB。
- ***CONFIG_LWIP_IRAM_OPTIMIZATION*** 如果使能该选项，一些 LWIP 功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 13 kB。

缓存：

- ***CONFIG_ESP32S2_INSTRUCTION_CACHE_SIZE*** 配置指令缓存的大小。
- ***CONFIG_ESP32S2_INSTRUCTION_CACHE_LINE_SIZE*** 配置指令缓存总线的宽度。

备注： 上述的缓冲区大小固定为 1.6 KB。

如何配置参数

ESP32-S2 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

| 等级 | Iperf | 高性能 | 默认 | 节省内存 | 最小 |
|----------------------------|-------|------|------|------|-------|
| 可用内存 (KB) | 4.1 | 24.2 | 78.4 | 86.5 | 116.4 |
| WIFI_STATIC_RX_BUFFER_NUM | 6 | 6 | 6 | 4 | 3 |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 12 | 12 | 12 | 8 | 6 |
| WIFI_DYNAMIC_TX_BUFFER_NUM | 12 | 12 | 12 | 8 | 6 |
| WIFI_RX_BA_WIN | 9 | 9 | 6 | 4 | 3 |
| TCP_SND_BUF_DEFAULT (KB) | 18 | 18 | 12 | 8 | 6 |
| TCP_WND_DEFAULT (KB) | 18 | 18 | 12 | 8 | 6 |
| WIFI_IRAM_OPT15 | 15 | 15 | 15 | 15 | 0 |
| WIFI_RX_IRAM_OPT | 16 | 16 | 16 | 0 | 0 |
| LWIP_IRAM_OPTIMIZATION | 13 | 13 | 0 | 0 | 0 |
| INSTRUCTION_CACHE | 16 | 16 | 16 | 16 | 8 |
| INSTRUCTION_CACHE_LINE | 16 | 16 | 16 | 16 | 16 |
| TCP 发送数据吞吐量 (Mbit/s) | 37.6 | 33.1 | 22.5 | 12.2 | 5.5 |
| TCP 接收数据吞吐量 (Mbit/s) | 31.5 | 28.1 | 20.1 | 13.1 | 7.2 |
| UDP 发送数据吞吐量 (Mbit/s) | 58.1 | 57.3 | 28.1 | 22.6 | 8.7 |
| UDP 接收数据吞吐量 (Mbit/s) | 78.1 | 66.7 | 65.3 | 53.8 | 28.5 |

备注： 以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32-S2 的 CPU 为单核，频率为 240 MHz，flash 为 QIO 模式，频率为 80 MHz。

等级：

- **Iperf 等级** ESP32-S2 极端性能等级，用于测试极端性能。
- **高性能等级** ESP32-S2 的高性能配置等级，适用于应用程序占用内存较少且有高性能要求的场景。
- **默认等级** ESP32-S2 的默认配置等级、兼顾可用内存和性能。
- **节省内存等级** 该等级适用于应用程序需要大量内存的场景，在这一等级下，收发器的性能会有所降低。
- **最小等级** ESP32-S2 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。

使用 PSRAM

PSRAM 一般在应用程序占用大量内存时使用。在该模式下，`CONFIG_ESP_WIFI_TX_BUFFER` 被强制为静态。`CONFIG_ESP_WIFI_STATIC_TX_BUFFER_NUM` 表示硬件层 DMA 缓冲区数量，提高这一参数可以增强性能。以下是使用 PSRAM 时的推荐等级。

| 等级 | lperf | 默认 | 节省内存 | 最小 |
|----------------------------|-------|------|-------|-------|
| 可用内存 (KB) | 70.6 | 96.4 | 118.8 | 148.2 |
| WIFI_STATIC_RX_BUFFER_NUM | 8 | 8 | 6 | 4 |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 64 | 64 | 64 | 64 |
| WIFI_STATIC_TX_BUFFER_NUM | 8 | 8 | 6 | 4 |
| WIFI_RX_BA_WIN | 6 | 6 | 6 | 禁用 |
| TCP_SND_BUF_DEFAULT (KB) | 32 | 32 | 32 | 32 |
| TCP_WND_DEFAULT (KB) | 32 | 32 | 32 | 32 |
| WIFI_IRAM_OPT | 15 | 15 | 15 | 0 |
| WIFI_RX_IRAM_OPT | 16 | 16 | 0 | 0 |
| LWIP_IRAM_OPTIMIZATION | 0 | 0 | 0 | 0 |
| INSTRUCTION_CACHE | 16 | 16 | 16 | 8 |
| INSTRUCTION_CACHE_LINE | 16 | 16 | 16 | 16 |
| DATA_CACHE | 8 | 8 | 8 | 8 |
| DATA_CACHE_LINE | 32 | 32 | 32 | 32 |
| TCP 发送数据吞吐量 (Mbit/s) | 40.1 | 29.2 | 20.1 | 8.9 |
| TCP 接收数据吞吐量 (Mbit/s) | 21.9 | 16.8 | 14.8 | 9.6 |
| UDP 发送数据吞吐量 (Mbit/s) | 50.1 | 25.7 | 22.4 | 10.2 |
| UDP 接收数据吞吐量 (Mbit/s) | 45.3 | 43.1 | 28.5 | 15.1 |

备注：达到性能的峰值可能会触发任务看门狗，由于 CPU 可能没有时间处理低优先级的任务，这是一个正常现象。

4.31.33 Wi-Fi Menuconfig

Wi-Fi 缓冲区配置

如果要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中如何分配或释放。下图显示了发送数据方向的过程。

图 52: TX Buffer Allocation

描述：

- 应用程序分配需要发送的数据。

- 应用程序调用 TCPIP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区：

图 53: 接收数据缓冲区分配

描述：

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据 DMA 缓冲区”。
- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”、复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。

| 缓冲区类型 | 分配类型 | 默认 | 是否可配置 | 描述 |
|----------------------|------|-----------------|-------|---|
| 静态接收数据缓冲区(硬件接收数据缓冲区) | 静态 | 10 * 1600 Bytes | 是 | 这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。该缓冲区形成硬件接收列表。当通过空中接收到一个帧时，硬件将该帧写入缓冲区，并向 CPU 发起一个中断。然后，Wi-Fi 驱动程序从缓冲区中读取内容，并将缓冲区返回到列表中。 如果应用程序希望减少 Wi-Fi 静态分配的内存，可以将该值从 10 减少到 6，从而节省 6400 Bytes 的内存。除非禁用 AMPDU 功能，否则不建议将该值降低到 6 以下。 |
| 动态接收数据缓冲区 | 动态 | 32 | 是 | 缓冲区的长度可变，取决于所接收帧的长度。当 Wi-Fi 驱动程序从“硬件接收数据缓冲区”接收到一帧时，需要从堆中分配“动态接收数据缓冲区”。在 Menuconfig 中配置的“动态接收数据缓冲区”数量用来限制未释放的“动态接收数据缓冲区”总数量。 |
| 动态发送数据缓冲区 | 动态 | 32 | 是 | 这是一种 DMA 内存，位于堆内存中。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“动态发送数据缓冲区”，并复制上层缓冲区。 动态发送数据缓冲区和静态发送数据缓冲区相互排斥。 |
| 静态发送数据缓冲区 | 静态 | 16 * 1600 Bytes | 是 | 这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“静态发送数据缓冲区”，并复制上层缓冲区。 动态发送数据缓冲区和静态发送数据缓冲区相互排斥。 由于发送数据缓冲区必须是 DMA 缓冲区，所以当使能 PSRAM 时，发送数据缓冲区必须是静态的。 |
| 管理短缓冲区 | 动态 | 8 | 否 | Wi-Fi 驱动程序的内部缓冲区。 |
| 管理长缓冲区 | 动态 | 32 | 否 | Wi-Fi 驱动程序的内部缓冲区。 |
| 管理超长缓冲区 | 动态 | 32 | 否 | Wi-Fi 驱动程序的内部缓冲区。 |

Wi-Fi NVS Flash

如果使能 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置都会被存储到 flash 中，Wi-Fi 驱动程序在下次开机或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中、其配置信息已安全备份，或仅出于某些调试原因等。

Wi-Fi AMPDU

ESP32-S2 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。

通常，应使能 AMPDU。禁用 AMPDU 通常用于调试目的。

4.31.34 故障排除

请见乐鑫 [Wireshark 使用指南](#)。

乐鑫 Wireshark 使用指南

1. 概述

1.1 什么是 Wireshark？ Wireshark（原称 Ethereal）是一个网络封包分析软件。网络封包分析软件的功能是撷取网络封包，并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口，直接与网卡进行数据报文交换。

网络封包分析软件的功能可想像成“电工技师使用电表来量测电流、电压、电阻”的工作，只是将场景移植到网络上，并将电线替换成网线。

在过去，网络封包分析软件是非常昂贵，或是专门属于营利用的软件。Wireshark 的出现改变了这一切。

在 GNU GPL 通用许可证的保障范围内，使用者可以以免费的代价取得软件与其源代码，并拥有针对其源代码修改及客制化的权利。

Wireshark 是目前全世界最广泛的网络封包分析软件之一。

1.2 Wireshark 的主要应用 下面是 Wireshark 一些应用的举例：

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的，Wireshark 还可以用在其它许多场合。

1.3 Wireshark 的特性

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等

1.4 Wireshark 的“能”与“不能”？

- **捕捉多种网络接口**
Wireshark 可以捕捉多种网络接口类型的包，哪怕是无线局域网接口。
- **支持多种其它程序捕捉的文件**
Wireshark 可以打开多种网络分析软件捕捉的包。
- **支持多格式输出**
Wireshark 可以将捕捉文件输出为多种其他捕捉软件支持的格式。
- **对多种协议解码提供支持**
Wireshark 可以支持许多协议的解码。
- **Wireshark 不是入侵检测系统**
如果你的网络中存在任何可疑活动，Wireshark 并不会主动发出警告。不过，当你希望对这些可疑活动一探究竟时，Wireshark 可以发挥作用。
- **Wireshark 不会处理网络事务，它仅仅是“测量”（监视）网络**
Wireshark 不会发送网络包或做其它交互性的事情（名称解析除外，但你也可以禁止解析）。

2. 如何获取 Wireshark 官网链接：<https://www.wireshark.org/download.html>

Wireshark 支持多种操作系统，请在下载安装文件时，注意选择与你所用操作系统匹配的安装文件。

3. 使用步骤 本文档仅以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。

1) 启动 Wireshark

Linux 下，可编写一个 Shell 脚本，运行该文件即可启动 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

脚本中有两个参数：\$1 和 \$2，分别表示网卡和信道，例如，./xxx.sh wlan0 6（此处，wlan0 即为抓包使用的网卡，后面的数字 6 即为 AP 或 soft-AP 所在的 channel）。

2) 运行 Shell 脚本打开 Wireshark，会出现 Wireshark 抓包开始界面

图 54: Wireshark 抓包界面

3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。

可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。

双击 `wlan0` 即可开始抓包。

4) 设置过滤条件

抓包过程中会抓取到同信道所有的空中包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 filter 的位置。

图 55: 设置 Wireshark 过滤条件

点击 *Filter* 按钮（下图的左上角蓝色按钮）会弹出 *display filter* 对话框。

图 56: *Display Filter* 对话框

点击 *Expression* 按钮，会出现 *Filter Expression* 对话框，在此你可以根据需求进行 filter 的设置。

最直接的方法：直接在工具栏上输入过滤条件。

点击在此区域输入或修改显示的过滤字符，在输入过程中会进行语法检查。如果输入的格式不正确，或者未输入完成，则背景显示为红色。直到输入合法的表达式，背景会变为绿色。你可以点击下拉列表选择先前键入的过滤字符。列表会一直保留，即使重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 *Apply*（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

5) 封包列表

若想查看包的具体的信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。

如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。

图 57: Filter Expression 对话框

图 58: 过滤条件工具栏

图 59: 在过滤条件工具栏中运用 MAC 地址过滤示例

图 60: 封包列表具体信息示例

图 61: 停止包的捕捉

图 62: 开始或继续包的捕捉

若要重新开始抓包，点击下图左上角的蓝色按钮即可。

7) 保存当前捕捉包

Linux 下，可以通过依次点击”File” -> ”Export Packet Dissections” -> ”As Plain Text File” 进行保存。

图 63: 保存捕捉包

上图中，需要注意的是，选择 *All packets*、*Displayed* 以及 *All expanded* 三项。

Wireshark 捕捉的包可以保存为其原生格式文件 (libpcap)，也可以保存为其他格式 (如.txt 文件) 供其他工具进行读取分析。

4.32 Wi-Fi 安全性

4.32.1 ESP32-S2 Wi-Fi 安全功能

- 支持受保护的管理帧 (PMF)
- 支持第三代 Wi-Fi 访问保护 (WPA3-Personal)
- 支持机会性无线加密 (OWE)

除传统安全方法 (WEP/WPA-TKIP/WPA2-CCMP) 外，ESP32-S2 Wi-Fi 还支持最先进的安全协议，即受保护的管理帧 (PMF)、第三代 Wi-Fi 访问保护和基于机会性无线加密技术的增强型开放式™ Wi-Fi 安全协议。WPA3 能更好地保护隐私，并在已知针对传统模式的攻击下具有更强的鲁棒性。增强型开放式™ Wi-Fi 安全协议可以在用户连接到无需认证的开放 (公共) Wi-Fi 时，确保用户设备安全，并保护隐私。

4.32.2 受保护的管理帧 (PMF)

简介

Wi-Fi 网络中，非 AP 设备使用如信标、探测、(解) 身份验证和 (断) 关联等管理帧，扫描并连接到 AP。不同于数据帧，管理帧在传输时不会加密。

由此，攻击者可以利用窃听和数据包注入，在适当时机发送伪造的 (解) 身份验证或 (断) 关联管理帧，发起拒绝服务 (DoS) 和中间人攻击等攻击。

PMF 通过加密单播管理帧以及为广播管理帧提供完整性检查，来应对上述解身份验证、解关联和鲁棒管理帧等攻击。此外，PMF 还提供了安全关联 (SA) 拆除机制，防止伪造的关联或验证帧使已连接的客户端断开连接。

station 和 AP 支持三类 PMF 配置模式：

- 可选 PMF
- 强制 PMF
- 禁用 PMF

API 及用法

在 station 模式和 SoftAP 模式下，ESP32-S2 都支持 PMF，两者均默认配置为可选 PMF。为了更高的安全性，可以在使用 `esp_wifi_set_config()` API 时设置 `pmf_cfg` 中的 `required` 标志，启用强制 PMF 模式。启用后，设备将仅连接到启用了 PMF 的设备，并拒绝其他设备发起的连接。使用 `esp_wifi_disable_pmf_config()` API 可以禁用可选 PMF 配置模式。如果在 WPA3 或 WPA2/WPA3 混合模式下启动了 SoftAP 模式，尝试禁用 PMF 会导致错误。

注意：为最大限度地利用 PMF 的额外安全性优势，已弃用 `pmf_cfg` 中的 `capable` 标志，并在内部设置为 `true`。

4.32.3 企业级 Wi-Fi

简介

企业级安全是企业无线网的安全认证机制，采用 RADIUS 服务器在设备接入到接入点 (AP) 前认证网络用户。该机制基于 802.1X 标准完成认证，并采用多种扩展认证协议 (EAP) 方法，如 TLS、TTLS、PEAP 和 EAP-FAST。RADIUS 服务器根据用户凭证（用户名和密码）、数字证书或两者的组合进行用户认证。

备注：ESP32-S2 仅在 station 模式下支持企业级 Wi-Fi。

ESP32-S2 支持 **企业级 WPA2** 和 **企业级 WPA3**。企业级 WPA3 构建在企业级 WPA2 的基础之上，并额外要求在所有 WPA3 连接中使用受保护的管理帧 (PMF) 和服务器证书验证。此外，**企业级 WPA3 还提供了一种更安全的模式，使用 192 位最低强度的安全协议和加密工具，更好地保护敏感数据。**企业级 WPA3 的 192 位模式可以确保用户正确使用密码工具组合，并在 WPA3 网络中设立了一致的安全基准。需要注意的是，只有支持 `SOC_WIFI_GCMP_SUPPORT` 的模组才支持企业级 WPA3 的 192 位模式。如需使用该模式，请启用 `CONFIG_ESP_WIFI_SUITE_B_192` 标志。

ESP32-S2 支持以下 EAP 方法：

- EAP-TLS：该认证方法基于证书实现，仅需提供 SSID 和 EAP-IDF。
- PEAP：该认证方法为受保护的 EAP 方法，必须提供用户名和密码。
- EAP-TTLS：该认证方法基于凭证实现，**必须提供服务器证书，用户证书为可选项。该方法支持多种第二阶段**
 - PAP：密码认证协议
 - CHAP：挑战握手认证协议
 - MSCHAP 和 MSCHAP-V2
- EAP-FAST：该认证方法基于受保护访问凭证 (PAC) 实现，同时也使用身份和密码。目前，需禁用 `CONFIG_ESP_WIFI_MBEDTLS_TLS_CLIENT` 标志以使用此功能。

示例 `wifi/wifi_enterprise` 展示了除 EAP-FAST 之外的所有支持的企业级 Wi-Fi 方法。有关 EAP-FAST 的示例，请参阅 `wifi/wifi_eap_fast`。可以在 `idf.py menuconfig` 的示例配置菜单中选择 EAP 方法。请参阅 `examples/wifi/wifi_enterprise/README.md` 了解如何生成证书及如何运行示例。

4.32.4 个人级 WPA3

简介

第三代 Wi-Fi 访问保护 (WPA3) 是一组强化的 Wi-Fi 接入安全性标准，旨在取代当前的 WPA2 标准。WPA3 包含了新的功能和属性，可以提供更显著的保护效果，应对不同类型的攻击。相比 WPA2-Personal, WPA 3-Personal 有以下改进：

- WPA3 使用对等实体同时验证 (SAE) 技术，这是一种基于 Diffie-Hellman 密钥交换的密码验证密钥协商方法。与 WPA2 不同，SAE 技术能够抵抗离线字典攻击，即攻击者在无需进一步网络交互的情况下，尝试通过窃听的四次握手确定共享密钥。
- 禁用过时协议，如 TKIP 协议，该协议容易受到如 MIC 密钥恢复攻击等简单攻击。
- 强制使用受保护的管理帧 (PMF) 保护单播和组播鲁棒管理帧，包括 Disassoc 和 Deauth 帧。这意味着攻击者无法通过向 AP 发送伪造的 Assoc 帧或向 station 发送 Deauth/Disassoc 帧来中断已建立的 WPA3 会话。
- 提供前向保密功能，即使攻击者在数据传输后成功破解密码，也无法解密捕获的数据。

ESP32-S2 的 station 模式还支持以下额外的 Wi-Fi CERTIFIED WPA3™ 功能：

- **禁用过渡：**WPA3 为客户端定义了过渡模式。该模式下，即使网络中的某些 AP 不支持最强的安全模式，客户端也能正常接入网络。客户端通常会默认将网络配置文件配置为过渡模式。然而，这类客户端可能会遭受主动降级攻击，即攻击者会引导客户端使用强度较低的安全模式，以利用该模式的漏洞。为减轻这种攻击的影响，WPA3 引入了禁用过渡功能。当连接到某个网络时，若该网络已全面支持更高级的安全模式，则支持客户端从过渡模式切换到“纯粹”模式。请在 `wifi_sta_config_t` 中启用 `transition_disable`，为 ESP32-S2 的 station 模式启用此功能。
- **SAE 公钥 (PK)：**由于小型公共网络中的密码与多个用户共享，攻击者可能更容易破解密码，发动伪装双子攻击。为阻止这类攻击，个人级 WPA3 引入了 SAE-PK 扩展认证机制。SAE-PK 认证交换与常规 SAE 交换非常相似，唯一区别在于 AP 会向客户端发送数字签名。客户端基于密码指纹验证 AP 断言的公钥，并使用公钥验证签名。因此，即使攻击者知道密码，也不知道生成有效签名所需的私钥，避免客户端遭受伪装双子攻击。请启用 `CONFIG_ESP_WIFI_ENABLE_SAE_PK`，并在 `wifi_sta_config_t` 中使用 `sae_pk_mode` 进行相应配置，为 ESP32-S2 的 station 模式添加 SAE PK 支持。
- **SAE PWE Methods：**ESP32-S2 的 station 和 SoftAP 模式都支持 SAE 密码元素的推导方法 *Hunting And Pecking* 和 *Hash to Element (H2E)*。H2E 所需迭代次数较少，因此计算效率更高，还可以减轻侧通道攻击的风险。这些方法可以分别在 station 模式和 SoftAP 中通过参数 `sae_pwe_h2e` 配置，其中 `wifi_sta_config_t` 用于 station 模式，`wifi_ap_config_t` 用于 SoftAP 模式。请使用配置选项 `WPA3_SAE_PWE_BOTH` 启用 *Hunting And Pecking* 和 *H2E* 方法。

请参阅 Wi-Fi 联盟官网的 [安全性](#) 部分，了解更多详情。

在 ESP32-S2 上设置 WPA3

配置选项 `CONFIG_ESP_WIFI_ENABLE_WPA3_SAE` 用于在 station 上启用或禁用 WPA3，该选项默认启用，如果禁用，则 ESP32-S2 无法建立 WPA3 连接。Wi-Fi 组件中还提供了配置选项 `CONFIG_ESP_WIFI_SOFTAP_SAE_SUPPORT`，用于在 SoftAP 上启用或禁用 WPA3。此外，由于 WPA3 协议强制使用 PMF，因此，station 和 SoftAP 的 PMF 模式均默认为可选 PMF。可以使用 Wi-Fi 配置选项将 PMF 模式配置为强制 PMF。WPA3 SoftAP 仅支持使用强制 PMF 模式，如无特别指定，则将在 NVS 中隐式配置并存储该模式。

要了解如何设置 PMF 模式，请参阅[受保护的管理帧 \(PMF\)](#)。

在为 WPA3-Personal station 配置完所需设置后，应用程序开发人员无需再对 AP 的底层安全模式进行操作。从安全性来看，WPA3-Personal 是目前支持的最高级别协议，因此只要该协议可用，设备就会自动选择将该协议用于连接。例如，如果将 AP 配置为 WPA3 过渡模式，即同时支持 WPA2 和 WPA3，station 将根据以上设置连接 WPA3。

在为 WPA3-Personal 的 SoftAP 模式配置完所需设置后，应用程序开发人员必须在 `wifi_ap_config_t` 中的 `authmode` 设置 `WIFI_AUTH_WPA3_PSK`，启动以 WPA3 安全模式运行的 AP。也可将 SoftAP 配置为使用 `WIFI_AUTH_WPA2_WPA3_PSK` 的混合模式。

注意，启用 `CONFIG_ESP_WIFI_SOFTAP_SAE_SUPPORT` 时，二进制文件大小将增加约 6.5 千字节。

4.32.5 增强型开放式™ Wi-Fi 安全协议

简介

增强型开放式™ Wi-Fi 安全协议为连接到开放（公共）Wi-Fi 的用户提供更高的安全性和隐私保护，尤其适用于无需验证用户身份或无法分发凭证的场景。在此协议下，每位用户都可以获得独特的个人加密密钥，保障用户设备与 Wi-Fi 网络间的数据交换安全。同时，受保护的管理帧还进一步增强了接入点与用户设备之间管理流量的安全性。增强型开放式™ Wi-Fi 安全协议基于机会性无线加密 (OWE) 实现，OWE 过渡模式可以从开放的未加密 WLAN 完美过渡到 OWE WLAN，不会对终端用户体验造成不良影响。

备注：ESP32-S2 仅在 station 模式下支持增强型开放式™ Wi-Fi 安全协议。

在 ESP32-S2 上设置 OWE

配置选项 `CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA` 和 `wifi_sta_config_t` 中的配置参数 `owe_enabled` 可以为 station 模式启用 OWE 支持。除上述配置外，请将 `wifi_scan_threshold_t` 中的 `authmode` 设置为 `WIFI_AUTH_OPEN` 以使用 OWE 过渡模式。

4.33 低功耗模式使用指南

对于物联网应用场景，终端的待机性能表现十分重要，本文档旨在介绍 ESP32-S2 低功耗的基本原理，同时介绍 ESP32-S2 支持的低功耗模式，需注意本文档主要针对 `station mode`。文档还会具体给出每种模式的配置步骤、推荐配置和功耗表现，以帮助用户根据实际需求快速配置适合的低功耗模式。

4.33.1 系统低功耗模式介绍

低功耗模式不仅涉及到系统相关问题，还涉及到芯片具体的工作场景，如处在 Wi-Fi 工作场景就会与处在蓝牙工作场景时产生不同。为此本节将首先介绍纯系统角度，即不涉及具体场景的低功耗模式，主要有 DFS、Light-sleep、Deep-sleep。纯系统下的低功耗模式主要思想就是在休眠时关闭或门控一些功能模块来降低功耗。

DFS

DFS (Dynamic frequency scaling) 即动态频率切换，是 ESP-IDF 中集成的电源管理机制的基础功能。DFS 可以根据应用程序持有电源锁的情况，调整外围总线 (APB) 频率和 CPU 频率。持有高性能锁就使用高频，空闲状态不持有电源锁时则使用低频来降低功耗，以此来尽可能减少运行应用程序的功耗。

DFS 的调频机制即根据持有电源锁的最大频率需求来调整频率，同时，`freertos tick rates` 的数值也会对 DFS 调频产生影响。系统任务调度的灵敏度越大，则意味着系统能更及时的根据需求调整频率。有关调频机制的详细信息，请参见 [电源管理](#)。

下图为 DFS 调频机制运行的理想电流情况。

DFS 适用于 CPU 必须处于工作状态但是对低功耗有需求的场景，因此 DFS 经常与其他低功耗模式共同开启，下文会详细介绍。

Light-sleep

Light-sleep 模式是 ESP32-S2 预设的一种低功耗模式，其核心思想就是在休眠时关闭或门控一些功能模块来降低功耗。从纯系统方面来说，Light-sleep 模式有两种进入方式，一种是通过 API 调用进入休眠，一

图 64: 理想 DFS 机制调频电流图

种是自动进入的 auto 模式。两种模式都需要配置唤醒源进行唤醒，同时在进入休眠后会门控或关闭一些模块。这里主要介绍 Auto Light-sleep 模式。

Auto Light-sleep 模式是 ESP-IDF 电源管理机制和 Light-sleep 模式的结合。开启电源管理机制是其前置条件，auto 体现在系统进入空闲状态 (IDLE) 超过设定时间后，自动进入 Light-sleep。空闲状态下，应用程序释放所有电源锁，此时，DFS 将降频以减小功耗。

Auto Light-sleep 依赖于电源管理机制，系统经过提前判断，发现空闲时间超过设定时间时，则直接进入休眠。该过程为自动进行。休眠时会自动关闭 RF、8 MHz 振荡器、40 MHz 高速晶振、PLL、门控数字内核时钟，暂停 CPU 工作。

Auto Light-sleep 模式需配置唤醒源。该模式拥有多种唤醒源，支持相互组合，此时任何一个唤醒源都可以触发唤醒。唤醒后，会从进入休眠的位置继续执行程序。若不配置唤醒源，进入 Light-sleep 休眠后，芯片将一直处在睡眠状态，直到外部复位。具体唤醒源有 RTC 定时器、触摸传感器、外部唤醒 (ext0)、外部唤醒 (ext1)、ULP 协处理器、SDIO、GPIO、UART、Wi-Fi、BT 唤醒等。

Auto Light-sleep 模式工作流程相对复杂，但是进入休眠状态是自动进行，同时需注意在进入前配置好唤醒源，防止芯片一直处在休眠状态。

根据 Auto Light-sleep 的工作流程可得其理想电流图，关键节点均在图上标出。

备注：为更加清晰地展现出 Auto Light-sleep 的主要变化，图中省略了 DFS 降频过程。

Auto Light-sleep 模式适用于不需要实时响应外界需求的场景。

Deep-sleep

Deep-sleep 模式是为了追求更好的功耗表现所设计，休眠时仅保留 RTC 控制器、RTC 外设（可配置）、ULP 协处理器、RTC 高速内存、RTC 低速内存，其余模块全部关闭。与 Light-sleep 类似，Deep-sleep 同样通过 API 进入，且需要配置唤醒源进行唤醒。

Deep-sleep 通过调用 API 进入，休眠时会关闭除 RTC 控制器、RTC 外设、ULP 协处理器、RTC 高速内存、RTC 低速内存外的所有模块。

图 65: Auto Light-sleep 模式工作流程图

图 66: Auto Light-sleep 模式模式理想电流图

Deep-sleep 模式需配置唤醒源，其拥有多种唤醒源，这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。若不配置唤醒源进入 Deep-sleep 模式，芯片将一直处在睡眠状态，直到外部复位。具体唤醒源有 RTC 定时器、触摸传感器、外部唤醒 (ext0)、外部唤醒 (ext1)、ULP 协处理器、GPIO 唤醒等。

Deep-sleep 模式工作流程如下图所示：

图 67: Deep-sleep 模式工作流程图

Deep-sleep 模式主要应用场景决定了系统很长时间才会苏醒一次，完成工作后又会继续进入 Deep-sleep，所以其理想电流图如下。

图 68: Deep-sleep 模式理想电流图

Deep-sleep 可以用于低功耗的传感器应用，或是大部分时间都不需要进行数据传输的情况，也就是通常所说的待机模式。设备可以每隔一段时间从 Deep-sleep 状态醒来测量数据并上传，之后重新进入 Deep-sleep；也可以将多个数据存储于 RTC memory，然后一次性发送出去。

如何配置纯系统下低功耗模式

介绍完纯系统下的低功耗模式后，本节将介绍公共配置选项、每种模式独有的配置选项，以及相应低功耗模式 API 的使用说明，同时给出相应模式推荐的配置。

公共配置选项

DFS 配置

DFS 有如下可配置选项：

- **max_freq_mhz** 该参数表示最大 CPU 频率 (MHz)，即 CPU 最高性能工作时候的频率，一般设置为芯片参数的最大值。
- **min_freq_mhz** 该参数表示最小 CPU 频率 (MHz)，即系统处在空闲状态时 CPU 的工作频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值除以整数。
- **light_sleep_enable** 使能该选项，系统将在空闲状态下自动进入 Light-sleep 状态，即 Auto Light-sleep 使能，上文已经具体介绍。

具体配置方法如下：

- 1. 使能 CONFIG_PM_ENABLE
- 2. 配置 max_freq_mhz 和 min_freq_mhz，方式如下：

```
esp_pm_config_t pm_config = {
    .max_freq_mhz = CONFIG_EXAMPLE_MAX_CPU_FREQ_MHZ,
    .min_freq_mhz = CONFIG_EXAMPLE_MIN_CPU_FREQ_MHZ,
    .light_sleep_enable = false
};
ESP_ERROR_CHECK(esp_pm_configure(&pm_config));
```

推荐配置：

| 配置名称 | 设置情况 |
|---------------------|-------|
| CONFIG_PM_ENABLE | ON |
| RTOS Tick rate (Hz) | 1000 |
| max_freq_mhz | 160 |
| min_freq_mhz | 40 |
| light_sleep_enable | false |

备注： 上表中不涉及的配置均是默认。

Light-sleep 配置

本节介绍 Auto Light-sleep 的推荐配置和配置步骤。

Auto Light-sleep 有如下可配置选项：

- **Minimum step to enter sleep mode** 该参数表示系统自动进入休眠的阈值。该参数单位为 RTOS Tick，故其表示的时间与 RTOS Tick rate 相关，例该参数值为 3，RTOS Tick rate 配置为 1000 Hz 时，即当系统空闲时间大于等于 3 ms 时进入休眠。
- **Put light sleep related codes in internal RAM** 如果使能该选项，一些 light-sleep 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加 1.8 kB。
- **Put RTOS IDLE related codes in internal RAM** 如果使能该选项，一些 RTOS IDLE 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加 260 B。
- **RTC slow clock source** 该参数表表示 RTC 慢速时钟源。系统休眠时计时器模块的时钟被门控，此时使用 RTC Timer 进行计时，唤醒后使用 RTC Timer 的计数值对系统时间进行补偿。

| 时钟源 | 精度 | 频偏 |
|----------------------|-----------------|----|
| Internal 150 kHz OSC | 约 6.7 us/cycle | 大 |
| External 32 kHz XTAL | 约 30.5 us/cycle | 小 |

- **Disable all GPIO when chip at sleep** 如果使能该选项，系统将在休眠过程中禁用所有 GPIO 管脚，消除 GPIO 漏电，降低功耗，但是休眠过程中 GPIO 无法进行信号输入和输出。

唤醒源：

- RTC Timer Wakeup
- GPIO Wakeup
- UART Wakeup
- Touchpad Wakeup
- External Wakeup (ext0)
- External Wakeup (ext1)
- ULP Coprocessor Wakeup

备注： 以上仅列出可配置唤醒源，详细介绍请参考[睡眠模式](#)。

配置方法：

- 1. 配置唤醒源
- 2. 使能 CONFIG_PM_ENABLE
- 3. 使能 CONFIG_FREERTOS_USE_TICKLESS_IDLE
- 4. 配置 DFS 参数
- 5. light_sleep_enable = true，具体如下：

```
esp_pm_config_t pm_config = {
    .max_freq_mhz = CONFIG_EXAMPLE_MAX_CPU_FREQ_MHZ,
    .min_freq_mhz = CONFIG_EXAMPLE_MIN_CPU_FREQ_MHZ,
    #if CONFIG_FREERTOS_USE_TICKLESS_IDLE
    .light_sleep_enable = true
    #endif
};
ESP_ERROR_CHECK(esp_pm_configure(&pm_config));
```

- 6. 配置介绍的其余相关参数

推荐配置：

| 配置名称 | 设置情况 |
|-------------------------------------|----------------------|
| CONFIG_PM_ENABLE | ON |
| CONFIG_FREERTOS_USE_TICKLESS_IDLE | ON |
| max_freq_mhz | 160 |
| min_freq_mhz | 40 |
| RTOS Tick rate (Hz) | 1000 |
| light_sleep_enable | true |
| Minimum step to enter sleep mode | 3 |
| Put light sleep codes in IRAM | OFF |
| Put RTOS IDLE codes in IRAM | OFF |
| RTC slow clock source | Internal 150 kHz OSC |
| Disable all GPIO when chip at sleep | ON |

备注： 上表中不涉及的配置均是默认

Deep-sleep 配置

对 Deep-sleep 模式来说，除了唤醒源相关配置，其余配置意义已经不大。

Deep-sleep 有如下可配置选项：

- RTC Timer wakeup
- EXT0/1 wakeup
- Touchpad wakeup
- ULP wakeup

备注： 以上仅列出可配置唤醒源，详细介绍请参考[睡眠模式](#)。

配置步骤：

- 配置唤醒源
- 调用 API，具体如下：

```
/* Enter deep sleep */
esp_deep_sleep_start();
```

用户可以通过下列配置选项，让一些特定模块在休眠时保持开启状态：

- **Power up External 40 MHz XTAL** 在一些特殊应用中，部分模块对休眠时的时钟精度及稳定度有很高要求（例如 BT）。这种情况下，可以考虑在休眠过程中打开 External 40 MHz XTAL。打开和关闭代码如下：

```
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_XTAL, ESP_PD_OPTION_ON));
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_XTAL, ESP_PD_OPTION_
↪OFF));
```

- **Power up Internal 8 MHz OSC** 在一些特殊应用中，部分模块（例如 LEDC）将 Internal 8 MHz OSC 作为时钟源，并且希望在 Light-sleep 休眠过程中也可以正常使用。这种情况下，可以考虑在休眠过程中打开 Internal 8 MHz OSC。打开和关闭代码如下：

```
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_RTC8M, ESP_PD_OPTION_
↪ON));
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_RTC8M, ESP_PD_OPTION_
↪OFF));
```

4.33.2 Wi-Fi 场景下低功耗模式介绍

上文介绍了纯系统方向下的低功耗模式，但在实际应用中还需结合具体应用场景。本节将结合纯系统下的功耗模式来介绍在 Wi-Fi 场景下的低功耗模式。因为 Wi-Fi 场景的复杂性，本节会首先介绍 Wi-Fi 省电的基本原理，然后再介绍具体的低功耗模式，同时本节主要针对 station 模式。

Wi-Fi 场景如何选择低功耗模式

为方便用户选择合适的低功耗模式，在介绍具体内容前先给出 Wi-Fi 场景下低功耗模式总结表，以方便用户根据需求快速选择想要了解的内容。

| 项目 | Modem Sleep | Modem Sleep+DFS | auto light Sleep | Deep Sleep |
|----------|-------------|-----------------|------------------|------------|
| 休眠 | 自动 | 自动 | 自动 | 手动 |
| 唤醒 | 自动 | 自动 | 自动 | 配置唤醒源 |
| Wi-Fi 连接 | 保持 | 保持 | 保持 | 断开 |
| CPU | 开 | 开/降频 | 暂停 | 关 |
| 系统时钟 | 开 | 开 | 关 | 关 |
| 外设 | 开 | 开 | 开 | 关 |
| DTIM1 | 31.14 mA | 11.71 mA | 2.48 mA | / |
| DTIM3 | 29.06 mA | 12.4 mA | 2.96 mA | / |
| DTIM10 | 28.5 mA | 12.15 mA | 2.69 mA | / |
| 平均电流 | / | / | / | 5 μ A |

备注： 上表中所有电流均为平均电流，表中术语在下文均有介绍，用户可根据需求进行查看

Wi-Fi 省电的基本原理

首先，在 station 的工作过程中，为在接收发送过程中避免冲突，需要长时间监听信道，能耗较大的 RF 模块会一直处于工作中，浪费电量。为此，Wi-Fi 协议引入省电模式。

省电模式的基本原理是通过减少不必要的监听时间来降低耗能。AP 会缓存进入省电模式的 station 的包，同时周期发送包含 TIM 信息的 Beacon 帧，TIM 会指示 AP 缓存的单播包。TIM 中，DTIM 较为特殊，其会缓存广播包，并以 n 个（由 AP 决定）TIM 为周期发送。对 station 来说，TIM 非必听，而 DTIM 为必听。因此，station 可以选择只在每一个 DTIM 帧前醒来打开 Wi-Fi 相关模块（RF 模块），而不必时刻处于监听状态，这样就能有效降低功耗。

图 69: DTIM4 省电模式示意图

其次，station 从打开到再次关闭 Wi-Fi 相关模块的时间也会影响功耗。除必要的数据传输处理时间外，主要有四项配置会影响时间长短：

- 时钟准确性导致的 time offset，主要原因是时钟或多或少都会与理想的时间存在偏移，同时偏移的正负不定。
- 处理 Beacon 漏听后时间，如漏听后持续监听时间、允许最多丢失 Beacon 数目等，这段时间存不存在以及存在多久都不定，但是可以配置范围。
- 为了确保能够接受突发数据包而添加的 active 时间，可由配置决定。

- ILDE 时间是具体某些功耗模式进入条件要求。因此在满足通信需求的情况下，降低工作时间可以改善功耗表现。

| | | | | |
|-------------|--------|---------------|----------|--------|
| time offset | 必要处理时间 | Beacon 漏听处理时间 | active时间 | IDLE时间 |
|-------------|--------|---------------|----------|--------|

图 70: 芯片工作时间组成图

此外，在 station 没有处于 Wi-Fi 接收或发送状态时，影响功耗的因素变成了芯片的其他模块。不同的功耗模式会配置不同的时钟源，或者动态调整一些模块的工作频率如 CPU，同时还会关闭不同数量的功能模块，这将有效降低芯片的功耗。其实也就是纯系统相关的模式，用户可根据需求自己选择合适的配置。

如果以时间为横轴，电流大小为纵轴建立坐标轴，那么处在低功耗模式下芯片的理想工作电流图可以简化成下图：

图 71: 理想情况下 Wi-Fi 场景低功耗模式电流图

其中 station 要进行 Wi-Fi 通信时，Wi-Fi 相关模块 (PHY) 开启，电流会显著上升，在工作完成前，电流会一直维持在一个较高的水平。工作完成后，芯片会关闭 Wi-Fi 相关模块，这时电流又会降低到一个较低水平。

可以看出影响功耗表现的主要有三点：interval、period 和 base current。

- Interval 是 station Wi-Fi 相关模块工作的间隔，既可以由低功耗模式自定义，也可根据 Wi-Fi 协议省电机制（3.1 第一点介绍），由 DTIM 周期决定。可以看出在同等情况下，interval 越大，功耗表现会更好，但是响应会更慢，影响通信的及时性。
- Period 可以看作每次 station Wi-Fi 工作的时间，这段时间的长度也会影响功耗的表现。period 不是一个固定的时长（3.1 第二点介绍），在保证 Wi-Fi 通信正常的情况下，period 持续时间越短，功耗表现越好。但是减少 period 时间，必然会影响通信的可靠性。
- Base current 是 Wi-Fi 相关模块不工作时芯片的电流，影响其大小的因素很多，不同的功耗模式下休眠策略不同。所以，在满足功能的情况下，优化配置降低该电流大小可以提高功耗表现，但同时关闭其余模块会影响相关功能和芯片的唤醒时间。

知道了影响功耗的三点因素之后，要想降低功耗应从这三点入手，接下来介绍两种低功耗模式，Modem sleep、Auto Light-sleep。两种模式主要区别就是对三点因素的优化不同。

Modem-sleep Mode

Modem-sleep 模式主要工作原理基于 DTIM 机制，周期性的醒来处理 Wi-Fi 相关工作，又在周期间隔之间进入休眠，关闭 PHY (RF 模块) 来降低功耗。同时通过 DTIM 机制，station 可以与 AP 保持 Wi-Fi 连接，

数据传输。

Modem-sleep 模式会在 Wi-Fi task 结束后自动进入休眠无需调用 API，休眠时仅会关闭 Wi-Fi 相关模块 (PHY)，其余模块均处在正常上电状态。

Modem-sleep 模式默认会根据 DTIM 周期或 listen interval（下文介绍）醒来，相当于系统自动设置了一个 Wi-Fi 唤醒源，因此用户无需再配置唤醒源，同时系统主动发包时也可以唤醒。

Modem-sleep 是一个开关型的模式，调用 API 开启后一直自动运行，其工作流程十分简单，具体如下图。

图 72: Modem sleep 工作流程图

根据上文的基本电流图，结合 Modem-sleep 的工作原理，以 Min Modem（下文介绍）为例可得理想情况下电流变化图。

图 73: Min Modem-sleep 理想电流图

Modem-sleep 一般用于 CPU 持续处于工作状态并需要保持 Wi-Fi 连接的应用场景，例如，使用 ESP32-S2 本地语音唤醒功能，CPU 需要持续采集和处理音频数据。

DFS + Modem sleep

Modem sleep 模式休眠状态中 CPU 仍处在工作状态，而 DFS 机制主要作用于 CPU 和 APB 工作频率来降低功耗，因此 DFS + Modem sleep 可以进一步优化功耗表现，又因为 Wi-Fi task 会申请 ESP_PM_CPU_FREQ_MAX 电源锁来保证 Wi-Fi 任务快速运行，所以 DFS + Modem sleep 产生调频只会发生在 base current 阶段，即 Wi-Fi task 结束后。

在 Wi-Fi 场景下，为了介绍的简化，让用户抓住主要的变化，DFS 可以进行一定的状态简化。具体来说，虽然 DFS 主要根据 CPU 和 APB 两把锁的最高需求来调频，但是 Wi-Fi 场景都需要 CPU 的频率最大化来工作，同时 Wi-Fi task 结束后，也可以理想化的认为，没有其余的工作要完成，这样就可以简单认为

经过一段时间会释放两把锁进入空闲状态（IDLE 状态），也同时忽略这段时间锁的变化导致的电流变化，简化状态。

在 Wi-Fi 场景下，DFS 最终简化为如下流程：

图 74: Wi-Fi 场景 DFS 简化流程图

在 Wi-Fi 工作的 active 状态与系统空闲的 IDLE 状态转换，Wi-Fi task 结束后，系统经过一段时间释放了所有锁进入 IDLE 状态，此时 DFS 机制降低频率到设定最低值，忽略了转换状态期间的调频动作，方便理解。

简化过后的 DFS + Modem sleep 模式理想状态下的电流大小如下图所示：

Auto Light-sleep + Wi-Fi 场景

Auto Light-sleep 模式在 Wi-Fi 场景下是 ESP-IDF 电源管理机制、DTIM 机制和 light-sleep 的结合。开启电源管理是其前置条件，auto 体现在系统进入 IDLE 状态超过设定值后自动进入 light-sleep。同时 auto light sleep 模式同样遵循 DTIM 机制，会自动苏醒，可以与 AP 保持 Wi-Fi 连接。

Auto Light-sleep 模式在 Wi-Fi 场景下休眠机制与纯系统下一样，仍然依赖于电源管理机制，进入休眠的条件为系统处于 IDLE 状态的时间超过设定时间，并且系统会提前判断空闲时间是否满足条件，若满足直接休眠。该过程为自动进行。休眠时会自动关闭 RF、8 MHz 振荡器、40 MHz 高速晶振、PLL，门控数字内核时钟，暂停 CPU 工作。

Auto Light-sleep 模式在 Wi-Fi 场景下遵循 DTIM 机制，自动在 DTIM 帧到来前苏醒，相当于系统自动设置了一个 Wi-Fi 唤醒源，因此用户无需再配置唤醒源。同时系统主动发包时也可以唤醒。

Auto Light-sleep 模式在 Wi-Fi 场景下工作流程较为复杂，但全程都是自动进行，具体如下图所示。

Auto Light-sleep 模式在 Wi-Fi 场景下经常与 modem sleep 同时开启，这里给出 modem + auto light-sleep 模式的理想电流图，关键节点均在图上标出。

Auto Light-sleep 模式在 Wi-Fi 场景下可用于需要保持 Wi-Fi 连接，可以实时响应 AP 发来数据的场景。并且在未接收到命令时，CPU 可以处于空闲状态。比如 Wi-Fi 开关的应用，大部分时间 CPU 都是空闲的，直到收到控制命令，CPU 才需要进行 GPIO 的操作。

图 75: DFS + Modem sleep 模式理想电流图

图 76: Auto Light-sleep 工作流程图

图 77: modem + auto light-sleep 模式理想电流图

Deep-sleep + Wi-Fi 场景

Deep-sleep 模式在 Wi-Fi 场景下与纯系统下基本相同，详情可以参考 [Deep-sleep](#) 这里不再介绍。

如何配置 Wi-Fi 场景下低功耗模式

介绍完 Wi-Fi 场景下低功耗模式后，本节将介绍公共配置选项、每种模式独有的配置选项，以及相应低功耗模式 API 的使用说明，同时给出相应模式推荐的配置（包含纯系统下的低功耗推荐配置）以及该配置的具体表现。

公共配置选项：

- 功耗类：
 - **Max Wi-Fi TX power (dBm)** 该参数表示最大 TX 功率，降低该参数会减小发包功耗，但会影响 Wi-Fi 性能，默认设置最大 20。
- IRAM 类：
 - **Wi-Fi IRAM speed optimization** 如果使能该选项，一些 Wi-Fi 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加，默认开启。
 - **Wi-Fi RX IRAM speed optimization** 如果使能该选项，一些 Wi-Fi RX 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加，默认开启。
 - **Wi-Fi Sleep IRAM speed optimization** 如果使能该选项，一些 Wi-Fi sleep 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加，默认关闭。
- Wi-Fi 协议类：
 - **Minimum active time** 该参数表示 Station 接收完一次数据后需要等待时间。当终端与 AP 进行通信时，AP 发送到终端的数据经常是突发形式的，为确保后续的突发数据能够正常接收到，需要等待一段时间。默认 50。
 - **Maximum keep alive time** 该参数表示周期性的发送 sleep null data 来通告 AP 维持连接的时间。在 DTIM 机制下，若 AP 长时间没有某个 station 的包，可能会断开连接，因此需要 station 需要周期发送 sleep null data 维持连接。默认 10。
 - **Send gratuitous ARP periodically** 如果使能该选项，Station 将周期性的发送 gratuitous ARP 请求更新 AP ARP 缓存表。如无该需求，可以关闭。
 - **Wi-Fi sleep optimize when beacon lost** 如果使能该选项，Station 在检测到已经错过或者丢失 beacon 时，会立即关闭 RF 进入低功耗状态。

Modem sleep 配置方法如下：

- 可配置选项
 - **Min Modem** 该参数表示 station 按照 DTIM 周期工作，在每个 DTIM 前醒来接收 Beacon，这样不会漏掉广播信息，但是 DTIM 周期由 AP 决定，如果 DTIM 周期较短，省电效果会降低。

- **Max Modem** 该参数表示 station 会自定义一个 listen interval，并以 listen interval 为周期醒来接受 Beacon。这样在 listen interval 较大时会省电，但是容易漏听 DTIM，错过广播数据。
- 配置方法：
 - 调用 API，选择模式参数：

```
typedef enum {
    WIFI_PS_NONE,
    WIFI_PS_MIN_MODEM,
    WIFI_PS_MAX_MODEM,
} wifi_ps_type_t;
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type);
```

若选择 WIFI_PS_MAX_MODEM，还需配置 listen interval，示例如下：

```
#define LISTEN_INTERVAL 3
wifi_config_t wifi_config = {
    .sta = {
        .ssid = "SSID",
        .password = "Password",
        .listen_interval = LISTEN_INTERVAL,
    },
};
ESP_ERROR_CHECK(esp_wifi_set_mode(WIFI_MODE_STA));
ESP_ERROR_CHECK(esp_wifi_set_config(ESP_IF_WIFI_STA, &wifi_config));
ESP_ERROR_CHECK(esp_wifi_start());
```

配置推荐：

这里给出的配置推荐是 Min Modem sleep + DFS 开启的配置

| 配置名称 | 设置情况 |
|---------------------|-------|
| WIFI_PS_MIN_MODEM | ON |
| CONFIG_PM_ENABLE | ON |
| RTOS Tick rate (Hz) | 1000 |
| max_freq_mhz | 160 |
| min_freq_mhz | 40 |
| light_sleep_enable | false |

配置表现：

| CPU frequency | DFS | DTIM | Average current(mA) | Max current(mA) | Min current(mA) |
|---------------|-----|------|---------------------|-----------------|-----------------|
| 160 MHz | ON | 1 | 11.71 | 83.87 | 5.04 |
| 160 MHz | OFF | 1 | 31.14 | 160.26 | 29.04 |
| 160 MHz | ON | 3 | 12.4 | 84.85 | 10.0 |
| 160 MHz | OFF | 3 | 29.06 | 178.67 | 28.25 |
| 160 MHz | ON | 10 | 12.15 | 84.18 | 10.01 |
| 160 MHz | OFF | 10 | 28.5 | 176.69 | 28.21 |

Auto Light-sleep + Wi-Fi 场景配置：

Auto Light-sleep 在 Wi-Fi 场景下的配置比纯系统下少了唤醒源的配置要求，其余几乎与纯系统下配置一致，因此可配置选项、配置步骤、推荐配置的详细介绍可以参考上文 [Light-sleep](#)。同时 Wi-Fi 相关配置保持默认。

配置表现：

该配置表现为 Auto Light-sleep 纯系统推荐配置 + 默认的 Wi-Fi 相关配置在 Wi-Fi 场景的表现。

| CPU frequency | DTIM | Average current(mA) | Max current(mA) | Min current(mA) |
|---------------|------|---------------------|-----------------|-----------------|
| 160 MHz | 1 | 2.48 | 94.88 | 0.96 |
| 160 MHz | 3 | 2.96 | 97.15 | 2.25 |
| 160 MHz | 10 | 2.69 | 98.66 | 2.25 |

Deep-sleep + Wi-Fi 场景配置：

Deep-sleep 模式在 Wi-Fi 场景下的配置与纯系统下配置基本一致，因此可配置选项、配置步骤、推荐配置的详细介绍可以参考上文 [Deep-sleep](#)。同时 Wi-Fi 相关配置保持默认。

配置表现：

该配置表现为 Deep-sleep 纯系统推荐配置 + 默认的 Wi-Fi 相关配置在 Wi-Fi 场景的表现。

平均电流约 5.0 μ A

4.34 PHY

4.34.1 多根天线

多根天线功能原理和组成

多根天线功能主要通过将内部天线模块工作信号输出到具体 IO 引脚上，通过 IO 引脚控制外部天线切换器选择指定天线，最多支持 16 根天线。

下图描述多根天线功能组成：

ESP32-S2 多根天线功能主要包含 3 个部分：芯片内部的 PHY 天线模块、IO MUX 和 GPIO Matrix、以及外部的天线切换器。

1. 芯片内部的天线选择模块 PHY Antenna Module：- 两个天线模块均支持工作于发送 (TX) 或接收 (RX) 模式，可以通过软件配置发送和接收选用某个模块。- 每个天线模块最多支持输出 4 个天线选择信号 antenna_select[3:0]，该信号值可由软件配置并且可以一一映射到任意 IO 引脚。- 当某个天线模块处于工作状态时，IO 引脚的高低电平值为软件配置的信号值。

2. IO MUX 和 GPIO Matrix: - 将内部 4 路天线信号输出到具体的 IO 引脚上。

3. 外部的天线切换器: - 一般为多路选择器, 通过 `ant_sel_in[x]` 引脚的电平, 选择工作的天线, 例如 `ant_sel_in[3:0]` 为“0b1011”, 表示选中天线 11。

多根天线使用步骤

1. 根据硬件电路设计及外部天线切换器确定用于控制天线切换的 IO 引脚。

2. 配置天线选择信号输出到指定 IO 引脚 - API `esp_phy_set_ant_gpio()` 用于配置 `antenna_selects[3:0]` 信号连接 `GPIO[x3:x0]`。如果 `GPIO[x0]` 连接到 `antenna_select[0]`, `gpio_config->gpio_cfg[x0].gpio_select` 应设置为 1, 且 `gpio_config->gpio_cfg[x0].gpio_num` 的值为 `GPIO[x0]`。

3. 配置内部天线工作模式及输出信号 - API `esp_phy_set_ant()` 用于配置发送或接收时使用内部天线模块 0 或 1, 并配置当天线模块 0 或 1 工作时的输出信号值。- 对于 `ESP_PHY_ANT_MODE_AUTO` 模式目前不推荐使用。

多根天线配置参考例子

通常, 可以执行以下步骤来配置多根天线:

- 配置 `antenna_selects` 连接哪些 GPIOs, 例如, 如果支持四根天线, 且 `GPIO20/GPIO21` 连接到 `antenna_select[0]/antenna_select[1]`, 配置如下所示:

```
esp_phy_ant_gpio_config_t ant_gpio_config = {
    .gpio_cfg[0] = { .gpio_select = 1, .gpio_num = 20 },
    .gpio_cfg[1] = { .gpio_select = 1, .gpio_num = 21 }
};
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线, 例如, 如果使能了天线 1 和天线 3, 接收数据需要自动选择较好的天线, 并将天线 1 作为默认天线, 发送数据始终选择天线 3。配置如下所示:

```
esp_phy_ant_config_t config = {
    .rx_ant_mode = ESP_PHY_ANT_MODE_AUTO,
    .rx_ant_default = ESP_PHY_ANT_ANT0,
    .tx_ant_mode = ESP_PHY_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

注意事项

1. 不同天线切换器, `ant_sel_in[3:0]` 的输入值中可能存在非法值, 即 ESP32-S2 通过外部天线开关支持的天线数可能小于 16 根。例如, ESP32-WROOM-DA 使用 RTC6603SP 作为天线切换器, 仅支持 2 根天线。两个天线选择输入管脚为高电平有效, 连接到两个 GPIO。'0b01' 表示选中天线 0, '0b10' 表示选中天线 1。输入值'0b00' 和'0b11' 为非法值。

2. 尽管最多支持 16 根天线, 发送和接收数据时, 最多仅能同时使能两根天线。

3. 对于 `ESP_PHY_ANT_MODE_AUTO` 模式目前不推荐使用, 主要有以下限制情况需要考虑:

- 因为发送数据天线基于 `ESP_PHY_ANT_MODE_AUTO` 类型的接收数据天线选择算法, 只有接收数据的天线模式为 `ESP_PHY_ANT_MODE_AUTO` 时, 发送数据天线才能设置为 `ESP_PHY_ANT_MODE_AUTO`。
- 接收或者发送天线模式配置为 `ESP_PHY_ANT_MODE_AUTO` 时, 只要存在 RF 信号的恶化, 很容易触发天线切换。如果射频信号不稳定, 天线会频繁切换, 使得总的射频性能无法达到预期效果。

推荐在以下场景中使用多根天线

1. 应用程序可以始终选择指定的天线，也可以执行自身天线选择算法，如根据应用程序收集的信息来选择天线模式等。请参考 IDF 示例 [examples/phy/antenna/README.md](#) 来设计天线选择算法。
2. 接收/发送数据的天线模式均配置为 ESP_PHY_ANT_MODE_ANT0 或 ESP_PHY_ANT_MODE_ANT1。

Chapter 5

迁移指南

5.1 迁移到 ESP-IDF 5.x

5.1.1 从 4.4 迁移到 5.0

迁移构建系统至 ESP-IDF v5.0

从 GNU Make 构建系统迁移至 ESP-IDF v5.0 ESP-IDF v5.0 已不再支持基于 Make 的工程，请参考从 [ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统](#) 进行迁移。

更新片段文件语法 ESP-IDF v5.0 中将不再支持 ESP-IDF v3.x 中链接器脚本片段文件的旧式语法。在迁移的过程中需注意以下几点：

- 必须缩进，缩进不当的文件会产生解析异常；旧版本不强制缩进，但之前的文档和示例均遵循了正确的缩进语法。
- 条件改用 `if...elif...else` 结构，可以参照[之前的章节](#)。
- 映射片段和其他片段类型一样，需有名称。

明确指定组件依赖 在之前的 ESP-IDF 版本中，除了[通用组件依赖项](#)，还有一些组件总是作为公共依赖项，在构建时添加至每个组件中，如：

- driver
- efuse
- esp_timer
- lwip
- vfs
- esp_wifi
- esp_event
- esp_netif
- esp_eth
- esp_phy

这意味着可以直接包含这些组件的头文件，而无需在 `idf_component_register` 中将它们指定为依赖。此行为是由各种常见组件的传递依赖关系引起的。

在 ESP-IDF v5.0 中，此行为已修复，这些组件不再默认作为公共依赖项添加。

如果组件所依赖的某个组件不属于通用组件依赖项，则必须显式地声明此依赖关系。可以通过在组件的 CMakeLists.txt 中的 `idf_component_register` 调用中添加 `REQUIRES <component_name>` 或 `PRIV_REQUIRES <component_name>` 来完成。有关指定组件依赖的更多信息，请参阅[组件依赖](#)。

设置 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量 为了实现构建项目时的路径能够包含空格，ESP-IDF v5.0 做了一系列改进，其中包括改进了 CMakeLists.txt 文件中的 `COMPONENT_DIRS` 和 `EXTRA_COMPONENT_DIRS` 变量。

ESP-IDF v5.0 版本中，不再支持添加不存在的目录到变量 `COMPONENT_DIRS` 或 `EXTRA_COMPONENT_DIRS` 中，否则会出现报错。

同时，ESP-IDF v5.0 中也不再支持使用字符串拼接的方式定义 `COMPONENT_DIRS` 或 `EXTRA_COMPONENT_DIRS` 变量。这些变量应该定义为 CMake 列表。例如：

```
set(EXTRA_COMPONENT_DIRS path1 path2)
list(APPEND EXTRA_COMPONENT_DIRS path3)
```

不支持：

```
set(EXTRA_COMPONENT_DIRS "path1 path2")
set(EXTRA_COMPONENT_DIRS "${EXTRA_COMPONENT_DIRS} path3")
```

将这些变量定义为 CMake 列表的方式兼容之前的 ESP-IDF 版本。

更新 target_link_libraries 用法 ESP-IDF v5.0 修复了组件的 CMake 变量传播问题。此问题导致本应该只应用于某一组件的编译器标志和定义应用到了项目中的每个组件。

该修复也带来一定的副作用，从 ESP-IDF v5.0 开始，用户项目在使用 `target_link_libraries` 时必须明确指定 `project_elf`，同时自定义 CMake 项目必须指定 `PRIVATE`、`PUBLIC` 或 `INTERFACE` 参数。这是一项重大变更，不兼容以前的 ESP-IDF 版本。

例如：

```
target_link_libraries(${project_elf} PRIVATE "-Wl,--wrap=esp_panic_handler")
```

不支持：

```
target_link_libraries(${project_elf} "-Wl,--wrap=esp_panic_handler")
```

更新 CMake 版本 在 ESP-IDF v5.0 中，最低 CMake 版本已更新到 3.16，并且不再支持低于 3.16 的版本。如果你的操作系统没有安装 CMake，请运行 `tools/idf_tools.py install cmake` 来安装合适的版本。

该变更会影响到使用系统提供的 CMake 以及自定义 CMake 的 ESP-IDF 用户。

重新定义特定目标配置文件的应用顺序 ESP-IDF v5.0 重新安排了特定目标配置文件和 `SDKCONFIG_DEFAULTS` 中所有其他文件的应用顺序。现在，特定目标的配置文件将在引入它的文件之后、在 `SDKCONFIG_DEFAULTS` 中后续的其他文件之前应用。

例如：

```
如果 ``SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1
→``，且同一文件夹内有 ``sdkconfig.defaults.esp32``
→文件，那么文件的应用顺序为：(1) sdkconfig.defaults (2) sdkconfig.defaults.esp32
→(3) sdkconfig_devkit1
```

如果某个键在不同的特定目标配置文件中有不同的值，那么后者的值会覆盖前者。例如在以上案例中，如果某个键在 `sdkconfig.defaults.esp32` 和 `sdkconfig_devkit1` 中的值不同，则在 `sdkconfig_devkit1` 中的值会覆盖在 `sdkconfig.defaults.esp32` 中的值。

如果确实需要设置特定目标的配置值，请将其放到后应用的特定目标文件中，如 `sdkconfig_devkit1.esp32`。

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 8.4.0，现已针对所有芯片目标升级至 GCC 11.2.0。若需要将代码从 GCC 8.4.0 迁移到 GCC 11.2.0，请参考以下官方 GCC 迁移指南。

- [迁移至 GCC 9](#)
- [迁移至 GCC 10](#)
- [迁移至 GCC 11](#)

警告 升级至 GCC 11.2.0 后会触发新警告，或是导致原有警告内容发生变化。所有 GCC 警告的详细内容，请参考 [GCC 警告选项](#)。建议用户仔细检查代码，并设法解决这些警告。但由于某些警告的特殊性及用户代码的复杂性，有些警告可能为误报，需要进行关键修复。在这种情况下，用户可以采取多种方式来抑制这些警告。本节介绍了用户可能遇到的常见警告及如何抑制这些警告。

注意： 建议用户在抑制警告之前仔细确认该警告是否确实为误报。

-Wstringop-overflow、-Wstringop-overread、-Wstringop-truncation 和 -Warray-bounds 如果编译器不能准确判断内存或字符串的大小，使用 `memory/string copy/compare` 函数的用户会遇到某种 `-Wstringop` 警告。下文展示了触发这些警告的代码，并介绍了如何抑制这些警告。

```
#pragma GCC diagnostic push
#pragma GCC diagnostic ignored "-Wstringop-overflow"
#pragma GCC diagnostic ignored "-Warray-bounds"
    memset(RTC_SLOW_MEM, 0, CONFIG_ULP_COPROC_RESERVE_MEM); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

```
#pragma GCC diagnostic push
#if __GNUC__ >= 11
#pragma GCC diagnostic ignored "-Wstringop-overread" // <<-- 此键从 GCC 11 开始引入
#endif
#pragma GCC diagnostic ignored "-Warray-bounds" (-Warray-bounds) 。
    memcpy(backup_write_data, (void *)EFUSE_PGM_DATA0_REG, sizeof(backup_
->write_data)); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

-Waddress-of-packed-member 当访问打包 `struct` 中的某个未对齐成员时，由于非对齐内存访问会对性能产生影响，GCC 会触发 `-Waddress-of-packed-member` 警告。然而，所有基于 Xtensa 或 RISC-V 架构的 ESP 芯片都允许非对齐内存访问，并且不会产生额外的性能影响。因此，在大多数情况下，可以忽略此问题。

```
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c: In function
->'btc_to_bta_gatt_id':
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c:105:21: warning: <
->taking address of packed member of 'struct <anonymous>' may result in an<
->unaligned pointer value [-Waddress-of-packed-member]
  105 |         btc_to_bta_uuid(&p_dest->uuid, &p_src->uuid);
      |                         ^~~~~~
```

如果该警告在多个源文件中多次出现，可以在 CMake 级别抑制该警告，如下所示。

网络

Wi-Fi

回调函数类型 `esp_now_recv_cb_t` 此前 `esp_now_recv_cb_t` 的第一个参数的类型是 `const uint8_t *mac_addr`，该参数只包含对端 ESP-NOW 设备的地址。

现在该函数有所更新。第一个参数的类型变更为 `esp_now_recv_info_t`，它包含三个成员变量 `src_addr`，`des_addr` 和 `rx_ctrl`。因此，需要进行如下更新：

- 重新定义的 ESP-NOW 收包回调函数。
- `src_addr` 可以等价替换原来的 `mac_addr`。
- `des_addr` 是 ESP-NOW 包的目的地 MAC 地址，可以是单播或广播地址。使用 `des_addr` 可以区分单播或广播的 ESP-NOW 包，其中，即使是在加密的 ESP-NOW 配置中，广播的 ESP-NOW 包也可以是非加密的。
- `rx_ctrl` 是 ESP-NOW 包的 Rx control info，它包含此包的更多有用信息。

请参考 ESP-NOW 样例：[wifi/espnow/main/espnow_example_main.c](#)

以太网

`esp_eth_ioctl()` API 此前，`esp_eth_ioctl()` API 存在以下问题：

- 在某些情况下，第三个参数（数据类型为 `void *`）可以接受 `int/bool` 类型实参（而非指针）作为输入。然而，文档中未描述这些情况。
- 为了将 `int/bool` 类型实参作为第三个参数传递，实参将强制转换为 `void *` 类型，以防出现如下所示的编译器警告。此等转换可能引起 `esp_eth_ioctl()` 函数的滥用。

```
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, (void *)true);
```

因此，我们统一了 `esp_eth_ioctl()` 的用法。现在，该结构体的第三个参数在传递时必须作为指向特定数据类型的指针，表示 `esp_eth_ioctl()` 读取/存储数据的位置。`esp_eth_ioctl()` 的用法如下列代码所示。

设置以太网配置的用例如下：

```
eth_duplex_t new_duplex_mode = ETH_DUPLEX_HALF;
esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```

获取以太网配置的用例如下：

```
eth_duplex_t duplex_mode;
esp_eth_ioctl(eth_handle, ETH_CMD_G_DUPLEX_MODE, &duplex_mode);
```

KSZ8041/81 和 LAN8720 驱动更新 KSZ8041/81 和 LAN8720 驱动现已更新，以支持相关产品系列中的更多设备（如新一代设备）。上述驱动能够识别特定芯片编号及驱动提供的潜在支持。

更新之后，通用函数将替代特定“芯片编号”函数得以调用：

- 删除 `esp_eth_phy_new_ksz8041()` 以及 `esp_eth_phy_new_ksz8081()`，转而使用 `esp_eth_phy_new_ksz80xx()`
- 删除 `esp_eth_phy_new_lan8720()`，转而使用 `esp_eth_phy_new_lan87xx()`

ESP NETIF Glue 时间处理程序 `esp_eth_set_default_handlers()` 和 `esp_eth_clear_default_handlers()` 函数现已删除。现在可以自动处理以太网默认 IP 层处理程序的注册。如果在注册以太网/IP 事件处理程序之前，你已经按照建议，完全初始化以太网驱动和网络接口，则无需执行任何操作（除了删除受影响的函数）。否则，在注册用户事件处理程序后，应随即启动以太网驱动。

PHY 地址自动检测 以太网 PHY 地址自动检测函数 `esp_eth_detect_phy_addr()` 已重命名为 `esp_eth_phy_802_3_detect_phy_addr()`，其声明移至 `esp_eth/include/esp_eth_phy_802_3.h`。

SPI 以太网模块初始化 SPI 以太网模块的初始化过程已经简化。此前，你需要在实例化 SPI 以太网 MAC 之前，使用 `spi_bus_add_device()` 手动分配 SPI 设备。

现在，SPI 设备已在内部分配，因此无需再调用 `spi_bus_add_device()`。`eth_dm9051_config_t`、`eth_w5500_config_t` 和 `eth_ksz8851snl_config_t` 配置结构体现已包含 SPI 设备配置成员（例如，可以微调可能依赖 PCB 设计的 SPI 时序）。`ETH_DM9051_DEFAULT_CONFIG`、`ETH_W5500_DEFAULT_CONFIG` 和 `ETH_KSZ8851SNL_DEFAULT_CONFIG` 配置初始化宏也已接受新的参数输入。了解 SPI 以太网模块初始化示例，请查看[以太网 API 参考指南](#)。

Ethernet 驱动 用于创建 MAC 实例的 API (`esp_eth_mac_new_*`) 的输入参数由一个配置参数改为两个，这两个参数用于

- 供应商特定的 MAC 配置
- Ethernet 驱动 MAC 配置

该更新不仅适用于内部 Ethernet MAC `esp_eth_mac_new_esp32()` 也适用于外部 MAC 设备，如 `esp_eth_mac_new_ksz8851snl()`、`esp_eth_mac_new_dm9051()` 和 `esp_eth_mac_new_w5500()`。

TCP/IP 适配器 TCP/IP 适配器是在 ESP-IDF v4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` API 迁移至 *ESP-NETIF* 的过程。

更新网络连接代码

网络软件栈初始化

- 你只需用 `esp_netif_init()` 替换 `tcpip_adapter_init()`，注意 `esp_netif_init()` 函数现将返回标准错误代码。了解详细信息，请参考[ESP-NETIF](#)。
- `esp_netif_deinit()` 函数用于反初始化网络软件栈。
- 你还需用 `#include "esp_netif.h"` 替换 `#include "tcpip_adapter.h"`。

创建网络接口 更新之前，TCP/IP 适配器静态定义了以下三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

接口定义现已更新。网络接口的设计应严格参考[ESP-NETIF](#)，使其能够连接至 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`；或 `esp_netif_create_default_wifi_ap()`；。

请参考上述三个接口的初始化代码示例：

- Wi-Fi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- Wi-Fi AP: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- 以太网: [ethernet/basic/main/ethernet_example_main.c](#)

其他 tcpip_adapter API 更换 所有 tcpip_adapter 函数都有对应的 esp-netif。请参考以下章节中的 esp_netif.h 部分，了解更多信息：

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

TCP/IP 适配器 API tcpip_adapter_get_sta_list() 用于获取与软件接入点 (softAP) 相关联的 Wi-Fi 站点列表，现已移到 Wi-Fi 组件，并更名为 esp_wifi_ap_get_sta_list_with_ip()，它是 ESP-NETIF API *esp_netif_dhcps_get_clients_by_mac()* 一个特例。无论服务器在哪个网络接口上运行，该 API 都可更方便地提供连接到 DHCP 服务器的客户端列表。

默认事件处理程序 事件处理程序已从 tcpip_adapter 移至相应驱动程序代码。从应用程序的角度来看，这一变更不会产生任何影响，所有事件仍将以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 esp-netif 结构体而非 LwIP 结构体的形式接收 IP 地址。两种结构体均兼容二进制格式。

打印地址的首选方式如下所示：

```
ESP_LOGI(TAG, "got ip:" IPSTR, IP2STR(&event->ip_info.ip));
```

不建议使用下述方式：

```
ESP_LOGI(TAG, "got ip:%s", ip4addr_ntoa(&event->ip_info.ip));
```

ip4addr_ntoa() 为 LwIP API，因此 esp-netif 还提供了替代函数 esp_ip4addr_ntoa()，然而总得来说仍推荐使用 IP2STR() 这一方法。

IP 地址 推荐使用 esp-netif 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。

- [esp-netif IP address definitions](#)

外设

外设时钟门控 与更新之前相同，外设的时钟仍由驱动处理，用户无需对外设模块的时钟门控进行设置。但是，如果用户想基于组件 hal 和 soc 开发自己的驱动，请注意时钟门控的头文件引用路径已由 driver/periph_ctrl.h 更新为 esp_private/periph_ctrl.h。

RTC 子系统控制 RTC 控制 API 已经从 driver/rtc_ctrl.h 移动到了 esp_private/rtc_ctrl.h。

ADC

ADC 单次模式及连续模式驱动 ADC 单次模式的驱动已更新。

- 新的驱动位于组件 esp_adc 中，头文件引用路径为 esp_adc/adc_oneshot.h。
- 旧版驱动仍然可用，其头文件引用路径为 driver/adc.h。

对于 ADC 连续模式驱动，其位置已由组件 driver 更新为 esp_adc。

- 头文件引用路径由 driver/adc.h 更新为 esp_adc/adc_continuous.h。

但是，引用两种模式的旧版路径 `driver/adc.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_ADC_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy adc driver is deprecated, please migrate to use esp_adc/adc_one_shot.h and
↳ esp_adc/adc_continuous.h for oneshot mode and continuous mode drivers
↳ respectively
```

ADC 校准驱动 ADC 校准驱动已更新。

- 新的驱动位于组件 `esp_adc` 中，头文件引用路径为 `esp_adc/adc_cali.h` 和 `esp_adc/adc_cali_scheme.h`。

旧版驱动仍然可用，其头文件引用路径为 `esp_adc_cal.h`。如果用户要使用旧版路径，需要将组件 `esp_adc` 添加到文件 `CMakeLists.txt` 的组件需求表中。

默认情况下，引用路径 `esp_adc_cal.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_ADC_CALI_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy adc calibration driver is deprecated, please migrate to use esp_adc/adc_
↳ cali.h and esp_adc/adc_cali_scheme.h
```

API 更新

- ADC 电源管理 API `adc_power_acquire` 和 `adc_power_release` 已被移至 `esp_private/adc_share_hw_ctrl.h`，用于内部功能。
 - 更新前，由于硬件勘误表的工作原理，这两个 API 可以被用户调用。
 - 更新后，ADC 电源管理完全由驱动在内部实现。
 - 如果用户仍需调用这个 API，可以通过引用路径 `esp_private/adc_share_hw_ctrl.h` 来调用它。
- 更新后，`driver/adc2_wifi_private.h` 已被移至 `esp_private/adc_share_hw_ctrl.h`。
- `adc_unit_t` 中的枚举 `ADC_UNIT_BOTH`，`ADC_UNIT_ALTER` 及 `ADC_UNIT_MAX` 已被删除。
- 由于只有部分芯片支持下列枚举的某些取值，因此将下列枚举删除。如果用户使用了不支持的取值，会造成驱动运行错误。
 - 枚举 `ADC_CHANNEL_MAX`
 - 枚举 `ADC_ATTEN_MAX`
 - 枚举 `ADC_CONV_UNIT_MAX`
- ESP32 中的 API `hall_sensor_read` 已被删除，因此 ESP32 不再支持霍尔传感器。
- API `adc_set_i2s_data_source` 和 `adc_i2s_mode_init` 已被弃用，相关的枚举 `adc_i2s_source_t` 也被弃用，请使用 `esp_adc/adc_continuous.h` 进行迁移。
- API `adc_digi_filter_reset`，`adc_digi_filter_set_config`，`adc_digi_filter_get_config` 和 `adc_digi_filter_enable` 已被移除。这些接口的行为不被保证。枚举 `adc_digi_filter_idx_t`，`adc_digi_filter_mode_t` 和结构体 `adc_digi_iir_filter_t` 已被移除。
- API `esp_adc_cal_characterize` 已被弃用，请迁移到 `adc_cali_create_scheme_curve_fitting` 或 `adc_cali_create_scheme_line_fitting`。
- API `esp_adc_cal_raw_to_voltage` 已被弃用，请迁移到 `adc_cali_raw_to_voltage`。
- API `esp_adc_cal_get_voltage` 已被弃用，请迁移到 `adc_one_shot_get_calibrated_result`。

GPIO

- 之前的 `Kconfig` 选项 `RTCIO_SUPPORT_RTC_GPIO_DESC` 已被删除，因此数组 `rtc_gpio_desc` 已不可用，请使用替代数组 `rtc_io_desc`。
- 更新后，用户回调函数无法再通过读取 GPIO 中断的状态寄存器来获取用于触发中断的 GPIO 管脚的编号。但是，用户可以通过使用回调函数变量来确定该管脚编号。
 - 更新前，GPIO 中断发生时，GPIO 中断状态寄存器调用用户回调函数之后，会被清空。因此，用户可以在回调函数中读取 GPIO 中断状态寄存器，以便确定触发中断的 GPIO 管脚。
 - 但是，在调用回调函数后清空中断状态寄存器可能会导致边沿触发的中断丢失。例如，在调用用户回调函数时，如果某个边沿触发的中断 (re) 被触发，该中断会被清除，并且其注册的用户回调函数还未被处理。

- 更新后，GPIO 的中断状态寄存器在调用用户回调函数 **之前** 被清空。因此，用户无法读取 GPIO 中断状态寄存器来确定哪个管脚触发了中断。但是，用户可以通过回调函数变量来传递被触发的管脚编号。

Sigma-Delta 调制器 Sigma-Delta 调制器的驱动现已更新为 *SDM*。

- 新驱动中实现了工厂模式，SDM 通道都位于内部通道池中，因此用户无需手动将 SDM 通道配置到 GPIO 管脚。
- SDM 通道会被自动分配。

尽管我们推荐用户使用新的驱动 API，旧版驱动仍然可用，位于头文件引用路径 `driver/sigmadelat.h` 中。但是，引用 `driver/sigmadelat.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_SDM_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
The legacy sigma-delta driver is deprecated, please use driver/sdm.h
```

概念与使用方法上的主要更新如下所示：

主要概念更新

- SDM 通道名称已由 `sigmadelta_channel_t` 更新为 `sdm_channel_handle_t`，后者为一个不透明指针。
- SDM 通道配置原来存放于 `sigmadelta_config_t`，现存放于 `sdm_config_t`。
- 旧版驱动中，用户无需为 SDM 通道设置时钟源。但是在新驱动中，用户需要在 `sdm_config_t::clk_src` 为 SDM 通道设置合适的时钟源，`soc_periph_sdm_clk_src_t` 中列出了可用的时钟源。
- 旧版驱动中，用户需要为通道设置 `prescale`，该参数会影响调制器输出脉冲的频率。在新的驱动中，用户需要使用 `sdm_config_t::sample_rate_hz` 实现该功能。
- 旧版驱动中，用户通过设置 `duty` 来改变输出的模拟量，现在换成了一个更贴切的名字 `density`

主要使用方法更新

- 更新前，通道配置由通道分配在 `sdm_new_channel()` 完成。在新驱动中，只有 `density` 可在运行时由 `sdm_channel_set_pulse_density()` 更新。其他参数如 `gpio number`、`prescale` 只能在通道分配时进行设置。
- 在进行下一步通道操作前，用户应通过调用 `sdm_channel_enable()` 提前 **使能** 该通道。该函数有助于管理一些系统级服务，如 **电源管理**。

定时器组驱动 为统一和简化通用定时器的使用，定时器组驱动已更新为 *GPTimer*。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，其头文件引用路径为 `driver/timer.h`。但是，引用 `driver/timer.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_GPTIMER_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy timer group driver is deprecated, please migrate to driver/gptimer.h
```

概念和使用方法上的主要更新如下所示：

主要概念更新

- 用于识别定时器的 `timer_group_t` 和 `timer_idx_t` 已被删除。在新驱动中，定时器用参数 `gptimer_handle_t` 表示。
- 更新后，定时器的时钟源由 `gptimer_clock_source_t` 定义，之前的时钟源参数 `timer_src_clk_t` 不再使用。
- 更新后，定时器计数方向由 `gptimer_count_direction_t` 定义，之前的计数方向参数 `timer_count_dir_t` 不再使用。
- 更新后，仅支持电平触发的中断，`timer_intr_t` 和 `timer_intr_mode_t` 不再使用。

- 更新后，通过设置标志位 `gptimer_alarm_config_t::auto_reload_on_alarm`，可以使能自动加载。`timer_autoreload_t` 不再使用。

主要使用方法更新

- 更新后，通过从 `gptimer_new_timer()` 创建定时器示例可以初始化定时器。用户可以在 `gptimer_config_t` 进行一些基本设置，如时钟源，分辨率和计数方向。请注意，无需在驱动安装阶段进行报警事件的特殊设置。
- 更新后，报警事件在 `gptimer_set_alarm_action()` 中进行设置，参数在 `gptimer_alarm_config_t` 中进行设置。
- 更新后，通过 `gptimer_get_raw_count()` 设置计数数值，通过 `gptimer_set_raw_count()` 获取计数数值。驱动不会自动将原始数据同步到 UTC 时间戳。由于定时器的分辨率已知，用户可以自行转换数据。
- 更新后，如果 `gptimer_event_callbacks_t::on_alarm` 被设置为有效的回调函数，驱动程序也会安装中断服务。在回调函数中，用户无需配置底层寄存器，如用于“清除中断状态”，“重新使能事件”的寄存器等。因此，`timer_group_get_intr_status_in_isr` 与 `timer_group_get_auto_reload_in_isr` 这些函数不再使用。
- 更新后，当报警事件发生时，为更新报警配置，用户可以在中断回调中调用 `gptimer_set_alarm_action()`，这样报警事件会被重新使能。
- 更新后，如果用户将 `gptimer_alarm_config_t::auto_reload_on_alarm` 设置为 `true`，报警事件将会一直被驱动程序使能。

UART

| 删除/弃用项目 | 替代 | 备注 |
|---|--|-------------------|
| <code>uart_isr_register()</code> | 无 | 更新后，UART 中断由驱动处理。 |
| <code>uart_isr_free()</code> | 无 | 更新后，UART 中断由驱动处理。 |
| <code>uart_config_t</code> 中的 <code>use_ref_tick</code> | <code>uart_config_t::source_clk</code> | 选择时钟源。 |
| <code>uart_enable_pattern_detect</code> | <code>uart_enable_pattern_detect_baud</code> | 使能模式检测中断。 |

I2C

| 删除/弃用项目 | 替代 | 备注 |
|-----------------------------------|----|-------------------------------------|
| <code>i2c_isr_register()</code> | 无 | 更新后，I2C 中断由驱动处理。 |
| <code>i2c_isr_unregister()</code> | 无 | 更新后，I2C 中断由驱动处理。 |
| <code>i2c_opmode_t</code> | 无 | 更新后，该项不再在 <code>esp-idf</code> 中使用。 |

SPI

| 删除/弃用项目 | 替代 | 备注 |
|------------------------------|-------------------------------------|-----------------|
| <code>spi_cal_clock()</code> | <code>spi_get_actual_clock()</code> | 获取 SPI 真实的工作频率。 |

- 内部头文件 `spi_common_internal.h` 已被移至 `esp_private/spi_common_internal.h`。

LEDC

| 删除/弃用项目 | 替代 | 备注 |
|--|---|-----------|
| <code>ledc_timer_config_t</code> 中的 <code>bit_num</code> | <code>ledc_timer_config_t::duty_resolution</code> | 设置占空比分辨率。 |

脉冲计数器 (PCNT) 驱动 为统一和简化 PCNT 外设，PCNT 驱动已更新，详见 [PCNT](#)。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，保留在头文件引用路径 `driver/pcnt.h` 中。但是，引用路径 `driver/pcnt.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_PCNT_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy pcnt driver is deprecated, please migrate to use driver/pulse_cnt.h
```

主要概念和使用方法上的更新如下所示：

主要概念更新

- 更新后，`pcnt_port_t`、`pcnt_unit_t` 和 `pcnt_channel_t` 这些用于识别 PCNT 单元和通道的参数已被删除。在新的驱动中，PCNT 单元由参数 `pcnt_unit_handle_t` 表示，PCNT 通道由参数 `pcnt_channel_handle_t` 表示，这两个参数都是不透明指针。
- 更新后，不再使用 `pcnt_evt_type_t`，它们由统一的 **观察点事件** 表示。在事件回调函数 `pcnt_watch_cb_t` 中，通过 `pcnt_watch_event_data_t` 可以分辨不同观察点。
- `pcnt_count_mode_t` 更新为 `cpp:type:pcnt_channel_edge_action_t`，`pcnt_ctrl_mode_t` 更新为 `pcnt_channel_level_action_t`。

主要使用方法更新

- 更新前，PCNT 的单元配置和通道配置都通过函数 `pcnt_unit_config` 实现。更新后，PCNT 的单元配置通过工厂 API `pcnt_new_unit()` 完成，通道配置通过工厂 API `pcnt_new_channel()` 完成。
 - 只需配置计数范围即可初始化一个 PCNT 单元。更新后，GPIO 管脚分配通过 `pcnt_new_channel()` 完成。
 - 高/低电平控制模式和上升沿/下降沿计数模式分别通过函数 `pcnt_channel_set_edge_action()` 和 `pcnt_channel_set_level_action()` 进行设置。
- `pcnt_get_counter_value` 更新为 `pcnt_unit_get_count()`。
- `pcnt_counter_pause` 更新为 `pcnt_unit_stop()`。
- `pcnt_counter_resume` 更新为 `pcnt_unit_start()`。
- `pcnt_counter_clear` 更新为 `pcnt_unit_clear_count()`。
- 更新后，`pcnt_intr_enable` 与 `pcnt_intr_disable` 已被删除。新的驱动中，通过注册时间回调函数 `pcnt_unit_register_event_callbacks()` 来使能中断。
- 更新后，`pcnt_event_enable` 与 `pcnt_event_disable` 已被删除。新的驱动中，可通过 `pcnt_unit_add_watch_point()` 和 `pcnt_unit_remove_watch_point()` 来增加/删除观察点，以使能/停用 PCNT 事件。
- 更新后，`pcnt_set_event_value` 已被删除。新的驱动中，通过 `pcnt_unit_add_watch_point()` 增加观察点时，也同时设置了事件的数值。
- 更新后，`pcnt_get_event_value` 与 `pcnt_get_event_status` 已被删除。在新的驱动中，这些信息存储在 `pcnt_watch_event_data_t` 的回调函数 `pcnt_watch_cb_t` 中。
- 更新后，`pcnt_isr_register` 与 `pcnt_isr_unregister` 已被删除，不允许注册 ISR 句柄。用户可以通过调用 `cpp:func:pcnt_unit_register_event_callbacks` 来注册事件回调函数。
- 更新后，`pcnt_set_pin` 已被删除，新的驱动不再允许在运行时切换 GPIO 管脚。如果用户想切换为其他 GPIO 管脚，可通过 `cpp:func:pcnt_del_channel` 删除当前的 PCNT 通道，然后通过 `cpp:func:pcnt_new_channel` 安装新的 GPIO 管脚。
- `pcnt_filter_enable`、`pcnt_filter_disable` 与 `pcnt_set_filter_value` 更新为 `pcnt_unit_set_glitch_filter()`。同时，`pcnt_get_filter_value` 已被删除。
- `pcnt_set_mode` 更新为 `pcnt_channel_set_edge_action()` 与 `pcnt_channel_set_level_action()`。
- `pcnt_isr_service_install`、`pcnt_isr_service_uninstall`、`pcnt_isr_handler_add` 与 `pcnt_isr_handler_remove` 更新为 `pcnt_unit_register_event_callbacks()`。默认的 ISR 句柄已安装在新的驱动中。

温度传感器驱动 温度传感器的驱动已更新，推荐用户使用新驱动。旧版驱动仍然可用，但是无法与新驱动同时使用。

新驱动的头文件引用路径为 `driver/temperature_sensor.h`。旧版驱动仍然可用，保留在引用路径 `driver/temp_sensor.h` 中。但是，引用路径 `driver/temp_sensor.h` 会默认触发如下编译警告，可通过设置 Kconfig 选项 `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy temperature sensor driver is deprecated, please migrate to driver/
↳temperature_sensor.h
```

配置内容已更新。更新前，用户需要设置 `clk_div` 与 `dac_offset`。更新后，用户仅需设置 `tsens_range`。

温度传感器的使用过程也已更新。更新前，用户可通过 `config->start->read_celsius` 获取数据。更新后，用户需要通过 `temperature_sensor_install` 先安装温度传感器的驱动，测量完成后需卸载驱动，详情请参考 [Temperature Sensor](#)。

RMT 驱动 为统一和扩展 RMT 外设的使用，RMT 驱动已更新，详见 [RMT transceiver](#)。

尽管我们建议使用新的驱动 API，旧版驱动仍然可用，保留在头文件引用路径 `driver/rmt.h` 中。但是，引用路径 `driver/rmt.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_RMT_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
The legacy RMT driver is deprecated, please use driver/rmt_tx.h and/or driver/rmt_
↳rx.h
```

主要概念和使用方法更新如下所示：

主要概念更新

- 更新后，用于识别硬件通道的 `rmt_channel_t` 已删除。在新的驱动中，RMT 通道用参数 `rmt_channel_handle_t` 表示，该通道由驱动程序动态分配，而不是由用户指定。
- `rmt_item32_t` 更新为 `rmt_symbol_word_t`，以避免在结构体中出现嵌套的共用体。
- 更新后，`rmt_mem_t` 已被删除，因为我们不允许用户直接访问 RMT 内存块（即 RMTMEM）。直接访问 RMTMEM 没有意义，反而会引发错误，特别是当 RMT 通道与 DMA 通道相连时。
- 更新后，由于 `rmt_mem_owner_t` 由驱动控制，而不是用户，因此 `rmt_mem_owner_t` 已被删除。
- `rmt_source_clk_t` 更新为 `rmt_clock_source_t`，后者不支持二进制兼容。
- 更新后，`rmt_data_mode_t` 已被删除，RMT 内存访问模式配置为始终使用 Non-FIFO 和 DMA 模式。
- 更新后，由于驱动有独立的发送和接收通道安装函数，因此 `rmt_mode_t` 已被删除。
- 更新后，`rmt_idle_level_t` 已被删除，在 `rmt_transmit_config_t::eot_level` 中可为发送通道设置空闲状态电平。
- 更新后，`rmt_carrier_level_t` 已被删除，可在 `rmt_carrier_config_t::polarity_active_low` 设置载流子极性。
- 更新后，`rmt_channel_status_t` 与 `rmt_channel_status_result_t` 已被删除，不再使用。
- 通过 RMT 通道发送并不需要用户提供 RMT 符号，但是用户需要提供一个 RMT 编码器用来告诉驱动如何将用户数据转换成 RMT 符号。

主要使用方法更新

- 更新后，分别通过 `rmt_new_tx_channel()` 和 `rmt_new_rx_channel()` 安装发送通道和接收通道。
- 更新后，`rmt_set_clk_div` 和 `rmt_get_clk_div` 已被删除。通道时钟配置只能在通道安装时完成。
- 更新后，`rmt_set_rx_idle_thresh` 和 `rmt_get_rx_idle_thresh` 已被删除。新驱动中，接收通道的空闲状态阈值定义为 `rmt_receive_config_t::signal_range_max_ns`。
- 更新后，`rmt_set_mem_block_num` 和 `rmt_get_mem_block_num` 已被删除。新驱动中，内存块的数量由 `rmt_tx_channel_config_t::mem_block_symbols` 与 `rmt_rx_channel_config_t::mem_block_symbols` 决定。
- 更新后，`rmt_set_tx_carrier` 已被删除。新驱动使用 `rmt_apply_carrier()` 来设置载波动作。
- 更新后，`rmt_set_mem_pd` 和 `rmt_get_mem_pd` 已被删除，驱动程序自动调整内存的功率。

- 更新后, `rmt_memory_rw_rst`, `rmt_tx_memory_reset` 和 `rmt_rx_memory_reset` 已被删除, 驱动程序自动进行内存重置。
- 更新后, `rmt_tx_start` 和 `rmt_rx_start` 被合并为函数 `rmt_enable()`, 该函数同时适用于发射通道和接收通道。
- 更新后, `rmt_tx_stop` 和 `rmt_rx_stop` 被合并为函数 `rmt_disable()`, 该函数同时适用于发射通道和接收通道。
- 更新后, `rmt_set_memory_owner` 和 `rmt_get_memory_owner` 已被删除, 驱动程序自动添加 RMT 内存保护。
- 更新后, `rmt_set_tx_loop_mode` 和 `rmt_get_tx_loop_mode` 已被删除。新驱动中, 在 `rmt_transmit_config_t::loop_count` 中设置循环模式。
- 更新后, `rmt_set_source_clk` 和 `rmt_get_source_clk` 已被删除。仅能在通道安装时通过 `rmt_tx_channel_config_t::clk_src` 和 `rmt_rx_channel_config_t::clk_src` 设置时钟源。
- 更新后, `rmt_set_rx_filter` 已被删除。新驱动中, 过滤阈值定义为 `rmt_receive_config_t::signal_range_min_ns`。
- 更新后, `rmt_set_idle_level` 和 `rmt_get_idle_level` 已被删除, 可在 `rmt_transmit_config_t::eot_level` 中设置发射通道的空闲状态电平。
- 更新后, `rmt_set_rx_intr_en`, `rmt_set_err_intr_en`, `rmt_set_tx_intr_en`, `rmt_set_tx_thr_intr_en` 和 `rmt_set_rx_thr_intr_en` 已被删除。新驱动不允许用户在用户端开启/关闭中断, 而是提供了回调函数。
- 更新后, `rmt_set_gpio` 和 `rmt_set_pin` 已被删除。新驱动不支持运行时动态切换 GPIO 管脚。
- 更新后, `rmt_config` 已被删除。新驱动中, 基础配置在通道安装阶段完成。
- 更新后, `rmt_isr_register` 和 `rmt_isr_deregister` 已被删除, 驱动程序负责分配中断。
- `rmt_driver_install` 更新为 `rmt_new_tx_channel()` 与 `rmt_new_rx_channel()`。
- `rmt_driver_uninstall` 更新为 `rmt_del_channel()`。
- 更新后, `rmt_fill_tx_items`, `rmt_write_items` 和 `rmt_write_sample` 已被删除。新驱动中, 用户需要提供一个编码器用来将用户数据“翻译”为 RMT 符号。
- 更新后, 由于用户可以通过 `rmt_tx_channel_config_t::resolution_hz` 配置通道的时钟分辨率, `rmt_get_counter_clock` 已被删除。
- `rmt_wait_tx_done` 更新为 `rmt_tx_wait_all_done()`。
- 更新后, `rmt_translator_init`, `rmt_translator_set_context` 和 `rmt_translator_get_context` 已被删除。新驱动中, 翻译器更新为 RMT 译码器。
- 更新后, `rmt_get_ringbuf_handle` 已被删除。新驱动程序不再使用 Ringbuffer 来保存 RMT 符号。输入数据会直接保存到用户提供的缓冲区中, 这些缓冲区甚至可以直接被挂载到 DMA 链接内部。
- `rmt_register_tx_end_callback` 更新为 `rmt_tx_register_event_callbacks()`, 用户可以在这个参数里面注册事件回调函数 `rmt_tx_event_callbacks_t::on_trans_done`。
- 更新后, `rmt_set_intr_enable_mask` 和 `rmt_clr_intr_enable_mask` 已被删除。由于驱动程序负责处理中断, 因此用户无需进行处理。
- `rmt_add_channel_to_group` 和 `rmt_remove_channel_from_group` 更新为 RMT 同步管理器, 详见 `rmt_new_sync_manager()`。
- 更新后, `rmt_set_tx_loop_count` 已被删除。新驱动中, 循环计数在 `rmt_transmit_config_t::loop_count` 进行配置。
- 更新后, `rmt_enable_tx_loop_autostop` 已被删除。新驱动中, 发射循环自动终止一直使能, 用户无法进行配置。

LCD

- LCD 面板的初始化流程也有一些更新。更新后, `esp_lcd_panel_init()` 不再会自动打开显示器。用户需要调用 `esp_lcd_panel_disp_on_off()` 来手动打开显示器。请注意, 打开显示器与打开背光是不同的。更新后, 打开屏幕前, 用户可以烧录一个预定义的图案, 这可以避免开机复位后屏幕上的随机噪音。
- 更新后, `esp_lcd_panel_disp_off()` 已被弃用, 请使用 `esp_lcd_panel_disp_on_off()` 作为替代。
- 更新后, `dc_as_cmd_phase` 已被删除, SPI LCD 驱动不再支持 9-bit 的 SPI LCD。请使用专用的 GPIO 管脚来控制 LCD D/C 线。
- 更新后, 用于注册 RGB 面板的事件回调函数已从 `esp_lcd_rgb_panel_config_t` 更新为单独的 API `esp_lcd_rgb_panel_register_event_callbacks()`。但是, 事件回调签名仍保持

不变。

- 更新后, `esp_lcd_rgb_panel_config_t` 中的标志位 `relax_on_idle` 被重命名为 `esp_lcd_rgb_panel_config_t::refresh_on_demand`, 后者虽表达了同样的含义, 但是其命名更有意义。
- 更新后, 如果创建 RGB LCD 时, 标志位 `refresh_on_demand` 使能, 驱动不会在 `esp_lcd_panel_draw_bitmap()` 中进行刷新, 用户需要调用 `esp_lcd_rgb_panel_refresh()` 来刷新屏幕。
- 更新后, `esp_lcd_color_space_t` 已被弃用, 请使用 `lcd_color_space_t` 来描述色彩空间, 使用 `lcd_rgb_element_order_t` 来描述 RGB 颜色的排列顺序。

专用的 GPIO 驱动

- 更新后, 所有与专用 GPIO 管脚相关的底层 (LL) 函数从 `cpu_ll.h` 中被移至 `dedic_gpio_cpu_ll.h`, 并重新命名。

I2S 驱动 旧版 I2S 驱动在支持 ESP32-C3 和 ESP32-S3 新功能时暴露了很多缺点, 为解决这些缺点, I2S 驱动已更新 (请参考: [<../..../api-reference/peripherals/i2s>](doc:I2S_Driver))。用户可以通过引用不同 I2S 模式对应的头文件来使用新版驱动的 API, 如 `esp_driver_i2s/include/driver/i2s_std.h`, `esp_driver_i2s/include/driver/i2s_pdm.h` 以及 `esp_driver_i2s/include/driver/i2s_tdm.h`。

为保证前向兼容, 旧版驱动的 API 仍然在 `driver/deprecated/driver/i2s.h` 中可用。但使用旧版 API 会触发编译警告, 该警告可通过配置 Kconfig 选项 `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` 来关闭。

以下是更新后的 I2S 文件概况。

主要概念更新

独立的发送通道和接收通道 更新后, I2S 驱动的最小控制单元是发送/接收通道, 而不是整个 I2S 控制器 (控制器包括多个通道)。

- 用户可以分别控制同一个 I2S 控制器的发送通道和接收通道, 即可以通过配置实现分别开启和关闭发送通道和接收通道。
- `i2s_chan_handle_t` 句柄类型用于唯一地识别 I2S 通道。所有的 API 都需要该通道句柄, 用户需要对这些通道句柄进行维护。
- 对于 ESP32-C3 和 ESP32-S3, 同一个控制器中的发送通道和接收通道可以配置为不同的时钟或不同的模式。

- 但是对于 ESP32 和 ESP32-S2，同一个控制器中的发送通道和接收通道共享某些硬件资源。因此，配置可能会造成一个通道影响同一个控制器中的另一个通道。
- 通过将 `i2s_port_t::I2S_NUM_AUTO` 设置为 I2S 端口 ID，驱动会搜索可用的发送/接收通道，之后通道会被自动注册到可用的 I2S 控制器上。但是，驱动仍然支持将通道注册到一个特定的端口上。
- 为区分发送/接收通道和声音通道，在更新后的驱动中，“通道 (channel)” 一词仅代表发送/接收通道，用“声道 (slot)”来表示声音通道。

I2S 模式分类 I2S 通信模式包括以下三种模式，请注意：

- **标准模式**：标准模式通常包括两个声道，支持 Philips, MSB 和 PCM (短帧同步) 格式，详见 `esp_driver_i2s/include/driver/i2s_std.h`。
- **PDM 模式**：PDM 模式仅支持两个声道，16 bit 数据位宽，但是 PDM TX 和 PDM RX 的配置略有不同。对于 PDM TX，采样率可通过 `i2s_pdm_tx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于上采样的配置。对于 PDM RX，采样率可通过 `i2s_pdm_rx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于下采样的配置，详见 `esp_driver_i2s/include/driver/i2s_pdm.h`。
- **TDM 模式**：TDM 模式可支持高达 16 声道，该模式可工作在 Philips, MSB, PCM (短帧同步) 和 PCM (长帧同步) 格式下，详见 `esp_driver_i2s/include/driver/i2s_tdm.h`。

在某个模式下分配新通道时，必须通过相应的函数初始化这个通道。我们强烈建议使用辅助宏来生成默认配置，以避免默认值被改动。

独立的声道配置和时钟配置 可以单独进行声道配置和时钟配置。

- 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `cpp:func:i2s_channel_init_tdm_mode` 初始化声道/时钟/GPIO 管脚配置。
- 通过调用 `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_pdm_rx_slot()`, `i2s_channel_reconfig_pdm_tx_slot()` 或 `i2s_channel_reconfig_tdm_slot()` 可以在初始化之后改变声道配置。
- 通过调用 `i2s_channel_reconfig_std_clock()`, `i2s_channel_reconfig_pdm_rx_clock()`, `i2s_channel_reconfig_pdm_tx_clock()` 或 `i2s_channel_reconfig_tdm_clock()` 可以在初始化之后改变时钟配置。
- 通过调用 `i2s_channel_reconfig_std_gpio()`, `i2s_channel_reconfig_pdm_rx_gpio()`, `i2s_channel_reconfig_pdm_tx_gpio()` 或 `i2s_channel_reconfig_tdm_gpio()` 可以在初始化之后改变 GPIO 管脚配置。

Misc

- 更新后，I2S 驱动利用状态和状态机避免在错误状态下调用 API。
- 更新后，ADC 和 DAC 模式已被删除，只有它们各自专用的驱动及 I2S 旧版驱动还支持这两种模式。

主要使用方法更新 请参考以下步骤使用更新后的 I2S 驱动：

1. 通过调用 `i2s_new_channel()` 来获取通道句柄。我们应该在此步骤中指定外设为主机还是从机以及 I2S 端口。此外，驱动负责生成发送通道或接收通道的句柄。不需要同时输入发送通道和接收通道句柄，但需要输入至少一个句柄。输入两个句柄时，驱动会工作在双工模式。在同一端口上，发送通道和接收通道同时可用，并且共享 MCLK, BCLK 和 WS 信号。如果只输入了发送通道句柄或接收通道句柄，该通道只能工作在单工模式。
2. 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()` 将通道初始化为指定模式。进行相应的声道、时钟和 GPIO 管脚配置。
3. (可选) 通过调用 `i2s_channel_register_event_callback()` 注册 ISR 事件回调函数。I2S 事件由回调函数同步接收，而不是从事件队列中异步接收。
4. 通过调用 `i2s_channel_enable()` 来开启 I2S 通道的硬件资源。在更新后的驱动中，I2S 在安装后不会再自动开启，用户需要确定通道是否已经开启。

5. 分别通过 `i2s_channel_read()` 和 `i2s_channel_write()` 来读取和写入数据。当然，在 `i2s_channel_read()` 中只能输入接收通道句柄，在 `i2s_channel_write()` 中只能输入发送通道句柄。
6. (可选) 通过相应的 'reconfig' 函数可以更改声道、时钟和 GPIO 管脚配置，但是更改配置前必须调用 `i2s_channel_disable()`。
7. 通过调用 `i2s_channel_disable()` 可以停止使用 I2S 通道的硬件资源。
8. 不再使用某通道时，通过调用 `i2s_del_channel()` 可以删除和释放该通道资源，但是删除之前必须先停用该通道。

TWAI 驱动程序 CAN 外设驱动程序已弃用并被删除，请使用 TWAI 驱动程序代替（即在应用程序中包含 `driver/twai.h`）。

用于访问寄存器的宏 更新前，所有用于访问寄存器的宏都可以作为表达式来使用，所以以下命令是允许的：

```
uint32_t val = REG_SET_BITS(reg, bits, mask);
```

在 ESP-IDF v5.0 中，用于写入或读取-修改-写入寄存器的宏不能再作为表达式使用，而只能作为语句使用，这适用于以下宏：`REG_WRITE`，`REG_SET_BIT`，`REG_CLR_BIT`，`REG_SET_BITS`，`REG_SET_FIELD`，`WRITE_PERI_REG`，`CLEAR_PERI_REG_MASK`，`SET_PERI_REG_MASK`，`SET_PERI_REG_BITS`。

为存储要写入寄存器的值，请按以下步骤完成操作：

```
uint32_t new_val = REG_READ(reg) | mask;
REG_WRITE(reg, new_val);
```

要获得修改后的寄存器的值（该值可能与写入的值不同），要增加一个显示的读取命令：

```
REG_SET_BITS(reg, bits, mask);
uint32_t new_val = REG_READ(reg);
```

协议

Mbed TLS 在 ESP-IDF v5.0 版本中，[Mbed TLS](#) 已从 v2.x 版本更新到 v3.1.0 版本。

更多有关 Mbed TLS 从 v2.x 版本迁移到 v3.0 或更高版本的详细信息，请参考 [官方指南](#)。

重大更新（概述）

增加私有结构体字段数量

- 不再支持直接访问公共头文件中声明的结构体（`struct` 类型）字段。
- 当前版本下，访问公共头文件中声明的结构体字段需要使用特定的访问函数（`getter/setter`）。另外，也可以用 `MBEDTLS_PRIVATE` 宏暂时代替，但不建议使用此种方法。
- 更多详细信息，请参考 [官方指南](#)。

SSL

- 不再支持 TLS 1.0、TLS 1.1 和 DTLS 1.0
- 不再支持 SSL 3.0

移除密码模块中的废弃函数

- 更新了与 MD、SHA、RIPEMD、RNG、HMAC 模块相关的函数 `MBEDTLS*_*_ret()` 的返回值，并将其重新命名，以取代未附加 `_ret` 的相应函数。
- 更多详细信息，请参考 [官方指南](#)。

废弃配置选项 下列为在此次更新中废弃的重要配置选项。与以下配置有关或是依赖于下列配置的相关配置也已相应废弃。

- `MBEDTLS_SSL_PROTO_SSL3`: 原用于支持 SSL 3.0
- `MBEDTLS_SSL_PROTO_TLS1`: 原用于支持 TLS 1.0
- `MBEDTLS_SSL_PROTO_TLS1_1`: 原用于支持 TLS 1.1
- `MBEDTLS_SSL_PROTO_DTLS`: 原用于支持 DTLS 1.1 (当前版本仅支持 DTLS 1.2)
- `MBEDTLS_DES_C`: 原用于支持 3DES 密码套件
- `MBEDTLS_RC4_MODE`: 原用于支持基于 RC4 的密码套件

备注: 上述仅列出了可通过 `idf.py menuconfig` 配置的主要选项。更多有关废弃选项的信息，请参考 [官方指南](#)。

其他更新

禁用 Diffie-Hellman 密码交换模式 为避免 [安全风险](#)，当前版本已默认禁用 Diffie-Hellman 密码交换模式。以下为相应的禁用配置项：

- `MBEDTLS_DHM_C`: 原用于支持 Diffie-Hellman-Merkle 模块
- `MBEDTLS_KEY_EXCHANGE_DHE_PSK`: 原用于支持 Diffie-Hellman 预共享密钥 (PSK) TLS 认证模式
- `MBEDTLS_KEY_EXCHANGE_DHE_RSA`: 原用于支持带有前缀的密码套件 TLS-DHE-RSA-WITH-

备注: 在信号交换的初始步骤 (即 `client_hello`) 中，服务器会在客户端提供的列表选择一个密码。由于 `DHE_PSK/DHE_RSA` 密码已在本次更新中禁用，服务器将退回到一个替代密码。在极个别情况中，服务器不支持任何其他的代码，此时，初始步骤将失败。若要检索服务器所支持的密码列表，需要首先在客户端使用特定的密码连接服务器，可以使用 `sslscan` 等工具完成连接。

从 X509 库中移除 `certs` 模块

- `MBEDTLS 3.1` 不再支持 `MBEDTLS/certs.h` 头文件。大多数应用程序支持从包含列表中安全删除该头文件。

对 `esp_crt_bundle_set` API 的重大更新

- 更新后，调用 `esp_crt_bundle_set()` API 需要一个额外的参数 `bundle_size`。该 API 的返回类型也从 `void` 变为了 `esp_err_t`。

对 `esp_ds_rsa_sign` API 的重大更新

- 更新后，调用 `esp_ds_rsa_sign()` API 无需再使用参数 `mode`。

HTTPS 服务器

重大更新 (概述) 更新 `httpd_ssl_config_t` 结构体中持有不同证书的变量名。

- `httpd_ssl_config::servercert`: 原 `cacert_pem`
- `httpd_ssl_config::servercert_len`: 原 `cacert_len`
- `httpd_ssl_config::cacert_pem`: 原 `client_verify_cert_pem`
- `httpd_ssl_config::cacert_len`: 原 `client_verify_cert_len`

`httpd_ssl_stop()` API 的返回类型从 `void` 变为了 `esp_err_t`。

ESP HTTPS OTA

重大更新 (概述)

- 函数 `esp_https_ota()` 现需以指向 `esp_https_ota_config_t` 的指针作为参数，而非之前的指向 `esp_http_client_config_t` 的指针。

ESP-TLS

重大更新 (概述)

私有化 `esp_tls_t` 结构体 更新后，`esp_tls_t` 已完全私有化，用户无法直接访问其内部结构。之前需要通过 ESP-TLS 句柄获得的必要数据，现在可由对应的 `getter/setter` 函数获取。如需特定功能的 `getter/setter` 函数，请在 ESP-IDF 的 [Issue 板块](#) 提出。

下列为新增的 `getter/setter` 函数：

- `esp_tls_get_ssl_context()`：从 ESP-TLS 句柄获取底层 ssl 栈的 ssl 上下文。

废弃函数及推荐的替代函数 下表总结了在 ESP-IDF v5.0 中废弃的函数以及相应的替代函数。

| 废弃函数 | 替代函数 |
|------------------------------------|--------------------------------------|
| <code>esp_tls_conn_new()</code> | <code>esp_tls_conn_new_sync()</code> |
| <code>esp_tls_conn_delete()</code> | <code>esp_tls_conn_destroy()</code> |

- 函数 `esp_tls_conn_http_new()` 现已废弃。请使用替代函数 `esp_tls_conn_http_new_sync()` (或其异步函数 `esp_tls_conn_http_new_async()`)。请注意，使用替代函数时，需要额外的参数 `esp_tls_t`，此参数必须首先通过 `esp_tls_init()` 函数进行初始化。

HTTP 服务器

重大更新 (概述)

- `esp_http_server` 现不再支持 `http_server.h` 头文件。请使用 `esp_http_server.h`。

ESP HTTP 客户端

重大更新 (概述)

- 函数 `esp_http_client_read()` 和 `esp_http_client_fetch_headers()` 现在会返回额外的返回值 `-ESP_ERR_HTTP_EAGAIN` 用于处理超时错误，即数据准备好前就已调用超时的情况。

TCP 传输

重大更新 (概述)

- 更新后, 出现连接超时的情况时, 函数 `esp_transport_read()` 将返回 0, 对其他错误则返回 < 0。请参考 `esp_tcp_transport_err_t`, 查看所有可能的返回值。

MQTT 客户端

重大更新 (概述)

- `esp_mqtt_client_config_t` 的所有字段都分组存放在子结构体中。

以下为较为常用的配置选项:

- 通过 `esp_mqtt_client_config_t::broker::address::uri` 配置 MQTT Broker
- 通过 `esp_mqtt_client_config_t::broker::verification` 配置 MQTT Broker 身份验证的相关安全问题
- 通过 `esp_mqtt_client_config_t::credentials::username` 配置客户端用户名
- `esp_mqtt_client_config_t` 不再支持 `user_context` 字段。之后注册事件处理程序, 请使用 `esp_mqtt_client_register_event()`; 最后一个参数 `event_handler_arg` 可用于将用户上下文传递给处理程序。

ESP-Modbus

重大更新 (概述) 本次更新从 ESP-IDF 中移除了组件 `freemodbus`, 该组件已作为一个独立组件受到支持。可前往如下的独立仓库, 查看更多有关 ESP-Modbus 的信息:

- [GitHub 中的 ESP-Modbus 组件](#)

在新版应用程序中, `main` 组件文件夹应包括组件管理器清单文件 `idf_component.yml`, 如下所示:

```
dependencies:
  espressif/esp-modbus:
    version: "^1.0"
```

可以前往 [组件管理器注册表](#) 找到 ESP-Modbus 组件。更多有关如何设置组件管理器的信息, 请参考 [组件管理器文档](#)。

对于使用 ESP-IDF v4.x 及以后版本的应用程序, 需要通过添加组件管理器清单文件 `idf_component.yml` 拉取新版 ESP-Modbus 组件。同时, 在编译时, 应去掉已过时的 `freemodbus` 组件。此项操作可通过项目 `CMakeLists.txt` 中的以下语句实现:

```
set(EXCLUDE_COMPONENTS freemodbus)
```

配置

Protocomm `protocomm_set_security()` API 中的 `pop` 字段现已弃用。请使用 `sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构 (包括安全参数)。

例如, 当使用安全版本 2 时, `sec_params` 参数应包含指向 `protocomm_security2_params_t` 类型结构的指针。

Wi-Fi 配置

- `wifi_prov_mgr_start_provisioning()` API 中的 `pop` 字段现已弃用。为了向后兼容，在使用安全版本 1 时，`pop` 仍可以作为字符串传递。但在使用安全版本 2 时，请使用 `wifi_prov_sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。例如，当使用安全版本 2 时，`wifi_prov_sec_params` 参数应包含指向 `wifi_prov_security2_params_t` 结构体类型的指针。对于安全版本 1，该 API 的行为和使用方式保持不变。
- `wifi_prov_mgr_is_provisioned()` API 不再返回 `ESP_ERR_INVALID_STATE` 错误。此 API 现在可以在不依赖配置管理器初始化状态的情况下工作。

ESP 本地控制 `esp_local_ctrl_proto_sec_cfg_t` API 中的 `pop` 字段现已弃用。请使用 `sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，`sec_params` 字段应包含指向 `esp_local_ctrl_security2_params_t` 类型结构的指针。

从 ESP-IDF 中移出或弃用的组件

移至 ESP-IDF Component Registry 的组件 以下组件已经从 ESP-IDF 中迁出至 [ESP-IDF Component Registry](#)：

- `libsodium`
- `cbor`
- `jsmn`
- `esp_modem`
- `nghttp`
- `mdns`
- `esp_websocket_client`
- `asio`
- `freemodbus`
- `sh2lib`
- `expat`
- `coap`
- `esp-cryptoauthlib`
- `qrcode`
- `tjpgd`
- `esp_serial_slave_link`
- `tinyusb`

备注： 请注意，`http` 解析功能以前属于 `nghttp` 组件一部分，但现在属于 `http_parser` 组件。

可使用 `idf.py add-dependency` 命令安装以上组件。

例如，要安装 X.Y 版本的 `libsodium` 组件，请运行：`idf.py add-dependency libsodium==X.Y`。

根据 [semver](#) 规则安装与 X.Y 兼容的最新版本 `libsodium` 组件，请运行 `idf.py add-dependency libsodium~X.Y`。

可前往 <https://components.espressif.com> 查询每个组件有哪些版本，按名称搜索该组件，组件页面上会列出所有版本。

弃用的组件 ESP-IDF v4.x 版本中已不再使用以下组件，这些组件已弃用：

- `tcpip_adapter`。可使用 [ESP-NETIF](#) 组件代替，具体可参考 [TCP/IP 适配器](#)。

备注：不再支持 OpenSSL-API 组件。ESP-IDF Component Registry 中也没有该组件。请直接使用 [ESP-TLS](#) 或 [mbedtls](#) API。

备注：不再支持 `esp_adc_cal` 组件。新的 `adc` 校准驱动在 `esp_adc` 组件中。旧版 `adc` 校准驱动已被迁移进 `esp_adc` 组件中。要使用旧版 `esp_adc_cal` 驱动接口，你应该在 `CMakeLists.txt` 文件的组件依赖列表中增加 `esp_adc`。更多细节请查看 [Peripherals Migration Guide](#)。

版本更新后无需目标组件，因此以下目标组件也已经从 ESP-IDF 中删除：

- `esp32`
- `esp32s2`
- `esp32s3`
- `esp32c2`
- `esp32c3`
- `esp32h2`

存储

分区 API 的新组件 非兼容性更新：所有的分区 API 代码都已迁移到新组件 `esp_partition` 中。如需查看所有受影响的函数及数据类型，请参见头文件 `esp_partition.h`。

在以前，这些 API 函数和数据类型属于 `spi_flash` 组件。因此，在现有的应用程序中或将依赖 `spi_flash`，这也意味着在直接使用 `esp_partition_*` API/数据类型时，可能会导致构建过程失败（比如，在出现 `#include "esp_partition.h"` 的行中报错 `fatal error: esp_partition.h: No such file or directory`）。如果遇到类似问题，请按以下步骤更新项目中的 `CMakeLists.txt` 文件：

原有的依赖性设置：

```
idf_component_register(...
    REQUIRES spi_flash)
```

更新后的依赖性设置：

```
idf_component_register(...
    REQUIRES spi_flash esp_partition)
```

备注：请根据项目的实际情况，更新相应的 `REQUIRES` 或是 `PRIV_REQUIRES` 部分。上述代码片段仅为范例。

如果问题仍未解决，请联系我们，我们将协助你进行代码迁移。

SDMMC/SDSPI 用户现可通过 `sdmmc_host_t.max_freq_khz` 将 SDMMC/SDSPI 接口上的 SD 卡频率配置为特定值，不再局限于之前的 `SDMMC_FREQ_PROBING (400 kHz)`、`SDMMC_FREQ_DEFAULT (20 MHz)` 或是 `SDMMC_FREQ_HIGHSPEED (40 MHz)`。此前，如果用户配置了上述三个给定频率之外的值，用户所选频率将自动调整为与其最为接近的给定值。

更新后，底层驱动将计算与用户配置的特定值最为接近的合适频率。相对于枚举项选择，该频率现由可用的分频器提供。不过，如果尚未更新现有的应用代码，可能会导致与 SD 卡的通信过程出现问题。如发现上述问题，请继续尝试配置与期望值接近的不同频率，直到找到合适的频率。如需查看底层驱动的计算结果以及实际应用的频率，请使用 `void sdmmc_card_print_info(FILE* stream, const sdmmc_card_t* card)` 函数。

FatFs FatFs 已更新至 v0.14, `f_mkfs()` 函数签名也已变更。新签名为 `FRESULT f_mkfs (const TCHAR* path, const MKFS_PARM* opt, void* work, UINT len);`, 使用 `MKFS_PARM` 结构体作为第二个实参。

分区表 分区表生成器不再支持未对齐的分区。生成分区表时, ESP-IDF 将只接受偏移量与 4 KB 对齐的分区。此变更仅影响新生成的分区表, 不影响读写现有分区。

VFS `esp_vfs_semihost_register()` 函数签名有所更改:

- 新签名为 `esp_err_t esp_vfs_semihost_register(const char* base_path);`
- 旧签名的 `host_path` 参数不再存在, 请使用 `OpenOCD` 命令 `ESP_SEMIHOST_BASEDIR` 设置主机上的完整路径。

函数签名更改 以下函数现将返回 `esp_err_t`, 而非 `void` 或 `nvs_iterator_t`。此前, 当参数无效或内部出现问题时, 这些函数将 `assert()` 或返回 `nullptr`。通过返回 `esp_err_t`, 你将获得更加实用的错误报告。

- `nvs_entry_find()`
- `nvs_entry_next()`
- `nvs_entry_info()`

由于 `esp_err_t` 返回类型的更改, `nvs_entry_find()` 和 `nvs_entry_next()` 的使用模式也发生了变化。上述函数现均通过参数修改迭代器, 而非返回一个迭代器。

迭代 NVS 分区的旧编程模式如下所示:

```
nvs_iterator_t it = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↳ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d'", info.key, info.type);
};
```

现在, 迭代 NVS 分区的编程模式已更新为:

```
nvs_iterator_t it = nullptr;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &
↳it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are_
↳guaranteed to be non-NULL
    printf("key '%s', type '%d'", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

迭代器有效性 请注意, 由于函数签名的改动, 如果存在参数错误, 则可能从 `nvs_entry_find()` 获得无效迭代器。因此, 请务必在使用 `nvs_entry_find()` 之前将迭代器初始化为 `NULL`, 以免在调用 `nvs_release_iterator()` 之前进行复杂的错误检查。上述编程模式便是一个很好的例子。

删除 SDSPI 弃用的 API 结构体 `sdspi_slot_config_t` 和函数 `sdspi_host_init_slot()` 现已删除, 并由结构体 `sdspi_device_config_t` 和函数 `sdspi_host_init_device()` 替代。

ROM SPI flash 在 v5.0 之前的版本中，ROM SPI flash 函数一般通过 `esp32**/rom/spi_flash.h` 得以体现。因此，为支持不同 ESP 芯片而编写的代码可能会填充不同目标的 ROM 头文件。此外，并非所有 API 都可以在全部的 ESP 芯片上使用。

现在，常用 API 已提取至 `esp_rom_spiflash.h`。尽管这不能算作重大变更，我们强烈建议仅使用此头文件中的函数（即以 `esp_rom_spiflash` 为前缀并包含在 `esp_rom_spiflash.h` 中），以获得不同 ESP 芯片之间更佳的交叉兼容性。

为了提高 ROM SPI flash API 的可读性，以下函数也进行了重命名：

- `esp_rom_spiflash_lock()` 更名为 `esp_rom_spiflash_set_bp()`
- `esp_rom_spiflash_unlock()` 更名为 `esp_rom_spiflash_clear_bp()`

SPI flash 驱动 `esp_flash_speed_t` enum 类型现已弃用。现在，可以直接将实际时钟频率值传递给 flash 配置结构。下为配置 80 MHz flash 频率的示例：

```
esp_flash_spi_device_config_t dev_cfg = {
    // Other members
    .freq_mhz = 80,
    // Other members
};
```

旧版 SPI flash 驱动 为了使 SPI flash 驱动更为稳定，v5.0 已经删除旧版 SPI flash 驱动。旧版 SPI flash 驱动程序是指自 v3.0 以来的默认 SPI flash 驱动程序，以及自 v4.0 以来启用配置选项 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 的 SPI flash 驱动。从 v5.0 开始，我们将不再支持旧版 SPI flash 驱动程序。因此，旧版驱动 API 和 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 配置选项均已删除，请改用新 SPI flash 驱动的 API。

| 删除项目 | 替代项目 |
|--|--|
| <code>spi_flash_erase_sector()</code> | <code>esp_flash_erase_region()</code> |
| <code>spi_flash_erase_range()</code> | <code>esp_flash_erase_region()</code> |
| <code>spi_flash_write()</code> | <code>esp_flash_write()</code> |
| <code>spi_flash_read()</code> | <code>esp_flash_read()</code> |
| <code>spi_flash_write_encrypted()</code> | <code>esp_flash_write_encrypted()</code> |
| <code>spi_flash_read_encrypted()</code> | <code>esp_flash_read_encrypted()</code> |

备注：带有前缀 `esp_flash` 的新函数接受额外的 `esp_flash_t*` 参数。你可以直接将其设置为 `NULL`，从而使函数运行主 flash (`esp_flash_default_chip`)。

由于系统函数不再是公共函数，`esp_spi_flash.h` 头文件已停止使用。若要使用 flash 映射 API，请使用 `spi_flash_mmap.h`。

系统

跨核执行 跨核执行 (Inter-Processor Call, IPC) 不再是一个独立组件，现已包含至 `esp_system`。

因此，若项目的 `CMakeLists.txt` 文件中出现 `PRIV_REQUIRES esp_ipc` 或 `REQUIRES esp_ipc`，应删除这些选项，因为项目中已默认包含 `esp_system` 组件。

ESP 时钟 ESP 时钟 API (即以 `esp_clk` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "ESP32-S2/clk.h"` 和 `#include "esp_clk.h"` 已移除。如仍需使用 ESP 时钟 API (并不推荐), 请使用 `#include "esp_private/esp_clk.h"` 来包含。

注意: 私有 API 不属于稳定的 API, 不会遵循 ESP-IDF 的版本演进规则, 因此不推荐用户在应用中使用。

缓存错误中断 缓存错误中断 API (即以 `esp_cache_err` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "ESP32-S2/cache_err_int.h"` 已移除。如仍需使用缓存错误中断 API (并不推荐), 请使用 `#include "esp_private/cache_err_int.h"` 来包含。

bootloader_support

- 函数 `bootloader_common_get_reset_reason()` 已移除。请使用 ROM 组件中的函数 `esp_rom_get_reset_reason()`。
- 函数 `esp_secure_boot_verify_sbv2_signature_block()` 和 `esp_secure_boot_verify_rsa_signature_block()` 已移除, 无新的替换函数。不推荐用户直接使用以上函数。如确需要, 请在 [GitHub](#) 上对该功能提交请求, 并解释需要此函数的原因。

断电 断电 API (即以 `esp_brownout` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "brownout.h"` 已移除。如仍需使用断电 API (并不推荐), 请使用 `#include "esp_private/brownout.h"` 来包含。

Trax Trax API (即以 `trax_` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "trax.h"` 已移除。如仍需使用 Trax API (并不推荐), 请使用 `#include "esp_private/trax.h"` 来包含。

ROM `components/esp32/rom/` 路径下存放的已弃用的 ROM 相关头文件已移除 (原包含路径为 `rom/*.h`)。请使用新的特定目标的路径 `components/esp_rom/include/ESP32-S2/` (新的包含路径为 `ESP32-S2/rom/*.h`)。

esp_hw_support

- 头文件 `soc/cpu.h` 及弃用的 CPU util 函数都已移除。请包含 `esp_cpu.h` 来代替相同功能的函数。
- 头文件 `hal/cpu_ll.h`, `hal/cpu_hal.h`, `hal/soc_ll.h`, `hal/soc_hal.h` 和 `interrupt_controller_hal.h` 的 CPU API 函数已弃用。请包含 `esp_cpu.h` 来代替相同功能的函数。
- 头文件 `compare_set.h` 已移除。请使用 `esp_cpu.h` 中提供的 `esp_cpu_compare_and_set()` 函数来代替。
- `esp_cpu_get_ccount()`, `esp_cpu_set_ccount()` 和 `esp_cpu_in_ocd_debug_mode()` 已从 `esp_cpu.h` 中移除。请分别使用 `esp_cpu_get_cycle_count()`, `esp_cpu_set_cycle_count()` 和 `esp_cpu_dbgr_is_attached()` 代替。
- 头文件 `esp_intr.h` 已移除。请包含 `esp_intr_alloc.h` 以分配和操作中断。
- Panic API (即以 `esp_panic` 为前缀的函数、类型或宏) 已更新为私有 API。因此, 原先的包含路径 `#include "esp_panic.h"` 已移除。如仍需使用 Panic API (并不推荐), 请使用 `#include "esp_private/panic_reason.h"` 来包含。此外, 请包含 `esp_debug_helpers.h` 以使用与调试有关的任意辅助函数, 如打印回溯。
- 头文件 `soc_log.h` 现更名为 `esp_hw_log.h`, 并已更新为私有。建议用户使用 `esp_log.h` 头文件下的日志 API。
- 包含头文件 `spinlock.h`, `clk_ctrl_os.h` 和 `rtc_wdt.h` 时不应当使用 `soc` 前缀, 如 `#include "spinlock.h"`。
- `esp_chip_info()` 命令返回芯片版本, 格式为 `= 100 * 主要 eFuse 版本 + 次要 eFuse 版本`。因此, 为适应新格式, `esp_chip_info_t` 结构体中的 `revision` 扩展为 `uint16_t`。

PSRAM

- 针对特定目标的头文件 `spiram.h` 及头文件 `esp_spiram.h` 已移除，创建新组件 `esp_psram`。对于与 PSRAM 或 SPIRAM 相关的函数，请包含 `esp_psram.h`，并在 `CMakeLists.txt` 项目文件中将 `esp_psram` 设置为必需组件。
- `esp_spiram_get_chip_size` 和 `esp_spiram_get_size` 已移除，请使用 `esp_psram_get_size`。

eFuse

- 函数 `esp_secure_boot_read_key_digests()` 的参数类型从 `ets_secure_boot_key_digests_t*` 更新为 `esp_secure_boot_key_digests_t*`。新类型与旧类型相同，仅移除了 `allow_key_revoke` 标志。在当前代码中，后者总是设置为 `true`，并未提供额外信息。
- 针对 eFuse 晶圆增加主要修订版本和次要修订版本。API `esp_efuse_get_chip_ver()` 与新修订不兼容，因此已移除。请使用 API `efuse_hal_get_major_chip_version()`、`efuse_hal_get_minor_chip_version()` 或 `efuse_hal_chip_revision()` 来代替原有 API。

esp_common `EXT_RAM_ATTR` 已弃用。请使用新的宏 `EXT_RAM_BSS_ATTR` 以将 `.bss` 放在 PSRAM 上。

esp_system

- 头文件 `esp_random.h`、`esp_mac.h` 和 `esp_chip_info.h` 以往都是通过头文件 `esp_system.h` 间接包含，更新后必须直接包含。已移除从 `esp_system.h` 中的间接包含功能。
- 回溯解析器 API（即以 `esp_eh_frame_` 为前缀的函数、类型或宏）已更新为私有 API。因此，原先的包含路径 `#include "eh_frame_parser.h"` 已移除。如仍需使用回溯解析器 API（并不推荐），请使用 `#include "esp_private/eh_frame_parser.h"` 来包含。
- 中断看门狗定时器 API（即以 `esp_int_wdt_` 为前缀的函数、类型或宏）已更新为私有 API。因此，原先的包含路径 `#include "esp_int_wdt.h"` 已移除。如仍需使用中断看门狗定时器 API（并不推荐），请使用 `#include "esp_private/esp_int_wdt.h"` 来包含。

SOC 依赖性

- Doxyfiles 中列出的公共 API 头文件中不会显示不稳定和非必要的 SOC 头文件，如 `soc/soc.h` 和 `soc/rtc.h`。这意味着，如果用户仍然需要这些“缺失”的头文件，就必须在代码中明确包含这些文件。
- Kconfig 选项 `LEGACY_INCLUDE_COMMON_HEADERS` 也已移除。
- 头文件 `soc/soc_memory_types.h` 已弃用。请使用 `esp_memory_utils.h`。包含 `soc/soc_memory_types.h` 将触发构建警告，如 `soc_memory_types.h is deprecated, please migrate to esp_memory_utils.h`。

应用跟踪 其中一个时间戳源已从定时器组驱动改为新的 *GPTimer*。Kconfig 选项已重新命名，例如 `APPTRACE_SV_TS_SOURCE_TIMER00` 已更改为 `APPTRACE_SV_TS_SOURCE_GPTIMER`。用户已无需选择组和定时器 ID。

esp_timer 基于 FRC2 的 `esp_timer` 过去可用于 ESP32，现在已移除，更新后仅可使用更简单有效的 LAC 定时器。

ESP 镜像 ESP 镜像中关于 SPI 速度的枚举成员已重新更名：

- `ESP_IMAGE_SPI_SPEED_80M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_1`。
- `ESP_IMAGE_SPI_SPEED_40M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_2`。
- `ESP_IMAGE_SPI_SPEED_26M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_3`。
- `ESP_IMAGE_SPI_SPEED_20M` 已重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_4`。

任务看门狗定时器

- API `esp_task_wdt_init()` 更新后有如下变化：
 - 以结构体的形式传递配置。
 - 可将该函数配置为订阅空闲任务。
- 原先的配置选项 `CONFIG_ESP_TASK_WDT` 重新命名为 `CONFIG_ESP_TASK_WDT_INIT` 并引入了一个新选项 `CONFIG_ESP_TASK_WDT_EN`。

FreeRTOS

遗留 API 及数据类型 在以往版本中,ESP-IDF 默认设置 `configENABLE_BACKWARD_COMPATIBILITY` 选项,因此可使用 FreeRTOS v8.0.0 之前的函数名称和数据类型。该选项现在已默认禁用,因此默认情况下不再支持以往的 FreeRTOS 名称或类型。用户可以选择以下一种解决方式:

- 更新代码,删除以往的 FreeRTOS 名称或类型。
- 启用 `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` 以显式调用这些名称或类型。

任务快照 头文件 `task_snapshot.h` 已从 `freertos/task.h` 中移除。如需使用任务快照 API,请包含 `freertos/task_snapshot.h`。

函数 `vTaskGetSnapshot()` 现返回 `BaseType_t` ,成功时返回值为 `pdTRUE`,失败则返回 `pdFALSE`。

FreeRTOS 断言 在以往版本中,FreeRTOS 断言通过 `FREERTOS_ASSERT` `kconfig` 选项独立配置,不同于系统的其他部分。该选项已移除,现在需要通过 `COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 来完成配置。

FreeRTOS 移植相关的宏 已移除用以保证弃用 API 向后兼容性的 `portmacro_deprecated.h` 文件。建议使用下列函数来代替弃用 API。

- `portENTER_CRITICAL_NESTED()` 已移除,请使用 `portSET_INTERRUPT_MASK_FROM_ISR()` 宏。
- `portEXIT_CRITICAL_NESTED()` 已移除,请使用 `portCLEAR_INTERRUPT_MASK_FROM_ISR()` 宏。
- `vPortCPUInitializeMutex()` 已移除,请使用 `spinlock_initialize()` 函数。
- `vPortCPUAcquireMutex()` 已移除,请使用 `spinlock_acquire()` 函数。
- `vPortCPUAcquireMutexTimeout()` 已移除,请使用 `spinlock_acquire()` 函数。
- `vPortCPUReleaseMutex()` 已移除,请使用 `spinlock_release()` 函数。

应用程序更新

- 函数 `esp_ota_get_app_description()` 和 `esp_ota_get_app_elf_sha256()` 已弃用,请分别使用 `esp_app_get_description()` 和 `esp_app_get_elf_sha256()` 函数来代替。这些函数已移至新组件 `esp_app_format`。请参考头文件 `esp_app_desc.h`。

引导加载程序支持

- `esp_app_desc_t` 结构体此前在 `esp_app_format.h` 中声明,现在在 `esp_app_desc.h` 中声明。
- 函数 `bootloader_common_get_partition_description()` 已更新为私有函数,请使用代替函数 `esp_ota_get_partition_description()`。注意,此函数的第一个参数为 `esp_partition_t`,而非 `esp_partition_pos_t`。

芯片版本 在应用程序开始加载时,引导加载程序会检查芯片版本。只有当版本为 \geq `CONFIG_ESP32S2_REV_MIN` 和 $<$ `CONFIG_ESP32S2_REV_MAX_FULL` 时,应用程序才能成功加载。

在 OTA 升级时,会检查应用程序头部中的版本需求和芯片版本是否符合条件。只有当版本为 \geq `CONFIG_ESP32S2_REV_MIN` 和 $<$ `CONFIG_ESP32S2_REV_MAX_FULL` 时,应用程序才能成功更新。

工具

ESP-IDF 监视器 ESP-IDF 监视器在波特率方面的改动如下：

- 目前, ESP-IDF 监视器默认遵循自定义的控制台波特率 (`CONFIG_ESP_CONSOLE_UART_BAUDRATE`), 而非 115200。
- ESP-IDF v5.0 不再支持通过 `menuconfig` 自定义波特率。
- 支持通过设置环境变量或在命令行中使用 `idf.py monitor -b <baud>` 命令自定义波特率。
- 注意, 为了与全局波特率 `idf.py -b <baud>` 保持一致, 波特率参数已从 `-B` 改名为 `-b`。请运行 `idf.py monitor --help` 获取更多信息。

废弃指令 ESP-IDF v5.0 已将 `idf.py` 子命令和 `cmake` 目标名中的下划线 (`_`) 统一为连字符 (`-`)。使用废弃的子命令及目标名将会触发警告, 建议使用更新后的版本。具体改动如下：

表 1: 废弃子命令及目标名

| 废弃名 | 现用名 |
|------------------------------------|------------------------------------|
| <code>efuse_common_table</code> | <code>efuse-common-table</code> |
| <code>efuse_custom_table</code> | <code>efuse-custom-table</code> |
| <code>erase_flash</code> | <code>erase-flash</code> |
| <code>partition_table</code> | <code>partition-table</code> |
| <code>partition_table-flash</code> | <code>partition-table-flash</code> |
| <code>post_debug</code> | <code>post-debug</code> |
| <code>show_efuse_table</code> | <code>show-efuse-table</code> |
| <code>erase_otadata</code> | <code>erase-otadata</code> |
| <code>read_otadata</code> | <code>read-otadata</code> |

Esptool `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT` 选项已重命名为 `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`, 且默认禁用。迁移到 ESP-IDF v5.0 的新项目和现有项目必须设置 `CONFIG_ESPTOOLPY_FLASHSIZE`。若因编译时 `flash` 大小未知而无法设置, 可启用 `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`。但需注意的是, 启用该项后, 为在烧录期间使用 `flash` 大小更新二进制头时不会导致摘要无效, 映像后将不再附加 SHA256 摘要。

Windows 环境 基于 MSYS/MinGW 的 Windows 环境支持已在 ESP-IDF v4.0 中弃用, v5.0 则完全移除了该项服务。请使用 [ESP-IDF 工具安装器](#) 设置 Windows 兼容环境。目前支持 Windows 命令行、Power Shell 和基于 Eclipse IDE 的图形用户界面等选项。此外, 还可以使用 [支持的插件](#), 设置基于 VSCode 的环境。

5.1.2 从 5.0 迁移到 5.1

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 11.2.0, 现已针对所有芯片目标升级至 GCC 12.2.0。若需将代码从 GCC 11.2.0 迁移到 GCC 12.2.0, 请参考以下 GCC 官方迁移指南。

- [迁移至 GCC 12](#)

警告 升级至 GCC 12.2.0 后会触发新警告，或是导致原有警告内容发生变化。了解所有 GCC 警告的详细内容，请参考 [GCC 警告选项](#)。建议用户仔细检查代码，并尽量解决这些警告。但由于某些警告的特殊性及用户代码的复杂性，有些警告可能为误报，需要进行关键修复。在这种情况下，用户可以采取多种方式来抑制警告。本节介绍了用户可能遇到的常见警告及如何修复这些警告。

-Wuse-after-free 一般而言，此警告不会针对发布版本的代码产生误报，但是这种情况可能出现在测试用例中。以下示例为如何在 ESP-IDF 的 `test_realloc.c` 中修复该警告。

```
void *x = malloc(64);
void *y = realloc(x, 48);
TEST_ASSERT_EQUAL_PTR(x, y);
```

将指针转换为 `int` 可以避免出现 `-Wuse-after-free` 警告。

```
int x = (int) malloc(64);
int y = (int) realloc((void *) x, 48);
TEST_ASSERT_EQUAL_UINT32((uint32_t) x, (uint32_t) y);
```

-Waddress GCC 12.2.0 引入了增强版 `-Waddress` 警告选项，该选项对 `if` 语句中的数组指针检查更加敏感。

以下代码将触发警告：

```
char array[8];
...
if (array)
    memset(array, 0xff, sizeof(array));
```

删去不必要的检查可以消除警告。

```
char array[8];
...
memset(array, 0xff, sizeof(array));
```

在 ESP-IDF 框架之外构建 RISC-V RISC-V 的 `zicsr` 和 `zifencei` 扩展现已独立于 I 扩展，这一变化在 GCC 12 中也有所体现。因此，在 ESP-IDF 框架之外构建 RISC-V ESP32 芯片时，请在构建系统中指定 `-march` 选项时添加 `_zicsr_zifencei` 后缀。示例如下。

原为：

```
riscv32-esp-elf-gcc main.c -march=rv32imac
```

现为：

```
riscv32-esp-elf-gcc main.c -march=rv32imac_zicsr_zifencei
```

外设

DAC DAC 驱动程序已经过重新设计（参考 [DAC API 参考](#)），以统一接口并扩展 DAC 外设的使用。建议使用更新后的驱动 API，但用户仍然可以通过包含路径 `driver/dac.h` 使用原有驱动。然而默认情况下，在文件中包含 `driver/dac.h` 会引发构建警告，例如 `The legacy DAC driver is deprecated, please use 'driver/dac_one_shot.h', 'driver/dac_cosine.h' or 'driver/dac_continuous.h' instead.` 可通过 `Kconfig` 选项 `CONFIG_DAC_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

主要概念和使用方法上的更新如下所示：

主要概念更新

- 用于识别硬件通道的 `dac_channel_t` 已从用户空间被删除，更新后通道索引起始为 0，请使用 `DAC_CHAN_0` 和 `DAC_CHAN_1` 代替原来的索引。在新驱动中可通过 `dac_channel_mask_t` 删除 DAC 通道。这些通道可以被分配到同一个通道组中，由 `dac_channels_handle_t` 表示。
- `dac_cw_scale_t` 更新为 `dac_cosine_atten_t`，以区分原有驱动程序和新驱动程序。
- `dac_cw_phase_t` 更新为 `dac_cosine_phase_t`，更新后，枚举值即为相位角。
- `dac_cw_config_t` 更新为 `dac_cosine_config_t`，但删除了 `en_ch` 字段，因为该字段应在分配通道组时被指定。
- `dac_digi_convert_mode_t` 已被删除。驱动程序现在可以通过调用 `dac_channels_write_continuously()` 或 `dac_channels_write_cyclically()` 以不同方式传输 DMA 数据。
- `dac_digi_config_t` 更新为 `dac_continuous_config_t`。

主要使用方法更新

- `dac_pad_get_io_num` 已被删除。
- `dac_output_voltage` 更新为 `dac_oneshot_output_voltage()`。
- `dac_output_enable` 已被删除，单次采样模式下在分配通道后启用。
- `dac_output_disable` 已被删除，单次采样模式下在删除通道前被禁用。
- `dac_cw_generator_enable` 更新为 `dac_cosine_start()`。
- `dac_cw_generator_disable` 更新为 `dac_cosine_stop()`。
- `dac_cw_generator_config` 更新为 `dac_cosine_new_channel()`。
- `dac_digi_init` 和 `dac_digi_controller_config` 合并为 `dac_continuous_new_channels()`。
- `dac_digi_deinit` 更新为 `dac_continuous_del_channels()`。
- `dac_digi_start`、`dac_digi_fifo_reset` 和 `dac_digi_reset` 合并为 `dac_continuous_enable()`。
- `dac_digi_stop` 更新为 `dac_continuous_disable()`。

GPSPI 不再支持以下函数。从 ESP-IDF v5.1 版本起，GPSPI 时钟源可配置。

- `spi_get_actual_clock` 已废弃，更新为 `spi_device_get_actual_freq()`。

LEDC

- `soc_periph_ledc_clk_src_legacy_t::LEDC_USE_RTC8M_CLK` 已废弃，更新为 `LEDC_USE_RC_FAST_CLK`。

存储

FatFs `esp_vfs_fat_sdmmc_unmount()` 已弃用，可以使用 `esp_vfs_fat_sdcard_unmount()` 代替。此接口在更早的 ESP-IDF 版本中已弃用，但是尚未添加弃用警告。自 ESP-IDF v5.1 起，调用 `esp_vfs_fat_sdmmc_unmount()` 接口将会产生弃用警告。

SPI_FLASH

- `spi_flash_get_counters()` 已弃用，请使用 `esp_flash_get_counters()` 代替。
- `spi_flash_dump_counters()` 已弃用，请使用 `esp_flash_dump_counters()` 代替。
- `spi_flash_reset_counters()` 已弃用，请使用 `esp_flash_reset_counters()` 代替。

网络

SNTP SNTP 模块现在提供线程安全的 API 用于访问 lwIP 功能。建议使用 *ESP_NETIF* API。了解更多信息，请参考章节 *SNTP API*。

系统

FreeRTOS

动态内存分配 过去，FreeRTOS 通常使用 `malloc()` 函数来分配动态内存。因此，如果应用程序允许 `malloc()` 从外部 RAM 分配内存（通过将 *CONFIG_SPIRAM_USE* 选项配置为 *CONFIG_SPIRAM_USE_MALLOC*），FreeRTOS 就有可能从外部 RAM 分配动态内存，并且具体位置由堆分配器确定。

备注：任务的动态内存分配（通常占用大部分内存）与上述介绍的情况不同，是种例外情况。FreeRTOS 会使用单独的内存分配函数，确保为任务分配的动态内存始终位于内部 RAM 中。

允许将 FreeRTOS 对象（如队列和信号量）放置在外部 RAM 中可能会出现一些问题，例如如果在访问这些对象时 cache 被禁用（如在 SPI flash 写入操作期间），则会导致 cache 访问错误（详细信息请参阅 *严重错误*）。

因此，FreeRTOS 已经更新为始终使用内部内存（即 DRAM）进行动态内存分配。调用 FreeRTOS 创建函数（例如 `xTaskCreate()` 或 `xQueueCreate()`）将保证为这些任务/对象分配的内存来自内部内存（详细信息请参阅 *FreeRTOS 堆*）。

警告：如果你之前使用 *CONFIG_SPIRAM_USE* 将 FreeRTOS 对象放置在外部内存中，这个更改则会导致内部内存的使用增加，因为现在 FreeRTOS 对象将被分配到内部内存中。

现在将 FreeRTOS 任务/对象放置在外部内存中，需要显式地设置，可采用以下方法之一：

- 使用 `...CreateWithCaps()` API 函数，如 `xTaskCreateWithCaps()` 或 `xQueueCreateWithCaps()` 分配任务/对象到外部内存（详情请参阅 *IDF 附加 API*）。
- 使用 `heap_caps_malloc()` 为 FreeRTOS 对象手动分配外部内存，然后使用 `...CreateStatic()` FreeRTOS 函数从分配的内存中创建对象。

电源管理

- `esp_pm_config_esp32xx_t` 已弃用，应使用 `esp_pm_config_t` 替代。
- `esp32xx/pm.h` 已弃用，应使用 `esp_pm.h` 替代。

5.1.3 从 5.1 迁移到 5.2

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 12.2.0，现已针对所有芯片目标升级至 GCC 13.2.0。若需将代码从 GCC 12.2.0 迁移到 GCC 13.2.0，请参考以下 GCC 官方迁移指南。

- [迁移至 GCC 13](#)

常见迁移问题和解决方法

stdio.h 不再包含 sys/types.h

问题描述 使用旧工具链的代码可能会出现编译错误，例如：

```
#include <stdio.h>
clock_t var; // error: expected specifier-qualifier-list before 'clock_t'
```

解决方法 使用正确的头文件可以解决这一问题。请按照以下方式重构代码：

```
#include <time.h>
clock_t var;
```

外设

UART

- `UART_FIFO_LEN` 已弃用，更新为 `UART_HW_FIFO_LEN`。

I2C I2C 驱动已经被重新设计在 `I2C`，以统一接口并扩展 I2C 外设的使用。尽管我们推荐使用新驱动接口，但用户仍然可以通过包含路径 `driver/i2c.h` 来使用老驱动。

主要的概念上和用法上的改变如下所示：

主要概念更新

- 用于初始化整个 I2C 总线的结构体 `i2c_config_t` 已经被移除。在新驱动中，从机和主机是分开的。用户可以独立调用 `i2c_master_bus_config_t` 和 `i2c_slave_config_t`。
- `i2c_mode_t` 用来判断 I2C 控制器是工作在从模式还是主模式。该枚举器已被弃用。在新驱动程序中，用户无需自行设置，驱动程序会妥善处理。
- `i2c_rw_t` 用来判断 I2C 主控制器是在进行“写”还是“读”。现在，它已被弃用。
- `i2c_addr_mode_t` 被重命名为 `i2c_addr_bit_len_t`。
- 在老驱动中，你需要将 I2C 命令通过 `I2C_LINK_RECOMMENDED_SIZE`，`i2c_cmd_link_create_static`，等链接成链表。在新驱动中，你不需要这么做，你只需要调用相关的接口函数即可。
- 在老驱动中，选择时钟通过例如 `I2C_SCLK_SRC_FLAG_FOR_NOMAL` 的时钟标志位。在新驱动中，你可以直接选择时钟源。

主要用法更新

- I2C 总线初始化通过两部分完成。第一步通过 `i2c_new_master_bus()` 初始化 I2C 总线，然后初始化 I2C 设备通过 `i2c_master_bus_add_device()`。
- `i2c_reset_tx_fifo` 和 `i2c_reset_rx_fifo` 已被删除，因为用户不太需要重置 fifo。但可以通过 `i2c_master_bus_reset` 重置整个总线。
- 删除了 `i2c_cmd_link_xxx` 函数，用户不需要自己使用 `link` 来链接命令。
- `i2c_master_write_to_device` 更名为 `i2c_master_transmit`。
- `i2c_master_read_from_device` 已更名为 `i2c_master_receive`。
- `i2c_master_write_read_device` 已更名为 `i2c_master_transmit_receive`。
- `i2c_slave_write_buffer` 重命名为 `i2c_slave_transmit`。
- `i2c_slave_read_buffer` 已更名为 `i2c_slave_receive`。

协议

CoAP CoAP 相关示例已迁移至 [idf-extra-components](#) 仓库。

HTTP2 http2_request 相关示例已迁移至 [idf-extra-components](#) 仓库。

存储

NVS 加密

- 在集成 HMAC 外设 (SOC_HMAC_SUPPORTED) 的 SoC 上, 启用 *flash 加密* 时将不再自动启用 *NVS 加密*。
- 因此需显式启用 NVS 加密, 并按照需要选择基于 flash 加密或基于 HMAC 外设的方案。即使未启用 flash 加密, 也可选择基于 HMAC 外设的方案 (*CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME*)。
- 启用 flash 加密后, 未集成 HMAC 外设的 SoC 仍会自动启用 NVS 加密。

系统

FreeRTOS

升级 IDF FreeRTOS IDF FreeRTOS 内核 (通过 FreeRTOS 实现的双核 SMP) 已升级, 现基于 Vanilla FreeRTOS v10.5.1。伴随升级, IDF FreeRTOS 的设计和实现也发生了重大变化。因此, 用户应注意以下关于内核行为和 API 的变化:

- 通过 *CONFIG_FREERTOS_UNICORE* 选项启用单核模式时, 内核行为将与 Vanilla FreeRTOS 完全相同 (详见 [单核模式](#))。
- 对于由 IDF FreeRTOS 添加的与 SMP 相关的 API, xCoreID 参数的检查将更加严格。为 xCoreID 参数提供超出范围的值现在将触发断言。
- 为了保证命名一致性, 以下与 SMP 相关的 API 现已被弃用并已重新更名:
 - 弃用 xTaskGetAffinity(), 更名为 *xTaskGetCoreID()*。
 - 弃用 xTaskGetIdleTaskHandleForCPU(), 更名为 *xTaskGetIdleTaskHandleForCore()*。
 - 弃用 xTaskGetCurrentTaskHandleForCPU(), 更名为 *xTaskGetCurrentTaskHandleForCore()*。

任务快照 由于缺乏从用户代码中使用该 API 的实际方法 (必须先暂停调度器才能调用该 API), 任务快照 API 已被设置为私有。

Xtensa 几个 Xtensa 头文件的旧版包含路径已被弃用:

- 弃用 #include "freertos/xtensa_api.h", 请改用 #include "xtensa_api.h"。
- 弃用 #include "freertos/xtensa_context.h", 请改用 #include "xtensa_context.h"。
- 弃用 #include "freertos/xtensa_timer.h", 请改用 #include "xtensa_timer.h"。

紧急处理程序行为 在配置选项 *CONFIG_ESP_SYSTEM_PANIC* 中, 是否可选择 *CONFIG_ESP_SYSTEM_PANIC_GDBSTUB* 取决于是否在构建中包含了 esp_gdbstub 组件。使用 set (COMPONENTS main) 来缩减这类构建的组件列表时, 必须将 esp_gdbstub 组件添加到这个组件列表中, 以使 *CONFIG_ESP_SYSTEM_PANIC_GDBSTUB* 选项可用。

Wi-Fi

Wi-Fi 企业级安全 在 *esp_wpa2.h* 中定义的 API 已弃用，请使用来自 *esp_eap_client.h* 的新 API。

Wi-Fi 多天线 Wi-Fi 多天线相关的 API 将要被弃用，请使用来自 *esp_phy.h* 的新 API。

5.1.4 从 5.2 迁移到 5.3

经典蓝牙

Bluedroid

以下 Bluedroid API 已被废弃：

- [/bt/host/bluedroid/api/include/api/esp_bt_device.h](#)
 - 废弃 `esp_err_t esp_bt_dev_set_device_name(const char *name)`
 - * 设置设备名 API 已被替换为 `esp_err_t esp_bt_gap_set_device_name(const char *name)` 或 `esp_err_t esp_ble_gap_set_device_name(const char *name)`。原来的函数已经被废弃。
 - 废弃 `esp_err_t esp_bt_dev_get_device_name(void)`
 - * 获取设备名 API 已被替换为 `esp_err_t esp_bt_gap_get_device_name(void)` 或 `esp_err_t esp_ble_gap_get_device_name(void)`。原来的函数已经被废弃。

GCC

常见的移植问题及解决方法

`sys/dirent.h` 不再包含一些函数原型

问题 使用旧工具链的代码可能会出现编译错误。例如：

```
#include <sys/dirent.h>
/* .... */
DIR* dir = opendir("test_dir");
/* .... */
/**
 * Compile error:
 * test.c: In function 'test_opendir':
 * test.c:100:16: error: implicit declaration of function 'opendir' [-
↳Werror=implicit-function-declaration]
 *   100 |     DIR* dir = opendir(path);
 *       |                   ^~~~~~
 */
```

解决方法 包含正确的头文件即可解决此问题。请将代码重构如下：

```
#include <dirent.h>
/* ... */
DIR* dir = opendir("test_dir");
```

外设

驱动程序 为了细粒度地控制其他组件对外设驱动的依赖，原先位于 `driver` 组件下的驱动程序被拆分到了各自独立的组件中。这些组件包括：

- `esp_driver_gptimer` - 通用定时器驱动
- `esp_driver_pcnt` - 脉冲计数器驱动
- `esp_driver_gpio` - GPIO 驱动
- `esp_driver_spi` - 通用 SPI 驱动
- `esp_driver_mcpwm` - 电机控制 PWM 驱动
- `esp_driver_sdmmc` - SDMMC 驱动
- `esp_driver_sdspi` - SDSPI 驱动
- `esp_driver_sdio` - SDIO 驱动
- `esp_driver_ana_cmpr` - 模拟比较器驱动
- `esp_driver_i2s` - I2S 驱动
- `esp_driver_dac` - DAC 驱动
- `esp_driver_rmt` - RMT 驱动
- `esp_driver_tsens` - 温度传感器驱动
- `esp_driver_sdm` - Sigma-Delta 调制器驱动
- `esp_driver_i2c` - I2C 驱动
- `esp_driver_uart` - UART 驱动
- `esp_driver_ledc` - LEDC 驱动
- `esp_driver_parlio` - 并行 IO 驱动
- `esp_driver_usb_serial_jtag` - USB_SERIAL_JTAG 驱动

为了兼容性，原来的 `driver` 组件仍然存在，并作为一个“all-in-one”的组件，将以上这些 `esp_driver_xyz` 组件注册成自己的公共依赖。换句话说，你无需修改既有项目的 CMake 文件，但是你现在多了一个途径去指定你项目依赖的具体的外设驱动。

原来你可能使用 `linker.lf` 指定了一些驱动函数在内存空间的链接位置，但是现在，因为驱动文件的位置发生了挪动，就需要你对 `linker.lf` 文件做出相应的改动的。假如，你的 `linker.lf` 文件里面有以下的条目：

```
[mapping:my_mapping_scheme]
archive: libdriver.a
entries:
    gpio (noflash)
```

现在需要修改成：

```
[mapping:my_mapping_scheme]
archive: libesp_driver_gpio.a
entries:
    gpio (noflash)
```

安全元素 ATECC608A 安全元素接口示例现已移至 GitHub 上的 [esp-cryptoauthlib](#) 仓库中。

该示例也是组件管理器注册表中 [esp-cryptoauthlib](#) 的一部分。

I2S 回调事件 `i2s_event_data_t` 中指向 DMA 数组的二级指针 `data` 因使用过于繁琐已被弃用，请使用新增的指向 DMA 数组的一级指针 `dma_buf` 字段代替。

Protocols

ESP HTTPS OTA

Breaking Changes (Summary)

- If the image length is found in the HTTP header and `esp_https_ota_config_t::bulk_flash_erase` is set to true, then instead of erasing the entire flash, the erase operation will be performed to accommodate the size of the image length.

安全性

平台安全特性 当启用 flash 加密时，仅加密 app 分区中存在的应用程序镜像，而不是加密整个分区。这可以帮助优化在首次启动期间所需的加密时间。

这可以通过配置 `CONFIG_SECURE_FLASH_ENCRYPT_ONLY_IMAGE_LEN_IN_APP_PART` 来实现，默认情况下从 ESP-IDF v5.3 开始启用，而在所有早期版本中均禁用，以避免任何破坏性行为。

存储

VFS VFS 操作符的 UART 具体实现函数从 `vfs` 组件挪到了 `esp_driver_uart` 组件中。

所有以 `esp_vfs_dev_uart_` 前缀开头的 API 已被弃用，更新成在 `uart_vfs.h` 文件中定义的以 `uart_vfs_dev_` 为前缀的一组 API。具体来说，`esp_vfs_dev_uart_register` 更名为 `uart_vfs_dev_register` - `esp_vfs_dev_uart_port_set_rx_line_endings` 更名为 `uart_vfs_dev_port_set_rx_line_endings` - `esp_vfs_dev_uart_port_set_tx_line_endings` 更名为 `uart_vfs_dev_port_set_tx_line_endings` - `esp_vfs_dev_uart_use_nonblocking` 更名为 `uart_vfs_dev_use_nonblocking` - `esp_vfs_dev_uart_use_driver` 更名为 `uart_vfs_dev_use_driver`

为了兼容性，`vfs` 组件依旧将 `esp_driver_uart` 注册成了其私有依赖。换句话说，你无需修改既有项目的 CMake 文件。

System

Power Management

- `esp_sleep_enable_ext1_wakeup_with_level_mask` is deprecated, use `esp_sleep_enable_ext1_wakeup_io()` and `esp_sleep_disable_ext1_wakeup_io()` instead.

Unit Testing In the past versions of Unity framework, it was possible to omit a semicolon at the end of a `TEST_ASSERT_*` macro statement. This is no longer the case in the newer version of Unity, used in IDF v5.3.

For example, the following code:

```
TEST_ASSERT(some_func() == ESP_OK)
```

will now result in a compilation error. To fix this, add a semicolon at the end of the statement:

```
TEST_ASSERT(some_func() == ESP_OK);
```

Partition Table Partition Table generation tool has been fixed to ensure that the size of partition of type `app` is having flash sector (minimum erase size) aligned size (please see [偏移地址 \(Offset\)](#) 和 [大小 \(Size\)](#) 字段). If the partition does not have aligned size, partition table generator tool will raise an error. This fix ensures that OTA updates for a case where the file size is close or equal to the size of partition works correctly (erase operation does not go beyond the partition size).

In case you have the `app` partition size which is not a multiple of the 4 KB then please note that while migrating to ESP-IDF 5.3, you must align this size to its lower 4 KB boundary for the build to succeed. This does not impact the partition table for existing devices as such but ensures that generated firmware size remains within the OTA update capability limit.

Chapter 6

安全指南

6.1 概述

6.1.1 安全

本指南概述了乐鑫解决方案中可用的整体安全功能。从 **安全** 角度考虑，强烈建议在使用乐鑫平台和 ESP-IDF 软件栈设计产品时参考本指南。

目标

高级安全目标包括：

1. 防止执行不受信任的代码
2. 保护存储在外部 flash 中代码的可信度和完整性
3. 保护设备身份
4. 安全存储机密数据
5. 设备身份验证与加密通信

平台安全

安全启动 安全启动功能可以确保设备仅执行通过身份认证的软件。安全启动时，会验证 **应用程序的启动流程** 中所涉及的所有 **可变** 软件实体，形成信任链。设备启动以及 OTA 更新过程中都会进行签名认证。

关于安全启动功能的更多详情，请参阅 [Secure Boot V2](#)。

重要： 强烈建议在所有生产设备上启用安全启动功能。

安全启动最佳实践

- 在具备高质量熵源的系统中生成签名密钥。
- 签名密钥始终保密；签名密钥泄露会危及安全启动系统。
- 禁止第三方使用 `espsecure.py` 观察密钥生成或签名过程的相关细节，这两个过程都容易受到时序攻击或其他侧信道攻击的影响。
- 确保正确烧录所有安全性 eFuse，包括禁用调试接口以及非必需的启动介质（例如 UART 下载模式）等。

flash 加密 flash 加密功能可以加密外部 flash 中的内容，从而保护存储在 flash 中软件或数据的 **机密性**。

关于该功能的更多详情，请参阅[flash 加密](#)。

如果 ESP32-S2 连接了外部 SPI RAM，那么写入或读取到 SPI RAM 的内容将会分别进行加密和解密。当启用 flash 加密时，上述过程将通过 MMU 的 flash 缓存实现。以上加密和解密过程为存储在 SPI RAM 中的数据提供了额外的安全层，有助于安全地启用 CONFIG_MBEDTLS_EXTERNAL_MEM_ALLOC 等特定配置选项。

flash 加密最佳实践

- 建议在生产环境中使用 flash 加密的发布模式。
- 建议为每个设备生成唯一的 flash 加密密钥。
- 启用[安全启动](#)作为额外保护层，防止 flash 在启动前遭受恶意攻击。

设备身份 在 ESP32-S2 中，数字签名外设借助硬件加速，通过 HMAC 算法生成 RSA 数字签名。RSA 私钥仅限设备硬件访问，软件无法获取，保证了设备上存储密钥的安全性。

DS 外设可以建立与远程终端之间的 **安全设备身份**，如基于 RSA 加密算法的 TLS 双向认证。

详情请参阅[数字签名 \(DS\)](#)。

内存保护 ESP32-S2 可以通过架构或 PMS 等特定外设实现 **内存保护**，强制执行和监控内存以及某些外设的权限属性。使用相应外设，ESP-IDF 应用程序启动代码可以配置数据内存的读取/写入权限以及指令内存的读取/执行权限。如有任何操作尝试违反这些权限属性，如写入指令内存区域，将触发违规中断，导致系统 panic。

使用该功能需启用配置选项 `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`，该选项默认启用。请注意，该功能的 API 是 **私有的**，仅供 ESP-IDF 代码使用。

备注：内存保护功能可以防止因软件漏洞导致的远程代码注入。

调试接口

JTAG

- 如果启用了任一安全功能，则 JTAG 接口将保持禁用。更多详情请参阅[JTAG 与 flash 加密和安全引导](#)。
- 如果不启用其他安全功能，也可以使用[eFuse API](#)禁用 JTAG 接口。
- ESP32-S2 支持软禁用 JTAG 接口，并且可以通过 HMAC 烧录密钥重新启用，请参阅[HMAC 启用 JTAG 接口](#)。

UART 下载模式 ESP32-S2 中，如果启用了任一安全功能，则会激活安全 UART 下载模式。

- 要启用安全 UART 下载模式，也可以调用 `esp_efuse_enable_rom_secure_download_mode()`。
- 该模式下，禁止执行通过 UART 下载模式下载的任何代码。
- 该模式将限制部分涉及更新 SPI 配置的命令，如更改波特率、基本的 flash 写入以及通过 `get_security_info` 返回当前启用的安全功能摘要。
- 要完全禁用安全 UART 下载模式，可以将 `CONFIG_SECURE_UART_ROM_DL_MODE` 设置为建议选项 Permanently disable ROM Download Mode，或者在运行时调用 `esp_efuse_disable_rom_download_mode()`。

重要：安全 UART 下载模式下，仅支持使用 `--no-stub` 参数调用 `esptool.py`。

网络安全

Wi-Fi 除传统安全协议 WEP/WPA-TKIP/WPA2-CCMP 外，ESP-IDF 的 Wi-Fi 驱动程序还支持其他先进的安全协议。详情请参阅 [Wi-Fi 安全性](#)。

TLS (传输层安全性协议) 建议在 ESP 设备的所有外部通信中使用 TLS，如云通信、OTA 更新等。[mbedTLS](#) 是 ESP-IDF 官方支持的 TLS 协议栈。

TLS 默认集成在 [ESP HTTP 客户端](#)、[HTTPS 服务器](#) 和其他几个 ESP-IDF 预置的组件中。

备注： 推荐使用 ESP-IDF 协议组件已确认安全的默认配置。请勿禁用 HTTPS 和类似的安全相关配置。

ESP-TLS 抽象层 ESP-IDF 为最常用的 TLS 功能提供了一个抽象层，因此，建议应用程序使用由 [ESP-TLS](#) 提供的 API。

[TLS 服务器验证](#) 部分着重描述了在设备端建立服务器身份的多种方式。

ESP 证书捆绑包 调用 [ESP x509 证书包](#) API 即可包含一组自定义 x509 根证书，用于验证 TLS 服务器。对于绝大部分的标准 TLS 服务器，都可以使用证书捆绑包轻松验证服务器身份。

重要： 强烈建议基于 X.509 证书验证服务器身份，谨防与 **伪造** 服务器建立通信。

根证书管理 内嵌在应用程序内的根证书必须谨慎管理。更新根证书列表或 [ESP x509 证书包](#) 都可能影响与远程端点的 TLS 连接，包括与 OTA 更新服务器的连接。在某些情况下，此类问题可能会在后续 OTA 更新中出现，导致设备永远无法进行 OTA 更新。

根证书列表更新可能出于以下原因：

- 新固件的远程端点不同。
- 现有证书过期。
- 证书已从上游证书包中添加或撤销。
- 市场份额统计数据的变化引起证书列表的变化 (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN 情况)。

其他相关建议：

- 请考虑启用 [回滚过程](#)，将成功连接至 OTA 更新服务器作为取消回滚过程的检查点，从而确保更新后的固件成功连接至 OTA 更新服务器。否则，回滚过程将导致设备回退到之前的固件版本。
- 如果计划启用 [CONFIG_MBEDTLS_HAVE_TIME_DATE](#) 选项，请确保具备时间同步机制 (SNTP) 和足够的受信任证书。

产品安全

安全配网 安全配网是指将 ESP 设备安全接入 Wi-Fi 网络的过程。该机制还支持在初始配网阶段从配网实体（如智能手机等）获取额外的自定义配置数据。

ESP-IDF 提供了多种安全方案，可以在 ESP 设备和配网实体之间建立安全会话，具体方案请参阅 [安全方案](#)。

关于该功能的更多详情和代码示例，请参阅 [Wi-Fi 配网](#)。

备注： 乐鑫提供了 Android 和 iOS 手机应用程序及其源代码，以便进一步根据产品需求定制安全配网方案。

安全 OTA 更新

- OTA 更新必须通过安全传输进行，如 HTTPS。
- ESP-IDF 为此提供了一个简化的抽象层，即 [ESP HTTPS OTA 升级](#)。
- 如果启用了 [安全启动](#)，则服务器应托管已签名的应用程序镜像。
- 如果启用了 [flash 加密](#)，则服务器端不需要额外操作，在 flash 写入时，设备将自动加密。
- OTA 更新的 [回滚过程](#) 可以在验证完应用程序的功能后，再将应用程序切换为 active 状态。

防回滚保护 防回滚保护功能确保设备仅执行特定版本的应用程序，即应满足设备 eFuse 存储的安全版本条件。因此，即使已由合法密钥信任和签名，应用程序可能包含已撤销的安全功能或凭据，因此设备必须拒绝执行此类应用程序。

ESP-IDF 仅支持在应用程序使用该功能，并通过二级引导加载程序管理。安全版本存储在设备 eFuse 中，并在启动时和 OTA 更新期间与应用程序镜像头进行比较。

关于启用此功能的更多详情，请参阅 [防回滚](#)。

加密固件分发 OTA 更新期间，使用加密的固件分发，可以确保在从服务器 **传输**到设备的过程中，应用程序保持加密。OTA 更新期间，这可以作为在 TLS 通信之上的额外保护层，保护应用程序身份。

关于加密固件分发的工作示例，请参阅 [使用预加密固件进行 OTA 升级](#)。

安全存储 安全存储指在设备上以安全方式存储应用程序的特定数据，即将数据存储在外部 flash 中。外部 flash 通常是可读写的 flash 分区，用于存储设备特定的配置数据，如 Wi-Fi 凭据。

ESP-IDF 提供了 **NVS (非易失性存储)** 管理组件，允许加密数据分区。该功能与上文提到的 [flash 加密](#) 平台功能相关。

关于该功能的工作原理和启用说明，请参阅 [NVS 加密](#)。

重要： ESP-IDF 组件会默认将 Wi-Fi 证书等设备特定数据写入 NVS 默认分区，建议使用 **NVS 加密功能** 来保护这些数据。

安全设备控制 ESP-IDF 提供了 ESP 本地控制组件，可以通过 Wi-Fi/Ethernet + HTTP 或 BLE 安全地控制 ESP 设备。

关于该功能的更多详情，请参阅 [ESP 本地控制](#)。

安全策略

ESP-IDF GitHub 代码库内含 [安全政策介绍](#)。

公告

- 乐鑫会发布重要 [安全公告](#)，包括硬件和软件相关公告。
- ESP-IDF 软件组件的相关安全公告会发布在 [GitHub 仓库](#)。

软件更新 ESP-IDF 会及时处理针对组件和第三方库的相关报告，并修复关键安全问题。修复内容会逐步同步到 ESP-IDF 的所有适用版本分支中。

ESP-IDF 的发布说明将涵盖各 ESP-IDF 组件和第三方库的相应安全问题和 CVE 编号。

重要： 为获取所有关键安全修复，建议定期更新到 ESP-IDF 的最新 **Bugfix** 版本。

6.2 功能

6.2.1 flash 加密

本文档旨在引导用户快速了解 ESP32-S2 的 flash 加密功能，通过应用程序代码示例向用户演示如何在开发及生产过程中测试及验证 flash 加密的相关操作。

概述

flash 加密功能用于加密与 ESP32-S2 搭载使用的片外 flash 中的内容。启用 flash 加密功能后，固件会以明文形式烧录，然后在首次启动时将数据进行加密。因此，物理读取 flash 将无法恢复大部分 flash 内容。

重要： 对于生产用途，flash 加密仅应在“发布”模式下启用。

重要： 启用 flash 加密将限制后续 ESP32-S2 更新。在使用 flash 加密功能前，请务必阅读本文档了解其影响。

加密分区

启用 flash 加密后，会默认加密以下类型的数据：

- [二级引导程序](#)（固件引导加载程序）
- 分区表
- [NVS 密钥分区](#)
- Otadata
- 所有 app 类型的分区

其他类型的数据将视情况进行加密：

- 分区表中标有 encrypted 标志的分区。如需了解详情，请参考[加密分区标志](#)。
- 如果启用了安全启动，则会对安全启动引导程序摘要进行加密（见下文）。

相关 eFuses

flash 加密操作由 ESP32-S2 上的多个 eFuse 控制。以下是这些 eFuse 列表及其描述，下表中的各 eFuse 名称也在 `espefuse.py` 工具中使用，为了能在 eFuse API 中使用，请在名称前加上 `ESP_EFUSE_`，如：`esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT)`。

表 1: flash 加密过程中使用的 eFuses

| eFuse | 描述 | 位深 |
|-----------------------------|---|--|
| BLOCK_KEYN | AES 密钥存储, N 在 0-5 之间。 | XTS_AES_128 有一个 256 位密钥块, XTS_AES_256 有两个 256 位密钥块 (共 512 位)。 |
| KEY_PURPOSE_N | 控制 eFuse 块 BLOCK_KEYN 的目的, 其中 N 在 0-5 之间。可能的值: 2 代表 XTS_AES_256_KEY_1, 3 代表 XTS_AES_256_KEY_2, 4 代表 XTS_AES_128_KEY。最终 AES 密钥是基于其中一个或两个目的 eFuses 值推导。有关各种可能的组合, 请参阅 <i>ESP32-S2 技术参考手册 > 外部内存加密和解密 (XTS_AES) [PDF]</i> 。 | 4 |
| DIS_DOWNLOAD_MANUAL_ENCRYPT | 设置后, 在下载启动模式下禁用 flash 加密。 | 1 |
| SPI_BOOT_CRYPT_CNT | 设置 SPI 启动模式后, 可启用加密和解密。如果在 eFuse 中设置了 1 或 3 个比特位, 则启用该功能, 否则将禁用。 | 3 |

备注:

- 上表中列出的所有 eFuse 位都提供读/写访问控制。
- 这些位的默认值是 0。

对上述 eFuse 位的读写访问由 WR_DIS 和 RD_DIS 寄存器中的相应字段控制。有关 ESP32-S2 eFuse 的详细信息, 请参考 *eFuse 管理器*。要使用 `espefuse.py` 更改 eFuse 字段的保护位, 请使用以下两个命令: `read_protect_efuse` 和 `write_protect_efuse`。例如 `espefuse.py write_protect_efuse DISABLE_DL_ENCRYPT`。

flash 的加密过程

假设 eFuse 值处于默认状态, 且固件的引导加载程序编译为支持 flash 加密, 则 flash 加密的具体过程如下:

1. 第一次开机复位时, flash 中的所有数据都是未加密的 (明文)。ROM 引导加载程序加载固件引导加载程序。
2. 固件的引导加载程序将读取 SPI_BOOT_CRYPT_CNT eFuse 值 (0b000)。因为该值为 0 (偶数位), 固件引导加载程序将配置并启用 flash 加密块。关于 flash 加密块的更多信息, 请参考 *ESP32-S2 技术参考手册 > eFuse 控制器 (eFuse) > 自动加密块 [PDF]*。
3. 固件引导加载程序首先检查 eFuse 中是否已经存在有效密钥 (例如用 `espefuse` 工具烧写的密钥), 如果存在, 则会跳过密钥生成, 并将该密钥用于 flash 加密过程。否则, 固件引导加载程序使用 RNG (随机数发生器) 模块生成一个 256 位或 512 位的密钥, 具体位数取决于生成的 *XTS-AES 密钥的大小*, 然后将其分别写入一个或两个 *BLOCK_KEYN* eFuse 中。软件也为存储密钥的块更新了 KEY_PURPOSE_N。由于上述一个或两个 BLOCK_KEYN eFuse 已设置了读保护和写保护位, 因此无法通过软件访问密钥。KEY_PURPOSE_N 字段也受写保护。flash 加密操作完全在硬件中完成, 无法通过软件访问密钥。
4. flash 加密块将加密 flash 的内容 (固件的引导加载程序、应用程序、以及标有“加密”标志的分区)。就地加密可能会耗些时间 (对于大分区最多需要一分钟)。
5. 固件引导加载程序将在 SPI_BOOT_CRYPT_CNT (0b001) 中设置第一个可用位来对已加密的 flash 内容进行标记。设置奇数位。
6. 对于 *开发模式*, 固件引导加载程序允许 UART 引导加载程序重新烧录加密后的二进制文件。同时, SPI_BOOT_CRYPT_CNT eFuse 位不受写入保护。此外, 固件引导加载程序默认置位以下 eFuse 位:

- DIS_BOOT_REMAP
- DIS_DOWNLOAD_ICACHE
- DIS_DOWNLOAD_DCACHE
- HARD_DIS_JTAG
- DIS_LEGACY_SPI_BOOT

7. 对于**发布模式**，固件引导加载程序设置所有在开发模式下设置的 eFuse 位。它还写保护 SPI_BOOT_CRYPT_CNT eFuse 位。要修改此行为，请参阅[启用 UART 引导加载程序加密/解密](#)。
8. 重新启动设备以开始执行加密镜像。固件引导加载程序调用 flash 解密块来解密 flash 内容，然后将解密的内容加载到 IRAM 中。

在开发阶段常需编写不同的明文 flash 镜像并测试 flash 的加密过程。这要求固件下载模式能够根据需求不断加载新的明文镜像。但是，在制造和生产过程中，出于安全考虑，固件下载模式不应有权限访问 flash 内容。

因此需要有两种不同的 flash 加密配置：一种用于开发，另一种用于生产。详情请参考[flash 加密设置](#) 小节。

flash 加密设置

提供以下 flash 加密模式：

- **开发模式** - 建议仅在开发过程中使用。因为在这种模式下，仍然可以将新的明文固件烧录到设备，并且引导加载程序将使用存储在硬件中的密钥对该固件进行透明加密。此操作间接允许从 flash 中读出固件明文。
- **发布模式** - 推荐用于制造和生产。因为在这种模式下，如果不知道加密密钥，则不可能将明文固件烧录到设备。

本节将详细介绍上述 flash 加密模式，并且逐步说明如何使用它们。

开发模式 在开发过程中，可使用 ESP32-S2 内部生成的密钥或外部主机生成的密钥进行 flash 加密。

使用 ESP32-S2 生成的密钥 开发模式允许用户使用固件下载模式下载多个明文镜像。

测试 flash 加密过程需完成以下步骤：

1. 确保你的 ESP32-S2 设备有[相关 eFuses](#) 中所示的 flash 加密 eFuse 的默认设置。
请参考[如何检查 ESP32-S2 flash 加密状态](#)。
2. 在[项目配置菜单](#)，执行以下操作：
 - 启动时使能 *flash* 加密。
 - 选择加密模式（默认是 **开发模式**）。
 - 选择 *UART ROM* 下载模式（默认是 **启用**）。
 - 设置生成的 *XTS-AES* 密钥大小。
 - 选择适当详细程度的引导加载程序日志。
 - 保存配置并退出。

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考[引导加载程序大小](#)。

3. 运行以下命令来构建和烧录完整的镜像。

```
idf.py flash monitor
```

备注： 这个命令不包括任何应该写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-S2 将复位。在下次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为“加密”的分区，然后复位。就地加密可能需要时间，对于大分区最多需要一分钟。之后，应用程序在运行时解密并执行命令。

下面是启用 flash 加密后 ESP32-S2 首次启动时的样例输出：

```

↪flash

```

```
FLASH_CRYPT_CNT eFuse value is 1
Flash encryption feature is enabled in DEVELOPMENT mode
```

在此阶段，如果用户需要更新或重新烧录二进制文件，请参考[重新烧录更新后的分区](#)。

使用主机生成的密钥 可在主机中预生成 flash 加密密钥，并将其烧录到 eFuse 密钥块中。这样，无需明文 flash 更新便可以在主机上预加密数据并将其烧录。该功能可在[开发模式](#)和[发布模式](#)两模式下使用。如果没有预生成的密钥，数据将以明文形式烧录，然后 ESP32-S2 对数据进行就地加密。

备注： 不建议在生产中使用该方法，除非为每个设备都单独生成一个密钥。

使用主机生成的密钥需完成以下步骤：

1. 确保你的 ESP32-S2 设备有[相关 eFuses](#)中所示的 flash 加密 eFuse 的默认设置。

请参考[如何检查ESP32-S2 flash 加密状态](#)。

2. 通过运行以下命令生成一个随机密钥：

如果生成的 [XTS-AES 密钥大小](#) 是 AES-128 (256 位密钥)：

```
espssecure.py generate_flash_encryption_key my_flash_encryption_
↳key.bin
```

如果生成的 [XTS-AES 密钥大小](#) 是 AES-256 (512 位密钥)：

```
espssecure.py generate_flash_encryption_key --keylen 512 my_flash_
↳encryption_key.bin
```

3. 在第一次加密启动前，使用以下命令将该密钥烧录到设备上，这个操作只能执行一次。

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin
↳KEYPURPOSE
```

其中 BLOCK 是 BLOCK_KEY0 和 BLOCK_KEY5 之间的空闲密钥区。而 KEYPURPOSE 是 AES_256_KEY_1、XTS_AES_256_KEY_2 或 XTS_AES_128_KEY。关于密钥用途，请参考 [ESP32-S2 技术参考手册](#)。

对于 AES-128 (256 位密钥) - XTS_AES_128_KEY：

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↳AES_128_KEY
```

对于 AES-256 (512 位密钥) - XTS_AES_256_KEY_1 和 XTS_AES_256_KEY_2。espefuse.py 支持通过虚拟密钥用途 XTS_AES_256_KEY 将这两个密钥用途和一个 512 位密钥一起烧录到两个独立的密钥块。使用此功能时，espefuse.py 将把密钥的前 256 位烧录到指定的 BLOCK，并把相应的区块密钥用途烧录到 XTS_AES_256_KEY_1。密钥的后 256 位将被烧录到 BLOCK 后的第一个空闲密钥块，并把相应的密钥用途烧录到 XTS_AES_256_KEY_2。

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↳AES_256_KEY
```

如果你想指定使用哪两个区块，则可以将密钥分成两个 256 位密钥，并分别使用 XTS_AES_256_KEY_1 和 XTS_AES_256_KEY_2 为密钥用途进行手动烧录：

```
split -b 32 my_flash_encryption_key.bin my_flash_encryption_key.bin.
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin.aa
↳XTS_AES_256_KEY_1
espefuse.py --port PORT burn_key BLOCK+1 my_flash_encryption_key.bin.ab
↳XTS_AES_256_KEY_2
```

如果未烧录密钥并在启用 flash 加密后启动设备，ESP32-S2 将生成一个软件无法访问或修改的随机密钥。

4. 在**项目配置菜单**中进行如下设置：
 - 启动时启用 *flash* 加密功能
 - 选择加密模式（默认为**开发模式**）
 - 选择适当详细程度的引导加载程序日志
 - 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考[引导加载程序大小](#)。

5. 运行以下命令来构建并烧录完整的镜像：

```
idf.py flash monitor
```

备注：这个命令不包括任何应该被写入 flash 上的分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-S2 将复位。在下次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

如果使用开发模式，那么更新和重新烧录二进制文件最简单的方法是[重新烧录更新后的分区](#)。

如果使用发布模式，那么可以在主机上预先加密二进制文件，然后将其作为密文烧录。具体请参考[手动加密文件](#)。

重新烧录更新后的分区 如果用户以明文方式更新了应用程序代码并需要重新烧录，则需要在烧录前对其进行加密。请运行以下命令一次完成应用程序的加密与烧录：

```
idf.py encrypted-app-flash monitor
```

如果所有分区都需要以加密形式更新，请运行：

```
idf.py encrypted-flash monitor
```

发布模式 在发布模式下，UART 引导加载程序无法执行 flash 加密操作，**只能**使用 OTA 方案下载新的明文镜像，该方案将在写入 flash 前加密明文镜像。

使用该模式需要执行以下步骤：

1. 确保你的 ESP32-S2 设备有**相关 eFuses** 中所示的 flash 加密 eFuse 的默认设置。
请参考[如何检查 ESP32-S2 flash 加密状态](#)。
2. 在**项目配置菜单**，执行以下操作：
 - 启动时使能 *flash* 加密
 - 选择**发布模式**（注意一旦选择了发布模式，EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT eFuse 位将被编程为在 ROM 下载模式下禁用 flash 加密硬件。）
 - 选择 **UART ROM 下载**（推荐永久性的切换到安全模式）。这是默认且推荐使用的选项。如果不需要该模式，也可以改变此配置设置永久地禁用 UART ROM 下载模式。
 - 选择适当详细程度的引导加载程序日志
 - 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考[引导加载程序大小](#)。

3. 运行以下命令来构建并烧录完整的镜像：

```
idf.py flash monitor
```

备注：这个命令不包括任何应该被写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-S2 将复位。在下次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

一旦在发布模式下启用 flash 加密，引导加载程序将写保护 SPI_BOOT_CRYPT_CNT eFuse。

请使用 [OTA 方案](#) 对字段中的明文进行后续更新。

备注：如果用户已经预先生成了 flash 加密密钥并存储了一个副本，并且 UART 下载模式没有通过 `CONFIG_SECURE_UART_ROM_DL_MODE` 永久禁用，那么可以通过使用 `espsecure.py encrypt_flash_data --aes_xts` 预加密文件，从而在本地更新 flash，然后烧录密文。请参考 [手动加密文件](#)。

最佳实践 在生产中使用 flash 加密时：

- 不要在多个设备之间重复使用同一个 flash 加密密钥，这样攻击者就无法从一台设备上复制加密数据后再将其转移到第二台设备上。
- 如果不需要 UART ROM 下载模式，则应完全禁用该模式，或者永久设置为“安全下载模式”。安全下载模式永久性地将可用的命令限制在更新 SPI 配置、更改波特率、基本的 flash 写入和使用 `get_security_info` 命令返回当前启用的安全功能摘要。默认在发布模式下第一次启动时设置为安全下载模式。要完全禁用下载模式，请选择 `CONFIG_SECURE_UART_ROM_DL_MODE` 为“永久禁用 ROM 下载模式（推荐）”或在运行时调用 `esp_efuse_disable_rom_download_mode()`。
- 启用 [安全启动](#) 作为额外的保护层，防止攻击者在启动前有选择地破坏 flash 中某部分。

外部启用 flash 加密

在上述过程中，对与 flash 加密相关的 eFuse 是通过固件引导加载程序烧写的，或者，也可以借助 `espefuse` 工具烧写 eFuse。如需了解详情，请参考 [Enable Flash Encryption Externally](#)。

可能出现的错误

一旦启用 flash 加密，SPI_BOOT_CRYPT_CNT 的 eFuse 值将设置为奇数位。这意味着所有标有加密标志的分区都会包含加密的密本。如果 ESP32-S2 错误地加载了明文数据，则会出现以下三种典型的错误情况：

1. 如果通过 **明文固件引导加载程序镜像** 重新烧录了引导加载程序分区，则 ROM 加载器将无法加载固件引导加载程序，并会显示以下错误类型：

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
```

备注: 不同应用程序中无效头文件的值不同。

备注: 如果 flash 内容被擦除或损坏, 也会出现这个错误。

2. 如果固件的引导加载程序已加密, 但通过 **明文分区表镜像** 重新烧录了分区表, 引导加载程序将无法读取分区表, 从而出现以下错误:

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee

```

ESP32-S2 flash 加密状态

1. 确保你的 ESP32-S2 设备有相关 *eFuses* 中所示的 flash 加密 eFuse 的默认设置。

要检查你的 ESP32-S2 设备上是否启用了 flash 加密，请执行以下操作之一：

- 将应用示例 [security/flash_encryption](#) 烧录到你的设备上。此应用程序会打印 SPI_BOOT_CRYPT_CNT eFuse 值，以及是否启用了 flash 加密。
- [查询设备所连接的串口名称](#)，在以下命令中将 PORT 替换为串口名称后运行：

```
espefuse.py -p PORT summary
```

在加密的 flash 中读写数据

ESP32-S2 应用程序代码可以通过调用函数 `esp_flash_encryption_enabled()` 来检查当前是否启用了 flash 加密。此外，设备可以通过调用函数 `esp_get_flash_encryption_mode()` 来识别 flash 加密模式。

一旦启用 flash 加密，使用代码访问 flash 内容时要更加小心。

flash 加密范围 当 SPI_BOOT_CRYPT_CNT eFuse 设置为奇数位的值，所有通过 MMU 的 flash 缓存访问的 flash 内容都将被透明解密。包括：

- flash 中可执行的应用程序代码 (IROM)。
- 所有存储于 flash 中的只读数据 (DROM)。
- 通过函数 `spi_flash_mmap()` 访问的任意数据。
- ROM 引导加载程序读取的固件引导加载程序镜像。

重要： MMU flash 缓存将无条件解密所有数据。flash 中未加密存储的数据将通过 flash 缓存“被透明解密”，并在软件中存储为随机垃圾数据。

读取加密的 flash 如果需要在不使用 flash 缓存 MMU 映射的情况下读取数据，推荐使用分区读取函数 `esp_partition_read()`。该函数只会解密从加密分区读取的数据。从未加密分区读取的数据不会被解密。这样，软件便能以相同的方式访问加密和未加密的 flash。

也可以使用以下 SPI flash API 函数：

- 通过函数 `esp_flash_read()` 读取不会被解密的原（加密）数据。
- 通过函数 `esp_flash_read_encrypted()` 读取和解密数据。

使用非易失性存储器 (NVS) API 存储的数据始终从 flash 加密的角度进行存储和读取解密。如有需要，则由库提供加密功能。详情可参考 [NVS 加密](#)。

写入加密的 flash 推荐使用分区写入函数 `esp_partition_write()`。此函数只会在将数据写入加密分区时加密数据，而写入未加密分区的数据不会被加密。通过这种方式，软件可以以相同的方式访问加密和非加密 flash。

也可以使用函数 `esp_flash_write_encrypted()` 预加密和写入数据。

此外，esp-idf 应用程序中存在但不支持以下 ROM 函数：

- `esp_rom_spiflash_write_encrypted` 预加密并将数据写入 flash
- `SPIWrite` 将未加密的数据写入 flash

由于数据是按块加密的，加密数据最小的写入大小为 16 字节，对齐也是 16 字节。

更新加密的 flash

OTA 更新 如果使用函数 `esp_partition_write()`，对加密分区的 OTA 更新将自动以加密形式写入。

在为已加密设备的 OTA 更新构建应用程序镜像之前，启用项目配置菜单中的 **启动时使能 flash 加密** 选项。请参考 [OTA](#) 获取更多关于 ESP-IDF OTA 更新的信息。

通过串口更新加密 flash 通过串行引导加载程序烧录加密设备，需要串行引导加载程序下载接口没有通过 eFuse 被永久禁用。

在开发模式下，推荐的方法是 [重新烧录更新后的分区](#)。

在发布模式下，如果主机上有存储在 eFuse 中的相同密钥的副本，那么就可以在主机上对文件进行预加密，然后进行烧录，具体请参考 [手动加密文件](#)。

关闭 flash 加密

如果意外启用了 flash 加密，则明文数据的 flash 会使 ESP32-S2 无法正常启动。设备将不断重启，并报 `flash read err, 1000` 或 `invalid header: 0xxxxxxx`。

对于开发模式下的 flash 加密，可以通过烧录 `SPI_BOOT_CRYPT_CNT` efuse 来关闭加密。每个芯片仅有 1 次机会，请执行以下步骤：

1. 在 **项目配置菜单** 中，禁用 **启动时使能 flash 加密** 选项，然后保存并退出。
2. 再次打开项目配置菜单，再次检查你是否已经禁用了该选项，如果这个选项仍被启用，引导加载程序在启动时将立即重新启用加密功能。
3. 在禁用 flash 加密后，通过运行 `idf.py flash` 来构建和烧录新的引导加载程序 and 应用程序。
4. 使用 `espefuse.py`（在 `components/esptool_py/esptool` 中）以关闭 `SPI_BOOT_CRYPT_CNT`，运行：

```
espefuse.py burn_efuse SPI_BOOT_CRYPT_CNT
```

重置 ESP32-S2，flash 加密应处于关闭状态，引导加载程序将正常启动。

flash 加密的要点

- 使用 XTS-AES-128 或 XTS-AES-256 加密 flash。flash 加密密钥分别为 256 位和 512 位，存储于芯片内部一个或两个 `BLOCK_KEYN` eFuse 中，并（默认）受保护，防止软件访问。
- 通过 ESP32-S2 的 flash 缓存映射功能，flash 可支持透明访问——任何映射到地址空间的 flash 区域在读取时都将被透明地解密。为便于访问，某些数据分区最好保持未加密状态，或者也可使用对已加密数据无效的 flash 友好型更新算法。由于 NVS 库无法与 flash 加密直接兼容，因此无法加密非易失性存储器的 NVS 分区。详情可参见 [NVS 加密](#)。
- 如果以后可能需要启用 flash 加密，则编程人员在编写 [使用加密 flash](#) 代码时需小心谨慎。
- 如果已启用安全启动，重新烧录加密设备的引导加载程序则需要“可重新烧录”的安全启动摘要（可参考 [flash 加密与安全启动](#)）。

启用 flash 加密将增大引导加载程序，因此可能需更新分区表偏移量。请参考 [引导加载程序大小](#)。

重要： 在首次启动加密过程中，请勿切断 ESP32-S2 的电源。如果电源被切断，flash 的内容将受到破坏，并需要重新烧录未加密数据。而这类重新烧录将不计入烧录限制次数。

flash 加密的局限性

flash 加密可以保护固件，防止未经授权的读取与修改。了解 flash 加密系统的局限之处亦十分重要：

- flash 加密功能与密钥同样稳固。因而，推荐在首次启动设备时，在设备上生成密钥（默认行为）。如果在设备外生成密钥，请确保遵循正确的后续步骤，不要在所有生产设备之间使用相同的密钥。
- 并非所有数据都是加密存储。因而在 flash 上存储数据时，请检查你使用的存储方式（库、API 等）是否支持 flash 加密。
- flash 加密无法防止攻击者获取 flash 的高层次布局信息。这是因为每对相邻的 16 字节 AES 块都使用相邻的 AES 密钥。当这些相邻的 16 字节块中包含相同内容时（如空白或填充区域），这些字节块将加密以产生匹配的加密块对。这让攻击者可在加密设备间进行高层次对比（例如，确认两设备是否可能运行相同的固件版本）。
- 单独使用 flash 加密可能无法防止攻击者修改本设备的固件。为防止设备上运行未经授权的固件，可搭配 flash 加密使用 [安全启动](#)。

flash 加密与安全启动

推荐 flash 加密与安全启动搭配使用。但是，如果已启用安全启动，则重新烧录设备时会受到其他限制：

- 如果新的应用程序已使用安全启动签名密钥正确签名，则 [OTA 更新](#) 不受限制。

flash 加密的高级功能

以下部分介绍了 flash 加密的高级功能。

加密分区标志 部分分区默认为已加密。通过在分区的标志字段中添加“encrypted”标志，可在分区表描述中将其他分区标记为需要加密。在这些标记分区中的数据会和应用程序分区一样视为加密数据。

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
secret_data, 0x40, 0x01, 0x20000, 256K, encrypted
```

请参考 [分区表](#) 获取更多关于分区表描述的具体信息。

关于分区加密，还需了解以下信息：

- 默认分区表都不包含任何加密数据分区。
- 启用 flash 加密后，“app”分区一般都视为加密分区，因此无需标记。
- 如果未启用 flash 加密，则“encrypted”标记无效。
- 将可选 phy 分区标记为“encrypted”，可以防止物理访问读取或修改 phy_init 数据。
- nvs 分区无法标记为“encrypted”因为 NVS 库与 flash 加密不直接兼容。

启用 UART 引导加载程序加密/解密 在第一次启动时，flash 加密过程默认会烧录以下 eFuse：

- DIS_DOWNLOAD_MANUAL_ENCRYPT 在 UART 引导加载程序启动模式下运行时，禁止 flash 加密操作。
- DIS_DOWNLOAD_ICACHE 和 DIS_DOWNLOAD_DCACHE 在 UART 引导加载程序模式下运行时禁止整个 MMU flash 缓存。
- HARD_DIS_JTAG 禁用 JTAG。
- DIS_DIRECT_BOOT（即之前的 DIS_LEGACY_SPI_BOOT）禁用传统的 SPI 启动模式。

为了能启用这些功能，可在首次启动前仅烧录部分 eFuse，并用未设置值 0 写保护其他部分。例如：

```
espfuse.py --port PORT burn_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
espfuse.py --port PORT write_protect_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
```

备注： 请注意在写保护前设置所有适当的位！

一个位可以控制三个 eFuse 的写保护，这意味着写保护一个 eFuse 位将写保护所有未设置的 eFuse 位。

由于 esptool.py 目前不支持读取加密 flash，所以对这些 eFuse 进行写保护从而使其保持未设置目前来说并不是很有用。

JTAG 调试 默认情况下，当启用 flash 加密（开发或发布模式）时，将通过 eFuse 禁用 JTAG 调试。引导加载程序在首次启动时执行此操作，同时启用 flash 加密。

请参考 [JTAG 与 flash 加密和安全引导](#) 了解更多关于使用 JTAG 调试与 flash 加密的信息。

手动加密文件 手动加密或解密文件需要在 eFuse 中预烧录 flash 加密密钥（请参阅 [使用主机生成的密钥](#)）并在主机上保留一份副本。如果 flash 加密配置在开发模式下，那么则不需要保留密钥的副本或遵循这些步骤，可以使用更简单的 [重新烧录更新后的分区](#) 步骤。

密钥文件应该是单个原始二进制文件（例如：key.bin）。

例如，以下是将文件 build/my-app.bin 进行加密、烧录到偏移量 0x10000 的步骤。运行 espsecure.py，如下所示：

```
espsecure.py encrypt_flash_data --aes_xts --keyfile /path/to/key.bin --address_
↪0x10000 --output my-app-ciphertext.bin build/my-app.bin
```

然后可以使用 esptool.py 将文件 my-app-ciphertext.bin 写入偏移量 0x10000。关于 esptool.py 推荐的所有命令行选项，请查看 [idf.py build](#) 成功时打印的输出。

备注：

如果 ESP32-S2 在启动时无法识别烧录进去的密文文件，请检查密钥是否匹配以及命令行参数是否完全匹配，包括偏移量是否正确。

espsecure.py decrypt_flash_data 命令可以使用同样的选项（和不同的输入/输出文件）来解密 flash 密文或之前加密的文件。

片外 RAM

启用 flash 加密后，任何通过缓存从片外 SPI RAM 读取和写入的数据也将被加密/解密。这个实现的方式以及使用的密钥与 flash 加密相同。如果启用 flash 加密，则片外 SPI RAM 的加密也会被启用，无法单独控制此功能。

技术细节

以下章节将提供 flash 加密操作的相关信息。

- 有关在 Python 中实现的完整 flash 加密算法，可参见 espsecure.py 源代码中的函数 `_flash_encryption_operation()`。

flash 加密算法

- ESP32-S2 使用 XTS-AES 块密码模式进行 flash 加密，密钥大小为 256 位或 512 位。
- XTS-AES 是一种专门为光盘加密设计的块密码模式，它解决了其它潜在模式如 AES-CTR 在此使用情景下的不足。有关 XTS-AES 算法的详细描述，请参考 [IEEE Std 1619-2007](#)。
- flash 加密的密钥存储于一个或两个 BLOCK_KEYN eFuse 中，默认受保护防止进一步写入或软件读取。
- 有关在 Python 中实现的完整 flash 加密算法，可参见 `espsecure.py` 源代码中的函数 `_flash_encryption_operation()`。

6.2.2 Secure Boot V2

重要： This document is about Secure Boot V2, supported on ESP32-S2

Secure Boot V2 uses RSA-PSS based app and bootloader (二级引导程序) verification. This document can also be used as a reference for signing apps using the RSA-PSS scheme without signing the bootloader.

Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32-S2, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

A RSA based Secure Boot verification scheme (Secure Boot V2) is implemented on ESP32-S2 .

The Secure Boot process on the ESP32-S2 involves the following steps:

1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader's RSA-PSS signature is verified. If the verification is successful, the second stage bootloader is executed.
2. When the second stage bootloader loads a particular application image, the application's RSA-PSS signature is verified. If the verification is successful, the application image is executed.

Advantages

- The RSA-PSS public key is stored on the device. The corresponding RSA-PSS private key is kept at a secret place and is never accessed by the device.
- Up to three public keys can be generated and stored in the chip during manufacturing.
- ESP32-S2 provides the facility to permanently revoke individual public keys. This can be configured conservatively or aggressively.
- Conservatively - The old key is revoked after the bootloader and application have successfully migrated to a new key. Aggressively - The key is revoked as soon as verification with this key fails.
- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section [How To Enable Secure Boot V2](#).

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*. Each image has a separately generated signature block which is appended to the end of the image.

Up to 3 signature blocks can be appended to the bootloader or application image in ESP32-S2.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key. For more details about the format, refer to [Signature Block Format](#). A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

Signature Block Format

The signature block starts on a 4 KB aligned boundary and has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes ([Secure Padding](#)).

The content of each signature block is shown in the following table:

表 2: Content of a RSA Signature Block

| Offset | Size (bytes) | Description |
|--------|--------------|--|
| 0 | 1 | Magic byte |
| 1 | 1 | Version number byte (currently 0x02), 0x01 is for Secure Boot V1. |
| 2 | 2 | Padding bytes, Reserved. Should be zero. |
| 4 | 32 | SHA-256 hash of only the image content, not including the signature block. |
| 36 | 384 | RSA Public Modulus used for signature verification. (value 'n' in RFC8017). |
| 420 | 4 | RSA Public Exponent used for signature verification (value 'e' in RFC8017). |
| 424 | 384 | Pre-calculated R, derived from 'n'. |
| 808 | 4 | Pre-calculated M', derived from 'n' |
| 812 | 384 | RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MGF1 function, salt length 32 bytes, default trailer field (0xBC). |
| 1196 | 4 | CRC32 of the preceding 1196 bytes. |
| 1200 | 16 | Zero padding to length 1216 bytes. |

备注: R and M' are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

Secure Padding

In Secure Boot V2 scheme, the application image is padded to the flash MMU page size boundary to ensure that only verified contents are mapped in the internal address space. This is known as secure padding. Signature of the image is calculated after padding and then signature block (4KB) gets appended to the image.

- Default flash MMU page size is 64KB
- Secure padding is applied through the option `--secure-pad-v2` in the `elf2image` conversion using `esptool.py`

Following table explains the Secure Boot V2 signed image with secure padding and signature block appended:

表 3: Contents of a signed application

| Offset | Size (KB) | Description |
|--------|-----------|--|
| 0 | 580 | Unsigned application size (as an example) |
| 580 | 60 | Secure padding (aligned to next 64KB boundary) |
| 640 | 4 | Signature block |

备注: Please note that the application image always starts on the next flash MMU page size boundary (default 64KB) and hence the space left over after the signature block shown above can be utilized to store any other data partitions (e.g., `nvs`).

Verifying a Signature Block

A signature block is "valid" if the first byte is `0xe7` and a valid CRC32 is stored at offset 1196. Otherwise it is invalid.

Verifying an Image

An image is "verified" if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader's signature block with the digest(s) saved in the eFuses. If public key's hash does not match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests do not match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [引导加载程序大小](#).

In the case when `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` is disabled, the bootloader is sector padded (4KB) using the `--pad-to-size` option in `elf2image` command of `esptool`.

eFuse Usage

- `SECURE_BOOT_EN` - Enables Secure Boot protection on boot.
- `KEY_PURPOSE_X` - Set the purpose of the key block on ESP32-S2 by programming `SECURE_BOOT_DIGESTX` ($X = 0, 1, 2$) into `KEY_PURPOSE_X` ($X = 0, 1, 2, 3, 4, 5$). Example: If `KEY_PURPOSE_2` is set to `SECURE_BOOT_DIGEST1`, then `BLOCK_KEY2` will have the Secure Boot V2 public key digest. The write-protection bit must be set (this field does not have a read-protection bit).
- `BLOCK_KEYX` - The block contains the data corresponding to its purpose programmed in `KEY_PURPOSE_X`. Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M' values (represented as 776 bytes –offsets 36 to 812 - as per the [Signature Block Format](#)) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.
- `KEY_REVOKEY` - The revocation bits corresponding to each of the 3 key block. Ex. Setting `KEY_REVOKE2` revokes the key block whose key purpose is `SECURE_BOOT_DIGEST2`.
- `SECURE_BOOT_AGGRESSIVE_REVOKE` - Enables aggressive revocation of keys. The key is revoked as soon as verification with this key fails.

To ensure no trusted keys can be added later by an attacker, each unused key digest slot should be revoked (`KEY_REVOKEY`). It will be checked during app startup in `esp_secure_boot_init_checks()` and fixed unless `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS` is enabled.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

How To Enable Secure Boot V2

1. Open the [项目配置菜单](#), in "Security features" set "Enable hardware Secure Boot in bootloader" to enable Secure Boot.
2. The "Secure Boot V2" option will be selected and the "App Signing Scheme" would be set to RSA by default.
3. Specify the path to Secure Boot signing key, relative to the project directory.
4. Select the desired UART ROM download mode in "UART ROM download mode". By default, it is set to "Permanently switch to Secure mode" which is generally recommended. For production devices, the most secure option is to set it to "Permanently disabled".
5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.
6. The first time you run `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

重要: A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

重要: For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

7. Run `idf.py bootloader` to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you are ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 6.

备注: `idf.py flash` does not flash the bootloader if Secure Boot is enabled.

10. Reset the ESP32-S2 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32-S2 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

备注: Secure boot will not be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

备注: If the ESP32-S2 is reset or powered down during the first boot, it will start the process again on the next boot.

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

Restrictions After Secure Boot Is Enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If *flash 加密* is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.
- Please note that enabling Secure Boot or flash encryption disables the USB-OTG USB stack in the ROM, disallowing updates via the serial emulation or Device Firmware Update (DFU) on that port.

Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`.

The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2. Additionally `--scheme rsa3072` can be passed as well to generate RSA 3072 private key

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA-PSS key generation utilities.

For example, to generate a signing key using the `openssl` command line:

For RSA 3072

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

Remote Signing of Images

Signing Using `espsecure.py` For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` Secure Boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` and build the firmware. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data BINARY_FILE --version 2 --keyfile PRIVATE_SIGNING_KEY
```

The above command appends the image signature to the existing binary. You can use the `--output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_  
↪BINARY_FILE BINARY_FILE
```

Signing Using Pre-calculated Signatures If you have valid pre-calculated signatures generated for an image and their corresponding public keys, you can use these signatures to generate a signature sector and append it to the image. Note that the pre-calculated signature should be calculated over all bytes in the image including the secure-padding bytes.

In such cases, the firmware image should be built by disabling the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`. This image will be secure-padded and to generate a signed binary use the following command:

```
espsecure.py sign_data --version 2 --pub-key PUBLIC_SIGNING_KEY --signature_  
↪SIGNATURE_FILE --output SIGNED_BINARY_FILE BINARY_FILE
```

The above command verifies the signature, generates a signature block (refer to *Signature Block Format*) and appends it to the binary file.

Signing Using an External Hardware Security Module (HSM) For security reasons, you might also use an external Hardware Security Module (HSM) to store your private signing key, which cannot be accessed directly but has an interface to generate the signature of a binary file and its corresponding public key.

In such cases, disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` and build the firmware. This secure-padded image then can be used to supply the external HSM for generating a signature. Refer to [Signing using an External HSM](#) to generate a signed image.

备注: For all the above three remote signing workflows, the signed binary is written to the filename provided to the `--output` argument and the option `--append_signatures` allows us to append multiple signatures (up to 3) the image.

Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with *flash 加密* to prevent local readout of the flash contents.

Key Management

- Between 1 and 3 RSA-3072 public key pairs (Keys #0, #1, #2) should be computed independently and stored separately.
- The `KEY_DIGEST` eFuses should be write protected after being programmed.
- The unused `KEY_DIGEST` slots must have their corresponding `KEY_REVOKE` eFuse burned to permanently disable them. This must happen before the device leaves the factory.
- The eFuses can either be written by the software bootloader during during first boot after enabling "Secure Boot V2" from menuconfig or can be done using `espefuse.py` which communicates with the serial bootloader program in ROM.

- The KEY_DIGESTs should be numbered sequentially beginning at key digest #0. (i.e., if key digest #1 is used, key digest #0 should be used. If key digest #2 is used, key digest #0 & #1 must be used.)
- The software bootloader (non OTA upgradeable) is signed using at least one, possibly all three, private keys and flashed in the factory.
- Apps should only be signed with a single private key (the others being stored securely elsewhere), however they may be signed with multiple private keys if some are being revoked (see Key Revocation, below).

Multiple Keys

- The bootloader should be signed with all the private key(s) that are needed for the life of the device, before it is flashed.
- The build system can sign with at most one private key, user has to run manual commands to append more signatures if necessary.
- **You can use the append functionality of `espsecure.py`, this command would also printed at the end of the Secure B**
`espsecure.py sign_data -k secure_boot_signing_key2.pem -v 2 --append_signatures -o signed_bootloader.bin build/bootloader/bootloader.bin`
- While signing with multiple private keys, it is recommended that the private keys be signed independently, if possible on different servers and stored separately.
- **You can check the signatures attached to a binary using -** `espsecure.py signature_info_v2 datafile.bin`

Key Revocation

- Keys are processed in a linear order. (key #0, key #1, key #2).
- Applications should be signed with only one key at a time, to minimize the exposure of unused private keys.
- The bootloader can be signed with multiple keys from the factory.

备注: Note that enabling the config `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS` only makes sure that the **app** does not revoke the unused digest slots. But if you plan to enable secure boot during the first boot up, the bootloader will intentionally revoke the unused digest slots while enabling secure boot, even if the above config is enabled because keeping the unused key slots un-revoked would be a security hazard. In case for any development workflow if you need to avoid this revocation, you should enable secure boot externally (*Enable Secure Boot V2 Externally*) rather than enabling it during the boot up, so that the bootloader would not need to enable secure boot and thus you could avoid its revocation strategy.

Conservative Approach: Assuming a trusted private key (N-1) has been compromised, to update to new key pair (N).

1. Server sends an OTA update with an application signed with the new private key (#N).
 2. The new OTA update is written to an unused OTA app partition.
 3. The new application's signature block is validated. The public keys are checked against the digests programmed in the eFuse & the application is verified using the verified public key.
 4. The active partition is set to the new OTA application's partition.
 5. Device resets, loads the bootloader (verified with key #N-1 and #N) which then boots new app (verified with key #N).
 6. The new app verifies bootloader and application with key #N (as a final check) and then runs code to revoke key #N-1 (sets KEY_REVOKE eFuse bit).
 7. The API `esp_ota_revoke_secure_boot_public_key()` can be used to revoke the key #N-1.
- A similar approach can also be used to physically re-flash with a new key. For physical re-flashing, the bootloader content can also be changed at the same time.

Aggressive Approach: ROM code has an additional feature of revoking a public key digest if the signature verification fails.

To enable this feature, you need to burn `SECURE_BOOT_AGGRESSIVE_REVOKE` efuse or enable `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`

Key revocation is not applicable unless secure boot is successfully enabled. Also, a key is not revoked in case of invalid signature block or invalid image digest, it is only revoked in case the signature verification fails, i.e., revoke key only if failure in step 3 of *Verifying an Image*

Once a key is revoked, it can never be used for verifying a signature of an image. This feature provides strong resistance against physical attacks on the device. However, this could also brick the device permanently if all the keys are revoked because of signature verification failure.

Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

Manual Commands Secure boot is integrated into the esp-idf build system, so `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
→signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

Secure Boot & Flash Encryption

If Secure Boot is used without *flash 加密*, it is possible to launch "time-of-check to time-of-use" attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app is not verified during the update process, it is assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it is essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app is not verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

Although multiple trusted keys are supported when using hardware Secure Boot, only the first public key in the signature block is used to verify updates if signature checking without Secure Boot is configured. If multiple trusted public keys are required, it is necessary to enable the full Secure Boot feature instead.

备注: In general, it is recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

How To Enable Signed App Verification

1. Open [项目配置菜单](#) -> Security features
2. Ensure *App Signing Scheme* is *RSA*
3. Enable `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
4. By default, "Sign binaries during build" will be enabled on selecting "Require signed app images" option, which will sign binary files as a part of build process. The file named in "Secure boot private signing key" will be used to sign the image.
5. If you disable "Sign binaries during build" option then all app binaries must be manually signed by following instructions in [Remote Signing of Images](#).

警告: It is very important that all apps flashed have been signed, either during the build or after the build.

Advanced Features

JTAG Debugging By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See [JTAG 与 flash 加密和安全引导](#) for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

6.3 流程

6.3.1 Host-Based Security Workflows

Introduction

It is recommended to have an uninterrupted power supply while enabling security features on ESP32 SoCs. Power failures during the secure manufacturing process could cause issues that are hard to debug and, in some cases, may cause permanent boot-up failures.

This guide highlights an approach where security features are enabled with the assistance of an external host machine. Security workflows are broken down into various stages and key material is generated on the host machine; thus, allowing greater recovery chances in case of power or other failures. It also offers better timings for secure manufacturing, e.g., in the case of encryption of firmware on the host machine vs. on the device.

Goals

1. Simplify the traditional workflow with stepwise instructions.
2. Design a more flexible workflow as compared to the traditional firmware-based workflow.
3. Improve reliability by dividing the workflow into small operations.
4. Eliminate dependency on [二级引导程序](#) (firmware bootloader).

Pre-requisite

- `esptool`: Please make sure the `esptool` has been installed. It can be installed by running:

```
pip install esptool
```

Scope

- [Enable Flash Encryption and Secure Boot V2 Externally](#)
- [Enable Flash Encryption Externally](#)
- [Enable Secure Boot V2 Externally](#)
- [Enable NVS Encryption Externally](#)

Security Workflows

Enable Flash Encryption and Secure Boot V2 Externally

重要: It is recommended to enable both Flash Encryption and Secure Boot V2 for a production use case.

When enabling the Flash Encryption and Secure Boot V2 together we need to enable them in the following order:

1. Enable the Flash Encryption feature by following the steps listed in [Enable Flash Encryption Externally](#).
2. Enable the Secure Boot V2 feature by following the steps listed in [Enable Secure Boot V2 Externally](#).

The reason for this order is as follows:

备注: To enable the Secure Boot (SB) V2, it is necessary to keep the SB V2 key readable. To protect the key's readability, the write protection for RD_DIS (ESP_EFUSE_WR_DIS_RD_DIS) is applied. However, this action poses a challenge when attempting to enable Flash Encryption, as the Flash Encryption (FE) key needs to remain unreadable. This conflict arises because the RD_DIS is already write-protected, making it impossible to read protect the FE key.

Enable Flash Encryption Externally In this case, all the eFuses related to Flash Encryption are written with help of the `espefuse` tool. More details about flash encryption can be found in the [Flash Encryption Guide](#)

1. Check device status

Ensure that you have an ESP32-S2 device with default Flash Encryption eFuse settings as shown in [相关 eFuses](#).

See how to check [ESP32-S2 flash 加密状态](#).

At this point, the Flash Encryption must not be already enabled on the chip. Additionally, the flash on the chip needs to be erased, which can be done by running:

```
esptool.py --port PORT erase_flash
```

2. Generate a Flash Encryption key

A random Flash Encryption key can be generated by running:

If *Size of generated AES-XTS key* is AES-128 (256-bit key):

```
espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
```

else if *Size of generated AES-XTS key* is AES-256 (512-bit key):

```
espsecure.py generate_flash_encryption_key --keylen 512 my_flash_
↪ encryption_key.bin
```

3. Burn the Flash Encryption key into eFuse

This action **cannot be reverted**. It can be done by running:

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin_
↳KEYPURPOSE
```

where BLOCK is a free keyblock between BLOCK_KEY0 and BLOCK_KEY5. And KEYPURPOSE is either XTS_AES_256_KEY_1, XTS_AES_256_KEY_2, XTS_AES_128_KEY. See [ESP32-S2 Technical Reference Manual](#) for a description of the key purposes.

For AES-128 (256-bit key) - XTS_AES_128_KEY:

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↳AES_128_KEY
```

For AES-256 (512-bit key) - XTS_AES_256_KEY_1 and XTS_AES_256_KEY_2. espefuse.py supports burning both these two key purposes together with a 512-bit key to two separate key blocks via the virtual key purpose XTS_AES_256_KEY. When this is used espefuse.py will burn the first 256 bits of the key to the specified BLOCK and burn the corresponding block key purpose to XTS_AES_256_KEY_1. The last 256 bits of the key will be burned to the first free key block after BLOCK and the corresponding block key purpose to XTS_AES_256_KEY_2

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↳AES_256_KEY
```

If you wish to specify exactly which two blocks are used then it is possible to divide the key into two 256-bit keys, and manually burn each half with XTS_AES_256_KEY_1 and XTS_AES_256_KEY_2 as key purposes:

```
split -b 32 my_flash_encryption_key.bin my_flash_encryption_key.bin
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin.aa XTS_
↳AES_256_KEY_1
espefuse.py --port PORT burn_key BLOCK+1 my_flash_encryption_key.bin.ab_
↳XTS_AES_256_KEY_2
```

4. Burn the SPI_BOOT_CRYPT_CNT eFuse

If you only want to enable Flash Encryption in **Development** mode and want to keep the ability to disable it in the future, Update the SPI_BOOT_CRYPT_CNT value in the below command from 7 to 0x1 (not recommended for production).

```
espefuse.py --port PORT --chip esp32s2 burn_efuse SPI_BOOT_CRYPT_CNT 7
```

5. Burn Flash Encryption-related security eFuses as listed below

A) Burn security eFuses

重要: For production use cases, it is highly recommended to burn all the eFuses listed below.

- DIS_BOOT_REMAP: Disable capability to Remap ROM to RAM address space
- DIS_DOWNLOAD_ICACHE: Disable UART cache
- DIS_DOWNLOAD_DCACHE: Disable UART cache
- HARD_DIS_JTAG: Hard disable JTAG peripheral
- DIS_LEGACY_SPI_BOOT: Disable legacy SPI boot mode
- DIS_DOWNLOAD_MANUAL_ENCRYPT: Disable UART bootloader encryption access

The respective eFuses can be burned by running:

```
espefuse.py burn_efuse --port PORT EFUSE_NAME 0x1
```

备注: Please update the EFUSE_NAME with the eFuse that you need to burn. Multiple eFuses can be burned at the same time by appending them to the above command (e.g., EFUSE_NAME VAL EFUSE_NAME2 VAL2). More documentation about *espefuse.py* can be found [here](#).

B) Write protect security eFuses

After burning the respective eFuses we need to write_protect the security configurations. It can be done by burning following eFuse

```
espefuse.py --port PORT write_protect_efuse DIS_ICACHE
```

备注: The write protection of above eFuse also write protects multiple other eFuses, Please refer to the ESP32-S2 eFuse table for more details.

6. Configure the project

The bootloader and the application binaries for the project must be built with Flash Encryption Release mode with default configurations.

Flash encryption Release mode can be set in the menuconfig as follows:

- *Enable Flash Encryption on boot*
- *Select Release mode* (Note that once Release mode is selected, the EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT eFuse bit will be burned to disable Flash Encryption hardware in ROM Download Mode)
- *Select UART ROM download mode (Permanently switch to Secure mode (recommended))*. This is the default option and is recommended. It is also possible to change this configuration setting to permanently disable UART ROM download mode, if this mode is not needed
- *Select the appropriate bootloader log verbosity*
- Save the configuration and exit

7. Build, Encrypt and Flash the binaries

The binaries can be encrypted on the host machine by running:

```
espssecure.py encrypt_flash_data --aes_xts --keyfile my_flash_encryption_
→key.bin --address 0x1000 --output bootloader-enc.bin build/bootloader/
→bootloader.bin

espssecure.py encrypt_flash_data --aes_xts --keyfile my_flash_encryption_
→key.bin --address 0x8000 --output partition-table-enc.bin build/
→partition_table/partition-table.bin

espssecure.py encrypt_flash_data --aes_xts --keyfile my_flash_encryption_
→key.bin --address 0x10000 --output my-app-enc.bin build/my-app.bin
```

In the above command the offsets are used for a sample firmware, the actual offset for your firmware can be obtained by checking the partition table entry or by running *idf.py partition-table*. Please note that not all the binaries need to be encrypted, the encryption applies only to those generated from the partitions which are marked as `encrypted` in the partition table definition file. Other binaries are flashed unencrypted, i.e., as a plain output of the build process.

The above files can then be flashed to their respective offset using *esptool.py*. To see all of the command line options recommended for *esptool.py*, see the output printed when *idf.py build* succeeds.

When the application contains the following partition: `otadata`, `nvs_encryption_keys` they need to be encrypted as well. Please refer to [加密分区](#) for more details about encrypted partitions.

备注: If the flashed ciphertext file is not recognized by the ESP32-S2 when it boots, check that the keys match and that the command line arguments match exactly, including the correct offset. It is important to provide the correct offset as the ciphertext changes when the offset changes.

The command `espsecure.py decrypt_flash_data` can be used with the same options (and different input/output files), to decrypt ciphertext flash contents or a previously encrypted file.

8. Secure the ROM Download mode

警告: Please perform the following step at the very end. After this eFuse is burned, the `espefuse` tool can no longer be used to burn additional eFuses.

Disable UART ROM DL mode:

- `UART_DOWNLOAD_DIS` : Disable the UART ROM Download mode

The eFuse can be burned by running:

```
espefuse.py --port PORT burn_efuse UART_DOWNLOAD_DIS
```

Enable Security Download mode:

- `ENABLE_SECURITY_DOWNLOAD`: Enable Secure ROM download mode

The eFuse can be burned by running:

```
espefuse.py --port PORT burn_efuse ENABLE_SECURITY_DOWNLOAD
```

重要:

9. Delete Flash Encryption key on host

Once the Flash Encryption has been enabled for the device, the key **must be deleted immediately**. This ensures that the host cannot produce encrypted binaries for the same device going forward. This step is important to reduce the vulnerability of the flash encryption key.

Flash Encryption Guidelines

- It is recommended to generate a unique Flash Encryption key for each device for production use-cases.
- It is recommended to ensure that the RNG used by host machine to generate the Flash Encryption key has good entropy.
- See [flash 加密的局限性](#) for more details.

Enable Secure Boot V2 Externally In this workflow, we shall use `espsecure` tool to generate signing keys and use the `espefuse` tool to burn the relevant eFuses. The details about the Secure Boot V2 process can be found at [Secure Boot V2 Guide](#)

1. Generate Secure Boot V2 Signing Private Key

The Secure Boot V2 signing key for the RSA3072 scheme can be generated by running:

```
espsecure.py generate_signing_key --version 2 --scheme rsa3072 secure_
↪boot_signing_key.pem
```

A total of 3 keys can be used for Secure Boot V2 at once. These should be computed independently and stored separately. The same command with different key file names can be used to generate multiple Secure Boot V2 signing keys. It is recommended to use multiple keys in order to reduce dependency on a single key.

2. Generate Public Key Digest

The public key digest for the private key generated in the previous step can be generated by running:

```
espsecure.py digest_sbv2_public_key --keyfile secure_boot_signing_key.pem
↳--output digest.bin
```

In case of multiple digests, each digest should be kept in a separate file.

3. Burn the key digest in eFuse

The public key digest can be burned in the eFuse by running:

```
espefuse.py --port PORT --chip esp32s2 burn_key BLOCK digest.bin SECURE_
↳BOOT_DIGEST0
```

where BLOCK is a free keyblock between BLOCK_KEY0 and BLOCK_KEY5.

In case of multiple digests, the other digests can be burned sequentially by changing the key purpose to SECURE_BOOT_DIGEST1 and SECURE_BOOT_DIGEST2 respectively.

4. Enable Secure Boot V2

Secure Boot V2 eFuse can be enabled by running:

```
espefuse.py --port PORT --chip esp32s2 burn_efuse SECURE_BOOT_EN
```

5. Burn relevant eFuses

A) Burn security eFuses

重要: For production use cases, it is highly recommended to burn all the eFuses listed below.

- DIS_BOOT_REMAP: Disable capability to Remap ROM to RAM address space
- HARD_DIS_JTAG: Hard disable JTAG peripheral
- SOFT_DIS_JTAG: Disable software access to JTAG peripheral
- DIS_LEGACY_SPI_BOOT: Disable legacy SPI boot mode
- SECURE_BOOT_AGGRESSIVE_REVOKE: Aggressive revocation of key digests, see [Aggressive Approach](#): for more details.

The respective eFuses can be burned by running:

```
espefuse.py burn_efuse --port PORT EFUSE_NAME 0x1
```

备注: Please update the EFUSE_NAME with the eFuse that you need to burn. Multiple eFuses can be burned at the same time by appending them to the above command (e.g., EFUSE_NAME VAL EFUSE_NAME2 VAL2). More documentation about *espefuse.py* can be found [here](#)

B) Secure Boot V2-related eFuses

- i) Disable the read-protection option:

The Secure Boot digest burned in the eFuse must be kept readable otherwise the Secure Boot operation would result in a failure. To prevent the accidental enabling of read protection for this key block, the following eFuse needs to be burned:

重要: After burning above-mentioned eFuse, the read protection cannot be enabled for any key. E.g., if Flash Encryption which requires read protection for its key is not enabled at this point, then it cannot be enabled afterwards. Please ensure that no eFuse keys are going to need read protection after completing this step.

```
espefuse.py -p $ESPPORT write_protect_efuse RD_DIS
```

ii) Revoke key digests:

The unused digest slots need to be revoked when we are burning the Secure Boot key. The respective slots can be revoked by running

```
espefuse.py --port PORT --chip esp32s2 burn_efuse EFUSE_REVOKE_BIT
```

The `EFUSE_REVOKE_BIT` in the above command can be `SECURE_BOOT_KEY_REVOKE0` or `SECURE_BOOT_KEY_REVOKE1` or `SECURE_BOOT_KEY_REVOKE2`. Please note that only the unused key digests must be revoked. Once revoked, the respective digest cannot be used again.

6. Configure the project

By default, the ROM bootloader would only verify the [二级引导程序](#) (firmware bootloader). The firmware bootloader would verify the app partition only when the `CONFIG_SECURE_BOOT` option is enabled (and `CONFIG_SECURE_BOOT_VERSION` is set to `SECURE_BOOT_V2_ENABLED`) while building the bootloader.

a) Open the [项目配置菜单](#), in "Security features" set "Enable hardware Secure Boot in bootloader" to enable Secure Boot.

The "Secure Boot V2" option will be selected and the "App Signing Scheme" will be set to RSA by default.

b) Disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` for the project in the [项目配置菜单](#). This shall make sure that all the generated binaries are secure padded and unsigned. This step is done to avoid generating signed binaries as we are going to manually sign the binaries using `espsecure` tool.

7. Build, Sign and Flash the binaries

After the above configurations, the bootloader and application binaries can be built with `idf.py build` command.

The Secure Boot V2 workflow only verifies the bootloader and application binaries, hence only those binaries need to be signed. The other binaries (e.g., `partition-table.bin`) can be flashed as they are generated in the build stage.

The `bootloader.bin` and `app.bin` binaries can be signed by running:

```
espsecure.py sign_data --version 2 --keyfile secure_boot_signing_key.pem -
↳-output bootloader-signed.bin build/bootloader/bootloader.bin

espsecure.py sign_data --version 2 --keyfile secure_boot_signing_key.pem -
↳-output my-app-signed.bin build/my-app.bin
```

If multiple keys Secure Boot keys are to be used then the same signed binary can be appended with a signature block signed with the new key as follows:

```

espsecure.py sign_data --keyfile secure_boot_signing_key2.pem --version 2.
↳--append_signatures -o bootloader-signed2.bin bootloader-signed.bin

espsecure.py sign_data --keyfile secure_boot_signing_key2.pem --version 2.
↳--append_signatures -o my-app-signed2.bin my-app-signed.bin

```

The same process can be repeated for the third key. Note that the names of the input and output files must not be the same.

The signatures attached to a binary can be checked by running:

```

espsecure.py signature_info_v2 bootloader-signed.bin

```

The above files along with other binaries (e.g., partition table) can then be flashed to their respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, see the output printed when `idf.py build` succeeds. The flash offset for your firmware can be obtained by checking the partition table entry or by running `idf.py partition-table`.

8. Secure the ROM Download mode:

警告: Please perform the following step at the very end. After this eFuse is burned, the `espefuse` tool can no longer be used to burn additional eFuses.

Disable UART ROM DL mode:

- `UART_DOWNLOAD_DIS` : Disable the UART ROM Download mode

The eFuse can be burned by running:

```

espefuse.py --port PORT burn_efuse UART_DOWNLOAD_DIS

```

Enable Security Download mode:

- `ENABLE_SECURITY_DOWNLOAD`: Enable Secure ROM download mode

The eFuse can be burned by running:

```

espefuse.py --port PORT burn_efuse ENABLE_SECURITY_DOWNLOAD

```

Secure Boot V2 Guidelines

- It is recommended to store the Secure Boot key in a highly secure place. A physical or a cloud HSM may be used for secure storage of the Secure Boot private key. Please take a look at [Remote Signing of Images](#) for more details.
- It is recommended to use all the available digest slots to reduce dependency on a single private key.

Enable NVS Encryption Externally The details about NVS Encryption and related schemes can be found at [NVS Encryption](#).

Enable NVS Encryption based on HMAC

1. Generate the HMAC key and NVS Encryption key

In the HMAC based NVS scheme, there are two keys:

- HMAC key - this is a 256 bit HMAC key that shall be stored in the eFuse

- NVS Encryption key - This is the NVS Encryption key that is used to encrypt the NVS partition. This key is derived at run-time using the HMAC key.

The above keys can be generated with the `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` script with help of the following command:

```
python3 nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_
↪keygen --kp_hmac_keyfile hmac_key.bin --keyfile nvs_encr_key.bin
```

This shall generate the respective keys in the `keys` folder.

2. Burn the HMAC key in the eFuse

The NVS key can be burned in the eFuse of ESP32-S2 with help of following command:

```
espefuse.py --port PORT burn_key BLOCK hmac_key.bin HMAC_UP
```

where `BLOCK` is a free keyblock between `BLOCK_KEY0` and `BLOCK_KEY5`.

3. Generate the encrypted NVS partition

We shall generate the actual encrypted NVS partition on host. More details about generating the encryption NVS partition can be found at [生成 NVS 加密分区](#). For this purpose, the contents of the NVS file shall be available in a CSV file. Please check out [CSV 文件格式](#) for more details.

The encrypted NVS partition can be generated with following command:

```
python3 nvs_partition_gen.py encrypt sample_singlepage_blob.csv nvs_encr_
↪partition.bin 0x3000 --inputkey keys/nvs_encr_key.bin
```

Some command arguments are explained below:

- CSV file name - In this case `sample_singlepage_blob.csv` is the CSV file which contains the NVS data, Replace this with the file you wish to choose.
- NVS partition offset - This is the offset at which that NVS partition shall be stored in the flash of ESP32-S2. The offset of your `nvs-partition` can be found by executing `idf.py partition-table` in the project directory. Please update the sample value of `0x3000` in the above-provided command to the correct offset.

4. Configure the project

- Enable *NVS Encryption* by enabling `CONFIG_NVS_ENCRYPTION`.
- Enable the HMAC based NVS Encryption by setting `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` to `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`
- Set the HMAC efuse key id at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` to the one in which the eFuse key was burned in Step 2.

5. Flash NVS partition

The NVS partition (`nvs_encr_partition.bin`) generated in Step 3 can then be flashed to its respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, check the output printed when `idf.py build` succeeds. If Flash encryption is enabled for the chip then please encrypt the partition first before flashing. You may refer the flashing related steps of [Flash Encryption workflow](#).

Enable NVS Encryption based on Flash Encryption In this case we generate NVS Encryption keys on a host. This key is then flashed on the chip and protected with help of the [Flash Encryption](#) feature.

1. Generate the NVS Encryption key

For generation of respective keys, we shall use [NVS partition generator utility](#). We shall generate the encryption key on host and this key shall be stored on the flash of ESP32-S2 in encrypted state.

The key can be generated with the `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` script with help of the following command:

```
python3 nvs_partition_gen.py generate-key --keyfile nvs_encr_key.bin
```

This shall generate the respective key in the `keys` folder.

2. Generate the encrypted NVS partition

We shall generate the actual encrypted NVS partition on host. More details about generating the encryption NVS partition can be found at [生成 NVS 加密分区](#). For this, the contents of the NVS file shall be available in a CSV file. Please refer [CSV 文件格式](#) for more details.

The encrypted NVS partition can be generated with following command:

```
python3 nvs_partition_gen.py encrypt sample_singlepage_blob.csv nvs_encr_
↪partition.bin 0x3000 --inputkey keys/nvs_encr_key.bin
```

Some command arguments are explained below:

- CSV file name - In this case *sample_singlepage_blob.csv* is the CSV file which contains the NVS data, Replace this with the file you wish to choose.
- NVS partition offset - This is the offset at which that NVS partition shall be stored in the flash of ESP32-S2. The offset of your nvs-partition can be found by executing *idf.py partition-table* in the project directory. Please update the sample value of *0x3000* in the above-provided command to the correct offset.

3. Configure the project

- Enable *NVS Encryption* by enabling [CONFIG_NVS_ENCRYPTION](#).
- Set NVS to use Flash Encryption based scheme by setting [CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME](#) to [CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC](#).

4. Flash NVS partition and NVS Encryption keys

The NVS partition (`nvs_encr_partition.bin`) and NVS Encryption key (`nvs_encr_key.bin`) can then be flashed to their respective offset using `esptool.py`. To see all of the command line options recommended for `esptool.py`, check the output printed when `idf.py build` succeeds. If Flash encryption is enabled for the chip then please encrypt the partition first before flashing. You may refer the flashing related steps of [Flash Encryption workflow](#).

Chapter 7

库与框架

7.1 云框架

ESP32-S2 可以使用构建在 ESP-IDF 之上的代理来支持多个云框架。以下是各种支持的云框架代理和示例：

7.1.1 ESP RainMaker

ESP RainMaker 是用于加速 AIoT 开发的完整解决方案。更多信息见 [ESP RainMaker GitHub 仓库](#)。

7.1.2 AWS IoT

<https://github.com/espressif/esp-aws-iot> 是 ESP32-S2 的开源仓库，基于亚马逊 Web 服务的 `aws-iot-device-sdk-embedded-C`。

7.1.3 Azure IoT

<https://github.com/espressif/esp-azure> 是 ESP32-S2 的开源存储库，基于微软 Azure 的 `azure-iot-sdk-c` SDK。

7.1.4 Google IoT Core

<https://github.com/espressif/esp-google-iot> 是 ESP32-S2 的开源存储库，基于谷歌的 `iot-device-sdk-embedded-c` SDK。

7.1.5 阿里云 IoT

<https://github.com/espressif/esp-aliyun> 是 ESP32-S2 的开源存储库，基于阿里云的 `iotkit-embedded` SDK。

7.1.6 Joylink IoT

<https://github.com/espressif/esp-joylink> 是 ESP32-S2 的开源存储库，基于 Joylink 的 `joylink_dev_sdk` SDK。

7.1.7 腾讯 IoT

<https://github.com/espressif/esp-welink> 是 ESP32-S2 的开源存储库，基于腾讯的 [welink SDK](#)。

7.1.8 腾讯云 IoT

<https://github.com/espressif/esp-qcloud> 是 ESP32-S2 的开源存储库，基于腾讯云的 [qcloud-iot-sdk-embedded-c SDK](#)。

7.1.9 百度 IoT

<https://github.com/espressif/esp-baidu-iot> 是 ESP32-S2 的开源存储库，基于百度的 [iot-sdk-c SDK](#)。

7.2 其他库和开发框架

本文展示了一系列乐鑫官方发布的库和框架。

7.2.1 ESP-ADF

ESP-ADF 是一个全方位的音频应用程序框架，该框架支持：

- CODEC 的 HAL
- 音乐播放器和录音机
- 音频处理
- 蓝牙扬声器
- 互联网收音机
- 免提设备
- 语音识别

该框架对应的 GitHub 仓库为 [ESP-ADF](#)。

7.2.2 ESP-CSI

ESP-CSI 是一个具有实验性的框架，它利用 Wi-Fi 信道状态信息来检测人体存在。

该框架对应的 GitHub 仓库为 [ESP-CSI](#)。

7.2.3 ESP-DSP

ESP-DSP 提供了针对数字信号处理应用优化的算法，该库支持：

- 矩阵乘法
- 点积
- 快速傅立叶变换 (FFT)
- 无限脉冲响应 (IIR)
- 有限脉冲响应 (FIR)
- 向量数学运算

该库对应的 GitHub 仓库为 [ESP-DSP 库](#)。

7.2.4 ESP-WIFI-MESH

ESP-WIFI-MESH 基于 ESP-WIFI-MESH 协议搭建，该框架支持：

- 快速网络配置
- 稳定升级
- 高效调试
- LAN 控制
- 多种应用示例

该框架对应的 GitHub 仓库为 [ESP-MDF](#)。

7.2.5 ESP-WHO

ESP-WHO 框架利用 ESP32 及摄像头实现人脸检测及识别。

该框架对应的 GitHub 仓库为 [ESP-WHO](#)。

7.2.6 ESP RainMaker

[ESP RainMaker](#) 提供了一个快速 AIoT 开发的完整解决方案。使用 ESP RainMaker，用户可以创建多种 AIoT 设备，包括固件 AIoT 以及集成了语音助手、手机应用程序和云后端的 AIoT 等。

该解决方案对应的 GitHub 仓库为 [GitHub 上的 ESP RainMaker](#)。

7.2.7 ESP-IoT-Solution

[ESP-IoT-Solution](#) 涵盖了开发 IoT 系统时常用的设备驱动程序及代码框架。在 ESP-IoT-Solution 中，设备驱动程序和代码框架以独立组件存在，可以轻松地集成到 ESP-IDF 项目中。

ESP-IoT-Solution 支持：

- 传感器、显示器、音频、GUI、输入、执行器等设备驱动程序
- 低功耗、安全、存储等框架和文档
- 从实际应用角度指导乐鑫开源解决方案

该解决方案对应的 GitHub 仓库为 [GitHub 上的 ESP-IoT-Solution](#)。

7.2.8 ESP-Protocols

[ESP-Protocols](#) 库包含 ESP-IDF 的协议组件集。ESP-Protocols 中的代码以独立组件存在，可以轻松地集成到 ESP-IDF 项目中。此外，每个组件都可以在 [ESP-IDF 组件注册表](#) 中找到。

ESP-Protocols 组件：

- [esp_modem](#) 使用 AT 命令或 PPP 协议与 GSM/LTE 调制解调器连接，详情请参阅 [esp_modem 文档](#)。
- [mdns](#) (mDNS) 是一种组播 UDP 服务，用于提供本地网络服务与主机发现，详情请参阅 [mdns 文档](#)。
- [esp_websocket_client](#) 是 ESP-IDF 的托管组件，可在 ESP32 上实现 WebSocket 协议客户端，详情请参阅 [esp_websocket_client 文档](#)。有关 WebSocket 协议客户端，请参阅 [WebSocket_protocol_client](#)。
- [asio](#) 是一个跨平台的 C++ 库，请参阅 <https://think-async.com/Asio/>。该库基于现代 C++ 提供一致的异步模型，请参阅 [asio 文档](#)。

7.2.9 ESP-BSP

[ESP-BSP](#) 库包含了各种乐鑫和第三方开发板的板级支持包 (BSP)，可以帮助快速上手特定的开发板。它们通常包含管脚定义和辅助函数，这些函数可用于初始化特定开发板的外设。此外，BSP 还提供了一些驱动程序，可用于开发版上的外部芯片，如传感器、显示屏、音频编解码器等。

7.2.10 ESP-IDF-CXX

ESP-IDF-CXX 包含了 ESP-IDF 的部分 C++ 封装, 重点在实现易用性、安全性、自动资源管理, 以及将错误检查转移到编译过程中, 以避免运行时失败。它还提供了 ESP 定时器、I2C、SPI、GPIO 等外设或 ESP-IDF 其他功能的 C++ 类。ESP-IDF-CXX 作为组件可以从 [组件注册表](#) 中获取。详情请参阅 [README.md](#)。

Chapter 8

贡献指南

欢迎为 ESP-IDF 项目贡献内容！

8.1 如何贡献

欢迎为 ESP-IDF 贡献内容，如修复问题、新增功能、添加文档等。你可通过 [Github Pull Requests](#) 提交你的贡献内容。

8.2 准备工作

在提交 Pull Request 前，请检查以下要点：

- 贡献内容是否完全是自己的成果，或已获得与 Apache License 2.0 兼容的开源许可？如果不是，我们不能接受该内容。了解更多信息，请见 [版权标头指南](#)。
- 要提交的代码是否符合 ESP-IDF [Espressif IoT Development Framework Style Guide](#)？
- 是否安装了 ESP-IDF [pre-commit 钩子](#)？
- 代码文档是否符合 [编写文档](#) 的要求？
- 代码是否注释充分，便于读者理解其结构？
- 是否为贡献的代码提供文档或示例？要写出好的示例，请参考 [examples readme](#)。
- 注释或文档是否以英语书写并表达清晰，不存在拼写或语法错误？
- 欢迎贡献新的代码示例。了解更多信息，请参考 [创建示例项目](#)。
- 如果需提交多个内容，是否将所有内容按照改动的类型（每个 pull request 对应一个主要改动）进行分组？是否有命名类似“fixed typo”的提交 [压缩到了此前的提交中](#)？
- 如不能确定上述任意内容，请提交 Pull Request，并向我们寻求反馈。

8.3 Pull Request 提交流程

创建 Pull Request 后，PR 评论区中可能有一些关于该请求的讨论。

Pull Request 准备好待合并时，首先会合并到我们的内部 git 系统中进行内部自动化测试。

测试流程通过后，你贡献的内容将合并到公共 GitHub 库。

8.4 法律规范

在提交贡献内容前，你需签署 [贡献者协议](#)。该协议将在 Pull Request 过程中自动推送。

8.5 相关文档

8.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

Indentation Use 4 spaces for each indentation level. Do not use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space Place one empty line between functions. Do not begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
}
// INCORRECT, do not place empty line here
// place empty line here
void function2()
{
    // INCORRECT, do not use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

The maximum line length is 120 characters as long as it does not seriously affect the readability.

Horizontal Space Always add single space after conditional and loop keywords:

```
if (condition) {    // correct
    // ...
}

switch (n) {        // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);        // also okay

int y_cur = -y;                                          // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);                // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF,  I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK,  I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g., `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{
}

// NOT like this:
void function(int arg) {
}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```

if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}

```

Comments Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Do not use single comments to disable some functionality:

```

void init_something()
{
    setup_dma();
    // load_resources();           // WHY is this thing commented, asks_
    ↪the reader?
    start_timer();
}

```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```

void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated_
    ↪yet.
    // load_resources();
    start_timer();
}

```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Do not use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.
- Do not add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g., this comment adds clutter to the code without adding any useful information:

```

void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}

```

Line Endings Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option* <[github-line-endings](#)>.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```

git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs_
↪dos2unix && git commit -a --amend --no-edit --allow-empty' master

```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it is possible to run `dos2unix FILENAME` and then run `git commit --amend`

Formatting Your Code ESP-IDF uses Astyle to format source code. The configuration is stored in `tools/ci/astyle-rules.yml` file.

Initially, all components are excluded from formatting checks. You can enable formatting checks for the component by removing it from `components_not_formatted_temporary` list. Then run:

```
pre-commit run --files <path_to_files> astyle_py
```

Alternatively, you can run `astyle_py` manually. You can install it with `pip install astyle_py==VERSION`. Make sure you have the same version installed as the one specified in `.pre-commit-config.yml` file. With `astyle_py` installed, run:

```
astyle_py --rules=$IDF_PATH/tools/ci/astyle-rules.yml <path-to-file>
```

Type Definitions Should be snake_case, ending with `_t` suffix:

```
typedef int signed_32_bit_t;
```

Enum Enums should be defined through the `typedef` and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

Assertions The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or `0` will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it is not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

备注: When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK` 宏 instead of an `assert()`.

It is possible to configure ESP-IDF projects with assertions disabled (see `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`). Therefore, functions called in an `assert()` statement should not have side-effects.

It is also necessary to use particular techniques to avoid "variable set but not used" warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

Header File Guards

All public facing header files should have preprocessor guards. A pragma is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

Include Statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`.)
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

Naming

- **Class and struct** names shall be written in `CamelCase` with a capital letter as beginning. Member variables and methods shall be in `snake_case`. An exception from `CamelCase` is if the readability is severely decreased, e.g., in `GPIOOutput`, then an underscore `_` is allowed to make it more readable: `GPIO_Output`.
- **Namespaces** shall be in lower `snake_case`.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

Spacing

- Do not indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

Simple Example

```

// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only_
↪initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{

```

(下页继续)

```
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Do not put anything in the optional parentheses after `endforeach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the [cmake-lint](#) project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see [EditorConfig Website](#).

Third Party Component Code Styles

ESP-IDF integrates a number of third party components where these components may have differing code styles.

FreeRTOS The code style adopted by FreeRTOS is described in the [FreeRTOS style guide](#). Formatting of FreeRTOS source code is automated using [Uncrustify](#), thus a copy of the FreeRTOS code style's Uncrustify configuration (`uncrustify.cfg`) is stored within ESP-IDF FreeRTOS component.

If a FreeRTOS source file is modified, the updated file can be formatted again by following the steps below:

1. Ensure that Uncrustify (v0.69.0) is installed on your system
2. Run the following command on the update FreeRTOS source file (where `source.c` is the path to the source file that requires formatting).

```
uncrustify -c $IDF_PATH/components/freertos/FreeRTOS-Kernel/uncrustify.cfg --
↪replace source.c --no-backup
```

Documenting Code

Please see the guide here: [编写文档](#).

Structure

To be written.

Language Features

To be written.

8.5.2 为 ESP-IDF 安装 pre-commit 钩子

环境依赖

我们向 IDF 开发人员推荐 Python 3.8.* 及以上版本。

如果你已安装了不兼容的 Python 版本，应在安装 pre-commit 工具前进行更新。

安装 pre-commit 工具

运行 `pip install pre-commit`。

安装 pre-commit 钩子

1. 切换到 IDF 项目路径。
2. 运行 `pre-commit install --allow-missing-config -t pre-commit -t commit-msg` 命令。使用这种方式安装钩子后，即使在没有 `.pre-commit-config.yaml` 的分支中也能成功提交。
3. 在运行 `git commit` 命令时，pre-commit 钩子会自动运行。

卸载 pre-commit 钩子

运行 `pre-commit uninstall`。

更多

更多详细使用方法，请参考 [pre-commit](#) 文档。

Windows 用户常见问题

```
/usr/bin/env: python: Permission denied.
```

如果使用 Git Bash，请运行 `which python` 检查 Python 的可执行位置。

如果该可执行文件位于 `~/AppData/Local/Microsoft/WindowsApps/`，这其实是一个到 Windows 应用商店的链接，而不是真正的可执行文件。

请手动安装 Python，并在 PATH 环境变量中进行更新。

你的 USERPROFILE 中包含非 ASCII 字符

如果 pre-commit 的缓存路径包含非 ASCII 字符，用 pre-commit 为特定钩子初始化环境时可能会失败。解决方案是，将 `PRE_COMMIT_HOME` 设置为一个仅包含标准字符的路径，然后再运行 pre-commit。

- **CMD:** `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- **PowerShell:** `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- **git bash:** `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

8.5.3 编写文档

本文档简要总结了 `espressif/esp-idf` 库中的文档风格，并介绍了如何添加新文档。

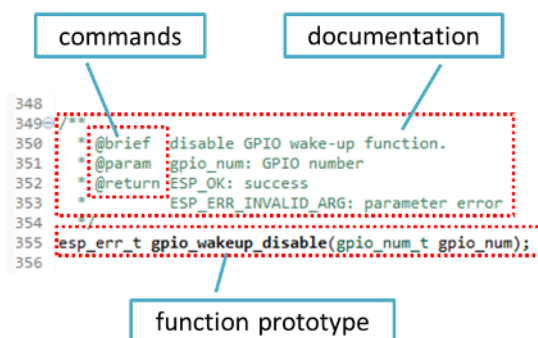

概述

为本仓库代码编写文档时，请遵循 [Doxygen style](#)，即在标准注释块中插入特殊命令，如 `@param`：

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen 能够解析代码，提取此类特殊命令及其后续文本，并基于提取的信息构建文档。

下图为一个包含函数文档的典型注释块：

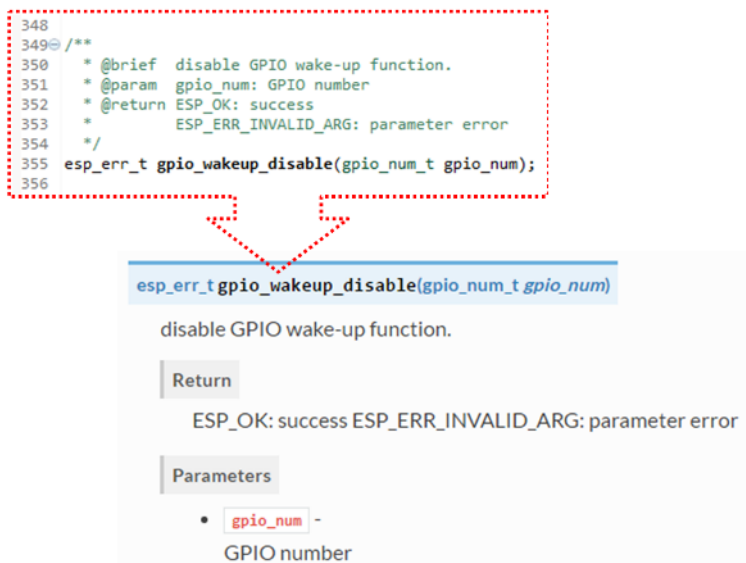

Doxygen 支持多种格式，并支持文档内部的多个详情级别，具有很强的灵活性。要了解更多可用功能，请参考 [Doxygen Manual](#)。

为什么要用 Doxygen?

我们的最终目的是保证代码文档的一致性。因此，我们可以使用 [Sphinx](#) 和 [Breathe](#) 等工具，在代码变更时自动更新 API 文档。

借助这些工具，以上代码的渲染效果如下：

试一试!

为 ESP-IDF 库添加代码时，请遵循以下标准：

1. 为代码的所有构件提供文档说明，包括函数、结构体、类型定义、枚举、宏等。对其目的、功能和局限性进行充分介绍，提供符合读者预期的良好体验。
2. 函数文档应说明该函数的作用。如果函数接受输入参数并返回值，也需要对输入参数和返回值进行解释。
3. 请勿在参数前添加数据类型或除空格外的任何字符。所有空格和换行符都会压缩为一个空格。如需换行，请换行两次。

```

41 @
42 /**
43  * @brief Set log level for given tag
44  *
45  * If logging for given component has already been enabled, changes previous setting.
46  *
47  * @param tag Tag of the log entries to enable. Must be a non-NULL zero terminated string.
48  *           Value "" resets log level for all tags to the given value.
49  *
50  * @param level Selects log level to enable.
51  *             Only logs at this and lower levels will be shown.
52  */
53 void esp_log_level_set(const char *tag, esp_log_level_t level);

```

do not add data type

white spaces are compressed

a line break that will render

this line break will not render

```

void esp_log_level_set(const char *tag, esp_log_level_t level)

```

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Parameters

- **tag** - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "" resets log level for all tags to the given value.
- **level** - Selects log level to enable. Only logs at this and lower levels will be shown.

4. 在函数输入为空或不返回值时，无需插入 @param 或 @return 命令。

```

26 @
27 /**
28  * @brief Initialize BT controller
29  *
30  * This function should be called only once,
31  * before any other BT functions are called.
32  */
33 void bt_controller_init(void);

```

this line break will not render

```

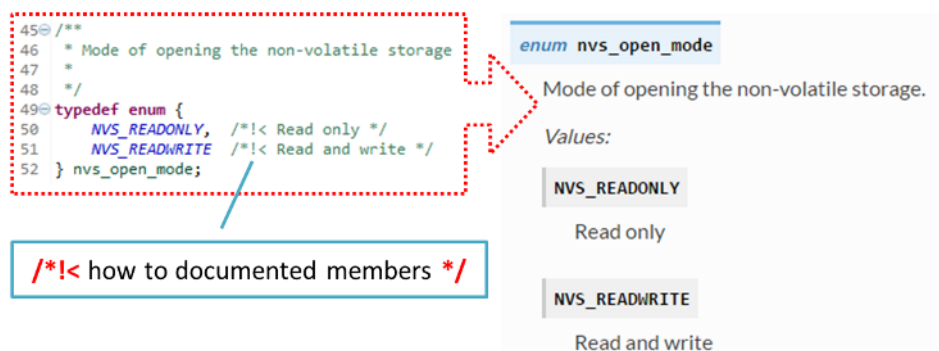

void bt_controller_init(void)

```

Initialize BT controller.

This function should be called only once, before any other BT functions are called.

5. 为 define struct 或 enum 的成员撰写文档时，需遵循以下格式在每个成员后添加注释。

6. 要渲染出整齐的列表，可在命令后换行（如以下代码示例中的 @return 命令）。

```

*
* @return
* - ESP_OK if erase operation was successful
* - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
* - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
* - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
* - other error codes from the underlying storage driver

```

7. 头文件或一组文件库的功能概述需在同一路径下单独的 README.rst 文档中进行描述。如该路径下还有其他 API 的头文件，则应将此头文件对应的 README 文件命名为 apiname-readme.rst。

进阶用法

也可以使用以下进阶技巧，产出更加优质使用的文档。

在编写代码时，请遵循以下标准：

1. 使用 @code{c} 和 @endcode 命令添加代码示例片段，阐述实现过程。

```

*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*

```

该代码片段应添加在其所说明的函数的注释区中。

2. 要高亮重点信息，可使用 @attention 或 @note 命令。

```

*
* @attention
* 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
* 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to
* ↪disconnect.
*

```

以上示例也展示了有序列表的用法。

3. 要描述一组具有相似功能的函数，可使用 /**@{*/ 和 /**@}*/ 标记命令。

```

/**@{*/
/**
* @brief common description of similar functions
*
* /

```

(下页继续)

(续上页)

```
void first_similar_function (void);
void second_similar_function (void);
/**@}*/
```

如需更多应用示例，请参考 [nvs_flash/include/nvs.h](#)。

- 如需进一步跳过重复定义或枚举等代码，可使用 `/** @cond */` 和 `/** @endcond */` 命令附上该代码。相关应用实例，请参考 [esp_driver_gpio/include/driver/gpio.h](#)。
- 使用 `markdown` 添加标题、链接和表格等，增强文档的可读性。

```
*
* [ESP32-S2 Technical Reference Manual] (https://www.espressif.com/sites/
* ↪default/files/documentation/esp32-s2_technical_reference_manual_en.pdf)
*
```

备注：如果没有将代码片段、说明或链接等内容包含在一个文档对象相关联的注释块中，则文档中不会出现相关内容。

- 为一个或多个完整代码示例提供说明。将说明写入单独的 `README.md` 文件中并放在 `examples` 路径下对应文件夹。

文档格式标准化

撰写代码文档文本时，请遵循以下标准，提供格式良好的 Markdown (.md) 或 reST (.rst) 文档。

- 确保将一个段落写在同一行。通过换行加强可读性仅适用于代码，请勿在文本中以下图形式换行。为方便阅读，建议在段落之间空一行。

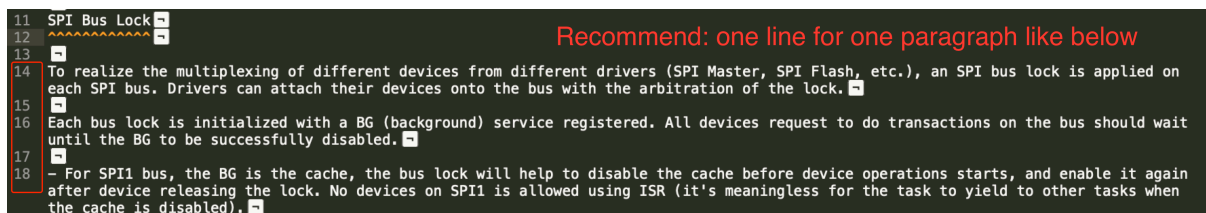

图 1: 一个段落写在同一行 (点击放大)

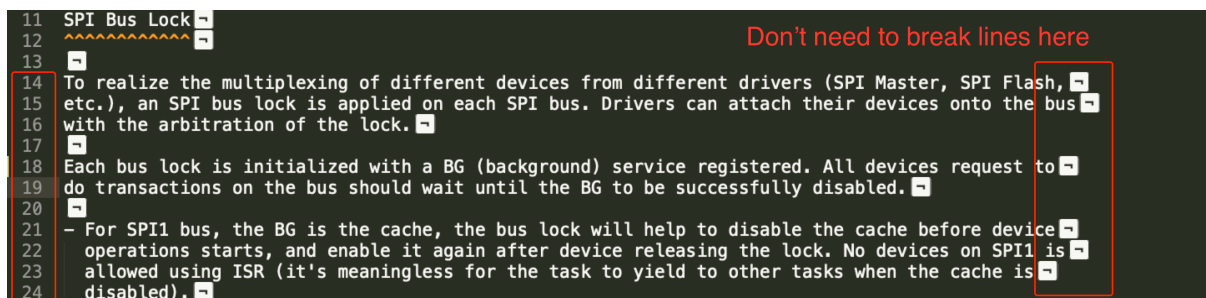

图 2: 同一段落中请勿换行 (点击放大)

- 中英文文档行号需对齐，如下所示。这样做的好处是为作者和译者节省时间。非双语作者更新文档时，仅需更新对应中文或英文文档的同一行。对译者来说，如果英文文档出现更新，可快速定位对应中文文档需更新的位置。另外，通过比较英文和中文文档的总行数，可以快速检查文档的中文版本是否落后于英文版本。

图 3: 对齐中英文文档行号 (点击放大)

构建文档

文档由基于 [Sphinx](#) 的 Python 包 `esp-docs` 进行构建。

安装命令:

```
pip install esp-docs
```

安装成功后, 使用如下命令在 `docs` 文件夹中构建文档:

```
build-docs build
```

或使用以下命令指定目标芯片和语言:

```
build-docs -t esp32 -l en build
```

如需深入了解 `esp-docs` 的功能, 请参考 [esp-docs](#)。

小结

出色的代码可以实现令人赞叹的功能, 精心编写的文档则让开发者们如虎添翼。

期待你的贡献!

相关文章

- [API 文档模板](#)

8.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目, 其他人可以将示例复制至本地, 并根据实际情况进行一定修改。请注意, 示例项目主要是为了展示 ESP-IDF 的功能。

示例项目结构

- `main` 目录需要包含一个名为 `(something)_example_main.c` 的源文件, 里面包含示例项目的主要功能。

- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 main 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。
- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 components 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 components 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)，并根据项目实际情况进行修改。
- 示例项目需要包含一个 example_test.py 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 [Pull Request](#) 的相关内容。

一般准则

示例代码需要遵循《[乐鑫物联网开发框架风格指南](#)》。

检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)。
- 示例项目中的函数和变量的命令要遵循[命名规范](#)中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 example 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或常量。
- 配置项可见 KConfig.projbuild 文件，该文件中包含一个名为“Example Configuration”的菜单。具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 in the public domain CC0）和免责声明。或者，源代码也可以应用 Apache License 2.0 许可条款。请查看现有示例项目的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 Apache License 2.0 协议。

8.5.5 API 文档模板

备注：说明

1. 使用此文件 ([docs/zh_CN/api-reference/template.rst](#)) 作为 API 参考文档模板。
2. API 参考文档需和 API 的头文件名称保持一致。
3. 使用 `..include::` 从 API 文件夹中添加相应的说明文件。
 - README.rst
 - example.rst
 - ...
4. 可选择在此文件中直接提供描述。
5. 完成后，删除所有的说明信息（类似本说明）和多余的头部信息。

概述

备注：撰写说明

1. 提供概述，简要说明 API 的用途和使用方法。
2. 必要时提供代码片段，以说明特定函数的功能。
3. 用此 [文档](#) 中介绍的方式区分不同的章节标题：
 - # 用于设置各部分，标题上下同时标记
 - * 用于设置章标题，标题上下同时标记
 - = 用于设置节标题
 - - 用于设置小节标题
 - ^ 用于设置小小节标题
 - " 用于设置段落标题

应用示例

备注：撰写说明

1. 准备一个或多个实际示例，展示此 API 的功能。
2. 每个示例应遵循 esp-idf/examples/ 文件夹中项目的模式。
3. 将示例放在此文件夹中，添加 README.md 文件。
4. 在 README.md 中对展示的功能进行概述。
5. 良好的概述让读者能够充分理解示例，而无需参考源代码。
6. 按照示例的复杂程度，将代码描述分解成几个部分，并对每部分的功能进行概述。
7. 必要时，添加流程图和应用程序的输出截图。
8. 最后为本章节的每个示例添加对应链接，示例文件夹应位于 esp-idf/examples/ 中。

API 参考

备注：撰写说明

1. ESP-IDF 仓库通过用 [Doxygen](#) 从头文件中检索代码标记的方式自动更新 API 参考文档。
2. 通过调用 Sphinx 扩展工具 esp_extensions/run_doxygen.py，对 [docs/doxygen/Doxyfile](#) 中 INPUT 语句列出的所有头文件进行更新。
3. INPUT 语句的每一行（以 ## 开头的注释除外）都包含一个到头文件 *.h 的路径，用于生成相应的 *.inc 文件：

```
##
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

4. 头文件被展开时，sdkconfig.h 中默认定义的宏以及在 SOC 特定 include/soc/*_caps.h 头文件中定义的宏都会被展开。这样，头文件就可以根据 IDF_TARGET 的值来添加或排除相关内容。
5. *.inc 文件中包含每次文档构建时自动生成的 API 成员格式化参考。所有 *.inc 文件都位于 Sphinx 的 _build 路径下。如需查看生成指令，以 esp_wifi.h 为例，运行 python gen-dxd.py esp32/include/esp_wifi.h。
6. 用以下语句在文档中显示 *.inc 文件的内容：

```
.. include-build-file:: inc/esp_wifi.inc
```

参考示例：[docs/en/api-reference/network/esp_wifi.rst](#)

7. 你也可以不用 *.inc 文件，而使用自己的方式描述 API。参考示例：[docs/en/api-reference/storage/fatfs.rst](#)。

以下为常见的 .. doxygen...:: 指令：

- 函数 - .. doxygenfunction:: name_of_function
- 联合体 - .. doxygenunion:: name_of_union
- 结构体 - .. doxygenstruct:: name_of_structure 和 :members:

- 宏 -... doxygendefine:: name_of_define
- 类定义 -... doxygentypedef:: name_of_type
- 枚举 -... doxygenenum:: name_of_enumeration

如需更多信息，请参考 [Breathe 文档](#)。

使用 `link custom role` 指令添加指向头文件的链接，如下所示：

```
* :component_file:`path_to/header_file.h`
```

8. 在任何情况下，要生成 API 参考文档，应该更新文件 `docs/doxygen/Doxyfile` 并将其中的路径更新为正在添加文档的 *.h 头文件的路径。
9. 更改提交并构建文档后，可以查看文档的渲染效果。如有需要，为相应的头文件 [纠正注释](#)。

8.5.6 贡献者协议

个人贡献者非独占性许可协议（包含传统专利许可选项）

感谢您以贡献者身份为托管在 GitHub 上的乐鑫项目（以下简称“乐鑫”）做出贡献。

本贡献者协议（以下简称“协议”）旨在将贡献者授予乐鑫的权利明确写入文档。要有效利用这份文档，请遵循 [贡献指南](#)。

1. 定义 **贡献者**是指向乐鑫提交贡献的个人版权所有人，本文中称“贡献者”或“您”。如果您以雇员身份提交贡献，且该贡献属于您的部分工作内容，您的雇主须已批准此协议，或作为实体签署此协议。

贡献是指您向乐鑫提交的、您拥有版权的原创作品（软件/文档），包括对既有工作进行的任何修改或补充。如果您没有该原创作品的完整版权，请在 GitHub 上向乐鑫提交评论。

版权是指在原创作品的整个存续期内（包括许可的延期），保护您所拥有或控制的原创作品的所有权利，包括版权、精神权、邻接权等，视具体情况而定。

材料是指乐鑫向第三方提供的软件或文档。当本协议涉及多个软件项目时，材料指您的贡献内容所提交到的软件或文档。在您提交贡献后，此贡献可能被包含在材料中。

提交是指向乐鑫发送的任何形式的实体、电子、或书面交流信息，包括但不限于由乐鑫管理或代表乐鑫管理的电子邮件列表、源代码控制系统和问题跟踪系统，但不包括您以显著方式标记或以其他书面形式指定为“非贡献”的交流内容。

提交日期是指您向乐鑫提交贡献的日期。

文档是指贡献中任何非软件的部分。

2. 版权许可 2.1 向乐鑫授予版权许可

根据本协议的条款和条件，对包含您贡献的版权，您在此授予乐鑫全球范围内免版权授权费、非独占、永久且不可撤销的版权许可，允许乐鑫无限次转让非独占性版权许可或向第三方转许可，以任何方式使用您的贡献，使用方式包括但不限于：

- 公开发布您的贡献
- 修改您的贡献内容，制作基于或包含贡献内容的衍生作品，以及将贡献内容并入其他软件代码中
- 复制原始或修改后的贡献内容
- 分发、公开、展示和公开演示您的原始贡献或修改后贡献

2.2 精神权在其受到承认的范围内不受影响，不受适用法免除。尽管如此，您仍可在贡献的源代码文件中添加自己的姓名。在使用您的贡献时，乐鑫尊重这一归属。

3. 专利许可 3.1 向乐鑫授予专利许可

根据本协议的条款和条件，您在此授予乐鑫全球范围内免专利授权费、非独占、永久且不可撤销（3.2 节所述情况除外）的专利许可，允许乐鑫无限次转让非独占性专利许可或向第三方转许可，从而制作、委托制作、使用、出售、许诺出售、进口、以其他方式转让贡献以及并入材料的贡献（或此结合产物的一部分）。本许可适用于您现在或此后拥有或控制的所有专利，如未经您的许可而制作、委托制作、使用、出售、许诺出售、进口、或以其他方式转让贡献本身或并入材料中的贡献，都将构成侵权。

3.2 撤回专利许可

如果乐鑫对您的贡献提出任何不出于防卫目的的侵权索赔，您保留撤回专利许可（如 3.1 条所述）的权利。如果某实体已向乐鑫或乐鑫的任何被许可人提出、维持或威胁进行专利侵权诉讼，或已自愿参与专利侵权诉讼，则乐鑫在此情况下向该实体提出的索赔应被视为出于“防卫目的”。

4. 免责声明 贡献以“原样”提供。具体地，所有明示和默示的保证条款，包括但不限于任何默示适销性保证、特定用途适用性和非侵权性保证条款，均由您对乐鑫和乐鑫对您双方互相明确表示免责。在任何此类保证不能被免责的情况下，此类保证的适用期限为法律允许的最短期限。

5. 间接损害豁免 在所适用的法律允许的最大范围内，对于本协议引起的任何利润损失、预期存款损失、数据丢失以及间接性、特殊性、偶然性、后果性和惩戒性损害，无论索赔所依据的法律或衡平法理论（合同、侵权或其他）如何，乐鑫或您在任何情况下均不承担责任。

6. 近似免责声明和损害豁免 如果第 4 节和第 5 节中提及的免责声明和间接损害豁免声明在当地适用法律下不具有法律效力，则复审法院应采用最接近于绝对免除所有与该贡献相关的民事责任的当地法律。

7. 协议期限 7.1 本协议在您接受条款和条件后生效。

7.2 如果本协议终止，第 4、5、6、7、8 条在本协议终止后仍然完全有效。为避免疑义，在本协议终止日前获得自由开源许可的贡献，在本协议终止后仍然完全有效。

8. 其他条款 8.1 本协议以及由本协议引起、或以任何方式与本协议有关的所有争议、索赔、法律行动、诉讼或其他程序，均应受中华人民共和国法律管辖，但不包括其国际私法条款。

8.2 本协议规定了您与乐鑫之间、关于您向乐鑫提供的贡献内容的完整协议，并且此协议的优先级高于其他所有正式或非正式协议。

8.3 如果本协议的任何条款被认定为无效或不可执行条款，该条款将尽量由最接近原始条款含义且可执行的条款取代。即使在本协议的基本目的或有限的补救措施失效的情况下，本协议中规定的条款和条件应仍在法律允许的最大范围内适用。

8.4 如果您了解到任何事实或情况可能影响本协议在某方面的准确性，您都同意将此事实或情况告知乐鑫。

8.5.7 版权标头指南

ESP-IDF 基于 [the Apache License 2.0](#)，并包含一些不同许可证下的第三方版权代码。要了解更多信息，请参考 [Copyrights and Licenses](#)。

本页面介绍了如何在源代码中正确标注版权标头。ESP-IDF 使用 [Software Package Data Exchange \(SPDX\)](#) 格式，简短易读，能够方便自动化工具处理及进行版权检查。

如何检查版权标头

请确保你已安装了包含版权标头检查器的 [pre-commit hooks](#)。若该检查器无法检测到格式正确的 [SPDX](#) 标头，则会提供标头建议。

检查器的建议不正确怎么办

再好的自动化检查工具都无法取代人工检查。因此，开发者有责任修改检查器提供的标头，使其符合源代码的法律规范和许可证要求。某些许可证可能并不兼容，请参考后文示例。

检查器由 `tools/ci/check_copyright_config.yaml` 进行配置。请检查该配置文件提供的选项，并根据实际情况进行更新，以正确匹配标头。

常见版权标头示例

最简单的情况是，你的代码不基于任何此前已获得许可的代码，例如你完全独立完成的代码。此类代码可以使用如下版权标头，并放在 [ESP-IDF](#) 许可证下：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Apache-2.0
 */
```

ESP-IDF 限制性较小的部分 ESP-IDF 的某些部分特意采用了限制性较小的许可证，方便在商业闭源代码项目中重复使用。例如公有域下或免费知识共享 (CC0) 许可下的 [ESP-IDF examples](#)。此类源文件可使用如下标头：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Unlicense OR CC0-1.0
 */
```

如允许使用多个许可证，可采用关键字 `OR` 连接，如上例所示。这可以通过在 `tools/ci/check_copyright_config.yaml` 配置文件中定义多个许可证实现。但是，请谨慎使用该方法，并仅在 [ESP-IDF](#) 项目限制性较小的部分中选择性使用。

第三方许可证 受到不同许可证许可，经乐鑫修改，并包含在 ESP-IDF 中的代码不能使用 Apache License 2.0 进行许可，即便检查器可能提出此类建议。建议保留原有版权标头，并在前面添加 SPDX 标识。

例如，对于一个由“GNU General Public License v2.0 及以上”许可证许可、John Doe 持有、且由 Espressif Systems 做出额外修改的代码文件，请按照如下示例提供标头：

```
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 *
 * SPDX-License-Identifier: GPL-2.0-or-later
 *
 * SPDX-FileContributor: 2019-2023 Espressif Systems (Shanghai) CO LTD
 */
```

这些许可证能够得到识别，并且可以在官方 [SPDX license list](#) 中找到 SPDX 标识符。其他常见许可证还包括 GPL-2.0-only, BSD-3-Clause 和 BSD-2-Clause。

特殊情况下，如果一个许可证没有包含在 [SPDX license list](#) 中，可使用 `LicenseRef-[idString]` 自定义许可证标识符，如以下示例中的 `LicenseRef-Special-License`。另外，必须把完整的许可文本添加到 `Special-License` 文件夹下的 `LICENSES` 路径中：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: LicenseRef-Special-License
 */
```

如果自定义许可证直接包含在源文件中，可使用专门的自定义许可证标识符 `LicenseRef-Included` 进行说明：

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: LicenseRef-Included
 *
 * <Full custom license text>
 */
```

`tools/ci/check_copyright_config.yaml` 中的配置为第三方许可证提供了许多有用的功能：

- 对第三方程序库的文件部分，可以定义一个不同的许可证。
- 可以永久禁用对选定文件集的检查。请谨慎使用该选项，并且仅在其他选项都不适用时，才可使用该选项。

8.5.8 ESP-IDF pytest 指南

ESP-IDF 有多种类型的测试需在 ESP 芯片上执行（即 **目标测试**）。目标测试通常作为 IDF 测试项目（即 **测试应用程序**）的一部分进行编译，在这个过程中，测试应用程序和其他标准 IDF 项目遵循同样的构建、烧写和监控流程。

通常，目标测试需要连接一台主机（如个人电脑），负责触发特定的测试用例、提供测试数据、检查测试结果。

ESP-IDF 在主机端使用 `pytest` 框架（以及一些 `pytest` 插件）来自动进行目标测试。本文档介绍 ESP-IDF 中的 `pytest`，并介绍以下内容：

1. ESP-IDF 中不同类型的测试应用程序。
2. 将 `pytest` 框架应用于 Python 测试脚本，进行自动化目标测试。
3. ESP-IDF CI (Continuous Integration) 板载测试流程。
4. 使用 `pytest` 在本地执行目标测试。
5. `pytest` 的使用技巧。

备注: ESP-IDF 默认使用以下插件:

- [pytest-embedded](#) 和默认服务 `esp,idf`
- [pytest-rerunfailures](#)

本文档介绍的所有概念和用法都基于 ESP-IDF 的默认配置, 并非都适用于原生 `pytest`。

安装

所有依赖项都可以通过执行安装脚本的 `--enable-pytest` 进行安装:

```
$ install.sh --enable-pytest
```

安装过程常见问题

No Package 'dbus-1' Found

```
configure: error: Package requirements (dbus-1 >= 1.8) were not met:
No package 'dbus-1' found
Consider adjusting the PKG_CONFIG_PATH environment variable if you
installed software in a non-standard prefix.
```

如果遇到上述错误信息, 可能需要安装一些缺失的软件包。

如果使用 Ubuntu 系统, 可能需要执行:

```
sudo apt-get install libdbus-glib-1-dev
```

或

```
sudo apt-get install libdbus-1-dev
```

如使用 Linux 其他发行版本, 请在搜索引擎中查询上述错误信息, 并查找对应发行版需安装哪些缺失的软件包。

Invalid command 'bdist_wheel'

```
error: invalid command 'bdist_wheel'
```

如果遇到上述错误信息, 可能需要安装一些缺失的 Python 包, 例如:

```
python -m pip install -U pip
```

或

```
python -m pip install wheel
```

备注: 执行 `pip` 命令前, 请确保使用的环境为 IDF Python 虚拟环境。

测试应用程序

ESP-IDF 包含不同类型的测试应用程序, 可用 `pytest` 自动完成。

组件测试 ESP-IDF 组件通常包含针对特定组件的测试应用程序，执行针对特定组件的单元测试。推荐通过组件测试应用程序来测试组件。所有测试应用程序都应位于 `${IDF_PATH}/components/<COMPONENT_NAME>/test_apps` 下，例如：

```

components/
├── my_component/
│   ├── include/
│   │   └── ...
│   ├── test_apps/
│   │   ├── test_app_1
│   │   │   ├── main/
│   │   │   │   └── ...
│   │   │   ├── CMakeLists.txt
│   │   │   └── pytest_my_component_app_1.py
│   │   ├── test_app_2
│   │   │   ├── ...
│   │   │   └── pytest_my_component_app_2.py
│   │   └── parent_folder
│   │       ├── test_app_3
│   │       │   ├── ...
│   │       │   └── pytest_my_component_app_3.py
│   │       └── ...
│   ├── my_component.c
│   └── CMakeLists.txt

```

例程测试 例程测试是为了向用户展示 ESP-IDF 的部分功能（要了解更多信息，请参考 [Examples Readme](#)）。

但是，要确保这些例程正确运行，可将例程看作测试应用，并用 `pytest` 自动执行。所有例程都应和已测试的例程，包括 Python 测试脚本一起放在 `${IDF_PATH}/examples` 路径下，例如：

```

examples/
├── parent_folder/
│   └── example_1/
│       ├── main/
│       │   └── ...
│       ├── CMakeLists.txt
│       └── pytest_example_1.py

```

自定义测试 自定义测试是为了测试 ESP-IDF 的一些任意功能，这些测试不是为了向用户展示 ESP-IDF 的功能。

所有自定义测试应用都位于 `${IDF_PATH}/tools/test_apps` 路径下。要了解更多信息，请参考 [Custom Test Readme](#)。

在 ESP-IDF 中使用 `pytest`

pytest 执行步骤

1. 引导阶段

创建会话缓存：

- 端口目标缓存
- 端口应用缓存

2. 数据获取阶段

- 获取所有前缀为 `pytest_` 的 Python 文件。
- 获取所有前缀为 `test_` 的测试函数。
- 应用 `params`，并复制测试函数。
- 利用 CLI 选项筛选测试用例。详细用法请参考 [筛选测试用例](#)。

3. 运行阶段

- A. 创建 `fixture`。在 ESP-IDF 中，常见 `fixture` 的初始化顺序如下：
 - a. `pexpect_proc`: `pexpect` 实例
 - b. `app`: `IdfApp` 实例
此阶段会解析测试应用程序的相关信息，如 `sdkconfig`、`flash_files`、`partition_table` 等。
 - c. `serial`: `IdfSerial` 实例
此阶段会自动检测目标芯片所连接的主机端口。考虑到主机可能连接了多个目标芯片，应用程序会解析测试目标芯片的类型。测试程序的二进制文件会自动烧写到测试目标芯片上。
 - d. `dut`: `IdfDut` 实例
- B. 运行测试函数。
- C. 析构 `fixture`。析构顺序如下：
 - a. `dut`
 - i. 关闭 `serial` 端口。
 - ii. (仅适用于使用了 `Unity` 测试框架 的应用程序) 生成 `Unity` 测试用例的 JUnit 报告。
 - b. `serial`
 - c. `app`
 - d. `pexpect_proc`: 关闭文件描述符
- D. (仅适用于使用了 `Unity` 测试框架 的应用程序)
如果调用了 `dut.expect_from_unity_output()`，那么检测到 `Unity` 测试失败时会触发 `AssertionError`。

4. 报告阶段

- A. 为测试函数生成 Junit 报告。
 - B. 将 JUnit 报告中的测试用例名修改为 ESP-IDF 测试用例 ID 格式: `<target>.<config>.<test function name>`。
5. 完成阶段 (仅适用于使用了 `Unity` 测试框架 的应用程序)
如果生成了 `Unity` 测试用例的 JUnit 报告，这些报告会被合并。

入门示例 以下 Python 测试脚本示例来自 `pytest_console_basic.py`。

```
@pytest.mark.esp32
@pytest.mark.esp32c3
@pytest.mark.generic
@pytest.mark.parametrize('config', [
    'history',
    'nohistory',
], indirect=True)
def test_console_advanced(config: str, dut: IdfDut) -> None:
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

下面的小节对这个简单的测试脚本进行了逐行讲解，以说明 `pytest` 在 ESP-IDF 测试脚本中的典型使用方法。

目标芯片 marker 使用 `Pytest marker` 可以指出某个特定测试用例应在哪个目标芯片 (即 ESP 芯片) 上运行。例如:

```
@pytest.mark.esp32      # <-- support esp32
@pytest.mark.esp32c3   # <-- support esp32c3
@pytest.mark.generic    # <-- test env "generic"
```

上例表明，某一测试用例可以在 ESP32 和 ESP32-C3 上运行。此外，目标芯片的类型应为 `generic`。要了解有关 `generic` 类型，运行 `pytest --markers` 以获取所有 `marker` 的详细信息。

备注：如果测试用例可以在 ESP-IDF 官方支持的所有目标芯片上运行(调用 `idf.py --list-targets` 了解详情)，则可以使用特殊 `marker supported_targets` 指定所有目标芯片。

参数化 marker 可使用 `pytest.mark.parametrize` 和 `config` 参数对包含不同 `sdkconfig` 文件的不同应用程序进行相同的测试。如需了解关于 `sdkconfig.ci.xxx` 文件的更多信息，请参考 `readme` 下的 `Configuration Files` 章节。

```
@pytest.mark.parametrize('config', [
    'history',      # <-- run with app built by sdkconfig.ci.history
    'nohistory',   # <-- run with app built by sdkconfig.ci.nohistory
], indirect=True) # <-- `indirect=True` is required
```

总体而言，这一测试函数会复制为 4 个测试用例：

- `esp32.history.test_console_advanced`
- `esp32.nohistory.test_console_advanced`
- `esp32c3.history.test_console_advanced`
- `esp32c3.nohistory.test_console_advanced`

测试串行输出 为确保测试在目标芯片上顺利执行，测试脚本可使用 `dut.expect()` 函数来测试目标芯片上的串行输出：

```
def test_console_advanced(config: str, dut: IdfDut) -> None: # The value of _
    <-- argument `config` is assigned by the parameterization.
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

在执行 `dut.expect(...)` 时，首先会将预期字符串编译成正则表达式用于搜索串行输出结果，直到找到与该编译后的正则表达式匹配的结果或运行超时。

如果预期字符串中包含正则表达式关键字（如括号或方括号），则需格外注意。或者，也可以使用 `dut.expect_exact(...)`，它会尝试直接匹配字符串，而不将其转换为正则表达式。

如需了解关于 `expect` 函数类型的更多信息，请参考 [pytest-embedded Expecting documentation](#)。

进阶示例

用同一应用程序进行多个 DUT 测试 有时，一个测试可能涉及多个运行同一测试程序的目标芯片。在这种情况下，可以使用 `parameterize` 将多个 DUT 实例化，例如：

```
@pytest.mark.esp32s2
@pytest.mark.esp32s3
@pytest.mark.usb_host
@pytest.mark.parametrize('count', [
    2,
], indirect=True)
def test_usb_host(dut: Tuple[IdfDut, IdfDut]) -> None:
    device = dut[0] # <-- assume the first dut is the device
    host = dut[1]  # <-- and the second dut is the host
    ...
```

将参数 `count` 设置为 2 后，所有 `fixture` 都会改为元组。

用不同应用程序进行多个 DUT 测试 有时（特别是协议测试），一个测试可能涉及多个运行不同测试程序的目标芯片（例如不同目标芯片作为主机和从机）。在这种情况下，可以使用 `parameterize` 将针对不同测试应用程序的多个 DUT 实例化。

以下代码示例来自 `pytest_wifi_getting_started.py`。

```
@pytest.mark.esp32
@pytest.mark.multi_dut_generic
@pytest.mark.parametrize(
    'count, app_path', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↳path.dirname(__file__), "station")}'),
        ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

以上示例中，第一个 DUT 用 `softAP` 应用程序烧录，第二个 DUT 用 `station` 应用程序烧录。

备注： 这里的 `app_path` 应设置为绝对路径。Python 中的 `__file__` 宏会返回测试脚本自身的绝对路径。

用不同应用程序和目标芯片进行多目标测试 以下代码示例来自 `pytest_wifi_getting_started.py`。如注释所述，该代码目前尚未在 ESP-IDF CI 中运行。

```
@pytest.mark.parametrize(
    'count, app_path, target', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↳path.dirname(__file__), "station")}'),
         'esp32|esp32s2'),
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↳path.dirname(__file__), "station")}'),
         'esp32s2|esp32'),
    ],
    indirect=True,
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

总体而言，此测试函数会被复制为 2 个测试用例：

- 在 ESP32 上烧录 `softAP`，在 ESP32-S2 上烧录 `station`
- 在 ESP32-S2 上烧录 `softAP`，在 ESP32 上烧录 `station`

支持对不同 `sdkconfig` 文件及目标芯片的组合测试 以下进阶代码示例来自 `pytest_panic.py`。

```
CONFIGS = [
    pytest.param('coredump_flash_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↳esp32s2]),
    pytest.param('coredump_flash_elf_sha', marks=[pytest.mark.esp32]), # sha256_
↳only supported on esp32
    pytest.param('coredump_uart_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↳esp32s2]),
```

(下页继续)

```

    pytest.param('coredump_uart_elf_crc', marks=[pytest.mark.esp32, pytest.mark.
↳ esp32s2]),
    pytest.param('gdbstub', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('panic', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
]

@pytest.mark.parametrize('config', CONFIGS, indirect=True)
...

```

自定义类 通常，可能会在下列情况下编写自定义类：

1. 向一定数量的 DUT 添加更多可复用功能。
2. 为不同阶段添加自定义的前置和后置函数，请参考章节 [pytest 执行步骤](#)。

以下代码示例来自 [panic/confstest.py](#)。

```

class PanicTestDut (IdfDut):
    ...

@pytest.fixture(scope='module')
def monkeypatch_module(request: FixtureRequest) -> MonkeyPatch:
    mp = MonkeyPatch()
    request.addfinalizer(mp.undo)
    return mp

@pytest.fixture(scope='module', autouse=True)
def replace_dut_class(monkeypatch_module: MonkeyPatch) -> None:
    monkeypatch_module.setattr('pytest_embedded_idf.dut.IdfDut', PanicTestDut)

```

`monkeypatch_module` 提供了一个 [基于模块](#) 的 `monkeypatch` fixture。

`replace_dut_class` 是一个 [基于模块](#) 的 [自动执行](#) fixture。该函数会用你的自定义类替换 `IdfDut` 类。

标记不稳定测试 某些测试用例基于以太网或 Wi-Fi。然而由于网络问题，测试可能会不稳定。此时，可以将某个测试用例标记为不稳定的测试用例。

以下代码示例来自 [pytest_esp_eth.py](#)。

```

@pytest.mark.flaky(reruns=3, reruns_delay=5)
def test_esp_eth_ip101(dut: IdfDut) -> None:
    ...

```

这一 marker 表示，如果该测试函数失败，其测试用例会每隔 5 秒钟再运行一次，最多运行三次。

标记已知失败 有时，测试会因以下原因而持续失败：

- 测试的功能（或测试本身）存在错误。
- 测试环境不稳定（例如网络问题），导致失败率较高。

可使用 `xfail` marker 来标记此测试用例，并写出原因。

以下代码来自 [pytest_panic.py](#)。

```

@pytest.mark.xfail('config.getvalue("target") == "esp32s2"', reason='raised_
↳ IllegalInstruction instead')
def test_cache_error(dut: PanicTestDut, config: str, test_func_name: str) -> None:

```

这一 marker 表示该测试在 ESP32-S2 上是一个已知失败。

标记夜间运行的测试用例 在缺少 runner 时，一些测试用例仅在夜间运行的管道中触发。

```
@pytest.mark.nightly_run
```

这一 marker 表示，此测试用例仅在环境变量为 NIGHTLY_RUN 或 INCLUDE_NIGHTLY_RUN 时运行。

标记在 CI 中暂时禁用的测试用例 在缺少 runner 时，可以在 CI 中禁用一些本地能够通过测试的测试用例。

```
@pytest.mark.temp_skip_ci(targets=['esp32', 'esp32s2'], reason='lack of runners')
```

这一 marker 表明，此测试用例仍可以在本地用 `pytest --target esp32` 执行，但不会在 CI 中执行。

运行 Unity 测试用例 对基于组件的单元测试应用程序，以下代码即可执行所有的单板测试用例，包括普通测试用例和多阶段测试用例：

```
def test_component_ut(dut: IdfDut):
    dut.run_all_single_board_cases()
```

此代码还会跳过所有 tag 为 [ignore] 的测试用例。

如需按组执行测试用例，可运行：

```
def test_component_ut(dut: IdfDut):
    dut.run_all_single_board_cases(group='psram')
```

此代码会触发模块包含 [psram] tag 的所有测试用例。

你可能还会看到一些包含以下语句的测试脚本，这些脚本已被弃用。请使用上述建议的方法。

```
def test_component_ut(dut: IdfDut):
    dut.expect_exact('Press ENTER to see the list of tests')
    dut.write('*')
    dut.expect_unity_test_output()
```

如需了解关于 ESP-IDF 单元测试的更多内容，请参考 [ESP32-S2 中的单元测试](#)。

在 CI 中执行测试

CI 的工作流程很简单，即编译任务 -> 板载测试任务。

编译任务

编译任务命名

- 基于组件的单元测试: `build_pytest_components_<target>`
- 例程测试: `build_pytest_examples_<target>`
- 自定义测试: `build_pytest_test_apps_<target>`

编译任务命令 CI 用于创建所有相关测试的命令为: `python $IDF_PATH/tools/ci/ci_build_apps.py <parent_dir> --target <target> -vv --pytest-apps`

所有支持指定目标芯片的应用程序都使用 `build_<target>_<config>` 下支持的 `sdkconfig` 文件创建。

例如，如果运行 `python $IDF_PATH/tools/ci/ci_build_apps.py $IDF_PATH/examples/system/console/basic --target esp32 --pytest-apps` 指令，文件夹结构将如下所示：

```

basic
├── build_esp32_history/
│   └── ...
├── build_esp32_nohistory/
│   └── ...
├── main/
├── CMakeLists.txt
├── pytest_console_basic.py
└── ...

```

所有编译文件的文件夹都会上传到同一路径。

板载测试任务

板载测试任务命名

- 基于部件的单元测试: `component_ut_pytest_<target>_<test_env>`
- 例程测试: `example_test_pytest_<target>_<test_env>`
- 自定义测试: `test_app_test_pytest_<target>_<test_env>`

板载测试任务命令 CI 用于执行所有相关测试的命令为: `pytest <parent_dir> --target <target> -m <test_env_marker>`

这一命令将执行父文件夹下所有具有指定目标芯片 `marker` 和测试环境 `marker` 的测试用例。

板载测试任务中的二进制文件是从编译任务中下载的，相应文件会放在同一路径下。

本地测试

首先，你需为 ESP-IDF 安装 Python 依赖：

```

$ cd $IDF_PATH
$ bash install.sh --enable-pytest
$ ./export.sh

```

默认情况下，`pytest` 脚本会按照以下顺序查找编译目录：

- `build_<target>_<sdkconfig>`
- `build_<target>`
- `build_<sdkconfig>`
- `build`

因此，运行 `pytest` 最简单的方式是调用 `idf.py build`。

例如，如果你要执行 `$IDF_PATH/examples/get-started/hello_world` 文件夹下的所有 ESP32 测试，你可执行：

```

$ cd examples/get-started/hello_world
$ idf.py build
$ pytest --target esp32

```

如果你的测试应用程序中有多个 `sdkconfig` 文件，例如那些 `sdkconfig.ci.*` 文件，仅使用 `idf.py build` 命令并不能调用这些额外的 `sdkconfig` 文件。下文以 `$IDF_PATH/examples/system/console/basic` 为例进行说明。

如果要用 `history` 配置测试此应用程序，并用 `idf.py build` 进行编译，你需运行：

```

$ cd examples/system/console/basic
$ idf.py -DSDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig.ci.history" build
$ pytest --target esp32 --sdkconfig history

```

如果你想同时编译测试所有 `sdkconfig` 文件，则需运行我们的 CI 脚本 (`ci_build_apps.py`) 作为辅助脚本：

```
$ cd examples/system/console/basic
$ python ${IDF_PATH}/tools/ci/ci_build_apps.py . --target esp32 -vv --pytest-apps
$ pytest --target esp32
```

包含 `sdkconfig.ci.history` 配置的应用程序会编译到 `build_esp32_history` 中，而包含 `sdkconfig.ci.nohistory` 配置的应用程序会编译到 `build_esp32_nohistory` 中。`pytest --target esp32` 命令会在这两个应用程序上运行测试。

使用技巧

筛选测试用例

- 根据目标芯片筛选：`pytest --target <target>`
`pytest` 会执行所有支持指定目标芯片的测试用例。
- 根据 `sdkconfig` 文件筛选：`pytest --sdkconfig <sdkconfig>`
如果 `<sdkconfig>` 为 `default`，`pytest` 会执行所有 `sdkconfig` 文件包含 `sdkconfig.defaults` 的测试用例。
如果是其他情况，`pytest` 会执行所有 `sdkconfig` 文件包含 `sdkconfig.ci.<sdkconfig>` 的测试用例。
- 使用 `pytest -k <test-case name>` 按测试用例名称筛选，可以运行单个测试用例，例如 `pytest -k test_int_wdt_cache_disabled`。

添加新 marker 我们目前使用两种自定义 marker。`target marker` 是指测试用例支持此目标芯片，`env marker` 是指测试用例应分配到 CI 中具有相应 tag 的 runner 上。

你可以在 `${IDF_PATH}/conftest.py` 文件后添加一行新的 marker。如果该 marker 是 `target marker`，应将其添加到 `TARGET_MARKERS` 中。如果该 marker 指定了一类测试环境，应将其添加到 `ENV_MARKERS` 中。自定义 marker 格式：`<marker_name>: <marker_description>`。

生成 JUnit 报告 你可调用 `pytest` 执行 `--junitxml <filepath>` 生成 JUnit 报告。在 ESP-IDF 中，测试用例命名会统一为 `<target>.<config>.<function_name>`。

跳过自动烧录二进制文件 调试测试脚本时最好跳过自动烧录二进制文件。

调用 `pytest` 执行 `--skip-autoflash y` 即可实现。

记录数据 在执行测试时，你有时需要记录一些数据，例如性能测试数据。

在测试脚本中使用 `record_xml_attribute` fixture，数据就会记录在 JUnit 报告的属性中。

日志系统 在执行测试用例时，你有时可能需要添加一些额外的日志行。

这可通过使用 [Python 日志模块](#) 实现。

其他日志函数（作为 fixture）

log_performance

```
def test_hello_world(
    dut: IdfDut,
    log_performance: Callable[[str, object], None],
) -> None:
    log_performance('test', 1)
```

以上示例可实现用预定义格式 [performance][test]: 1 记录性能数据，并在指定 --junitxml <filepath> 的情况下将其记录在 JUnit 报告的 properties tag 下。相应的 JUnit 测试用例节点如下所示：

```
<testcase classname="examples.get-started.hello_world.pytest_hello_world" file=
↳"examples/get-started/hello_world/pytest_hello_world.py" line="13" name="esp32.
↳default.test_hello_world" time="8.389">
  <properties>
    <property name="test" value="1"/>
  </properties>
</testcase>
```

check_performance 我们提供了 TEST_PERFORMANCE_LESS_THAN 和 TEST_PERFORMANCE_GREATER_THAN 宏来记录性能项，并检测性能项的数值是否在有效范围内。有时 C 宏无法检测一些性能项的值，为此，我们提供了 Python 函数实现相同的目的。注意，由于 Python 函数不能很好地识别不同的 ifdef 块下同一性能项的阈值，请尽量使用 C 宏。

```
def test_hello_world(
    dut: IdfDut,
    check_performance: Callable[[str, float, str], None],
) -> None:
    check_performance('RSA_2048KEY_PUBLIC_OP', 123, 'esp32')
    check_performance('RSA_2048KEY_PUBLIC_OP', 19001, 'esp32')
```

以上示例会首先从 [components/idf_test/include/idf_performance.h](#) 和指定目标芯片的 [components/idf_test/include/esp32/idf_performance_target.h](#) 头文件中获取性能项 RSA_2048KEY_PUBLIC_OP 的阈值，然后检查该值是否达到了最小值或超过了最大值。

例如，假设 IDF_PERFORMANCE_MAX_RSA_2048KEY_PUBLIC_OP 的值为 19000，则上例中第一行 check_performance 会通过测试，第二行会失败并警告：[Performance] RSA_2048KEY_PUBLIC_OP value is 19001, doesn't meet pass standard 19000. 0。

Chapter 9

ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 master 分支。
如有量产需求，请使用稳定版本。

9.1 发布版本

通过以下链接，可以访问各个版本的配套文档：

- 最新稳定版 ESP-IDF： https://docs.espressif.com/projects/esp-idf/zh_CN/stable/
- 最新版 ESP-IDF（即 master 分支）： https://docs.espressif.com/projects/esp-idf/zh_CN/latest/

ESP-IDF 在 GitHub 平台上的完整发布历史请见 [发布说明页面](#)。该页面支持查看各个版本的发布说明、配套文档及相应获取方式。

9.2 我该选择哪个版本？

- 如有量产需求，请使用 [最新稳定版本](#)。稳定版本已通过人工测试，后续更新仅修复 bug，主要特性不受影响（更多详情，请见 [版本管理](#)）。请访问 [发布说明页面](#) 界面查看每一个稳定发布版本。另外，为确保使用的 ESP-IDF 版本与需生产的芯片版本兼容，可参考 [ESP-IDF 版本与乐鑫芯片版本兼容性](#)。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 [最新版本（在 master 分支上）](#)。最新版本包含 ESP-IDF 的所有最新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 master 分支更新的影响，可以按照需求选择一个最适合的稳定版本，将其 [更新至一个预发布版本](#) 或 [更新至一个发布分支](#)。
- 如需使用其他基于 ESP-IDF 的项目，请先查看该项目的文档，以确定其兼容的 ESP-IDF 版本。

有关如何更新 ESP-IDF 本地副本的内容，请参考 [更新 ESP-IDF](#) 章节。

9.3 版本管理

ESP-IDF 采用了 [语义版本管理方法](#)，你可以从字面含义理解每个版本的差异。其中

- 主要版本（例 v3.0）代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。升级至一个新的主要版本（例 v2.1 升级至 v3.0）意味着你可能需要更新工程代码，并重新测试工程，具体可参考 [发布说明页面](#) 的重大变更 (Breaking Change) 部分。
- 次要版本（例 v3.1）代表有新增特性和 bug 修复，但现有特性不受影响，公开 API 的使用也不受影响。

升级至一个新的次要版本（例 v3.0 升级至 v3.1）意味着你可能不需要更新工程代码，但需重新测试工程，特别是 [发布说明页面](#) 中专门提到的部分。

- **Bugfix** 版本（例 v3.0.1）仅修复 bug，并不增加任何新特性。
升级至一个新的 **Bugfix** 版本（例 v3.0 升级至 v3.0.1）意味着你不需要更新工程代码，仅需测试与本次发布修复 bug（列表见 [发布说明页面](#)）直接相关的特性。

9.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

[支持期限政策](#) 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

[发布说明页面](#) 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如果你刚开始一个新项目，建议使用最新稳定版本。
- 如果你有 GitHub 账号，请点击 [发布说明页面](#) 界面右上角的“Watch”按钮，并选中“Releases only”选项。GitHub 将会在新版本发布的时候发送通知。当你所使用的版本有 **Bugfix** 版本发布时，请做好升级至该 **Bugfix** 版本的规划。
- 如可能，请定期（如每年一次）将项目的 IDF 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保你所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日期起。

在支持期限内意味着 ESP-IDF 团队将继续在 GitHub 的发布分支上进行 bug 修复、安全修复等，并根据需要定期发布新的 **Bugfix** 版本。

支持期限分为“服务期”和“维护期”：

| 周期 | 时长 | 是否推荐新工程使用 |
|-----|-------|-----------|
| 服务期 | 12 个月 | 是 |
| 维护期 | 18 个月 | 否 |

在服务期内，**Bugfix** 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 bug 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在所用版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 bug 修复。

支持期限不包括预发布版本（betas、预览版、-rc 和 -dev 版等），有时会将某个特性在发布版中标记为“预览版”，这意味着该特性也不在支持期限内。

关于 [不同版本的 ESP-IDF](#)（主要版本、次要版本、**Bugfix** 版本等）的更多信息，请参考 ESP-IDF 编程指南。

9.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 `idf.py` 命令：

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此你也可以使用宏 `IDF_VER` 查看 ESP-IDF 的版本（以字符串的格式）。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 *compile-time macros* 检查版本。

几个 ESP-IDF 版本的例子：

| 版本字符串 | 含义 |
|--------------------------|--|
| v3.2-dev-306-gbeb3611ca | <p>master 分支上的预发布版本。</p> <ul style="list-style-type: none"> - v3.2-dev: 为 v3.2 进行的开发。 - 306: v3.2 开发启动后的 commit 数量。 - beb3611ca: commit 标识符。 |
| v3.0.2 | 稳定版本，标签为 v3.0.2。 |
| v3.1-beta1-75-g346d6b0ea | <p>v3.1 的 beta 测试版本（可参考更新至一个发布分支）。</p> <ul style="list-style-type: none"> - v3.1-beta1 - 预发布标签。 - 75: 添加预发布 beta 标签后的 commit 数量。 - 346d6b0ea: commit 标识符。 |
| v3.0.1-dirty | <p>稳定版本，标签为 v3.0.1。</p> <ul style="list-style-type: none"> - dirty 代表 ESP-IDF 的本地副本有修改。 |

9.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 `master` 分支（最新版本）上进行。`master` 分支上的 ESP-IDF 版本总带有 `-dev` 标签，表示“正在开发中”，例 `v3.1-dev`。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 `master` 分支上进行）并达到进入 `beta` 测试的标准，则将该版本切换至一个新分支（例 `release/v3.1`）。此外，该分支还打上预发布标签（例 `v3.1-beta1`）。你可以在 GitHub 平台上查看 ESP-IDF 的完整 [分支列表](#) 和 [标签列表](#)。`Beta` 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 `beta` 版本的不断测试，`bug` 修复将同时增加至该发布分支和 `master` 分支。而且，`master` 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 `rc` 标签，代表候选发布（Release Candidate），例 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 `bug`，则该预发布版本将最终增加“主要版本”（例 `v4.0`）或“次要版本”标记（例 `v3.1`），成为正式发布版本，并体现在 [发布说明页面](#)。
- 后续，发布版本中发现的 `bug` 都将在该发布分支上进行修复。
- 发布分支上会定期进行 `bug` 修复，人工测试完成后，该分支将增加一个 `Bugfix` 版本标签（例 `v3.1.1`），并体现在 [发布说明页面](#)。

9.7 更新 ESP-IDF

请根据实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考[更新至一个稳定发布版本](#)。
- 如需测试/研发/尝试最新特性，建议参考[更新至 `master` 分支](#)。
- 两者折衷建议参考[更新至一个发布分支](#)。

备注： 在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考[入门指南](#) 中的介绍。

9.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 [发布说明页面](#)，了解最新发布情况。
- 如有新发布的 `Bugfix` 版本（例 `v3.0.1` 或 `v3.0.2`）时，请将新的 `Bugfix` 版本更新至你的 ESP-IDF 目录。
- 在 Linux 或 macOS 系统中，请运行如下命令将分支更新至 `vX.Y.Z`：

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在 Windows 系统中，需要将 `cd $IDF_PATH` 替换为 `cd %IDF_PATH%`。
- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级版本。具体命令与上方描述一致。

备注： 如果你在安装 ESP-IDF 时使用的是 `zip` 文件包，而非通过 `Git` 命令，则将无法使用 `Git` 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 `zip` 文件包，并替换掉之前 `IDF_PATH` 下的全部内容。

9.7.2 更新至一个预发布版本

你也可以将你的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考[更新至一个稳定发布版本](#) 中的描述。

预发布版本通常不体现在 [发布说明页面](#)。更多详情，请查看完整 [标签列表](#)。使用预发布版本的注意事项，请参考[更新至一个发布分支](#) 中的描述。

9.7.3 更新至 master 分支

备注：ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在“流血的边缘试探”，存在一定风险。

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 在 Linux 或 macOS 系统中，使用如下命令在本地切换至 master 分支：

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 在 Windows 系统中，需要将 `cd $IDF_PATH` 替换为 `cd %IDF_PATH%`。
- 此外，你还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，你可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

重要：强烈建议定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本得到及时更新。旧的 master 分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考[更新至一个发布分支](#)。

9.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但也同时保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 GitHub 查看完整 [标签列表](#)。

例如，在 Linux 或 macOS 系统中，可以运行以下命令更新至 ESP-IDF v3.1，随时关注该分支上的 Bugfix 版本发布（如 v3.1.1 等）：

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

在 Windows 系统中，需要将 `cd $IDF_PATH` 替换为 `cd %IDF_PATH%`。

每次在该分支上使用 `git pull` 时，都相当于把最新的 Bugfix 版本发布更新至你的本地副本中。

备注：发布分支并不会会有专门的配套文档，建议使用与本分支最接近版本的文档。

Chapter 10

资源

10.1 PlatformIO

- [什么是 PlatformIO ?](#)
- [安装](#)
- [配置](#)
- [教程](#)
- [项目示例](#)
- [更多内容](#)

10.1.1 什么是 PlatformIO ?

PlatformIO 是一个跨平台的嵌入式开发环境，能直接支持 ESP-IDF。

由于 PlatformIO 对 ESP-IDF 的支持并非由 Espressif 团队维护，如果遇到 PlatformIO 相关的问题，请通过 [官方 PlatformIO 库](#) 联系其开发人员。

要了解关于 PlatformIO 生态系统及其理念的详细概述，请参考 [官方 PlatformIO 文档](#)。

10.1.2 安装

- [PlatformIO IDE](#) 是一个可在 Windows, macOS 和 Linux 平台上使用的嵌入式 C/C++ 开发工具集。
- [PlatformIO Core \(CLI\)](#) 是一个命令行工具，包含多平台编译系统，平台和库管理器以及其他集成组件。它可以与各种代码开发环境一起使用，还可以集成云平台和网络服务。

10.1.3 配置

请参阅 [PlatformIO 官方的 ESP-IDF 配置指南](#)。

10.1.4 教程

- [ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis](#)

10.1.5 项目示例

请参阅 [PlatformIO 官方文档](#) 中 ESP-IDF 相关内容。

10.1.6 更多内容

访问以下链接探索 PlatformIO 生态系统：

- 了解更多 [与其他 IDE 或文本编辑器集成](#) 的信息。
- 从 [PlatformIO 社区](#) 获取帮助。

10.2 CLion

10.2.1 CLion 是什么？

CLion 是用于 C 和 C++ 编程的跨平台集成开发环境 (IDE)。CLion 还提供了专门支持 ESP-IDF 的功能，使开发人员能够无缝使用 ESP-IDF 框架。

10.2.2 安装

安装 CLion，请参考 [CLion 安装指南](#)，可根据操作系统（Windows, macOS, or Linux）选择适用的版本。

10.2.3 配置

要在 CLion 中配置一个 ESP-IDF 项目，请参考 [在 CLion 中配置 ESP CMake 项目](#)。本指南将带您逐步完成配置项目的必要步骤。

10.2.4 资源

有关 CLion 和 ESP-IDF 集成的更多信息，请参考以下资源：

- [CLion 文档](#)：CLion 官方文档提供了有关 IDE 各方面内容的详细信息，包括 ESP-IDF 集成。

10.3 VisualGDB

10.3.1 VisualGDB 是什么?

VisualGDB 是 Microsoft Visual Studio 的一个强大扩展，为嵌入式系统提供包括支持 ESP-IDF 框架在内的一系列先进的开发工具和功能。通过 VisualGDB，能够在 ESP-IDF 项目中利用熟悉且功能丰富的 Visual Studio 环境，从而实现高效的编码、调试与部署。

10.3.2 安装

请参照 [下载和安装 VisualGDB](#)，下载和安装 VisualGDB。

10.3.3 配置

请参照 [使用 ESP-IDF 在 VisualGDB 中创建高级 ESP32 项目](#)，在 VisualGDB 中配置 ESP-IDF 项目。

也可以参考 [高级 ESP-IDF 项目结构](#)，了解更多关于使用 VisualGDB 开发 ESP-IDF 项目的信息。

10.3.4 资源

有关 VisualGDB 和 ESP-IDF 集成的更多信息，请参阅以下资源：

- [VisualGDB 文档](#): VisualGDB 的官方文档提供了关于使用 VisualGDB 与 ESP-IDF 的全面指南和教程。有关这些第三方工具的问题，请寻求该工具的支持渠道或用户社区的帮助。

10.4 有用的链接

- 请在 [ESP32 论坛](#) 中提出问题，访问社区资源。
- 请通过 GitHub 的 [Issues](#) 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 [Issues](#)。
- 请在 [ESP IoT Solution](#) 库中找到基于 ESP-IDF 的 [解决方案](#)、[应用实例](#)、[组件和驱动](#) 等内容。多数文档均提供中英文版本。
- 通过 Arduino 平台开发应用，请参考 [ESP32](#)、[ESP32-S2](#) 和 [ESP32-C3](#) 芯片的 [Arduino 内核](#)。
- 关于 ESP32 的书籍列表，请查看 [乐鑫](#) 网站。
- 如果你有兴趣参与到 ESP-IDF 的开发，请查阅 [贡献指南](#)。
- 关于 ESP32-S2 的其它信息，请查看官网 [文档](#) 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 [下载](#)。

11.5 TjpgDec License

TjpgDec - Tiny JPEG Decompressor R0.01 (C) ChaN, 2011 The TjpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TjpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

Chapter 12

关于本指南

本指南为 ESP32-S2 官方应用开发框架 **ESP-IDF** 的配套文档。

ESP32-S2 是一款 2.4 GHz Wi-Fi 系统级芯片，搭载 Xtensa® 32 位 LX7 处理器。

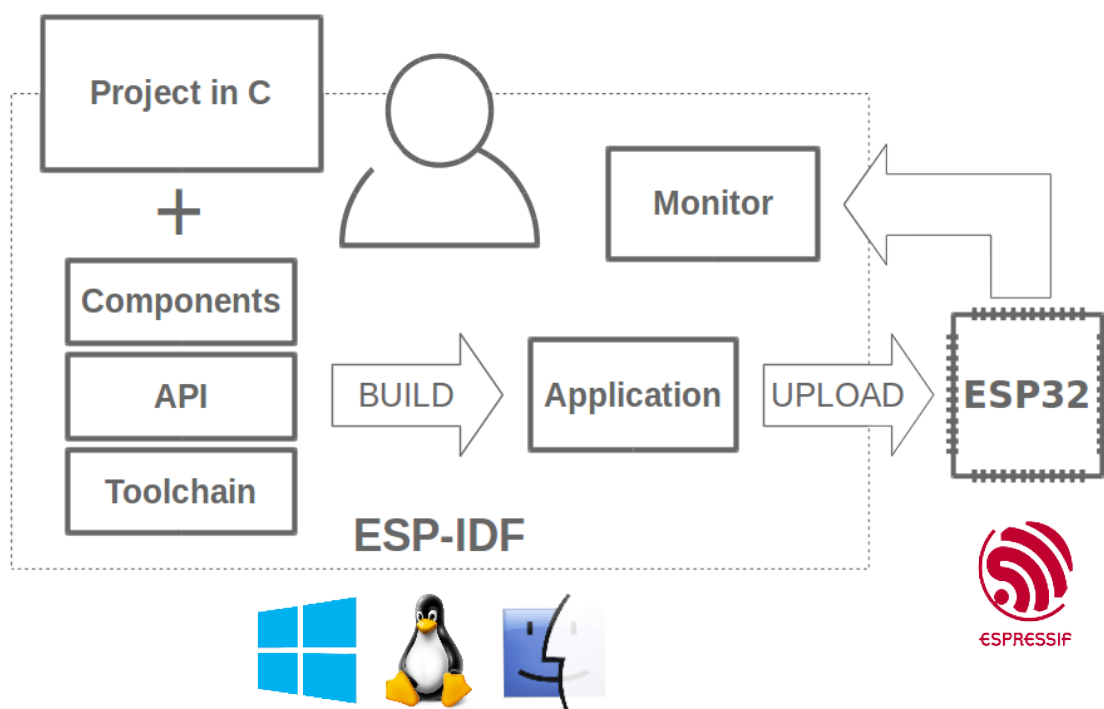

图 1: 乐鑫物联网综合开发框架

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32-S2 应用程序提供工具链、API、组件和工作流程的支持。

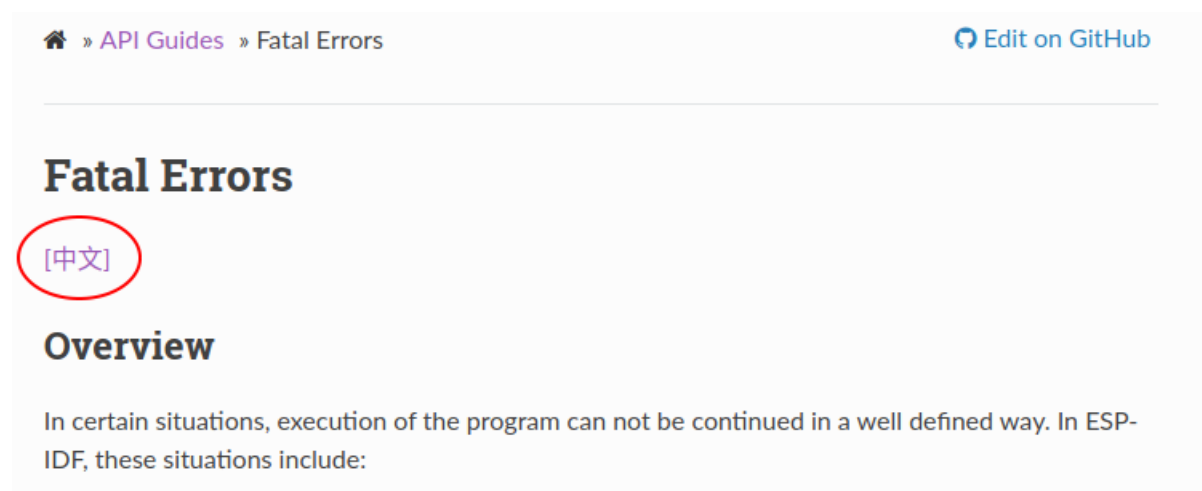

Chapter 13

切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入，请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，可以通过点击文档上方的语言链接，轻松进行语言切换。
