

# ESP32

## ESP-IDF 编程指南

Release v4.1.1  
乐鑫信息科技  
2021年01月28日

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 快速入门</b>	<b>3</b>
1.1 概述	3
1.2 准备工作	3
1.3 开发板简介	4
1.3.1 ESP32-DevKitC V4 入门指南	4
1.3.2 ESP-WROVER-KIT V4.1 入门指南	9
1.3.3 ESP32-PICO-KIT V4/V4.1 入门指南	34
1.3.4 ESP32-Ethernet-Kit V1.1 入门指南	44
1.4 详细安装步骤	60
1.4.1 设置开发环境	60
1.4.2 创建您的第一个工程	60
1.5 第一步：安装准备	61
1.5.1 Windows 平台工具链的标准设置	61
1.5.2 Linux 平台工具链的标准设置	62
1.5.3 MacOS 平台工具链的标准设置	64
1.6 第二步：获取 ESP-IDF	65
1.6.1 Linux 和 macOS 操作系统	65
1.6.2 Windows 操作系统	66
1.7 第三步：设置工具	66
1.7.1 Windows 操作系统	66
1.7.2 Linux 和 macOS 操作系统	66
1.7.3 自定义工具安装路径	66
1.8 第四步：设置环境变量	66
1.8.1 Windows 操作系统	67
1.8.2 Linux 和 macOS 操作系统	67
1.9 第五步：开始创建工程	67
1.9.1 Linux 和 macOS 操作系统	67
1.9.2 Windows 操作系统	67
1.10 第六步：连接设备	68
1.11 第七步：配置	68
1.11.1 Linux 和 macOS 操作系统	68
1.11.2 Windows 操作系统	68
1.12 第八步：编译工程	69
1.13 第九步：烧录到设备	69
1.14 第十步：监视器	70
1.15 更新 ESP-IDF	71
1.16 相关文档	71
1.16.1 与 ESP32 创建串口连接	71
1.16.2 Eclipse IDE 创建和烧录指南	77
1.16.3 IDF 监视器	77
1.16.4 工具链的自定义设置	81
1.16.5 快速入门（传统 GNU Make）	86
<b>2 API 参考</b>	<b>111</b>
2.1 蓝牙 API	111

2.1.1	Controller && VHCI	111
2.1.2	BT COMMON	118
2.1.3	BT LE	123
2.1.4	CLASSIC BT	198
2.1.5	NimBLE-based host APIs	271
2.1.6	ESP-BLE-MESH	273
2.2	连网 API	481
2.2.1	Wi-Fi	481
2.2.2	以太网	550
2.2.3	IP 网络层协议	564
2.2.4	应用层协议	579
2.3	外设 API	579
2.3.1	Analog to Digital Converter	579
2.3.2	Controller Area Network (CAN)	593
2.3.3	Digital To Analog Converter	608
2.3.4	GPIO & RTC GPIO	611
2.3.5	I2C Driver	624
2.3.6	I2S	636
2.3.7	LED Control	647
2.3.8	MCPWM	659
2.3.9	Pulse Counter	677
2.3.10	RMT	685
2.3.11	SDMMC Host Driver	701
2.3.12	SD SPI Host Driver	706
2.3.13	SDIO Card Slave Driver	709
2.3.14	Sigma-delta Modulation	723
2.3.15	SPI Master Driver	725
2.3.16	SPI Slave Driver	743
2.3.17	ESP32-S2 Temperature Sensor	750
2.3.18	定时器	752
2.3.19	触摸传感器	762
2.3.20	UART	765
2.4	应用层协议	787
2.4.1	mDNS 服务	787
2.4.2	ESP-TLS	795
2.4.3	ESP HTTP Client	804
2.4.4	ESP WebSocket Client	816
2.4.5	HTTP 服务器	820
2.4.6	HTTPS server	841
2.4.7	ICMP Echo	843
2.4.8	ASIO port	847
2.4.9	ESP-MQTT	848
2.4.10	ESP-Modbus	858
2.4.11	ESP Local Control	863
2.4.12	ESP Serial Slave Link	870
2.4.13	IP 网络层协议	876
2.5	配网 API	876
2.5.1	Unified Provisioning	876
2.5.2	Protocol Communication	879
2.5.3	Wi-Fi Provisioning	890
2.6	存储 API	905
2.6.1	SPI Flash API	905
2.6.2	SD/SDIO/MMC 驱动程序	923
2.6.3	非易失性存储库	932
2.6.4	NVS 分区生成程序	949
2.6.5	虚拟文件系统组件	954
2.6.6	FAT 文件系统	962
2.6.7	磨损均衡 API	966

2.6.8	SPIFFS 文件系统	970
2.6.9	量产程序	974
2.7	System API	978
2.7.1	App Image Format	978
2.7.2	Application Level Tracing	983
2.7.3	eFuse Manager	987
2.7.4	Error Codes and Helper Functions	997
2.7.5	ESP HTTPS OTA	999
2.7.6	ESP-pthread	1002
2.7.7	Event Loop Library	1004
2.7.8	FreeRTOS	1017
2.7.9	FreeRTOS Additions	1095
2.7.10	Heap Memory Allocation	1112
2.7.11	Heap Memory Debugging	1123
2.7.12	High Resolution Timer	1132
2.7.13	The himem allocation API	1136
2.7.14	Inter-Processor Call	1138
2.7.15	Call function with external stack	1140
2.7.16	Interrupt allocation	1141
2.7.17	Logging library	1146
2.7.18	Miscellaneous System APIs	1151
2.7.19	Over The Air Updates (OTA)	1158
2.7.20	Performance Monitor	1167
2.7.21	电源管理	1170
2.7.22	Sleep Modes	1175
2.7.23	Watchdogs	1183
2.7.24	System Time	1185
2.8	Project Configuration	1190
2.8.1	Introduction	1190
2.8.2	Project Configuration Menu	1190
2.8.3	Using sdkconfig.defaults	1190
2.8.4	Kconfig Formatting Rules	1190
2.8.5	Backward Compatibility of Kconfig Options	1191
2.8.6	Configuration Options Reference	1191
2.8.7	Customisations	1355
2.9	Error Codes Reference	1355
<b>3</b>	<b>ESP32 H/W 硬件参考</b>	<b>1361</b>
3.1	ESP32 系列模组和开发板	1361
3.1.1	WROOM、SOLO、WROVER 和 PICO 系列模组	1361
3.1.2	ESP32 开发板	1364
3.1.3	相关文档	1366
3.2	Previous Versions of ESP32 Modules and Boards	1366
3.2.1	Modules (No updated or discontinued modules)	1368
3.2.2	Development Boards	1368
3.2.3	Related Documents	1374
<b>4</b>	<b>ESP32-S2 Beta Preview Support</b>	<b>1375</b>
4.1	Documentation	1375
4.2	Setting up for ESP32-S2 Beta	1375
4.2.1	Manual toolchain URLs	1375
4.3	Building a project for ESP32-S2 Beta	1376
4.4	Limitations	1376
4.5	Roadmap	1376
4.6	Issues	1377
<b>5</b>	<b>API 指南</b>	<b>1379</b>
5.1	ESP-IDF 编程注意事项	1379
5.1.1	应用程序的启动流程	1379

5.1.2	应用程序的内存布局	1380
5.1.3	DMA 能力要求	1382
5.2	构建系统 (CMake 版)	1383
5.2.1	概述	1383
5.2.2	使用构建系统	1384
5.2.3	示例项目	1386
5.2.4	项目 CMakeLists 文件	1387
5.2.5	组件 CMakeLists 文件	1388
5.2.6	组件配置	1390
5.2.7	预处理器定义	1390
5.2.8	组件依赖	1391
5.2.9	构建的内部过程	1392
5.2.10	组件 CMakeLists 示例	1393
5.2.11	自定义 sdkconfig 的默认值	1397
5.2.12	Flash 参数	1397
5.2.13	构建 Bootloader	1397
5.2.14	选择硬件目标	1398
5.2.15	编写纯 CMake 组件	1398
5.2.16	组件中使用第三方 CMake 项目	1398
5.2.17	在自定义 CMake 项目中使用 ESP-IDF	1399
5.2.18	文件通配符 & 增量构建	1400
5.2.19	构建系统的元数据	1400
5.2.20	从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统	1402
5.3	构建系统 (传统 GNU Make)	1403
5.3.1	使用构建系统	1403
5.3.2	概述	1403
5.3.3	构建 Bootloader	1412
5.4	错误处理	1412
5.4.1	概述	1412
5.4.2	错误码	1413
5.4.3	错误码到错误消息	1413
5.4.4	ESP_ERROR_CHECK 宏	1413
5.4.5	错误处理模式	1414
5.4.6	C++ 异常	1414
5.5	严重错误	1415
5.5.1	概述	1415
5.5.2	紧急处理程序	1415
5.5.3	寄存器转储与回溯	1416
5.5.4	GDB Stub	1417
5.5.5	Guru Meditation 错误	1418
5.5.6	其它严重错误	1419
5.6	Event Handling	1420
5.6.1	Wi-Fi, Ethernet, and IP Events	1420
5.6.2	Mesh Events	1422
5.6.3	Bluetooth Events	1422
5.7	Deep Sleep Wake Stubs	1423
5.7.1	Rules for Wake Stubs	1423
5.7.2	Implementing A Stub	1423
5.7.3	Loading Code Into RTC Memory	1424
5.7.4	Loading Data Into RTC Memory	1424
5.8	ESP32 Core Dump	1425
5.8.1	Overview	1425
5.8.2	Configuration	1425
5.8.3	Save core dump to flash	1426
5.8.4	Print core dump to UART	1426
5.8.5	ROM Functions in Backtraces	1426
5.8.6	Running 'espcoredump.py'	1426
5.9	Flash 加密	1427

5.9.1	概述	1427
5.9.2	Flash 加密过程中使用的 eFuse	1427
5.9.3	Flash 的加密过程	1428
5.9.4	设置 Flash 加密的步骤	1429
5.9.5	Flash 加密的要点	1435
5.9.6	使用加密的 Flash	1435
5.9.7	更新加密的 Flash	1436
5.9.8	关闭 Flash 加密	1436
5.9.9	Flash 加密的局限性	1436
5.9.10	Flash 加密与安全启动	1437
5.9.11	使用无安全启动的 Flash 加密	1437
5.9.12	Flash 加密的高级功能	1437
5.9.13	技术细节	1438
5.10	ESP-IDF FreeRTOS SMP Changes	1439
5.10.1	Overview	1439
5.10.2	Backported Features	1440
5.10.3	Tasks and Task Creation	1440
5.10.4	Scheduling	1441
5.10.5	Critical Sections & Disabling Interrupts	1444
5.10.6	Floating Point Arithmetic	1444
5.10.7	Task Deletion	1445
5.10.8	Thread Local Storage Pointers & Deletion Callbacks	1445
5.10.9	Configuring ESP-IDF FreeRTOS	1445
5.11	Thread Local Storage	1446
5.11.1	Overview	1446
5.11.2	FreeRTOS Native API	1446
5.11.3	Pthread API	1446
5.11.4	C11 Standard	1446
5.12	High-Level Interrupts	1447
5.12.1	Interrupt Levels	1447
5.12.2	Notes	1447
5.13	JTAG 调试	1448
5.13.1	引言	1448
5.13.2	工作原理	1448
5.13.3	选择 JTAG 适配器	1449
5.13.4	安装 OpenOCD	1449
5.13.5	配置 ESP32 目标板	1450
5.13.6	启动调试器	1455
5.13.7	调试范例	1455
5.13.8	从源码构建 OpenOCD	1455
5.13.9	注意事项和补充内容	1459
5.13.10	相关文档	1459
5.14	引导加载程序 (Bootloader)	1494
5.14.1	恢复出厂设置	1494
5.14.2	从测试固件启动	1495
5.14.3	自定义引导程序	1495
5.15	分区表	1495
5.15.1	概述	1495
5.15.2	内置分区表	1496
5.15.3	创建自定义分区表	1496
5.15.4	生成二进制分区表	1498
5.15.5	烧写分区表	1498
5.16	Secure Boot	1499
5.16.1	Background	1499
5.16.2	Secure Boot Process Overview	1499
5.16.3	Keys	1500
5.16.4	Bootloader Size	1500
5.16.5	How To Enable Secure Boot	1500

5.16.6	Re-Flashable Software Bootloader	1501
5.16.7	Generating Secure Boot Signing Key	1502
5.16.8	Remote Signing of Images	1502
5.16.9	Secure Boot Best Practices	1503
5.16.10	Technical Details	1503
5.16.11	Secure Boot & Flash Encryption	1504
5.16.12	Signed App Verification Without Hardware Secure Boot	1504
5.16.13	Advanced Features	1505
5.17	Secure Boot V2	1505
5.17.1	Background	1505
5.17.2	Advantages	1505
5.17.3	Secure Boot V2 Process	1505
5.17.4	Signature Block Format	1506
5.17.5	Verifying the signature Block	1506
5.17.6	Bootloader Size	1507
5.17.7	eFuse usage	1507
5.17.8	How To Enable Secure Boot V2	1507
5.17.9	Restrictions after Secure Boot is enabled	1508
5.17.10	Generating Secure Boot Signing Key	1508
5.17.11	Remote Signing of Images	1509
5.17.12	Secure Boot Best Practices	1509
5.17.13	Technical Details	1509
5.17.14	Secure Boot & Flash Encryption	1509
5.17.15	Advanced Features	1510
5.18	ULP 协处理器编程	1510
5.18.1	ESP32 ULP coprocessor instruction set	1510
5.18.2	ESP32-S2 ULP coprocessor instruction set	1523
5.18.3	Programming ULP coprocessor using C macros	1539
5.18.4	安装工具链	1543
5.18.5	编译 ULP 代码	1544
5.18.6	访问 ULP 程序变量	1544
5.18.7	启动 ULP 程序	1545
5.18.8	ULP 程序流	1546
5.19	ULP 协处理器 (传统的 GNU Make)	1547
5.19.1	安装工具链	1547
5.19.2	编译 ULP 代码	1547
5.19.3	访问 ULP 程序变量	1548
5.19.4	启动 ULP 程序	1549
5.19.5	ULP 程序流	1550
5.20	ESP32 中的单元测试	1551
5.20.1	添加常规测试用例	1551
5.20.2	添加多设备测试用例	1551
5.20.3	添加多阶段测试用例	1552
5.20.4	编译单元测试程序	1553
5.20.5	运行单元测试	1553
5.21	单元测试 (传统的 GNU Make)	1554
5.21.1	添加常规测试用例	1554
5.21.2	添加多设备测试用例	1555
5.21.3	添加多阶段测试用例	1556
5.21.4	编译单元测试程序	1556
5.21.5	运行单元测试	1557
5.22	控制台终端	1558
5.22.1	行编辑	1558
5.22.2	将命令行拆分成参数列表	1560
5.22.3	参数解析	1560
5.22.4	命令的注册与调度	1560
5.22.5	示例	1561
5.23	ESP32 ROM console	1561

5.23.1	Full list of supported statements and functions	1561
5.23.2	Example programs	1562
5.23.3	Credits	1562
5.24	RF calibration	1563
5.24.1	Partial calibration	1563
5.24.2	Full calibration	1563
5.24.3	No calibration	1563
5.24.4	PHY initialization data	1563
5.25	Wi-Fi Driver	1564
5.25.1	ESP32 Wi-Fi Feature List	1564
5.25.2	How To Write a Wi-Fi Application	1564
5.25.3	ESP32 Wi-Fi API Error Code	1565
5.25.4	ESP32 Wi-Fi API Parameter Initialization	1565
5.25.5	ESP32 Wi-Fi Programming Model	1565
5.25.6	ESP32 Wi-Fi Event Description	1566
5.25.7	ESP32 Wi-Fi Station General Scenario	1568
5.25.8	ESP32 Wi-Fi AP General Scenario	1571
5.25.9	ESP32 Wi-Fi Scan	1571
5.25.10	ESP32 Wi-Fi Station Connecting Scenario	1579
5.25.11	ESP32 Wi-Fi Station Connecting When Multiple APs Are Found	1583
5.25.12	Wi-Fi Reconnect	1583
5.25.13	Wi-Fi Beacon Timeout	1583
5.25.14	ESP32 Wi-Fi Configuration	1583
5.25.15	Wi-Fi Security	1589
5.25.16	ESP32 Wi-Fi Power-saving Mode	1590
5.25.17	ESP32 Wi-Fi Connect Crypto	1590
5.25.18	ESP32 Wi-Fi Throughput	1591
5.25.19	Wi-Fi 80211 Packet Send	1591
5.25.20	Wi-Fi Sniffer Mode	1594
5.25.21	Wi-Fi Multiple Antennas	1594
5.25.22	Wi-Fi Channel State Information	1595
5.25.23	Wi-Fi Channel State Information Configure	1596
5.25.24	Wi-Fi HT20/40	1597
5.25.25	Wi-Fi QoS	1597
5.25.26	Wi-Fi AMSDU	1598
5.25.27	Wi-Fi Fragment	1598
5.25.28	WPS Enrolle	1598
5.25.29	Wi-Fi Buffer Usage	1598
5.25.30	Wi-Fi Menuconfig	1599
5.25.31	Troubleshooting	1602
5.26	ESP-BLE-MESH	1606
5.26.1	概述	1608
5.26.2	ESP-BLE-MESH 快速入门	1608
5.26.3	ESP-BLE-MESH 示例	1614
5.26.4	ESP-BLE-MESH 演示视频	1615
5.26.5	ESP-BLE-MESH 常见问题手册	1615
5.26.6	相关文档	1615
5.27	ESP-MESH	1642
5.27.1	Overview	1642
5.27.2	Introduction	1643
5.27.3	ESP-MESH Concepts	1644
5.27.4	Building a Network	1649
5.27.5	Managing a Network	1654
5.27.6	Data Transmission	1657
5.27.7	Channel Switching	1659
5.27.8	Performance	1662
5.27.9	Further Notes	1663
5.28	BluFi	1663

5.28.1	概览	1663
5.28.2	BluFi 流程	1663
5.28.3	ESP32 配网流程	1663
5.28.4	配网流程图	1664
5.28.5	BluFi 传输格式	1664
5.28.6	ESP32 端的安全实现	1668
5.28.7	GATT 相关说明	1669
5.29	片外 RAM	1669
5.29.1	简介	1669
5.29.2	硬件	1669
5.29.3	配置片外 RAM	1670
5.29.4	片外 RAM 使用限制	1671
5.29.5	芯片版本	1671
5.30	链接脚本生成机制	1672
5.30.1	概述	1672
5.30.2	快速上手	1672
5.30.3	组件	1675
5.30.4	与构建系统的集成	1679
5.31	lwIP	1680
5.31.1	Supported APIs	1680
5.31.2	BSD Sockets API	1680
5.31.3	Netconn API	1684
5.31.4	lwIP FreeRTOS Task	1684
5.31.5	esp-lwip custom modifications	1684
5.31.6	Performance Optimization	1685
5.32	工具	1686
5.32.1	IDF Docker Image	1686
<b>6</b>	<b>Libraries and Frameworks</b>	<b>1689</b>
6.1	Cloud Frameworks	1689
6.1.1	AWS IoT	1689
6.1.2	Azure IoT	1689
6.1.3	Google IoT Core	1689
<b>7</b>	<b>Contributions Guide</b>	<b>1691</b>
7.1	How to Contribute	1691
7.2	Before Contributing	1691
7.3	Pull Request Process	1691
7.4	Legal Part	1691
7.5	Related Documents	1692
7.5.1	Espressif IoT Development Framework Style Guide	1692
7.5.2	编写代码文档	1697
7.5.3	Documentation Add-ons and Extensions Reference	1704
7.5.4	创建示例项目	1705
7.5.5	API Documentation Template	1706
7.5.6	Contributor Agreement	1708
<b>8</b>	<b>ESP-IDF 版本简介</b>	<b>1711</b>
8.1	发布版本	1711
8.2	我该选择哪个版本?	1712
8.3	版本管理	1712
8.4	支持期限	1713
8.5	查看当前版本	1713
8.6	Git 工作流	1714
8.7	更新 ESP-IDF	1714
8.7.1	更新至一个稳定发布版本	1715
8.7.2	更新至一个预发布版本	1715
8.7.3	更新至 master 分支	1715
8.7.4	更新至一个发布分支	1715

# Chapter 1

## 快速入门

[English]

本文档旨在指导用户搭建 ESP32 硬件开发的软件环境。

通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32 开发板等步骤。

---

**注解：** 这是 ESP-IDF 稳定版本 v4.1.1 的文档，还有其他版本的文档[ESP-IDF 版本简介](#) 供参考。

---

### 1.1 概述

ESP32 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 蓝牙 4.2
- 高性能双核
- 超低功耗协处理器
- 多种外设

ESP32 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

### 1.2 准备工作

硬件：

- 一款 **ESP32** 开发板
- **USB 数据线** (A 转 Micro-B)
- **电脑** (Windows、Linux 或 macOS)

软件：

- 设置 **工具链**，用于编译 ESP32 代码；
- **编译工具**——CMake 和 Ninja 编译工具，用于编译 ESP32 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32 使用的 API (软件库和源代码) 和运行 **工具链** 的脚本；
- 安装 C 语言编程 (工程) 的 **文本编辑器**，例如 [Eclipse](#)。

图 1: ESP32 应用程序开发

## 1.3 开发板简介

请点击下方连接，了解有关具体开发板的详细信息。

### 1.3.1 ESP32-DevKitC V4 入门指南

[English]

本指南介绍了如何开始使用 ESP32-DevKitC V4 开发板。有关 ESP32-DevKitC 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

#### 准备工作

- ESP32-DevKitC V4 开发板
- USB A / micro USB B 数据线
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

#### 概述

ESP32-DevKitC V4 是 [乐鑫](#) 一款基于 ESP32 的小型开发板，板上模组的绝大部分管脚均已引出，开发人员可根据实际需求，轻松通过跳线连接多种外围器件，或将开发板插在面包板上使用。

为了更好地满足不同用户需求，ESP32-DevKitC V4 还支持以下不同配置：

- 可选多款 ESP32 模组
  - [ESP32-WROOM-32 模组](#)
  - [ESP32-WROOM-32D](#)
  - [ESP32-WROOM-32U](#)

- *ESP32-SOLO-1* 模组
  - *ESP32-WROVER*
  - *ESP32-WROVER-B*
  - *ESP32-WROVER-I*
  - *ESP32-WROVER-I (IPEX)*
- 可选排针或排母

详情请见 《乐鑫产品订购信息》。

## 功能说明

ESP32-DevKitC V4 开发板的主要组件、接口及控制方式见下。

ESP32-DevKitC V4 (板载 ESP32-WROOM-32)

主要组件	基本介绍
ESP32-WROOM-32	基于 ESP32 的模组。更多详情，请见 《ESP32-WROOM-32 技术规格书》。
EN	复位按键。
Boot	下载按键。按下 <b>Boot</b> 键并保持，同时按一下 <b>EN</b> 键（此时不要松开 <b>Boot</b> 键）进入“固件下载”模式，通过串口下载固件。
USB-to-UART 桥接器   单芯片 USB-UART 桥接器，可提供高达 3 Mbps 的传输速率。	Micro USB 端口
USB 接口。	可用作电路板的供电电源，或连接 PC 和 ESP32-WROOM-32 模组的通信接口。
5V Power On LED	开发板通电后（USB 或外部 5 V），该指示灯将亮起。更多信息，请见 <a href="#">相关文档</a> 中的原理图。
I/O	板上模组的绝大部分管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。

**注解：**管脚 D0、D1、D2、D3、CMD 和 CLK 用于 ESP32 芯片与 SPI flash 间的内部通信，集中分布在开发板两侧靠近 USB 端口的位置。通常而言，这些管脚最好不连，否则可能影响 SPI flash / SPI RAM 的工作。

**注解：**管脚 GPIO16 和 GPIO17 仅适用于板载 ESP32-WROOM 系列和 ESP32-SOLO-1 的开发板，保留内部使用。

## 电源选项

开发板可从以下三种供电方式中任选其一：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

**警告：**上述供电模式 **不可同时连接**，否则可能会损坏开发板和/或电源。

## 有关 C15 的提示

较早版本 ESP32-DevKitC 开发板上的 C15 可能存在以下问题：

- 开发板上电后可能进入下载模式；
- 如果用户通过 GPIO0 输出时钟，C15 可能会影响信号。

用户如果认为 C15 可能影响开发板的使用，则可以将 C15 完全移除。C15 在开发板上的具体位置见下图黄色部分。

C15（黄色）在 ESP32-DevKitC V4 开发板上的位置

## 应用程序开发

ESP32-DevKitC V4 上电前，请首先确认开发板完好无损。

现在，请前往 [ESP32 H/W 硬件参考](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

## 开发板尺寸

## 1.3.2 ESP-WROVER-KIT V4.1 入门指南

[English]

本指南介绍了如何开始使用 ESP-WROVER-KIT V4.1 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

### 准备工作

- [ESP-WROVER-KIT V4.1 开发板](#)
- USB 2.0 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

### 概述

ESP-WROVER-KIT 是 [乐鑫](#) 一款基于 ESP32 的开发板。

ESP-WROVER-KIT 开发板已集成了如下组件：

- ESP32-WROVER-B 模组
- LCD 屏
- MicroSD 卡槽

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

---

**注解：**ESP32 的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

---

### 功能概述

ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

### 功能说明

ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表将从图片右上角开始，以顺时针顺序介绍图 1 中的主要组件，然后按同样顺序介绍图 2 中的主要组件。

图 2: ESP-WROVER-KIT 功能框图

图 3: ESP-WROVER-KIT 开发板布局-俯视图

图 4: ESP-WROVER-KIT 开发板布局-仰视图

主要组件	基本介绍
FT2232	FT2232 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。详见 <a href="#">ESP-WROVER-KIT V4.1 原理图</a> 。
32.768 kHz	32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。
0 欧电阻	ESP-WROVER-KIT 开发板设计了一个 0 欧电阻，可在测量 ESP32 系列模组在不同功耗模式下的电流时，直接移除或替换为分流器。
ESP32-WROVER-B 模组	这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
诊断 LED 信号灯	本开发板 FT2232 芯片的 GPIO 管脚连接了 4 个红色 LED 信号灯，以备后用。
UART	串口。FT2232 和 ESP32 的串行 TX/RX 信号已引出至 JP2 的两端。默认情况下，这两路信号由跳线帽连接。如果仅需使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI	默认情况下，ESP32 使用 SPI 接口访问内置 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，本接口的工作电压为 3.3 V。
CTS/RTS	串口流控信号。管脚默认不连接至电路。为了能使该功能，必须用跳线帽断路掉 JP14 的相应管脚。
JTAG	JTAG 接口。FT2232 和 ESP32 的 JTAG 信号已引出至 JP2 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照 <a href="#">设置选项</a> 的介绍，连接跳线帽。
USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
EN	复位按键。
BOOT 按键	下载按键。按下 <b>Boot</b> 键并保持，同时按一下 <b>EN</b> 键（此时不要松开 <b>Boot</b> 键）进入“固件下载”模式，通过串口下载固件。
电源开关	电源开关。拨向 <b>Boot</b> 按键一侧，开发板上电；拨离 <b>Boot</b> 按键一侧，开发板掉电。
电源选择开关	ESP-WROVER-KIT 开发板可通过 USB 端口或 5V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节 <a href="#">设置选项</a> 中有关 JP7 连接器的描述。
5V Input	5V 电源接口。建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
5V Power On LED	当开发板通电后（USB 或外部 5V 供电），该红色指示灯将亮起。
LDO	5V-to-3.3V 低压差线型稳压器 NCP1117(1A)。NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 <a href="#">ESP-WROVER-KIT V4.1 原理图</a> 。
摄像头连接器	摄像头接口，支持标准 OV7670 摄像头模块。

### 设置选项

用户可通过 3 组排针，设置开发板功能，其中常见功能见下表：

排针	跳线设置	功能描述
JP7		使用外部电源为 ESP-WROVER-KIT 开发板供电
JP7		使用 USB 端口为 ESP-WROVER-KIT 开发板供电
JP2		使能 JTAG 功能
JP2		使能 UART 通信
		

**ESP32 管脚分配**

ESP32 模组的部分管脚/终端已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可用作他用。比如，摄像头/JP4 排针未连接相应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用，比如 GPIO0 和 GPIO2。由于管脚限制，一些外围设备不可同时使用，比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的 CD 信号（卡检测信号）。如无需使用卡检测功能，开发人员还可以通过移除 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

**主要 I/O 连接器 / JP1** JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间“I/O”列的介绍。两侧的“共用”列则介绍了这些管脚在板上的其他用途。

共用	I/O	I/O	共用
n/a	3.3V	GND	n/a
NC/XTAL	IO32	IO33	NC/XTAL
JTAG, MicroSD	IO12	IO13	JTAG, MicroSD
JTAG, MicroSD	IO14	IO27	摄像头
摄像头	IO26	IO25	摄像头, LCD
摄像头	IO35	IO34	摄像头
摄像头	IO39	IO36	摄像头
JTAG	EN	IO23	摄像头, LCD
摄像头, LCD	IO22	IO21	摄像头, LCD, MicroSD
摄像头, LCD	IO19	IO18	摄像头, LCD
摄像头, LCD	IO5	IO17	PSRAM
PSRAM	IO16	IO4	LED, 摄像头, MicroSD
摄像头, LED, Boot	IO0	IO2	LED, MicroSD
JTAG, MicroSD	IO15	5V	

说明：

- NC/XTAL - [32.768 kHz 晶振](#)
- JTAG - [JTAG / JP2](#)
- Boot - Boot 按键 / SW2
- 摄像头 - [摄像头 / JP4](#)
- LED - [RGB LED](#)
- MicroSD - [MicroSD Card / J4](#)
- LCD - [LCD / U5](#)
- PSRAM - ESP32-WROVER-B 的 PSRAM

**32.768 kHz 晶振**

.	ESP32 管脚
1.	GPIO32
2.	GPIO33

**注解：**默认情况下，管脚 GPIO32 和 GPIO33 已连接至晶振。因此，为了保证信号的完整性，这两个管

脚并未连接至 JP1 I/O 连接器。用户可通过将 R11/R23 处的 0 欧电阻移至 R12/R24 处，以将 GP1O32 和 GPIO33 的连接从晶振移至 JP1。

### SPI Flash / JP2

.	ESP32 管脚
1.	CLK / GPIO6
2.	SD0 / GPIO7
3.	SD1 / GPIO8
4.	SD2 / GPIO9
5.	SD3 / GPIO10
6.	CMD / GPIO11

**重要：** 模组的 flash 总线已通过 0 欧电阻 R140 ~ R145 连接至排针 JP2。如果需要将 flash 的工作频率控制在 80 MHz，以达到保证总线信号完整性等目的，建议移除 R140 ~ R145 电阻，将模组的 flash 总线与排针 JP2 断开。

### JTAG / JP2

.	ESP32 管脚	JTAG 信号
1.	EN	TRST_N
2.	MTMS / GPIO14	TMS
3.	MTDO / GPIO15	TDO
4.	MTDI / GPIO12	TDI
5.	MTCK / GPIO13	TCK

### 摄像头 / JP4

.	ESP32 管脚	摄像头信号
1.	n/a	3.3V
2.	n/a	地
3.	GPIO27	SIO_C / SCCB 时钟
4.	GPIO26	SIO_D / SCCB 数据
5.	GPIO25	VSYNC / 垂直同步
6.	GPIO23	HREF / 水平参考
7.	GPIO22	PCLK / 像素时钟
8.	GPIO21	XCLK / 系统时钟
9.	GPIO35	D7 / 像素数据 Bit 7
10.	GPIO34	D6 / 像素数据 Bit 6
11.	GPIO39	D5 / 像素数据 Bit 5
12.	GPIO36	D4 / 像素数据 Bit 4
13.	GPIO19	D3 / 像素数据 Bit 3
14.	GPIO18	D2 / 像素数据 Bit 2
15.	GPIO5	D1 / 像素数据 Bit 1
16.	GPIO4	D0 / 像素数据 Bit 0
17.	GPIO0	RESET / 摄像头复位
18.	n/a	PWDN / 摄像头断电

- D0 到 D7 为摄像头的数据总线

### RGB LED

.	ESP32 管脚	RGB LED
1.	GPIO0	红色
2.	GPIO2	绿色
3.	GPIO4	蓝色

**MicroSD 卡**

.	ESP32 管脚	MicroSD 信号
1.	MTDI / GPIO12	DATA2
2.	MTCK / GPIO13	CD / DATA3
3.	MTDO / GPIO15	CMD
4.	MTMS / GPIO14	CLK
5.	GPIO2	DATA0
6.	GPIO4	DATA1
7.	GPIO21	CD

**LCD / U5**

.	ESP32 管脚	LCD 信号
1.	GPIO18	复位
2.	GPIO19	SCL
3.	GPIO21	D/C
4.	GPIO22	CS
5.	GPIO23	SDA
6.	GPIO25	SDO
7.	GPIO5	背光

## 应用程序开发

ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

**初始设置** 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP2 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 **电源开关**，**5V Power On LED** 应点亮。

**正式开始开发** 现在，请前往 [ESP32 H/W 硬件参考](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

## ESP-WROVER-KIT V3 入门指南 [\[English\]](#)

本指南介绍了如何开始使用 ESP-WROVER-KIT V3 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

## 准备工作

- [ESP-WROVER-KIT V3 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 macOS)

您可以跳过介绍部分，直接前往 [应用程序开发](#) 章节。

**概述** ESP-WROVER-KIT 是 乐鑫 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 MicroSD 卡槽。

ESP-WROVER-KIT 可选贴以下 ESP32 模组：

- [ESP32-WROOM-32 模组](#)
- [ESP32-WROVER](#)

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

**注解：** 该版本 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供的可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

**功能概述** ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 5: ESP-WROVER-KIT 功能框图

**功能说明** ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件，然后以同样的顺序介绍图 2 中的主要组件。

图 6: ESP-WROVER-KIT 开发板布局-俯视图

图 7: ESP-WROVER-KIT 开发板布局-仰视图

主要组件	基本介绍
32.768 kHz	外接 32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。
0 欧电阻	ESP-WROVER-KIT 开发板设计了一个 0 欧电阻，可在测量 ESP32 系列模组在不同功耗模式下的电流时，直接移除或替换为分流器。
ESP32 模组	可选贴 ESP32-WROOM-32 或 ESP32-WROVER。ESP32-WROVER 模组完整集成了 ESP32-WROOM-32 的所有功能，且内置 32-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
FT2232	FT2232 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。见 <a href="#">ESP-WROVER-KIT V3 原理图</a> 。
UART	串口。FT2232HL 和 ESP32 的串行 TX/RX 信号已引出至 JP11 的两端。默认情况下，这两路信号由跳线帽连接。如果要跳过 FT2232 使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI	默认情况下，ESP32 使用 SPI 接口访问内置 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，选贴 ESP32-WROVER 模组时，该接口的工作电压为 1.8 V；选贴 ESP32-WROOM-32 时，该接口的工作电压为 3.3V。
CTS/RTS	串口流控信号。管脚默认不连接至电路。为了使能该功能，必须用跳线帽短路掉 JP14 的相应管脚。
JTAG	JTAG 接口。FT2232HL 和 ESP32 的 JTAG 信号已引出至 JP8 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照 <a href="#">设置选项</a> 的介绍，连接跳线帽。
EN	复位按键。
Boot	下载按键。按下 <b>Boot</b> 键并保持，同时按一下 <b>EN</b> 键（此时不要松开 <b>Boot</b> 键）进入“固件下载”模式，通过串口下载固件。
USB	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源开关	拨向 <b>USB</b> 按键一侧，开发板上电；拨离 <b>USB</b> 按键一侧，开发板掉电。
电源选择开关	ESP-WROVER-KIT 开发板可通过 USB 端口或 5V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节 <a href="#">设置选项</a> 中有关 JP7 连接器的描述。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
LDO	5V-to-3.3V 低压差线型稳压器 NCP1117(1A)。NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 <a href="#">ESP-WROVER-KIT V3 原理图</a> 。
摄像头	摄像头接口，支持标准 OV7670 摄像头模块。
RGB LED	红绿蓝发光二极管，可由 PWM（脉冲宽度调制）控制。
I/O	板上模组的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。
MicroSD 卡槽	适用于需要扩充数据存储空间或进行备份的应用开发场景。
LCD 显示屏	支持贴装一款 3.2” 的 SPI（标准四线串行外设接口）LCD 显示器，请见 <a href="#">ESP-WROVER-KIT 开发板布局-仰视图</a> 。

**设置选项** 用户可通过 5 组排针，设置开发板功能，其中常见功能见下表：

排针	跳线设置	功能描述
JP7		使用外部电源为 ESP-WROVER-KIT 开发板供电
JP7		使用 USB 端口为 ESP-WROVER-KIT 开发板供电
JP8		使能 JTAG 功能
Espressif Systems		<p style="text-align: center;">23</p> <p style="text-align: center;"><a href="#">Submit Document Feedback</a></p>

**ESP32 管脚分配** ESP32 模组的部分管脚/终端已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可用作他用。比如，摄像头/JP4 排针未连接相应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用，比如 GPIO0 和 GPIO2。由于管脚限制，一些外围设备不可同时使用，比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的 CD 信号（卡检测信号）。如无需使用卡检测功能，开发人员还可以通过移除 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

**主要 I/O 连接器 / JP1** JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间“I/O”列的介绍。两侧的“共用”列则介绍了这些管脚在板上的其他用途。

共用	I/O	I/O	共用
n/a	3.3V	GND	n/a
NC/XTAL	IO32	IO33	NC/XTAL
JTAG, MicroSD	IO12	IO13	JTAG, MicroSD
JTAG, MicroSD	IO14	IO27	摄像头
摄像头	IO26	IO25	摄像头, LCD
摄像头	IO35	IO34	摄像头
摄像头	IO39	IO36	摄像头
JTAG	EN	IO23	摄像头, LCD
摄像头, LCD	IO22	IO21	摄像头, LCD, MicroSD
摄像头, LCD	IO19	IO18	摄像头, LCD
摄像头, LCD	IO5	IO17	PSRAM
PSRAM	IO16	IO4	LED, 摄像头, MicroSD
摄像头, LED, Boot	IO0	IO2	LED, MicroSD
JTAG, MicroSD	IO15	5V	

说明：

- NC/XTAL - [32.768 kHz Oscillator](#)
- JTAG - [JTAG / JP8](#)
- Boot - Boot 按键 / SW2
- 摄像头 - 摄像头 / JP4
- LED - [RGB LED](#)
- MicroSD - [MicroSD Card / J4](#)
- LCD - [LCD / U5](#)
- PSRAM - 仅适用于选贴 ESP32-WROVER 的情况。

### 32.768 kHz 晶振

	ESP32 管脚
1.	GPIO32
2.	GPIO33

**注解：**默认情况下，管脚 GPIO32 和 GPIO33 已连接至晶振。因此，为了保证信号的完整性，这两个管脚并未连接至 JP1 I/O 连接器。用户可通过将 R11/R23 处的 0 欧姆电阻移至 R12/R24 处，以将 GPIO32 和

GPIO33 的连接从晶振移至 JP1。

### SPI Flash / JP13

.	ESP32 管脚
1.	CLK / GPIO6
2.	SD0 / GPIO7
3.	SD1 / GPIO8
4.	SD2 / GPIO9
5.	SD3 / GPIO10
6.	CMD / GPIO11

**重要：** 模组的 flash 总线已通过 0 欧电阻 R140 ~ R145 连接至排针 JP13。如果需要将 flash 的工作频率控制在 80 MHz，为了达到保证总线信号完整性等目的，建议移除 R140 ~ R145 电阻，将模组的 flash 总线与排针 JP2 断开。

### JTAG / JP8

.	ESP32 管脚	JTAG 信号
1.	EN	TRST_N
2.	MTMS / GPIO14	TMS
3.	MTDO / GPIO15	TDO
4.	MTDI / GPIO12	TDI
5.	MTCK / GPIO13	TCK

### 摄像头 / JP4

.	ESP32 管脚	摄像头信号
1.	n/a	3.3V
2.	n/a	地
3.	GPIO27	SIO_C / SCCB 时钟
4.	GPIO26	SIO_D / SCCB 数据
5.	GPIO25	VSYNC / 垂直同步
6.	GPIO23	HREF / 水平参考
7.	GPIO22	PCLK / 像素时钟
8.	GPIO21	XCLK / 系统时钟
9.	GPIO35	D7 / 像素数据 Bit 7
10.	GPIO34	D6 / 像素数据 Bit 6
11.	GPIO39	D5 / 像素数据 Bit 5
12.	GPIO36	D4 / 像素数据 Bit 4
13.	GPIO19	D3 / 像素数据 Bit 3
14.	GPIO18	D2 / 像素数据 Bit 2
15.	GPIO5	D1 / 像素数据 Bit 1
16.	GPIO4	D0 / 像素数据 Bit 0
17.	GPIO0	RESET / 摄像头复位
18.	n/a	PWDN / 摄像头断电

- D0 到 D7 为摄像头的数据总线

### RGB LED

.	ESP32 管脚	RGB LED
1.	GPIO0	红色
2.	GPIO2	绿色
3.	GPIO4	蓝色

### MicroSD 卡

.	ESP32 管脚	MicroSD 信号
1.	MTDI / GPIO12	DATA2
2.	MTCK / GPIO13	CD / DATA3
3.	MTDO / GPIO15	CMD
4.	MTMS / GPIO14	CLK
5.	GPIO2	DATA0
6.	GPIO4	DATA1
7.	GPIO21	CD

### LCD / U5

.	ESP32 管脚	LCD 信号
1.	GPIO18	复位
2.	GPIO19	SCL
3.	GPIO21	D/C
4.	GPIO22	CS
5.	GPIO23	SDA
6.	GPIO25	SDO
7.	GPIO5	背光

**应用程序开发** ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

**初始设置** 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP11 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 **电源开关**，**5V Power On LED** 应点亮。

**正式开始开发** 现在，请前往 [ESP32 H/W 硬件参考](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

### ESP-WROVER-KIT V2 入门指南 [\[English\]](#)

本指南介绍了如何开始使用 ESP-WROVER-KIT V2 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

### 准备工作

- ESP-WROVER-KIT V2 开发板
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 macOS)

您可以跳过介绍部分，直接前往 [应用程序开发](#) 章节。

**概述** ESP-WROVER-KIT 是 [乐鑫](#) 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 MicroSD 卡槽。

ESP-WROVER-KIT 可选贴以下 ESP32 模组：

- [ESP32-WROOM-32 模组](#)

- *ESP32-WROVER*

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

**注解：**ESP-WROVER-KIT V2 板载 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供了可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

**功能概述** ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 8: ESP-WROVER-KIT 功能框图

**功能说明** ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件，然后以同样的顺序介绍了图 2 中的主要组件。

图 9: ESP-WROVER-KIT 开发板布局-俯视图

图 10: ESP-WROVER-KIT 开发板布局-仰视图

主要组件	基本介绍
32.768 kHz	外接 32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。
ESP32 模组	可选贴 ESP32-WROOM-32 或 ESP32-WROVER。ESP32-WROVER 模组完整集成了 ESP32-WROOM-32 的所有功能，且内置 32-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
CTS/RTS	串口流控信号。管脚默认不连接至电路。为了使能该功能，必须用跳线帽短路掉 JP14 的相应管脚。
UART	串口。FT2232HL 和 ESP32 的串行 TX/RX 信号已引出至 JP11 的两端。默认情况下，这两路信号由跳线帽连接。如果要跳过 FT2232 使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI	默认情况下，ESP32 使用 SPI 接口访问内置 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，选贴 ESP32-WROVER 模组时，该接口的工作电压为 1.8 V；选贴 ESP32-WROOM-32 时，该接口的工作电压为 3.3V。
JTAG	JTAG 接口。FT2232HL 和 ESP32 的 JTAG 信号已引出至 JP8 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照 <a href="#">设置选项</a> 的介绍，连接跳线帽。
FT2232	FT2232 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 具有 USB-to-UART 和 USB-to-JTAG 功能。
EN	复位按键。
Boot	下载按键。按下 <b>Boot</b> 键并保持，同时按一下 <b>EN</b> 键（此时不要松开 <b>Boot</b> 键）进入“固件下载”模式，通过串口下载固件。
USB	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源选择开关	ESP-WROVER-KIT 开发板可通过 USB 端口或 5V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节 <a href="#">设置选项</a> 中有关 JP7 连接器的描述。
电源开关	拨向 <b>USB</b> 按键一侧，开发板上电；拨离 <b>USB</b> 按键一侧，开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
LDO	5V-to-3.3V 低压差线型稳压器 NCP1117(1A)。NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 <a href="#">ESP-WROVER-KIT V2 原理图</a> 。
摄像头	摄像头接口，支持标准 OV7670 摄像头模块。
RGB LED	红绿蓝发光二极管，可由 PWM（脉冲宽度调制）控制。
I/O	板上模组的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。
MicroSD 卡槽	MicroSD 卡槽，可扩充存储空间：当 ESP32 进入下载模式时，GPIO2 不可处于高电平。然而，为了使能 MicroSD 卡功能，需为 GPIO2 增加一个上拉电阻。默认情况下，GPIO2 和上拉电阻 R153 处于断开状态。为了使能 MicroSD 卡，请按照 <a href="#">设置选项</a> 章节的要求，连接 JP1 连接器。
LCD 显示屏	支持贴装一款 3.2” 的 SPI（标准四线串行外设接口）LCD 显示器，请见 <a href="#">ESP-WROVER-KIT 开发板布局-仰视图</a> 。

**设置选项** 用户可通过 5 组排针，设置开发板功能，其中常见功能见下表：

排针	跳线设置	功能描述
JP1		使能 MicroSD Card 功能的上拉电阻
JP1		确保开发板处于下载模式时，GPIO2 时钟处于低位（将 JP1 连接至 GPIO0）
JP7		使用外部电源为 ESP-WROVER-KIT 开发板供电
JP7		使用 USB 端口为 ESP-WROVER-KIT 开发板供电
JP8		使能 JTAG 功能
Espressif Systems		

**应用程序开发** ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

**初始设置** 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP11 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 **电源开关**，**5V Power On LED** 应点亮。

**正式开始开发** 现在，请前往[ESP32 H/W 硬件参考](#)中的[详细安装步骤](#)章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

## 1.3.3 ESP32-PICO-KIT V4/V4.1 入门指南

[English]

本指南介绍了如何开始使用 ESP32-PICO-KIT V4 / V4.1 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

本指南仅适用于 ESP32-PICO-KIT V4 和 V4.1。ESP32-PICO-KIT V4.1 与 V4 的最大差别在于桥接器，其中 V4 搭载的 CP2102 USB-to-UART 桥接器最高速率为 1 Mbps，V4.1 搭载的 CP2102N 桥接器最高传输速率 3 Mbps。

### 准备工作

- [ESP32-PICO-KIT 迷你开发板](#)
- USB 2.0 线 (A 型转 Micro-B 型)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#)章节。

## 概述

ESP32-PICO-KIT 是一款来自 乐鑫 的迷你开发板，其核心是具有完整 Wi-Fi 和蓝牙功能的 ESP32 系列 SiP 模组 ESP32-PICO-D4。与其他 ESP32 系列模组相比，ESP32-PICO-D4 模组已完整集成以下外围器件：

- 40 MHz 晶体振荡器
- 4 MB flash
- 滤波电容
- 射频匹配网络等

这大大降低了用户额外采购和安装这些元器件的数量和成本，及额外组装测试的复杂度，并增加了可用性。

ESP32-PICO-KIT 集成了 USB 转 UART 桥接电路，允许开发人员直接通过 PC 的 USB 端口进行下载和调试。

为了便于连接，ESP32-PICO-D4 上的所有 IO 信号和系统电源管脚均通过开发板两侧焊盘（每侧 20 个 x 0.1 英寸间隔）引出。为了方便杜邦线的使用，ESP32-PICO-KIT 开发板每侧的 20 个焊盘中，有 17 个引出至排针，另外 3 个靠近天线的焊盘未引出，可供用户日后焊接使用。

## 注解：

1. 每排未引出至排针的 3 个管脚已连接至 ESP32-PICO-D4 SiP 模组的内置 flash 模块。更多信息，请见 [相关文档](#) 中的模组技术规格书。
2. ESP32-PICO-D4 开发板默认采用排针。

## 功能概述

ESP32-PICO-KIT 开发板的主要组件和连接方式见下。

图 11: ESP32-PICO-KIT 框图

## 功能说明

ESP32-PICO-KIT 开发板的主要组件、接口及控制方式见下。

图 12: ESP32-PICO-KIT 开发板布局

ESP32-PICO-KIT 开发板的主要组件描述见下表（从左上角起顺时针顺序）。

主要组件	基本介绍
ESP32-PICO-D4	ESP32-PICO-KIT 开发板上焊接的标准 ESP32-PICO-D4 模组，集成了 ESP32 芯片的完整系统，仅需连接天线、LC 匹配电路、退耦电容和一个 EN 信号上拉电阻即可正常工作。
LDO	5V-to-3.3V 低压差稳压器
USB-to-UART 桥接器	单芯片 USB-to-UART 桥接器。V4 版本搭载的 CP2102 可提供高达 1 Mbps 的传输速率，V4.1 版本搭载的 CP2102N 可提供高达 3 Mbps 的传输速率。
Micro USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
5V Power On LED	开发板通电后，该红色指示灯将亮起。更多信息，请见 <a href="#">相关文档</a> 中的原理图。
I/O	ESP32-PICO-D4 的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。更多详情，请见章节 <a href="#">管脚说明</a> 。
BOOT	下载按键。按下 <b>Boot</b> 键并保持，同时按一下 <b>EN</b> 键（此时不要松开 <b>Boot</b> 键）进入“固件下载”模式，通过串口下载固件。
EN	复位按键。

## 电源选项

开发板可任一选用以下三种供电方式：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

**警告：** 上述供电模式 **不可同时连接**，否则可能会损坏开发板和/或电源。

### 管脚说明

下表介绍了开发板 I/O 管脚的 **名称**和 **功能**，具体布局请见[相关文档](#)中的原理图。请参考[ESP32-PICO-KIT 开发板布局](#)。

## Header J2

编号	名称	类型	功能
1	FLASH_SD1 (FSD1)	I/O	GPIO8, SD_DATA1, SPID, HS1_DATA1 (见说明 1) , U2CTS
2	FLASH_SD3 (FSD3)	I/O	GPIO7, SD_DATA0, SPIQ, HS1_DATA0 (见说明 1) , U2RTS
3	FLASH_CLK (FCLK)	I/O	GPIO6, SD_CLK, SPICLK, HS1_CLK (见说明 1) , U1CTS
4	IO21	I/O	GPIO21, VSPIHD, EMAC_TX_EN
5	IO22	I/O	GPIO22, VSPIWP, U0RTS, EMAC_TXD1
6	IO19	I/O	GPIO19, VSPIQ, U0CTS, EMAC_TXD0
7	IO23	I/O	GPIO23, VSPID, HS1_STROBE
8	IO18	I/O	GPIO18, VSPICLK, HS1_DATA7
9	IO5	I/O	GPIO5, VSPICS0, HS1_DATA6, EMAC_RX_CLK
10	IO10	I/O	GPIO10, SD_DATA3, SPIWP, HS1_DATA3, U1TXD
11	IO9	I/O	GPIO9, SD_DATA2, SPIHD, HS1_DATA2, U1RXD
12	RXD0	I/O	
Espressif Systems			Release v4.1.1
			GPIO3, U0RXD (见说明 3) , CLK_OUT2

## Header J3

No.	Name	Type	Function
1	FLASH_CS (FCS)	I/O	GPIO16, HS1_DATA4 (见说明 1), U2RXD, EMAC_CLK_OUT
2	FLASH_SD0 (FSD0)	I/O	GPIO17, HS1_DATA5 (见说明 1), U2TXD, EMAC_CLK_OUT_180
3	FLASH_SD2 (FSD2)	I/O	GPIO11, SD_CMD, SPICS0, HS1_CMD (见说明 1), U1RTS
4	SENSOR_VP (FSVP)	I	GPIO36, ADC1_CH0, RTC_GPIO0
5	SENSOR_VN (FSVN)	I	GPIO39, ADC1_CH3, RTC_GPIO3
6	IO25	I/O	GPIO25, DAC_1, ADC2_CH8, RTC_GPIO6, EMAC_RXD0
7	IO26	I/O	GPIO26, DAC_2, ADC2_CH9, RTC_GPIO7, EMAC_RXD1
8	IO32	I/O	32K_XP (见说明 2a) , ADC1_CH4, TOUCH9, RTC_GPIO9
9	IO33	I/O	32K_XN (见说明 2b) , ADC1_CH5, TOUCH8, RTC_GPIO8
10	IO27	I/O	GPIO27, ADC2_CH7, TOUCH7, RTC_GPIO17 EMAC_RX_DV
Espressif Systems	IO14	40 I/O	Release v4.1.1 ADC2_CH6, TOUCH6, RTC_GPIO16, MTMS, HSPICLK

有关上表的说明：

1. 该管脚已连接至 ESP32-PICO-D4 的内置 flash 管脚。
2. 32.768 kHz 晶振：(a) 输入；(b) 输出。
3. 该管脚已连接至开发板的 USB 桥接器芯片。
4. ESP32-PICO-KIT 内置 SPI flash 的工作电压为 3.3V。因此，strapping 管脚 MTDI 在模组上电复位过程中应保持低电平。如连接该管脚，请确保该管脚在复位中不要保持高电平。

## 应用程序开发

ESP32-PICO-KIT 上电前，请首先确认开发板完好无损。

现在，请前往 [ESP32 H/W 硬件参考](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

## 开发板尺寸

ESP32-PICO-KIT 的尺寸为 52 x 20.3 x 10 mm (2.1" x 0.8" x 0.4" )。

图 13: ESP32-PICO-KIT 尺寸图-背面

图 14: ESP32-PICO-KIT 尺寸图-侧面

有关开发板的物理结构细节，请见下方参考设计。

## 1.3.4 ESP32-Ethernet-Kit V1.1 入门指南

[English]

本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

*ESP32-Ethernet-Kit* 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

### 准备工作

- [ESP32-Ethernet-Kit V1.1 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

### 概述

ESP32-Ethernet-Kit 是一款来自 [乐鑫](#) 的开发板。

它由 [以太网母板 \(A 板\)](#) 和 [PoE 子板 \(B 板\)](#) 两部分组成。其中 [以太网母板 \(A 板\)](#) 集成蓝牙 / Wi-Fi 双模 ESP32-WROVER-B 模组和单端口 10/100 Mbps 快速以太网收发器 (PHY) IP101GRI。 [PoE 子板 \(B 板\)](#) 提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器 (FTDI FT2232H 芯片)。FTDI FT2232H 芯片使得开发人员无需额外的 JTAG 适配器，通过 USB 桥接器使用 JTAG 接口便可对 ESP32 直接进行调试。

### 功能概述

ESP32-Ethernet-Kit 开发板的主要组件和连接方式如下。

### 功能说明

有关 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式，请见下方的图片和表格。

**以太网母板 (A 板)** 下表将从图片右上角开始，以顺时针顺序介绍图中的主要组件。

图 16: ESP32-Ethernet-Kit V1.1

图 17: ESP32-Ethernet-Kit 功能框图 (点击放大)

图 18: ESP32-Ethernet-Kit - 以太网母板 (A 板) 布局 (点击放大) (请更新图片)

表 1: 表格 1 组件介绍

主要组件	基本介绍
ESP32-WROVER-B 模组	这款 ESP32 模组内置 64-Mbit PSRAM, 可提供灵活的额外存储空间和数据处理能力。
GPIO Header 2	由 5 个未引出通孔组成, 可连接至 ESP32 的部分 GPIO。具体介绍, 请见 <a href="#">GPIO Header 2</a> 。
功能选择开关	一个 4 位拨码开关, 可配置 ESP32 部分 GPIO 的功能。请注意, 拨码开关旁边开发板的丝印层上的 GPIO 管脚标记的位置是不正确的。有关详细信息和正确的管脚分配, 请见 <a href="#">功能选择开关</a> 。
Tx/Rx LEDs	2 个 LED, 可显示 UART 传输的状态。
FT2232H	FT2232H 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232H 芯片进行控制和编程, 与 ESP32 建立连接。FT2232H 芯片可在通道 A 提供 USB-to-JTAG 接口功能, 并在通道 B 提供 USB-to-Serial 接口功能, 便利开发人员的应用开发与调试。见 <a href="#">ESP32-Ethernet-Kit V1.1 以太网母板 (A 板) 原理图</a> 。
USB 端口	USB 接口。可用作开发板的供电电源, 或连接 PC 和开发板的通信接口。
电源开关	电源开关。拨向 <b>5V0</b> 按键侧, 开发板上电; 拨向 <b>GND</b> 按键一侧, 开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行 (未连接 PC) 时使用。
5V Power On LED	当开发板通电后 (USB 或外部 5V 供电), 该红色指示灯将亮起。
DC/DC 转换器	直流 5 V 转 3.3 V, 输出电流最高可达 2 A。
Board B 连接器	1 对排针和排母, 用于连接 <a href="#">PoE 子板 (B 板)</a> 。
IP101GRI (PHY)	物理层 (PHY) 单端口 10/100 快速以太网收发器 <a href="#">IP101GRI</a> 芯片, 允许开发人员实现与以太网线缆的物理层连接。PHY 与 ESP32 通过简化媒体独立接口 (RMII) 实现连接。RMII 是 <a href="#">媒体独立接口 (MII)</a> 的标准简化版本。PHY 可在 10/100 Mbps 速率下支持 IEEE 802.3 / 802.3u 标准。
RJ45 端口	以太网数据传输端口。
网络变压器	网络变压器属于以太网物理层的一部分, 可保护电路, 使其免受故障和电压瞬变影响, 包括防止收发器芯片和线缆之间产生共模信号。同时它也可以在收发器与以太网设备之间提供电流隔绝。
Link/Activity LED	2 个 LED (绿色和红色), 可分别显示 PHY 处于 “Link” 状态或 “Activity” 状态。
BOOT Button	下载按键。按下 <b>BOOT</b> 键并保持, 同时按一下 <b>EN</b> 键 (此时不要松开 <b>BOOT</b> 键) 进入 “固件下载” 模式, 通过串口下载固件。
EN 按键	复位按键。
GPIO Header 1	由 6 个未引出通孔组成, 可连接至 ESP32 的备用 GPIO。具体介绍, 请见 <a href="#">GPIO Header 1</a> 。

**PoE 子板 (B 板)** PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板 (A 板) 提供电源。PoE 子板 (B 板) 的主要组件见 [功能概述](#) 中的功能框图。

PoE 子板 (B 板) 具有以下特性：

- 支持 IEEE 802.3at 标准
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板 (A 板) 上的 **RJ45 Port** 连接至 PoE 的交换机。以太网母板 (A 板) 检测到来自 PoE 子板 (B 板) 的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

图 19: ESP32-Ethernet-Kit - PoE 子板 (B 板) 布局 (点击放大)

表 2: 表格 2 PoE 子板 (B 板)

主要组件	基本介绍
A 板连接器	4 个排针 (左侧) 和排母 (右侧)，用于将 PoE 子板 (B 板) 连接至 <a href="#">Ethernet board (A)</a> 。左侧的管脚接受来自 PoE 交换机的电源。右侧的管脚为以太网母板 (A 板) 提供 5 V 电源。
外部电源终端	PoE 子板 (B 板) 可选电源 (26.6 ~ 54 V)。

## 设置选项

本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

**功能选择开关** 拨码开关打开时，拨码开关将列出的 GPIO 路由到 FT2232H 以提供 JTAG 功能。拨码开关关闭时，GPIO 可以用于其他目的。

拨码开关	GPIO 管脚
1	GPIO13
2	GPIO12
3	GPIO15
4	GPIO14

**注解：** 拨码开关旁边开发板的丝印层上的 GPIO 管脚标记的位置是不正确的。请以表格中的顺序为准。

**RMII 时钟源选择** RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50MHz 同步时钟 (即 RMII 时钟)，它既可以由外部提供，也可以由内部的 ESP32 APLL 产生。

**注解：** 有关 RMII 时钟源选择的更多信息，请参见 [ESP32-Ethernet-Kit V1.1 以太网母板 \(A 板\) 原理图](#)，第 2 页的位置 D2。

图 20: PHY 侧提供 RMIi 时钟

**PHY 侧提供 RMII 时钟** ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M\_CLKO 信号线提供 RMII 时钟，该时钟信号由 PHY 外侧连接的 25MHz 无源晶振经过倍频产生。详情请参见下图。

请注意，系统上电时 RESET\_N 旁的下拉电阻会将 PHY 置于复位状态，ESP32 需要通过 GPIO5 将 RESET\_N 拉高才能启动 PHY，只有这样才能保证系统的正常上电，否则 ESP32 会存在一定几率进入下载模式（当 REF\_CLK\_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平）。

**ESP32 APLL 内部提供的 RMII 时钟** 另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

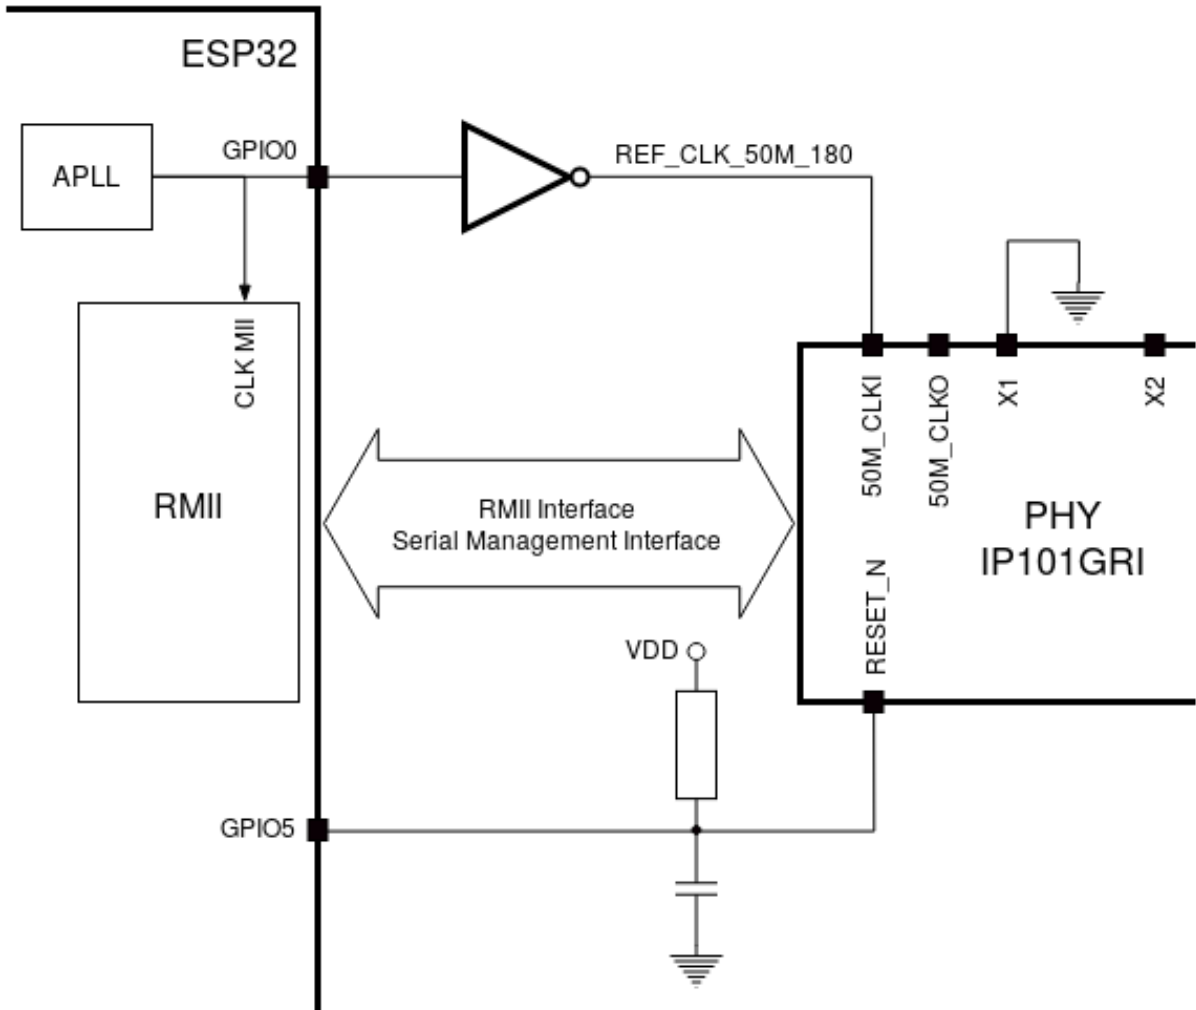

图 21: ESP32 APLL 内部提供的 RMII 时钟

要实现此选项，用户需要在板子上移除或添加一些阻容元器件。有关详细信息，请参见 [ESP32-Ethernet-Kit V1.1 以太网母板 \(A 板\) 原理图](#)，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

## GPIO 分配

本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

**IP101GRI (PHY) 接口** 下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。

.	ESP32 管脚 (MAC)	IP101GRI (PHY)
<i>RMII</i> 接口		
1	GPIO21	TX_EN
2	GPIO19	TXD[0]
3	GPIO22	TXD[1]
4	GPIO25	RXD[0]
5	GPIO26	RXD[1]
6	GPIO27	CRS_DV
7	GPIO0	REF_CLK
串行管理接口		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY</i> 复位		
10	GPIO5	Reset_N

**注解：**除了 REF\_CLK 之外，ESP32 的 *RMII* 接口下的所有管脚分配都是固定的，不能通过 IOMUX 或 GPIO 矩阵进行更改。

**GPIO Header 1** 本连接器包括 ESP32-Ethernet-Kit 开发板上部分不用做他用的 GPIO。

.	ESP32 管脚
1	GPIO32
2	GPIO33
3	GPIO34
4	GPIO35
5	GPIO36
6	GPIO39

**GPIO Header 2** 根据“说明”描述的不同情形，本连接器包含可用做他用的 GPIO。

.	ESP32 管脚	说明
1	GPIO17	见下方说明 1
2	GPIO16	见下方说明 1
3	GPIO4	
4	GPIO2	
5	GPIO13	见下方说明 2
6	GPIO12	见下方说明 2
7	GPIO15	见下方说明 2
8	GPIO14	见下方说明 2
9	GND	Ground
10	3V3	3.3 V 电源

**注解：**

- ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
- 具体功能取决于 [功能选择开关](#) 的设置。

**GPIO 管脚分配总结**

ESP32-WROVER-B	IP101GRI	UART	JTAG	GPIO	Comments
S_VP				IO36	
S_VN				IO39	
IO34				IO34	
IO35				IO35	
IO32				IO32	
IO33				IO33	
IO25	RXD[0]				
IO26	RXD[1]				
IO27	CRS_DV				
IO14			TMS	IO14	
IO12			TDI	IO12	
IO13		RTS	TCK	IO13	
IO15		CTS	TDO	IO15	
IO2				IO2	
IO0	REF_CLK				See note 1
IO4				IO4	
IO16				IO16 (NC)	See note 2
IO17				IO17 (NC)	See note 2
IO5	Reset_N				See note 1
IO18	MDIO				
IO19	TXD[0]				
IO21	TX_EN				
RXD0		RXD			
TXD0		TXD			
IO22	TXD[1]				
IO23	MDC				

**注解:**

1. 为防止 ESP32 侧 GPIO0 的上电状态受 PHY 侧时钟输出的影响，PHY 侧 RESET\_N 默认为低，以关闭 PHY 侧时钟输出。上电后，您可通过 GPIO5 控制 RESET\_N 以打开该时钟输出。参见 [PHY 侧提供 RMI 时钟](#)。对于无法通过 RESET\_N 关闭时钟输出的 PHY，PHY 侧建议使用可在外部禁用/使能的有源晶振。与使用 RESET\_N 类似，默认情况下晶振模块应禁用，并在上电后由 ESP32 开启。有关参考设计，请参见 [ESP32-Ethernet-Kit V1.1 以太网母板 \(A 板\) 原理图](#)。
2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GP1016 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。

**应用程序开发**

ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

**初始设置**

1. 首先，请将 [以太网母板 \(A 板\)](#) 上的所有开关均拨至 **ON** 状态，使 **功能选择开关** 处于默认状态。
2. 为了方便应用程序的下载和测试，不要为开发板输入任何信号。
3. 此时可以连接 [PoE 子板 \(B 板\)](#)，但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将 [以太网母板 \(A 板\)](#) 连接至 PC。
5. 将 **电源开关** 从 GND 拨至 5V0 一侧。此时，**5V Power On LED** 应点亮。

**正式开始开发** 现在，请前往 [快速入门](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

请务必在进入下一步前，确保您已完成上述所有步骤。

**配置与加载以太网示例** 在完成开发环境设置和开发板测试后，您可以配置并烧录 [ethernet/ethernet](#) 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 *ESP32-Ethernet-Kit V1.1* 开发板使用的 **IP101GRI**。

### 针对 ESP32-Ethernet-Kit V1.0 的主要修改：

- 原 GPIO0 反相后时钟提供给 PHY 方案改为由 PHY 侧外接无源晶振，提供时钟给 GPIO0。原用于控制有源晶振的 OSC\_EN 的 IO2 释放，可用作其他用途。
- 为防止 ESP32 侧 GPIO0 的上电状态受到 PHY 侧时钟输出的影响，PHY 侧 RESET\_N 默认为低，关闭 PHY 侧时钟输出。而后可通过 GPIO5 控制 RESET\_N 打开该时钟输出。
- 移除 FT2232H 芯片的外部 SPI Flash U6。
- 移除流控的测试排针 J4。
- 移除 nTRST JTAG 信号，相应的 GPIO4 可用作其他用途。
- GPIO15 线上的上拉电阻 R68 移至 JTAG 的 MTDO 侧。
- 为了加强 A 板和 B 板连接间的防呆设计（减少反向插入 B 板的机会），将原先 A 板上的 2 排 4 针排针改为 1 排 4 针排母和 1 排 4 针排针。相应的 4 针排针排和排母排则安装在 B 板上。

### ESP32-Ethernet-Kit V1.0 入门指南 [\[English\]](#)

本指南介绍了如何使用 ESP32-Ethernet-Kit 开发板以及配置相关功能。

*ESP32-Ethernet-Kit* 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 也同时支持以太网供电 (PoE)。

### 准备工作

- [ESP32-Ethernet-Kit V1.0 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

**概述** ESP32-Ethernet-Kit 是一款来自 [乐鑫](#) 的开发板，由以太网子板 (A 板) 和 PoE 子板 (B 板) 两部分组成。其中 [以太网子板 \(A 板\)](#) 贴蓝牙 / Wi-Fi 双模 ESP32-WROVER-B 模组和单端口 10/100 快速以太网收发器 (PHY) IP101GRI。 [PoE 子板 \(B 板\)](#) 提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器 (FTDI FT2232H 芯片)，进而允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 适配器。

**功能概述** ESP32-Ethernet-Kit 开发板的主要组件和连接方式见下。

图 22: ESP32-Ethernet-Kit V1.0

图 23: ESP32-Ethernet-Kit 功能框图 (点击放大)

**功能说明** ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式见下。

图 24: ESP32-Ethernet-Kit - 以太网子板 (A 板) 布局 (点击放大)

**以太网子板 (A 板)** 下表将从图片右上角开始, 以顺时针顺序介绍图中的主要组件。

主要组件	基本介绍
ESP32-WROVER-B 模组	这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
GPIO Header 2	由 5 个未引出通孔组成，可连接至 ESP32 的部分 GPIO。具体介绍，请见 <a href="#">GPIO Header 2</a> 。
流控	跳线帽，可接入开发板信号。具体介绍，请见 <a href="#">流控</a> 。
功能选择开关	DIP 开关，可配置 ESP32 部分 GPIO 的功能。具体介绍，请见 <a href="#">功能选择开关</a> 。
Tx/Rx LED	2 个 LED，可显示 UART 传输的状态。
GPIO Header 3	可连接至 ESP32 的部分 GPIO，根据 <a href="#">功能选择开关</a> 的位置有不同功能。
FT2232H	FT2232H 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232H 芯片进行控制和编程，与 ESP32 建立连接。FT2232H 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。见 <a href="#">ESP32-Ethernet-Kit V1.0 以太网子板 (A 板) 原理图</a> 。
USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源开关	电源开关。拨向 <b>Boot</b> 按键一侧，开发板上电；拨离 <b>Boot</b> 按键一侧，开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
5V Power On LED	当开发板通电后（USB 或外部 5V 供电），该红色指示灯将亮起。
DC/DC 转换器	直流 5 V 转 3.3 V，输出电流高达 2 A。
B 板连接器	1 对 2 针排针，用于连接 <a href="#">PoE 子板 (B 板)</a> 。
IP101GRI (PHY)	物理层 (PHY) 单端口 10/100 快速以太网收发器 <a href="#">IP101GRI</a> ，允许开发人员实现与以太网线缆的物理层连接。PHY 与 ESP32 通过简化媒体独立接口 (RMII) 实现连接。RMII 是 <a href="#">媒体独立接口 (MII)</a> 的简化版本。PHY 可在 10/100 Mbps 速率下支持 IEEE 802.3 / 802.3u 标准。
RJ45 端口	以太网数据传输端口。
网络变压器	网络变压器属于以太网物理层的一部分，可保护电路免受故障和电压瞬变影响，包括防止收发器芯片和线缆之间产生共模信号。同时它也可以在收发器与以太网设备之间提供电流隔绝。
Link/Activity LED	2 个 LED（绿色和红色），可分别显示 PHY 处于“Link”状态或“Activity”状态。
BOOT 按键	下载按键。按下 <b>BOOT</b> 键并保持，同时按一下 <b>EN</b> 键（此时不要松开 <b>BOOT</b> 键）进入“固件下载”模式，通过串口下载固件。
CH_PU 按键	复位按键。
GPIO Header 1	由 6 个未引出通孔组成，可连接至 ESP32 的备用 GPIO。具体介绍，请见 <a href="#">GPIO Header 1</a> 。

**PoE 子板 (B 板)** PoE 子板通过以太网电缆传输电能 (PoE)，为以太网子板 (A 板) 提供电源。PoE 子板 (B 板) 的主要组件见 [功能概述](#) 中的功能框图。

PoE 子板 (B 板) 具有以下特性:

- 支持 IEEE 802.3at
- 电源输出: 5 V, 1.4 A

如需使用 PoE 功能, 请用以太网线缆将以太网子板 (A 板) 上的 **RJ45 端口** 连接至 PoE 的交换机。以太网子板 (A 板) 检测到来自 PoE 子板 (B 板) 的 5 V 供电后, 将从 USB 供电自动切换至 PoE 供电。

图 25: ESP32-Ethernet-Kit - PoE 子板 (B 板) 布局 (点击放大)

主要组件	基本介绍
A 板连接器	1 个 4 针排母, 用于将 B 板连接至以太网子板 (A 板)。
外部电源终端	PoE 子板 (B 板) 备用电源。

**设置选项** 本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

**功能选择开关** 用户可使用 **功能选择开关** 配置特定 GPIO 管脚的功能。

DIP SW	GPIO 管脚	管脚功能 (DIP SW 开启状态)
1.	GPIO14	连接至 FT2232H, 提供 JTAG 功能
2.	GPIO12	连接至 FT2232H, 提供 JTAG 功能
3.	GPIO13	连接至 FT2232H, 提供 JTAG 功能
4.	GPIO15	连接至 FT2232H, 提供 JTAG 功能
5.	GPIO4	连接至 FT2232H, 提供 JTAG 功能
6.	GPIO2	连接至板上 25 MHz 晶振
7.	GPIO5	连接至 IP101GRI 的 RESET_N 输入
8.	n/a	

用户还可以关闭 DIP DW, 将部分 GPIO 用于其他用途。

**流控** 2 x 2 跳线连接器, 可用于 UART 流控功能。

.	信号	备注
1.	MTDO	GPIO13, 见 <a href="#">功能选择开关</a> 。
2.	MTCK	GPIO15, 见 <a href="#">功能选择开关</a> 。
3.	RTS	FT2232H 的 RTS 信号
4.	CTS	FT2232H 的 CTS 信号

**GPIO 分配** 本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

**IP101GRI (PHY) 接口** ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系见下：

.	ESP32 管脚 (MAC)	IP101GRI (PHY)
<i>RMII</i> 接口		
1.	GPIO21	TX_EN
2.	GPIO19	TXD[0]
3.	GPIO22	TXD[1]
4.	GPIO25	RXD[0]
5.	GPIO26	RXD[1]
6.	GPIO27	CRS_DV
7.	GPIO0	REF_CLK
串行管理接口		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY</i> 复位		
10	GPIO5	Reset_N

**注解：**除了 REF\_CLK 之外，*RMII* 接口下的所有管脚分配都是固定的，不能通过 IOMUX 或 GPIO 矩阵进行更改。

**GPIO Header 1** 本连接器包括 ESP32-Ethernet-Kit 开发板上部分不用做他用的 GPIO。

.	ESP32 管脚
1.	GPIO32
2.	GPIO33
3.	GPIO34
4.	GPIO35
5.	GPIO36
6.	GPIO39

**GPIO Header 2** 本连接器包括具有特定 MII 功能的 GPIO (GPIO2 除外)。根据具体情况, 部分以太网应用程序可能需要使用此功能。

.	ESP32 管脚	MI I 功能	说明
1.	GPIO17	EMAC_CLK_180	见说明 1。
2.	GPIO16	EMAC_CLK_OUT	见说明 1。
3.	GPIO4	EMAC_TX_ER	
4.	GPIO2	n/a	见说明 2。
5.	GPIO5	EMAC_RX_CLK	见说明 2。

**注解:**

1. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚, 因此无法使用。如需使用 ESP32 的 GP1016 和 GPIO17 管脚, 建议更换其他不含 SPIRAM 的模组, 比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
2. 具体功能取决与[功能选择开关](#)的设置。

**GPIO Header 3** 本连接器中 GPIO 的功能取决与[功能选择开关](#)的设置。

.	ESP32 管脚
1.	GPIO15
2.	GPIO13
3.	GPIO12
4.	GPIO14
5.	GND
6.	3V3

#### 注解:

- GPIO2 用于使能 PHY 的外部振荡器。
- GPIO0 用于为 PHY 提供 50 MHz 基准时钟源。为了防止传输线路延迟对时钟相位带来的影响，该时钟信号将首先被反相，而后提供给 PHY。
- 为防止 PHY 端 GPIO0 的上电状态受到时钟输出的影响，PHY 的外部晶振将在 ESP32 上电后通过 GPIO2 使能。

4. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 SPIRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
- 

**应用程序开发** ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

### 初始设置

1. 首先，请将以太网子板 (A 板) 上的所有开关均拨至 ON 状态，即使功能选择开关处于默认状态。
2. 为了方便应用程序的下载和测试，此时请不要在开发板安装任何条线帽，也不要为开发板接入任何信号。
3. 此时可以连接 PoE 子板 (B 板)，但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将以太网子板 (A 板) 连接至 PC。
5. 将电源开关从 GND 拨至 5V0 一侧。此时，5V Power On LED 应点亮。

**正式开始开发** 现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

如需使用较早 GNU Make 编译系统，则请参考详细安装步骤 章节。

请务必在进入下一步前，确保您已完成上述所有步骤。

**配置与加载以太网示例** 在完成开发环境设置和开发板测试后，您可以配置并烧录 ethernet/ethernet 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.0 开发板 使用的 IP101GRI。

## 1.4 详细安装步骤

请根据下方详细步骤，完成安装过程。

### 1.4.1 设置开发环境

- [第一步：安装准备 \(Windows、Linux 和 macOS\)](#)
- [第二步：获取 ESP-IDF](#)
- [第三步：设置工具](#)
- [第四步：设置环境变量](#)

### 1.4.2 创建您的第一个工程

- [第五步：开始创建工程](#)
- [第六步：连接设备](#)
- [第七步：配置](#)
- [第八步：编译工程](#)
- [第九步：烧录到设备](#)

- 第十步：监视器

## 1.5 第一步：安装准备

在正式开始创建工程前，请先完成工具的安装，具体步骤见下：

### 1.5.1 Windows 平台工具链的标准设置

[English]

---

**注解：**目前，基于 CMake 的构建系统仅支持 64 位 Windows 版本。32 位 Windows 版本的用户可根据 [传统 GNU Make 构建系统](#) 中的介绍进行操作。

---

#### 概述

ESP-IDF 需要安装一些必备工具，才能围绕 ESP32 构建固件，包括 Python、Git、交叉编译器、menuconfig 工具、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过 **命令提示符** 进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 [Eclipse](#) 或其他支持 CMake 的图形化工具 IDE。

---

**注解：**较早 ESP-IDF 版本使用 [传统 GNU Make 编译系统](#) 和 MSYS2 Unix 兼容环境。但如今已非必需，用户可直接通过 Windows 命令提示符使用 ESP-IDF。

---

#### ESP-IDF 工具安装器

要安装 ESP-IDF 必备工具，最简易的方式是下载 ESP-IDF 工具安装器，地址如下：

<https://dl.espressif.com/dl/esp-idf-tools-setup-2.3.exe>

本安装器可为您安装所需的交叉编译器、OpenOCD、cmake 和 Ninja 编译工具，以及一款 `mconf-idf` 配置工具。此外，本安装器还可在有需要时下载、运行 Python 3.7 和 *Git For Windows* 的安装器。

本安装器还可用于下载任意 ESP-IDF 发布版本。

#### 使用命令提示符

在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 `cmd.exe`），并运行 `export.bat` 脚本以设置各环境变量（比如 `PATH`，`IDF_PATH` 等）。此外，您还可以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF（比如您需要不同的 ESP-IDF 版本）需要使用快捷方式，您可以：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的“当前路径”指定为您希望使用的 ESP-IDF 路径。
2. 运行 `cmd.exe`，并更新至您希望使用的 ESP-IDF 目录，然后运行 `export.bat`。注意，这种方法要求 `PATH` 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

## 后续步骤

当 ESP-IDF 工具安装器安装完成后，则开发环境设置也到此结束。后续开发步骤，请前往[第五步：开始创建工程](#)查看。

## 相关文档

想要自定义安装流程的高阶用户可参照：

## 在 Windows 环境下更新 ESP-IDF 工具

**使用脚本安装 ESP-IDF 工具** 请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行：

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行：

```
install.ps1
```

该命令可下载安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为：C:\Users\username\.espressif。

**使用“导出脚本”将 ESP-IDF 工具添加至 PATH** ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的 ESP-IDF 版本可能并未创建命令提示符快捷方式，此时您可以根据下方步骤将 ESP-IDF 工具添加至 PATH。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至 ESP-IDF 的安装路径，然后执行 `export.bat`：

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至 ESP-IDF 的安装路径，然后执行 `export.ps1`：

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

## 1.5.2 Linux 平台工具链的标准设置

[\[English\]](#)

### 安装准备

编译 ESP-IDF 需要以下软件包：

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake_
↪ninja-build ccache
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-
↳setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util
```

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja-
↳ccache
```

**注解:** 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早版本的 Linux 可能需要升级才能向后移植仓库，或安装 “cmake3” 软件包，而不是安装 “cmake”。

## 其他提示

**权限问题 /dev/ttyUSB0** 使用某些 Linux 版本向 {IDF\_TARGET\_NAME} 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 [Linux Dialout 组](#)。

**设置 Python 3 为 CentOS 默认 Python 版本** CentOS 7 及更早的版本提供 Python 2.7 作为默认解释器。但这里推荐使用 Python 3，您可以运行下方命令安装 Python 3。或者查看当前所用系统的相关文档，按照文档推荐的其它方法安装 Python 3:

```
sudo yum -y update && sudo yum install python3 python3-pip python3-setuptools
```

设置 Python 3 为默认 Python 版本:

```
sudo update-alternatives --install /usr/bin/python python /usr/bin/python3 10 &&
↳alias pip=pip3
```

**设置 Python 3 为 Ubuntu 和 Debian 默认 Python 版本** Ubuntu (v18.04 及之前的版本) 和 Debian (v9 及之前的版本) 的默认解释器为 Python 2.7，但这里推荐使用 Python 3，您可以运行下方命令安装 Python 3。或者查看当前所用系统的相关文档，按照文档推荐的其它方法安装 Python 3:

```
sudo apt-get install python3 python3-pip python3-setuptools
```

设置 Python 3 为默认 Python 版本:

```
sudo update-alternatives --install /usr/bin/python python /usr/bin/python3 10 &&
↳alias pip=pip3
```

**注解:** 上述设置为全局设置，同时会影响到其它应用。

## 修复 Ubuntu 16.04 损坏的 pip

python3-pip 包可能已损坏无法升级。需使用脚本 [get-pip.py](#) 手动删除并安装该包:

```
apt remove python3-pip python3-virtualenv; rm -r ~/.local
rm -r ~/.espressif/python_env && python get-pip.py
```

## 停用 Python 2

Python 2 已经 [结束生命周期](#)，ESP-IDF 很快将不再支持 Python 2。请安装 Python 3.6 或以上版本。可参考上面列出的目前主流 Linux 发行版的安装说明。

## 后续步骤

继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

### 1.5.3 MacOS 平台工具链的标准设置

[English]

#### 安装准备

ESP-IDF 将使用 Mac OS 上默认安装的 Python 版本。

- 安装 pip:

```
sudo easy_install pip
```

- 安装 CMake 和 Ninja 编译工具：
  - 若有 [HomeBrew](#)，您可以运行:

```
brew install cmake ninja
```

- 若有 [MacPorts](#)，您可以运行:

```
sudo port install cmake ninja
```

- 若以上均不适用，请访问 [CMake](#) 和 [Ninja](#) 主页，查询有关 Mac OS 平台的下载安装问题。
- 强烈建议同时安装 [ccache](#) 以获得更快的编译速度。如有 [HomeBrew](#)，可通过 [MacPorts](#) 上的 `brew install ccache` 或 `sudo port install ccache` 完成安装。

**注解：** 如您在上述任何步骤中遇到以下错误:

```
``xcrun: error: invalid active developer path (/Library/Developer/
↪CommandLineTools), missing xcrun at:/Library/Developer/CommandLineTools/usr/bin/
↪xcrun``
```

则必须安装 XCode 命令行工具，具体可运行 `xcode-select --install`。

**安装并设置 Python 3 为默认版本** [Catalina 10.15 发布说明](#) 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本:

```
python --version
```

如果输出结果是 Python 2.7.17，则代表您的默认解析器是 Python 2.7。这时需要您运行以下命令检查电脑上是否已经安装过 Python 3:

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3 并使其成为默认解释器:

- 使用 [HomeBrew](#) 进行安装的方法如下:

```
brew install python3
ln -s /usr/local/bin/python3.8 /usr/local/bin/python
```

将上述的目录名 `/usr/local/bin/python3.8` 修改为 Python 3 所在的目录。您可以运行 `which -a python3` 来查看 Python 3 所在的目录。

- 使用 [MacPorts](#) 进行安装的方法如下:

```
sudo port install python38
sudo port select --set python python38
```

现在您可以打开终端窗口验证默认运行的 Python 版本:

```
python --version
```

如果输出结果类似于 Python 3.8.5 则代表安装成功。

**注解:** 上述设置为全局设置, 同时会影响到其它应用。

## 停用 Python 2

Python 2 已经 [结束生命周期](#), ESP-IDF 很快将不再支持 Python 2。请安装 Python 3.6 或以上版本。可参考上面列出的 macOS 安装说明。

## 后续步骤

继续设置开发环境, 请前往[第二步: 获取 ESP-IDF](#) 章节。

## 1.6 第二步: 获取 ESP-IDF

在围绕 ESP32 构建应用程序之前, 请先获取乐鑫提供的软件库文件 [ESP-IDF 仓库](#)。

获取 ESP-IDF 的本地副本: 打开终端, 切换到您要保存 ESP-IDF 的工作目录, 使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤, 请见下文。

**注解:** 在本文档中, Linux 和 macOS 操作系统中 ESP-IDF 的默认安装路径为 `~/esp`; Windows 操作系统的默认路径为 `%userprofile%\esp`。您也可以将 ESP-IDF 安装在任何其他路径下, 但请注意在使用命令行时进行相应替换。注意, ESP-IDF 不支持带有空格的路径。

### 1.6.1 Linux 和 macOS 操作系统

打开终端, 后运行以下命令:

```
cd ~/esp
git clone -b v4.1.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往[ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

## 1.6.2 Windows 操作系统

除了能安装必要工具外，第一步中介绍的[ESP-IDF 工具安装器](#)也能同时下载 ESP-IDF 本地副本。

请前往[ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

除了使用 ESP-IDF 工具安装器，您也可以参考[指南](#)手动下载 ESP-IDF。

## 1.7 第三步：设置工具

除了 ESP-IDF 本身，您还需要安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

### 1.7.1 Windows 操作系统

请根据第一步中对 Windows ([ESP-IDF 工具安装器](#)) 的介绍，安装所有必需工具。

除了使用 ESP-IDF 工具安装器，您可以通过 **命令提示符窗口** 手动安装这些工具。具体步骤见下：

```
cd %userprofile%\esp\esp-idf
install.bat
```

或使用 Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1
```

### 1.7.2 Linux 和 macOS 操作系统

```
cd ~/esp/esp-idf
./install.sh
```

### 1.7.3 自定义工具安装路径

本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户根文件夹中，即 Linux 和 macOS 系统中的 `$HOME/.espressif` 和 Windows 系统的 `%USERPROFILE%\espressif`。此外，您可以将工具安装到其他目录中，但请在运行安装脚本前，重新设置环境变量 `IDF_TOOLS_PATH`。注意，请确保您的用户已经具备了读写该路径的权限。

如果修改了 `IDF_TOOLS_PATH` 变量，请确保该变量在每次执行“安装脚本”(`install.bat`、`install.ps1` 或 `install.sh`) 和导出脚本 (`export.bat`、`export.ps1` 或 `export.sh`) 均保持一致。

## 1.8 第四步：设置环境变量

此时，您刚刚安装的工具尚未添加至 `PATH` 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量，这可以通过 ESP-IDF 提供的另一个脚本完成。

## 1.8.1 Windows 操作系统

Windows 安装器 (*ESP-IDF 工具安装器*) 可在“开始”菜单创建一个“ESP-IDF Command Prompt”快捷方式。该快捷方式可以打开命令提示符窗口，并设置所有环境变量。您可以点击该快捷方式，然后继续下一步。

此外，如果您希望在当下命令提示符窗口使用 ESP-IDF，请使用下方代码：

```
%userprofile%\esp\esp-idf\export.bat
```

或使用 Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

## 1.8.2 Linux 和 macOS 操作系统

请在您需要运行 ESP-IDF 的“命令提示符”窗口运行以下命令：

```
.$HOME/esp/esp-idf/export.sh
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 `export.sh` 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中 (`.profile`, `.bashrc`, `.zprofile` 等)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 `esp-idf` 环境。

这里不建议您直接将 `export.sh` 添加到 shell 的配置文件。因为这会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的情况），从而破坏使用虚拟环境的目的，并可能影响其他软件的使用。

## 1.9 第五步：开始创建工程

现在，您可以开始准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

将 `get-started/hello_world` 复制至您本地的 `~/esp` 目录下：

### 1.9.1 Linux 和 macOS 操作系统

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

### 1.9.2 Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 `examples` 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

---

**重要：** ESP-IDF 编译系统不支持带有空格的路径。

---

## 1.10 第六步：连接设备

现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Windows 操作系统：** COM1 等
- **Linux 操作系统：** 以 /dev/tty 开始
- **macOS 操作系统：** 以 /dev/cu. 开始

有关如何查看串口名称的详细信息，请见与 [ESP32 创建串口连接](#)。

---

**注解：** 请记住串口名，您会在下面的步骤中用到。

---

## 1.11 第七步：配置

请进入 [第五步：开始创建工程](#) 中提到的 hello\_world 目录，并运行工程配置工具 menuconfig。

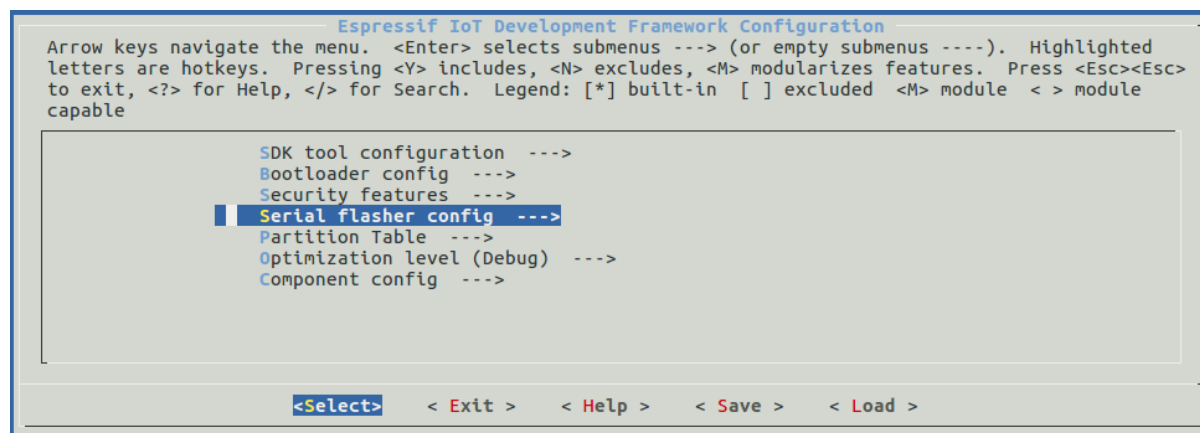

### 1.11.1 Linux 和 macOS 操作系统

```
cd ~/esp/hello_world
idf.py menuconfig
```

### 1.11.2 Windows 操作系统

```
cd %userprofile%\esp\hello_world
idf.py menuconfig
```

如果之前的步骤都正确，则会显示下面的菜单：

工程配置—主窗口

**注解：**您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。更多信息，请运行 `idf.py menuconfig --help` 命令。

menuconfig 工具的常见操作见下。

- 上下箭头：移动
- 回车：进入子菜单
- ESC 键：返回上级菜单或退出
- 英文问号：调出菜单或选项的帮助菜单，按回车键可退出帮助菜单。
- 空格或 Y 键：选择 [\*] 配置选项；N 键：禁用 [\*] 配置选项
- / 键：寻找配置工程

**注意：**如果您使用的是 ESP32-DevKitC (板载 ESP32-SOLO-1 模组)，请在烧写示例程序前，前往 menuconfig 中使能单核模式 (`CONFIG_FREERTOS_UNICORE`)。

## 1.12 第八步：编译工程

请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 bootloader、分区表和应用程序二进制文件。

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello-world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello-world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

如果一切正常，编译完成后将生成 .bin 文件。

## 1.13 第九步：烧录到设备

请使用以下命令，将刚刚生成的二进制文件烧录至您的 ESP32 开发板：

```
idf.py -p PORT [-b BAUD] flash
```

请将 PORT 替换为 ESP32 开发板的串口名称，具体可见[第六步：连接设备](#)。

您还可以将 BAUD 替换为您希望的烧录波特率。默认波特率为 460800。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

**注解：**勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

```
Running esptool.py in directory [...]esp/hello_world
Executing "python [...]esp-idf/components/esptool_py/esptool/esptool.py -b 460800_
↳write_flash @flash_project_args"...
esptool.py -b 460800 write_flash --flash_mode dio --flash_size detect --flash_freq_
↳40m 0x1000 bootloader/bootloader.bin 0x8000 partition_table/partition-table.bin_
↳0x10000 hello-world.bin
esptool.py v2.3.1
Connecting....

Wrote 136672 bytes (67544 compressed) at 0x00010000 in 1.9 seconds (effective 567.
↳5 kbit/s)...
Hash of data verified.

Leaving...
Hard resetting via RTS pin...
```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“`hello_world`”开始运行。

## 1.14 第十步：监视器

您可以使用 `make monitor` 命令，监视“`hello_world`”的运行情况。注意，不要忘记将 `PORT` 替换为您的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动：

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]esp/hello_world/build
Executing "python [...]esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_
↳world/build/hello-world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
...
Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 Ctrl+]，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（见下），很有可能是因为您的开发板采用了 26 MHz 晶振，而 ESP-IDF 默认支持大多数开发板使用的 40 MHz 晶振。

```
e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp
```

此时，您可以：

1. 退出监视器。
2. 打开 [menuconfig](#)。
3. 进入 Component config → ESP32-specific → Main XTAL frequency 进行配置，将 [CONFIG\\_ESP32\\_XTAL\\_FREQ\\_SEL](#) 设置为 26 MHz。
4. 然后，请重新编译和烧录应用程序。

**注解：**您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往 [IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往 [idf.py](#)，查看更多 idf.py 命令和选项。

**恭喜，您已完成 ESP32 的入门学习！**

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

## 1.15 更新 ESP-IDF

乐鑫会不时推出更新版本的 ESP-IDF，修复 bug 或提出新的特性。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，然后按照 [第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

此外，您可以仅更新变更部分。具体方式取决于您使用的 ESP-IDF 版本，请前往 [更新](#) 章节查看。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考 [第三步：设置工具](#)。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考 [第四步：设置环境变量](#)。

## 1.16 相关文档

### 1.16.1 与 ESP32 创建串口连接

[\[English\]](#)

本章节主要介绍如何创建 ESP32 和 PC 之间的串口连接。

## 连接 ESP32 和 PC

用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 开发板驱动程序的链接：

开发板	USB 驱动	备注
<a href="#">ESP32-DevKitC</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-LyraT</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-LyraTD-MSC</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-PICO-KIT</a>	<a href="#">CP210x</a>	
<a href="#">ESP-WROVER-KIT</a>	<a href="#">FTDI</a>	
<a href="#">ESP32 Demo 板</a>	<a href="#">FTDI</a>	
<a href="#">ESP-Prog</a>	<a href="#">FTDI</a>	编程板 (w/o ESP32)
<a href="#">ESP32-MeshKit-Sense</a>	n/a	搭配 <a href="#">ESP-Prog</a> 使用
<a href="#">ESP32-Sense Kit</a>	n/a	搭配 <a href="#">ESP-Prog</a> 使用

- [CP210x: CP210x USB 至 UART 桥 VCP 驱动程序](#)
- [FTDI: FTDI 虚拟 COM 端口驱动程序](#)

以上驱动仅用于参考。一般情况下，当上述任一 ESP32 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

### 在 Windows 上查看端口

检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失，然后再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

### 在 Linux 和 MacOS 上查看端口

查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请运行两次以下命令。首先，断开开发板或适配器，第一次运行命令；然后，连接开发板或适配器，第二次运行命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口：

Linux

```
ls /dev/tty*
```

MacOS

```
ls /dev/cu.*
```

**注解：**对于 MacOS 用户：若你没有看到串口，请检查你是否已按照《入门指南》安装了适用于你特定开发板的 USB/串口驱动程序。对于 MacOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的加载，具体可打开系统偏好设置 -> 安全和隐私 -> 通用，检查是否有信息显示：“来自开发人员的系统软件...”，其中开发人员的名称为 Silicon Labs 或 FTDI。

### 在 Linux 中添加用户到 dialout

当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，你都可以通过以下命令，将用户添加到 dialout 组，来获取读写权限：

图 26: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

图 27: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限可以生效。

### 确认串口连接

现在，请使用串口终端程序，验证串口连接是否可用。在本示例中，我们将使用 [PuTTY SSH Client](#)，[PuTTY SSH Client](#) 既可用于 Windows 也可用于 Linux。你也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置串口：波特率 = 115200，数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

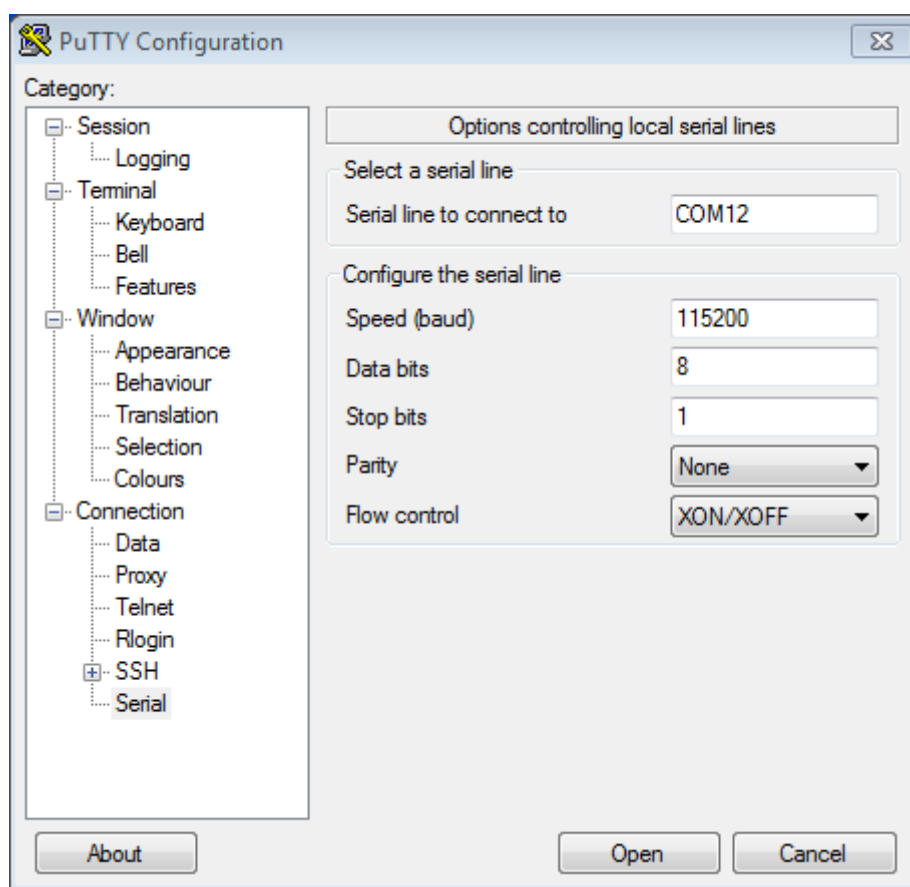

图 28: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

然后，请检查 ESP32 是否有打印日志。如有，请在终端打开串口进行查看。这里，日志内容取决于加载到 ESP32 的应用程序，下图即为一个示例。

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
```

(下页继续)

图 29: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

```

clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...

```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，你可以继续进行安装，并最终将应用程序上载到 ESP32。

**注解：**在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 引脚。该问题仅存在于将 RTS & DTR 引脚直接连接到 EN & GPIO0 引脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，参见 [esptool 文档](#)。

**注解：**请在验证完串口通信正常后，关闭串口终端。下一步，我们将使用另一个应用程序将新的固件上传到 ESP32。此时，如果串口被占用则无法成功。

如你在安装 ESP32 硬件开发的软件环境时，从 [第六步：连接设备](#) 跳转到了这里，请从 [第七步：配置](#) 继续阅读。

## 1.16.2 Eclipse IDE 创建和烧录指南

[\[English\]](#)

ESP-IDF V4.0 将默认采用基于 CMake 的编译系统。

对此，我们还推出了针对 CMake 编译系统的新 ESP-IDF Eclipse 插件。具体操作，请见 [ESP-IDF Eclipse 插件 <https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md>](https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md)。

如您仍需要对传统 GNU Make 编译系统的 Eclipse 支持，请前往 [传统 GNU Make 编译系统入门指南](#)，查看使用 [Eclipse IDE 进行编译与烧录](#) 章节。

## 1.16.3 IDF 监视器

[\[English\]](#)

IDF 监视器是一个串行终端程序，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用以下目标函数可以启用此监视器：

- 若使用 CMake 编译系统，则请调用：idf.py monitor
- 若使用传统 GNU Make 编译系统，请调用：make monitor

### 操作快捷键

为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。

快捷键	操作	描述
Ctrl+] ]	退出监视器程序	
Ctrl+T	菜单退出键	按下如下给出的任意键，并按指示操作。
• Ctrl+T	将菜单字符发送至远程	
• Ctrl+] ]	将 exit 字符发送至远程	
• Ctrl+P	重置目标设备，进入 Bootloader，通过 RTS 线暂停应用程序	重置目标设备，通过 RTS 线（如已连接）进入 Bootloader，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。
• Ctrl+R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl+F	编译并烧录此项目	暂停 idf_monitor，运行 idf.py flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。
• Ctrl+A (A)	仅编译及烧录应用程序	暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。
• Ctrl+Y	停止/恢复日志输出在屏幕上打印	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl+L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）
• Ctrl+H (H)	显示所有快捷键	

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

### 兼具 IDF 特性

**自动解码地址** ESP-IDF 输出形式为 0x4\_\_\_\_\_ 的十六进制代码地址后，IDF 监视器将使用 [addr2line](#) 查找该地址在源代码中的位置和对应的函数名。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:
PC      : 0x400f360d  PS      : 0x00060330  A0      : 0x800dbf56  A1      :

```

IDF 监视器在后台运行以下命令, 解码各地址:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**配置 GDBStub 以启用 GDB** 默认情况下, 如果 ESP-IDF 应用程序发生 crash 事件, panic 处理器将在串口上打印相关寄存器和堆栈转储 (类似上述情况), 然后重置开发板。

或者选择配置 panic 处理器以运行 GDBStub, GDBStub 工具可以与 GDB 项目调试器进行通信, 允许读取内存、检查调用堆栈帧和变量等。GDBStub 虽然没有 JTAG 通用, 但不需要使用特殊硬件。

如需启用 GDBStub, 请运行 `idf.py menuconfig` (适用于 CMake 编译系统), 并将 `CONFIG_ESP32_PANIC` 选项设置为 Invoke GDBStub。

在这种情况下, 如果 panic 处理器被触发, 只要 IDF 监视器监控到 GDBStub 已经加载, panic 处理器就会自动暂停串行监控并使用必要的参数运行 GDB。GDB 退出后, 通过 RTS 串口线复位开发板。如果未连接 RTS 串口线, 请按复位键, 手动复位开发板。

IDF 监控器在后台运行如下命令:

```
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↳ interrupt build/PROJECT.elf
```

**输出筛选** IDF 监视器有两种启用方式: 运行 `idf.py monitor PRINT_FILTER=""` (适用于 CMake) 或者 `make monitor PRINT_FILTER=""` (适用于传统 GNU Make), 其中, `--print-filter` 是输出筛选的参数。参数默认值为空字符串, 可打印任何内容。

若需对打印内容设置限制, 可指定 `<tag>:<log_level>` 等选项, 其中 `<tag>` 是标签字符串, `<log_level>` 是 {N, E, W, I, D, V, \*} 集合中的一个字母, 指的是日志级别。

例如, `PRINT_FILTER="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出, 或者写在较低冗余级别的输出, 即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用冗余级别默认值 `*`。

**注解:** 编译时, 可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置, 且无需重新编译应用程序。

应用程序标签不能包含空格、星号 `*`、分号 `:`, 以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车, 可能会影响输出筛选功能, 即, 监视器开始打印该行, 但后来发现该行不应该被写入。这是一个已知问题, 可以通过添加回车来避免此问题 (特别是在没有输出紧跟其后的情况下)。

### 筛选规则示例

- `*` 可用于匹配任何类型标签。但 `PRINT_FILTER="*:I tag1:E"` 打印关于 `tag1` 的输出时会报错, 这是因为 `tag1` 规则比 `*` 规则的优先级高。
- 默认规则 (空) 等价于 `*:V`, 因为在冗余级别或更低级别匹配任意标签即意味匹配所有内容。
- `"*:N"` 不仅抑制了日志功能的输出, 也抑制了 `printf` 的打印输出。为了避免这一问题, 请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`, 这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 冗余级别或更低级别打印 `tag1`, 在 Warning 冗余级别或更低级别打印 `tag2`。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则, 这是因为 `tag3:N` 指定 `tag3` 不打印。
- `tag3:N` 在规则 `"tag1:I tag2:W tag3:N *:V"` 中更有意义, 这是因为如果没有 `tag3:N`, `tag3` 信息就可能打印出来了; `tag1` 和 `tag2` 错误信息会打印在指定的冗余级别 (或更低级别), 并默认打印所有内容。

**高级筛选规则示例** 如下日志是在没有设置任何筛选选项的情况下获得的:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID ↵
↳ 1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

`PRINT_FILTER="wifi esp_image:E light_driver:I"` 筛选选项捕获的输出如下所示:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINTF\_FILTER="light\_driver:D esp\_image:N boot:N cpu\_start:N vfs:N wifi:N \*:V" 选项的输出如下:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

## IDF 监视器已知问题

### Windows 环境下已知问题

- 若在 Windows 环境下，出现 “winpty: command not found” 错误，请运行 `pacman -S winpty` 进行修复。
- 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
- 偶然情况下，`idf.py` 或 `make` 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
- GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

## 1.16.4 工具链的自定义设置

[English]

除了从乐鑫官网（请见 [第三步：设置工具](#)）下载二进制工具链外，您还可以自行编译工具链。

如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译工具链：

- 需要定制工具链编译配置
- 需要使用其他 GCC 版本（如 4.8.5）
- 需要破解 `gcc`、`newlib` 或 `libstdc++`
- 有相关兴趣或时间充裕
- 不信任从网站下载的 `bin` 文件

如需自行编译工具链，请查看以下文档：

### 从零开始设置 Windows 环境下的工具链

[English]

除了使用 [ESP-IDF 工具安装器](#)，用户也可以手动设置 Windows 环境下的工具链，这也是本文的主要内容。手动安装工具可以更好地控制安装流程，同时也方便高阶用户进行自定义安装。

使用 ESP-IDF 工具安装器对工具链及其他工具进行快速标准设置，请参照 [Windows 平台工具链的标准设置](#)。

---

**注解：** 基于 GNU Make 的构建系统要求 Windows 兼容 MSYS2 Unix，基于 CMake 的构建系统则无此要求。

---

### 获取 ESP-IDF

**注解：** 较早版本 ESP-IDF 使用了 MSYS2 `bash` 终端命令行。目前，基于 CMake 的编译系统可使用常见的 Windows 命令窗口，即本指南中使用的终端。

请注意，如果您使用基于 `bash` 的终端或 PowerShell 终端，一些命令语法将与下面描述有所不同。

---

打开命令提示符，运行以下命令：

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.1.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 %userprofile%\esp\esp-idf。

请前往[ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

---

**注解：** git clone 命令的 -b v4.1.1 选项告诉 git 从 ESP-IDF 仓库中克隆与此版本的文档对应的分支。

---

---

**注解：** 作为备份，还可以从 [Releases page](#) 下载此稳定版本的 zip 文件。不要下载由 GitHub 自动生成的“源代码”的 zip 文件，它们不适用于 ESP-IDF。

---

---

**注解：** 在克隆远程仓库时，不要忘记加上 --recursive 选项。否则，请接着运行以下命令，获取所有子模块

```
cd esp-idf
git submodule update --init
```

---

## 工具

**CMake 工具** 下载最新发布的 Windows 平台稳定版 [CMake](#)，并运行安装器。

当安装器询问“安装选项”时，选择“Add CMake to the system PATH for all users”（为所有用户的系统路径添加 CMake）或“Add CMake to the system PATH for the current user”（为当前用户的系统路径添加 CMake）。

## Ninja 编译工具

**注解：** 目前，Ninja 仅提供支持 64 位 Windows 版本的 bin 文件。您也可以配合其他编译工具在 32 位 Windows 版本中使用 CMake 和 idf.py，比如 mingw-make。但是目前暂无关于此工具的说明文档。

---

从 ([下载页面](#)) 下载最新发布的 Windows 平台稳定版 [ninja](#)。

适用于 Windows 平台的 Ninja 下载文件是一个 .zip 文件，包含一个 ninja.exe 文件。您需要将该文件解压到目录，并[添加到您的路径](#)（或者选择您路径中的已有目录）。

**Python** 下载并运行适用于 Windows 安装器的最新版 [Python](#)。

Python 安装器的“自定义”菜单可为您提供一系列选项，最后一项为“Add python.exe to Path”（添加 python.exe 到路径中）。请将该选项更改到“Will be installed”（将会安装）。

Python 安装完成后，从 Windows 开始菜单中打开“命令提示符”窗口，并运行以下命令：

```
pip install --user pyserial
```

**适用于 IDF 的 MConf** 从 [kconfig-frontends releases page](#) 下载配置工具 mconf-idf。此为 mconf 配置工具，可针对 ESP-IDF 进行少量自定义操作。

请将此工具解压到目录，并[添加到您的路径](#)。

**工具链设置** 下载预编译的 Windows 工具链:

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-win32.zip](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-win32.zip)

解压压缩包文件到 C:\Program Files (或其他位置)。压缩包文件包含一个 xtensa-esp32-elf 目录。

然后, 请将该目录下的 bin 子目录添加到您的路径。例如, C:\Program Files\xtensa-esp32-elf\bin。

---

**注解:** 如果您已安装 MSYS2 环境 (适用 “GNU Make” 编译系统), 则可以跳过下载那一步, 直接添加目录 C:\msys32\opt\xtensa-esp32-elf\bin 到路径, 因为 MSYS2 环境已包含工具链。

---

**添加目录到路径** 在 Windows 环境下, 向 Path 环境变量增加任何新目录, 请:

打开系统 “控制面板”, 找到环境变量对话框 (Windows 10 用户请前往 “高级系统设置”)。

双击 Path 变量 (选择 “用户” 或 “系统路径”, 具体取决于您是否希望其他用户路径中也存在该目录)。在最后数值那里新添 ;<new value>。

**后续步骤** 继续设置开发环境, 请前往 [第三步: 设置工具](#) 章节。

## 从零开始设置 Linux 环境下的工具链

[English]

除了从乐鑫官网直接下载已编译好的二进制工具链外, 您还可以按照本文介绍, 从头开始设置自己的工具链。如需快速使用已编译好的二进制工具链, 可回到 [Linux 平台工具链的标准设置](#) 章节。

**安装准备** 编译 ESP-IDF 需要以下软件包:

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf
↳python3 python3-pip cmake ninja-build ccache
```

目前仍然支持 CentOS 7, 但为了更好的用户体验, 建议使用 CentOS 8。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
↳pip python3-setuptools python3-serial python3-cryptography python3-future
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev
↳libssl-dev dfu-util
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial
↳python-cryptography python-future python-pyparsing python-pyelftools cmake
↳ninja ccache dfu-util
```

---

**注解:** 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库, 或开启 backports 套件库, 或安装 “cmake3” 软件包 (不是安装 “cmake”)。

---

**从源代码编译工具链** 安装依赖项:

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel ↵
↵automake bison flex texinfo help2man libtool make
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev ↵
↵automake bison flex texinfo help2man libtool make
```

- Ubuntu 16.04 或以上

```
sudo apt-get install gawk gperf grep gettext python python-dev automake bison ↵
↵flex texinfo help2man libtool libtool-bin make
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev ↵
↵automake bison flex texinfo help2man libtool libtool-bin make
```

- Arch:

```
sudo pacman -Sy --needed python-pip
```

创建工作目录，并进入该目录:

```
mkdir -p ~/esp
cd ~/esp
```

下载并编译 crosstool-NG :

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 ~/esp/crosstool-NG/builds/xtensa-esp32-elf。请按照[标准设置指南](#)的介绍，将工具链添加到 PATH。

**停用 Python 2** Python 2 已经 [结束生命周期](#)，ESP-IDF 很快将不再支持 Python 2。请安装 Python 3.6 或以上版本。可参考上面列出的目前主流 Linux 发行版的安装说明。

**后续步骤** 请前往[第二步：获取 ESP-IDF](#) 章节继续设置开发环境。

**从零开始设置 macOS 环境下的工具链**

[\[English\]](#)

**软件包管理器** 从零开始设置工具链，您需要安装 [MacPorts](#) 或 [homebrew](#) 软件包管理器。或者，您也可以直接[下载预编译的工具链](#)。

MacPorts 需要完整的 XCode 软件，而 homebrew 只需要安装 XCode 命令行工具即可。

请参考[工具链自定义设置](#) 章节，查看可能需要从头开始设置工具链的情况。

## 安装准备

- 安装 pip:

```
sudo easy_install pip
```

- 安装 pyserial:

```
pip install --user pyserial
```

- 安装 CMake 和 Ninja 编译工具:

- 若有 HomeBrew, 您可以运行:

```
brew install cmake ninja
```

- 若有 MacPorts, 您可以运行:

```
sudo port install cmake ninja
```

## 从源代码编译工具链 安装依赖项:

- 对于 MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf_
↳automake make
```

- 对于 homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool_
↳autoconf automake make
```

创建一个文件系统镜像 (区分大小写) :

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_
↳HFS+"
```

挂载:

```
hdiutil mount ~/esp/crosstool.dmg
```

创建指向您工作目录的符号链接:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

前往新创建的目录

```
cd ~/esp/ctng-volume
```

下载并编译 crosstool-NG

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf`。使用工具链前，请将 `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin` 添加至 `PATH` 环境变量。

**停用 Python 2** Python 2 已经 **结束生命周期**，ESP-IDF 很快将不再支持 Python 2。请安装 Python 3.6 或以上版本。可参考上面列出的 [macOS 安装说明](#)。

**后续步骤** 继续设置开发环境，请前往 [第二步：获取 ESP-IDF 章节](#)。

## 1.16.5 快速入门（传统 GNU Make）

[\[English\]](#)

---

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

---

本文档旨在指导用户搭建 ESP32 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32 开发板等步骤。

---

**注解：**这是 ESP-IDF 稳定版本 v4.1.1 的文档，还有其他版本的文档 [ESP-IDF 版本简介](#) 供参考。

---

### 概述

ESP32 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 蓝牙 4.2
- 高性能双核
- 超低功耗协处理器
- 多种外设

ESP32 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32 硬件设备的开发。其中，乐鑫的开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

### 准备工作

硬件：

- 一款 **ESP32** 开发板
- **USB 数据线** (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

软件：

- 设置 **工具链**，用于编译 ESP32 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32 使用的 API（软件库和源代码）和运行 **工具链** 的脚本；
- 安装 C 语言编程（工程）的 **文本编辑器**，例如 [Eclipse](#)。

图 30: ESP32 应用程序开发

## 开发板简介

请点击下方连接，了解有关具体开发板的详细信息。

## 详细安装步骤

请根据下方详细步骤，完成安装过程。

## 设置开发环境

- [Windows](#)、[Linux](#) 和 [macOS](#) 的第一步：设置工具链
- [第二步](#)：获取 [ESP-IDF](#)
- [第三步](#)：设置环境变量
- [第四步](#)：安装 [Python](#) 软件包

## 创建您的第一个工程

- [第五步](#)：开始创建工程
- [第六步](#)：连接设备
- [第七步](#)：配置
- [第八步](#)：编译和烧录
- [第九步](#)：监视器

## 第一步：设置工具链

工具链指一套用于编译代码和应用程序的程序。

为了加快开发进度，您可以直接使用乐鑫提供的预制工具链。请根据您的操作系统点击对应的链接，并按照链接中的指导进行安装。

## Windows 平台工具链的标准设置 (传统 GNU Make) [\[English\]](#)

**注解:** ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意, 未来, 我们可能不会继续支持基于 GNU Make 的构建系统。

**概述** Windows 系统没有内置的“make”环境, 所以除了安装工具链之外, 您还需要一个兼容 GNU 的环境。这里, 我们使用 MSYS2 环境兼容 GNU。您无需一直使用这个环境, 比如您可以使用 *Eclipse* 或其他前端, 仅需在后台运行 MSYS2 即可。

**工具链设置** 最简便的工具链设置方法是从下方地址下载 Windows 多合一工具链和 MSYS2 压缩包文件:

[https://dl.espressif.com/dl/esp32\\_win32\\_msys2\\_environment\\_and\\_esp2020r2\\_toolchain-20200601.zip](https://dl.espressif.com/dl/esp32_win32_msys2_environment_and_esp2020r2_toolchain-20200601.zip)

请将压缩包文件解压至 C:\` (或其他目录, 但本文档中以 `C:\ 为例), 该文件将为您创建一个带有预配置环境的 msys32 目录。

**开始尝试** 请运行 C:\msys32\mingw32.exe 文件, 打开一个 MSYS2 MINGW32 终端窗口。该窗口的环境为 bash shell。请创建一个名为 esp 的文件夹, 作为 ESP32 应用程序开发的默认目录。您可以使用以下命令创建文件夹:

```
mkdir -p ~/esp
```

您还可以通过 `cd ~/esp` 命令, 进入刚刚创建的文件夹。如无其他问题, 本步骤到此结束。

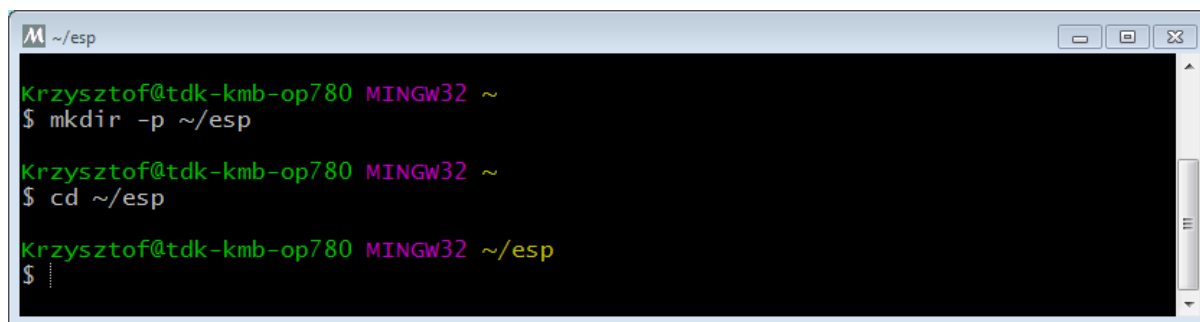

图 31: MSYS2 MINGW32 shell 窗口

请在后续步骤中, 使用本窗口配置 ESP32 的开发环境。

**后续步骤** 继续设置开发环境, 请前往 [第二步: 获取 ESP-IDF](#) 章节。

**更新环境** 当 IDF 有更新时, 有时需要安装新的工具链或为 Windows MSYS2 环境添加新的要求。如需将旧版本预编译环境中的数据迁移至新版本, 您可以:

1. 复制旧的 MSYS2 环境 (即 C:\msys32), 并将其移动/重命名到不同目录下 (即 C:\msys32\_old)。
2. 使用上述步骤, 下载新的预编译环境。
3. 将新的 MSYS2 环境解压缩至 C:\msys32 (或您指定的其他位置)。
4. 找到旧的 C:\msys32\_old\home 文件夹, 并将其移动至 C:\msys32。
5. 此时, 如无其他需要, 您可以删除旧的 C:\msys32\_old\home 文件夹。

注意, 您可以在电脑中安装多个不同的 MSYS2 环境, 仅需将它们保存在不同的路径下即可。

此外, 您还可以直接更新现有环境 (无需下载新的版本), 但步骤更加复杂。

## 相关文档

## 从零开始设置 Windows 环境下的工具链 (传统 GNU Make)

**注解:** ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

手动安装所有工具能更好地控制整个安装流程，同时也方便高阶用户进行自定义安装。此外，经验不足的用户还可以参考[预编译环境](#)中的步骤进行准备。

使用预编译环境对工具链进行快速标准设置，请参照[Windows 平台工具链的标准设置 \(传统 GNU Make\)](#)。

**从零开始配置工具链和环境** 本流程包括：首先，安装 MSYS2；其次，安装 ESP-IDF 所需的 Python 工具包；最后，下载并安装 Xtensa 工具链。

- 请前往 [MSYS2 安装器](#) 页面，并下载 `msys2-i686-xxxxxxx.exe` 安装器 (我们仅支持 32-bit MSYS 环境，32 位和 64 位 Window 均可使用)。截止至本文最新更新之时，最新版安装器为 `msys2-i686-20161025.exe`。
- 完成所有安装步骤。**最后一步时，请不要勾选 “Run MSYS2 32-bit now”。**
- 安装完成后，请从“开始”菜单中找到“MSYS2 MinGW 32-bit”，运行“命令提示符”窗口。
  - 为什么要特别打开这个终端窗口？MSYS2 会对不同环境进行区分。默认的“MSYS”环境与 Cygwin 相仿，会为 Windows 系统的 API 调用增加一个转换层。但为了使用支持 COM 端口的原生 Python，我们需要准备好“MinGW”环境。
- GitHub 上的 ESP-IDF 仓库的 `tools` 目录下可以找到名为 `windows_install_prerequisites.sh` 的脚本。如果您还没有本地 ESP-IDF 副本，也可以从以下地址进行下载 (请下载 raw 格式): [tools/windows/windows\\_install\\_prerequisites.sh](#)，并将其保存至您的电脑。
- 请在 MSYS2 终端窗口中指定该脚本的保存路径。注意，路径格式与 Window 路径相同，但需使用正斜杠 (/) 而不是反斜杠 (\)。例 `C:/Users/myuser/Downloads/windows_install_prerequisites.sh`。当然，您也可以直接打开查看该脚本的内容。
- `windows_install_prerequisites.sh` 脚本将帮您下载并安装支持 ESP-IDF 的软件包和 ESP32 工具链。

### 疑难解答

- MSYS 可能在脚本运行过程中进行自动升级，导致无法使用。此时，您会看到以下错误信息：

```
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408
```

这个问题很大可能是由于 cygwin DLL 版本不兼容。

这种情况下，请完全关闭终端窗口 (相当于终止所有进程)，并重新打开一个窗口。然后，请在新窗口中重新运行 `windows_install_prerequisites.sh` (小技巧：您可以使用“向上箭头”找到之前运行的命令)。此时，更新流程将重启。

- 注意，MSYS2 是一个“滚动”发行版，因此安装脚本可能会为您安装比“预编译环境”中更新的软件包。因此，如果遇到与 MSYS2 安装包有关的错误，请前往 [MSYS2-packages 问题列表](#) 页面寻找答案。如果未找到所需答案，请 [提交一个 IDF Issue](#)。

**中国地区的 MSYS2 镜像** 中国地区有一些 (非官方) 的 MSYS2 镜像，这可以大幅提高中国地区的下载速度。

如需添加这些镜像，请在运行安装脚本前修改以下两个 MSYS2 镜像列表文件。镜像文件的保存路径为 `/etc/pacman.d`，比如 `c:\msys2\etc\pacman.d`。

请在 `mirrorlist.mingw32` 最上方增加如下语句：

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

请在 `mirrorlist.msys` 最上方增加如下语句：

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

**HTTP 代理** 您可以在运行“设置脚本”之前，在终端中设置 `http_proxy` 变量，从而允许使用 HTTP 代理下载 MSYS 和 PIP:

```
export http_proxy='http://http.proxy.server:PORT'
```

或者修改证书:

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

如需始终用代理使用 MSYS，请在 MSYS 目录中增加 `/etc/profile`。

**其他设置：下载工具链** 如果您已经安装了 MSYS2，或者想要以不同的方式执行操作，您可以在此处下载工具链:

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-win32.zip](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-win32.zip)

---

**注解:** 如果您已完成了[从零开始配置工具链和环境](#)中介绍的所有步骤，则已经拥有了工具链，这里无需重复下载。

---

---

**重要:** 仅拥有工具链尚无法让您在 Windows 中使用 ESP-IDF。除此之外，您还至少需要安装 GNU make、bash 和 sed。上述环境已经包括这些配置，此外还有一个主机编译器（这样才能使用 `menuconfig`）。

---

**后续步骤** 继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

**更新环境** 当 IDF 有更新时，有时需要安装新的工具链或为 Windows MSYS2 环境添加新的系统要求。此时，您无需重新配置环境，仅需更新现有 Windows 环境和工具链即可。

- 将 IDF 更新至您希望的版本。
- 请运行 IDF 仓库中的 `tools/windows/windows_install_prerequisites.sh` 脚本。该脚本将帮您安装所有新的软件包，并下载更新工具链至最新版本。

注意，该脚本在更新 MSYS2 时也会遇到[疑难解答](#)中介绍的问题。

如需要同时支持多个 IDF 版本，您可以在不同的目录下配置独立的 MSYS2 环境。或者，您还可以下载多个工具链，并将其解压缩到不同的目录下，然后使用 `PATH` 环境变量指定默认工具链。

**Linux 平台工具链的标准设置（传统 GNU Make）** [\[English\]](#)

---

**注解:** ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

---

**安装准备** 编译 ESP-IDF 需要以下软件包:

- CentOS 7:

```
sudo yum install gcc git wget make flex bison gperf python python2-cryptography
```

- Ubuntu and Debian:

```
sudo apt-get install gcc git wget make flex bison gperf python python-pip_
↳python-setuptools python-serial python-cryptography python-future python-
↳pyparsing python-pyelftools libffi-dev libssl-dev
```

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pyserial python-
↳ cryptography python-future python-pyparsing python-pyelftools
```

**注解：**一些旧的（2014 年之前）Linux 发行版中使用的 pyserial 版本可能是 2.x，ESP-IDF 并不支持。这种情况下，请按照**第四步：安装 Python 软件包**章节的介绍，使用 pip 安装软件包。

**工具链设置** Linux 版的 ESP32 工具链可以从 Espressif 的网站下载：

- 64 位 Linux：  
[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-linux-amd64.tar.gz](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-amd64.tar.gz)
- 32 位 Linux：  
[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-linux-i686.tar.gz](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-i686.tar.gz)

1. 下载压缩文件之后，解压到 ~/esp 目录中：

- 64 位 Linux：

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-amd64.
↳tar.gz
```

- 32 位 Linux：

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-i686.
↳tar.gz
```

2. 工具链将被解压到 ~/esp/xtensa-esp32-elf/ 路径下。为了正常使用工具链，您必须更新 ~/.profile 文件中的 PATH 环境变量。此外，您还可以在 ~/.profile 文件中增加以下代码，这样一来，所有终端窗口均可以使用 xtensa-esp32-elf：

```
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

或者，您可以为上述命令创建一个别名。这样，您只有在需要时才可以使用工具链。如需设置别名，请将以下代码增加至您的 `~/.profile` 文件中：

```
alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
```

这样，您可以在终端输入 get\_esp32 命令将工具链添加至您的 PATH，从而使用工具链。

**注解：**如果您已将 /bin/bash 设置为登录 shell，且同时存在 .bash\_profile 和 .profile，则请更新 .bash\_profile。在 CentOS 环境下，alias 需要添加到 .bashrc 文件中。

3. 退出并重新登录以使 .profile 更改生效。运行以下命令来检查 PATH 设置是否正确

```
printenv PATH
```

检查字符串的开头是否包含类似的工具链路径：

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.
↳local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
↳games:/usr/local/games:/snap/bin
```

这里，您需要将 /home/user-name 替换为您的安装主目录。

**权限问题 /dev/ttyUSB0** 某些 Linux 版本可能在烧写 ESP32 时会出现 Failed to open port /dev/ttyUSB0 错误消息，这可以通过将当前用户添加到 dialout 组来解决。

**后续步骤** 继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

## 相关文档

**从零开始设置 Linux 环境下的工具链（传统 GNU Make）** [\[English\]](#)

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

**注解：**安装工具链的标准方法请见[这里](#)。请参考[工具链自定义设置](#) 章节，查看可能需从头开始设置工具链的情况。

**安装准备** 编译 ESP-IDF 需要以下软件包：

- Ubuntu and Debian:

```
sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python-  
↳python-pip python-setuptools python-serial python-cryptography python-future-  
↳python-pyparsing python-pyelftools libffi-dev libssl-dev
```

- Arch:

```
sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial-  
↳python-cryptography python-future python-pyparsing python-pyelftools
```

**注解：**一些旧的（2014 年之前）Linux 发行版中使用的 pyserial 版本可能是 2.x，ESP-IDF 并不支持。这种情况下，请按照[第四步：安装 Python 软件包](#) 章节的介绍，使用 pip 安装软件包。

## 从源代码编译工具链

- 安装依赖项：
  - CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python python-devel-  
↳automake bison flex texinfo help2man libtool
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-  
↳dev automake bison flex texinfo help2man libtool
```

- Ubuntu 16.04 或以上

```
sudo apt-get install gawk gperf grep gettext python python-dev automake-  
↳bison flex texinfo help2man libtool libtool-bin
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-  
↳dev automake bison flex texinfo help2man libtool libtool-bin
```

- Arch:

```
TODO
```

- 创建工作目录，并进入该目录：

```
mkdir -p ~/esp
cd ~/esp
```

- 下载并编译 crosstool-NG :

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

- 编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 `~/esp/crosstool-NG/builds/xtensa-esp32-elf`。请按照[标准设置指南](#)的介绍，将工具链添加到 `PATH`。

**后续步骤** 继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

### Mac OS 平台工具链的标准设置 (传统 GNU Make) [\[English\]](#)

**注解：** ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

### 安装准备

- 安装 pip:

```
sudo easy_install pip
```

**注解：** pip 稍后将用于安装[所需 Python 包](#)。

**工具链设置** Mac OS 版本的 ESP32 工具链可以从以下地址下载：

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2020r3-macos.tar.gz](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-macos.tar.gz)

下载压缩文件之后，解压到 `~/esp` 目录中：

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-macos.tar.gz
```

工具链将被解压到 `~/esp/xtensa-esp32-elf/` 路径下。

为了正常使用工具链，您必须更新 `~/.profile` 文件中的 `PATH` 环境变量。此外，您还可以在 `~/.profile` 文件中增加以下代码，这样一来，所有终端窗口均可以使用 `xtensa-esp32-elf`：

```
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

或者，您可以为上述命令创建一个别名。这样，您只有在需要时才可以使用工具链。如需设置别名，请将以下代码增加至您的 `~/.profile` 文件中：

```
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

这样，您可以在终端输入 `get_esp32` 命令将工具链添加至您的 `PATH`，从而使用工具链。

**后续步骤** 继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

## 相关文档

**从零开始设置 Mac OS 环境下的工具链（传统 GNU Make）** [\[English\]](#)

---

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

---

---

**注解：**安装工具链的标准方法请见[这里](#)。请参考[工具链自定义设置](#) 章节，查看可能需要从头开始设置工具链的情况。

---

## 安装准备

- 安装 pip:

```
sudo easy_install pip
```

---

**注解：**pip 稍后将用于安装必要的 *Python* 软件包。

---

## 从源代码编译工具链

- 安装依赖项：
  - 安装 [MacPorts](#) 或 [homebrew](#) 安装包管理器。MacPorts 需要完整的 XCode 软件，而 homebrew 只需要安装 XCode 命令行工具即可。
  - 对于 MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget  
↪libtool autoconf automake
```

- 对于 homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget  
↪help2man libtool autoconf automake
```

- 创建一个文件系统镜像（区分大小写）：

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-  
↪sensitive HFS+"
```

- 挂载:

```
hdiutil mount ~/esp/crosstool.dmg
```

- 创建指向您工作目录的符号链接:

```
mkdir -p ~/esp  
ln -s /Volumes/ctng ~/esp/ctng-volume
```

- 前往新创建的目录

```
cd ~/esp/ctng-volume
```

- 下载并编译 crosstool-NG :

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

- 编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf`。请按照[标准设置指南](#)的介绍，将工具链添加到 `PATH`。

**后续步骤** 继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

**注解：**在本文档中，Linux 和 MacOS 操作系统中 ESP-IDF 的默认安装路径为 `~/esp`；Windows 操作系统的默认路径为 `%userprofile%\esp`。您也可以将 ESP-IDF 安装在任何其他路径下，但请注意在使用命令行时进行相应替换。注意，ESP-IDF 不支持带有空格的路径。

此外，您也可以根据自身经验和实际需求，对环境进行个性化设置，而非使用预制工具链。此时，请前往[工具链自定义设置（传统 GNU Make 系统）](#) 章节获取更多信息。

## 第二步：获取 ESP-IDF

除了工具链，您还需要供 ESP32 使用的 API（软件库和源代码），具体请见[ESP-IDF 仓库](#)。

获取本地副本：打开终端，切换到你要存放 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。

打开终端，后运行以下命令：

```
cd ~/esp
git clone -b v4.1.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往[ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

**注解：**`git clone` 命令的 `-b v4.1.1` 选项告诉 `git` 从 ESP-IDF 仓库中克隆与此版本的文档对应的分支。

**注解：** 作为备份，还可以从 [Releases page](#) 下载此稳定版本的 zip 文件。不要下载由 GitHub 自动生成的“源代码”的 zip 文件，它们不适用于 ESP-IDF。

---

**注解：** 在克隆远程仓库时，不要忘记加上 `--recursive` 选项。否则，请接着运行以下命令，获取所有子模块：

```
cd esp-idf
git submodule update --init
```

---

### 第三步：设置环境变量

工具链通过环境变量 `IDF_PATH` 获得 ESP-IDF 的目录。因此，您需要在 PC 中设置该环境变量，否则无法编译工程。

您可以在每次重启会话时手动设置，也可以在用户配置中进行永久设置，具体请前往 [在用户配置文件中添加 IDF\\_PATH \(传统 GNU Make\)](#) 章节，查看 [Windows](#)、[Linux](#) 及 [MacOS](#) 操作系统的具体设置方式。

### 第四步：安装 Python 软件包

ESP-IDF 所需的 Python 软件包位于 `IDF_PATH/requirements.txt` 中。您可以运行以下命令进行安装：您可以运行以下命令进行安装：

```
python -m pip install --user -r $IDF_PATH/requirements.txt
```

---

**注解：** 请注意查询您所使用的 Python 解释器的版本（运行命令 `python --version`），并根据查询结果将上方命令中的 `python` 替换为 `python3`、`python3.7`，例如：

```
python3 -m pip install --user -r $IDF_PATH/requirements.txt
```

---

### 第五步：开始创建工程

现在，您可以开始准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 [examples](#) 目录下的 [get-started/hello\\_world](#) 工程开始。

将 [get-started/hello\\_world](#) 复制至您本地的 `~/esp` 目录下：

#### Linux 和 MacOS 操作系统

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

#### Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 [examples](#) 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

**重要：** ESP-IDF 编译系统不支持带有空格的路径。

---

## 第六步：连接设备

现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Windows 操作系统：** COM1 等
- **Linux 操作系统：** 以 /dev/tty 开始
- **MacOS 操作系统：** 以 /dev/cu. 开始

有关如何查看串口名称的详细信息，请见与 [ESP32 创建串口连接（传统 GNU Make 系统）](#)。

---

**注解：** 请记住串口名，您会在下面的步骤中用到。

---

## 第七步：配置

请进入 [第五步：开始创建工程](#) 中提到的 hello\_world 目录，并运行工程配置工具 menuconfig。

### Linux 和 MacOS 操作系统

```
cd ~/esp/hello_world
make menuconfig
```

### Windows 操作系统

```
cd %userprofile%\esp\hello_world
make menuconfig
```

如果之前的步骤都正确，则会显示下面的菜单：

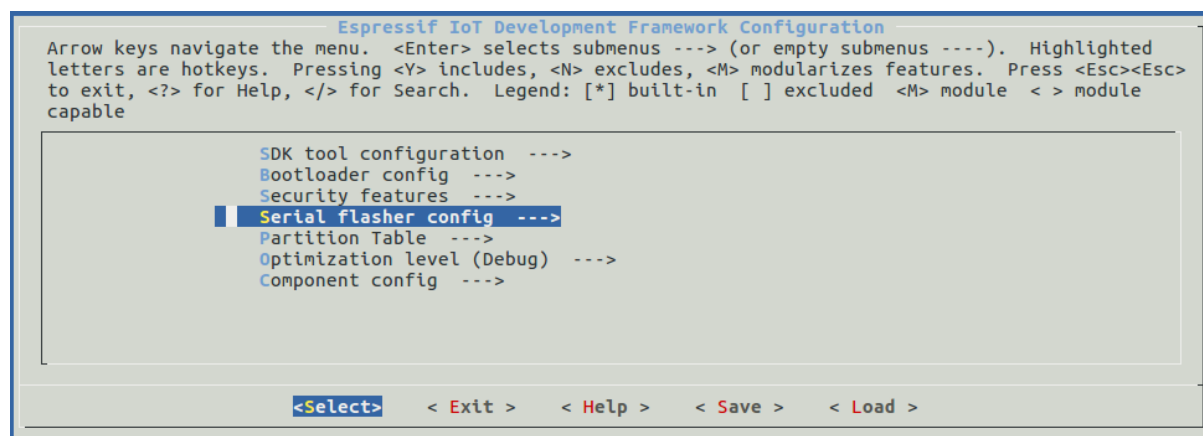

图 32: 工程配置—主窗口

进入菜单后，选择 Serial flasher config>Default serial port 配置串口（设备将通过该串口加载工程）。按回车键确认选择，点击 < Save > 保存配置，然后点击 < Exit > 退出 menuconfig。menuconfig 工具的常见操作见下。

- 上下箭头：移动
- 回车：进入子菜单
- ESC 键：返回上级菜单或退出
- 英文问号：调出帮助菜单（退出帮助菜单，请按回车键）。
- 空格 `` 或 ``Y 键：选择 [\*] 配置选项；N 键：禁用 [\*] 配置选项
- 英文问号（查询配置选项）：调出有关该选项的帮助菜单
- / 键：寻找配置工程

**注意：**如果您使用的是 ESP32-DevKitC (板载 ESP32-SOLO-1 模组)，请在烧写示例程序前，前往 menuconfig 中使能单核模式 (`CONFIG_FREERTOS_UNICORE`)。

## 第八步：编译和烧录

请使用以下命令，编译烧录工程：

```
make flash
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 bootloader、分区表和应用程序二进制文件。接着，这些二进制文件将被烧录至 ESP32 开发板。

如果一切顺利，您可在烧录完成后看到类似下方的打印信息（代表加载进程）。接着，开发板将会复位，应用程序“hello\_world”开始启动。

```
esptool.py v2.0-beta2
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...
esptool.py v2.0-beta2
Connecting.....____
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 921600
Changed.
Attaching SPI flash...
Configuring flash size...
Auto-detected Flash size: 4MB
Flash params set to 0x0220
Compressed 11616 bytes to 6695...
Wrote 11616 bytes (6695 compressed) at 0x00001000 in 0.1 seconds (effective 920.5
↔kbit/s)...
Hash of data verified.
Compressed 408096 bytes to 171625...
Wrote 408096 bytes (171625 compressed) at 0x00010000 in 3.9 seconds (effective 847.
↔3 kbit/s)...
Hash of data verified.
Compressed 3072 bytes to 82...
Wrote 3072 bytes (82 compressed) at 0x00008000 in 0.0 seconds (effective 8297.4
↔kbit/s)...
Hash of data verified.

Leaving...
Hard resetting...
```

如果您希望使用 Eclipse IDE，而非 make 编译系统，请参考 [Eclipse guide](#)。

## 第九步：监视器

您可以使用 make monitor 命令，监视“hello\_world”的运行情况。

运行该命令后，*IDF 监视器* 应用程序将启动：

```
$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
```

(下页继续)

(续上页)

```
ets Jun  8 2016 00:22:57
...
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
...
Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 Ctrl+]，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（见下），很有可能是因为您的开发板采用了 26 MHz 晶振，而 ESP-IDF 默认支持大多数开发板使用的 40 MHz 晶振。

```
e000)(Xnc@y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xnc@y.!Dr0zY(0 jpi0|0+z5Ymvp
```

此时，请您：

1. 退出监视器。
2. 打开 [menuconfig](#)，
3. 进入 Component config -> ESP32-specific -> Main XTAL frequency 进行配置，将 [CONFIG\\_ESP32\\_XTAL\\_FREQ\\_SEL](#) 设置为 26 MHz。
4. 然后，请重新编译和烧录应用程序。

**注解：**您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
make flash monitor
```

此外，请前往 [IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。

**恭喜，您已完成 ESP32 的入门学习！**

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

## 环境变量

用户可以在使用 make 命令时 **直接设置部分环境变量**，而无需进入 make menuconfig 进行重新配置。这些变量包括：

变量	描述与使用方式
ESPPORT	覆盖 flash 和 monitor 命令使用的串口。例：make flash ESPPORT=/dev/ttyUSB1,make monitor ESPPORT=COM1
ESPBAUD	覆盖烧录 ESP32 时使用的串口速率。例：make flash ESPBAUD=9600
MONITORBAUD	覆盖监控时使用的串口速率。例：make monitor MONITORBAUD=9600

**注解：**您可导出环境变量（例：export ESPPORT=/dev/ttyUSB1）。在同一会话窗口中，如果未被同步覆盖，所有 make 命令均会使用导出的环境变量值。

## 更新 ESP-IDF

乐鑫会不时推出更新版本的 ESP-IDF，修复 bug 或推出新的特性。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，然后按照[第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

如果您希望将 ESP-IDF 克隆到新的路径下，请务必重新设置 `IDF_PATH`。否则，工具链将无法找到 ESP-IDF。

此外，您可以仅更新变更部分。具体方式，请前往[更新](#) 章节查看。

## 相关文档

### 在用户配置文件中添加 `IDF_PATH` (传统 GNU Make) [\[English\]](#)

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

为了在系统多次启动时，保留 `IDF_PATH` 环境变量的设置，请按照以下说明将该变量的设置增加至用户配置文件。

**Windows 操作系统** 用户配置文件脚本保存在 `C:/msys32/etc/profile.d/` 路径下，每次打开 MSYS2 窗口时均会执行。

1. 在 `C:/msys32/etc/profile.d/` 目录下创建一个新的脚本文件，并将其命名为 `export_idf_path.sh`。
2. 指定您的 ESP-IDF 保存路径，这通常与您的系统配置有关，比如 `C:\msys32\home\user-name\esp\esp-idf`。
3. 在脚本文件中加入下方 `export` 命令行，例：

```
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

注意请将反斜杠替换为 Windows 操作系统路径要求的正斜杠。

4. 保存脚本文件。
5. 关闭 MSYS2 窗口，并重新打开。运行以下命令，检查 `IDF_PATH` 是否成功设置：

```
printenv IDF_PATH
```

如果设置成功，则此时将打印之前在脚本中输入的路径。

如果您不希望永久设置 `IDF_PATH` 变量，也可以在每次打开 MSYS2 窗口时进行手动设置：

```
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

如果您是在安装 ESP32 软件的过程中从[第三步：设置环境变量](#) 章节跳转至此，请返回[第五步：开始创建工程](#) 章节。

**Linux 和 MacOS 操作系统** 在 `~/.profile` 文件中增加以下命令，设置 `IDF_PATH` 变量：

```
export IDF_PATH=~/.esp/esp-idf
```

退出并重新登陆，检查设置是否生效。

**注解：**如果您已将 `/bin/bash` 设置为登录 shell，且同时存在 `.bash_profile` 和 `.profile`，则请更新 `.bash_profile`。

运行以下命令，检查 `IDF_PATH` 是否成功设置：

```
printenv IDF_PATH
```

如果设置成功，则此时将打印之前在 `~/.profile` 文件中输入（或手动设置）的路径。

如果您不希望永久设置 `IDF_PATH` 变量，也可以在每次重新打开终端窗口时进行手动设置：

```
export IDF_PATH=~/.esp/esp-idf
```

如果您是在安装 ESP32 软件的过程中从 [第三步：设置环境变量](#) 章节跳转至此，请返回 [第五步：开始创建工程](#) 章节。

## 与 ESP32 创建串口连接（传统 GNU Make 系统） [\[English\]](#)

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

本章节主要介绍如何创建 ESP32 和 PC 之间的串口连接。

**连接 ESP32 和 PC** 用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 等开发板驱动程序的链接：

开发板	USB 驱动	备注
<a href="#">ESP32-DevKitC</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-LyraT</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-LyraTD-MSC</a>	<a href="#">CP210x</a>	
<a href="#">ESP32-PICO-KIT</a>	<a href="#">CP210x</a>	
<a href="#">ESP-WROVER-KIT</a>	<a href="#">FTDI</a>	
<a href="#">ESP32 Demo 板</a>	<a href="#">FTDI</a>	
<a href="#">ESP-Prog</a>	<a href="#">FTDI</a>	编程板 (w/o ESP32)
<a href="#">ESP32-MeshKit-Sense</a>	n/a	搭配 <a href="#">ESP-Prog</a> 使用
<a href="#">ESP32-Sense Kit</a>	n/a	搭配 <a href="#">ESP-Prog</a> 使用

- [CP210x: CP210x USB to UART Bridge VCP Drivers](#)
- [FTDI: FTDI Virtual COM Port Drivers](#)

以上驱动仅用作参考。正常情况下，当上述任一 ESP32 开发板与 PC 连接时，打包在操作系统中的驱动程序将会开始自动安装。

**查看端口（Windows 用户）** 检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32 与 PC 的连接，然后重连。查看从列表中消失后再次出现的是哪个端口。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

**查看端口（Linux 和 MacOS 用户）** 查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请运行两次下述命令。首先，断开开发板或适配器，第一次运行命令；然后，连接开发板或适配器，第二次运行命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口：

Linux

```
ls /dev/tty*
```

MacOS

图 33: Windows 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

图 34: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

```
ls /dev/cu.*
```

**将用户增加至 Linux 的 dialout 组** 当前登录用户应当拥有通过 USB 对串口进行读写的权限。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，来获取读写权限：

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限可以生效。

**确认串口连接** 现在，请使用串口终端程序，验证串口连接是否可用。在本示例中，我们将使用 **PuTTY SSH Client** 进行验证。该工具同时适用于 Windows 和 Linux 操作系统。您也可以使用其他串口程序，设置通信参数如下。

运行终端，配置串口：波特率 = 115200，数据位 = 8，停止位 = 1，奇偶校验 = N。在 Windows 和 Linux 中配置串口和通信参数（如 115200-8-1-N）的截图如下。注意，这里一定要选择在上述步骤中确认的串口进行配置。

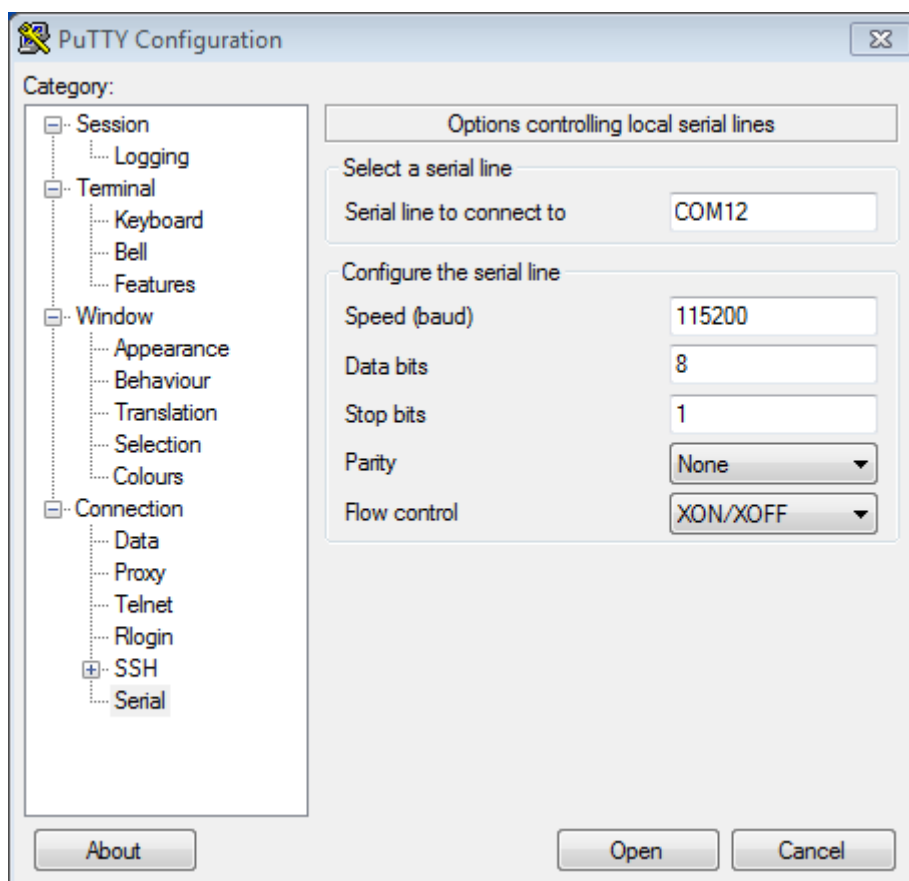

图 35: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

然后，请在终端打开串口，查看 ESP32 是否有任何打印，具体打印内容取决于加载至 ESP32 的程序。ESP32 打印示例

```
ets Jun 8 2016 00:22:57
```

(下页继续)

图 36: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

(续上页)

```

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...

```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序下载到 ESP32。

**注解：**在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 引脚。该问题仅存在于将 RTS & DTR 引脚直接连接到 EN & GPIO0 引脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，参见 [esptool 文档](#)。

**注解：**验证完成后，请关闭串口终端。我们将在后续步骤中向 ESP32 下载新的应用程序，如果未关闭终端，则该应用程序将无法访问串口。

如果您是在安装 ESP32 软件的过程中从 [第六步：连接设备](#) 章节跳转至此，请返回 [第七步：配置](#) 章节。

### 通过 make 指令创建和烧录项目（传统 GNU Make） [\[English\]](#)

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

**寻找项目** 除了 [esp-idf-template](#) 项目模版外，ESP-IDF 还在 GitHub 仓库中的 [examples](#) 目录下提供多个示例项目。

请找到并进入您想要的项目，开始配置、构建该项目。

#### 配置项目

```
make menuconfig
```

#### 编译项目

```
make all
```

该命令将配置 app 和 bootloader，并根据配置生成分区表。

**烧录项目** make all 完成后将打印一行命令，提示您如何使用 [esptool.py](#) 烧录芯片。不过，您可以使用以下命令进行烧录：

```
make flash
```

该命令可以将整个项目（包括 `app`、`bootloader` 和分区表）烧录至新芯片。此外，如果分区表中存在 `ota_data`，则该命令还会同时将初始 `ota_data` 烧录至芯片。该命令允许您直接从 `factory` 分区中运行新加载的 `app`（如果 `factory` 分区不存在，则从第一个 OTA 分区开始运行）。您可以使用 `make menuconfig` 配置串口的烧录。

在运行 `make flash` 之前无需单独运行 `make all`。`make flash` 命令本身就可以自动构建所需的文件。

**仅编译和烧录应用程序** 在首次烧录完成后，您可以只希望烧录并编译应用程序，而不再包括 `bootloader` 和分区表。这种情况可以使用以下命令：

- `make app` - 仅编译应用程序
- `make app-flash` - 仅烧录应用程序

`make app-flash` - 在有需要时自动重新编译应用程序

如果没有变化，每次都重新烧录、编译 `bootloader` 和分区表也没有坏处。

**分区表** 项目编译完成后，“`build`”目录下将出现一个名为“`my_app.bin`”（例）的二进制文件。这是一个可由 `bootloader` 加载的 ESP32 映像文件。

ESP32 的一块 `flash` 可以包含多个应用程序，以及多种数据（校准数据、文件系统、参数存储等）。因此，在向 `flash` 烧录分区表时，通常保留 `0x8000` 的偏移量。

分区表中的每个条目都有名称（标签）、类型（`app`、数据或其他）、子类型及在 `flash` 中的偏移量。

使用分区表最简便的方法是：运行 `make menuconfig`，选择一个预定义分区表：

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

上述两种情况中，`factory app` 在 `flash` 中的烧录偏移地址均为 `0x10000`。运行 `make partition_table` 命令可以打印分区表摘要。

更多有关分区表及自定义分区表的内容，请见[相关文档](#)。

## Eclipse IDE 的创建和烧录指南（传统 GNU Make） [\[English\]](#)

---

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

---

**安装 Eclipse IDE** Eclipse IDE 是一个可视化的集成开发环境，可用于编写、编译和调试 ESP-IDF 项目。

- 首先，请在您的平台上安装相应的 ESP-IDF，具体步骤请按照您的操作系统（Windows、OS X 和 Linux）对应的指示进行安装。
- 我们建议，您可以首先使用命令行创建一个项目，大致熟悉项目的创建流程。此外，您还需要使用命令行 (`make menuconfig`) 对您的 ESP-IDF 项目进行配置。目前，Eclipse 还无法配置 ESP-IDF 项目。
- 从 [eclipse.org](http://eclipse.org) 下载对应操作系统的 Eclipse 安装器。
- 运行 Eclipse Installer，选择 “Eclipse for C/C++ Development”（有的版本也可能显示为 CDT）。

**配置 Eclipse** 打开安装好的 Eclipse IDE，并按照以下步骤进行操作：

## 导入新项目

- Eclipse 需使用 ESP-IDF 的 Makefile 功能。因此，在使用 Eclipse 前，您需要先创建一个 ESP-IDF 项目。在创建 ESP-IDF 项目时，您可以使用 GitHub 中的 idf-template 项目模版，或从 ESP-IDF 子目录中复制一个 example。
- 运行 Eclipse，选择 “File” -> “Import…”。
- 在弹出的对话框中选择 “C/C++” -> “Existing Code as Makefile Project”，点击 “Next”。
- 进入下一界面，在 “Existing Code Location” 处输入您的 IDF 项目路径。注意，这里应输入 ESP-IDF 项目的路径，而非 ESP-IDF 本身的路径（这个稍后再填）。此外，您指定的目标路径中应包含名为 Makefile（项目 Makefile）的文件。
- 本界面中，找到 “Toolchain for Indexer Settings”，选择 “Cross GCC”，最后点击 “Finish”。

## 项目属性

- 新项目将出现在 “Project Explorer” 下。右键选择该项目，并在菜单中选择 “Properties”。
- 点击 “C/C++ Build” 下的 “Environment” 属性页，选择 “Add…”，并在对应位置输入 BATCH\_BUILD 和 1。
- 再次点击 “Add…”，并在 IDF\_PATH 处输入 ESP-IDF 所在的完整安装路径。Windows 用户可以从 Windows 浏览器复制 IDF\_PATH。
- 编辑 PATH 环境变量。保留当前值，并将该路径增加至 Xtensa 工具链安装路径后，作为 IDF 设置的一部分（如已增加至 PATH，则可忽略）。工具链的常见路径为 /home/user-name/esp/xtensa-esp32-elf/bin（例）。注意，您需要在补充的路径前增加一个冒号（:）。Windows 用户需要将 PATH 环境变量前增加 C:\msys32\mingw32\bin;C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin。注意，请根据 msys32 的具体安装路径，修改 PATH 环境变量。
- MacOS 用户需要增加一个 PYTHONPATH 环境变量，并将其设置为 /Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages。保证系统中预先安装的 Python（需安装 pyserial 模块）可以覆盖 Eclipse 内置的任何 Python。

**特别说明：**如果您的 IDF\_PATH 或项目不在 C:\msys32\home 之下，则应使用自定义编译命令：`python ${IDF_PATH}/tools/windows/eclipse_make.py`（请注意，这种方法可能导致编译时间显著增加。）

- 前往 “C/C++ General” -> “Preprocessor Include Paths” 属性页面。点击 “Providers” 选项卡。
  - 从 “Providers” 列表中选择 “CDT Cross GCC Built-in Compiler Settings”，将 “Command to get compiler specs” 修改为 `xtensa-esp32-elf-gcc ${FLAGS} -std=c++11 -E -P -v -dD "${INPUTS}"`。
  - 从 “Providers” 列表中选择 “CDT GCC Build Output Parser”，将 “Compiler command pattern” 修改为 `xtensa-esp32-elf-(gcc|g\+\+|c\+\+|cc|cpp|clang)`。
- 前往 “C/C++ General” -> “Indexer” 属性页面。
  - 勾选 “Enable project specific settings”，启用本页面上的其他设置。
  - 取消勾选 “Allow heuristic resolution of includes”。勾选该选项有时会导致 Eclipse 无法找到正确的头文件目录。
- 前往 “C/C++ Build” -> “Behavior” 属性页面。
  - 勾选 “Enable parallel build”，启用 “并行编译” 配置。

**在 Eclipse 中构建项目** 在首次创建项目前，Eclipse IDE 可能会显示大量有关未定义值的错误和警告，这是因为 ESP-IDF 在编译过程中会自动生成一些源文件。因此，这些错误和警告均会在项目编译完成后消失。

- 点击 “OK”，关闭 Eclipse IDE 中的 “Properties” 对话框。
- 在 Eclipse IDE 界面外，打开命令提示符窗口。进入项目目录，运行 `make menuconfig` 设置项目的 ESP-IDF 配置。现阶段，您还无法在 Eclipse 中完成本操作。
- 回到 Eclipse IDE 界面，选择 “Project” -> “Build” 开始编译项目。

**小提示：**如果您的项目不是通过 Eclipse 创建的，则在选择 “Project” -> “Build” 前还需进行 “Project” -> “Clean” 操作。如此操作后，Eclipse 才能查看所有源文件的编译器参数，并借此确定头文件包含路径。

**在 Eclipse 中烧录项目** 您可以将 `make flash` 目标集成在 Eclipse 项目中，这样就可以通过 Eclipse UI 调用 `esptool.py` 进行烧录：

- 打开 “**Project Explorer**”，并右击您的项目（请注意右击项目本身，而非项目下的子文件，否则 Eclipse 可能会找到错误的 `Makefile`）。
- 从菜单中选择 “**Build Targets**” -> “**Create...**”。
- 目标名称输入 “`flash`”，其他选项使用默认值。
- 这时，您可以选择 “**Project**” -> “**Build Target**” -> “**Build**”（快捷键：Shift + F9），创建自定义烧录目标，用于编译、烧录项目。

注意，您仍需要通过 `make menuconfig` 设置串行端口和其他烧录选项。`make menuconfig` 仍需通过命令行操作（具体请见对应操作系统的指南）。

如有需要，请按照相同步骤添加 `bootloader` 和 `partition_table` 目标。

**工具链自定义设置（传统 GNU Make 系统）** 除了从乐鑫官网（请见[第一步：设置工具链](#)）下载二进制工具链外，您还可以自行编译工具链。

---

**注解：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

---

如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译工具链：

- 需要定制工具链编译配置
- 需要使用其他 GCC 版本（如 4.8.5）
- 需要破解 `gcc`、`newlib` 或 `libstdc++`
- 有相关兴趣或时间充裕
- 不信任从网站下载的 `bin` 文件

如需自行编译工具链，请查看以下文档：

# Chapter 2

## API 参考

[English]

### 2.1 蓝牙 API

[English]

#### 2.1.1 Controller && VHCI

##### Overview

Instructions

##### Application Example

Check `bluetooth/bluedroid/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - `bluetooth/bluedroid/hci/controller_vhci_ble_adv`.

##### API Reference

##### Header File

- `bt/include/esp_bt.h`

##### Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`  
Set BLE TX power Connection Tx power should only be set after connection created.

**Return** ESP\_OK - success, other - failed

##### Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level`: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`  
Get BLE TX power Connection Tx power should only be get after connection created.

**Return**  $\geq 0$  - Power level,  $< 0$  - Invalid

##### Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

`esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)`

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

`esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)`

set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `data_path`: SCO data path

`esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)`

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `cfg`: Initial configuration of BT controller. Different from previous version, there' s a mode and some connection configuration in “`cfg`” to configure controller work mode and allocate the resource which is needed.

`esp_err_t esp_bt_controller_deinit (void)`

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

**Return** `ESP_OK` - success, other - failed

`esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)`

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `mode`: : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “`cfg`” of `esp_bt_controller_init()`.

`esp_err_t esp_bt_controller_disable (void)`

Disable BT controller.

**Return** `ESP_OK` - success, other - failed

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

uint8\_t \***esp\_bt\_get\_mac** (void)

Get BT MAC address.

**Return** Array pointer of length 6 storing MAC address value.

bool **esp\_vhci\_host\_check\_send\_available** (void)

esp\_vhci\_host\_check\_send\_available used for check actively if the host can send packet to controller or not.

**Return** true for ready to send, false means cannot send packet

void **esp\_vhci\_host\_send\_packet** (uint8\_t \*data, uint16\_t len)

esp\_vhci\_host\_send\_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- data: the packet point
- len: the packet length

*esp\_err\_t* **esp\_vhci\_host\_register\_callback** (const *esp\_vhci\_host\_callback\_t* \*callback)

esp\_vhci\_host\_register\_callback register the vhci reference callback struct defined by vhci\_host\_callback structure.

**Return** ESP\_OK - success, ESP\_FAIL - failed

**Parameters**

- callback: *esp\_vhci\_host\_callback* type variable

*esp\_err\_t* **esp\_bt\_controller\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_controller\_mem\_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp\_bt\_controller\_mem\_release(mode) should be called only before esp\_bt\_controller\_init() or after esp\_bt\_controller\_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp\_bt\_controller\_enable(ESP\_BT\_MODE\_BLE) to use BLE only then it is safe to call esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_CLASSIC\_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP\_BT\_MODE\_BTDM, then it may be useful to call API esp\_bt\_mem\_release(ESP\_BT\_MODE\_BTDM) instead, which internally calls esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp\_bt\_mem\_release() function

**Return** ESP\_OK - success, other - failed

**Parameters**

- mode: : the mode want to release memory

*esp\_err\_t* **esp\_bt\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_mem\_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp\_bt\_controller\_mem\_release(). Additionally, if the mode is set to ESP\_BT\_MODE\_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `mode`: : the mode whose memory is to be released

*esp\_err\_t* **esp\_bt\_sleep\_enable** (void)  
enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_BTDM_MODEM_SLEEP` is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

**Return**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush** (void)  
Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in `menuconfig`.

**Return**

- `ESP_OK` : success
- other : failed

## Structures

**struct** `esp_bt_controller_config_t`

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

## Public Members

`uint16_t` **controller\_task\_stack\_size**  
Bluetooth controller task stack size

**uint8\_t controller\_task\_prio**  
Bluetooth controller task priority

**uint8\_t hci\_uart\_no**  
If use UART1/2 as HCI IO interface, indicate UART number

**uint32\_t hci\_uart\_baudrate**  
If use UART1/2 as HCI IO interface, indicate UART baudrate

**uint8\_t scan\_duplicate\_mode**  
scan duplicate mode

**uint8\_t scan\_duplicate\_type**  
scan duplicate type

**uint16\_t normal\_adv\_size**  
Normal adv size for scan duplicate

**uint16\_t mesh\_adv\_size**  
Mesh adv size for scan duplicate

**uint16\_t send\_adv\_reserved\_size**  
Controller minimum memory value

**uint32\_t controller\_debug\_flag**  
Controller debug log flag

**uint8\_t mode**  
Controller mode: BR/EDR, BLE or Dual Mode

**uint8\_t ble\_max\_conn**  
BLE maximum connection numbers

**uint8\_t bt\_max\_acl\_conn**  
BR/EDR maximum ACL connection numbers

**uint8\_t bt\_sco\_datapath**  
SCO data path, i.e. HCI or PCM module

**bool auto\_latency**  
BLE auto latency, used to enhance classic BT performance

**bool bt\_legacy\_auth\_vs\_evt**  
BR/EDR Legacy auth complete event required to protect from BIAS attack

**uint8\_t bt\_max\_sync\_conn**  
BR/EDR maximum ACL connection numbers. Effective in menuconfig

**uint8\_t ble\_sca**  
BLE low power crystal accuracy index

**uint8\_t pcm\_role**  
PCM role (master & slave)

**uint8\_t pcm\_polar**  
PCM polar trig (falling clk edge & rising clk edge)

**uint32\_t magic**  
Magic number

**struct esp\_vhci\_host\_callback**  
*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Public Members

**void (\*notify\_host\_send\_available)** (void)  
callback used to notify that the host can send packet to controller

`int (*notify_host_recv) (uint8_t *data, uint16_t len)`  
 callback used to notify that the controller has a packet to send to the host

### Macros

`ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL`  
`BT_CONTROLLER_INIT_CONFIG_DEFAULT()`

### Type Definitions

`typedef struct esp_vhci_host_callback esp_vhci_host_callback_t`  
`esp_vhci_host_callback` used for vhci call host function to notify what host need to do

### Enumerations

`enum esp_bt_mode_t`  
 Bluetooth mode for controller enable/disable.

*Values:*

`ESP_BT_MODE_IDLE = 0x00`  
 Bluetooth is not running

`ESP_BT_MODE_BLE = 0x01`  
 Run BLE mode

`ESP_BT_MODE_CLASSIC_BT = 0x02`  
 Run Classic BT mode

`ESP_BT_MODE_BTDM = 0x03`  
 Run dual mode

`enum [anonymous]`

BLE sleep clock accuracy(SCA), values for `ble_sca` field in `esp_bt_controller_config_t`, currently only `ESP_BLE_SCA_500PPM` and `ESP_BLE_SCA_250PPM` are supported.

*Values:*

`ESP_BLE_SCA_500PPM = 0`  
 BLE SCA at 500ppm

`ESP_BLE_SCA_250PPM`  
 BLE SCA at 250ppm

`ESP_BLE_SCA_150PPM`  
 BLE SCA at 150ppm

`ESP_BLE_SCA_100PPM`  
 BLE SCA at 100ppm

`ESP_BLE_SCA_75PPM`  
 BLE SCA at 75ppm

`ESP_BLE_SCA_50PPM`  
 BLE SCA at 50ppm

`ESP_BLE_SCA_30PPM`  
 BLE SCA at 30ppm

`ESP_BLE_SCA_20PPM`  
 BLE SCA at 20ppm

`enum esp_bt_controller_status_t`

Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

`ESP_BT_CONTROLLER_STATUS_IDLE = 0`

```

ESP_BT_CONTROLLER_STATUS_INITED
ESP_BT_CONTROLLER_STATUS_ENABLED
ESP_BT_CONTROLLER_STATUS_NUM

```

**enum esp\_ble\_power\_type\_t**

BLE tx power type ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP\_BLE\_PWR\_TYPE\_ADV : for advertising/scan response. ESP\_BLE\_PWR\_TYPE\_SCAN : for scan. ESP\_BLE\_PWR\_TYPE\_DEFAULT : if each connection' s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP\_PWR\_LVL\_P3 as default for ADV/SCAN/CONN0-9.

*Values:*

```

ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
    For connection handle 0

ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
    For connection handle 1

ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
    For connection handle 2

ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
    For connection handle 3

ESP_BLE_PWR_TYPE_CONN_HDL4 = 4
    For connection handle 4

ESP_BLE_PWR_TYPE_CONN_HDL5 = 5
    For connection handle 5

ESP_BLE_PWR_TYPE_CONN_HDL6 = 6
    For connection handle 6

ESP_BLE_PWR_TYPE_CONN_HDL7 = 7
    For connection handle 7

ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
    For connection handle 8

ESP_BLE_PWR_TYPE_ADV = 9
    For advertising

ESP_BLE_PWR_TYPE_SCAN = 10
    For scan

ESP_BLE_PWR_TYPE_DEFAULT = 11
    For default, if not set other, it will use default value

ESP_BLE_PWR_TYPE_NUM = 12
    TYPE numbers

```

**enum esp\_power\_level\_t**

Bluetooth TX power level(index), it' s just a index corresponding to power(dbm).

*Values:*

```

ESP_PWR_LVL_N12 = 0
    Corresponding to -12dbm

ESP_PWR_LVL_N9 = 1
    Corresponding to -9dbm

ESP_PWR_LVL_N6 = 2
    Corresponding to -6dbm

```

**ESP\_PWR\_LVL\_N3** = 3  
Corresponding to -3dbm

**ESP\_PWR\_LVL\_N0** = 4  
Corresponding to 0dbm

**ESP\_PWR\_LVL\_P3** = 5  
Corresponding to +3dbm

**ESP\_PWR\_LVL\_P6** = 6  
Corresponding to +6dbm

**ESP\_PWR\_LVL\_P9** = 7  
Corresponding to +9dbm

**ESP\_PWR\_LVL\_N14** = [ESP\\_PWR\\_LVL\\_N12](#)  
Backward compatibility! Setting to -14dbm will actually result to -12dbm

**ESP\_PWR\_LVL\_N11** = [ESP\\_PWR\\_LVL\\_N9](#)  
Backward compatibility! Setting to -11dbm will actually result to -9dbm

**ESP\_PWR\_LVL\_N8** = [ESP\\_PWR\\_LVL\\_N6](#)  
Backward compatibility! Setting to -8dbm will actually result to -6dbm

**ESP\_PWR\_LVL\_N5** = [ESP\\_PWR\\_LVL\\_N3](#)  
Backward compatibility! Setting to -5dbm will actually result to -3dbm

**ESP\_PWR\_LVL\_N2** = [ESP\\_PWR\\_LVL\\_N0](#)  
Backward compatibility! Setting to -2dbm will actually result to 0dbm

**ESP\_PWR\_LVL\_P1** = [ESP\\_PWR\\_LVL\\_P3](#)  
Backward compatibility! Setting to +1dbm will actually result to +3dbm

**ESP\_PWR\_LVL\_P4** = [ESP\\_PWR\\_LVL\\_P6](#)  
Backward compatibility! Setting to +4dbm will actually result to +6dbm

**ESP\_PWR\_LVL\_P7** = [ESP\\_PWR\\_LVL\\_P9](#)  
Backward compatibility! Setting to +7dbm will actually result to +9dbm

**enum esp\_sco\_data\_path\_t**

Bluetooth audio data transport path.

*Values:*

**ESP\_SCO\_DATA\_PATH\_HCI** = 0  
data over HCI transport

**ESP\_SCO\_DATA\_PATH\_PCM** = 1  
data over PCM interface

## 2.1.2 BT COMMON

### BT GENERIC DEFINES

**Overview** [Instructions](#)

**Application Example** [Instructions](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_defs.h](#)

**Structures**

**struct esp\_bt\_uuid\_t**  
UUID type.

**Public Members**

**uint16\_t len**  
UUID length, 16bit, 32bit or 128bit

**union esp\_bt\_uuid\_t::[anonymous] uuid**  
UUID

**Macros**

**ESP\_BLUEDROID\_STATUS\_CHECK** (status)

**ESP\_BT\_OCTET16\_LEN**

**ESP\_BT\_OCTET8\_LEN**

**ESP\_DEFAULT\_GATT\_IF**  
Default GATT interface id.

**ESP\_BLE\_CONN\_INT\_MIN**  
relate to BTM\_BLE\_CONN\_INT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_INT\_MAX**  
relate to BTM\_BLE\_CONN\_INT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_LATENCY\_MAX**  
relate to ESP\_BLE\_CONN\_LATENCY\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MIN**  
relate to BTM\_BLE\_CONN\_SUP\_TOUT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MAX**  
relate to ESP\_BLE\_CONN\_SUP\_TOUT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_PARAM\_UNDEF**

**ESP\_BLE\_SCAN\_PARAM\_UNDEF**

**ESP\_BLE\_IS\_VALID\_PARAM** (x, min, max)  
Check the param is valid or not.

**ESP\_UUID\_LEN\_16**

**ESP\_UUID\_LEN\_32**

**ESP\_UUID\_LEN\_128**

**ESP\_BD\_ADDR\_LEN**  
Bluetooth address length.

**ESP\_BLE\_ENC\_KEY\_MASK**  
Used to exchange the encryption key in the init key & response key.

**ESP\_BLE\_ID\_KEY\_MASK**  
Used to exchange the IRK key in the init key & response key.

**ESP\_BLE\_CSR\_KEY\_MASK**  
Used to exchange the CSRK key in the init key & response key.

**ESP\_BLE\_LINK\_KEY\_MASK**  
Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP\_APP\_ID\_MIN**  
Minimum of the application id.

**ESP\_APP\_ID\_MAX**

Maximum of the application id.

**ESP\_BD\_ADDR\_STR****ESP\_BD\_ADDR\_HEX** (addr)**Type Definitions****typedef** uint8\_t **esp\_bt\_octet16\_t**[ESP\_BT\_OCTET16\_LEN]**typedef** uint8\_t **esp\_bt\_octet8\_t**[ESP\_BT\_OCTET8\_LEN]**typedef** uint8\_t **esp\_link\_key**[ESP\_BT\_OCTET16\_LEN]**typedef** uint8\_t **esp\_bd\_addr\_t**[ESP\_BD\_ADDR\_LEN]

Bluetooth device address.

**typedef** uint8\_t **esp\_ble\_key\_mask\_t****Enumerations****enum** **esp\_bt\_status\_t**

Status Return Value.

*Values:***ESP\_BT\_STATUS\_SUCCESS** = 0**ESP\_BT\_STATUS\_FAIL****ESP\_BT\_STATUS\_NOT\_READY****ESP\_BT\_STATUS\_NOMEM****ESP\_BT\_STATUS\_BUSY****ESP\_BT\_STATUS\_DONE** = 5**ESP\_BT\_STATUS\_UNSUPPORTED****ESP\_BT\_STATUS\_PARM\_INVALID****ESP\_BT\_STATUS\_UNHANDLED****ESP\_BT\_STATUS\_AUTH\_FAILURE****ESP\_BT\_STATUS\_RMT\_DEV\_DOWN** = 10**ESP\_BT\_STATUS\_AUTH\_REJECTED****ESP\_BT\_STATUS\_INVALID\_STATIC\_RAND\_ADDR****ESP\_BT\_STATUS\_PENDING****ESP\_BT\_STATUS\_UNACCEPT\_CONN\_INTERVAL****ESP\_BT\_STATUS\_PARAM\_OUT\_OF\_RANGE****ESP\_BT\_STATUS\_TIMEOUT****ESP\_BT\_STATUS\_PEER\_LE\_DATA\_LEN\_UNSUPPORTED****ESP\_BT\_STATUS\_CONTROL\_LE\_DATA\_LEN\_UNSUPPORTED****ESP\_BT\_STATUS\_ERR\_ILLEGAL\_PARAMETER\_FMT****ESP\_BT\_STATUS\_MEMORY\_FULL** = 20**ESP\_BT\_STATUS\_EIR\_TOO\_LARGE****enum** **esp\_bt\_dev\_type\_t**

Bluetooth device type.

*Values:*

```
ESP_BT_DEVICE_TYPE_BREDR = 0x01
```

```
ESP_BT_DEVICE_TYPE_BLE = 0x02
```

```
ESP_BT_DEVICE_TYPE_DUMO = 0x03
```

```
enum esp_ble_addr_type_t
```

BLE device address type.

*Values:*

```
BLE_ADDR_TYPE_PUBLIC = 0x00
```

```
BLE_ADDR_TYPE_RANDOM = 0x01
```

```
BLE_ADDR_TYPE_RPA_PUBLIC = 0x02
```

```
BLE_ADDR_TYPE_RPA_RANDOM = 0x03
```

```
enum esp_ble_wl_addr_type_t
```

white list address type

*Values:*

```
BLE_WL_ADDR_TYPE_PUBLIC = 0x00
```

```
BLE_WL_ADDR_TYPE_RANDOM = 0x01
```

## BT MAIN API

**Overview** [Instructions](#)

**Application Example** [Instructions](#)

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_main.h](#)

### Functions

*esp\_err\_t* **esp\_bluedroid\_get\_status** (void)

Get bluetooth stack status.

**Return** Bluetooth stack status

*esp\_err\_t* **esp\_bluedroid\_enable** (void)

Enable bluetooth, must after esp\_bluedroid\_init()

**Return**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_disable** (void)

Disable bluetooth, must prior to esp\_bluedroid\_deinit()

**Return**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**

- ESP\_OK : Succeed

- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**

- ESP\_OK : Succeed
- Other : Failed

### Enumerations

**enum esp\_bluedroid\_status\_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

*Values:*

**ESP\_BLUEDROID\_STATUS\_UNINITIALIZED** = 0

Bluetooth not initialized

**ESP\_BLUEDROID\_STATUS\_INITIALIZED**

Bluetooth initialized but not enabled

**ESP\_BLUEDROID\_STATUS\_ENABLED**

Bluetooth initialized and enabled

## BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

[Instructions](#)

**Application Example** [Instructions](#)

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_device.h](#)

### Functions

**const** uint8\_t \***esp\_bt\_dev\_get\_address** (void)

Get bluetooth device address. Must use after “esp\_bluedroid\_enable” .

**Return** bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

*esp\_err\_t* **esp\_bt\_dev\_set\_device\_name** (**const** char \**name*)

Set bluetooth device name. This function should be called after esp\_bluedroid\_enable() completes successfully. A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP\_ERR\_INVALID\_STATE : if bluetooth stack is not yet enabled
- ESP\_FAIL : others

**Parameters**

- [*in*] *name*: : device name to be set

## 2.1.3 BT LE

### GAP API

#### Overview [Instructions](#)

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_client](#)
  - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_server](#)
  - [GATT Security Server Example Walkthrough](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_gap\\_ble\\_api.h](#)

#### Functions

*esp\_err\_t* **esp\_ble\_gap\_register\_callback** (*esp\_gap\_ble\_cb\_t* callback)

This function is called to occur gap event, such as scan result.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] callback: callback function

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data** (*esp\_ble\_adv\_data\_t* \*adv\_data)

This function is called to override the BTA default ADV parameters.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] adv\_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config\_adv\_data is received.

*esp\_err\_t* **esp\_ble\_gap\_set\_scan\_params** (*esp\_ble\_scan\_params\_t* \*scan\_params)

This function is called to set scan parameters.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] scan\_params: Pointer to User defined scan\_params data structure. This memory space can not be freed until callback of set\_scan\_params

*esp\_err\_t* **esp\_ble\_gap\_start\_scanning** (uint32\_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

#### Return

- ESP\_OK : success
- other : failed

**Parameters**

- [in] duration: Keeping the scanning time, the unit is second.

*esp\_err\_t* **esp\_ble\_gap\_stop\_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_advertising** (*esp\_ble\_adv\_params\_t* \*adv\_params)

This function is called to start advertising.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] adv\_params: pointer to User defined adv\_params data structure.

*esp\_err\_t* **esp\_ble\_gap\_stop\_advertising** (void)

This function is called to stop advertising.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_conn\_params** (*esp\_ble\_conn\_update\_params\_t* \*params)

Update connection parameters, can only be used when connection is up.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] params: - connection update parameters

*esp\_err\_t* **esp\_ble\_gap\_set\_pkt\_data\_len** (*esp\_bd\_addr\_t* remote\_device, *uint16\_t* tx\_data\_length)

This function is to set maximum LE data packet size.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_rand\_addr** (*esp\_bd\_addr\_t* rand\_addr)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] rand\_addr: the random address which should be setting

*esp\_err\_t* **esp\_ble\_gap\_clear\_rand\_addr** (void)

This function clears the random address for the application.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_privacy** (bool privacy\_enable)

Enable/disable privacy on the local device.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `privacy_enable`: - enable/disable privacy on remote device.

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_icon** (uint16\_t *icon*)

set local gap appearance icon

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [in] `icon`: - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml>

*esp\_err\_t* **esp\_ble\_gap\_update\_whitelist** (bool *add\_remove*, *esp\_bd\_addr\_t* *remote\_bda*, *esp\_ble\_wl\_addr\_type\_t* *wl\_addr\_type*)

Add or remove device from white list.

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [in] `add_remove`: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] `remote_bda`: the remote device address add/remove from the white list.
- [in] `wl_addr_type`: whitelist address type

*esp\_err\_t* **esp\_ble\_gap\_get\_whitelist\_size** (uint16\_t \**length*)

Get the whitelist size in the controller.

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [out] `length`: the white list length.

*esp\_err\_t* **esp\_ble\_gap\_set\_prefer\_conn\_params** (*esp\_bd\_addr\_t* *bd\_addr*, uint16\_t *min\_conn\_int*, uint16\_t *max\_conn\_int*, uint16\_t *slave\_latency*, uint16\_t *supervision\_tout*)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [in] `bd_addr`: BD address of the peripheral
- [in] `min_conn_int`: minimum preferred connection interval
- [in] `max_conn_int`: maximum preferred connection interval
- [in] `slave_latency`: preferred slave latency
- [in] `supervision_tout`: preferred supervision timeout

*esp\_err\_t* **esp\_ble\_gap\_set\_device\_name** (const char \**name*)

Set device name to the local device.

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [in] `name`: - device name.

*esp\_err\_t* **esp\_ble\_gap\_get\_local\_used\_addr** (*esp\_bd\_addr\_t* *local\_used\_addr*, uint8\_t \**addr\_type*)

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get

the public address.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] local\_used\_addr: - current local used ble address (six bytes)
- [in] addr\_type: - ble address type

`uint8_t *esp_ble_resolve_adv_data (uint8_t *adv_data, uint8_t type, uint8_t *length)`

This function is called to get ADV data for a specific type.

**Return** pointer of ADV data

**Parameters**

- [in] adv\_data: - pointer of ADV data which to be resolved
- [in] type: - finding ADV data type
- [out] length: - return the length of ADV data not including type

`esp_err_t esp_ble_gap_config_adv_data_raw (uint8_t *raw_data, uint32_t raw_data_len)`

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] raw\_data: : raw advertising data
- [in] raw\_data\_len: : raw advertising data length , less than 31 bytes

`esp_err_t esp_ble_gap_config_scan_rsp_data_raw (uint8_t *raw_data, uint32_t raw_data_len)`

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] raw\_data: : raw scan response data
- [in] raw\_data\_len: : raw scan response data length , less than 31 bytes

`esp_err_t esp_ble_gap_read_rssi (esp_bd_addr_t remote_addr)`

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT event.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] remote\_addr: : The remote connection device address.

`esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)`

This function is called to add a device info into the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] type: device info type, it is defined in esp\_ble\_duplicate\_exceptional\_info\_type\_t when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- [in] device\_info: the device information.

*esp\_err\_t* **esp\_ble\_gap\_remove\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] type: device info type, it is defined in *esp\_ble\_duplicate\_exceptional\_info\_type\_t* when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- [in] device\_info: the device information.

*esp\_err\_t* **esp\_ble\_gap\_clean\_duplicate\_scan\_exceptional\_list** (*esp\_duplicate\_scan\_exceptional\_list\_type\_t* list\_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] list\_type: duplicate scan exceptional list type, the value can be one or more of *esp\_duplicate\_scan\_exceptional\_list\_type\_t*.

*esp\_err\_t* **esp\_ble\_gap\_set\_security\_param** (*esp\_ble\_sm\_param\_t* param\_type, void \*value, uint8\_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’ .

To accept only secure connection mode, it is necessary do as following:

1. Set bit ESP\_LE\_AUTH\_REQ\_SC\_ONLY (param\_type is ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE), bit ESP\_LE\_AUTH\_BOND and bit ESP\_LE\_AUTH\_REQ\_MITM is optional as required.
2. Set to ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE (param\_type is ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH).

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] param\_type: : the type of the param which to be set
- [in] value: : the param value
- [in] len: : the length of the param value

*esp\_err\_t* **esp\_ble\_gap\_security\_rsp** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Grant security request access.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: : BD address of the peer
- [in] accept: : accept the security request or not

*esp\_err\_t* **esp\_ble\_set\_encryption** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_sec\_act\_t* sec\_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: : the address of the peer device need to encryption

- [in] `sec_act`: : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

*esp\_err\_t* **esp\_ble\_passkey\_reply** (*esp\_bd\_addr\_t* `bd_addr`, bool `accept`, uint32\_t `passkey`)

Reply the key value to the peer device in the legacy connection stage.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : passkey entry successful or declined.
- [in] `passkey`: : passkey value, must be a 6 digit number, can be lead by 0.

*esp\_err\_t* **esp\_ble\_confirm\_reply** (*esp\_bd\_addr\_t* `bd_addr`, bool `accept`)

Reply the confirm value to the peer device in the secure connection stage.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device
- [in] `accept`: : numbers to compare are the same or different.

*esp\_err\_t* **esp\_ble\_remove\_bond\_device** (*esp\_bd\_addr\_t* `bd_addr`)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device

int **esp\_ble\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return** -  $\geq 0$  : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_ble\_get\_bond\_device\_list** (int \*`dev_num`, *esp\_ble\_bond\_dev\_t* \*`dev_list`)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [inout] `dev_num`: Indicate the `dev_list` array(buffer) size as input. If `dev_num` is large enough, it means the actual number as output. Suggest that `dev_num` value equal to `esp_ble_get_bond_device_num()`.
- [out] `dev_list`: an array(buffer) of *esp\_ble\_bond\_dev\_t* type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

*esp\_err\_t* **esp\_ble\_oob\_req\_reply** (*esp\_bd\_addr\_t* `bd_addr`, uint8\_t \*`TK`, uint8\_t `len`)

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_OOB\_REQ\_EVT.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peer device.
- [in] `TK`: TK value, the TK value shall be a 128-bit random number
- [in] `len`: length of tk, should always be 128-bit

*esp\_err\_t* **esp\_ble\_gap\_disconnect** (*esp\_bd\_addr\_t* `remote_device`)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple `app_id` registered. `esp_ble_gattc_close` (*esp\_gatt\_if\_t* `gattc_if`, uint16\_t

conn\_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp\_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device) disconnect the physical connection directly.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] remote\_device: : BD address of the peer device

*esp\_err\_t* **esp\_ble\_get\_current\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, *esp\_gap\_conn\_params\_t* \*conn\_params)

This function is called to read the connection parameters information of the device.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: BD address of the peer device.
- [out] conn\_params: the connection parameters information

*esp\_err\_t* **esp\_gap\_ble\_set\_channels** (*esp\_gap\_ble\_channels\_t* channels)

BLE set channels.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] channels: : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

*esp\_err\_t* **esp\_gap\_ble\_set\_authorization** (*esp\_bd\_addr\_t* bd\_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.

## Unions

**union esp\_ble\_key\_value\_t**

The value is ESP\_BLE\_WHITELIST\_ADD if add address to whitelist operation success, ESP\_BLE\_WHITELIST\_REMOVE if remove address from the whitelist operation success

### Structures

**struct esp\_ble\_adv\_params\_t**  
Advertising parameters.

### Public Members

**uint16\_t adv\_int\_min**  
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec

**uint16\_t adv\_int\_max**  
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

*esp\_ble\_adv\_type\_t* **adv\_type**  
Advertising type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**  
Owner bluetooth device address type

*esp\_bd\_addr\_t* **peer\_addr**  
Peer device bluetooth device address

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**  
Peer device bluetooth device address type, only support public address type and random address type

*esp\_ble\_adv\_channel\_t* **channel\_map**  
Advertising channel map

*esp\_ble\_adv\_filter\_t* **adv\_filter\_policy**  
Advertising filter policy

**struct esp\_ble\_adv\_data\_t**  
Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

### Public Members

bool **set\_scan\_rsp**  
Set this advertising data as scan response or not

bool **include\_name**  
Advertising data include device name or not

bool **include\_txpower**  
Advertising data include TX power

int **min\_interval**  
Advertising data show slave preferred connection min interval. The connection interval in the following manner:  $\text{connIntervalmin} = \text{Conn\_Interval\_Min} * 1.25 \text{ ms}$   $\text{Conn\_Interval\_Min}$  range: 0x0006 to 0x0C80  
Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max\_interval**  
Advertising data show slave preferred connection max interval. The connection interval in the following manner:  $\text{connIntervalmax} = \text{Conn\_Interval\_Max} * 1.25 \text{ ms}$   $\text{Conn\_Interval\_Max}$  range: 0x0006 to 0x0C80  $\text{Conn\_Interval\_Max}$  shall be equal to or greater than the  $\text{Conn\_Interval\_Min}$ . Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**  
External appearance of device

uint16\_t **manufacturer\_len**  
Manufacturer data length

uint8\_t \***p\_manufacturer\_data**  
Manufacturer data point

uint16\_t **service\_data\_len**  
Service data length

uint8\_t \***p\_service\_data**  
Service data point

uint16\_t **service\_uuid\_len**  
Service uuid length

uint8\_t \***p\_service\_uuid**  
Service uuid array point

uint8\_t **flag**  
Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

**struct esp\_ble\_scan\_params\_t**

Ble scan parameters.

**Public Members***esp\_ble\_scan\_type\_t* **scan\_type**

Scan type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner address type

*esp\_ble\_scan\_filter\_t* **scan\_filter\_policy**

Scan filter policy

uint16\_t **scan\_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16\_t **scan\_window**

Scan window. The duration of the LE scan. LE\_Scan\_Window shall be less than or equal to LE\_Scan\_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10240 msec

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

The Scan\_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE\_SCAN\_DUPLICATE\_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

**struct esp\_gap\_conn\_params\_t**

connection parameters information

**Public Members**uint16\_t **interval**

connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_ble\_conn\_update\_params\_t**

Connection update parameters.

**Public Members***esp\_bd\_addr\_t* **bda**

Bluetooth device address

uint16\_t **min\_int**

Min connection interval

uint16\_t **max\_int**

Max connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_ble\_pkt\_data\_length\_params\_t**

BLE pkt data length keys.

### Public Members

**uint16\_t rx\_len**

pkt rx data length value

**uint16\_t tx\_len**

pkt tx data length value

**struct esp\_ble\_penc\_keys\_t**

BLE encryption keys.

### Public Members

*esp\_bt\_octet16\_t* **ltk**

The long term key

*esp\_bt\_octet8\_t* **rand**

The random number

**uint16\_t ediv**

The ediv value

**uint8\_t sec\_level**

The security level of the security link

**uint8\_t key\_size**

The key size(7~16) of the security link

**struct esp\_ble\_pcsrkeys\_t**

BLE CSRK keys.

### Public Members

**uint32\_t counter**

The counter

*esp\_bt\_octet16\_t* **csrkey**

The csrkey

**uint8\_t sec\_level**

The security level

**struct esp\_ble\_pidkeys\_t**

BLE pid keys.

### Public Members

*esp\_bt\_octet16\_t* **irk**

The irk value

*esp\_ble\_addr\_type\_t* **addr\_type**

The address type

*esp\_bd\_addr\_t* **static\_addr**

The static address

**struct esp\_ble\_lenc\_keys\_t**  
BLE Encryption reproduction keys.

#### Public Members

*esp\_bt\_octet16\_t* **ltk**  
The long term key

**uint16\_t** **div**  
The div value

**uint8\_t** **key\_size**  
The key size of the security link

**uint8\_t** **sec\_level**  
The security level of the security link

**struct esp\_ble\_lcsrk\_keys**  
BLE SRK keys.

#### Public Members

**uint32\_t** **counter**  
The counter value

**uint16\_t** **div**  
The div value

**uint8\_t** **sec\_level**  
The security level of the security link

*esp\_bt\_octet16\_t* **csrk**  
The csrk key value

**struct esp\_ble\_sec\_key\_notif\_t**  
Structure associated with ESP\_KEY\_NOTIF\_EVT.

#### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

**uint32\_t** **passkey**  
the numeric value for comparison. If just\_works, do not show this number to UI

**struct esp\_ble\_sec\_req\_t**  
Structure of the security request.

#### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

**struct esp\_ble\_bond\_key\_info\_t**  
struct type of the bond key information value

**Public Members**

*esp\_ble\_key\_mask\_t* **key\_mask**  
the key mask to indicate witch key is present

*esp\_ble\_penc\_keys\_t* **penc\_key**  
received peer encryption key

*esp\_ble\_pcsrkeys\_t* **pcsrk\_key**  
received peer device SRK

*esp\_ble\_pid\_keys\_t* **pid\_key**  
peer device ID key

**struct esp\_ble\_bond\_dev\_t**  
struct type of the bond device value

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

*esp\_ble\_bond\_key\_info\_t* **bond\_key**  
the bond key information

**struct esp\_ble\_key\_t**  
union type of the security key value

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

*esp\_ble\_key\_type\_t* **key\_type**  
key type of the security link

*esp\_ble\_key\_value\_t* **p\_key\_value**  
the pointer to the key value

**struct esp\_ble\_local\_id\_keys\_t**  
structure type of the ble local id keys value

**Public Members**

*esp\_bt\_octet16\_t* **ir**  
the 16 bits of the ir value

*esp\_bt\_octet16\_t* **irk**  
the 16 bits of the ir key value

*esp\_bt\_octet16\_t* **dhk**  
the 16 bits of the dh key value

**struct esp\_ble\_auth\_cmpl\_t**  
Structure associated with ESP\_AUTH\_CMPL\_EVT.

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**  
BD address peer device.

bool **key\_present**  
Valid link key value in key element

*esp\_link\_key* **key**  
Link key associated with peer device.

uint8\_t **key\_type**  
The type of Link Key

bool **success**  
TRUE of authentication succeeded, FALSE if failed.

uint8\_t **fail\_reason**  
The HCI reason/error code for when success=FALSE

*esp\_ble\_addr\_type\_t* **addr\_type**  
Peer device address type

*esp\_bt\_dev\_type\_t* **dev\_type**  
Device type

*esp\_ble\_auth\_req\_t* **auth\_mode**  
authentication mode

### Macros

**ESP\_BLE\_ADV\_FLAG\_LIMIT\_DISC**  
BLE\_ADV\_DATA\_FLAG data flag bit definition used for advertising data flag

**ESP\_BLE\_ADV\_FLAG\_GEN\_DISC**

**ESP\_BLE\_ADV\_FLAG\_BREDR\_NOT\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_CONTROLLER\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_HOST\_SPT**

**ESP\_BLE\_ADV\_FLAG\_NON\_LIMIT\_DISC**

**ESP\_LE\_KEY\_NONE**

**ESP\_LE\_KEY\_PENC**

**ESP\_LE\_KEY\_PID**

**ESP\_LE\_KEY\_PCSRK**

**ESP\_LE\_KEY\_PLK**

**ESP\_LE\_KEY\_LLK**

**ESP\_LE\_KEY\_LENC**

**ESP\_LE\_KEY\_LID**

**ESP\_LE\_KEY\_LCSRK**

**ESP\_LE\_AUTH\_NO\_BOND**

**ESP\_LE\_AUTH\_BOND**

**ESP\_LE\_AUTH\_REQ\_MITM**

**ESP\_LE\_AUTH\_REQ\_BOND\_MITM**  
0101

**ESP\_LE\_AUTH\_REQ\_SC\_ONLY**

**ESP\_LE\_AUTH\_REQ\_SC\_BOND**

**ESP\_LE\_AUTH\_REQ\_SC\_MITM**

**ESP\_LE\_AUTH\_REQ\_SC\_MITM\_BOND**

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD\_AND\_NAV**  
**ESP\_GAP\_BLE\_CHANNELS\_LEN**  
**ESP\_GAP\_BLE\_ADD\_WHITELIST\_COMPLETE\_EVT**  
    This is the old name, just for backwards compatibility.  
**ESP\_BLE\_ADV\_DATA\_LEN\_MAX**  
    Advertising data maximum length.  
**ESP\_BLE\_SCAN\_RSP\_DATA\_LEN\_MAX**  
    Scan response data maximum length.  
**BLE\_BIT** (n)

**Type Definitions**

```
typedef uint8_t esp_ble_key_type_t
```

```
typedef uint8_t esp_ble_auth_req_t
```

combination of the above bit pattern

```
typedef uint8_t esp_ble_io_cap_t
```

combination of the io capability

```
typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]
```

```
typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]
```

```
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
```

GAP callback function type.

**Parameters**

- event: : Event type
- param: : Point to callback parameter, currently is union type

**Enumerations**

```
enum esp_gap_ble_cb_event_t
```

GAP BLE callback event type.

*Values:*

```
ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
```

When advertising data set complete, the event comes

```
ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
```

When scan response data set complete, the event comes

```
ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
```

When scan parameters set complete, the event comes

```
ESP_GAP_BLE_SCAN_RESULT_EVT
```

When one scan result ready, the event comes each time

```
ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
```

When raw advertising data set complete, the event comes

```
ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
```

When raw advertising data set complete, the event comes

```
ESP_GAP_BLE_ADV_START_COMPLETE_EVT
```

When starting advertising complete, the event comes

```
ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
```

When starting scan complete, the event comes

```
ESP_GAP_BLE_AUTH_CMPL_EVT
```

Authentication complete indication.

```
ESP_GAP_BLE_KEY_EVT
```

BLE key event for peer device keys

```
ESP_GAP_BLE_SEC_REQ_EVT
```

BLE security request

```
ESP_GAP_BLE_PASSKEY_NOTIF_EVT
```

passkey notification event

```
ESP_GAP_BLE_PASSKEY_REQ_EVT
```

passkey request event

```
ESP_GAP_BLE_OOB_REQ_EVT
```

OOB request event

**ESP\_GAP\_BLE\_LOCAL\_IR\_EVT**  
BLE local IR event

**ESP\_GAP\_BLE\_LOCAL\_ER\_EVT**  
BLE local ER event

**ESP\_GAP\_BLE\_NC\_REQ\_EVT**  
Numeric Comparison request event

**ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT**  
When stopping adv complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT**  
When stopping scan complete, the event comes

**ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT**  
When setting the static rand address complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT**  
When updating connection parameters complete, the event comes

**ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT**  
When setting pkt length complete, the event comes

**ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT**  
When enabling/disabling privacy on the local device complete, the event comes

**ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**  
When removing the bond device complete, the event comes

**ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT**  
When clearing the bond device clear complete, the event comes

**ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT**  
When getting the bond device list complete, the event comes

**ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT**  
When reading the rssi complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT**  
When adding or removing whitelist complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT**  
When updating duplicate exceptional list complete, the event comes

**ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT**  
When setting BLE channels complete, the event comes

**ESP\_GAP\_BLE\_EVT\_MAX**

**enum esp\_ble\_adv\_data\_type**  
The type of advertising data(not adv\_type)

*Values:*

**ESP\_BLE\_AD\_TYPE\_FLAG = 0x01**

**ESP\_BLE\_AD\_TYPE\_16SRV\_PART = 0x02**

**ESP\_BLE\_AD\_TYPE\_16SRV\_CMPL = 0x03**

```

```
enum esp_ble_adv_type_t
```

Advertising mode.

*Values:*

```

ADV_TYPE_IND = 0x00
ADV_TYPE_DIRECT_IND_HIGH = 0x01
ADV_TYPE_SCAN_IND = 0x02
ADV_TYPE_NONCONN_IND = 0x03
ADV_TYPE_DIRECT_IND_LOW = 0x04

```

```
enum esp_ble_adv_channel_t
```

Advertising channel mask.

*Values:*

```

ADV_CHNL_37 = 0x01
ADV_CHNL_38 = 0x02

```

**ADV\_CHNL\_39** = 0x04

**ADV\_CHNL\_ALL** = 0x07

**enum esp\_ble\_adv\_filter\_t**

*Values:*

**ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_ANY** = 0x00

Allow both scan and connection requests from anyone.

**ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_ANY**

Allow both scan req from White List devices only and connection req from anyone.

**ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_WLST**

Allow both scan req from anyone and connection req from White List devices only.

**ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_WLST**

Allow scan and connection requests from White List devices only.

**enum esp\_ble\_sec\_act\_t**

*Values:*

**ESP\_BLE\_SEC\_ENCRYPT** = 1

**ESP\_BLE\_SEC\_ENCRYPT\_NO\_MITM**

**ESP\_BLE\_SEC\_ENCRYPT\_MITM**

**enum esp\_ble\_sm\_param\_t**

*Values:*

**ESP\_BLE\_SM\_PASSKEY** = 0

**ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE**

**ESP\_BLE\_SM\_IOCAP\_MODE**

**ESP\_BLE\_SM\_SET\_INIT\_KEY**

**ESP\_BLE\_SM\_SET\_RSP\_KEY**

**ESP\_BLE\_SM\_MAX\_KEY\_SIZE**

**ESP\_BLE\_SM\_MIN\_KEY\_SIZE**

**ESP\_BLE\_SM\_SET\_STATIC\_PASSKEY**

**ESP\_BLE\_SM\_CLEAR\_STATIC\_PASSKEY**

**ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH**

**ESP\_BLE\_SM\_OOB\_SUPPORT**

**ESP\_BLE\_APP\_ENC\_KEY\_SIZE**

**ESP\_BLE\_SM\_MAX\_PARAM**

**enum esp\_ble\_scan\_type\_t**

Ble scan type.

*Values:*

**BLE\_SCAN\_TYPE\_PASSIVE** = 0x0

Passive scan

**BLE\_SCAN\_TYPE\_ACTIVE** = 0x1

Active scan

**enum esp\_ble\_scan\_filter\_t**

Ble scan filter type.

*Values:*

**BLE\_SCAN\_FILTER\_ALLOW\_ALL** = 0x0

Accept all :

1. advertisement packets except directed advertising packets not addressed to this device (default).

**BLE\_SCAN\_FILTER\_ALLOW\_ONLY\_WLST** = 0x1

Accept only :

1. advertisement packets from devices where the advertiser' s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

**BLE\_SCAN\_FILTER\_ALLOW\_UND\_RPA\_DIR** = 0x2

Accept all :

1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**BLE\_SCAN\_FILTER\_ALLOW\_WLIST\_PRA\_DIR** = 0x3

Accept all :

1. advertisement packets from devices where the advertiser' s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**enum esp\_ble\_scan\_duplicate\_t**

Ble scan duplicate type.

*Values:*

**BLE\_SCAN\_DUPLICATE\_DISABLE** = 0x0

the Link Layer should generate advertising reports to the host for each packet received

**BLE\_SCAN\_DUPLICATE\_ENABLE** = 0x1

the Link Layer should filter out duplicate advertising reports to the Host

**BLE\_SCAN\_DUPLICATE\_MAX** = 0x2

0x02 –0xFF, Reserved for future use

**enum esp\_gap\_search\_evt\_t**

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

*Values:*

**ESP\_GAP\_SEARCH\_INQ\_RES\_EVT** = 0

Inquiry result for a peer device.

**ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT** = 1

Inquiry complete.

**ESP\_GAP\_SEARCH\_DISC\_RES\_EVT** = 2

Discovery result for a peer device.

**ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT** = 3

Discovery result for BLE GATT based service on a peer device.

**ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT** = 4

Discovery complete.

**ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT** = 5

Discovery complete.

**ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT** = 6

Search cancelled

**ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT** = 7

The number of pkt discarded by flow control

**enum esp\_ble\_evt\_type\_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

- ESP\_BLE\_EVT\_CONN\_ADV** = 0x00  
Connectable undirected advertising (ADV\_IND)
- ESP\_BLE\_EVT\_CONN\_DIR\_ADV** = 0x01  
Connectable directed advertising (ADV\_DIRECT\_IND)
- ESP\_BLE\_EVT\_DISC\_ADV** = 0x02  
Scannable undirected advertising (ADV\_SCAN\_IND)
- ESP\_BLE\_EVT\_NON\_CONN\_ADV** = 0x03  
Non connectable undirected advertising (ADV\_NONCONN\_IND)
- ESP\_BLE\_EVT\_SCAN\_RSP** = 0x04  
Scan Response (SCAN\_RSP)

**enum esp\_ble\_wl\_opration\_t**

*Values:*

- ESP\_BLE\_WHITELIST\_REMOVE** = 0X00  
remove mac from whitelist
- ESP\_BLE\_WHITELIST\_ADD** = 0X01  
add address to whitelist

**enum esp\_bt\_duplicate\_exceptional\_subcode\_type\_t**

*Values:*

- ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD** = 0  
Add device info into duplicate scan exceptional list
- ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE**  
Remove device info from duplicate scan exceptional list
- ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN**  
Clean duplicate scan exceptional list

**enum esp\_ble\_duplicate\_exceptional\_info\_type\_t**

*Values:*

- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_ADV\_ADDR** = 0  
BLE advertising address, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_LINK\_ID**  
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_BEACON\_TYPE**  
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROV\_SRV\_ADV**  
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SRV\_ADV**  
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

**enum esp\_duplicate\_scan\_exceptional\_list\_type\_t**

*Values:*

- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST** = BLE\_BIT(0)  
duplicate scan exceptional addr list
- ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST** = BLE\_BIT(1)  
duplicate scan exceptional mesh link ID list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_BEACON\_TYPE\_LIST** = BLE\_BIT(2)  
duplicate scan exceptional mesh beacon type list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROV\_SRV\_ADV\_LIST** = BLE\_BIT(3)  
duplicate scan exceptional mesh adv with provisioning service uuid

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SRV\_ADV\_LIST** = BLE\_BIT(4)  
duplicate scan exceptional mesh adv with provisioning service uuid

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ALL\_LIST** = 0xFFFF  
duplicate scan exceptional all list

## GATT DEFINES

[Overview](#) [Instructions](#)

[Application Example](#) [Instructions](#)

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_gatt\\_defs.h](#)

### Unions

**union esp\_gatt\_rsp\_t**  
*#include <esp\_gatt\_defs.h>* GATT remote read request response type.

#### Public Members

*esp\_gatt\_value\_t* **attr\_value**  
Gatt attribute structure

uint16\_t **handle**  
Gatt attribute handle

### Structures

**struct esp\_gatt\_id\_t**  
Gatt id, include uuid and instance id.

#### Public Members

*esp\_bt\_uuid\_t* **uuid**  
UUID

uint8\_t **inst\_id**  
Instance id

**struct esp\_gatt\_srvc\_id\_t**  
Gatt service id, include id (uuid and instance id) and primary flag.

**Public Members**

*esp\_gatt\_id\_t* **id**  
Gatt id, include uuid and instance

bool **is\_primary**  
This service is primary or not

**struct esp\_attr\_desc\_t**  
Attribute description (used to create database)

**Public Members**

uint16\_t **uuid\_length**  
UUID length

uint8\_t \***uuid\_p**  
UUID value

uint16\_t **perm**  
Attribute permission

uint16\_t **max\_length**  
Maximum length of the element

uint16\_t **length**  
Current length of the element

uint8\_t \***value**  
Element value array

**struct esp\_attr\_control\_t**  
attribute auto response flag

**Public Members**

uint8\_t **auto\_rsp**  
if auto\_rsp set to ESP\_GATT\_RSP\_BY\_APP, means the response of Write/Read operation will be replied by application. if auto\_rsp set to ESP\_GATT\_AUTO\_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

**struct esp\_gatts\_attr\_db\_t**  
attribute type added to the gatt server database

**Public Members**

*esp\_attr\_control\_t* **attr\_control**  
The attribute control type

*esp\_attr\_desc\_t* **att\_desc**  
The attribute type

**struct esp\_attr\_value\_t**  
set the attribute value type

**Public Members**

uint16\_t **attr\_max\_len**  
attribute max value length

`uint16_t attr_len`  
attribute current value length

`uint8_t *attr_value`  
the pointer to attribute value

**struct esp\_gatts\_incl\_svc\_desc\_t**  
Gatt include service entry element.

### Public Members

`uint16_t start_hdl`  
Gatt start handle value of included service

`uint16_t end_hdl`  
Gatt end handle value of included service

`uint16_t uuid`  
Gatt attribute value UUID of included service

**struct esp\_gatts\_incl128\_svc\_desc\_t**  
Gatt include 128 bit service entry element.

### Public Members

`uint16_t start_hdl`  
Gatt start handle value of included 128 bit service

`uint16_t end_hdl`  
Gatt end handle value of included 128 bit service

**struct esp\_gatt\_value\_t**  
Gatt attribute value.

### Public Members

`uint8_t value[ESP_GATT_MAX_ATTR_LEN]`  
Gatt attribute value

`uint16_t handle`  
Gatt attribute handle

`uint16_t offset`  
Gatt attribute value offset

`uint16_t len`  
Gatt attribute value length

`uint8_t auth_req`  
Gatt authentication request

**struct esp\_gatt\_conn\_params\_t**  
Connection parameters information.

### Public Members

`uint16_t interval`  
connection interval

`uint16_t latency`  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_gattc\_multi\_t**  
read multiple attribute

### Public Members

**uint8\_t num\_attr**

The number of the attribute

**uint16\_t handles[ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES]**

The handles list

**struct esp\_gattc\_db\_elem\_t**  
data base attribute element

### Public Members

*esp\_gatt\_db\_attr\_type\_t* **type**

The attribute type

**uint16\_t attribute\_handle**

The attribute handle, it' s valid for all of the type

**uint16\_t start\_handle**

The service start handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

**uint16\_t end\_handle**

The service end handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties, it' s valid only when the type = ESP\_GATT\_DB\_CHARACTERISTIC

*esp\_bt\_uuid\_t* **uuid**

The attribute uuid, it' s valid for all of the type

**struct esp\_gattc\_service\_elem\_t**  
service element

### Public Members

**bool is\_primary**

The service flag, true if the service is primary service, else is secondary service

**uint16\_t start\_handle**

The start handle of the service

**uint16\_t end\_handle**

The end handle of the service

*esp\_bt\_uuid\_t* **uuid**

The uuid of the service

**struct esp\_gattc\_char\_elem\_t**  
characteristic element

**Public Members**

`uint16_t char_handle`  
The characteristic handle

`esp_gatt_char_prop_t properties`  
The characteristic properties

`esp_bt_uuid_t uuid`  
The characteristic uuid

`struct esp_gattc_descr_elem_t`  
descriptor element

**Public Members**

`uint16_t handle`  
The characteristic descriptor handle

`esp_bt_uuid_t uuid`  
The characteristic descriptor uuid

`struct esp_gattc_incl_svc_elem_t`  
include service element

**Public Members**

`uint16_t handle`  
The include service current attribute handle

`uint16_t incl_srvc_s_handle`  
The start handle of the service which has been included

`uint16_t incl_srvc_e_handle`  
The end handle of the service which has been included

`esp_bt_uuid_t uuid`  
The include service uuid

**Macros**

`ESP_GATT_UUID_IMMEDIATE_ALERT_SVC`  
All “ESP\_GATT\_UUID\_XXX” is attribute types

`ESP_GATT_UUID_LINK_LOSS_SVC`

`ESP_GATT_UUID_TX_POWER_SVC`

**ESP\_GATT\_CHAR\_PROP\_BIT\_INDICATE**

**ESP\_GATT\_CHAR\_PROP\_BIT\_AUTH**

**ESP\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP**

**ESP\_GATT\_MAX\_ATTR\_LEN**

GATT maximum attribute length.

**ESP\_GATT\_RSP\_BY\_APP**

**ESP\_GATT\_AUTO\_RSP**

**ESP\_GATT\_IF\_NONE**

If callback report `gattc_if/gatts_if` as this macro, means this event is not correspond to any app

**Type Definitions**

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different gatt\_if

**Enumerations**

```
enum esp_gatt_prep_write_type
```

Attribute write data type from the client.

*Values:*

```
ESP_GATT_PREP_WRITE_CANCEL = 0x00
```

Prepare write cancel

```
ESP_GATT_PREP_WRITE_EXEC = 0x01
```

Prepare write execute

```
enum esp_gatt_status_t
```

GATT success code and error codes.

*Values:*

```
ESP_GATT_OK = 0x0
```

```
ESP_GATT_INVALID_HANDLE = 0x01
```

```
ESP_GATT_READ_NOT_PERMIT = 0x02
```

```
ESP_GATT_WRITE_NOT_PERMIT = 0x03
```

```
ESP_GATT_INVALID_PDU = 0x04
```

```
ESP_GATT_INSUF_AUTHENTICATION = 0x05
```

```
ESP_GATT_REQ_NOT_SUPPORTED = 0x06
```

```
ESP_GATT_INVALID_OFFSET = 0x07
```

```
ESP_GATT_INSUF_AUTHORIZATION = 0x08
```

```
ESP_GATT_PREPARE_Q_FULL = 0x09
```

```
ESP_GATT_NOT_FOUND = 0x0a
```

```
ESP_GATT_NOT_LONG = 0x0b
```

```
ESP_GATT_INSUF_KEY_SIZE = 0x0c
```

```
ESP_GATT_INVALID_ATTR_LEN = 0x0d
```

```
ESP_GATT_ERR_UNLIKELY = 0x0e
```

```
ESP_GATT_INSUF_ENCRYPTION = 0x0f
```

```
ESP_GATT_UNSUPPORT_GRP_TYPE = 0x10
```

```
ESP_GATT_INSUF_RESOURCE = 0x11
```

```
ESP_GATT_NO_RESOURCES = 0x80
```

```
ESP_GATT_INTERNAL_ERROR = 0x81
```

```
ESP_GATT_WRONG_STATE = 0x82
```

```
ESP_GATT_DB_FULL = 0x83
```

```
ESP_GATT_BUSY = 0x84
```

```
ESP_GATT_ERROR = 0x85
```

```
ESP_GATT_CMD_STARTED = 0x86
```

```

ESP_GATT_ILLEGAL_PARAMETER = 0x87
ESP_GATT_PENDING = 0x88
ESP_GATT_AUTH_FAIL = 0x89
ESP_GATT_MORE = 0x8a
ESP_GATT_INVALID_CFG = 0x8b
ESP_GATT_SERVICE_STARTED = 0x8c
ESP_GATT_ENCRYPED_MITM = ESP_GATT_OK
ESP_GATT_ENCRYPED_NO_MITM = 0x8d
ESP_GATT_NOT_ENCRYPTED = 0x8e
ESP_GATT_CONGESTED = 0x8f
ESP_GATT_DUP_REG = 0x90
ESP_GATT_ALREADY_OPEN = 0x91
ESP_GATT_CANCEL = 0x92
ESP_GATT_STACK_RSP = 0xe0
ESP_GATT_APP_RSP = 0xe1
ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff

```

```
enum esp_gatt_conn_reason_t
```

Gatt Connection reason enum.

*Values:*

```

ESP_GATT_CONN_UNKNOWN = 0
    Gatt connection unknown

ESP_GATT_CONN_L2C_FAILURE = 1
    General L2cap failure

ESP_GATT_CONN_TIMEOUT = 0x08
    Connection timeout

ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
    Connection terminate by peer user

ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
    Connection terminated by local host

ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
    Connection fail to establish

ESP_GATT_CONN_LMP_TIMEOUT = 0x22
    Connection fail for LMP response tout

ESP_GATT_CONN_CONN_CANCEL = 0x0100
    L2CAP connection cancelled

ESP_GATT_CONN_NONE = 0x0101
    No connection to cancel

```

```
enum esp_gatt_auth_req_t
```

Gatt authentication request type.

*Values:*

```
ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4
```

```
enum esp_service_source_t
```

*Values:*

```
ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
ESP_GATT_SERVICE_FROM_UNKNOWN = 2
```

```
enum esp_gatt_write_type_t
```

Gatt write type.

*Values:*

```
ESP_GATT_WRITE_TYPE_NO_RSP = 1
    Gatt write attribute need no response
ESP_GATT_WRITE_TYPE_RSP
    Gatt write attribute need remote response
```

```
enum esp_gatt_db_attr_type_t
```

the type of attribute element

*Values:*

```
ESP_GATT_DB_PRIMARY_SERVICE
    Gattc primary service attribute type in the cache
ESP_GATT_DB_SECONDARY_SERVICE
    Gattc secondary service attribute type in the cache
ESP_GATT_DB_CHARACTERISTIC
    Gattc characteristic attribute type in the cache
ESP_GATT_DB_DESCRIPTOR
    Gattc characteristic descriptor attribute type in the cache
ESP_GATT_DB_INCLUDED_SERVICE
    Gattc include service attribute type in the cache
ESP_GATT_DB_ALL
    Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type
    in the cache
```

## GATT SERVER API

### Overview [Instructions](#)

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - [bluetooth/bluedroid/ble/gatt\\_server\\_service\\_table](#)
  - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.

- [bluetooth/bluedroid/ble/gatt\\_server](#)
- [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_server](#)

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_gatts\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_gatts\_register\_callback** (*esp\_gatts\_cb\_t* callback)

This function is called to register application callbacks with BTA GATTS module.

#### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_register** (uint16\_t app\_id)

This function is called to register application identifier.

#### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_unregister** (*esp\_gatt\_if\_t* gatts\_if)

unregister with GATT Server.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface

*esp\_err\_t* **esp\_ble\_gatts\_create\_service** (*esp\_gatt\_if\_t* gatts\_if, *esp\_gatt\_srvc\_id\_t* \*service\_id, uint16\_t num\_handle)

Create a service. When service creation is done, a callback event ESP\_GATTS\_CREATE\_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] service\_id: service ID.
- [in] num\_handle: number of handle requested for this service.

*esp\_err\_t* **esp\_ble\_gatts\_create\_attr\_tab** (const *esp\_gatts\_attr\_db\_t* \*gatts\_attr\_db, *esp\_gatt\_if\_t* gatts\_if, uint8\_t max\_nb\_attr, uint8\_t srvc\_inst\_id)

Create a service attribute tab.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_attr\_db: the pointer to the service attr tab
- [in] gatts\_if: GATT server access interface
- [in] max\_nb\_attr: the number of attribute to be added to the service database.

- [in] `srvc_inst_id`: the instance id of the service

`esp_err_t esp_ble_gatts_add_included_service` (uint16\_t *service\_handle*, uint16\_t *included\_service\_handle*)

This function is called to add an included service. This function have to be called between 'esp\_ble\_gatts\_create\_service' and 'esp\_ble\_gatts\_add\_char'. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `included_service_handle`: the service ID to be included.

`esp_err_t esp_ble_gatts_add_char` (uint16\_t *service\_handle*, *esp\_bt\_uuid\_t* \**char\_uuid*, *esp\_gatt\_perm\_t* *perm*, *esp\_gatt\_char\_prop\_t* *property*, *esp\_attr\_value\_t* \**char\_val*, *esp\_attr\_control\_t* \**control*)

This function is called to add a characteristic into a service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `char_uuid`: : Characteristic UUID.
- [in] `perm`: : Characteristic value declaration attribute permission.
- [in] `property`: : Characteristic Properties
- [in] `char_val`: : Characteristic value
- [in] `control`: : attribute response control byte

`esp_err_t esp_ble_gatts_add_char_descr` (uint16\_t *service\_handle*, *esp\_bt\_uuid\_t* \**descr\_uuid*, *esp\_gatt\_perm\_t* *perm*, *esp\_attr\_value\_t* \**char\_descr\_val*, *esp\_attr\_control\_t* \**control*)

This function is called to add characteristic descriptor. When it's done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: service handle to which this characteristic descriptor is to be added.
- [in] `perm`: descriptor access permission.
- [in] `descr_uuid`: descriptor UUID.
- [in] `char_descr_val`: : Characteristic descriptor value
- [in] `control`: : attribute response control byte

`esp_err_t esp_ble_gatts_delete_service` (uint16\_t *service\_handle*)

This function is called to delete a service. When this is done, a callback event ESP\_GATTS\_DELETE\_EVT is report with the status.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: `service_handle` to be deleted.

`esp_err_t esp_ble_gatts_start_service` (uint16\_t *service\_handle*)

This function is called to start a service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: the service handle to be started.

`esp_err_t esp_ble_gatts_stop_service` (uint16\_t *service\_handle*)

This function is called to stop a service.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `service_handle`: - service to be topped.

`esp_err_t esp_ble_gatts_send_indicate` (*esp\_gatt\_if\_t gatts\_if*, uint16\_t *conn\_id*, uint16\_t *attr\_handle*, uint16\_t *value\_len*, uint8\_t *\*value*, bool *need\_confirm*)

Send indicate or notify to GATT client. Set param `need_confirm` as false will send notification, otherwise indication.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: - connection id to indicate.
- [in] `attr_handle`: - attribute handle to indicate.
- [in] `value_len`: - indicate value length.
- [in] `value`: value to indicate.
- [in] `need_confirm`: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

`esp_err_t esp_ble_gatts_send_response` (*esp\_gatt\_if\_t gatts\_if*, uint16\_t *conn\_id*, uint32\_t *trans\_id*, *esp\_gatt\_status\_t status*, *esp\_gatt\_rsp\_t \*rsp*)

This function is called to send a response to a request.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: - connection identifier.
- [in] `trans_id`: - transfer id
- [in] `status`: - response status
- [in] `rsp`: - response data.

`esp_err_t esp_ble_gatts_set_attr_value` (uint16\_t *attr\_handle*, uint16\_t *length*, const uint8\_t *\*value*)

This function is called to set the attribute value by the application.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] `attr_handle`: the attribute handle which to be set
- [in] `length`: the value length
- [in] `value`: the pointer to the attribute value

`esp_gatt_status_t esp_ble_gatts_get_attr_value` (uint16\_t *attr\_handle*, uint16\_t *\*length*, const uint8\_t *\*\*value*)

Retrieve attribute value.

#### Return

- ESP\_GATT\_OK : success
- other : failed

#### Parameters

- [in] `attr_handle`: Attribute handle.

- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

`esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)`

Open a direct open connection or add a background auto connection.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] remote\_bda: remote device bluetooth device address.
- [in] is\_direct: direct connection or background auto connection

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] conn\_id: connection ID to be closed.

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] remote\_bda: remote device bluetooth device address. If remote\_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

## Unions

`union esp_ble_gatts_cb_param_t`

`#include <esp_gatts_api.h>` Gatt server callback parameters union.

### Public Members

`struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg`

Gatt server callback param of ESP\_GATTS\_REG\_EVT

`struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read`

Gatt server callback param of ESP\_GATTS\_READ\_EVT

`struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write`

Gatt server callback param of ESP\_GATTS\_WRITE\_EVT

`struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write`

Gatt server callback param of ESP\_GATTS\_EXEC\_WRITE\_EVT

`struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu`

Gatt server callback param of ESP\_GATTS\_MTU\_EVT

`struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf`

Gatt server callback param of ESP\_GATTS\_CONF\_EVT (confirm)

`struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create`

Gatt server callback param of ESP\_GATTS\_CREATE\_EVT

```

struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
    Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
    Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
    Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
    Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
    Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
    Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param

`esp_bd_addr_t bda`  
The bluetooth device address which been written

`uint16_t handle`  
The attribute handle

`uint16_t offset`  
Offset of the value, if the value is too long

`bool need_rsp`  
The write operation need to do response

`bool is_prep`  
This write operation is prepare write

`uint16_t len`  
The write attribute value length

`uint8_t *value`  
The write attribute value

**Macros**

**ESP\_GATT\_PREP\_WRITE\_CANCEL**  
Prepare write flag to indicate cancel prepare write

**ESP\_GATT\_PREP\_WRITE\_EXEC**  
Prepare write flag to indicate execute prepare write

**Type Definitions**

```
typedef void (*esp_gatts_cb_t) (esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,
                                esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

**Parameters**

- `event`: : Event type
- `gatts_if`: : GATT server access interface, normally different `gatts_if` correspond to different profile
- `param`: : Point to callback parameter, currently is union type

**Enumerations**

**enum esp\_gatts\_cb\_event\_t**  
GATT Server callback function events.

*Values:*

**ESP\_GATTS\_REG\_EVT** = 0  
When register application id, the event comes

**ESP\_GATTS\_READ\_EVT** = 1  
When gatt client request read operation, the event comes

**ESP\_GATTS\_WRITE\_EVT** = 2  
When gatt client request write operation, the event comes

**ESP\_GATTS\_EXEC\_WRITE\_EVT** = 3  
When gatt client request execute write, the event comes

- ESP\_GATTS\_MTU\_EVT = 4**  
When set mtu complete, the event comes
- ESP\_GATTS\_CONF\_EVT = 5**  
When receive confirm, the event comes
- ESP\_GATTS\_UNREG\_EVT = 6**  
When unregister application id, the event comes
- ESP\_GATTS\_CREATE\_EVT = 7**  
When create service complete, the event comes
- ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT = 8**  
When add included service complete, the event comes
- ESP\_GATTS\_ADD\_CHAR\_EVT = 9**  
When add characteristic complete, the event comes
- ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT = 10**  
When add descriptor complete, the event comes
- ESP\_GATTS\_DELETE\_EVT = 11**  
When delete service complete, the event comes
- ESP\_GATTS\_START\_EVT = 12**  
When start service complete, the event comes
- ESP\_GATTS\_STOP\_EVT = 13**  
When stop service complete, the event comes
- ESP\_GATTS\_CONNECT\_EVT = 14**  
When gatt client connect, the event comes
- ESP\_GATTS\_DISCONNECT\_EVT = 15**  
When gatt client disconnect, the event comes
- ESP\_GATTS\_OPEN\_EVT = 16**  
When connect to peer, the event comes
- ESP\_GATTS\_CANCEL\_OPEN\_EVT = 17**  
When disconnect from peer, the event comes
- ESP\_GATTS\_CLOSE\_EVT = 18**  
When gatt server close, the event comes
- ESP\_GATTS\_LISTEN\_EVT = 19**  
When gatt listen to be connected the event comes
- ESP\_GATTS\_CONGEST\_EVT = 20**  
When congest happen, the event comes
- ESP\_GATTS\_RESPONSE\_EVT = 21**  
When gatt send response complete, the event comes
- ESP\_GATTS\_CREAT\_ATTR\_TAB\_EVT = 22**  
When gatt create table complete, the event comes
- ESP\_GATTS\_SET\_ATTR\_VAL\_EVT = 23**  
When gatt set attr value complete, the event comes
- ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT = 24**  
When gatt send service change indication complete, the event comes

## GATT CLIENT API

[Overview](#) [Instructions](#)

**Application Example** Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - `bluetooth/bluedroid/ble/gatt_client`
  - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - `bluetooth/bluedroid/ble/gattc_multi_connect`
  - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - `bluetooth/bluedroid/ble/ble_spp_client`

## API Reference

### Header File

- `bt/host/bluedroid/api/include/api/esp_gattc_api.h`

### Functions

`esp_err_t esp_ble_gattc_register_callback(esp_gattc_cb_t callback)`

This function is called to register application callbacks with GATTC module.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `callback`: pointer to the application callback function.

`esp_err_t esp_ble_gattc_app_register(uint16_t app_id)`

This function is called to register application callbacks with GATTC module.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `app_id`: Application Identify (UUID), for different application

`esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)`

This function is called to unregister an application from GATTC module.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.

`esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)`

Open a direct connection or add a background auto connection.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `remote_bda`: remote device bluetooth device address.
- [in] `remote_addr_type`: remote device bluetooth device the address type.
- [in] `is_direct`: direct connection or background auto connection

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app\_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp\_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device).

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID to be closed.

*esp\_err\_t* **esp\_ble\_gattc\_send\_mtu\_req** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp\_ble\_gatt\_set\_local\_mtu() to configure the local MTU size.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID.

*esp\_err\_t* **esp\_ble\_gattc\_search\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*filter\_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID.
- [in] filter\_uuid: a UUID of the service application is interested in. If Null, discover for all services.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*svc\_uuid, *esp\_gattc\_service\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc\_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp\_ble\_gattc\_search\_service.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] svc\_uuid: the pointer to the service uuid.
- [out] result: The pointer to the service which has been found in the gattc cache.
- [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- [in] offset: Offset of the service position to get.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_all\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_gattc\_char\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle.
- [in] `end_handle`: the attribute end handle
- [out] `result`: The pointer to the characteristic in the service.
- [inout] `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] `offset`: Offset of the characteristic position to get.

`esp_gatt_status_t esp_ble_gattc_get_all_descr` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `uint16_t char_handle`, `esp_gattc_descr_elem_t *result`, `uint16_t *count`, `uint16_t offset`)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `char_handle`: the given characteristic handle
- [out] `result`: The pointer to the descriptor in the characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] `offset`: Offset of the descriptor position to get.

`esp_gatt_status_t esp_ble_gattc_get_char_by_uuid` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `uint16_t start_handle`, `uint16_t end_handle`, `esp_bt_uuid_t char_uuid`, `esp_gattc_char_elem_t *result`, `uint16_t *count`)

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `char_uuid`: the characteristic uuid
- [out] `result`: The pointer to the characteristic in the service.
- [inout] `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

`esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `uint16_t start_handle`, `uint16_t end_handle`, `esp_bt_uuid_t char_uuid`, `esp_bt_uuid_t descr_uuid`, `esp_gattc_descr_elem_t *result`, `uint16_t *count`)

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `char_uuid`: the characteristic uuid.
- [in] `descr_uuid`: the descriptor uuid.
- [out] `result`: The pointer to the descriptor in the given characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_descr\_by\_char\_handle** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *uint16\_t* `char_handle`, *esp\_bt\_uuid\_t* `descr_uuid`, *esp\_gattc\_descr\_elem\_t* `*result`, *uint16\_t* `*count`)

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `char_handle`: the characteristic handle.
- [in] `descr_uuid`: the descriptor uuid.
- [out] `result`: The pointer to the descriptor in the given characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_include\_service** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *uint16\_t* `start_handle`, *uint16\_t* `end_handle`, *esp\_bt\_uuid\_t* `*incl_uuid`, *esp\_gattc\_incl\_svc\_elem\_t* `*result`, *uint16\_t* `*count`)

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `incl_uuid`: the include service uuid
- [out] `result`: The pointer to the include service in the given service.
- [inout] `count`: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_attr\_count** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *esp\_gatt\_db\_attr\_type\_t* `type`, *uint16\_t* `start_handle`, *uint16\_t* `end_handle`, *uint16\_t* `char_handle`, *uint16\_t* `*count`)

Find the attribute count with the given service or characteristic in the gattc cache.

**Return**

- ESP\_OK: success

- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `type`: the attribute type.
- [in] `start_handle`: the attribute start handle, if the type is `ESP_GATT_DB_DESCRIPTOR`, this parameter should be ignore
- [in] `end_handle`: the attribute end handle, if the type is `ESP_GATT_DB_DESCRIPTOR`, this parameter should be ignore
- [in] `char_handle`: the characteristic handle, this parameter valid when the type is `ESP_GATT_DB_DESCRIPTOR`. If the type isn't `ESP_GATT_DB_DESCRIPTOR`, this parameter should be ignore.
- [out] `count`: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle, esp_gattc_db_elem_t
*db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `conn_id`: connection ID which identify the server.
- [in] `db`: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] `count`: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic handle.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic handle to read.
- [in] `auth_req`: authenticate request type

```
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid,
esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic UUID.

#### Return

- `ESP_OK`: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `start_handle`: the attribute start handle.
- [in] `end_handle`: the attribute end handle
- [in] `uuid`: The UUID of attribute which will be read.
- [in] `auth_req`: authenticate request type

```
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                     esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t
                                     auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] read\_multi: : pointer to the read multiple parameter.
- [in] auth\_req: : authenticate request type

```
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                       esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] handle: : descriptor handle to read.
- [in] auth\_req: : authenticate request type

```
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                   uint16_t value_len, uint8_t *value, esp_gatt_write_type_t
                                   write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] handle: : characteristic handle to write.
- [in] value\_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] write\_type: : the type of attribute write operation.
- [in] auth\_req: : authentication request.

```
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                          uint16_t handle, uint16_t value_len, uint8_t
                                          *value, esp_gatt_write_type_t write_type,
                                          esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID
- [in] handle: : descriptor handle to write.
- [in] value\_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] write\_type: : the type of attribute write operation.
- [in] auth\_req: : authentication request.

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic value.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] handle: : characteristic handle to prepare write.
- [in] offset: : offset of the write value.
- [in] value\_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] auth\_req: : authentication request.

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic descriptor value.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] handle: : characteristic descriptor handle to prepare write.
- [in] offset: : offset of the write value.
- [in] value\_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] auth\_req: : authentication request.

*esp\_err\_t* **esp\_ble\_gattc\_execute\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, bool is\_execute)

This function is called to execute write a prepare write sequence.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] is\_execute: : execute or cancel.

*esp\_err\_t* **esp\_ble\_gattc\_register\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to register for notification of a service.

#### Return

- ESP\_OK: registration succeeds
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] server\_bda: : target GATT server.
- [in] handle: : GATT characteristic handle.

*esp\_err\_t* **esp\_ble\_gattc\_unregister\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to de-register for notification of a service.

#### Return

- ESP\_OK: unregister succeeds
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* remote\_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `remote_bda`: remote device BD address.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_assoc** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* src\_addr, *esp\_bd\_addr\_t* assoc\_addr, bool is\_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.
- [in] `src_addr`: the source address which provide the attribute table.
- [in] `assoc_addr`: the associated device address which went to share the attribute table with the source address.
- [in] `is_assoc`: true add the associated device address, false remove the associated device address.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_get\_addr\_list** (*esp\_gatt\_if\_t* gattc\_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP\_GATTC\_GET\_ADDR\_LIST\_EVT event when get address list complete.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `gattc_if`: Gatt client access interface.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_clean** (*esp\_bd\_addr\_t* remote\_bda)

Clean the service cache of this device in the gattc stack,.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] `remote_bda`: remote device BD address.

**Unions**

**union esp\_ble\_gattc\_cb\_param\_t**

*#include <esp\_gattc\_api.h>* Gatt client callback parameters union.

**Type Definitions**

```
typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
                               esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

**Parameters**

- *event*: : Event type
- *gatts\_if*: : GATT client access interface, normally different *gattc\_if* correspond to different profile
- *param*: : Point to callback parameter, currently is union type

**Enumerations**

**enum esp\_gattc\_cb\_event\_t**  
GATT Client callback function events.

*Values:*

- ESP\_GATTC\_REG\_EVT = 0**  
When GATT client is registered, the event comes
- ESP\_GATTC\_UNREG\_EVT = 1**  
When GATT client is unregistered, the event comes
- ESP\_GATTC\_OPEN\_EVT = 2**  
When GATT virtual connection is set up, the event comes
- ESP\_GATTC\_READ\_CHAR\_EVT = 3**  
When GATT characteristic is read, the event comes
- ESP\_GATTC\_WRITE\_CHAR\_EVT = 4**  
When GATT characteristic write operation completes, the event comes
- ESP\_GATTC\_CLOSE\_EVT = 5**  
When GATT virtual connection is closed, the event comes
- ESP\_GATTC\_SEARCH\_CMPL\_EVT = 6**  
When GATT service discovery is completed, the event comes
- ESP\_GATTC\_SEARCH\_RES\_EVT = 7**  
When GATT service discovery result is got, the event comes
- ESP\_GATTC\_READ\_DESCR\_EVT = 8**  
When GATT characteristic descriptor read completes, the event comes
- ESP\_GATTC\_WRITE\_DESCR\_EVT = 9**  
When GATT characteristic descriptor write completes, the event comes
- ESP\_GATTC\_NOTIFY\_EVT = 10**  
When GATT notification or indication arrives, the event comes
- ESP\_GATTC\_PREP\_WRITE\_EVT = 11**  
When GATT prepare-write operation completes, the event comes
- ESP\_GATTC\_EXEC\_EVT = 12**  
When write execution completes, the event comes
- ESP\_GATTC\_ACL\_EVT = 13**  
When ACL connection is up, the event comes
- ESP\_GATTC\_CANCEL\_OPEN\_EVT = 14**  
When GATT client ongoing connection is cancelled, the event comes
- ESP\_GATTC\_SRVC\_CHG\_EVT = 15**  
When “service changed” occurs, the event comes
- ESP\_GATTC\_ENC\_CMPL\_CB\_EVT = 17**  
When encryption procedure completes, the event comes
- ESP\_GATTC\_CFG\_MTU\_EVT = 18**  
When configuration of MTU completes, the event comes
- ESP\_GATTC\_ADV\_DATA\_EVT = 19**  
When advertising of data, the event comes
- ESP\_GATTC\_MULT\_ADV\_ENB\_EVT = 20**  
When multi-advertising is enabled, the event comes
- ESP\_GATTC\_MULT\_ADV\_UPD\_EVT = 21**  
When multi-advertising parameters are updated, the event comes
- ESP\_GATTC\_MULT\_ADV\_DATA\_EVT = 22**  
When multi-advertising data arrives, the event comes
- ESP\_GATTC\_MULT\_ADV\_DIS\_EVT = 23**  
When multi-advertising is disabled, the event comes

**ESP\_GATTC\_CONGEST\_EVT = 24**

When GATT connection congestion comes, the event comes

**ESP\_GATTC\_BTH\_SCAN\_ENB\_EVT = 25**

When batch scan is enabled, the event comes

**ESP\_GATTC\_BTH\_SCAN\_CFG\_EVT = 26**

When batch scan storage is configured, the event comes

**ESP\_GATTC\_BTH\_SCAN\_RD\_EVT = 27**

When Batch scan read event is reported, the event comes

**ESP\_GATTC\_BTH\_SCAN\_THR\_EVT = 28**

When Batch scan threshold is set, the event comes

**ESP\_GATTC\_BTH\_SCAN\_PARAM\_EVT = 29**

When Batch scan parameters are set, the event comes

**ESP\_GATTC\_BTH\_SCAN\_DIS\_EVT = 30**

When Batch scan is disabled, the event comes

**ESP\_GATTC\_SCAN\_FLT\_CFG\_EVT = 31**

When Scan filter configuration completes, the event comes

**ESP\_GATTC\_SCAN\_FLT\_PARAM\_EVT = 32**

When Scan filter parameters are set, the event comes

**ESP\_GATTC\_SCAN\_FLT\_STATUS\_EVT = 33**

When Scan filter status is reported, the event comes

**ESP\_GATTC\_ADV\_VSC\_EVT = 34**

When advertising vendor spec content event is reported, the event comes

**ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT = 38**

When register for notification of a service completes, the event comes

**ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT = 39**

When unregister for notification of a service completes, the event comes

**ESP\_GATTC\_CONNECT\_EVT = 40**

When the ble physical connection is set up, the event comes

**ESP\_GATTC\_DISCONNECT\_EVT = 41**

When the ble physical connection disconnected, the event comes

**ESP\_GATTC\_READ\_MULTIPLE\_EVT = 42**

When the ble characteristic or descriptor multiple complete, the event comes

**ESP\_GATTC\_QUEUE\_FULL\_EVT = 43**

When the gattc command queue full, the event comes

**ESP\_GATTC\_SET\_ASSOC\_EVT = 44**

When the ble gattc set the associated address complete, the event comes

**ESP\_GATTC\_GET\_ADDR\_LIST\_EVT = 45**

When the ble get gattc address list in cache finish, the event comes

**ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT = 46**

When the ble discover service complete, the event comes

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.

2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example** Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32's wifi to softap/station/softap&station mode and config wifi connections - `bluetooth/bluedroid/ble/blufi`

## API Reference

### Header File

- `bt/host/bluedroid/api/include/api/esp_blufi_api.h`

### Functions

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`

This function is called to receive blufi callback event.

**Return** ESP\_OK - success, other - failed

#### Parameters

- `[in] callbacks`: callback functions

`esp_err_t esp_blufi_profile_init (void)`

This function is called to initialize blufi\_profile.

**Return** ESP\_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`

This function is called to de-initialize blufi\_profile.

**Return** ESP\_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`

This function is called to send wifi connection report.

**Return** ESP\_OK - success, other - failed

#### Parameters

- `opmode`: : wifi opmode
- `sta_conn_state`: : station is already in connection or not
- `softap_conn_num`: : softap connection number
- `extra_info`: : extra information, such as `sta_ssid`, `softap_ssid` and etc.

`esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)`

This function is called to send wifi list.

**Return** ESP\_OK - success, other - failed

#### Parameters

- `apCount`: : wifi list count
- `list`: : wifi list

`uint16_t esp_blufi_get_version (void)`

Get BLUFI profile version.

**Return** Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_close (esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

#### Return

- ESP\_OK : success

- other : failed

#### Parameters

- [in] gatts\_if: GATT server access interface
- [in] conn\_id: connection ID to be closed.

*esp\_err\_t* **esp\_blufi\_send\_error\_info** (*esp\_blufi\_error\_state\_t* state)

This function is called to send blufi error information.

**Return** ESP\_OK - success, other - failed

#### Parameters

- state: : error state

*esp\_err\_t* **esp\_blufi\_send\_custom\_data** (uint8\_t \*data, uint32\_t data\_len)

This function is called to custom data.

**Return** ESP\_OK - success, other - failed

#### Parameters

- data: : custom data value
- data\_len: : the length of custom data

### Unions

**union esp\_blufi\_cb\_param\_t**

#include <esp\_blufi\_api.h> BLUFI callback parameters union.

### Public Members

**struct esp\_blufi\_cb\_param\_t::blufi\_init\_finish\_evt\_param** **init\_finish**

Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

**struct esp\_blufi\_cb\_param\_t::blufi\_deinit\_finish\_evt\_param** **deinit\_finish**

Blufi callback param of ESP\_BLUFI\_EVENT\_DEINIT\_FINISH

**struct esp\_blufi\_cb\_param\_t::blufi\_set\_wifi\_mode\_evt\_param** **wifi\_mode**

Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

**struct esp\_blufi\_cb\_param\_t::blufi\_connect\_evt\_param** **connect**

Blufi callback param of ESP\_BLUFI\_EVENT\_CONNECT

**struct esp\_blufi\_cb\_param\_t::blufi\_disconnect\_evt\_param** **disconnect**

Blufi callback param of ESP\_BLUFI\_EVENT\_DISCONNECT

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_bssid\_evt\_param** **sta\_bssid**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_BSSID

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_ssid\_evt\_param** **sta\_ssid**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_SSID

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_passwd\_evt\_param** **sta\_passwd**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_PASSWD

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_ssid\_evt\_param** **softap\_ssid**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_SSID

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_passwd\_evt\_param** **softap\_passwd**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_PASSWD

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_max\_conn\_num\_evt\_param** **softap\_max\_conn\_num**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_MAX\_CONN\_NUM

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_auth\_mode\_evt\_param** **softap\_auth\_mode**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_AUTH\_MODE

**struct esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_channel\_evt\_param** **softap\_channel**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_CHANNEL

```

Description of an WiFi AP.

**Public Members**

`uint8_t ssid[33]`  
SSID of AP

`int8_t rssi`  
signal strength of AP

**struct esp\_blufi\_callbacks\_t**  
BLUFI callback functions type.

**Public Members**

`esp_blufi_event_cb_t event_cb`  
BLUFI event callback

`esp_blufi_negotiate_data_handler_t negotiate_data_handler`  
BLUFI negotiate data function for negotiate share key

`esp_blufi_encrypt_func_t encrypt_func`  
BLUFI encrypt data function with share key generated by negotiate\_data\_handler

`esp_blufi_decrypt_func_t decrypt_func`  
BLUFI decrypt data function with share key generated by negotiate\_data\_handler

`esp_blufi_checksum_func_t checksum_func`  
BLUFI check sum function (FCS)

**Type Definitions**

**typedef void (\*esp\_blufi\_event\_cb\_t) (esp\_blufi\_cb\_event\_t event, esp\_blufi\_cb\_param\_t \*param)**  
BLUFI event callback function type.

**Parameters**

- event: : Event type
- param: : Point to callback parameter, currently is union type

**typedef void (\*esp\_blufi\_negotiate\_data\_handler\_t) (uint8\_t \*data, int len, uint8\_t \*\*output\_data, int \*output\_len, bool \*need\_free)**

BLUFI negotiate data handler.

**Parameters**

- data: : data from phone
- len: : length of data from phone
- output\_data: : data want to send to phone
- output\_len: : length of data want to send to phone

**typedef int (\*esp\_blufi\_encrypt\_func\_t) (uint8\_t iv8, uint8\_t \*crypt\_data, int crypt\_len)**  
BLUFI encrypt the data after negotiate a share key.

**Return** Nonnegative number is encrypted length, if error, return negative number;

**Parameters**

- iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
- crypt\_data: : plain text and encrypted data, the encrypt function must support autochthonous encrypt
- crypt\_len: : length of plain text

**typedef int (\*esp\_blufi\_decrypt\_func\_t) (uint8\_t iv8, uint8\_t \*crypt\_data, int crypt\_len)**  
BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

**Parameters**

- iv8: : initial vector(8bit), normally, blufi core will input packet sequence number

- `crypt_data`: : encrypted data and plain text, the encrypt function must support autochthonous decrypt
- `crypt_len`: : length of encrypted text

```
typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
BLUFI checksum.
```

#### Parameters

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `data`: : data need to checksum
- `len`: : length of data

#### Enumerations

```
enum esp_blufi_cb_event_t
```

*Values:*

```
ESP_BLUFI_EVENT_INIT_FINISH = 0
ESP_BLUFI_EVENT_DEINIT_FINISH
ESP_BLUFI_EVENT_SET_WIFI_OPMODE
ESP_BLUFI_EVENT_BLE_CONNECT
ESP_BLUFI_EVENT_BLE_DISCONNECT
ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP
ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP
ESP_BLUFI_EVENT_GET_WIFI_STATUS
ESP_BLUFI_EVENT_DEAUTHENTICATE_STA
ESP_BLUFI_EVENT_RECV_STA_BSSID
ESP_BLUFI_EVENT_RECV_STA_SSID
ESP_BLUFI_EVENT_RECV_STA_PASSWD
ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD
ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM
ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE
ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL
ESP_BLUFI_EVENT_RECV_USERNAME
ESP_BLUFI_EVENT_RECV_CA_CERT
ESP_BLUFI_EVENT_RECV_CLIENT_CERT
ESP_BLUFI_EVENT_RECV_SERVER_CERT
ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE
ESP_BLUFI_EVENT_GET_WIFI_LIST
ESP_BLUFI_EVENT_REPORT_ERROR
ESP_BLUFI_EVENT_RECV_CUSTOM_DATA
```

**enum esp\_blufi\_sta\_conn\_state\_t**

BLUFI config status.

*Values:*

**ESP\_BLUFI\_STA\_CONN\_SUCCESS** = 0x00

**ESP\_BLUFI\_STA\_CONN\_FAIL** = 0x01

**enum esp\_blufi\_init\_state\_t**

BLUFI init status.

*Values:*

**ESP\_BLUFI\_INIT\_OK** = 0

**ESP\_BLUFI\_INIT\_FAILED**

**enum esp\_blufi\_deinit\_state\_t**

BLUFI deinit status.

*Values:*

**ESP\_BLUFI\_DEINIT\_OK** = 0

**ESP\_BLUFI\_DEINIT\_FAILED**

**enum esp\_blufi\_error\_state\_t**

*Values:*

**ESP\_BLUFI\_SEQUENCE\_ERROR** = 0

**ESP\_BLUFI\_CHECKSUM\_ERROR**

**ESP\_BLUFI\_DECRYPT\_ERROR**

**ESP\_BLUFI\_ENCRYPT\_ERROR**

**ESP\_BLUFI\_INIT\_SECURITY\_ERROR**

**ESP\_BLUFI\_DH\_MALLOC\_ERROR**

**ESP\_BLUFI\_DH\_PARAM\_ERROR**

**ESP\_BLUFI\_READ\_PARAM\_ERROR**

**ESP\_BLUFI\_MAKE\_PUBLIC\_ERROR**

**ESP\_BLUFI\_DATA\_FORMAT\_ERROR**

## 2.1.4 CLASSIC BT

### CLASSIC BLUETOOTH GAP API

**Overview** [Instructions](#)

**Application Example** [Instructions](#)

#### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_gap\\_bt\\_api.h](#)

**Functions**

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_srvc** (uint32\_t *cod*)  
get major service field of COD

**Return** major service bits

**Parameters**

- [in] *cod*: Class of Device

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_major\_dev** (uint32\_t *cod*)  
get major device field of COD

**Return** major device bits

**Parameters**

- [in] *cod*: Class of Device

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_minor\_dev** (uint32\_t *cod*)  
get minor service field of COD

**Return** minor service bits

**Parameters**

- [in] *cod*: Class of Device

**static** uint32\_t **esp\_bt\_gap\_get\_cod\_format\_type** (uint32\_t *cod*)  
get format type of COD

**Return** format type

**Parameters**

- [in] *cod*: Class of Device

**static** bool **esp\_bt\_gap\_is\_valid\_cod** (uint32\_t *cod*)  
decide the integrity of COD

**Return**

- true if *cod* is valid
- false otherwise

**Parameters**

- [in] *cod*: Class of Device

*esp\_err\_t* **esp\_bt\_gap\_register\_callback** (*esp\_bt\_gap\_cb\_t* *callback*)  
register callback function. This function should be called after `esp_bluedroid_enable()` completes successfully

**Return**

- ESP\_OK : Succeed
- ESP\_FAIL: others

*esp\_err\_t* **esp\_bt\_gap\_set\_scan\_mode** (*esp\_bt\_connection\_mode\_t* *c\_mode*,  
*esp\_bt\_discovery\_mode\_t* *d\_mode*)

Set discoverability and connectability mode for legacy bluetooth. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG: if argument invalid
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] *c\_mode*: : one of the enums of `esp_bt_connection_mode_t`
- [in] *d\_mode*: : one of the enums of `esp_bt_discovery_mode_t`

*esp\_err\_t* **esp\_bt\_gap\_start\_discovery** (*esp\_bt\_inq\_mode\_t* *mode*, uint8\_t *inq\_len*, uint8\_t  
*num\_rsps*)

This function starts Inquiry and Name Discovery. It should be called after `esp_bluedroid_enable()` completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` when Inquiry is started or Name Discovery is completed.

esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_DISC\_RES\_EVT each time the two types of discovery results are got.

#### Return

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_ERR\_INVALID\_ARG: if invalid parameters are provided
- ESP\_FAIL: others

#### Parameters

- [in] mode: - Inquiry mode
- [in] inq\_len: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,
  - when this time expires, Inquiry will be halted.
- [in] num\_rsps: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

#### *esp\_err\_t* esp\_bt\_gap\_cancel\_discovery (void)

Cancel Inquiry and Name Discovery. This function should be called after esp\_bluedroid\_enable() completes successfully. esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_DISC\_STATE\_CHANGED\_EVT if Inquiry or Name Discovery is cancelled by calling this function.

#### Return

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### *esp\_err\_t* esp\_bt\_gap\_get\_remote\_services (*esp\_bd\_addr\_t* remote\_bda)

Start SDP to get remote services. This function should be called after esp\_bluedroid\_enable() completes successfully. esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_RMT\_SRVCS\_EVT after service discovery ends.

#### Return

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### *esp\_err\_t* esp\_bt\_gap\_get\_remote\_service\_record (*esp\_bd\_addr\_t* remote\_bda, *esp\_bt\_uuid\_t* \*uuid)

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp\_bluedroid\_enable() completes successfully.

esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_RMT\_SRVC\_REC\_EVT after service discovery ends

#### Return

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### uint8\_t \*esp\_bt\_gap\_resolve\_eir\_data (uint8\_t \*eir, *esp\_bt\_eir\_type\_t* type, uint8\_t \*length)

This function is called to get EIR data for a specific type.

**Return** pointer of starting position of eir data excluding eir data type, NULL if not found

#### Parameters

- [in] eir: - pointer of raw eir data to be resolved
- [in] type: - specific EIR data type
- [out] length: - return the length of EIR data excluding fields of length and data type

#### *esp\_err\_t* esp\_bt\_gap\_config\_eir\_data (*esp\_bt\_eir\_data\_t* \*eir\_data)

This function is called to config EIR data.

esp\_bt\_gap\_cb\_t will be called with ESP\_BT\_GAP\_CONFIG\_EIR\_DATA\_EVT after config EIR ends.

#### Return

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled

- ESP\_ERR\_INVALID\_ARG: if param is invalid
- ESP\_FAIL: others

**Parameters**

- [in] eir\_data: - pointer of EIR data content

*esp\_err\_t* **esp\_bt\_gap\_set\_cod** (*esp\_bt\_cod\_t* cod, *esp\_bt\_cod\_mode\_t* mode)

This function is called to set class of device. `esp_bt_gap_cb_t` will be called with ESP\_BT\_GAP\_SET\_COD\_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_ERR\_INVALID\_ARG: if param is invalid
- ESP\_FAIL: others

**Parameters**

- [in] cod: - class of device
- [in] mode: - setting mode

*esp\_err\_t* **esp\_bt\_gap\_get\_cod** (*esp\_bt\_cod\_t* \*cod)

This function is called to get class of device.

**Return**

- ESP\_OK : Succeed
- ESP\_FAIL: others

**Parameters**

- [out] cod: - class of device

*esp\_err\_t* **esp\_bt\_gap\_read\_rssi\_delta** (*esp\_bd\_addr\_t* remote\_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP\_BT\_GAP\_READ\_RSSI\_DELTA\_EVT.

**Return**

- ESP\_OK : Succeed
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: - remote device address, corresponding to a certain connection handle.

*esp\_err\_t* **esp\_bt\_gap\_remove\_bond\_device** (*esp\_bd\_addr\_t* bd\_addr)

Removes a device from the security database list of peer device.

**Return** - ESP\_OK : success

- ESP\_FAIL : failed

**Parameters**

- [in] bd\_addr: : BD address of the peer device

int **esp\_bt\_gap\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return** - >= 0 : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_bt\_gap\_get\_bond\_device\_list** (int \*dev\_num, *esp\_bd\_addr\_t* \*dev\_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [inout] dev\_num: Indicate the dev\_list array(buffer) size as input. If dev\_num is large enough, it means the actual number as output. Suggest that dev\_num value equal to

`esp_ble_get_bond_device_num()`.

- [out] `dev_list`: an array(buffer) of `esp_bd_addr_t` type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

`esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)`

Set pin type and default pin code for legacy pairing.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `pin_type`: Use variable or fixed pin. If `pin_type` is `ESP_BT_PIN_TYPE_VARIABLE`, `pin_code` and `pin_code_len` will be ignored, and `ESP_BT_GAP_PIN_REQ_EVT` will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- [in] `pin_code_len`: Length of `pin_code`
- [in] `pin_code`: Pin\_code

`esp_err_t esp_bt_gap_pin_reply(esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)`

Reply the `pin_code` to the peer device for legacy pairing when `ESP_BT_GAP_PIN_REQ_EVT` is coming.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peer
- [in] `accept`: Pin\_code reply successful or declined.
- [in] `pin_code_len`: Length of `pin_code`
- [in] `pin_code`: Pin\_code

`esp_err_t esp_bt_gap_set_security_param(esp_bt_sp_param_t param_type, void *value, uint8_t len)`

Set a GAP security parameter value. Overrides the default value.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `param_type`: : the type of the param which is to be set
- [in] `value`: : the param value
- [in] `len`: : the length of the param value

`esp_err_t esp_bt_gap_ssp_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)`

Reply the key value to the peer device in the legacy connection stage.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : passkey entry successful or declined.
- [in] `passkey`: : passkey value, must be a 6 digit number, can be lead by 0.

`esp_err_t esp_bt_gap_ssp_confirm_reply(esp_bd_addr_t bd_addr, bool accept)`

Reply the confirm value to the peer device in the legacy connection stage.

**Return** - `ESP_OK` : success

- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device
- [in] `accept`: : numbers to compare are the same or different.

*esp\_err\_t* **esp\_bt\_gap\_set\_afh\_channels** (*esp\_bt\_gap\_afh\_channels* channels)

Set the AFH channels.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] channels: : The n<sup>th</sup> such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

*esp\_err\_t* **esp\_bt\_gap\_read\_remote\_name** (*esp\_bd\_addr\_t* remote\_bda)

Read the remote device name.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] remote\_bda: The remote device' s address

## Unions

Bluetooth Device Property Descriptor.

**Public Members**

*esp\_bt\_gap\_dev\_prop\_type\_t* **type**  
device property type

int **len**  
device property value length

void **\*val**  
device property value

**struct esp\_bt\_eir\_data\_t**  
EIR data content, according to “Supplement to the Bluetooth Core Specification” .

**Public Members**

bool **fec\_required**  
FEC is required or not, true by default

bool **include\_txpower**  
EIR data include TX power, false by default

bool **include\_uuid**  
EIR data include UUID, false by default

uint8\_t **flag**  
EIR flags, see ESP\_BT\_EIR\_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16\_t **manufacturer\_len**  
Manufacturer data length, 0 by default

uint8\_t **\*p\_manufacturer\_data**  
Manufacturer data point

uint16\_t **url\_len**  
URL length, 0 by default

uint8\_t **\*p\_url**  
URL point

**Macros****ESP\_BT\_GAP\_RSSI\_HIGH\_THRLD**

RSSI threshold.

High RSSI threshold

**ESP\_BT\_GAP\_RSSI\_LOW\_THRLD**

Low RSSI threshold

**ESP\_BT\_GAP\_AFH\_CHANNELS\_LEN****ESP\_BT\_GAP\_MAX\_BDNAME\_LEN**

Maximum bytes of Bluetooth device name.

**ESP\_BT\_GAP\_EIR\_DATA\_LEN**

Maximum size of EIR Significant part.

**ESP\_BT\_EIR\_TYPE\_FLAGS**

Extended Inquiry Response data type.

Flag with information such as BR/EDR and LE support

**ESP\_BT\_EIR\_TYPE\_INCMPL\_16BITS\_UUID**

Incomplete list of 16-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_CMPL\_16BITS\_UUID**

Complete list of 16-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_INCMPL\_32BITS\_UUID**

Incomplete list of 32-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_CMPL\_32BITS\_UUID**

Complete list of 32-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_INCMPL\_128BITS\_UUID**

Incomplete list of 128-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_CMPL\_128BITS\_UUID**

Complete list of 128-bit service UUIDs

**ESP\_BT\_EIR\_TYPE\_SHORT\_LOCAL\_NAME**

Shortened Local Name

**ESP\_BT\_EIR\_TYPE\_CMPL\_LOCAL\_NAME**

Complete Local Name

**ESP\_BT\_EIR\_TYPE\_TX\_POWER\_LEVEL**

Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

**ESP\_BT\_EIR\_TYPE\_URL**

Uniform resource identifier

**ESP\_BT\_EIR\_TYPE\_MANU\_SPECIFIC**

Manufacturer specific data

**ESP\_BT\_EIR\_TYPE\_MAX\_NUM**

MAX number of EIR type

**ESP\_BT\_EIR\_FLAG\_LIMIT\_DISC****ESP\_BT\_EIR\_FLAG\_GEN\_DISC****ESP\_BT\_EIR\_FLAG\_BREDR\_NOT\_SPT****ESP\_BT\_EIR\_FLAG\_DMT\_CONTROLLER\_SPT****ESP\_BT\_EIR\_FLAG\_DMT\_HOST\_SPT****ESP\_BT\_EIR\_MAX\_LEN****ESP\_BT\_PIN\_CODE\_LEN**

Max pin code length

**ESP\_BT\_IO\_CAP\_OUT**

**ESP\_BT\_IO\_CAP\_IO**

**ESP\_BT\_IO\_CAP\_IN**

**ESP\_BT\_IO\_CAP\_NONE**

**ESP\_BT\_COD\_SRVC\_BIT\_MASK**

Bits of major service class field.

Major service bit mask

**ESP\_BT\_COD\_SRVC\_BIT\_OFFSET**

Major service bit offset

**ESP\_BT\_COD\_MAJOR\_DEV\_BIT\_MASK**

Bits of major device class field.

Major device bit mask

**ESP\_BT\_COD\_MAJOR\_DEV\_BIT\_OFFSET**

Major device bit offset

**ESP\_BT\_COD\_MINOR\_DEV\_BIT\_MASK**

Bits of minor device class field.

Minor device bit mask

**ESP\_BT\_COD\_MINOR\_DEV\_BIT\_OFFSET**

Minor device bit offset

**ESP\_BT\_COD\_FORMAT\_TYPE\_BIT\_MASK**

Bits of format type.

Format type bit mask

**ESP\_BT\_COD\_FORMAT\_TYPE\_BIT\_OFFSET**

Format type bit offset

**ESP\_BT\_COD\_FORMAT\_TYPE\_1**

Class of device format type 1.

**ESP\_BT\_GAP\_MIN\_INQ\_LEN**

Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

**ESP\_BT\_GAP\_MAX\_INQ\_LEN**

Maximum inquiry duration, unit is 1.28s

### Type Definitions

```
typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
```

```
typedef uint8_t esp_bt_eir_type_t
```

```
typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
```

Pin Code (upto 128 bits) MSB is 0

```
typedef uint8_t esp_bt_io_cap_t
```

combination of the io capability

```
typedef void (*esp_bt_gap_cb_t) (esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
```

bluetooth GAP callback function type

### Parameters

- event: : Event type
- param: : Pointer to callback parameter

**Enumerations****enum esp\_bt\_cod\_mode\_t**

class of device settings

*Values:***ESP\_BT\_SET\_COD\_MAJOR\_MINOR** = 0x01

overwrite major, minor class

**ESP\_BT\_SET\_COD\_SERVICE\_CLASS** = 0x02

set the bits in the input, the current bit will remain

**ESP\_BT\_CLR\_COD\_SERVICE\_CLASS** = 0x04

clear the bits in the input, others will remain

**ESP\_BT\_SET\_COD\_ALL** = 0x08

overwrite major, minor, set the bits in service class

**ESP\_BT\_INIT\_COD** = 0x0a

overwrite major, minor, and service class

**enum esp\_bt\_connection\_mode\_t**

Discoverability and Connectability mode.

*Values:***ESP\_BT\_NON\_CONNECTABLE**

Non-connectable

**ESP\_BT\_CONNECTABLE**

Connectable

**enum esp\_bt\_discovery\_mode\_t***Values:***ESP\_BT\_NON\_DISCOVERABLE**

Non-discoverable

**ESP\_BT\_LIMITED\_DISCOVERABLE**

Limited Discoverable

**ESP\_BT\_GENERAL\_DISCOVERABLE**

General Discoverable

**enum esp\_bt\_gap\_dev\_prop\_type\_t**

Bluetooth Device Property type.

*Values:***ESP\_BT\_GAP\_DEV\_PROP\_BDNAME** = 1

Bluetooth device name, value type is int8\_t []

**ESP\_BT\_GAP\_DEV\_PROP\_COD**

Class of Device, value type is uint32\_t

**ESP\_BT\_GAP\_DEV\_PROP\_RSSI**

Received Signal strength Indication, value type is int8\_t, ranging from -128 to 127

**ESP\_BT\_GAP\_DEV\_PROP\_EIR**

Extended Inquiry Response, value type is uint8\_t []

**enum esp\_bt\_cod\_srvc\_t**

Major service class field of Class of Device, mutiple bits can be set.

*Values:***ESP\_BT\_COD\_SRVC\_NONE** = 0

None indicates an invalid value

**ESP\_BT\_COD\_SRVC\_LMTD\_DISCOVER** = 0x1

Limited Discoverable Mode

**ESP\_BT\_COD\_SRVC\_POSITIONING** = 0x8  
Positioning (Location identification)

**ESP\_BT\_COD\_SRVC\_NETWORKING** = 0x10  
Networking, e.g. LAN, Ad hoc

**ESP\_BT\_COD\_SRVC\_RENDERING** = 0x20  
Rendering, e.g. Printing, Speakers

**ESP\_BT\_COD\_SRVC\_CAPTURING** = 0x40  
Capturing, e.g. Scanner, Microphone

**ESP\_BT\_COD\_SRVC\_OBJ\_TRANSFER** = 0x80  
Object Transfer, e.g. v-Inbox, v-Folder

**ESP\_BT\_COD\_SRVC\_AUDIO** = 0x100  
Audio, e.g. Speaker, Microphone, Headset service

**ESP\_BT\_COD\_SRVC\_TELEPHONY** = 0x200  
Telephony, e.g. Cordless telephony, Modem, Headset service

**ESP\_BT\_COD\_SRVC\_INFORMATION** = 0x400  
Information, e.g., WEB-server, WAP-server

**enum esp\_bt\_pin\_type\_t**

*Values:*

**ESP\_BT\_PIN\_TYPE\_VARIABLE** = 0  
Refer to BTM\_PIN\_TYPE\_VARIABLE

**ESP\_BT\_PIN\_TYPE\_FIXED** = 1  
Refer to BTM\_PIN\_TYPE\_FIXED

**enum esp\_bt\_sp\_param\_t**

*Values:*

**ESP\_BT\_SP\_IOCTL\_MODE** = 0  
Set IO mode

**enum esp\_bt\_cod\_major\_dev\_t**

Major device class field of Class of Device.

*Values:*

**ESP\_BT\_COD\_MAJOR\_DEV\_MISC** = 0  
Miscellaneous

**ESP\_BT\_COD\_MAJOR\_DEV\_COMPUTER** = 1  
Computer

**ESP\_BT\_COD\_MAJOR\_DEV\_PHONE** = 2  
Phone(cellular, cordless, pay phone, modem)

**ESP\_BT\_COD\_MAJOR\_DEV\_LAN\_NAP** = 3  
LAN, Network Access Point

**ESP\_BT\_COD\_MAJOR\_DEV\_AV** = 4  
Audio/Video(headset, speaker, stereo, video display, VCR)

**ESP\_BT\_COD\_MAJOR\_DEV\_PERIPHERAL** = 5  
Peripheral(mouse, joystick, keyboard)

**ESP\_BT\_COD\_MAJOR\_DEV\_IMAGING** = 6  
Imaging(printer, scanner, camera, display)

**ESP\_BT\_COD\_MAJOR\_DEV\_WEARABLE** = 7  
Wearable

**ESP\_BT\_COD\_MAJOR\_DEV\_TOY** = 8  
Toy

**ESP\_BT\_COD\_MAJOR\_DEV\_HEALTH = 9**  
Health

**ESP\_BT\_COD\_MAJOR\_DEV\_UNCATEGORIZED = 31**  
Uncategorized: device not specified

**enum esp\_bt\_gap\_discovery\_state\_t**  
Bluetooth Device Discovery state

*Values:*

**ESP\_BT\_GAP\_DISCOVERY\_STOPPED**  
device discovery stopped

**ESP\_BT\_GAP\_DISCOVERY\_STARTED**  
device discovery started

**enum esp\_bt\_gap\_cb\_event\_t**  
BT GAP callback events.

*Values:*

**ESP\_BT\_GAP\_DISC\_RES\_EVT = 0**  
device discovery result event

**ESP\_BT\_GAP\_DISC\_STATE\_CHANGED\_EVT**  
discovery state changed event

**ESP\_BT\_GAP\_RMT\_SRVCS\_EVT**  
get remote services event

**ESP\_BT\_GAP\_RMT\_SRVC\_REC\_EVT**  
get remote service record event

**ESP\_BT\_GAP\_AUTH\_CMPL\_EVT**  
AUTH complete event

**ESP\_BT\_GAP\_PIN\_REQ\_EVT**  
Legacy Pairing Pin code request

**ESP\_BT\_GAP\_CFM\_REQ\_EVT**  
Simple Pairing User Confirmation request.

**ESP\_BT\_GAP\_KEY\_NOTIF\_EVT**  
Simple Pairing Passkey Notification

**ESP\_BT\_GAP\_KEY\_REQ\_EVT**  
Simple Pairing Passkey request

**ESP\_BT\_GAP\_READ\_RSSI\_DELTA\_EVT**  
read rssi event

**ESP\_BT\_GAP\_CONFIG\_EIR\_DATA\_EVT**  
config EIR data event

**ESP\_BT\_GAP\_SET\_AFH\_CHANNELS\_EVT**  
set AFH channels event

**ESP\_BT\_GAP\_READ\_REMOTE\_NAME\_EVT**  
read Remote Name event

**ESP\_BT\_GAP\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**  
remove bond device complete event

**ESP\_BT\_GAP\_EVT\_MAX**

**enum esp\_bt\_inq\_mode\_t**  
Inquiry Mode

*Values:*

**ESP\_BT\_INQ\_MODE\_GENERAL\_INQUIRY**

General inquiry mode

**ESP\_BT\_INQ\_MODE\_LIMITED\_INQUIRY**

Limited inquiry mode

## Bluetooth A2DP API

### Overview [Instructions](#)

**Application Example** Check [bluetooth/bluedroid/classic\\_bt](#) folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - [bluetooth/bluedroid/classic\\_bt/a2dp\\_sink](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_a2dp\\_api.h](#)

#### Functions

*esp\_err\_t* **esp\_a2d\_register\_callback** (*esp\_a2d\_cb\_t* callback)

Register application callback function to A2DP module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by both A2DP source and sink.

##### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

##### Parameters

- [in] callback: A2DP event callback function

*esp\_err\_t* **esp\_a2d\_sink\_register\_data\_callback** (*esp\_a2d\_sink\_data\_cb\_t* callback)

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after `esp_bluedroid_enable()` completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through `menuconfig`.

##### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

##### Parameters

- [in] callback: A2DP sink data callback function

*esp\_err\_t* **esp\_a2d\_sink\_init** (void)

Initialize the bluetooth A2DP sink module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

##### Return

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_sink\_deinit** (void)

De-initialize for A2DP sink module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_sink\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote bluetooth A2DP source device, must after esp\_a2d\_sink\_init()

**Return**

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_a2d\_sink\_disconnect** (*esp\_bd\_addr\_t* remote\_bda)

Disconnect from the remote A2DP source device.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t* **esp\_a2d\_media\_ctrl** (*esp\_a2d\_media\_ctrl\_t* ctrl)

media control commands; this API can be used for both A2DP sink and source

**Return**

- ESP\_OK: control command is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] ctrl: control commands for A2DP data channel

*esp\_err\_t* **esp\_a2d\_source\_init** (void)

Initialize the bluetooth A2DP source module. This function should be called after esp\_bluedroid\_enable() completes successfully. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

**Return**

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_source\_deinit** (void)

De-initialize for A2DP source module. This function should be called only after esp\_bluedroid\_enable() completes successfully.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_a2d\_source\_register\_data\_callback** (*esp\_a2d\_source\_data\_cb\_t* callback)

Register A2DP source data input function; For now the input is PCM data stream. This function should be called only after esp\_bluedroid\_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

**Parameters**

- [in] `callback`: A2DP source data callback function

`esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)`  
Connect to remote A2DP sink device, must after `esp_a2d_source_init()`

#### Return

- `ESP_OK`: connect request is sent to lower layer
- `ESP_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

#### Parameters

- [in] `remote_bda`: remote bluetooth device address

`esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)`  
Disconnect from the remote A2DP sink device.

#### Return

- `ESP_OK`: disconnect request is sent to lower layer
- `ESP_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

#### Parameters

- [in] `remote_bda`: remote bluetooth device address

## Unions

`union esp_a2d_cb_param_t`  
`#include <esp_a2dp_api.h>` A2DP state callback parameters.

### Public Members

`struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat`  
A2DP connection status

`struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat`  
audio stream playing state

`struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg`  
media codec configuration information

`struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat`  
status in acknowledgement to media control commands

`struct a2d_audio_cfg_param`  
`#include <esp_a2dp_api.h>` `ESP_A2D_AUDIO_CFG_EVT`.

### Public Members

`esp_bd_addr_t remote_bda`  
remote bluetooth device address

`esp_a2d_mcc_t mcc`  
A2DP media codec capability information

`struct a2d_audio_stat_param`  
`#include <esp_a2dp_api.h>` `ESP_A2D_AUDIO_STATE_EVT`.

### Public Members

`esp_a2d_audio_state_t state`  
one of the values from `esp_a2d_audio_state_t`

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

**struct a2d\_conn\_stat\_param**  
*#include <esp\_a2dp\_api.h>* ESP\_A2D\_CONNECTION\_STATE\_EVT.

### Public Members

*esp\_a2d\_connection\_state\_t* **state**  
one of values from *esp\_a2d\_connection\_state\_t*

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

*esp\_a2d\_disc\_rsn\_t* **disc\_rsn**  
reason of disconnection for “DISCONNECTED”

**struct media\_ctrl\_stat\_param**  
*#include <esp\_a2dp\_api.h>* ESP\_A2D\_MEDIA\_CTRL\_ACK\_EVT.

### Public Members

*esp\_a2d\_media\_ctrl\_t* **cmd**  
media control commands to acknowledge

*esp\_a2d\_media\_ctrl\_ack\_t* **status**  
acknowledgement to media control commands

### Structures

**struct esp\_a2d\_mcc\_t**  
A2DP media codec capabilities union.

### Public Members

*esp\_a2d\_mct\_t* **type**  
A2DP media codec type

**union** *esp\_a2d\_mcc\_t::[anonymous]* **cie**  
A2DP codec information element

### Macros

**ESP\_A2D\_MCT\_SBC**  
Media codec types supported by A2DP.

SBC

**ESP\_A2D\_MCT\_M12**  
MPEG-1, 2 Audio

**ESP\_A2D\_MCT\_M24**  
MPEG-2, 4 AAC

**ESP\_A2D\_MCT\_ATRAC**  
ATRAC family

**ESP\_A2D\_MCT\_NON\_A2DP**

**ESP\_A2D\_CIE\_LEN\_SBC**

**ESP\_A2D\_CIE\_LEN\_M12**

**ESP\_A2D\_CIE\_LEN\_M24**

**ESP\_A2D\_CIE\_LEN\_ATRAC**

### Type Definitions

**typedef** uint8\_t **esp\_a2d\_mct\_t**

**typedef** void (\***esp\_a2d\_cb\_t**) (*esp\_a2d\_cb\_event\_t* event, *esp\_a2d\_cb\_param\_t* \*param)

A2DP profile callback function type.

#### Parameters

- event: : Event type
- param: : Pointer to callback parameter

**typedef** void (\***esp\_a2d\_sink\_data\_cb\_t**) (**const** uint8\_t \*buf, uint32\_t len)

A2DP profile data callback function.

#### Parameters

- [in] buf: : data received from A2DP source device and is PCM format decoder from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data
- [in] len: : size(in bytes) in buf

**typedef** int32\_t (\***esp\_a2d\_source\_data\_cb\_t**) (uint8\_t \*buf, int32\_t len)

A2DP source data read callback function.

**Return** size of bytes read successfully, if the argument len is -1, this value is ignored.

#### Parameters

- [in] buf: : buffer to be filled with PCM data stream from higher layer
- [in] len: : size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

### Enumerations

**enum** **esp\_a2d\_connection\_state\_t**

Bluetooth A2DP connection states.

*Values:*

**ESP\_A2D\_CONNECTION\_STATE\_DISCONNECTED** = 0

connection released

**ESP\_A2D\_CONNECTION\_STATE\_CONNECTING**

connecting remote device

**ESP\_A2D\_CONNECTION\_STATE\_CONNECTED**

connection established

**ESP\_A2D\_CONNECTION\_STATE\_DISCONNECTING**

disconnecting remote device

**enum** **esp\_a2d\_disc\_rsn\_t**

Bluetooth A2DP disconnection reason.

*Values:*

**ESP\_A2D\_DISC\_RSN\_NORMAL** = 0

Finished disconnection that is initiated by local or remote device

**ESP\_A2D\_DISC\_RSN\_ABNORMAL**

Abnormal disconnection caused by signal loss

**enum** **esp\_a2d\_audio\_state\_t**

Bluetooth A2DP datapath states.

*Values:*

**ESP\_A2D\_AUDIO\_STATE\_REMOTE\_SUSPEND** = 0

audio stream datapath suspended by remote device

**ESP\_A2D\_AUDIO\_STATE\_STOPPED**  
audio stream datapath stopped

**ESP\_A2D\_AUDIO\_STATE\_STARTED**  
audio stream datapath started

**enum esp\_a2d\_media\_ctrl\_ack\_t**  
A2DP media control command acknowledgement code.

*Values:*

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_SUCCESS = 0**  
media control command is acknowledged with success

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_FAILURE**  
media control command is acknowledged with failure

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_BUSY**  
media control command is rejected, as previous command is not yet acknowledged

**enum esp\_a2d\_media\_ctrl\_t**  
A2DP media control commands.

*Values:*

**ESP\_A2D\_MEDIA\_CTRL\_NONE = 0**  
Not for application use, use inside stack only.

**ESP\_A2D\_MEDIA\_CTRL\_CHECK\_SRC\_RDY**  
check whether AVDTP is connected, only used in A2DP source

**ESP\_A2D\_MEDIA\_CTRL\_START**  
command to set up media transmission channel

**ESP\_A2D\_MEDIA\_CTRL\_STOP**  
command to stop media transmission

**ESP\_A2D\_MEDIA\_CTRL\_SUSPEND**  
command to suspend media transmission

**enum esp\_a2d\_cb\_event\_t**  
A2DP callback events.

*Values:*

**ESP\_A2D\_CONNECTION\_STATE\_EVT = 0**  
connection state changed event

**ESP\_A2D\_AUDIO\_STATE\_EVT**  
audio stream transmission state changed event

**ESP\_A2D\_AUDIO\_CFG\_EVT**  
audio codec is configured, only used for A2DP SINK

**ESP\_A2D\_MEDIA\_CTRL\_ACK\_EVT**  
acknowledge event in response to media control commands

## BT AVRCP APIs

**Overview** Bluetooth AVRCP reference APIs.

[Instructions](#)

**Application Example** [Instructions](#)

## API Reference

## Header File

- `bt/host/bluetooth/api/include/api/esp_avrc_api.h`

## Functions

*esp\_err\_t* **esp\_avrc\_ct\_register\_callback** (*esp\_avrc\_ct\_cb\_t* callback)

Register application callbacks to AVRCP module. This function should be called after `esp_bluetooth_enable()` completes successfully.

### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

### Parameters

- [in] `callback`: AVRCP controller callback function

*esp\_err\_t* **esp\_avrc\_ct\_init** (void)

Initialize the bluetooth AVRCP controller module. This function should be called after `esp_bluetooth_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.

### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

*esp\_err\_t* **esp\_avrc\_ct\_deinit** (void)

De-initialize AVRCP controller module. This function should be called after after `esp_bluetooth_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be deinitialized before A2DP.

### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

*esp\_err\_t* **esp\_avrc\_ct\_send\_set\_player\_value\_cmd** (uint8\_t *tl*, uint8\_t *attr\_id*, uint8\_t *value\_id*)

Send player application settings command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

### Parameters

- [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.
- [in] `attr_id`: player application setting attribute IDs from one of `esp_avrc_ps_attr_ids_t`
- [in] `value_id`: attribute value defined for the specific player application setting attribute

*esp\_err\_t* **esp\_avrc\_ct\_send\_get\_rn\_capabilities\_cmd** (uint8\_t *tl*)

Send GetCapabilities PDU to AVRCP target to retrieve remote device's supported notification event\_ids. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

### Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

### Parameters

- [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.

*esp\_err\_t* **esp\_avrc\_ct\_send\_register\_notification\_cmd**(uint8\_t *tl*, uint8\_t *event\_id*,  
uint32\_t *event\_parameter*)

Send register notification command to AVRCP target, This function should be called after ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT is received and AVRCP connection is established.

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_ERR\_NOT\_SUPPORTED: if the event\_id is not supported in current implementation
- ESP\_FAIL: others

#### Parameters

- [in] *tl*: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] *event\_id*: : id of events, e.g. ESP\_AVRC\_RN\_PLAY\_STATUS\_CHANGE, ESP\_AVRC\_RN\_TRACK\_CHANGE, etc.
- [in] *event\_parameter*: : playback interval for ESP\_AVRC\_RN\_PLAY\_POS\_CHANGED; For other events , value of this parameter is ignored.

*esp\_err\_t* **esp\_avrc\_ct\_send\_set\_absolute\_volume\_cmd**(uint8\_t *tl*, uint8\_t *volume*)

Send set absolute volume command to AVRCP target, This function should be called after ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT is received and AVRCP connection is established.

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_ERR\_NOT\_SUPPORTED: if the event\_id is not supported in current implementation
- ESP\_FAIL: others

#### Parameters

- [in] *tl*: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] *volume*: : volume, 0 to 0x7f, means 0% to 100%

*esp\_err\_t* **esp\_avrc\_ct\_send\_metadata\_cmd**(uint8\_t *tl*, uint8\_t *attr\_mask*)

Send metadata command to AVRCP target, This function should be called after ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT is received and AVRCP connection is established.

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] *tl*: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] *attr\_mask*: : mask of attributes, e.g. ESP\_AVRC\_MD\_ATTR\_ID\_TITLE | ESP\_AVRC\_MD\_ATTR\_ID\_ARTIST.

*esp\_err\_t* **esp\_avrc\_ct\_send\_passthrough\_cmd**(uint8\_t *tl*, uint8\_t *key\_code*, uint8\_t *key\_state*)

Send passthrough command to AVRCP target, This function should be called after ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT is received and AVRCP connection is established.

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] *tl*: : transaction label, 0 to 15, consecutive commands should use different values.
- [in] *key\_code*: : passthrough command code, e.g. ESP\_AVRC\_PT\_CMD\_PLAY, ESP\_AVRC\_PT\_CMD\_STOP, etc.
- [in] *key\_state*: : passthrough command key state, ESP\_AVRC\_PT\_CMD\_STATE\_PRESSED or ESP\_AVRC\_PT\_CMD\_STATE\_RELEASED

*esp\_err\_t* **esp\_avrc\_tg\_register\_callback**(*esp\_avrc\_tg\_cb\_t* *callback*)

Register application callbacks to AVRCP target module; This function should be called after esp\_bluedroid\_enable() completes successfully.

#### Return

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `callback`: AVRCP target callback function

*esp\_err\_t* **esp\_avrc\_tg\_init** (void)

Initialize the bluetooth AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_avrc\_tg\_deinit** (void)

De-initialize AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be deinitialized before A2DP.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_avrc\_tg\_get\_psth\_cmd\_filter** (*esp\_avrc\_psth\_filter\_t* *filter*,  
*esp\_avrc\_psth\_bit\_mask\_t* \**cmd\_set*)

Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. For filter type `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type `ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS`, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using `esp_avrc_tg_set_psth_cmd_filter()`

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP\_ERR\_INVALID\_ARG: if filter type is invalid or `cmd_set` is NULL
- ESP\_FAIL: otherwise

*esp\_err\_t* **esp\_avrc\_tg\_set\_psth\_cmd\_filter** (*esp\_avrc\_psth\_filter\_t* *filter*, **const**  
*esp\_avrc\_psth\_bit\_mask\_t* \**cmd\_set*)

Set the filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. If filter type is `ESP_AVRC_PSTH_FILTER_SUPPORT_CMD`, the passthrough commands which are set "1" as given in `cmd_set` will generate `ESP_AVRC_CT_PASSTHROUGH_RSP_EVT` callback event and are auto-accepted in the protocol stack, other commands are replied with response type "NOT IMPLEMENTED" (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using `esp_avrc_tg_get_psth_cmd_filter()` with filter type "ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD"

Filter type "ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD" does not apply to this function

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled
- ESP\_ERR\_INVALID\_ARG: if filter type is invalid or `cmd_set` is NULL
- ESP\_ERR\_NOT\_SUPPORTED: if filter type is `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, or `cmd_set` includes unallowed commands

```
bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op,
                                     esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)
```

Operate on the type *esp\_avrc\_psth\_bit\_mask\_t* with regard to a specific PASSTHROUGH command.

**Return** For operation ESP\_AVRC\_BIT\_MASK\_OP\_SET or ESP\_AVRC\_BIT\_MASK\_OP\_CLEAR, return true for a successful operation, otherwise return false For operation ESP\_AVRC\_BIT\_MASK\_OP\_TEST, return true if the corresponding bit is set, otherwise false

**Parameters**

- [in] op: operation requested on the bit mask field
- [in] psth: pointer to passthrough command bit mask structure
- [in] cmd: passthrough command code

```
esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in *evt\_set*. This function should be called after *esp\_avrc\_tg\_init()*. For capability type “ESP\_AVRC\_RN\_CAP\_ALLOWED\_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation. For capability type ESP\_AVRC\_RN\_CAP\_SUPPORTED\_EVT, the event set covers the notification events selected to be supported under current configuration, The configuration can be changed using *esp\_avrc\_tg\_set\_rn\_evt\_cap()*

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP\_ERR\_INVALID\_ARG: if cap is invalid or *evt\_set* is NULL
- ESP\_FAIL: otherwise

```
esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in *evt\_set* and must be a subset of allowed event IDs with current implementation. This function should be called after *esp\_avrc\_tg\_init()*.

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled
- ESP\_ERR\_INVALID\_ARG: if *evt\_set* is NULL

```
bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op,
                                       esp_avrc_rn_evt_cap_mask_t *events,
                                       esp_avrc_rn_event_ids_t event_id)
```

Operate on the type *esp\_avrc\_rn\_evt\_cap\_mask\_t* with regard to a specific event.

**Return** For operation ESP\_AVRC\_BIT\_MASK\_OP\_SET or ESP\_AVRC\_BIT\_MASK\_OP\_CLEAR, return true for a successful operation, otherwise return false For operation ESP\_AVRC\_BIT\_MASK\_OP\_TEST, return true if the corresponding bit is set, otherwise false

**Parameters**

- [in] op: operation requested on the bit mask field
- [in] events: pointer to event notification capability bit mask structure
- [in] event\_id: notification event code

```
esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp,
                                 esp_avrc_rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using *esp\_avrc\_tg\_set\_rn\_evt\_cap()*, in a bit mask representation in *evt\_set*. This function should be called after *esp\_avrc\_tg\_init()*

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP\_ERR\_INVALID\_ARG: if *evt\_set* is NULL

**Parameters**

- [in] event\_id: notification event ID that remote AVRCP CT registers

- [in] `rsp`: notification response code
- [in] `param`: parameters included in the specific notification

### Unions

**union `esp_avrc_rn_param_t`**  
*#include <esp\_avrc\_api.h>* AVRCP notification parameters.

#### Public Members

`uint8_t volume`  
 response data for `ESP_AVRC_RN_VOLUME_CHANGE`, ranges 0..127

`esp_avrc_playback_stat_t playback`  
 response data for `ESP_AVRC_RN_PLAY_STATUS_CHANGE`

`uint8_t elm_id[8]`  
 response data for `ESP_AVRC_RN_TRACK_CHANGE`

`uint32_t play_pos`  
 response data for `ESP_AVRC_RN_PLAY_POS_CHANGED`, in millisecond

`esp_avrc_batt_stat_t batt`  
 response data for `ESP_AVRC_RN_BATTERY_STATUS_CHANGE`

**union `esp_avrc_ct_cb_param_t`**  
*#include <esp\_avrc\_api.h>* AVRCP controller callback parameters.

#### Public Members

**struct `esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat`**  
 AVRCP connection status

**struct `esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp`**  
 passthrough command response

**struct `esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp`**  
 metadata attributes response

**struct `esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf`**  
 notifications

**struct `esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats`**  
 AVRCP features discovered from remote SDP server

 get supported event capabilities response from AVRCP target

**struct `esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp`**  
 set absolute volume response event

**struct `avrc_ct_change_notify_param`**  
*#include <esp\_avrc\_api.h>* `ESP_AVRC_CT_CHANGE_NOTIFY_EVT`.

#### Public Members

`uint8_t event_id`  
 id of AVRCP event notification

`esp_avrc_rn_param_t event_parameter`  
 event notification parameter

```
struct avrc_ct_conn_stat_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.
```

### Public Members

bool **connected**  
whether AVRC connection is set up

*esp\_bd\_addr\_t* **remote\_bda**  
remote bluetooth device address

```
struct avrc_ct_get_rn_caps_rsp_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.
```

### Public Members

uint8\_t **cap\_count**  
number of items provided in event or company\_id according to cap\_id used

*esp\_avrc\_rn\_evt\_cap\_mask\_t* **evt\_set**  
supported event\_ids represented in bit-mask

```
struct avrc_ct_meta_rsp_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.
```

### Public Members

uint8\_t **attr\_id**  
id of metadata attribute

uint8\_t \***attr\_text**  
attribute itself

int **attr\_length**  
attribute character length

```
struct avrc_ct_psth_rsp_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

### Public Members

uint8\_t **t1**  
transaction label, 0 to 15

uint8\_t **key\_code**  
passthrough command code

uint8\_t **key\_state**  
0 for PRESSED, 1 for RELEASED

```
struct avrc_ct_rmt_feats_param  
#include <esp_avrc_api.h> ESP_AVRC_CT_REMOTE_FEATURES_EVT.
```

### Public Members

uint32\_t **feat\_mask**  
AVRC feature mask of remote device

`uint16_t tg_feat_flag`  
feature flag of remote device as TG

`esp_bd_addr_t remote_bda`  
remote bluetooth device address

**struct avrc\_ct\_set\_volume\_rsp\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_CT\_SET\_ABSOLUTE\_VOLUME\_RSP\_EVT.

### Public Members

`uint8_t volume`  
the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%

**union esp\_avrc\_tg\_cb\_param\_t**  
*#include <esp\_avrc\_api.h>* AVRC target callback parameters.

### Public Members

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_conn\_stat\_param conn\_stat**  
AVRC connection status

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_rmt\_feats\_param rmt\_feats**  
AVRC features discovered through SDP

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_psth\_cmd\_param psth\_cmd**  
passthrough command

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_set\_abs\_vol\_param set\_abs\_vol**  
set absolute volume command targeted on audio sink

**struct esp\_avrc\_tg\_cb\_param\_t::avrc\_tg\_reg\_ntf\_param reg\_ntf**  
register notification

**struct avrc\_tg\_conn\_stat\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_CONNECTION\_STATE\_EVT.

**Public Members**

**uint8\_t event\_id**  
event id of AVRC RegisterNotification

**uint32\_t event\_parameter**  
event notification parameter

**struct avrc\_tg\_rmt\_feats\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_REMOTE\_FEATURES\_EVT.

**Public Members**

**uint32\_t feat\_mask**  
AVRC feature mask of remote device

**uint16\_t ct\_feat\_flag**  
feature flag of remote device as CT

**esp\_bd\_addr\_t remote\_bda**  
remote bluetooth device address

**struct avrc\_tg\_set\_abs\_vol\_param**  
*#include <esp\_avrc\_api.h>* ESP\_AVRC\_TG\_SET\_ABSOLUTE\_VOLUME\_CMD\_EVT.

**Public Members**

**uint8\_t volume**  
volume ranges from 0 to 127

**Structures**

**struct esp\_avrc\_psth\_bit\_mask\_t**  
AVRC passthrough command bit mask.

**Public Members**

**uint16\_t bits[8]**  
bit mask representation of PASSTHROUGH commands

**struct esp\_avrc\_rn\_evt\_cap\_mask\_t**  
AVRC target notification event capability bit mask.

**Public Members**

**uint16\_t bits**  
bit mask representation of PASSTHROUGH commands

**Macros**

**ESP\_AVRC\_TRANS\_LABEL\_MAX**  
max transaction label

**Type Definitions**

```
typedef void (*esp_avrc_ct_cb_t) (esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t
                                *param)
```

AVRCP controller callback function type.

**Parameters**

- *event*: : Event type
- *param*: : Pointer to callback parameter union

```
typedef void (*esp_avrc_tg_cb_t) (esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t
                                *param)
```

AVRCP target callback function type.

**Parameters**

- *event*: : Event type
- *param*: : Pointer to callback parameter union

**Enumerations**

```
enum esp_avrc_features_t
```

AVRC feature bit mask.

*Values:*

```
ESP_AVRC_FEAT_RCTG = 0x0001
```

remote control target

```
ESP_AVRC_FEAT_RCCT = 0x0002
```

remote control controller

```
ESP_AVRC_FEAT_VENDOR = 0x0008
```

remote control vendor dependent commands

```
ESP_AVRC_FEAT_BROWSE = 0x0010
```

use browsing channel

```
ESP_AVRC_FEAT_META_DATA = 0x0040
```

remote control metadata transfer command/response

```
ESP_AVRC_FEAT_ADV_CTRL = 0x0200
```

remote control advanced control command/response

```
enum esp_avrc_feature_flag_t
```

AVRC supported features flag retrieved in SDP record.

*Values:*

```
ESP_AVRC_FEAT_FLAG_CAT1 = 0x0001
```

category 1

```
ESP_AVRC_FEAT_FLAG_CAT2 = 0x0002
```

category 2

```
ESP_AVRC_FEAT_FLAG_CAT3 = 0x0004
```

category 3

```
ESP_AVRC_FEAT_FLAG_CAT4 = 0x0008
```

vendor unique

**enum esp\_avrc\_psth\_filter\_t**

AVRC passthrough command filter.

*Values:*

**ESP\_AVRC\_PSTH\_FILTER\_ALLOWED\_CMD** = 0  
all of the PASSTHROUGH commands that can possibly be used, immutable

**ESP\_AVRC\_PSTH\_FILTER\_SUPPORTED\_CMD** = 1  
PASSTHROUGH commands selectively supported according to the current configuration

**ESP\_AVRC\_PSTH\_FILTER\_SUPPORT\_MAX**

**enum esp\_avrc\_bit\_mask\_op\_t**

*Values:*

**ESP\_AVRC\_BIT\_MASK\_OP\_TEST** = 0  
operation code to test a specific bit

**ESP\_AVRC\_BIT\_MASK\_OP\_SET** = 1  
operation code to set a specific bit

**ESP\_AVRC\_BIT\_MASK\_OP\_CLEAR** = 2  
operation code to clear a specific bit

**enum esp\_avrc\_pt\_cmd\_state\_t**

AVRC passthrough command state.

*Values:*

**ESP\_AVRC\_PT\_CMD\_STATE\_PRESSED** = 0  
key pressed

**ESP\_AVRC\_PT\_CMD\_STATE\_RELEASED = 1**  
key released

**enum esp\_avrc\_ct\_cb\_event\_t**  
AVRC Controller callback events.

*Values:*

**ESP\_AVRC\_CT\_CONNECTION\_STATE\_EVT = 0**  
connection state changed event

**ESP\_AVRC\_CT\_PASSTHROUGH\_RSP\_EVT = 1**  
passthrough response event

**ESP\_AVRC\_CT\_METADATA\_RSP\_EVT = 2**  
metadata response event

**ESP\_AVRC\_CT\_PLAY\_STATUS\_RSP\_EVT = 3**  
play status response event

**ESP\_AVRC\_CT\_CHANGE\_NOTIFY\_EVT = 4**  
notification event

**ESP\_AVRC\_CT\_REMOTE\_FEATURES\_EVT = 5**  
feature of remote device indication event

**ESP\_AVRC\_CT\_GET\_RN\_CAPABILITIES\_RSP\_EVT = 6**  
supported notification events capability of peer device

**ESP\_AVRC\_CT\_SET\_ABSOLUTE\_VOLUME\_RSP\_EVT = 7**  
set absolute volume response event

**enum esp\_avrc\_tg\_cb\_event\_t**  
AVRC Target callback events.

*Values:*

**ESP\_AVRC\_TG\_CONNECTION\_STATE\_EVT = 0**  
connection state changed event

**ESP\_AVRC\_TG\_REMOTE\_FEATURES\_EVT = 1**  
feature of remote device indication event

**ESP\_AVRC\_TG\_PASSTHROUGH\_CMD\_EVT = 2**  
passthrough command event

**ESP\_AVRC\_TG\_SET\_ABSOLUTE\_VOLUME\_CMD\_EVT = 3**  
set absolute volume command from remote device

**ESP\_AVRC\_TG\_REGISTER\_NOTIFICATION\_EVT = 4**  
register notification event

**enum esp\_avrc\_md\_attr\_mask\_t**  
AVRC metadata attribute mask.

*Values:*

**ESP\_AVRC\_MD\_ATTR\_TITLE = 0x1**  
title of the playing track

**ESP\_AVRC\_MD\_ATTR\_ARTIST = 0x2**  
track artist

**ESP\_AVRC\_MD\_ATTR\_ALBUM = 0x4**  
album name

**ESP\_AVRC\_MD\_ATTR\_TRACK\_NUM = 0x8**  
track position on the album

**ESP\_AVRC\_MD\_ATTR\_NUM\_TRACKS** = 0x10  
number of tracks on the album

**ESP\_AVRC\_MD\_ATTR\_GENRE** = 0x20  
track genre

**ESP\_AVRC\_MD\_ATTR\_PLAYING\_TIME** = 0x40  
total album playing time in milliseconds

**enum esp\_avrc\_rn\_event\_ids\_t**

AVRC event notification ids.

*Values:*

**ESP\_AVRC\_RN\_PLAY\_STATUS\_CHANGE** = 0x01  
track status change, eg. from playing to paused

**ESP\_AVRC\_RN\_TRACK\_CHANGE** = 0x02  
new track is loaded

**ESP\_AVRC\_RN\_TRACK\_REACHED\_END** = 0x03  
current track reached end

**ESP\_AVRC\_RN\_TRACK\_REACHED\_START** = 0x04  
current track reached start position

**ESP\_AVRC\_RN\_PLAY\_POS\_CHANGED** = 0x05  
track playing position changed

**ESP\_AVRC\_RN\_BATTERY\_STATUS\_CHANGE** = 0x06  
battery status changed

**ESP\_AVRC\_RN\_SYSTEM\_STATUS\_CHANGE** = 0x07  
system status changed

**ESP\_AVRC\_RN\_APP\_SETTING\_CHANGE** = 0x08  
application settings changed

**ESP\_AVRC\_RN\_NOW\_PLAYING\_CHANGE** = 0x09  
now playing content changed

**ESP\_AVRC\_RN\_AVAILABLE\_PLAYERS\_CHANGE** = 0x0a  
available players changed

**ESP\_AVRC\_RN\_ADDRESSED\_PLAYER\_CHANGE** = 0x0b  
the addressed player changed

**ESP\_AVRC\_RN\_UIDS\_CHANGE** = 0x0c  
UIDs changed

**ESP\_AVRC\_RN\_VOLUME\_CHANGE** = 0x0d  
volume changed locally on TG

**ESP\_AVRC\_RN\_MAX\_EVT**

**enum esp\_avrc\_rn\_evt\_cap\_t**

AVRC target notification event notification capability.

*Values:*

**ESP\_AVRC\_RN\_CAP\_ALLOWED\_EVT** = 0  
all of the notification events that can possibly be supported, immutable

**ESP\_AVRC\_RN\_CAP\_SUPPORTED\_EVT** = 1  
notification events selectively supported according to the current configuration

**ESP\_AVRC\_RN\_CAP\_MAX**

**enum esp\_avrc\_rn\_rsp\_t**

AVRC notification response type.

*Values:***ESP\_AVRC\_RN\_RSP\_INTERIM** = 13

initial response to RegisterNotification, should be sent T\_mtp(1000ms) from receiving the command

**ESP\_AVRC\_RN\_RSP\_CHANGED** = 15

final response to RegisterNotification command

**enum esp\_avrc\_ps\_attr\_ids\_t**

AVRC player setting ids.

*Values:***ESP\_AVRC\_PS\_EQUALIZER** = 0x01

equalizer, on or off

**ESP\_AVRC\_PS\_REPEAT\_MODE** = 0x02

repeat mode

**ESP\_AVRC\_PS\_SHUFFLE\_MODE** = 0x03

shuffle mode

**ESP\_AVRC\_PS\_SCAN\_MODE** = 0x04

scan mode on or off

**ESP\_AVRC\_PS\_MAX\_ATTR****enum esp\_avrc\_ps\_eq\_value\_ids\_t**

AVRC equalizer modes.

*Values:***ESP\_AVRC\_PS\_EQUALIZER\_OFF** = 0x1

equalizer OFF

**ESP\_AVRC\_PS\_EQUALIZER\_ON** = 0x2

equalizer ON

**enum esp\_avrc\_ps\_rpt\_value\_ids\_t**

AVRC repeat modes.

*Values:***ESP\_AVRC\_PS\_REPEAT\_OFF** = 0x1

repeat mode off

**ESP\_AVRC\_PS\_REPEAT\_SINGLE** = 0x2

single track repeat

**ESP\_AVRC\_PS\_REPEAT\_GROUP** = 0x3

group repeat

**enum esp\_avrc\_ps\_shf\_value\_ids\_t**

AVRC shuffle modes.

*Values:***ESP\_AVRC\_PS\_SHUFFLE\_OFF** = 0x1**ESP\_AVRC\_PS\_SHUFFLE\_ALL** = 0x2**ESP\_AVRC\_PS\_SHUFFLE\_GROUP** = 0x3**enum esp\_avrc\_ps\_scn\_value\_ids\_t**

AVRC scan modes.

*Values:*

**ESP\_AVRC\_PS\_SCAN\_OFF** = 0x1  
scan off

**ESP\_AVRC\_PS\_SCAN\_ALL** = 0x2  
all tracks scan

**ESP\_AVRC\_PS\_SCAN\_GROUP** = 0x3  
group scan

**enum esp\_avrc\_rsp\_t**  
AVCTP response codes.

*Values:*

**ESP\_AVRC\_RSP\_NOT\_IMPL** = 8  
not implemented

**ESP\_AVRC\_RSP\_ACCEPT** = 9  
accept

**ESP\_AVRC\_RSP\_REJECT** = 10  
reject

**ESP\_AVRC\_RSP\_IN\_TRANS** = 11  
in transition

**ESP\_AVRC\_RSP\_IMPL\_STBL** = 12  
implemented/stable

**ESP\_AVRC\_RSP\_CHANGED** = 13  
changed

**ESP\_AVRC\_RSP\_INTERIM** = 15  
interim

**enum esp\_avrc\_batt\_stat\_t**  
AVRCP battery status.

*Values:*

**ESP\_AVRC\_BATT\_NORMAL** = 0  
normal state

**ESP\_AVRC\_BATT\_WARNING** = 1  
unable to operate soon

**ESP\_AVRC\_BATT\_CRITICAL** = 2  
cannot operate any more

**ESP\_AVRC\_BATT\_EXTERNAL** = 3  
plugged to external power supply

**ESP\_AVRC\_BATT\_FULL\_CHARGE** = 4  
when completely charged from external power supply

**enum esp\_avrc\_playback\_stat\_t**  
AVRCP current status of playback.

*Values:*

**ESP\_AVRC\_PLAYBACK\_STOPPED** = 0  
stopped

**ESP\_AVRC\_PLAYBACK\_PLAYING** = 1  
playing

**ESP\_AVRC\_PLAYBACK\_PAUSED** = 2  
paused

```
ESP_AVRC_PLAYBACK_FWD_SEEK = 3
    forward seek

ESP_AVRC_PLAYBACK_REV_SEEK = 4
    reverse seek

ESP_AVRC_PLAYBACK_ERROR = 0xFF
    error
```

## SPP API

### Overview [Instructions](#)

**Application Example** Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data `bluetooth/bluedroid/classic_bt/bt_spp_acceptor`, `bluetooth/bluedroid/classic_bt/bt_spp_initiator`

### API Reference

#### Header File

- `bt/host/bluedroid/api/include/api/esp_spp_api.h`

#### Functions

*esp\_err\_t* **esp\_spp\_register\_callback** (*esp\_spp\_cb\_t* callback)

This function is called to init callbacks with SPP module.

##### Return

- ESP\_OK: success
- other: failed

##### Parameters

- [in] callback: pointer to the init callback function.

*esp\_err\_t* **esp\_spp\_init** (*esp\_spp\_mode\_t* mode)

This function is called to init SPP.

##### Return

- ESP\_OK: success
- other: failed

##### Parameters

- [in] mode: Choose the mode of SPP, ESP\_SPP\_MODE\_CB or ESP\_SPP\_MODE\_VFS.

*esp\_err\_t* **esp\_spp\_deinit** (void)

This function is called to uninit SPP.

##### Return

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_start\_discovery** (*esp\_bd\_addr\_t* bd\_addr)

This function is called to perform service discovery for the services provided by the given peer device. When the operation is complete the callback function will be called with a ESP\_SPP\_DISCOVERY\_COMP\_EVT.

##### Return

- ESP\_OK: success
- other: failed

##### Parameters

- [in] bd\_addr: Remote device bluetooth device address.

*esp\_err\_t* **esp\_spp\_connect** (*esp\_spp\_sec\_t* *sec\_mask*, *esp\_spp\_role\_t* *role*, *uint8\_t* *remote\_scn*,  
*esp\_bd\_addr\_t* *peer\_bd\_addr*)

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP\_SPP\_CL\_INIT\_EVT. When the connection is established or failed, the callback is called with ESP\_SPP\_OPEN\_EVT.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] *sec\_mask*: Security Setting Mask. Suggest to use ESP\_SPP\_SEC\_NONE, ESP\_SPP\_SEC\_AUTHORIZE or ESP\_SPP\_SEC\_AUTHENTICATE only.
- [in] *role*: Master or slave.
- [in] *remote\_scn*: Remote device bluetooth device SCN.
- [in] *peer\_bd\_addr*: Remote device bluetooth device address.

*esp\_err\_t* **esp\_spp\_disconnect** (*uint32\_t* *handle*)

This function closes an SPP connection.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] *handle*: The connection handle.

*esp\_err\_t* **esp\_spp\_start\_srv** (*esp\_spp\_sec\_t* *sec\_mask*, *esp\_spp\_role\_t* *role*, *uint8\_t* *local\_scn*, *const*  
*char* *\*name*)

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP\_SPP\_START\_EVT. When the connection is established, the callback is called with ESP\_SPP\_SRV\_OPEN\_EVT.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] *sec\_mask*: Security Setting Mask. Suggest to use ESP\_SPP\_SEC\_NONE, ESP\_SPP\_SEC\_AUTHORIZE or ESP\_SPP\_SEC\_AUTHENTICATE only.
- [in] *role*: Master or slave.
- [in] *local\_scn*: The specific channel you want to get. If channel is 0, means get any channel.
- [in] *name*: Server' s name.

*esp\_err\_t* **esp\_spp\_stop\_srv** (*void*)

This function stops a SPP server When the server is stopped successfully, the callback is called with ESP\_SPP\_SRV\_STOP\_EVT.

#### Return

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_spp\_write** (*uint32\_t* *handle*, *int* *len*, *uint8\_t* *\*p\_data*)

This function is used to write data, only for ESP\_SPP\_MODE\_CB.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] *handle*: The connection handle.
- [in] *len*: The length of the data written.
- [in] *p\_data*: The data written.

*esp\_err\_t* **esp\_spp\_vfs\_register** (*void*)

This function is used to register VFS.

#### Return

- ESP\_OK: success
- other: failed

### Unions

**union esp\_spp\_cb\_param\_t**  
*#include <esp\_spp\_api.h>* SPP callback parameters union.

#### Public Members

```

struct esp_spp_cb_param_t::spp_init_evt_param init
    SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
    SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
    SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
    SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
    SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
    SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
    SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
    SPP callback param of ESP_SPP_SRV_STOP_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
    SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
    SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
    SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
    SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

```

#### Public Members

*#include <esp\_spp\_api.h>* ESP\_SPP\_START\_EVT.

**Public Members**

*esp\_spp\_status\_t* **status**  
status

uint32\_t **handle**  
The connection handle

uint8\_t **sec\_id**  
security ID used by this server

bool **use\_co**  
TRUE to use co\_rfc\_data

**struct spp\_uninit\_evt\_param**  
*#include <esp\_spp\_api.h> SPP\_UNINIT\_EVT.*

### Public Members

*esp\_spp\_status\_t* **status**  
status

**struct spp\_write\_evt\_param**  
*#include <esp\_spp\_api.h> ESP\_SPP\_WRITE\_EVT.*

### Public Members

*esp\_spp\_status\_t* **status**  
status

uint32\_t **handle**  
The connection handle

int **len**  
The length of the data written.

bool **cong**  
congestion status

### Macros

**ESP\_SPP\_SEC\_NONE**  
No security. relate to BTA\_SEC\_NONE in bta/bta\_api.h

**ESP\_SPP\_SEC\_AUTHORIZE**  
Authorization required (only needed for out going connection ) relate to BTA\_SEC\_AUTHORIZE in bta/bta\_api.h

**ESP\_SPP\_SEC\_AUTHENTICATE**  
Authentication required. relate to BTA\_SEC\_AUTHENTICATE in bta/bta\_api.h

**ESP\_SPP\_SEC\_ENCRYPT**  
Encryption required. relate to BTA\_SEC\_ENCRYPT in bta/bta\_api.h

**ESP\_SPP\_SEC\_MODE4\_LEVEL4**  
Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA\_SEC\_MODE4\_LEVEL4 in bta/bta\_api.h

**ESP\_SPP\_SEC\_MITM**  
Man-In-The-Middle protection relate to BTA\_SEC\_MITM in bta/bta\_api.h

**ESP\_SPP\_SEC\_IN\_16\_DIGITS**  
Min 16 digit for pin code relate to BTA\_SEC\_IN\_16\_DIGITS in bta/bta\_api.h

**ESP\_SPP\_MAX\_MTU**  
SPP max MTU

**ESP\_SPP\_MAX\_SCN**  
SPP max SCN

### Type Definitions

```
typedef uint16_t esp_spp_sec_t
```

```
typedef void (esp_spp_cb_t) (esp_spp_cb_event_t event, esp_spp_cb_param_t *param)
```

SPP callback function type.

#### Parameters

- event: Event type
- param: Point to callback parameter, currently is union type

### Enumerations

```
enum esp_spp_status_t
```

*Values:*

```
ESP_SPP_SUCCESS = 0
```

Successful operation.

```
ESP_SPP_FAILURE
```

Generic failure.

```
ESP_SPP_BUSY
```

Temporarily can not handle this request.

```
ESP_SPP_NO_DATA
```

no data.

```
ESP_SPP_NO_RESOURCE
```

No more resource

```
ESP_SPP_NEED_INIT
```

SPP module shall init first

```
ESP_SPP_NEED_DEINIT
```

SPP module shall deinit first

```
ESP_SPP_NO_CONNECTION
```

connection may have been closed

```
enum esp_spp_role_t
```

*Values:*

```
ESP_SPP_ROLE_MASTER = 0
```

Role: master

```
ESP_SPP_ROLE_SLAVE = 1
```

Role: slave

```
enum esp_spp_mode_t
```

*Values:*

```
ESP_SPP_MODE_CB = 0
```

When data is coming, a callback will come with data

```
ESP_SPP_MODE_VFS = 1
```

Use VFS to write/read data

```
enum esp_spp_cb_event_t
```

SPP callback function events.

*Values:*

```
ESP_SPP_INIT_EVT = 0
```

When SPP is inited, the event comes

```
ESP_SPP_UNINIT_EVT = 1
```

When SPP is uninited, the event comes

```
ESP_SPP_DISCOVERY_COMP_EVT = 8
```

When SDP discovery complete, the event comes

- ESP\_SPP\_OPEN\_EVT = 26**  
When SPP Client connection open, the event comes
- ESP\_SPP\_CLOSE\_EVT = 27**  
When SPP connection closed, the event comes
- ESP\_SPP\_START\_EVT = 28**  
When SPP server started, the event comes
- ESP\_SPP\_CL\_INIT\_EVT = 29**  
When SPP client initiated a connection, the event comes
- ESP\_SPP\_DATA\_IND\_EVT = 30**  
When SPP connection received data, the event comes, only for ESP\_SPP\_MODE\_CB
- ESP\_SPP\_CONG\_EVT = 31**  
When SPP connection congestion status changed, the event comes, only for ESP\_SPP\_MODE\_CB
- ESP\_SPP\_WRITE\_EVT = 33**  
When SPP write operation completes, the event comes, only for ESP\_SPP\_MODE\_CB
- ESP\_SPP\_SRV\_OPEN\_EVT = 34**  
When SPP Server connection open, the event comes
- ESP\_SPP\_SRV\_STOP\_EVT = 35**  
When SPP server stopped, the event comes

## HFP DEFINES

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_hf\\_defs.h](#)

### Macros

**ESP\_BT\_HF\_NUMBER\_LEN**  
**ESP\_BT\_HF\_OPERATOR\_NAME\_LEN**  
**BTC\_HSAG\_SERVICE\_NAME**  
**BTC\_HFAG\_SERVICE\_NAME**  
**BTC\_HF\_SERVICES**  
**BTC\_HF\_SERVICE\_NAMES**  
**BTC\_HF\_SECURITY**  
**BTC\_HF\_CALL\_END\_TIMEOUT**  
**BTC\_HF\_INVALID\_IDX**

### Type Definitions

```
typedef void (*esp_hf_connection_state_callback) (esp_hf_connection_state_t state,
esp_bd_addr_t *bd_addr)
```

Callback for connection state change. state will have one of the values from BtHfConnectionState

```
typedef void (*esp_hf_audio_state_callback) (esp_hf_audio_state_t state, esp_bd_addr_t
*bd_addr)
```

Callback for audio connection state change. state will have one of the values from BtHfAudioState

```

typedef void (*esp_hf_vr_cmd_callback) (esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)
    Callback for VR connection state change. state will have one of the values from BtHfVRState

typedef void (*esp_hf_answer_call_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for answer incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback) (esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)
    Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback) (char *number, esp_bd_addr_t *bd_addr)
    Callback for dialing an outgoing call If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback) (char tone, esp_bd_addr_t *bd_addr)
    Callback for sending DTMF tones tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback) (esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)
    Callback for enabling/disabling noise reduction/echo cancellation value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback) (esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)
    Callback for AT+BCS and event from BAC WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback) (esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)
    Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for indicators (CIND)

typedef void (*esp_hf_cops_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback) (char *at_string, esp_bd_addr_t *bd_addr)
    Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback) (esp_bd_addr_t *bd_addr)
    Callback for keypressed (HSP) event.

```

### Enumerations

```

enum esp_hf_in_band_ring_state_t

```

in-band ring tone state

*Values:*

```

ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0

```

```

ESP_HF_IN_BAND_RINGTONE_PROVIDED

```

```

enum esp_hf_vr_state_t

```

voice recognition state

*Values:*

```

ESP_HF_VR_STATE_DISABLED = 0

```

voice recognition disabled

```

ESP_HF_VR_STATE_ENABLED

```

voice recognition enabled

**enum esp\_hf\_volume\_control\_target\_t**

Bluetooth HFP audio volume control target.

*Values:***ESP\_HF\_VOLUME\_CONTROL\_TARGET\_SPK = 0**

speaker

**ESP\_HF\_VOLUME\_CONTROL\_TARGET\_MIC**

microphone

**enum esp\_hf\_audio\_state\_t**

Bluetooth HFP audio connection status.

*Values:***ESP\_HF\_AUDIO\_STATE\_DISCONNECTED = 0**

audio connection released

**ESP\_HF\_AUDIO\_STATE\_CONNECTING**

audio connection has been initiated

**ESP\_HF\_AUDIO\_STATE\_CONNECTED**

audio connection is established

**ESP\_HF\_AUDIO\_STATE\_CONNECTED\_MSBC**

mSBC audio connection is established

**enum esp\_hf\_volume\_type\_t***Values:***ESP\_HF\_VOLUME\_TYPE\_SPK = 0****ESP\_HF\_VOLUME\_TYPE\_MIC****enum esp\_hf\_network\_state\_t**

+CIND network service availability status

*Values:***ESP\_HF\_NETWORK\_STATE\_NOT\_AVAILABLE = 0****ESP\_HF\_NETWORK\_STATE\_AVAILABLE****enum esp\_hf\_service\_type\_t**

+CIEV Service type

*Values:***ESP\_HF\_SERVICE\_TYPE\_HOME = 0****ESP\_HF\_SERVICE\_TYPE\_ROAMING****enum esp\_hf\_call\_status\_t**

+CIND call status indicator values

*Values:***ESP\_HF\_CALL\_STATUS\_NO\_CALLS = 0**

no call in progress

**ESP\_HF\_CALL\_STATUS\_CALL\_IN\_PROGRESS = 1**

call is present(active or held)

**enum esp\_hf\_call\_setup\_status\_t**

+CIND call setup status indicator values

*Values:***ESP\_HF\_CALL\_SETUP\_STATUS\_IDLE = 0**

no call setup in progress

```
ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
    incoming call setup in progress

ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
    outgoing call setup in dialing state

ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
    outgoing call setup in alerting state
```

```
enum esp_hf_roaming_status_t
+CIND roaming status indicator values
```

*Values:*

```
ESP_HF_ROAMING_STATUS_INACTIVE = 0
    roaming is not active

ESP_HF_ROAMING_STATUS_ACTIVE
    a roaming is active
```

```
enum esp_hf_call_held_status_t
+CIND call held indicator values
```

*Values:*

```
ESP_HF_CALL_HELD_STATUS_NONE = 0
    no calls held

ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE = 1
    both active and held call

ESP_HF_CALL_HELD_STATUS_HELD = 2
    call on hold, no active call
```

```
enum esp_hf_current_call_status_t
+CLCC status of the call
```

*Values:*

```
ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
    active

ESP_HF_CURRENT_CALL_STATUS_HELD = 1
    held

ESP_HF_CURRENT_CALL_STATUS_DIALING = 2
    dialing (outgoing calls only)

ESP_HF_CURRENT_CALL_STATUS_ALERTING = 3
    alerting (outgoing calls only)

ESP_HF_CURRENT_CALL_STATUS_INCOMING = 4
    incoming (incoming calls only)

ESP_HF_CURRENT_CALL_STATUS_WAITING = 5
    waiting (incoming calls only)

ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD = 6
    call held by response and hold
```

```
enum esp_hf_current_call_direction_t
+CLCC direction of the call
```

*Values:*

```
ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING = 0
    outgoing

ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
    incoming
```

**enum esp\_hf\_current\_call\_mpty\_type\_t**

+CLCC multi-party call flag

*Values:*

**ESP\_HF\_CURRENT\_CALL\_MPTY\_TYPE\_SINGLE** = 0

not a member of a multi-party call

**ESP\_HF\_CURRENT\_CALL\_MPTY\_TYPE\_MULTI** = 1

member of a multi-party call

**enum esp\_hf\_current\_call\_mode\_t**

+CLCC call mode

*Values:*

**ESP\_HF\_CURRENT\_CALL\_MODE\_VOICE** = 0

**ESP\_HF\_CURRENT\_CALL\_MODE\_DATA** = 1

**ESP\_HF\_CURRENT\_CALL\_MODE\_FAX** = 2

**enum esp\_hf\_call\_addr\_type\_t**

+CLCC address type

*Values:*

**ESP\_HF\_CALL\_ADDR\_TYPE\_UNKNOWN** = 0x81

unknown address type

**ESP\_HF\_CALL\_ADDR\_TYPE\_INTERNATIONAL** = 0x91

international address

**enum esp\_hf\_subscriber\_service\_type\_t**

+CNUM service type of the phone number

*Values:*

**ESP\_HF\_SUBSCRIBER\_SERVICE\_TYPE\_UNKNOWN** = 0

unknown

**ESP\_HF\_SUBSCRIBER\_SERVICE\_TYPE\_VOICE**

voice service

**ESP\_HF\_SUBSCRIBER\_SERVICE\_TYPE\_FAX**

fax service

**enum esp\_hf\_btrh\_status\_t**

+BTRH response and hold result code

*Values:*

**ESP\_HF\_BTRH\_STATUS\_HELD** = 0

incoming call is put on held in AG

**ESP\_HF\_BTRH\_STATUS\_ACCEPTED**

held incoming call is accepted in AG

**ESP\_HF\_BTRH\_STATUS\_REJECTED**

held incoming call is rejected in AG

**enum esp\_hf\_btrh\_cmd\_t**

AT+BTRH response and hold action code.

*Values:*

**ESP\_HF\_BTRH\_CMD\_HOLD** = 0

put the incoming call on hold

**ESP\_HF\_BTRH\_CMD\_ACCEPT** = 1

accept a held incoming call

**ESP\_HF\_BTRH\_CMD\_REJECT = 2**  
reject a held incoming call

**enum esp\_hf\_nrec\_t**

*Values:*

**ESP\_HF\_NREC\_STOP = 0**

**ESP\_HF\_NREC\_START**

**enum esp\_hf\_call\_waiting\_status\_t**

+CCWA response status

*Values:*

**ESP\_HF\_CALL\_WAITING\_INACTIVE**

**ESP\_HF\_CALL\_WAITING\_ACTIVE**

**enum esp\_hf\_wbs\_config\_t**

*Values:*

**ESP\_HF\_WBS\_NONE**

**ESP\_HF\_WBS\_NO**

**ESP\_HF\_WBS\_YES**

**enum esp\_hf\_connection\_state\_t**

Bluetooth HFP RFCOMM connection and service level connection status.

*Values:*

**ESP\_HF\_CONNECTION\_STATE\_DISCONNECTED = 0**  
RFCOMM data link channel released

**ESP\_HF\_CONNECTION\_STATE\_CONNECTING**  
connecting remote device on the RFCOMM data link

**ESP\_HF\_CONNECTION\_STATE\_CONNECTED**  
RFCOMM connection established

**ESP\_HF\_CONNECTION\_STATE\_SLC\_CONNECTED**  
service level connection established

**ESP\_HF\_CONNECTION\_STATE\_DISCONNECTING**  
disconnecting with remote device on the RFCOMM data link

**enum esp\_hf\_chld\_type\_t**

AT+CHLD command values.

*Values:*

**ESP\_HF\_CHLD\_TYPE\_REL = 0**  
<0>, Terminate all held or set UDUB( “busy” ) to a waiting call

**ESP\_HF\_CHLD\_TYPE\_REL\_ACC**  
<1>, Terminate all active calls and accepts a waiting/held call

**ESP\_HF\_CHLD\_TYPE\_HOLD\_ACC**  
<2>, Hold all active calls and accepts a waiting/held call

**ESP\_HF\_CHLD\_TYPE\_MERGE**  
<3>, Add all held calls to a conference

**ESP\_HF\_CHLD\_TYPE\_MERGE\_DETACH**  
<4>, connect the two calls and disconnects the subscriber from both calls

**ESP\_HF\_CHLD\_TYPE\_REL\_X**  
<1x>, releases specified calls only

**ESP\_HF\_CHLD\_TYPE\_PRIV\_X**  
<2x>, request private consultation mode with specified call

**enum esp\_hf\_at\_response\_code\_t**

*Values:*

**ESP\_HF\_AT\_RESPONSE\_CODE\_OK = 0**  
acknowledges execution of a command line

**ESP\_HF\_AT\_RESPONSE\_CODE\_ERR**  
command not accepted

**ESP\_HF\_AT\_RESPONSE\_CODE\_NO\_CARRIER**  
connection terminated

**ESP\_HF\_AT\_RESPONSE\_CODE\_BUSY**  
busy signal detected

**ESP\_HF\_AT\_RESPONSE\_CODE\_NO\_ANSWER**  
connection completion timeout

**ESP\_HF\_AT\_RESPONSE\_CODE\_DELAYED**  
delayed

**ESP\_HF\_AT\_RESPONSE\_CODE\_BLACKLISTED**  
blacklisted

**ESP\_HF\_AT\_RESPONSE\_CODE\_CME**  
CME error

**enum esp\_hf\_at\_response\_t**

*Values:*

**ESP\_HF\_AT\_RESPONSE\_ERROR = 0**

**ESP\_HF\_AT\_RESPONSE\_OK**

**enum esp\_hf\_cme\_err\_t**

Extended Audio Gateway Error Result Code Response.

*Values:*

**ESP\_HF\_CME\_AG\_FAILURE = 0**  
ag failure

**ESP\_HF\_CME\_NO\_CONNECTION\_TO\_PHONE = 1**  
no connection to phone

**ESP\_HF\_CME\_OPERATION\_NOT\_ALLOWED = 3**  
operation not allowed

**ESP\_HF\_CME\_OPERATION\_NOT\_SUPPORTED = 4**  
operation not supported

**ESP\_HF\_CME\_PH\_SIM\_PIN\_REQUIRED = 5**  
PH-SIM PIN Required

**ESP\_HF\_CME\_SIM\_NOT\_INSERTED = 10**  
SIM not inserted

**ESP\_HF\_CME\_SIM\_PIN\_REQUIRED = 11**  
SIM PIN required

**ESP\_HF\_CME\_SIM\_PUK\_REQUIRED = 12**  
SIM PUK required

**ESP\_HF\_CME\_SIM\_FAILURE = 13**  
SIM failure

**ESP\_HF\_CME\_SIM\_BUSY** = 14  
SIM busy

**ESP\_HF\_CME\_INCORRECT\_PASSWORD** = 16  
incorrect password

**ESP\_HF\_CME\_SIM\_PIN2\_REQUIRED** = 17  
SIM PIN2 required

**ESP\_HF\_CME\_SIM\_PUK2\_REQUIRED** = 18  
SIM PUK2 required

**ESP\_HF\_CME\_MEMEORY\_FULL** = 20  
memory full

**ESP\_HF\_CME\_INVALID\_INDEX** = 21  
invalid index

**ESP\_HF\_CME\_MEMEORY\_FAILURE** = 23  
memory failure

**ESP\_HF\_CME\_TEXT\_STRING\_TOO\_LONG** = 24  
test string too long

**ESP\_HF\_CME\_INVALID\_CHARACTERS\_IN\_TEXT\_STRING** = 25  
invalid characters in text string

**ESP\_HF\_CME\_DIAL\_STRING\_TOO\_LONG** = 26  
dial string too long

**ESP\_HF\_CME\_INVALID\_CHARACTERS\_IN\_DIAL\_STRING** = 27  
invalid characters in dial string

**ESP\_HF\_CME\_NO\_NETWORK\_SERVICE** = 30  
no network service

**ESP\_HF\_CME\_NETWORK\_TIMEOUT** = 31  
network timeout

**ESP\_HF\_CME\_NETWORK\_NOT\_ALLOWED** = 32  
network not allowed emergency calls only

## HFP CLIENT API

[Overview](#) [Instructions](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_hf\\_client\\_api.h](#)

#### Functions

*esp\_err\_t* **esp\_hf\_client\_register\_callback** (*esp\_hf\_client\_cb\_t* callback)

Register application callback function to HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by HFP client.

#### Return

- **ESP\_OK**: success
- **ESP\_INVALID\_STATE**: if bluetooth stack is not yet enabled
- **ESP\_FAIL**: if callback is a NULL function pointer

#### Parameters

- [*in*] `callback`: HFP client event callback function

***esp\_err\_t esp\_hf\_client\_init*** (void)

Initialize the bluetooth HFP client module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t esp\_hf\_client\_deinit*** (void)

De-initialize for HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t esp\_hf\_client\_connect*** (*esp\_bd\_addr\_t remote\_bda*)

Connect to remote bluetooth HFP audio gateway(AG) device, must after `esp_hf_client_init()`

**Return**

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `remote_bda`: remote bluetooth device address

***esp\_err\_t esp\_hf\_client\_disconnect*** (*esp\_bd\_addr\_t remote\_bda*)

Disconnect from the remote HFP audio gateway.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `remote_bda`: remote bluetooth device address

***esp\_err\_t esp\_hf\_client\_connect\_audio*** (*esp\_bd\_addr\_t remote\_bda*)

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `remote_bda`: remote bluetooth device address

***esp\_err\_t esp\_hf\_client\_disconnect\_audio*** (*esp\_bd\_addr\_t remote\_bda*)

Release the established audio connection with remote HFP AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] `remote_bda`: remote bluetooth device address

***esp\_err\_t esp\_hf\_client\_start\_voice\_recognition*** (void)

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer

- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_stop\_voice\_recognition** (void)

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_volume\_update** (*esp\_hf\_volume\_control\_target\_t* type, int volume)

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

*esp\_err\_t* **esp\_hf\_client\_dial** (const char \*number)

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] number: number string of the call. If NULL, the last number is called(aka re-dial)

*esp\_err\_t* **esp\_hf\_client\_dial\_memory** (int location)

Place a call with number specified by location(speed dial). As a precondition, to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] location: location of the number in the memory

*esp\_err\_t* **esp\_hf\_client\_send\_chld\_cmd** (*esp\_hf\_chld\_type\_t* chld, int idx)

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] chld: AT+CHLD call hold and multiparty handling AT command.
- [in] idx: used in Enhanced Call Control Mechanisms, used if chld is ESP\_HF\_CHLD\_TYPE\_REL\_X or ESP\_HF\_CHLD\_TYPE\_PRIV\_X

*esp\_err\_t* **esp\_hf\_client\_send\_btrh\_cmd** (*esp\_hf\_btrh\_cmd\_t* btrh)

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] btrh: response and hold action to send

***esp\_err\_t* esp\_hf\_client\_answer\_call (void)**

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t* esp\_hf\_client\_reject\_call (void)**

Reject an incoming call(send AT+CHUP command), As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t* esp\_hf\_client\_query\_current\_calls (void)**

Query list of current calls in AG(send AT+CLCC command), As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t* esp\_hf\_client\_query\_current\_operator\_name (void)**

Query the name of currently selected network operator in AG(use AT+COPS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t* esp\_hf\_client\_retrieve\_subscriber\_info (void)**

Get subscriber information number from AG(send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

***esp\_err\_t* esp\_hf\_client\_send\_dtmf (char code)**

Transmit DTMF codes during an ongoing call(use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] code: dtmf code, single ascii character in the set 0-9, #, \*, A-D

***esp\_err\_t* esp\_hf\_client\_request\_last\_voice\_tag\_number (void)**

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_send\_nrec** (void)

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: NREC=0 request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

*esp\_err\_t* **esp\_hf\_client\_register\_data\_callback** (*esp\_hf\_client\_incoming\_data\_cb\_t* *recv*,  
*esp\_hf\_client\_outgoing\_data\_cb\_t* *send*)

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

**Parameters**

- [in] *recv*: HFP client incoming data callback function
- [in] *send*: HFP client outgoing data callback function

void **esp\_hf\_client\_outgoing\_data\_ready** (void)

Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke *esp\_hf\_client\_outgoing\_data\_cb\_t* to fetch data.

void **esp\_hf\_client\_pcm\_resample\_init** (uint32\_t *src\_sps*, uint32\_t *bits*, uint32\_t *channels*)

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**

- [in] *src\_sps*: original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- [in] *bits*: number of bits per pcm sample (16)
- [in] *channels*: number of channels (i.e. mono(1), stereo(2)...

void **esp\_hf\_client\_pcm\_resample\_deinit** (void)

Deinitialize the down sampling converter.

int32\_t **esp\_hf\_client\_pcm\_resample** (void \**src*, uint32\_t *in\_bytes*, void \**dst*)

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

**Return** number of samples converted

**Parameters**

- [in] *src*: pointer to the buffer where the original sampling PCM are stored
- [in] *in\_bytes*: length of the input PCM sample buffer in byte
- [in] *dst*: pointer to the buffer which is to be used to store the converted PCM samples

**Unions**

union **esp\_hf\_client\_cb\_param\_t**

*#include* <esp\_hf\_client\_api.h> HFP client callback parameters.

**Public Members**

struct *esp\_hf\_client\_cb\_param\_t::hf\_client\_conn\_stat\_param* **conn\_stat**

HF callback param of ESP\_HF\_CLIENT\_CONNECTION\_STATE\_EVT

### Type Definitions

**typedef void (\*esp\_hf\_client\_incoming\_data\_cb\_t) (const uint8\_t \*buf, uint32\_t len)**  
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

#### Parameters

- [in] *buf*: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] *len*: : size(in bytes) in *buf*

```
typedef uint32_t (*esp_hf_client_outgoing_data_cb_t) (uint8_t *buf, uint32_t len)
```

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

#### Parameters

- [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] len: : size(in bytes) in buf
- [out] length: of data successfully read

```
typedef void (*esp_hf_client_cb_t) (esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
```

HFP client callback function type.

#### Parameters

- event: : Event type
- param: : Pointer to callback parameter

### Enumerations

```
enum esp_hf_client_connection_state_t
```

Bluetooth HFP RFCOMM connection and service level connection status.

*Values:*

```
ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED = 0  
RFCOMM data link channel released
```

```
ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING  
connecting remote device on the RFCOMM data link
```

```
ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED  
RFCOMM connection established
```

```
ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED  
service level connection established
```

```
ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING  
disconnecting with remote device on the RFCOMM dat link
```

```
enum esp_hf_client_audio_state_t
```

Bluetooth HFP audio connection status.

*Values:*

```
ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED = 0  
audio connection released
```

```
ESP_HF_CLIENT_AUDIO_STATE_CONNECTING  
audio connection has been initiated
```

```
ESP_HF_CLIENT_AUDIO_STATE_CONNECTED  
audio connection is established
```

```
ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC  
mSBC audio connection is established
```

```
enum esp_hf_client_in_band_ring_state_t
```

in-band ring tone state

*Values:*

```
ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0
```

```
ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED
```

**enum esp\_hf\_client\_cb\_event\_t**

HF CLIENT callback events.

*Values:*

- ESP\_HF\_CLIENT\_CONNECTION\_STATE\_EVT = 0**  
connection state changed event
- ESP\_HF\_CLIENT\_AUDIO\_STATE\_EVT**  
audio connection state change event
- ESP\_HF\_CLIENT\_BVRA\_EVT**  
voice recognition state change event
- ESP\_HF\_CLIENT\_CIND\_CALL\_EVT**  
call indication
- ESP\_HF\_CLIENT\_CIND\_CALL\_SETUP\_EVT**  
call setup indication
- ESP\_HF\_CLIENT\_CIND\_CALL\_HELD\_EVT**  
call held indication
- ESP\_HF\_CLIENT\_CIND\_SERVICE\_AVAILABILITY\_EVT**  
network service availability indication
- ESP\_HF\_CLIENT\_CIND\_SIGNAL\_STRENGTH\_EVT**  
signal strength indication
- ESP\_HF\_CLIENT\_CIND\_ROAMING\_STATUS\_EVT**  
roaming status indication
- ESP\_HF\_CLIENT\_CIND\_BATTERY\_LEVEL\_EVT**  
battery level indication
- ESP\_HF\_CLIENT\_COPS\_CURRENT\_OPERATOR\_EVT**  
current operator information
- ESP\_HF\_CLIENT\_BTRH\_EVT**  
call response and hold event
- ESP\_HF\_CLIENT\_CLIP\_EVT**  
Calling Line Identification notification
- ESP\_HF\_CLIENT\_CCWA\_EVT**  
call waiting notification
- ESP\_HF\_CLIENT\_CLCC\_EVT**  
list of current calls notification
- ESP\_HF\_CLIENT\_VOLUME\_CONTROL\_EVT**  
audio volume control command from AG, provided by +VGM or +VGS message
- ESP\_HF\_CLIENT\_AT\_RESPONSE\_EVT**  
AT command response event
- ESP\_HF\_CLIENT\_CNUM\_EVT**  
subscriber information response from AG
- ESP\_HF\_CLIENT\_BSIR\_EVT**  
setting of in-band ring tone
- ESP\_HF\_CLIENT\_BINP\_EVT**  
requested number of last voice tag from AG
- ESP\_HF\_CLIENT\_RING\_IND\_EVT**  
ring indication event

## HFP AG API

### Overview [Instructions](#)

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_hf\\_ag\\_api.h](#)

#### Functions

*esp\_err\_t* **esp\_bt\_hf\_register\_callback** (*esp\_hf\_cb\_t* callback)

Register application callback function to HFP AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by HFP AG.

##### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

##### Parameters

- [in] callback: HFP AG event callback function

*esp\_err\_t* **esp\_bt\_hf\_init** (*esp\_bd\_addr\_t* remote\_addr)

Initialize the bluetooth HF AG module. This function should be called after `esp_bluedroid_enable()` completes successfully.

##### Return

- ESP\_OK: if the initialization request is sent successfully
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

##### Parameters

- [in] remote\_addr: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_deinit** (*esp\_bd\_addr\_t* remote\_addr)

De-initialize for HF AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

##### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

##### Parameters

- [in] remote\_addr: remote bluetooth device address

*esp\_err\_t* **esp\_bt\_hf\_connect** (*esp\_bd\_addr\_t* remote\_bda)

Connect to remote bluetooth HFP client device, must after `esp_bt_hf_init()`

##### Return

- ESP\_OK: connect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

##### Parameters

- [in] remote\_bda: remote bluetooth HFP client device address

*esp\_err\_t* **esp\_bt\_hf\_disconnect** (*esp\_bd\_addr\_t* remote\_bda)

Disconnect from the remote HFP client.

##### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t esp\_bt\_hf\_connect\_audio(esp\_bd\_addr\_t remote\_bda)*

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist between HF client and AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t esp\_bt\_hf\_disconnect\_audio(esp\_bd\_addr\_t remote\_bda)*

Release the established audio connection with remote HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address

*esp\_err\_t esp\_bt\_hf\_vra(esp\_bd\_addr\_t remote\_bda, esp\_hf\_vr\_state\_t value)*

Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: the device address of voice recognition initiator
- [in] value: 0 - voice recognition disabled, 1- voice recognition enabled

*esp\_err\_t esp\_bt\_hf\_volume\_control(esp\_bd\_addr\_t remote\_bda, esp\_hf\_volume\_control\_target\_t type, int volume)*

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_bda: remote bluetooth device address
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

*esp\_err\_t esp\_hf\_unat\_response(esp\_bd\_addr\_t remote\_addr, char \*unat)*

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] unat: User AT command response to HF Client. It will response "ERROR" by default if unat is NULL.

*esp\_err\_t* **esp\_bt\_hf\_cmee\_response** (*esp\_bd\_addr\_t* remote\_bda, *esp\_hf\_at\_response\_code\_t* response\_code, *esp\_hf\_cme\_err\_t* error\_code)

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_bda: remote bluetooth device address
- [in] response\_code: AT command response code
- [in] error\_code: CME error code

*esp\_err\_t* **esp\_bt\_hf\_indchange\_notification** (*esp\_bd\_addr\_t* remote\_addr, *esp\_hf\_call\_status\_t* call\_state, *esp\_hf\_call\_setup\_status\_t* call\_setup\_state, *esp\_hf\_network\_state\_t* ntk\_state, int signal)

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_addr: remote bluetooth device address
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] ntk\_state: network service state
- [in] signal: signal strength from 0 to 5

*esp\_err\_t* **esp\_bt\_hf\_cind\_response** (*esp\_bd\_addr\_t* remote\_addr, *esp\_hf\_call\_status\_t* call\_state, *esp\_hf\_call\_setup\_status\_t* call\_setup\_state, *esp\_hf\_network\_state\_t* ntk\_state, int signal, *esp\_hf\_roaming\_status\_t* roam, int batt\_lev, *esp\_hf\_call\_held\_status\_t* call\_held\_status)

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_addr: remote bluetooth device address
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] ntk\_state: network service state
- [in] signal: signal strength from 0 to 5
- [in] roam: roam state
- [in] batt\_lev: battery level from 0 to 5
- [in] call\_held\_status: call held status

*esp\_err\_t* **esp\_bt\_hf\_cops\_response** (*esp\_bd\_addr\_t* remote\_addr, char \*name)

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP Client.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] name: current operator name

*esp\_err\_t esp\_bt\_hf\_clcc\_response* (*esp\_bd\_addr\_t remote\_addr*, int *index*, *esp\_hf\_current\_call\_direction\_t dir*, *esp\_hf\_current\_call\_status\_t current\_call\_state*, *esp\_hf\_current\_call\_mode\_t mode*, *esp\_hf\_current\_call\_mpty\_type\_t mpty*, char *\*number*, *esp\_hf\_call\_addr\_type\_t type*)

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] index: the index of current call
- [in] dir: call direction (incoming/outgoing)
- [in] current\_call\_state: current call state
- [in] mode: current call mode (voice/data/fax)
- [in] mpty: single or multi type
- [in] number: current call number
- [in] type: international type or unknow

*esp\_err\_t esp\_bt\_hf\_cnum\_response* (*esp\_bd\_addr\_t remote\_addr*, char *\*number*, *esp\_hf\_subscriber\_service\_type\_t type*)

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] number: registration number
- [in] type: service type (unknown/voice/fax)

*esp\_err\_t esp\_bt\_hf\_bsir* (*esp\_bd\_addr\_t remote\_addr*, *esp\_hf\_in\_band\_ring\_state\_t state*)

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

**Parameters**

- [in] remote\_addr: remote bluetooth device address
- [in] state: in-band ring tone state

*esp\_err\_t esp\_bt\_hf\_answer\_call* (*esp\_bd\_addr\_t remote\_addr*, int *num\_active*, int *num\_held*, *esp\_hf\_call\_status\_t call\_state*, *esp\_hf\_call\_setup\_status\_t call\_setup\_state*, char *\*number*, *esp\_hf\_call\_addr\_type\_t call\_addr\_type*)

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled

- ESP\_FAIL: others

#### Parameters

- [in] remote\_addr: remote bluetooth device address
- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the incoming call
- [in] call\_addr\_type: call address type

```
esp_err_t esp_bt_hf_reject_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                               esp_hf_call_status_t call_state, esp_hf_call_setup_status_t
                               call_setup_state, char *number, esp_hf_call_addr_type_t
                               call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_addr: remote bluetooth device address
- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the incoming call
- [in] call\_addr\_type: call address type

```
esp_err_t esp_bt_hf_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                             esp_hf_call_status_t call_state, esp_hf_call_setup_status_t
                             call_setup_state, char *number, esp_hf_call_addr_type_t
                             call_addr_type)
```

Reject incoming call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_addr: remote bluetooth device address
- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the outgoing call
- [in] call\_addr\_type: call address type

```
esp_err_t esp_bt_hf_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
                              esp_hf_call_status_t call_state, esp_hf_call_setup_status_t
                              call_setup_state, char *number, esp_hf_call_addr_type_t
                              call_addr_type)
```

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with AG.

#### Return

- ESP\_OK: disconnect request is sent to lower layer
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: others

#### Parameters

- [in] remote\_addr: remote bluetooth device address

- [in] num\_active: the number of active call
- [in] num\_held: the number of held call
- [in] call\_state: call state
- [in] call\_setup\_state: call setup state
- [in] number: number of the call
- [in] call\_addr\_type: call address type

`esp_err_t esp_bt_hf_register_data_callback(esp_hf_incoming_data_cb_t recv, esp_hf_outgoing_data_cb_t send)`

Register AG data output function; the callback is only used in the case that Voice Over HCI is enabled.

#### Return

- ESP\_OK: success
- ESP\_INVALID\_STATE: if bluetooth stack is not yet enabled
- ESP\_FAIL: if callback is a NULL function pointer

#### Parameters

- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function

void `esp_hf_outgoing_data_ready` (void)

Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke `esp_hf_client_outgoing_data_cb_t` to fetch data.

## Unions

`union esp_hf_cb_param_t`

`#include <esp_hf_ag_api.h>` HFP AG callback parameters.

### Public Members

```

### Type Definitions

**typedef void (\*esp\_hf\_incoming\_data\_cb\_t) (const uint8\_t \*buf, uint32\_t len)**  
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

#### Parameters

- [in] *buf*: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] *len*: : size(in bytes) in *buf*

**typedef uint32\_t (\*esp\_hf\_outgoing\_data\_cb\_t) (uint8\_t \*buf, uint32\_t len)**

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

#### Parameters

- [in] *buf*: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- [in] *len*: : size(in bytes) in *buf*

- [out] length: of data successfully read

**typedef** void (\***esp\_hf\_cb\_t**) (*esp\_hf\_cb\_event\_t* event, *esp\_hf\_cb\_param\_t* \*param)  
HF AG callback function type.

#### Parameters

- event: : Event type
- param: : Pointer to callback parameter

#### Enumerations

**enum esp\_hf\_cb\_event\_t**

HF callback events.

*Values:*

**ESP\_HF\_CONNECTION\_STATE\_EVT = 0**

Connection state changed event

**ESP\_HF\_AUDIO\_STATE\_EVT**

Audio connection state change event

**ESP\_HF\_BVRA\_RESPONSE\_EVT**

Voice recognition state change event

**ESP\_HF\_VOLUME\_CONTROL\_EVT**

Audio volume control command from HF Client, provided by +VGM or +VGS message

**ESP\_HF\_UNAT\_RESPONSE\_EVT**

Unknown AT cmd Response

**ESP\_HF\_IND\_UPDATE\_EVT**

Indicator Update Event

**ESP\_HF\_CIND\_RESPONSE\_EVT**

Call And Device Indicator Response

**ESP\_HF\_COPS\_RESPONSE\_EVT**

Current operator information

**ESP\_HF\_CLCC\_RESPONSE\_EVT**

List of current calls notification

**ESP\_HF\_CNUM\_RESPONSE\_EVT**

Subscriber information response from HF Client

**ESP\_HF\_VTS\_RESPONSE\_EVT**

Enable or not DTMF

**ESP\_HF\_NREC\_RESPONSE\_EVT**

Enable or not NREC

**ESP\_HF\_ATA\_RESPONSE\_EVT**

Answer an Incoming Call

**ESP\_HF\_CHUP\_RESPONSE\_EVT**

Reject an Incoming Call

**ESP\_HF\_DIAL\_EVT**

Origin an outgoing call with specific number or the dial the last number

**ESP\_HF\_WBS\_RESPONSE\_EVT**

Codec Status

**ESP\_HF\_BCS\_RESPONSE\_EVT**

Final Codec Choice

## 2.1.5 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

### Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

图 1: ESP NimBLE Stack

### Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

### Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

**Typical programming sequence with NimBLE stack consists of the following steps:**

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

## API Reference

### Header File

- [bt/host/nimble/esp-hci/include/esp\\_nimble\\_hci.h](#)

### Functions

*esp\_err\_t* **esp\_nimble\_hci\_init** (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

#### Return

- ESP\_OK if the initialization is successful
- Appropriate error code from *esp\_err\_t* in case of an error

*esp\_err\_t* **esp\_nimble\_hci\_and\_controller\_init** (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration

nimble_port_freertos_init(ble_host_task);
```

*nimble\_port\_freertos\_init*() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to *nimble\_port\_run*(). If a separate task is not required, calling *nimble\_port\_run*() will run the NimBLE host in the current task.

#### Return

- ESP\_OK if the initialization is successful
- Appropriate error code from *esp\_err\_t* in case of an error

*esp\_err\_t* **esp\_nimble\_hci\_deinit** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

#### Return

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from *esp\_err\_t* in case of an error

*esp\_err\_t* **esp\_nimble\_hci\_and\_controller\_deinit** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.

```
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with
↳error: %d", ret);
    }
}
```

If `nimble_port_freertos_init()` is used during initialization, then `nimble_port_freertos_deinit()` should be called in the host task after `nimble_port_run()`.

#### Return

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

#### Macros

**BLE\_HCI\_UART\_H4\_NONE**

**BLE\_HCI\_UART\_H4\_CMD**

**BLE\_HCI\_UART\_H4\_ACL**

**BLE\_HCI\_UART\_H4\_SCO**

**BLE\_HCI\_UART\_H4\_EVT**

## 2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [ESP-BLE-MESH 快速入门](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH 架构](#).

#### Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH 示例](#) and [ESP-BLE-MESH 演示视频](#).

#### API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

## ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

### Header File

- `bt/esp_ble_mesh/api/esp_ble_mesh_defs.h`

### Unions

```
union esp_ble_mesh_prov_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

### Public Members

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param prov_register_comp

```

struct ble_mesh_friend_friendship_terminate_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

```

### Public Types

```

enum [anonymous]
    This enum value is the reason of friendship termination on the friend node side
    Values:

```

```

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
    Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to
    be established

```

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_POLL\_TIMEOUT**

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_REQ**

Receive Friend Request from existing Low Power Node

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_CLEAR**

Receive Friend Clear from other friend node

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_DISABLE**

Friend feature disabled or corresponding NetKey is deleted

**Public Members****uint16\_t lpn\_addr**

Low Power Node unicast address

**esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_friend\_friendship\_terminate\_param::[anonymous] reason**

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

**struct ble\_mesh\_heartbeat\_msg\_rcv\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_HEARTBEAT\_MESSAGE\_RECV\_EVT.

**Public Members****uint8\_t hops**

Heartbeat hops (InitTTL - RxTTL + 1)

**uint16\_t feature**

Bit field of currently active features of the node

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT.

**Public Members**

`uint32_t opcode`  
Opcode of the unsolicited received message

`esp_ble_mesh_model_t *model`  
Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`  
Pointer to the context of the message

`uint16_t length`  
Length of the received message

`uint8_t *msg`  
Value of the received message

**struct ble\_mesh\_model\_operation\_evt\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT.

**Public Members**

`uint32_t opcode`  
Opcode of the received message

`esp_ble_mesh_model_t *model`  
Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`  
Pointer to the context of the received message

`uint16_t length`  
Length of the received message

`uint8_t *msg`  
Value of the received message

**struct ble\_mesh\_model\_publish\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT.

**Public Members**

`int err_code`  
Indicate the result of publishing a message

`esp_ble_mesh_model_t *model`  
Pointer to the model which publishes the message

**struct ble\_mesh\_model\_publish\_update\_evt\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT.

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the model which is going to update its publish message

**struct ble\_mesh\_model\_send\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT.

### Public Members

**int err\_code**  
Indicate the result of sending a message

**uint32\_t opcode**  
Opcode of the message

***esp\_ble\_mesh\_model\_t* \*model**  
Pointer to the model which sends the message

***esp\_ble\_mesh\_msg\_ctx\_t* \*ctx**  
Context of the message

**struct ble\_mesh\_server\_model\_update\_state\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>*ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT.

### Public Members

**int err\_code**  
Indicate the result of updating server model state

***esp\_ble\_mesh\_model\_t* \*model**  
Pointer to the server model which state value is updated

***esp\_ble\_mesh\_server\_state\_type\_t* type**  
Type of the updated server state

### Structures

**struct esp\_ble\_mesh\_deinit\_param\_t**  
BLE Mesh deinit parameters

### Public Members

**bool erase\_flash**  
Indicate if erasing flash when deinit mesh stack

**struct esp\_ble\_mesh\_elem\_t**  
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt\_mesh\_elem in mesh\_access.h

### Public Members

**uint16\_t element\_addr**  
Element Address, assigned during provisioning.

**const uint16\_t location**  
Location Descriptor (GATT Bluetooth Namespace Descriptors)

**const uint8\_t sig\_model\_count**  
SIG Model count

**const uint8\_t vnd\_model\_count**  
Vendor Model count

***esp\_ble\_mesh\_model\_t* \*sig\_models**  
SIG Models

***esp\_ble\_mesh\_model\_t* \*vnd\_models**  
Vendor Models

**struct esp\_ble\_mesh\_model\_pub\_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16\_t **publish\_addr**

Publish Address.

uint16\_t **app\_idx** : 12

Publish AppKey Index.

uint16\_t **cred** : 1

Friendship Credentials Flag.

uint16\_t **send\_rel** : 1

Force reliable sending (segment acks)

uint8\_t **ttl**

Publish Time to Live.

uint8\_t **retransmit**

Retransmit Count & Interval Steps.

uint8\_t **period**

Publish Period.

uint8\_t **period\_div** : 4

Divisor for the Period.

uint8\_t **fast\_period** : 1

Use FastPeriodDivisor

uint8\_t **count** : 3

Retransmissions left.

uint32\_t **period\_start**

Start of the current period.

**struct** net\_buf\_simple \***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

`ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

*esp\_ble\_mesh\_cb\_t* **update**

Callback used to update publish message. Initialized by the stack.

**struct** k\_delayed\_work **timer**

Publish Period Timer. Initialized by the stack.

uint8\_t **dev\_role**

Role of the device that is going to publish messages

**struct esp\_ble\_mesh\_model\_op\_t**

Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

### Public Members

**const** uint32\_t **opcode**

Message opcode

**const** size\_t **min\_len**

Message minimum length

*esp\_ble\_mesh\_cb\_t* **param\_cb**

Callback used to handle message. Initialized by the stack.

**struct** **esp\_ble\_mesh\_model\_cbs\_t**

Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

### Public Members

*esp\_ble\_mesh\_cb\_t* **init\_cb**

Callback used during model initialization. Initialized by the stack.

**struct** **esp\_ble\_mesh\_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`.

### Public Members

**union** *esp\_ble\_mesh\_model::*[anonymous] [anonymous]

Model ID

uint8\_t **element\_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8\_t **model\_idx**

Is the Nth model in the element

uint16\_t **flags**

Information about what has changed

*esp\_ble\_mesh\_elem\_t* \***element**

The Element to which this Model belongs

*esp\_ble\_mesh\_model\_pub\_t* \***const pub**

Model Publication

uint16\_t **keys**[CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT]

AppKey List

uint16\_t **groups**[CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT]

Subscription List (group or virtual addresses)

*esp\_ble\_mesh\_model\_op\_t* \***op**

Model operation context

*esp\_ble\_mesh\_model\_cbs\_t* \***cb**

Model callback structure

void \***user\_data**

Model-specific user data

**struct** **esp\_ble\_mesh\_msg\_ctx\_t**

Message sending context. This structure is associated with struct `bt_mesh_msg_ctx` in `mesh_access.h`.

**Public Members****uint16\_t net\_idx**

NetKey Index of the subnet through which to send the message.

**uint16\_t app\_idx**

AppKey Index for message encryption.

**uint16\_t addr**

Remote address.

**uint16\_t recv\_dst**

Destination address of a received message. Not used for sending.

**int8\_t recv\_rssi**

RSSI of received packet. Not used for sending.

**uint8\_t recv\_ttl : 7**

Received TTL value. Not used for sending.

**uint8\_t send\_rel : 1**

Force sending reliably by using segment acknowledgement

**uint8\_t send\_ttl**

TTL, or ESP\_BLE\_MESH\_TTL\_DEFAULT for default TTL.

**uint32\_t recv\_op**

Opcode of a received message. Not used for sending message.

***esp\_ble\_mesh\_model\_t* \*model**

Model corresponding to the message, no need to be initialized before sending message

**bool srv\_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

**struct esp\_ble\_mesh\_prov\_t**

Provisioning properties &amp; capabilities. This structure is associated with struct bt\_mesh\_prov in mesh\_access.h

**struct esp\_ble\_mesh\_comp\_t**

Node Composition data context. This structure is associated with struct bt\_mesh\_comp in mesh\_access.h

**Public Members****uint16\_t cid**

16-bit SIG-assigned company identifier

**uint16\_t pid**

16-bit vendor-assigned product identifier

**uint16\_t vid**

16-bit vendor-assigned product version identifier

**size\_t element\_count**

Element count

***esp\_ble\_mesh\_elem\_t* \*elements**

A sequence of elements

**struct esp\_ble\_mesh\_unprov\_dev\_add\_t**

Information of the device which is going to be added for provisioning.

**Public Members*****esp\_ble\_mesh\_bd\_addr\_t* addr**

Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint16\_t **oob\_info**

Device OOB Info ADD\_DEV\_START\_PROV\_NOW\_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

*esp\_ble\_mesh\_prov\_bearer\_t* **bearer**

Provisioning Bearer

**struct esp\_ble\_mesh\_device\_delete\_t**

Information of the device which is going to be deleted.

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint8\_t **flag**

BIT0: device address; BIT1: device UUID

**struct esp\_ble\_mesh\_prov\_data\_info\_t**

Information of the provisioner which is going to be updated.

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **flags**

Flags

uint32\_t **iv\_index**

IV Index

uint8\_t **flag**

BIT0: net\_idx; BIT1: flags; BIT2: iv\_index

**struct esp\_ble\_mesh\_node\_t**

Information of the provisioned node

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Node device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Node device address type

uint8\_t **dev\_uuid**[16]

Device UUID

uint16\_t **oob\_info**

Node OOB information

**uint16\_t unicast\_addr**  
Node unicast address

**uint8\_t element\_num**  
Node element number

**uint16\_t net\_idx**  
Node NetKey Index

**uint8\_t flags**  
Node key refresh flag and iv update flag

**uint32\_t iv\_index**  
Node IV Index

**uint8\_t dev\_key[16]**  
Node device key

**char name[ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN + 1]**  
Node name

**uint16\_t comp\_length**  
Length of Composition Data

**uint8\_t \*comp\_data**  
Value of Composition Data

**struct esp\_ble\_mesh\_fast\_prov\_info\_t**  
Context of fast provisioning which need to be set.

### Public Members

**uint16\_t unicast\_min**  
Minimum unicast address used for fast provisioning

**uint16\_t unicast\_max**  
Maximum unicast address used for fast provisioning

**uint16\_t net\_idx**  
Netkey index used for fast provisioning

**uint8\_t flags**  
Flags used for fast provisioning

**uint32\_t iv\_index**  
IV Index used for fast provisioning

**uint8\_t offset**  
Offset of the UUID to be compared

**uint8\_t match\_len**  
Length of the UUID to be compared

**uint8\_t match\_val[16]**  
Value of UUID to be compared

**struct esp\_ble\_mesh\_ble\_adv\_param\_t**  
Context of BLE advertising parameters.

### Public Members

**uint16\_t interval**  
BLE advertising interval

**uint8\_t adv\_type**  
BLE advertising type

`uint8_t own_addr_type`  
Own address type

`uint8_t peer_addr_type`  
Peer address type

`uint8_t peer_addr[BD_ADDR_LEN]`  
Peer address

`uint16_t duration`  
Duration is milliseconds

`uint16_t period`  
Period in milliseconds

`uint16_t count`  
Number of advertising duration

`uint8_t priority : 2`  
Priority of BLE advertising packet

**struct esp\_ble\_mesh\_ble\_adv\_data\_t**  
Context of BLE advertising data.

### Public Members

`uint8_t adv_data_len`  
Advertising data length

`uint8_t adv_data[31]`  
Advertising data

`uint8_t scan_rsp_data_len`  
Scan response data length

`uint8_t scan_rsp_data[31]`  
Scan response data

**struct esp\_ble\_mesh\_client\_op\_pair\_t**  
BLE Mesh client models related definitions.  
Client model Get/Set message opcode and corresponding Status message opcode

### Public Members

`uint32_t cli_op`  
The client message opcode

`uint32_t status_op`  
The server status opcode corresponding to the client message opcode

**struct esp\_ble\_mesh\_client\_t**  
Client Model user data context.

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the client model. Initialized by the stack.

`int op_pair_size`  
Size of the op\_pair

`const esp_ble_mesh_client_op_pair_t *op_pair`  
Table containing get/set message opcode and corresponding status message opcode

uint32\_t **publish\_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void \***internal\_data**

Pointer to the internal data of client model

uint8\_t **msg\_role**

Role of the device (Node/Provisioner) that is going to send messages

**struct esp\_ble\_mesh\_client\_common\_param\_t**

Common parameters of the messages sent by Client Model.

### Public Members

*esp\_ble\_mesh\_opcode\_t* **opcode**

Message opcode

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

The context used to send message

int32\_t **msg\_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8\_t **msg\_role**

Role of the device - Node/Provisioner

**struct esp\_ble\_mesh\_state\_transition\_t**

Parameters of the server model state transition

### Public Functions

**BLE\_MESH\_ATOMIC\_DEFINE** (flag, *ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp\_ble\_mesh\_state\_transition\_t* sets “set\_auto\_rsp” to *ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

### Public Members

bool **just\_started**

Indicate if the state transition has just started

uint8\_t **trans\_time**

State transition time

uint8\_t **remain\_time**

Remaining time of state transition

uint8\_t **delay**

Delay before starting state transition

uint32\_t **quo\_tt**

Duration of each divided transition step

uint32\_t **counter**

Number of steps which the transition duration is divided

**uint32\_t total\_duration**  
State transition total duration

**int64\_t start\_timestamp**  
Time when the state transition is started

**struct k\_delayed\_work timer**  
Timer used for state transition

**struct esp\_ble\_mesh\_last\_msg\_info\_t**  
Parameters of the server model received last same set message.

### Public Members

**uint8\_t tid**  
Transaction number of the last message

**uint16\_t src**  
Source address of the last message

**uint16\_t dst**  
Destination address of the last message

**int64\_t timestamp**  
Time when the last message is received

**struct esp\_ble\_mesh\_server\_rsp\_ctrl\_t**  
Parameters of the Server Model response control

### Public Members

**uint8\_t get\_auto\_rsp : 1**  
BLE Mesh Server Response Option.

1. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;Response control for Client Get messages

**uint8\_t set\_auto\_rsp : 1**  
Response control for Client Set messages

**uint8\_t status\_auto\_rsp : 1**  
Response control for Server Status messages

### Macros

**ESP\_BLE\_HOST\_STATUS\_ENABLED**

**ESP\_BLE\_HOST\_STATUS\_CHECK** (status)

The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC

**ESP\_BLE\_MESH\_SDU\_MAX\_LEN**

Length of a short Mesh MIC.

**ESP\_BLE\_MESH\_MIC\_SHORT**

Length of a long Mesh MIC.

**ESP\_BLE\_MESH\_MIC\_LONG**

The maximum length of a BLE Mesh provisioned node name

**ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN**

The maximum length of a BLE Mesh unprovisioned device name

**ESP\_BLE\_MESH\_DEVICE\_NAME\_MAX\_LEN**

Define the BLE Mesh octet 16 bytes size

**ESP\_BLE\_MESH\_OCTET16\_LEN****ESP\_BLE\_MESH\_OCTET8\_LEN****ESP\_BLE\_MESH\_CID\_NVAL**

Special TTL value to request using configured default TTL

**ESP\_BLE\_MESH\_TTL\_DEFAULT**

Maximum allowed TTL value

**ESP\_BLE\_MESH\_TTL\_MAX****ESP\_BLE\_MESH\_ADDR\_UNASSIGNED****ESP\_BLE\_MESH\_ADDR\_ALL\_NODES****ESP\_BLE\_MESH\_ADDR\_PROXIES****ESP\_BLE\_MESH\_ADDR\_FRIENDS****ESP\_BLE\_MESH\_ADDR\_RELAYS****ESP\_BLE\_MESH\_KEY\_UNUSED****ESP\_BLE\_MESH\_KEY\_DEV****ESP\_BLE\_MESH\_KEY\_PRIMARY****ESP\_BLE\_MESH\_KEY\_ANY**

Primary Network Key index

**ESP\_BLE\_MESH\_NET\_PRIMARY**

Relay state value

**ESP\_BLE\_MESH\_RELAY\_DISABLED****ESP\_BLE\_MESH\_RELAY\_ENABLED****ESP\_BLE\_MESH\_RELAY\_NOT\_SUPPORTED**

Beacon state value

**ESP\_BLE\_MESH\_BEACON\_DISABLED****ESP\_BLE\_MESH\_BEACON\_ENABLED**

GATT Proxy state value

**ESP\_BLE\_MESH\_GATT\_PROXY\_DISABLED****ESP\_BLE\_MESH\_GATT\_PROXY\_ENABLED****ESP\_BLE\_MESH\_GATT\_PROXY\_NOT\_SUPPORTED**

Friend state value

**ESP\_BLE\_MESH\_FRIEND\_DISABLED****ESP\_BLE\_MESH\_FRIEND\_ENABLED****ESP\_BLE\_MESH\_FRIEND\_NOT\_SUPPORTED**

Node identity state value

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_STOPPED**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_RUNNING**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_NOT\_SUPPORTED**

Supported features

**ESP\_BLE\_MESH\_FEATURE\_RELAY**

**ESP\_BLE\_MESH\_FEATURE\_PROXY**

**ESP\_BLE\_MESH\_FEATURE\_FRIEND**

**ESP\_BLE\_MESH\_FEATURE\_LOW\_POWER**

**ESP\_BLE\_MESH\_FEATURE\_ALL\_SUPPORTED**

**ESP\_BLE\_MESH\_ADDR\_IS\_UNICAST** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_GROUP** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_VIRTUAL** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_RFU** (addr)

**ESP\_BLE\_MESH\_INVALID\_NODE\_INDEX**

**ESP\_BLE\_MESH\_TRANSMIT** (count, int\_ms)

Encode transmission count & interval steps.

**Note** For example, `ESP_BLE_MESH_TRANSMIT(2, 20)` means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- `count`: Number of retransmissions (first transmission is excluded).
- `int_ms`: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_COUNT** (transmit)

Decode transmit count from a transmit value.

**Return** Transmission count (actual transmissions equal to  $N + 1$ ).

**Parameters**

- `transmit`: Encoded transmit count & interval value.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**Return** Transmission interval in milliseconds.

**Parameters**

- `transmit`: Encoded transmit count & interval value.

**ESP\_BLE\_MESH\_PUBLISH\_TRANSMIT** (count, int\_ms)

Encode Publish Retransmit count & interval steps.

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- `count`: Number of retransmissions (first transmission is excluded).
- `int_ms`: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Return** Retransmission count (actual transmissions equal to  $N + 1$ ).

**Parameters**

- `transmit`: Encoded Publish Retransmit count & interval value.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Return** Transmission interval in milliseconds.

**Parameters**

- `transmit`: Encoded Publish Retransmit count & interval value.

**ESP\_BLE\_MESH\_PROV\_STATIC\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_OUTPUT\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_INPUT\_OOB\_MAX\_LEN**

Macros used to define message opcode

**ESP\_BLE\_MESH\_MODEL\_OP\_1** (b0)

**ESP\_BLE\_MESH\_MODEL\_OP\_2** (b0, b1)

**ESP\_BLE\_MESH\_MODEL\_OP\_3** (b0, cid)

This macro is associated with BLE\_MESH\_MODEL\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_SIG\_MODEL** (\_id, \_op, \_pub, \_user\_data)

This macro is associated with BLE\_MESH\_MODEL\_VND\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_VENDOR\_MODEL** (\_company, \_id, \_op, \_pub, \_user\_data)

**ESP\_BLE\_MESH\_ELEMENT** (\_loc, \_mods, \_vnd\_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP\_BLE\_MESH\_MODEL\_NONE can be given instead.

**Note** This macro is associated with BLE\_MESH\_ELEM in mesh\_access.h

**Parameters**

- `_loc`: Location Descriptor.
- `_mods`: Array of SIG models.
- `_vnd_mods`: Array of vendor models.

**ESP\_BLE\_MESH\_PROV** (uuid, sta\_val, sta\_val\_len, out\_size, out\_act, in\_size, in\_act)

**BT\_OCTET32\_LEN**

**BD\_ADDR\_LEN**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_PUBLIC**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RANDOM**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_PUBLIC**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_RANDOM**

**ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE** (\_name, \_msg\_len, \_role)

Define a model publication context.

**Parameters**

- `_name`: Variable name given to the context.
- `_msg_len`: Length of the publication message.
- `_role`: Role of the device which contains the model.

**ESP\_BLE\_MESH\_MODEL\_OP** (\_opcode, \_min\_len)

Define a model operation context.

**Parameters**

- `_opcode`: Message opcode.
- `_min_len`: Message minimum length.

**ESP\_BLE\_MESH\_MODEL\_OP\_END**

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

**ESP\_BLE\_MESH\_MODEL\_NONE**

Helper to define an empty model array. This structure is associated with BLE\_MESH\_MODEL\_NONE in mesh\_access.h

**ADD\_DEV\_RM\_AFTER\_PROV\_FLAG**

Device will be removed from queue after provisioned successfully

**ADD\_DEV\_START\_PROV\_NOW\_FLAG**

Start provisioning device immediately

**ADD\_DEV\_FLUSHABLE\_DEV\_FLAG**

Device can be remove when queue is full and new device is going to added

**DEL\_DEV\_ADDR\_FLAG****DEL\_DEV\_UUID\_FLAG****PROV\_DATA\_NET\_IDX\_FLAG****PROV\_DATA\_FLAGS\_FLAG****PROV\_DATA\_IV\_INDEX\_FLAG****ESP\_BLE\_MESH\_BLE\_ADV\_INFINITE**

Count for sending BLE advertising packet infinitely This enum value is the priority of BLE advertising packet

**ESP\_BLE\_MESH\_MODEL\_ID\_CONFIG\_SRV**

BLE Mesh models related Model ID and Opcode definitions.

< Foundation Models

**ESP\_BLE\_MESH\_MODEL\_ID\_CONFIG\_CLI****ESP\_BLE\_MESH\_MODEL\_ID\_HEALTH\_SRV****ESP\_BLE\_MESH\_MODEL\_ID\_HEALTH\_CLI**

 Response will be sent internally

**Type Definitions**

**typedef uint8\_t esp\_ble\_mesh\_octet16\_t[ESP\_BLE\_MESH\_OCTET16\_LEN]**  
 Define the BLE Mesh octet 8 bytes size

**typedef uint8\_t esp\_ble\_mesh\_octet8\_t[ESP\_BLE\_MESH\_OCTET8\_LEN]**  
 Invalid Company ID

**typedef uint32\_t esp\_ble\_mesh\_cb\_t**

**typedef uint8\_t UINT8**

**typedef uint16\_t UINT16**

**typedef uint32\_t UINT32**

**typedef uint64\_t UINT64**

**typedef *UINT8* BT\_OCTET32[BT\_OCTET32\_LEN]**

**typedef uint8\_t BD\_ADDR[BD\_ADDR\_LEN]**

**typedef uint8\_t esp\_ble\_mesh\_bd\_addr\_t[BD\_ADDR\_LEN]**

**typedef uint8\_t esp\_ble\_mesh\_addr\_type\_t**  
 BLE device address type.

**typedef struct *esp\_ble\_mesh\_model* esp\_ble\_mesh\_model\_t**

**typedef uint8\_t esp\_ble\_mesh\_dev\_add\_flag\_t**

**typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_client\_get\_t**  
 esp\_ble\_mesh\_opcode\_config\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_get\_state function.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_client\_set\_t**  
 esp\_ble\_mesh\_opcode\_config\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_set\_state function.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_config\_status\_t**  
 esp\_ble\_mesh\_opcode\_config\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Config Model messages The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model' s request messages.

**typedef uint8\_t esp\_ble\_mesh\_cfg\_status\_t**  
 This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

**typedef uint32\_t esp\_ble\_mesh\_opcode\_health\_client\_get\_t**  
 esp\_ble\_mesh\_opcode\_health\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to

locate the opcodes used by `esp_ble_mesh_health_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_get_state` function.

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_set\_t**

`esp_ble_mesh_opcode_health_client_set_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_health_client_set_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_set_state` function.

**typedef** uint32\_t **esp\_ble\_mesh\_health\_model\_status\_t**

`esp_ble_mesh_health_model_status_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

**typedef** uint32\_t **esp\_ble\_mesh\_generic\_message\_opcode\_t**

`esp_ble_mesh_generic_message_opcode_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by functions `esp_ble_mesh_generic_client_get_state` & `esp_ble_mesh_generic_client_set_state`. Generic OnOff Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_sensor\_message\_opcode\_t**

`esp_ble_mesh_sensor_message_opcode_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by functions `esp_ble_mesh_sensor_client_get_state` & `esp_ble_mesh_sensor_client_set_state`. Sensor Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_time\_scene\_message\_opcode\_t**

`esp_ble_mesh_time_scene_message_opcode_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by functions `esp_ble_mesh_time_scene_client_get_state` & `esp_ble_mesh_time_scene_client_set_state`. Time Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_light\_message\_opcode\_t**

`esp_ble_mesh_light_message_opcode_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by functions `esp_ble_mesh_light_client_get_state` & `esp_ble_mesh_light_client_set_state`. Light Lightness Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_t**

End of defines of `esp_ble_mesh_opcode_t`

**typedef** uint8\_t **esp\_ble\_mesh\_model\_status\_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

## Enumerations

**enum** **esp\_ble\_mesh\_cb\_type\_t**

*Values:*

**ESP\_BLE\_MESH\_TYPE\_PROV\_CB**

**ESP\_BLE\_MESH\_TYPE\_OUTPUT\_NUM\_CB**

**ESP\_BLE\_MESH\_TYPE\_OUTPUT\_STR\_CB**

**ESP\_BLE\_MESH\_TYPE\_INTPUT\_CB**

**ESP\_BLE\_MESH\_TYPE\_LINK\_OPEN\_CB**

**ESP\_BLE\_MESH\_TYPE\_LINK\_CLOSE\_CB**

**ESP\_BLE\_MESH\_TYPE\_COMPLETE\_CB**

**ESP\_BLE\_MESH\_TYPE\_RESET\_CB**

**enum** **esp\_ble\_mesh\_oob\_method\_t**

*Values:*

**ESP\_BLE\_MESH\_NO\_OOB**

**ESP\_BLE\_MESH\_STATIC\_OOB**

**ESP\_BLE\_MESH\_OUTPUT\_OOB**

```
ESP_BLE_MESH_INPUT_OOB

enum esp_ble_mesh_output_action_t
    Values:
    ESP_BLE_MESH_NO_OUTPUT = 0
    ESP_BLE_MESH_BLINK = BIT(0)
    ESP_BLE_MESH_BEEP = BIT(1)
    ESP_BLE_MESH_VIBRATE = BIT(2)
    ESP_BLE_MESH_DISPLAY_NUMBER = BIT(3)
    ESP_BLE_MESH_DISPLAY_STRING = BIT(4)

enum esp_ble_mesh_input_action_t
    Values:
    ESP_BLE_MESH_NO_INPUT = 0
    ESP_BLE_MESH_PUSH = BIT(0)
    ESP_BLE_MESH_TWIST = BIT(1)
    ESP_BLE_MESH_ENTER_NUMBER = BIT(2)
    ESP_BLE_MESH_ENTER_STRING = BIT(3)

enum esp_ble_mesh_prov_bearer_t
    Values:
    ESP_BLE_MESH_PROV_ADV = BIT(0)
    ESP_BLE_MESH_PROV_GATT = BIT(1)

enum esp_ble_mesh_prov_oob_info_t
    Values:
    ESP_BLE_MESH_PROV_OOB_OTHER = BIT(0)
    ESP_BLE_MESH_PROV_OOB_URI = BIT(1)
    ESP_BLE_MESH_PROV_OOB_2D_CODE = BIT(2)
    ESP_BLE_MESH_PROV_OOB_BAR_CODE = BIT(3)
    ESP_BLE_MESH_PROV_OOB_NFC = BIT(4)
    ESP_BLE_MESH_PROV_OOB_NUMBER = BIT(5)
    ESP_BLE_MESH_PROV_OOB_STRING = BIT(6)
    ESP_BLE_MESH_PROV_OOB_ON_BOX = BIT(11)
    ESP_BLE_MESH_PROV_OOB_IN_BOX = BIT(12)
    ESP_BLE_MESH_PROV_OOB_ON_PAPER = BIT(13)
    ESP_BLE_MESH_PROV_OOB_IN_MANUAL = BIT(14)
    ESP_BLE_MESH_PROV_OOB_ON_DEV = BIT(15)

enum esp_ble_mesh_dev_role_t
    Values:
    ROLE_NODE = 0
    ROLE_PROVISIONER
    ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
    Values:
```

**FAST\_PROV\_ACT\_NONE**

**FAST\_PROV\_ACT\_ENTER**

**FAST\_PROV\_ACT\_SUSPEND**

**FAST\_PROV\_ACT\_EXIT**

**FAST\_PROV\_ACT\_MAX**

**enum esp\_ble\_mesh\_proxy\_filter\_type\_t**

*Values:*

**PROXY\_FILTER\_WHITELIST**

**PROXY\_FILTER\_BLACKLIST**

**enum esp\_ble\_mesh\_ble\_adv\_priority\_t**

*Values:*

**ESP\_BLE\_MESH\_BLE\_ADV\_PRIO\_LOW**

**ESP\_BLE\_MESH\_BLE\_ADV\_PRIO\_HIGH**

**enum esp\_ble\_mesh\_prov\_cb\_event\_t**

*Values:*

**ESP\_BLE\_MESH\_PROV\_REGISTER\_COMP\_EVT**

Initialize BLE Mesh provisioning capabilities and internal data information completion event

**ESP\_BLE\_MESH\_NODE\_SET\_UNPROV\_DEV\_NAME\_COMP\_EVT**

Set the unprovisioned device name completion event

**ESP\_BLE\_MESH\_NODE\_PROV\_ENABLE\_COMP\_EVT**

Enable node provisioning functionality completion event

**ESP\_BLE\_MESH\_NODE\_PROV\_DISABLE\_COMP\_EVT**

Disable node provisioning functionality completion event

**ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_OPEN\_EVT**

Establish a BLE Mesh link event

**ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_CLOSE\_EVT**

Close a BLE Mesh link event

**ESP\_BLE\_MESH\_NODE\_PROV\_OOB\_PUB\_KEY\_EVT**

Generate Node input OOB public key event

**ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_NUMBER\_EVT**

Generate Node Output Number event

**ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_STRING\_EVT**

Generate Node Output String event

**ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT**

Event requiring the user to input a number or string

**ESP\_BLE\_MESH\_NODE\_PROV\_COMPLETE\_EVT**

Provisioning done event

**ESP\_BLE\_MESH\_NODE\_PROV\_RESET\_EVT**

Provisioning reset event

**ESP\_BLE\_MESH\_NODE\_PROV\_SET\_OOB\_PUB\_KEY\_COMP\_EVT**

Node set oob public key completion event

**ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_NUMBER\_COMP\_EVT**

Node input number completion event

**ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_STRING\_COMP\_EVT**

Node input string completion event

<b>ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT</b>	Enable BLE Mesh Proxy Identity advertising completion event
<b>ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT</b>	Enable BLE Mesh GATT Proxy Service completion event
<b>ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT</b>	Disable BLE Mesh GATT Proxy Service completion event
<b>ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT</b>	Node add NetKey locally completion event
<b>ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT</b>	Node add AppKey locally completion event
<b>ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT</b>	Node bind AppKey to model locally completion event
<b>ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT</b>	Provisioner enable provisioning functionality completion event
<b>ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT</b>	Provisioner disable provisioning functionality completion event
<b>ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT</b>	Provisioner receives unprovisioned device beacon event
<b>ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT</b>	Provisioner read unprovisioned device OOB public key event
<b>ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT</b>	Provisioner input value for provisioning procedure event
<b>ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT</b>	Provisioner output value for provisioning procedure event
<b>ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT</b>	Provisioner establish a BLE Mesh link event
<b>ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT</b>	Provisioner close a BLE Mesh link event
<b>ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT</b>	Provisioner provisioning done event
<b>ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT</b>	Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
<b>ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT</b>	Provisioner start to provision an unprovisioned device completion event
<b>ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT</b>	Provisioner delete a device from the list, close provisioning link with the device completion event
<b>ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT</b>	Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
<b>ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT</b>	Provisioner set net_idx/flags/iv_index used for provisioning completion event
<b>ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT</b>	Provisioner set static oob value used for provisioning completion event
<b>ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT</b>	Provisioner set unicast address of primary element completion event
<b>ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT</b>	Provisioner read unprovisioned device OOB public key completion event

<b>ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT</b>	Provisioner input number completion event
<b>ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT</b>	Provisioner input string completion event
<b>ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT</b>	Provisioner set node name completion event
<b>ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT</b>	Provisioner add local app key completion event
<b>ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT</b>	Provisioner update local app key completion event
<b>ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT</b>	Provisioner bind local model with local app key completion event
<b>ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT</b>	Provisioner add local network key completion event
<b>ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT</b>	Provisioner update local network key completion event
<b>ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT</b>	Provisioner store node composition data completion event
<b>ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT</b>	Provisioner delete node with uuid completion event
<b>ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT</b>	Provisioner delete node with unicast address completion event
<b>ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT</b>	Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event
<b>ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT</b>	Set fast provisioning action completion event
<b>ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT</b>	Receive Heartbeat message event
<b>ESP_BLE_MESH_LPN_ENABLE_COMP_EVT</b>	Enable Low Power Node completion event
<b>ESP_BLE_MESH_LPN_DISABLE_COMP_EVT</b>	Disable Low Power Node completion event
<b>ESP_BLE_MESH_LPN_POLL_COMP_EVT</b>	Low Power Node send Friend Poll completion event
<b>ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT</b>	Low Power Node establishes friendship event
<b>ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT</b>	Low Power Node terminates friendship event
<b>ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT</b>	Friend Node establishes friendship event
<b>ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT</b>	Friend Node terminates friendship event
<b>ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT</b>	Proxy Client receives Network ID advertising packet event
<b>ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT</b>	Proxy Client establishes connection successfully event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECTED\_EVT**  
Proxy Client terminates connection successfully event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_FILTER\_STATUS\_EVT**  
Proxy Client receives Proxy Filter Status event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECT\_COMP\_EVT**  
Proxy Client connect completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECT\_COMP\_EVT**  
Proxy Client disconnect completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_SET\_FILTER\_TYPE\_COMP\_EVT**  
Proxy Client set filter type completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_ADD\_FILTER\_ADDR\_COMP\_EVT**  
Proxy Client add filter address completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_REMOVE\_FILTER\_ADDR\_COMP\_EVT**  
Proxy Client remove filter address completion event

**ESP\_BLE\_MESH\_START\_BLE\_ADVERTISING\_COMP\_EVT**  
Start BLE advertising completion event

**ESP\_BLE\_MESH\_STOP\_BLE\_ADVERTISING\_COMP\_EVT**  
Stop BLE advertising completion event

**ESP\_BLE\_MESH\_MODEL\_SUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**  
Local model subscribes group address completion event

**ESP\_BLE\_MESH\_MODEL\_UNSUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**  
Local model unsubscribes group address completion event

**ESP\_BLE\_MESH\_DEINIT\_MESH\_COMP\_EVT**  
De-initialize BLE Mesh stack completion event

**ESP\_BLE\_MESH\_PROV\_EVT\_MAX**

**enum [anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

*Values:*

**ESP\_BLE\_MESH\_SERVER\_TRANS\_TIMER\_START**

**ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX**

**enum esp\_ble\_mesh\_server\_state\_type\_t**

This enum value is the type of server model states

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_ONOFF\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_LEVEL\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_ONPOWERUP\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_POWER\_ACTUAL\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_ACTUAL\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_LINEAR\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_CTL\_LIGHTNESS\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_CTL\_TEMP\_DELTA\_UV\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_HSL\_LIGHTNESS\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_HSL\_HUE\_STATE**

```

ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

```

```
enum esp_ble_mesh_model_cb_event_t
```

Values:

```

ESP_BLE_MESH_MODEL_OPERATION_EVT
    User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
ESP_BLE_MESH_MODEL_SEND_COMP_EVT
    User-defined models send messages completion event
ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
    User-defined models publish messages completion event
ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
    User-defined client models receive publish messages event
ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
    Timeout event for the user-defined client models that failed to receive response from peer server models
ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
    When a model is configured to publish messages periodically, this event will occur during every publish
    period
ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
    Server models update state value completion event
ESP_BLE_MESH_MODEL_EVT_MAX

```

## ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

## ESP-BLE-MESH Stack Initialization

### Header File

- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h`

### Functions

```
esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

*esp\_err\_t* **esp\_ble\_mesh\_deinit** (*esp\_ble\_mesh\_deinit\_param\_t* \*param)

De-initialize BLE Mesh module.

**Note** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] param: Pointer to the structure of BLE Mesh deinit parameters.

## Reading of Local Data Information

### Header File

- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h`

### Functions

*int32\_t* **esp\_ble\_mesh\_get\_model\_publish\_period** (*esp\_ble\_mesh\_model\_t* \*model)

Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

**Parameters**

- [in] model: Model instance pointer.

*uint16\_t* **esp\_ble\_mesh\_get\_primary\_element\_address** (void)

Get the address of the primary element.

**Return** Address of the primary element on success, or ESP\_BLE\_MESH\_ADDR\_UNASSIGNED on failure which means the device has not been provisioned.

*uint16\_t* \***esp\_ble\_mesh\_is\_model\_subscribed\_to\_group** (*esp\_ble\_mesh\_model\_t* \*model, *uint16\_t* group\_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**

- [in] model: Pointer to the model.
- [in] group\_addr: Group address.

*esp\_ble\_mesh\_elem\_t* \***esp\_ble\_mesh\_find\_element** (*uint16\_t* element\_addr)

Find the BLE Mesh element pointer via the element address.

**Return** Pointer to the element on success, or NULL on failure.

**Parameters**

- [in] element\_addr: Element address.

*uint8\_t* **esp\_ble\_mesh\_get\_element\_count** (void)

Get the number of elements that have been registered.

**Return** Number of elements.

*esp\_ble\_mesh\_model\_t* \***esp\_ble\_mesh\_find\_vendor\_model** (const *esp\_ble\_mesh\_elem\_t* \*element, *uint16\_t* company\_id, *uint16\_t* model\_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**

- [in] `element`: Element to which the model belongs.
- [in] `company_id`: A 16-bit company identifier assigned by the Bluetooth SIG.
- [in] `model_id`: A 16-bit vendor-assigned model identifier.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)`

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**

- [in] `element`: Element to which the model belongs.
- [in] `model_id`: SIG model identifier.

`const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)`

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

`esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)`

A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `element_addr`: Unicast address of the element to which the model belongs.
- [in] `company_id`: A 16-bit company identifier.
- [in] `model_id`: A 16-bit model identifier.
- [in] `group_addr`: The group address to be subscribed.

`esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)`

A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `element_addr`: Unicast address of the element to which the model belongs.
- [in] `company_id`: A 16-bit company identifier.
- [in] `model_id`: A 16-bit model identifier.
- [in] `group_addr`: The subscribed group address.

`const uint8_t *esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)`

This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**

- [in] `net_idx`: NetKey index.

`const uint8_t *esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)`

This function is called by Node to get the local AppKey.

**Return** AppKey on success, or NULL on failure.

**Parameters**

- [in] `app_idx`: AppKey index.

`esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)`

This function is called by Node to add a local NetKey.

**Note** This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] net\_key: NetKey to be added.
- [in] net\_idx: NetKey Index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_app\_key**(const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is called by Node to add a local AppKey.

**Note** The net\_idx must be an existing one. This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] app\_key: AppKey to be added.
- [in] net\_idx: NetKey Index.
- [in] app\_idx: AppKey Index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_bind\_app\_key\_to\_local\_model**(uint16\_t element\_addr, uint16\_t company\_id, uint16\_t model\_id, uint16\_t app\_idx)

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind app\_key with local vendor model, the company\_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] element\_addr: Node local element address
- [in] company\_id: Node local company id
- [in] model\_id: Node local model id
- [in] app\_idx: Node local appkey index

## Low Power Operation (Updating)

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_low\\_power\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_enable**(void)

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_disable**(bool force)

Disable BLE Mesh device LPN functionality.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] force: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_poll**(void)

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP\_OK on success or error code otherwise.

## Send/Publish Messages, add Local AppKey, etc.

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_networking\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_custom\_model\_callback** (*esp\_ble\_mesh\_model\_cb\_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_model\_msg\_opcode\_init** (*uint8\_t* \*data, *uint32\_t* opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `data`: Pointer to the message data.
- [in] `opcode`: The message opcode.

*esp\_err\_t* **esp\_ble\_mesh\_client\_model\_init** (*esp\_ble\_mesh\_model\_t* \*model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. **Note:** Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `model`: BLE Mesh Client model to which the message belongs.

*esp\_err\_t* **esp\_ble\_mesh\_client\_model\_deinit** (*esp\_ble\_mesh\_model\_t* \*model)

De-initialize the user-defined client model.

**Note** This function shall be invoked before `esp_ble_mesh_deinit()` is called.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `model`: Pointer of the Client model.

*esp\_err\_t* **esp\_ble\_mesh\_server\_model\_send\_msg** (*esp\_ble\_mesh\_model\_t* \*model, *esp\_ble\_mesh\_msg\_ctx\_t* \*ctx, *uint32\_t* opcode, *uint16\_t* length, *uint8\_t* \*data)

Send server model messages (such as server model status messages).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: BLE Mesh Server Model to which the message belongs.
- [in] ctx: Message context, includes keys, TTL, etc.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of Access Payload (exclude the message opcode) to be sent.

```
esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
                                             esp_ble_mesh_msg_ctx_t *ctx, uint32_t
                                             opcode, uint16_t length, uint8_t *data,
                                             int32_t msg_timeout, bool need_rsp,
                                             esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: BLE Mesh Client Model to which the message belongs.
- [in] ctx: Message context, includes keys, TTL, etc.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] msg\_timeout: Time to get response to the message (in milliseconds).
- [in] need\_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] device\_role: Role of the device (Node/Provisioner) that sends the message.

```
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t
                                     length, uint8_t *data, esp_ble_mesh_dev_role_t de-
                                     vice_role)
```

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (*esp\_ble\_mesh\_model\_pub\_t:msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT with the message updated.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: Mesh (client) Model publishing the message.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] device\_role: Role of the device (node/provisioner) publishing the message of the type *esp\_ble\_mesh\_dev\_role\_t*.

```
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model,
                                                  esp_ble_mesh_server_state_type_t type,
                                                  esp_ble_mesh_server_state_value_t
                                                  *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: Server model which is going to update the state.
- [in] type: Server model state type.
- [in] value: Server model state value.

```
esp_err_t esp_ble_mesh_node_local_reset(void)
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function *esp\_ble\_mesh\_node\_prov\_enable()* needs to be called to start a new provisioning procedure.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_node\_name** (uint16\_t *index*, const char \**name*)

This function is called to set the node (provisioned device) name.

**Note** *index* is obtained from the parameters of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *index*: Index of the node in the node queue.
- [in] *name*: Name (end by '\0') to be set for the node.

const char \***esp\_ble\_mesh\_provisioner\_get\_node\_name** (uint16\_t *index*)

This function is called to get the node (provisioned device) name.

**Note** *index* is obtained from the parameters of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**

- [in] *index*: Index of the node in the node queue.

uint16\_t **esp\_ble\_mesh\_provisioner\_get\_node\_index** (const char \**name*)

This function is called to get the node (provisioned device) index.

**Return** Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**

- [in] *name*: Name of the node (end by '\0').

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_store\_node\_comp\_data** (uint16\_t *unicast\_addr*,  
uint8\_t \**data*, uint16\_t  
*length*)

This function is called to store the Composition Data of the node.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *unicast\_addr*: Element address of the node
- [in] *data*: Pointer of Composition Data
- [in] *length*: Length of Composition Data

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_uuid** (const uint8\_t  
*uuid*[16])

This function is called to get the provisioned node information with the node device uuid.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] *uuid*: Device UUID of the node

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_addr** (uint16\_t *uni-*  
*cast\_addr*)

This function is called to get the provisioned node information with the node unicast address.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] *unicast\_addr*: Unicast address of the node

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_name** (const char  
*\*name*)

This function is called to get the provisioned node information with the node name.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] *name*: Name of the node (end by '\0').

uint16\_t **esp\_ble\_mesh\_provisioner\_get\_prov\_node\_count** (void)

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.

**const esp\_ble\_mesh\_node\_t\*\*esp\_ble\_mesh\_provisioner\_get\_node\_table\_entry** (void)

This function is called by Provisioner to get the entry of the node table.

**Note** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t **node)` is NULL. For example: “ const esp\_ble\_mesh\_node\_t \*\*entry = esp\_ble\_mesh\_provisioner\_get\_node\_table\_entry(); for (int i = 0; i < CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES; i++) { const esp\_ble\_mesh\_node\_t \*node = entry[i]; if (node) { … } } ”

**Return** Pointer to the start of the node table.

**esp\_err\_t esp\_ble\_mesh\_provisioner\_delete\_node\_with\_uuid** (const uint8\_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uuid: Device UUID of the node

**esp\_err\_t esp\_ble\_mesh\_provisioner\_delete\_node\_with\_addr** (uint16\_t unicast\_addr)

This function is called to delete the provisioned node information with the node unicast address.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] unicast\_addr: Unicast address of the node

**esp\_err\_t esp\_ble\_mesh\_provisioner\_add\_local\_app\_key** (const uint8\_t app\_key[16],  
uint16\_t net\_idx, uint16\_t  
app\_idx)

This function is called to add a local AppKey for Provisioner.

**Note** app\_key: If set to NULL, app\_key will be generated internally. net\_idx: Should be an existing one. app\_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app\_idx will be reported via an event.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] app\_key: The app key to be set for the local BLE Mesh stack.
- [in] net\_idx: The network key index.
- [in] app\_idx: The app key index.

**esp\_err\_t esp\_ble\_mesh\_provisioner\_update\_local\_app\_key** (const uint8\_t app\_key[16],  
uint16\_t net\_idx, uint16\_t  
app\_idx)

This function is used to update a local AppKey for Provisioner.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] app\_key: Value of the AppKey.
- [in] net\_idx: Corresponding NetKey Index.
- [in] app\_idx: The AppKey Index

**const uint8\_t\*esp\_ble\_mesh\_provisioner\_get\_local\_app\_key** (uint16\_t net\_idx, uint16\_t  
app\_idx)

This function is called by Provisioner to get the local app key value.

**Return** App key on success, or NULL on failure.

**Parameters**

- [in] net\_idx: Network key index.
- [in] app\_idx: Application key index.

```

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t      el-
                                                                element_addr,
                                                                uint16_t app_idx,
                                                                uint16_t
                                                                model_id,
                                                                uint16_t      com-
                                                                pany_id)

```

This function is called by Provisioner to bind own model with proper app key.

**Note** company\_id: If going to bind app\_key with local vendor model, company\_id should be set to 0xFFFF.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] element\_addr: Provisioner local element address
- [in] app\_idx: Provisioner local appkey index
- [in] model\_id: Provisioner local model id
- [in] company\_id: Provisioner local company id

```

esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t  net_key[16],
                                                       uint16_t net_idx)

```

This function is called by Provisioner to add local network key.

**Note** net\_key: If set to NULL, net\_key will be generated internally. net\_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net\_idx will be reported via an event.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] net\_key: The network key to be added to the Provisioner local BLE Mesh stack.
- [in] net\_idx: The network key index.

```

esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16],
                                                         uint16_t net_idx)

```

This function is called by Provisioner to update a local network key.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] net\_key: Value of the NetKey.
- [in] net\_idx: The NetKey Index.

```

const uint8_t *esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)

```

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

#### Parameters

- [in] net\_idx: Network key index.

```

const uint8_t *esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)

```

This function is called to get fast provisioning application key.

**Return** Application key on success, or NULL on failure.

#### Parameters

- [in] net\_idx: Network key index.
- [in] app\_idx: Application key index.

### Type Definitions

```

typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t      event,
                                         esp_ble_mesh_model_cb_param_t *param)
: event, event code of user-defined model events; param, parameters of user-defined model events

```

### ESP-BLE-MESH Node/Provisioner Provisioning

#### Header File

- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h`

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_prov\_callback** (*esp\_ble\_mesh\_prov\_cb\_t* callback)

Register BLE Mesh provisioning callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

bool **esp\_ble\_mesh\_node\_is\_provisioned** (void)

Check if a device has been provisioned.

**Return** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

**Note** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- bearers: Bit-wise OR of provisioning bearers.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- bearers: Bit-wise OR of provisioning bearers.

*esp\_err\_t* **esp\_ble\_mesh\_node\_set\_oob\_pub\_key** (uint8\_t pub\_key\_x[32], uint8\_t pub\_key\_y[32],  
uint8\_t private\_key[32])

Unprovisioned device set own oob public key & private key pair.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] pub\_key\_x: Unprovisioned device' s Public Key X
- [in] pub\_key\_y: Unprovisioned device' s Public Key Y
- [in] private\_key: Unprovisioned device' s Private Key

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_number** (uint32\_t number)

Provide provisioning input OOB number.

**Note** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] number: Number input by device.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_string** (const char \*string)

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] string: String input by device.

*esp\_err\_t* **esp\_ble\_mesh\_set\_unprovisioned\_device\_name** (const char \*name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn' t apply to PB-ADV mode.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] name: Unprovisioned device name

```
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])
```

Provisioner inputs unprovisioned device's oob public key.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] link\_idx: The provisioning link index
- [in] pub\_key\_x: Unprovisioned device's Public Key X
- [in] pub\_key\_y: Unprovisioned device's Public Key Y

```
esp_err_t esp_ble_mesh_provisioner_input_string (const char *string, uint8_t link_idx)
```

Provide provisioning input OOB string.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* prov\_input\_num callback has been called with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] string: String input by Provisioner.
- [in] link\_idx: The provisioning link index.

```
esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* prov\_input\_num callback has been called with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] number: Number input by Provisioner.
- [in] link\_idx: The provisioning link index.

```
esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)
```

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)
```

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev (esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov\_dev queue.

**Return** ESP\_OK on success or error code otherwise.

**Note** : 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.

- In this situation, the Provisioner can set bearers with each one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled, and cannot set flags with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
3. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
    - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with `ESP_BLE_MESH_PROV_ADV` enabled and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
    - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with `ESP_BLE_MESH_PROV_GATT` enabled, and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
    - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
    - Note: `ESP_BLE_MESH_PROV_ADV`, `ESP_BLE_MESH_PROV_GATT` and `ADD_DEV_START_PROV_NOW_FLAG` can not be enabled at the same time.

#### Parameters

- [in] `add_dev`: Pointer to a struct containing the device information
- [in] `flags`: Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
                                                         esp_ble_mesh_bd_addr_t
                                                         addr,
                                                         esp_ble_mesh_addr_type_t
                                                         addr_type,
                                                         esp_ble_mesh_prov_bearer_t
                                                         bearer, uint16_t oob_info,
                                                         uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note** : 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to `ESP_BLE_MESH_PROV_ADV` or `ESP_BLE_MESH_PROV_GATT`, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the `ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT` event.
2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
3. Recommend to use only one of the functions “`esp_ble_mesh_provisioner_add_unprov_dev`” and “`esp_ble_mesh_provisioner_prov_device_with_addr`” by a Provisioner.

#### Parameters

- [in] `uuid`: Device UUID of the unprovisioned device
- [in] `addr`: Device address of the unprovisioned device
- [in] `addr_type`: Device address type of the unprovisioned device
- [in] `bearer`: Provisioning bearer going to be used by Provisioner
- [in] `oob_info`: OOB info of the unprovisioned device
- [in] `unicast_addr`: Unicast address going to be allocated for the unprovisioned device

```
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `del_dev`: Pointer to a struct containing the device information.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_dev_uuid_match` (`const` `uint8_t` *\*match\_val*,  
`uint8_t` *match\_len*, `uint8_t`  
*offset*, `bool` *prov\_after\_match*)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `match_val`: Value to be compared with the part of the device UUID.
- [in] `match_len`: Length of the compared match value.
- [in] `offset`: Offset of the device UUID to be compared (based on zero).
- [in] `prov_after_match`: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_prov_data_info` (*esp\_ble\_mesh\_prov\_data\_info\_t*  
*\*prov\_data\_info*)

This function is called by Provisioner to set provisioning data information before starting to provision.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `prov_data_info`: Pointer to a struct containing `net_idx` or `flags` or `iv_index`.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_static_oob_value` (`const` `uint8_t` *\*value*,  
`uint8_t` *length*)

This function is called by Provisioner to set static oob value used for provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `value`: Pointer to the static oob value.
- [in] `length`: Length of the static oob value.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_primary_elem_addr` (`uint16_t` *addr*)

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the `prov_unicast_addr` value in the struct *esp\_ble\_mesh\_prov\_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `addr`: Unicast address of the Primary element of Provisioner.

*esp\_err\_t* `esp_ble_mesh_set_fast_prov_info` (*esp\_ble\_mesh\_fast\_prov\_info\_t* *\*fast\_prov\_info*)

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `fast_prov_info`: Pointer to a struct containing unicast address range, `net_idx`, etc.

*esp\_err\_t* `esp_ble_mesh_set_fast_prov_action` (*esp\_ble\_mesh\_fast\_prov\_action\_t* *action*)

This function is called to start/suspend/exit fast provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `action`: fast provisioning action (i.e. enter, suspend, exit).

## Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t          event,
                                       esp_ble_mesh_prov_cb_param_t *param)
    : event, event code of provisioning events; param, parameters of provisioning events
typedef void (*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t      addr,
                                           const esp_ble_mesh_addr_type_t     addr_type,
                                           const uint8_t                     adv_type,
                                           const uint8_t                     *dev_uuid,
                                           const uint16_t                    oob_info,
                                           esp_ble_mesh_prov_bearer_t         bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

### Parameters

- [in] addr: Pointer to the unprovisioned device address.
- [in] addr\_type: Unprovisioned device address type.
- [in] adv\_type: Adv packet type(ADV\_IND or ADV\_NONCONN\_IND).
- [in] dev\_uuid: Unprovisioned device UUID pointer.
- [in] oob\_info: OOB information of the unprovisioned device.
- [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

## ESP-BLE-MESH GATT Proxy Server

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_proxy\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_identity\_enable** (void)

Enable advertising with Node Identity.

**Note** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_enable** (void)

Enable BLE Mesh GATT Proxy Service.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_connect** (esp\_ble\_mesh\_bd\_addr\_t addr,
 esp\_ble\_mesh\_addr\_type\_t addr\_type, uint16\_t
 net\_idx)

Proxy Client creates a connection with the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

### Parameters

- [in] addr: Device address of the Proxy Server.
- [in] addr\_type: Device address type(public or static random).
- [in] net\_idx: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_disconnect** (uint8\_t conn\_handle)

Proxy Client terminates a connection with the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] conn\_handle: Proxy connection handle.

```
esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle,
                                                    uint16_t net_idx,
                                                    esp_ble_mesh_proxy_filter_type_t
                                                    filter_type)
```

Proxy Client sets the filter type of the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] conn\_handle: Proxy connection handle.
- [in] net\_idx: Corresponding NetKey Index.
- [in] filter\_type: whitelist or blacklist.

```
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t
                                                    net_idx, uint16_t *addr, uint16_t
                                                    addr_num)
```

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] conn\_handle: Proxy connection handle.
- [in] net\_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr\_num: Number of the filter address.

```
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr (uint8_t conn_handle, uint16_t
                                                       net_idx, uint16_t *addr,
                                                       uint16_t addr_num)
```

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] conn\_handle: Proxy connection handle.
- [in] net\_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr\_num: Number of the filter address.

## ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

---

注解: Definitions related to Server Models are being updated, and will be released soon.

---

### Configuration Client/Server Models

#### Header File

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h`

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_config\_client\_callback** (*esp\_ble\_mesh\_cfg\_client\_cb\_t* callback)

Register BLE Mesh Config Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_register\_config\_server\_callback** (*esp\_ble\_mesh\_cfg\_server\_cb\_t* callback)

Register BLE Mesh Config Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_get\_state\_t* \*get\_state)

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_opcode\_config\_client\_get\_t in esp\_ble\_mesh\_defs.h

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get\_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_set\_state\_t* \*set\_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_opcode\_config\_client\_set\_t in esp\_ble\_mesh\_defs.h

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set\_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Unions**

**union** **esp\_ble\_mesh\_cfg\_client\_get\_state\_t**

```
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET

Friend state

uint8\_t **default\_ttl**  
Default TTL

**struct k\_delayed\_work timer**  
Heartbeat Publication timer

**uint16\_t dst**

Destination address for Heartbeat messages

**uint16\_t count**

Number of Heartbeat messages to be sent

Number of Heartbeat messages received

**uint8\_t period**

Period for sending Heartbeat messages

**uint8\_t ttl**

TTL to be used when sending Heartbeat messages

**uint16\_t feature**

Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**

NetKey Index used by Heartbeat Publication

**struct esp\_ble\_mesh\_cfg\_srv::[anonymous] heartbeat\_pub**

Heartbeat Publication

**int64\_t expiry**

Timestamp when Heartbeat subscription period is expired

**uint16\_t src**

Source address for Heartbeat messages

**uint8\_t min\_hops**

Minimum hops when receiving Heartbeat messages

**uint8\_t max\_hops**

Maximum hops when receiving Heartbeat messages

**esp\_ble\_mesh\_cb\_t heartbeat\_rcv\_cb**

Optional heartbeat subscription tracking function

**struct esp\_ble\_mesh\_cfg\_srv::[anonymous] heartbeat\_sub**

Heartbeat Subscription

**struct esp\_ble\_mesh\_cfg\_composition\_data\_get\_t**

Parameters of Config Composition Data Get.

### Public Members

**uint8\_t page**

Page number of the Composition Data.

The app key index

`uint8_t app_key[16]`  
The app key value

`struct esp_ble_mesh_cfg_model_app_bind_t`  
Parameters of Config Model App Bind.

**Public Members**

`uint16_t element_addr`  
The element address

`uint16_t model_app_idx`  
Index of the app key to bind with the model

`uint16_t model_id`  
The model id

`uint16_t company_id`  
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_pub_set_t`  
Parameters of Config Model Publication Set.

**Public Members**

`uint16_t element_addr`  
The element address

`uint16_t publish_addr`  
Value of the publish address

uint16\_t **publish\_app\_idx**  
Index of the application key

bool **cred\_flag**  
Value of the Friendship Credential Flag

uint8\_t **publish\_ttl**  
Default TTL value for the publishing messages

uint8\_t **publish\_period**  
Period for periodic status publishing

uint8\_t **publish\_retransmit**  
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16\_t **model\_id**  
The model id

uint16\_t **company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_add\_t**  
Parameters of Config Model Subscription Add.

### Public Members

uint16\_t **element\_addr**  
The element address

uint16\_t **sub\_addr**  
The address to be added to the Subscription List

uint16\_t **model\_id**  
The model id

uint16\_t **company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_t**  
Parameters of Config Model Subscription Delete.

### Public Members

uint16\_t **element\_addr**  
The element address

uint16\_t **sub\_addr**  
The address to be removed from the Subscription List

The model id

**uint16\_t company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_overwrite\_t**  
Parameters of Config Model Subscription Virtual Address Overwrite.

### Public Members

**uint16\_t element\_addr**  
The element address

**uint8\_t label\_uuid[16]**  
The Label UUID of the virtual address to be added to the Subscription List

**uint16\_t model\_id**  
The model id

**uint16\_t company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_pub\_va\_set\_t**  
Parameters of Config Model Publication Virtual Address Set.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

Value of the Label UUID publish address

**uint16\_t publish\_app\_idx**

Index of the application key

**bool cred\_flag**

Value of the Friendship Credential Flag

**uint8\_t publish\_ttl**

Default TTL value for the publishing messages

**uint8\_t publish\_period**

Period for periodic status publishing

**uint8\_t publish\_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_all\_t**

Parameters of Config Model Subscription Delete All.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_net\_key\_update\_t**

Parameters of Config NetKey Update.

**Public Members****uint16\_t net\_idx**

The network key index

**uint8\_t net\_key[16]**

The network key value

**struct esp\_ble\_mesh\_cfg\_net\_key\_delete\_t**

Parameters of Config NetKey Delete.

**Public Members****uint16\_t net\_idx**

The network key index

**struct esp\_ble\_mesh\_cfg\_app\_key\_update\_t**  
Parameters of Config AppKey Update.

#### Public Members

uint16\_t **net\_idx**  
The network key index

uint16\_t **app\_idx**  
The app key index

uint8\_t **app\_key**[16]  
The app key value

**struct esp\_ble\_mesh\_cfg\_app\_key\_delete\_t**  
Parameters of Config AppKey Delete.

#### Public Members

uint16\_t **net\_idx**  
The network key index

uint16\_t **app\_idx**  
The app key index

**struct esp\_ble\_mesh\_cfg\_node\_identity\_set\_t**  
Parameters of Config Node Identity Set.

#### Public Members

uint16\_t **net\_idx**  
The network key index

uint8\_t **identity**  
New Node Identity state

**struct esp\_ble\_mesh\_cfg\_model\_app\_unbind\_t**  
Parameters of Config Model App Unbind.

#### Public Members

uint16\_t **element\_addr**  
The element address

uint16\_t **model\_app\_idx**  
Index of the app key to bind with the model

uint16\_t **model\_id**  
The model id

uint16\_t **company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_set\_t**  
Parameters of Config Key Refresh Phase Set.

**Public Members**

**uint16\_t net\_idx**  
The network key index

**uint8\_t transition**  
New Key Refresh Phase Transition

**struct esp\_ble\_mesh\_cfg\_net\_transmit\_set\_t**  
Parameters of Config Network Transmit Set.

**Public Members**

**uint8\_t net\_transmit**  
Network Transmit State

**struct esp\_ble\_mesh\_cfg\_heartbeat\_pub\_set\_t**  
Parameters of Config Model Heartbeat Publication Set.

**Public Members**

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t count**  
Number of Heartbeat messages to be sent

**uint8\_t period**  
Period for sending Heartbeat messages

**uint8\_t ttl**  
TTL to be used when sending Heartbeat messages

**uint16\_t feature**  
Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**  
NetKey Index

**struct esp\_ble\_mesh\_cfg\_heartbeat\_sub\_set\_t**  
Parameters of Config Model Heartbeat Subscription Set.

**Public Members**

**uint16\_t src**  
Source address for Heartbeat messages

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t period**  
Period for receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t**  
Parameter of Config Beacon Status

**Public Members**

**uint8\_t beacon**  
Secure Network Beacon state value

**struct esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t**  
Parameters of Config Composition Data Status

#### Public Members

**uint8\_t page**  
Page number of the Composition Data

**struct net\_buf\_simple \*composition\_data**  
Pointer to Composition Data for the identified page

**struct esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t**  
Parameter of Config Default TTL Status

#### Public Members

**uint8\_t default\_ttl**  
Default TTL state value

**struct esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t**  
Parameter of Config GATT Proxy Status

#### Public Members

**uint8\_t gatt\_proxy**  
GATT Proxy state value

**struct esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t**  
Parameters of Config Relay Status

#### Public Members

**uint8\_t relay**  
Relay state value

**uint8\_t retransmit**  
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

**struct esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t**  
Parameters of Config Model Publication Status

#### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t publish\_addr**  
Value of the publish address

**uint16\_t app\_idx**  
Index of the application key

**bool cred\_flag**  
Value of the Friendship Credential Flag

**uint8\_t ttl**  
Default TTL value for the outgoing messages

**uint8\_t period**  
Period for periodic status publishing

**uint8\_t transmit**  
Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_model\_sub\_status\_cb\_t**  
Parameters of Config Model Subscription Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t sub\_addr**  
Value of the address

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_net\_key\_status\_cb\_t**  
Parameters of Config NetKey Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**struct esp\_ble\_mesh\_cfg\_app\_key\_status\_cb\_t**  
Parameters of Config AppKey Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint16\_t app\_idx**  
Index of the application key

**struct esp\_ble\_mesh\_cfg\_mod\_app\_status\_cb\_t**  
Parameters of Config Model App Status

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t app\_idx**  
Index of the application key

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_friend\_status\_cb\_t**  
Parameter of Config Friend Status

**Public Members**

**uint8\_t friend\_state**  
Friend state value

**struct esp\_ble\_mesh\_cfg\_hb\_pub\_status\_cb\_t**  
Parameters of Config Heartbeat Publication Status

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t count**  
Number of Heartbeat messages remaining to be sent

**uint8\_t period**  
Period for sending Heartbeat messages

**uint8\_t ttl**  
TTL to be used when sending Heartbeat messages

**uint16\_t features**  
Features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**  
Index of the NetKey

**struct esp\_ble\_mesh\_cfg\_hb\_sub\_status\_cb\_t**  
Parameters of Config Heartbeat Subscription Status

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t src**  
Source address for Heartbeat messages

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t period**  
Remaining Period for processing Heartbeat messages

**uint8\_t count**  
Number of Heartbeat messages received

**uint8\_t min\_hops**  
Minimum hops when receiving Heartbeat messages

**uint8\_t max\_hops**  
Maximum hops when receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_net\_trans\_status\_cb\_t**  
Parameters of Config Network Transmit Status

### Public Members

**uint8\_t net\_trans\_count** : 3  
Number of transmissions for each Network PDU originating from the node

**uint8\_t net\_trans\_step** : 5  
Maximum hops when receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t**  
Parameters of Config SIG/Vendor Subscription List

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct net\_buf\_simple \*sub\_addr**  
A block of all addresses from the Subscription List

**struct esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t**  
Parameter of Config NetKey List

### Public Members

**struct net\_buf\_simple \*net\_idx**  
A list of NetKey Indexes known to the node

**struct esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t**  
Parameters of Config AppKey List

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
NetKey Index of the NetKey that the AppKeys are bound to

**struct net\_buf\_simple \*app\_idx**  
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

**struct esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t**  
Parameters of Config Node Identity Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint8\_t identity**  
Node Identity state

**struct esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t**  
Parameters of Config SIG/Vendor Model App List

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct net\_buf\_simple \*app\_idx**  
All AppKey indexes bound to the Model

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_status\_cb\_t**  
Parameters of Config Key Refresh Phase Status

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint8\_t phase**  
Key Refresh Phase state

**struct esp\_ble\_mesh\_cfg\_lpn\_pollto\_status\_cb\_t**  
Parameters of Config Low Power Node PollTimeout Status

### Public Members

**uint16\_t lpn\_addr**  
The unicast address of the Low Power node

`int32_t poll_timeout`

The current value of the PollTimeout timer of the Low Power node

`struct esp_ble_mesh_cfg_client_cb_param_t`

Configuration Client Model callback parameters

### Public Members

`int error_code`

Appropriate error code

`esp_ble_mesh_client_common_param_t *params`

The client common parameters

`esp_ble_mesh_cfg_client_common_cb_param_t status_cb`

The config status message callback values

`struct esp_ble_mesh_state_change_cfg_mod_pub_set_t`

Configuration Server model related context.

### Public Members

`uint16_t element_addr`

Element Address

`uint16_t pub_addr`

Publish Address

`uint16_t app_idx`

AppKey Index

`bool cred_flag`

Friendship Credential Flag

`uint8_t pub_ttl`

Publish TTL

`uint8_t pub_period`

Publish Period

`uint8_t pub_retransmit`

Publish Retransmit

`uint16_t company_id`

Company ID

`uint16_t model_id`

Model ID

`struct esp_ble_mesh_state_change_cfg_model_sub_add_t`

Parameters of Config Model Subscription Add

### Public Members

`uint16_t element_addr`

Element Address

`uint16_t sub_addr`

Subscription Address

`uint16_t company_id`

Company ID

`uint16_t model_id`  
Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_delete\_t**  
Parameters of Config Model Subscription Delete

### Public Members

`uint16_t element_addr`  
Element Address

`uint16_t sub_addr`  
Subscription Address

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_netkey\_add\_t**  
Parameters of Config NetKey Add

### Public Members

`uint16_t net_idx`  
NetKey Index

`uint8_t net_key[16]`  
NetKey

**struct esp\_ble\_mesh\_state\_change\_cfg\_netkey\_update\_t**  
Parameters of Config NetKey Update

### Public Members

`uint16_t net_idx`  
NetKey Index

`uint8_t net_key[16]`  
NetKey

**struct esp\_ble\_mesh\_state\_change\_cfg\_netkey\_delete\_t**  
Parameter of Config NetKey Delete

### Public Members

`uint16_t net_idx`  
NetKey Index

**struct esp\_ble\_mesh\_state\_change\_cfg\_appkey\_add\_t**  
Parameters of Config AppKey Add

### Public Members

`uint16_t net_idx`

`uint16_t app_idx`  
AppKey Index

uint8\_t **app\_key**[16]  
AppKey

**struct esp\_ble\_mesh\_state\_change\_cfg\_appkey\_update\_t**  
Parameters of Config AppKey Update

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

uint8\_t **app\_key**[16]  
AppKey

**struct esp\_ble\_mesh\_state\_change\_cfg\_appkey\_delete\_t**  
Parameters of Config AppKey Delete

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_bind\_t**  
Parameters of Config Model App Bind

### Public Members

uint16\_t **element\_addr**  
Element Address

uint16\_t **app\_idx**  
AppKey Index

uint16\_t **company\_id**  
Company ID

uint16\_t **model\_id**  
Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_unbind\_t**  
Parameters of Config Model App Unbind

### Public Members

uint16\_t **element\_addr**  
Element Address

uint16\_t **app\_idx**  
AppKey Index

uint16\_t **company\_id**  
Company ID

uint16\_t **model\_id**  
Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_kr\_phase\_set\_t**  
Parameters of Config Key Refresh Phase Set

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint8\_t **kr\_phase**  
New Key Refresh Phase Transition

**struct esp\_ble\_mesh\_cfg\_server\_cb\_param\_t**  
Configuration Server model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the server model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**  
Context of the received message

*esp\_ble\_mesh\_cfg\_server\_cb\_value\_t* **value**  
Value of the received configuration messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_CFG\_SRV** (srv\_data)  
Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

#### Parameters

- *srv\_data*: Pointer to a unique Config Server Model user\_data.

**ESP\_BLE\_MESH\_MODEL\_CFG\_CLI** (cli\_data)  
Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

#### Parameters

- *cli\_data*: Pointer to a unique struct *esp\_ble\_mesh\_client\_t*.

### Type Definitions

**typedef struct esp\_ble\_mesh\_cfg\_srv esp\_ble\_mesh\_cfg\_srv\_t**  
Configuration Server Model context

**typedef void (\*esp\_ble\_mesh\_cfg\_client\_cb\_t)** (*esp\_ble\_mesh\_cfg\_client\_cb\_event\_t* event,  
*esp\_ble\_mesh\_cfg\_client\_cb\_param\_t*  
\*param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

#### Parameters

- *event*: Event type
- *param*: Pointer to callback parameter

**typedef void (\*esp\_ble\_mesh\_cfg\_server\_cb\_t)** (*esp\_ble\_mesh\_cfg\_server\_cb\_event\_t* event,  
*esp\_ble\_mesh\_cfg\_server\_cb\_param\_t*  
\*param)

Configuration Server Model callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

**enum esp\_ble\_mesh\_cfg\_client\_cb\_event\_t**  
This enum value is the event of Configuration Client Model

Values:

**ESP\_BLE\_MESH\_CFG\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_EVT\_MAX**

**enum esp\_ble\_mesh\_cfg\_server\_cb\_event\_t**  
This enum value is the event of Configuration Server model

Values:

**ESP\_BLE\_MESH\_CFG\_SERVER\_STATE\_CHANGE\_EVT**

**ESP\_BLE\_MESH\_CFG\_SERVER\_EVT\_MAX**

**Health Client/Server Models****Header File**

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_generic\\_model\\_api.h](#)

**Functions**

**esp\_err\_t esp\_ble\_mesh\_register\_generic\_client\_callback** (*esp\_ble\_mesh\_generic\_client\_cb\_t* callback)

Register BLE Mesh Generic Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

**esp\_err\_t esp\_ble\_mesh\_generic\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_get\_state\_t* \*get\_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to generic get message value. Shall not be set to NULL.

**esp\_err\_t esp\_ble\_mesh\_generic\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_set\_state\_t* \*set\_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to generic set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_generic_server_callback` (`esp_ble_mesh_generic_server_cb_t callback`)

Register BLE Mesh Generic Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

## Unions

Generic Delta Set/Generic Delta Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_move\_set\_t* **move**  
Generic Move Set/Generic Move Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_def\_trans\_time\_set\_t* **def\_trans\_time**  
Generic Default Transition Time Set/Generic Default Transition Time Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_onpowerup\_set\_t* **onpowerup**  
Generic OnPowerUp Set/Generic OnPowerUp Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_power\_level\_set\_t* **power\_level**  
Generic Power Level Set/Generic Power Level Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_power\_default\_set\_t* **power\_default**  
Generic Power Default Set/Generic Power Default Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_power\_range\_set\_t* **power\_range**  
Generic Power Range Set/Generic Power Range Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_loc\_global\_set\_t* **location\_global**  
Generic Location Global Set/Generic Location Global Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_loc\_local\_set\_t* **location\_local**  
Generic Location Local Set/Generic Location Local Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_set\_t* **user\_property**  
Generic User Property Set/Generic User Property Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_set\_t* **admin\_property**  
Generic Admin Property Set/Generic Admin Property Set Unack

*esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_set\_t* **manu\_property**  
Generic Manufacturer Property Set/Generic Manufacturer Property Set Unack

**union esp\_ble\_mesh\_generic\_server\_cb\_value\_t**  
#include <esp\_ble\_mesh\_generic\_model\_api.h> Generic Server Model callback value union.

### Public Members

*esp\_ble\_mesh\_generic\_server\_state\_change\_t* **state\_change**  
ESP\_BLE\_MESH\_GENERIC\_SERVER\_STATE\_CHANGE\_EVT

*esp\_ble\_mesh\_generic\_server\_rcv\_get\_msg\_t* **get**  
ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_GET\_MSG\_EVT

*esp\_ble\_mesh\_generic\_server\_rcv\_set\_msg\_t* **set**  
ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_SET\_MSG\_EVT

### Structures

**struct esp\_ble\_mesh\_gen\_onoff\_set\_t**  
Bluetooth Mesh Generic Client Model Get and Set parameters structure.  
Parameters of Generic OnOff Set.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint8\_t **onoff**  
Target value of Generic OnOff state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_level\_set\_t**  
Parameters of Generic Level Set.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **level**  
Target value of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_delta\_set\_t**  
Parameters of Generic Delta Set.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

**int32\_t level**  
Delta change of Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_move\_set\_t**  
Parameters of Generic Move Set.

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**int16\_t delta\_level**  
Delta Level step to calculate Move speed for Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_set\_t**  
Parameter of Generic Default Transition Time Set.

### Public Members

**uint8\_t trans\_time**  
The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_set\_t**  
Parameter of Generic OnPowerUp Set.

### Public Members

**uint8\_t onpowerup**  
The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_set\_t**  
Parameters of Generic Power Level Set.

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t power**  
Target value of Generic Power Actual state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_power\_default\_set\_t**  
Parameter of Generic Power Default Set.

### Public Members

**uint16\_t power**  
The value of the Generic Power Default state

**struct esp\_ble\_mesh\_gen\_power\_range\_set\_t**  
Parameters of Generic Power Range Set.

### Public Members

**uint16\_t range\_min**  
Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**  
Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_gen\_loc\_global\_set\_t**  
Parameters of Generic Location Global Set.

### Public Members

**int32\_t global\_latitude**  
Global Coordinates (Latitude)

**int32\_t global\_longitude**  
Global Coordinates (Longitude)

**int16\_t global\_altitude**  
Global Altitude

**struct esp\_ble\_mesh\_gen\_loc\_local\_set\_t**  
Parameters of Generic Location Local Set.

### Public Members

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

**int16\_t local\_altitude**  
Local Altitude

**uint8\_t floor\_number**  
Floor Number

**uint16\_t uncertainty**  
Uncertainty

**struct esp\_ble\_mesh\_gen\_user\_property\_get\_t**  
Parameter of Generic User Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic User Property

`struct esp_ble_mesh_gen_user_property_set_t`  
Parameters of Generic User Property Set.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic User Property

`struct net_buf_simple *property_value`  
Raw value for the User Property

`struct esp_ble_mesh_gen_admin_property_get_t`  
Parameter of Generic Admin Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

`struct esp_ble_mesh_gen_admin_property_set_t`  
Parameters of Generic Admin Property Set.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

`uint8_t user_access`  
Enumeration indicating user access

`struct net_buf_simple *property_value`  
Raw value for the Admin Property

`struct esp_ble_mesh_gen_manufacturer_property_get_t`  
Parameter of Generic Manufacturer Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`struct esp_ble_mesh_gen_manufacturer_property_set_t`  
Parameters of Generic Manufacturer Property Set.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`  
Enumeration indicating user access

`struct esp_ble_mesh_gen_client_properties_get_t`  
Parameter of Generic Client Properties Get.

**Public Members****uint16\_t property\_id**

A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_gen\_onoff\_status\_cb\_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint8\_t present\_onoff**

Current value of Generic OnOff state

**uint8\_t target\_onoff**

Target value of Generic OnOff state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_level\_status\_cb\_t**

Parameters of Generic Level Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**int16\_t present\_level**

Current value of Generic Level state

**int16\_t target\_level**

Target value of the Generic Level state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_status\_cb\_t**

Parameter of Generic Default Transition Time Status.

**Public Members****uint8\_t trans\_time**

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_ontopowerup\_status\_cb\_t**

Parameter of Generic OnPowerUp Status.

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_status\_cb\_t**

Parameters of Generic Power Level Status.

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_power**  
Current value of Generic Power Actual state

**uint16\_t target\_power**  
Target value of Generic Power Actual state (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_power\_last\_status\_cb\_t**  
Parameter of Generic Power Last Status.

**Public Members**

**uint16\_t power**  
The value of the Generic Power Last state

**struct esp\_ble\_mesh\_gen\_power\_default\_status\_cb\_t**  
Parameter of Generic Power Default Status.

**Public Members**

**uint16\_t power**  
The value of the Generic Default Last state

**struct esp\_ble\_mesh\_gen\_power\_range\_status\_cb\_t**  
Parameters of Generic Power Range Status.

**Public Members**

**uint8\_t status\_code**  
Status Code for the request message

**uint16\_t range\_min**  
Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**  
Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_gen\_battery\_status\_cb\_t**  
Parameters of Generic Battery Status.

**Public Members**

**u32\_t battery\_level : 8**  
Value of Generic Battery Level state

**u32\_t time\_to\_discharge : 24**  
Value of Generic Battery Time to Discharge state

**u32\_t time\_to\_charge : 24**  
Value of Generic Battery Time to Charge state

**u32\_t flags : 8**  
Value of Generic Battery Flags state

**struct esp\_ble\_mesh\_gen\_loc\_global\_status\_cb\_t**  
Parameters of Generic Location Global Status.

#### Public Members

**int32\_t global\_latitude**  
Global Coordinates (Latitude)

**int32\_t global\_longitude**  
Global Coordinates (Longitude)

**int16\_t global\_altitude**  
Global Altitude

**struct esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t**  
Parameters of Generic Location Local Status.

#### Public Members

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

**int16\_t local\_altitude**  
Local Altitude

**uint8\_t floor\_number**  
Floor Number

**uint16\_t uncertainty**  
Uncertainty

**struct esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t**  
Parameter of Generic User Properties Status.

#### Public Members

**struct net\_buf\_simple \*property\_ids**  
Buffer contains a sequence of N User Property IDs

**struct esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t**  
Parameters of Generic User Property Status.

#### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t property\_id**  
Property ID identifying a Generic User Property

**uint8\_t user\_access**  
Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**  
Raw value for the User Property (C.1)

**struct esp\_ble\_mesh\_gen\_admin\_properties\_status\_cb\_t**  
Parameter of Generic Admin Properties Status.

**Public Members**

**struct** net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N Admin Property IDs

**struct esp\_ble\_mesh\_gen\_admin\_property\_status\_cb\_t**  
Parameters of Generic Admin Property Status.

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic Admin Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

**struct** net\_buf\_simple \***property\_value**  
Raw value for the Admin Property (C.1)

**struct esp\_ble\_mesh\_gen\_manufacturer\_properties\_status\_cb\_t**  
Parameter of Generic Manufacturer Properties Status.

**Public Members**

**struct** net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N Manufacturer Property IDs

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_status\_cb\_t**  
Parameters of Generic Manufacturer Property Status.

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic Manufacturer Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

**struct** net\_buf\_simple \***property\_value**  
Raw value for the Manufacturer Property (C.1)

**struct esp\_ble\_mesh\_gen\_client\_properties\_status\_cb\_t**  
Parameter of Generic Client Properties Status.

**Public Members**

**struct** net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N Client Property IDs

**struct esp\_ble\_mesh\_generic\_client\_cb\_param\_t**  
Generic Client Model callback parameters

**Public Members****int error\_code**

Appropriate error code

***esp\_ble\_mesh\_client\_common\_param\_t* \*params**

The client common parameters.

***esp\_ble\_mesh\_gen\_client\_status\_cb\_t* status\_cb**

The generic status message callback values

**struct esp\_ble\_mesh\_gen\_onoff\_state\_t**

Parameters of Generic OnOff state

**Public Members****uint8\_t onoff**

The present value of the Generic OnOff state

**uint8\_t target\_onoff**

The target value of the Generic OnOff state

**struct esp\_ble\_mesh\_gen\_onoff\_srv\_t**

User data of Generic OnOff Server Model

**Public Members*****esp\_ble\_mesh\_model\_t* \*model**

Pointer to the Generic OnOff Server Model. Initialized internally.

***esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl**

Response control of the server model received messages

***esp\_ble\_mesh\_gen\_onoff\_state\_t* state**

Parameters of the Generic OnOff state

***esp\_ble\_mesh\_last\_msg\_info\_t* last**

Parameters of the last received set message

***esp\_ble\_mesh\_state\_transition\_t* transition**

Parameters of state transition

**struct esp\_ble\_mesh\_gen\_level\_state\_t**

Parameters of Generic Level state

**Public Members****int16\_t level**

The present value of the Generic Level state

**int16\_t target\_level**

The target value of the Generic Level state

**int16\_t last\_level**

When a new transaction starts, level should be set to last\_level, and use “level + incoming delta” to calculate the target level. In another word, “last\_level” is used to record “level” of the last transaction, and “last\_delta” is used to record the previously received delta\_level value. The last value of the Generic Level state

**int32\_t last\_delta**

The last delta change of the Generic Level state

bool **move\_start**  
Indicate if the transition of the Generic Level state has been started

bool **positive**  
Indicate if the transition is positive or negative

**struct esp\_ble\_mesh\_gen\_level\_srv\_t**  
User data of Generic Level Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_gen\_level\_state\_t* **state**  
Parameters of the Generic Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**  
Parameters of state transition

int32\_t **tt\_delta\_level**  
Delta change value of level state transition

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t**  
Parameter of Generic Default Transition Time state

### Public Members

uint8\_t **trans\_time**  
The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t**  
User data of Generic Default Transition Time Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Default Transition Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t* **state**  
Parameters of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_state\_t**  
Parameter of Generic OnPowerUp state

### Public Members

uint8\_t **onpowerup**  
The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t**  
User data of Generic Power OnOff Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t**

User data of Generic Power OnOff Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_state\_t**

Parameters of Generic Power Level state

**Public Members**

uint16\_t **power\_actual**

The present value of the Generic Power Actual state

uint16\_t **target\_power\_actual**

The target value of the Generic Power Actual state

uint16\_t **power\_last**

The value of the Generic Power Last state

uint16\_t **power\_default**

The value of the Generic Power Default state

uint8\_t **status\_code**

The status code of setting Generic Power Range state

uint16\_t **power\_range\_min**

The minimum value of the Generic Power Range state

uint16\_t **power\_range\_max**

The maximum value of the Generic Power Range state

**struct esp\_ble\_mesh\_gen\_power\_level\_srv\_t**

User data of Generic Power Level Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_power\_level\_state\_t* \*state  
Parameters of the Generic Power Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* last  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* transition  
Parameters of state transition

int32\_t tt\_delta\_level  
Delta change value of level state transition

**struct esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t**  
User data of Generic Power Level Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl  
Response control of the server model received messages

*esp\_ble\_mesh\_gen\_power\_level\_state\_t* \*state  
Parameters of the Generic Power Level state

**struct esp\_ble\_mesh\_gen\_battery\_state\_t**  
Parameters of Generic Battery state

### Public Members

uint32\_t battery\_level : 8  
The value of the Generic Battery Level state

uint32\_t time\_to\_discharge : 24  
The value of the Generic Battery Time to Discharge state

uint32\_t time\_to\_charge : 24  
The value of the Generic Battery Time to Charge state

uint32\_t battery\_flags : 8  
The value of the Generic Battery Flags state

**struct esp\_ble\_mesh\_gen\_battery\_srv\_t**  
User data of Generic Battery Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Generic Battery Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl  
Response control of the server model received messages

*esp\_ble\_mesh\_gen\_battery\_state\_t* state  
Parameters of the Generic Battery state

**struct esp\_ble\_mesh\_gen\_location\_state\_t**  
Parameters of Generic Location state

**Public Members**

`int32_t global_latitude`  
The value of the Global Latitude field

`int32_t global_longitude`  
The value of the Global Longitude field

`int16_t global_altitude`  
The value of the Global Altitude field

`int16_t local_north`  
The value of the Local North field

`int16_t local_east`  
The value of the Local East field

`int16_t local_altitude`  
The value of the Local Altitude field

`uint8_t floor_number`  
The value of the Floor Number field

`uint16_t uncertainty`  
The value of the Uncertainty field

**struct esp\_ble\_mesh\_gen\_location\_srv\_t**  
User data of Generic Location Server Model

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`  
Parameters of the Generic Location state

**struct esp\_ble\_mesh\_gen\_location\_setup\_srv\_t**  
User data of Generic Location Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Location Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`  
Parameters of the Generic Location state

**struct esp\_ble\_mesh\_generic\_property\_t**  
Parameters of Generic Property states

**Public Members**

`uint16_t id`  
The value of User/Admin/Manufacturer Property ID

`uint8_t user_access`  
The value of User Access field

`uint8_t admin_access`  
The value of Admin Access field

`uint8_t manu_access`  
The value of Manufacturer Access field

`struct net_buf_simple *val`  
The value of User/Admin/Manufacturer Property

`struct esp_ble_mesh_gen_user_prop_srv_t`  
User data of Generic User Property Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`uint8_t property_count`  
Generic User Property count

`esp_ble_mesh_generic_property_t *properties`  
Parameters of the Generic User Property state

`struct esp_ble_mesh_gen_admin_prop_srv_t`  
User data of Generic Admin Property Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`uint8_t property_count`  
Generic Admin Property count

`esp_ble_mesh_generic_property_t *properties`  
Parameters of the Generic Admin Property state

`struct esp_ble_mesh_gen_manu_prop_srv_t`  
User data of Generic Manufacturer Property Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`uint8_t property_count`  
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`  
Parameters of the Generic Manufacturer Property state

**struct esp\_ble\_mesh\_gen\_client\_prop\_srv\_t**  
User data of Generic Client Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **id\_count**

Generic Client Property ID count

uint16\_t \***property\_ids**

Parameters of the Generic Client Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_onoff\_set\_t**  
Parameter of Generic OnOff Set state change event

### Public Members

uint8\_t **onoff**

The value of Generic OnOff state

**struct esp\_ble\_mesh\_state\_change\_gen\_level\_set\_t**  
Parameter of Generic Level Set state change event

### Public Members

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_delta\_set\_t**  
Parameter of Generic Delta Set state change event

### Public Members

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_move\_set\_t**  
Parameter of Generic Move Set state change event

### Public Members

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_def\_trans\_time\_set\_t**  
Parameter of Generic Default Transition Time Set state change event

### Public Members

uint8\_t **trans\_time**

The value of Generic Default Transition Time state

**struct esp\_ble\_mesh\_state\_change\_gen\_onpowerup\_set\_t**  
Parameter of Generic OnPowerUp Set state change event

#### Public Members

**uint8\_t onpowerup**  
The value of Generic OnPowerUp state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_level\_set\_t**  
Parameter of Generic Power Level Set state change event

#### Public Members

**uint16\_t power**  
The value of Generic Power Actual state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_default\_set\_t**  
Parameter of Generic Power Default Set state change event

#### Public Members

**uint16\_t power**  
The value of Generic Power Default state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_range\_set\_t**  
Parameters of Generic Power Range Set state change event

#### Public Members

**uint16\_t range\_min**  
The minimum value of Generic Power Range state

**uint16\_t range\_max**  
The maximum value of Generic Power Range state

**struct esp\_ble\_mesh\_state\_change\_gen\_loc\_global\_set\_t**  
Parameters of Generic Location Global Set state change event

#### Public Members

**int32\_t latitude**  
The Global Latitude value of Generic Location state

**int32\_t longitude**  
The Global Longitude value of Generic Location state

**int16\_t altitude**  
The Global Altitude value of Generic Location state

**struct esp\_ble\_mesh\_state\_change\_gen\_loc\_local\_set\_t**  
Parameters of Generic Location Local Set state change event

#### Public Members

**int16\_t north**  
The Local North value of Generic Location state

**int16\_t east**

The Local East value of Generic Location state

**int16\_t altitude**

The Local Altitude value of Generic Location state

**uint8\_t floor\_number**

The Floor Number value of Generic Location state

**uint16\_t uncertainty**

The Uncertainty value of Generic Location state

**struct esp\_ble\_mesh\_state\_change\_gen\_user\_property\_set\_t**

Parameters of Generic User Property Set state change event

### Public Members

**uint16\_t id**

The property id of Generic User Property state

**struct net\_buf\_simple \*value**

The property value of Generic User Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_admin\_property\_set\_t**

Parameters of Generic Admin Property Set state change event

### Public Members

**uint16\_t id**

The property id of Generic Admin Property state

**uint8\_t access**

The property access of Generic Admin Property state

**struct net\_buf\_simple \*value**

The property value of Generic Admin Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_manu\_property\_set\_t**

Parameters of Generic Manufacturer Property Set state change event

### Public Members

**uint16\_t id**

The property id of Generic Manufacturer Property state

**uint8\_t access**

The property value of Generic Manufacturer Property state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_get\_t**

Context of the received Generic User Property Get message

### Public Members

**uint16\_t property\_id**

Property ID identifying a Generic User Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_get\_t**

Context of the received Generic Admin Property Get message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_get\_t**  
Context of the received Generic Manufacturer Property message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_client\_properties\_get\_t**  
Context of the received Generic Client Properties Get message

**Public Members**

`uint16_t property_id`  
A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_server\_rcv\_gen\_onoff\_set\_t**  
Context of the received Generic OnOff Set message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint8_t onoff`  
Target value of Generic OnOff state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_level\_set\_t**  
Context of the received Generic Level Set message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`int16_t level`  
Target value of Generic Level state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_delta\_set\_t**  
Context of the received Generic Delta Set message

#### Public Members

bool **op\_en**  
Indicate if optional parameters are included

int32\_t **delta\_level**  
Delta change of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_move\_set\_t**  
Context of the received Generic Move Set message

#### Public Members

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **delta\_level**  
Delta Level step to calculate Move speed for Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_def\_trans\_time\_set\_t**  
Context of the received Generic Default Transition Time Set message

#### Public Members

uint8\_t **trans\_time**  
The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_onpowerup\_set\_t**  
Context of the received Generic OnPowerUp Set message

#### Public Members

uint8\_t **onpowerup**  
The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_level\_set\_t**  
Context of the received Generic Power Level Set message

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t power**  
Target value of Generic Power Actual state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_default\_set\_t**  
Context of the received Generic Power Default Set message

**Public Members**

**uint16\_t power**  
The value of the Generic Power Default state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_range\_set\_t**  
Context of the received Generic Power Range Set message

**Public Members**

**uint16\_t range\_min**  
Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**  
Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_loc\_global\_set\_t**  
Context of the received Generic Location Global Set message

**Public Members**

**int32\_t global\_latitude**  
Global Coordinates (Latitude)

**int32\_t global\_longitude**  
Global Coordinates (Longitude)

**int16\_t global\_altitude**  
Global Altitude

**struct esp\_ble\_mesh\_server\_rcv\_gen\_loc\_local\_set\_t**  
Context of the received Generic Location Local Set message

**Public Members**

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

`int16_t local_altitude`  
Local Altitude

`uint8_t floor_number`  
Floor Number

`uint16_t uncertainty`  
Uncertainty

**struct esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_set\_t**  
Context of the received Generic User Property Set message

### Public Members

`uint16_t property_id`  
Property ID identifying a Generic User Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the User Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_set\_t**  
Context of the received Generic Admin Property Set message

### Public Members

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

`uint8_t user_access`  
Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**  
Raw value for the Admin Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_set\_t**  
Context of the received Generic Manufacturer Property Set message

### Public Members

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`  
Enumeration indicating user access

**struct esp\_ble\_mesh\_generic\_server\_cb\_param\_t**  
Generic Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Generic Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_generic_server_cb_value_t value`  
Value of the received Generic Messages

**Macros****ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_CLI** (cli\_pub, cli\_data)

Define a new Generic OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.**Return** New Generic OnOff Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.**Return** New Generic Level Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.**Return** New Generic Default Transition Time Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.**Return** New Generic Power OnOff Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.**Return** New Generic Power Level Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.**Return** New Generic Battery Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_CLI** (cli\_pub, cli\_data)

Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `cli_data`: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_PROPERTY\_CLI** (`cli_pub`, `cli_data`)

Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `cli_data`: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_SRV** (`srv_pub`, `srv_data`)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_onoff\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_level\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Default Transition Time Server Model.

**Note** 1. The Generic Default Transition Time Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Default Transition Time Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Server Model.

**Note** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.

**Return** New Generic Power OnOff Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power OnOff Setup Server Model.

**Note** 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.

**Return** New Generic Power OnOff Setup Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power Level Server Model.

**Note** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Generic Power Level Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power Level Setup Server Model.

**Note** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Generic Power Level Setup Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_SRV** (srv\_pub, srv\_data)

Define a new Generic Battery Server Model.

**Note** 1. The Generic Battery Server Model is a root model.

1. This model shall support model publication and model subscription.

2. The model may be used to represent an element that is powered by a battery.

**Return** New Generic Battery Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_gen\_battery\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SRV** (srv\_pub, srv\_data)

Define a new Generic Location Server Model.

**Note** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**

- *srv\_pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- *srv\_data*: Pointer to the unique struct *esp\_ble\_mesh\_gen\_location\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Location Setup Server Model.

**Note** 1. The Generic Location Setup Server model extends the Generic Location Server model.

1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_USER\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic User Property Server Model.

**Note** 1. The Generic User Property Server model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ADMIN\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Admin Property Server Model.

**Note** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_MANUFACTURER\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Manufacturer Property Server Model.

**Note** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

**Return** New Generic Manufacturer Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_CLIENT\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic User Property Server Model.

**Note** 1. The Generic Client Property Server model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Client Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

## Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t) (esp_ble_mesh_generic_client_cb_event_t
                                                event,
                                                esp_ble_mesh_generic_client_cb_param_t
                                                *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t) (esp_ble_mesh_generic_server_cb_event_t
                                                event,
                                                esp_ble_mesh_generic_server_cb_param_t
                                                *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

**Parameters**

- event: Event type
- param: Pointer to callback parameter

### Enumerations

**enum esp\_ble\_mesh\_generic\_client\_cb\_event\_t**

This enum value is the event of Generic Client Model

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_GENERIC\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_GENERIC\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_GENERIC\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_GENERIC\_CLIENT\_EVT\_MAX**

**enum esp\_ble\_mesh\_gen\_user\_prop\_access\_t**

This enum value is the access value of Generic User Property

*Values:*

**ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_PROHIBIT**

**ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_READ**

**ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_WRITE**

**ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_READ\_WRITE**

**enum esp\_ble\_mesh\_gen\_admin\_prop\_access\_t**

This enum value is the access value of Generic Admin Property

*Values:*

**ESP\_BLE\_MESH\_GEN\_ADMIN\_NOT\_USER\_PROP**

**ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_READ**

**ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_WRITE**

**ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_READ\_WRITE**

**enum esp\_ble\_mesh\_gen\_manu\_prop\_access\_t**

This enum value is the access value of Generic Manufacturer Property

*Values:*

**ESP\_BLE\_MESH\_GEN\_MANU\_NOT\_USER\_PROP**

**ESP\_BLE\_MESH\_GEN\_MANU\_ACCESS\_READ**

**enum esp\_ble\_mesh\_generic\_server\_cb\_event\_t**

This enum value is the event of Generic Server Model

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_STATE\_CHANGE\_EVT**

1. When get\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, no event will be callback to the application layer when Generic Get messages are received.
2. When set\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_GET\_MSG\_EVT**

When get\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Generic Get messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_EVT\_MAX****Generic Client/Server Models****Header File**

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_health\\_model\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_client\_callback** (*esp\_ble\_mesh\_health\_client\_cb\_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_server\_callback** (*esp\_ble\_mesh\_health\_server\_cb\_t* callback)

Register BLE Mesh Health Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_get\_state\_t* \*get\_state)

This function is called to get the Health Server states using the Health Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_set\_state\_t* \*set\_state)

This function is called to set the Health Server states using the Health Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_health\_server\_fault\_update** (*esp\_ble\_mesh\_elem\_t* \*element)

This function is called by the Health Server Model to update the context of its Health Current status.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `element`: The element to which the Health Server Model belongs.

**Unions**

**union esp\_ble\_mesh\_health\_client\_get\_state\_t**  
*#include <esp\_ble\_mesh\_health\_model\_api.h>* For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET  
 ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_GET  
 the get\_state parameter in the esp\_ble\_mesh\_health\_client\_get\_state function should not be set to NULL.

**Public Members**

*esp\_ble\_mesh\_health\_fault\_get\_t* **fault\_get**  
 For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET.

**union esp\_ble\_mesh\_health\_client\_set\_state\_t**  
*#include <esp\_ble\_mesh\_health\_model\_api.h>* For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET  
 ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK the set\_state parameter in the  
 esp\_ble\_mesh\_health\_client\_set\_state function should not be set to NULL.

**Public Members**

*esp\_ble\_mesh\_health\_attention\_set\_t* **attention\_set**  
 For ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK.

*esp\_ble\_mesh\_health\_period\_set\_t* **period\_set**  
 For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET or  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK.

*esp\_ble\_mesh\_health\_fault\_test\_t* **fault\_test**  
 For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST or  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK.

*esp\_ble\_mesh\_health\_fault\_clear\_t* **fault\_clear**  
 For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR or  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK.

**union esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t**  
*#include <esp\_ble\_mesh\_health\_model\_api.h>* Health Client Model received message union.

**Public Members**

*esp\_ble\_mesh\_health\_current\_status\_cb\_t* **current\_status**  
 The health current status value

    ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

```

**Structures**

```

struct esp_ble_mesh_health_srv_cb_t
    ESP BLE Mesh Health Server callback

```

**Public Members**

```

esp_ble_mesh_cb_t fault_clear
    Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t fault_test
    Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t attention_on
    Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t attention_off
    Health attention off callback. Initialized by the stack.

```

```

struct esp_ble_mesh_health_test_t
    ESP BLE Mesh Health Server test Context

```

**Public Members**

```

uint8_t id_count
    Number of Health self-test ID

const uint8_t *test_ids
    Array of Health self-test IDs

uint16_t company_id
    Company ID used to identify the Health Fault state

uint8_t prev_test_id
    Current test ID of the health fault test

uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
    Array of current faults

uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
    Array of registered faults

```

```

struct esp_ble_mesh_health_srv_t
    ESP BLE Mesh Health Server Model Context

```

**Public Members**

```

esp_ble_mesh_model_t *model
    Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
    Health callback struct

```

**struct** `k_delayed_work_attention_timer`  
Attention Timer state

**bool** `attention_timer_start`  
Attention Timer start flag

*esp\_ble\_mesh\_health\_test\_t* `health_test`  
Health Server fault test

**struct** `esp_ble_mesh_health_fault_get_t`  
Parameter of Health Fault Get

### Public Members

Health Client Model callback parameters

**Public Members**

`int error_code`  
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters.

`esp_ble_mesh_health_client_common_cb_param_t status_cb`  
The health message status callback values

`struct esp_ble_mesh_health_fault_update_comp_cb_t`  
Parameter of publishing Health Current Status completion event

**Public Members**

`int error_code`  
The result of publishing Health Current Status

`esp_ble_mesh_elem_t *element`  
Pointer to the element which contains the Health Server Model

**struct esp\_ble\_mesh\_health\_fault\_clear\_cb\_t**  
Parameters of Health Fault Clear event

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Health Server Model

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_fault\_test\_cb\_t**  
Parameters of Health Fault Test event

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Health Server Model

`uint8_t test_id`  
ID of a specific test to be performed

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_attention\_on\_cb\_t**  
Parameter of Health Attention On event

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Health Server Model

`uint8_t time`  
Duration of attention timer on (in seconds)

**struct esp\_ble\_mesh\_health\_attention\_off\_cb\_t**  
Parameter of Health Attention Off event

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Health Server Model

**Macros**

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_SRV** (srv, pub)  
Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**

- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_CLI** (`cli_data`)

Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**

- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP\_BLE\_MESH\_HEALTH\_PUB\_DEFINE** (`_name`, `_max`, `_role`)

A helper to define a health publication context

**Parameters**

- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

**ESP\_BLE\_MESH\_HEALTH\_STANDARD\_TEST**

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP\_BLE\_MESH\_NO\_FAULT**

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

**ESP\_BLE\_MESH\_BATTERY\_LOW\_WARNING**

**ESP\_BLE\_MESH\_BATTERY\_LOW\_ERROR**

### Type Definitions

**typedef** void (\***esp\_ble\_mesh\_health\_client\_cb\_t**) (*esp\_ble\_mesh\_health\_client\_cb\_event\_t* event, *esp\_ble\_mesh\_health\_client\_cb\_param\_t* \*param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

**typedef** void (\***esp\_ble\_mesh\_health\_server\_cb\_t**) (*esp\_ble\_mesh\_health\_server\_cb\_event\_t* event, *esp\_ble\_mesh\_health\_server\_cb\_param\_t* \*param)

Health Server Model callback function type.

#### Parameters

- event: Event type

- param: Pointer to callback parameter

### Enumerations

**enum esp\_ble\_mesh\_health\_client\_cb\_event\_t**

This enum value is the event of Health Client Model

Values:

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_EVT\_MAX**

**enum esp\_ble\_mesh\_health\_server\_cb\_event\_t**

This enum value is the event of Health Server Model

Values:

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_EVT\_MAX**

### Sensor Client/Server Models

#### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_lighting\\_model\\_api.h](#)

#### Functions

**esp\_err\_t esp\_ble\_mesh\_register\_light\_client\_callback** (*esp\_ble\_mesh\_light\_client\_cb\_t* callback)

Register BLE Mesh Light Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] callback: pointer to the callback function.

**esp\_err\_t esp\_ble\_mesh\_light\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_get\_state\_t* \*get\_state)

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_light\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get\_state: Pointer of light get message value. Shall not be set to NULL.

**esp\_err\_t esp\_ble\_mesh\_light\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_set\_state\_t* \*set\_state)

Set the value of Light Server Model states using the Light Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer of light set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_lighting_server_callback` (`esp_ble_mesh_lighting_server_cb_t` callback)

Register BLE Mesh Lighting Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

## Unions

**union** `esp_ble_mesh_light_client_get_state_t`

Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_default\_set\_t**  
Parameter of Light Lightness Default Set

**Public Members****uint16\_t lightness**

The value of the Light Lightness Default state

**struct esp\_ble\_mesh\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range Set

**Public Members****uint16\_t range\_min**

Value of range min field of light lightness range state

**uint16\_t range\_max**

Value of range max field of light lightness range state

**struct esp\_ble\_mesh\_light\_ctl\_set\_t**

Parameters of Light CTL Set

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t ctl\_lightness**

Target value of light ctl lightness state

**uint16\_t ctl\_temperatrue**

Target value of light ctl temperature state

**int16\_t ctl\_delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_set\_t**

Parameters of Light CTL Temperature Set

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t ctl\_temperatrue**

Target value of light ctl temperature state

**int16\_t ctl\_delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_range\_set\_t**

Parameters of Light CTL Temperature Range Set

### Public Members

**uint16\_t range\_min**

Value of temperature range min field of light ctl temperature range state

**uint16\_t range\_max**

Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_light\_ctl\_default\_set\_t**

Parameters of Light CTL Default Set

### Public Members

**uint16\_t lightness**

Value of light lightness default state

**uint16\_t temperature**

Value of light temperature default state

**int16\_t delta\_uv**

Value of light delta UV default state

**struct esp\_ble\_mesh\_light\_hsl\_set\_t**

Parameters of Light HSL Set

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t hsl\_lightness**

Target value of light hsl lightness state

**uint16\_t hsl\_hue**

Target value of light hsl hue state

**uint16\_t hsl\_saturation**

Target value of light hsl saturation state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_hue\_set\_t**

Parameters of Light HSL Hue Set

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t hue**  
Target value of light hsl hue state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_saturation\_set\_t**  
Parameters of Light HSL Saturation Set

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t saturation**  
Target value of light hsl hue state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_default\_set\_t**  
Parameters of Light HSL Default Set

### Public Members

**uint16\_t lightness**  
Value of light lightness default state

**uint16\_t hue**  
Value of light hue default state

**uint16\_t saturation**  
Value of light saturation default state

**struct esp\_ble\_mesh\_light\_hsl\_range\_set\_t**  
Parameters of Light HSL Range Set

### Public Members

**uint16\_t hue\_range\_min**  
Value of hue range min field of light hsl hue range state

**uint16\_t hue\_range\_max**  
Value of hue range max field of light hsl hue range state

**uint16\_t saturation\_range\_min**  
Value of saturation range min field of light hsl saturation range state

**uint16\_t saturation\_range\_max**  
Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_light\_xyl\_set\_t**

Parameters of Light xyL Set

**Public Members****bool op\_en**

Indicate whether optional parameters included

**uint16\_t xyl\_lightness**

The target value of the Light xyL Lightness state

**uint16\_t xyl\_x**

The target value of the Light xyL x state

**uint16\_t xyl\_y**

The target value of the Light xyL y state

**uint8\_t tid**

Transaction Identifier

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_xyl\_default\_set\_t**

Parameters of Light xyL Default Set

**Public Members****uint16\_t lightness**

The value of the Light Lightness Default state

**uint16\_t xyl\_x**

The value of the Light xyL x Default state

**uint16\_t xyl\_y**

The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_light\_xyl\_range\_set\_t**

Parameters of Light xyL Range Set

**Public Members****uint16\_t xyl\_x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

**uint16\_t xyl\_x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

**uint16\_t xyl\_y\_range\_min**

The value of the xyL y Range Min field of the Light xyL y Range state

**uint16\_t xyl\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode Set

**Public Members****uint8\_t mode**

The target value of the Light LC Mode state

**struct esp\_ble\_mesh\_light\_lc\_om\_set\_t**

Parameter of Light LC OM Set

**Public Members****uint8\_t mode**

The target value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t**

Parameters of Light LC Light OnOff Set

**Public Members****bool op\_en**

Indicate whether optional parameters included

**uint8\_t light\_onoff**

The target value of the Light LC Light OnOff state

**uint8\_t tid**

Transaction Identifier

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_lc\_property\_get\_t**

Parameter of Light LC Property Get

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

**struct esp\_ble\_mesh\_light\_lc\_property\_set\_t**

Parameters of Light LC Property Set

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**

Raw value for the Light LC Property

**struct esp\_ble\_mesh\_light\_lightness\_status\_cb\_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_lightness**  
Current value of light lightness actual state

**uint16\_t target\_lightness**  
Target value of light lightness actual state (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_linear\_status\_cb\_t**  
Parameters of Light Lightness Linear Status

**Public Members**

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_lightness**  
Current value of light lightness linear state

**uint16\_t target\_lightness**  
Target value of light lightness linear state (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_last\_status\_cb\_t**  
Parameter of Light Lightness Last Status

**Public Members**

**uint16\_t lightness**  
The value of the Light Lightness Last state

**struct esp\_ble\_mesh\_light\_lightness\_default\_status\_cb\_t**  
Parameter of Light Lightness Default Status

**Public Members**

**uint16\_t lightness**  
The value of the Light Lightness default State

**struct esp\_ble\_mesh\_light\_lightness\_range\_status\_cb\_t**  
Parameters of Light Lightness Range Status

**Public Members**

**uint8\_t status\_code**  
Status Code for the request message

**uint16\_t range\_min**  
Value of range min field of light lightness range state

**uint16\_t range\_max**  
Value of range max field of light lightness range state

**struct esp\_ble\_mesh\_light\_ctl\_status\_cb\_t**  
Parameters of Light CTL Status

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_ctl\_lightness**  
Current value of light ctl lightness state

**uint16\_t present\_ctl\_temperature**  
Current value of light ctl temperature state

**uint16\_t target\_ctl\_lightness**  
Target value of light ctl lightness state (optional)

**uint16\_t target\_ctl\_temperature**  
Target value of light ctl temperature state (C.1)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_status\_cb\_t**  
Parameters of Light CTL Temperature Status

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t present\_ctl\_temperature**  
Current value of light ctl temperature state

**uint16\_t present\_ctl\_delta\_uv**  
Current value of light ctl delta UV state

**uint16\_t target\_ctl\_temperature**  
Target value of light ctl temperature state (optional)

**uint16\_t target\_ctl\_delta\_uv**  
Target value of light ctl delta UV state (C.1)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_range\_status\_cb\_t**  
Parameters of Light CTL Temperature Range Status

### Public Members

**uint8\_t status\_code**  
Status code for the request message

**uint16\_t range\_min**  
Value of temperature range min field of light ctl temperature range state

Value of saturation range min field of light hsl saturation range state

**uint16\_t saturation\_range\_max**  
Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_light\_xyl\_status\_cb\_t**  
Parameters of Light xyL Status

**Public Members**

**bool op\_en**  
Indicate whether optional parameters included

**uint16\_t xyl\_lightness**  
The present value of the Light xyL Lightness state

**uint16\_t xyl\_x**  
The present value of the Light xyL x state

**uint16\_t xyl\_y**  
The present value of the Light xyL y state

**uint8\_t remain\_time**  
Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_xyl\_target\_status\_cb\_t**  
Parameters of Light xyL Target Status

**Public Members**

**bool op\_en**  
Indicate whether optional parameters included

**uint16\_t target\_xyl\_lightness**  
The target value of the Light xyL Lightness state

**uint16\_t target\_xyl\_x**  
The target value of the Light xyL x state

**uint16\_t target\_xyl\_y**  
The target value of the Light xyL y state

**uint8\_t remain\_time**  
Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_xyl\_default\_status\_cb\_t**  
Parameters of Light xyL Default Status

**Public Members**

**uint16\_t lightness**  
The value of the Light Lightness Default state

**uint16\_t xyl\_x**  
The value of the Light xyL x Default state

**uint16\_t xyl\_y**  
The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_light\_xyl\_range\_status\_cb\_t**  
Parameters of Light xyL Range Status

**Public Members**

**uint8\_t status\_code**  
Status Code for the requesting message

**uint16\_t xyl\_x\_range\_min**  
The value of the xyL x Range Min field of the Light xyL x Range state

`uint16_t xyl_x_range_max`

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t xyl_y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t xyl_y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_light\_lc\_mode\_status\_cb\_t**

Parameter of Light LC Mode Status

### Public Members

`uint8_t mode`

The present value of the Light LC Mode state

**struct esp\_ble\_mesh\_light\_lc\_om\_status\_cb\_t**

Parameter of Light LC OM Status

### Public Members

`uint8_t mode`

The present value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_status\_cb\_t**

Parameters of Light LC Light OnOff Status

### Public Members

`bool op_en`

Indicate whether optional parameters included

`uint8_t present_light_onoff`

The present value of the Light LC Light OnOff state

`uint8_t target_light_onoff`

The target value of the Light LC Light OnOff state (Optional)

`uint8_t remain_time`

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t**

Parameters of Light LC Property Status

### Public Members

`uint16_t property_id`

Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**

Raw value for the Light LC Property

**struct esp\_ble\_mesh\_light\_client\_cb\_param\_t**

Lighting Client Model callback parameters

**Public Members****int error\_code**

Appropriate error code

**esp\_ble\_mesh\_client\_common\_param\_t \*params**

The client common parameters.

**esp\_ble\_mesh\_light\_client\_status\_cb\_t status\_cb**

The light status message callback values

**struct esp\_ble\_mesh\_light\_lightness\_state\_t**

Parameters of Light Lightness state

**Public Members****uint16\_t lightness\_linear**

The present value of Light Lightness Linear state

**uint16\_t target\_lightness\_linear**

The target value of Light Lightness Linear state

**uint16\_t lightness\_actual**

The present value of Light Lightness Actual state

**uint16\_t target\_lightness\_actual**

The target value of Light Lightness Actual state

**uint16\_t lightness\_last**

The value of Light Lightness Last state

**uint16\_t lightness\_default**

The value of Light Lightness Default state

**uint8\_t status\_code**

The status code of setting Light Lightness Range state

**uint16\_t lightness\_range\_min**

The minimum value of Light Lightness Range state

**uint16\_t lightness\_range\_max**

The maximum value of Light Lightness Range state

**struct esp\_ble\_mesh\_light\_lightness\_srv\_t**

User data of Light Lightness Server Model

**Public Members****esp\_ble\_mesh\_model\_t \*model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**

Response control of the server model received messages

**esp\_ble\_mesh\_light\_lightness\_state\_t \*state**

Parameters of the Light Lightness state

**esp\_ble\_mesh\_last\_msg\_info\_t last**

Parameters of the last received set message

**esp\_ble\_mesh\_state\_transition\_t actual\_transition**

Parameters of state transition

**esp\_ble\_mesh\_state\_transition\_t linear\_transition**

Parameters of state transition

**int32\_t tt\_delta\_lightness\_actual**  
Delta change value of lightness actual state transition

**int32\_t tt\_delta\_lightness\_linear**  
Delta change value of lightness linear state transition

**struct esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t**  
User data of Light Lightness Setup Server Model

### Public Members

**esp\_ble\_mesh\_model\_t \*model**  
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**  
Response control of the server model received messages

**esp\_ble\_mesh\_light\_lightness\_state\_t \*state**  
Parameters of the Light Lightness state

**struct esp\_ble\_mesh\_light\_ctl\_state\_t**  
Parameters of Light CTL state

### Public Members

**uint16\_t lightness**  
The present value of Light CTL Lightness state

**uint16\_t target\_lightness**  
The target value of Light CTL Lightness state

**uint16\_t temperature**  
The present value of Light CTL Temperature state

**uint16\_t target\_temperature**  
The target value of Light CTL Temperature state

**int16\_t delta\_uv**  
The present value of Light CTL Delta UV state

**int16\_t target\_delta\_uv**  
The target value of Light CTL Delta UV state

**uint8\_t status\_code**  
The statue code of setting Light CTL Temperature Range state

**uint16\_t temperature\_range\_min**  
The minimum value of Light CTL Temperature Range state

**uint16\_t temperature\_range\_max**  
The maximum value of Light CTL Temperature Range state

**uint16\_t lightness\_default**  
The value of Light Lightness Default state

**uint16\_t temperature\_default**  
The value of Light CTL Temperature Default state

**int16\_t delta\_uv\_default**  
The value of Light CTL Delta UV Default state

**struct esp\_ble\_mesh\_light\_ctl\_srv\_t**  
User data of Light CTL Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_temperature**

Delta change value of temperature state transition

int32\_t **tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

**struct esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t**

User data of Light CTL Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

**struct esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t**

User data of Light CTL Temperature Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_temperature**

Delta change value of temperature state transition

int32\_t **tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

**struct esp\_ble\_mesh\_light\_hsl\_state\_t**  
Parameters of Light HSL state

### Public Members

**uint16\_t lightness**  
The present value of Light HSL Lightness state

**uint16\_t target\_lightness**  
The target value of Light HSL Lightness state

**uint16\_t hue**  
The present value of Light HSL Hue state

**uint16\_t target\_hue**  
The target value of Light HSL Hue state

**uint16\_t saturation**  
The present value of Light HSL Saturation state

**uint16\_t target\_saturation**  
The target value of Light HSL Saturation state

**uint16\_t lightness\_default**  
The value of Light Lightness Default state

**uint16\_t hue\_default**  
The value of Light HSL Hue Default state

**uint16\_t saturation\_default**  
The value of Light HSL Saturation Default state

**uint8\_t status\_code**  
The status code of setting Light HSL Hue & Saturation Range state

**uint16\_t hue\_range\_min**  
The minimum value of Light HSL Hue Range state

**uint16\_t hue\_range\_max**  
The maximum value of Light HSL Hue Range state

**uint16\_t saturation\_range\_min**  
The minimum value of Light HSL Saturation state

**uint16\_t saturation\_range\_max**  
The maximum value of Light HSL Saturation state

**struct esp\_ble\_mesh\_light\_hsl\_srv\_t**  
User data of Light HSL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting HSL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**  
Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**  
Parameters of state transition

`int32_t tt_delta_lightness`  
Delta change value of lightness state transition

`int32_t tt_delta_hue`  
Delta change value of hue state transition

`int32_t tt_delta_saturation`  
Delta change value of saturation state transition

**struct esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t**  
User data of Light HSL Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

**struct esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t**  
User data of Light HSL Hue Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_hue`  
Delta change value of hue state transition

**struct esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t**  
User data of Light HSL Saturation Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_saturation**

Delta change value of saturation state transition

**struct esp\_ble\_mesh\_light\_xyl\_state\_t**

Parameters of Light xyL state

### Public Members

uint16\_t **lightness**

The present value of Light xyL Lightness state

uint16\_t **target\_lightness**

The target value of Light xyL Lightness state

uint16\_t **x**

The present value of Light xyL x state

uint16\_t **target\_x**

The target value of Light xyL x state

uint16\_t **y**

The present value of Light xyL y state

uint16\_t **target\_y**

The target value of Light xyL y state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **x\_default**

The value of Light xyL x Default state

uint16\_t **y\_default**

The value of Light xyL y Default state

uint8\_t **status\_code**

The status code of setting Light xyL x & y Range state

uint16\_t **x\_range\_min**

The minimum value of Light xyL x Range state

uint16\_t **x\_range\_max**

The maximum value of Light xyL x Range state

uint16\_t **y\_range\_min**

The minimum value of Light xyL y Range state

uint16\_t **y\_range\_max**

The maximum value of Light xyL y Range state

**struct esp\_ble\_mesh\_light\_xyl\_srv\_t**

User data of Light xyL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_x**

Delta change value of x state transition

int32\_t **tt\_delta\_y**

Delta change value of y state transition

**struct esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t**

User data of Light xyL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

**struct esp\_ble\_mesh\_light\_lc\_state\_t**

Parameters of Light LC states

### Public Members

uint32\_t **mode** : 1

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32\_t **occupancy\_mode** : 1

The value of Light LC Occupancy Mode state

uint32\_t **light\_onoff** : 1

The present value of Light LC Light OnOff state

uint32\_t **target\_light\_onoff** : 1

The target value of Light LC Light OnOff state

uint32\_t **occupancy** : 1

The value of Light LC Occupancy state

uint32\_t **ambient\_luxlevel** : 24

The value of Light LC Ambient LuxLevel state

uint16\_t **linear\_output**

1. Light LC Linear Output =  $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

**struct esp\_ble\_mesh\_light\_lc\_property\_state\_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members****uint32\_t time\_occupancy\_delay**

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

**uint32\_t time\_fade\_on**

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

**uint32\_t time\_run\_on**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

**uint32\_t time\_fade**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

**uint32\_t time\_prolong**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

**uint32\_t time\_fade\_standby\_auto**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

**uint32\_t time\_fade\_standby\_manual**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

**uint16\_t lightness\_on**

A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16\_t lightness\_prolong**

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16\_t lightness\_standby**

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16\_t ambient\_luxlevel\_on**

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16\_t ambient\_luxlevel\_prolong**

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

**uint16\_t ambient\_luxlevel\_standby**

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

**float regulator\_kiu**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

**float regulator\_kid**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

**float regulator\_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

**float regulator\_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

**int8\_t regulator\_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

**uint32\_t set\_occupancy\_to\_1\_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to Ob1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t**

Parameters of Light LC state machine

**Public Members****uint8\_t fade\_on**

The value of transition time of Light LC Time Fade On

**uint8\_t fade**

The value of transition time of Light LC Time Fade

**uint8\_t fade\_standby\_auto**

The value of transition time of Light LC Time Fade Standby Auto

**uint8\_t fade\_standby\_manual**

The value of transition time of Light LC Time Fade Standby Manual

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t::[anonymous] trans\_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

**esp\_ble\_mesh\_light\_lc\_state\_t state**

The value of Light LC state machine state

**struct k\_delayed\_work timer**

Timer of Light LC state machine

**struct esp\_ble\_mesh\_light\_control\_t**  
Parameters of Light Lightness controller

#### Public Members

*esp\_ble\_mesh\_light\_lc\_state\_t* **state**  
Parameters of Light LC state

*esp\_ble\_mesh\_light\_lc\_property\_state\_t* **prop\_state**  
Parameters of Light LC Property state

*esp\_ble\_mesh\_light\_lc\_state\_machine\_t* **state\_machine**  
Parameters of Light LC state machine

**struct esp\_ble\_mesh\_light\_lc\_srv\_t**  
User data of Light LC Server Model

#### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting LC Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \***lc**  
Parameters of the Light controller

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**  
Parameters of state transition

**struct esp\_ble\_mesh\_light\_lc\_setup\_srv\_t**  
User data of Light LC Setup Server Model

#### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \***lc**  
Parameters of the Light controller

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_set\_t**  
Parameter of Light Lightness Actual state change event

#### Public Members

uint16\_t **lightness**  
The value of Light Lightness Actual state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_linear\_set\_t**  
Parameter of Light Lightness Linear state change event

**Public Members****uint16\_t lightness**

The value of Light Lightness Linear state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default state change event

**Public Members****uint16\_t lightness**

The value of Light Lightness Default state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range state change event

**Public Members****uint16\_t range\_min**

The minimum value of Light Lightness Range state

**uint16\_t range\_max**

The maximum value of Light Lightness Range state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_set\_t**

Parameters of Light CTL state change event

**Public Members****uint16\_t lightness**

The value of Light CTL Lightness state

**uint16\_t temperature**

The value of Light CTL Temperature state

**int16\_t delta\_uv**

The value of Light CTL Delta UV state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_set\_t**

Parameters of Light CTL Temperature state change event

**Public Members****uint16\_t temperature**

The value of Light CTL Temperature state

**int16\_t delta\_uv**

The value of Light CTL Delta UV state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_range\_set\_t**

Parameters of Light CTL Temperature Range state change event

**Public Members****uint16\_t range\_min**

The minimum value of Light CTL Temperature Range state

**uint16\_t range\_max**

The maximum value of Light CTL Temperature Range state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_default\_set\_t**  
Parameters of Light CTL Default state change event

#### Public Members

**uint16\_t lightness**  
The value of Light Lightness Default state

**uint16\_t temperature**  
The value of Light CTL Temperature Default state

**int16\_t delta\_uv**  
The value of Light CTL Delta UV Default state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_set\_t**  
Parameters of Light HSL state change event

#### Public Members

**uint16\_t lightness**  
The value of Light HSL Lightness state

**uint16\_t hue**  
The value of Light HSL Hue state

**uint16\_t saturation**  
The value of Light HSL Saturation state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_hue\_set\_t**  
Parameter of Light HSL Hue state change event

#### Public Members

**uint16\_t hue**  
The value of Light HSL Hue state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_saturation\_set\_t**  
Parameter of Light HSL Saturation state change event

#### Public Members

**uint16\_t saturation**  
The value of Light HSL Saturation state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_default\_set\_t**  
Parameters of Light HSL Default state change event

#### Public Members

**uint16\_t lightness**  
The value of Light HSL Lightness Default state

**uint16\_t hue**  
The value of Light HSL Hue Default state

**uint16\_t saturation**  
The value of Light HSL Saturation Default state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_range\_set\_t**  
Parameters of Light HSL Range state change event

**Public Members**

**uint16\_t hue\_range\_min**  
The minimum hue value of Light HSL Range state

**uint16\_t hue\_range\_max**  
The maximum hue value of Light HSL Range state

**uint16\_t saturation\_range\_min**  
The minimum saturation value of Light HSL Range state

**uint16\_t saturation\_range\_max**  
The maximum saturation value of Light HSL Range state

**struct esp\_ble\_mesh\_state\_change\_light\_xyl\_set\_t**  
Parameters of Light xyL state change event

**Public Members**

**uint16\_t lightness**  
The value of Light xyL Lightness state

**uint16\_t x**  
The value of Light xyL x state

**uint16\_t y**  
The value of Light xyL y state

**struct esp\_ble\_mesh\_state\_change\_light\_xyl\_default\_set\_t**  
Parameters of Light xyL Default state change event

**Public Members**

**uint16\_t lightness**  
The value of Light Lightness Default state

**uint16\_t x**  
The value of Light xyL x Default state

**uint16\_t y**  
The value of Light xyL y Default state

**struct esp\_ble\_mesh\_state\_change\_light\_xyl\_range\_set\_t**  
Parameters of Light xyL Range state change event

**Public Members**

**uint16\_t x\_range\_min**  
The minimum value of Light xyL x Range state

**uint16\_t x\_range\_max**  
The maximum value of Light xyL x Range state

**uint16\_t y\_range\_min**  
The minimum value of Light xyL y Range state

**uint16\_t y\_range\_max**  
The maximum value of Light xyL y Range state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_mode\_set\_t**  
Parameter of Light LC Mode state change event

**Public Members****uint8\_t mode**

The value of Light LC Mode state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_om\_set\_t**

Parameter of Light LC Occupancy Mode state change event

**Public Members****uint8\_t mode**

The value of Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_light\_onoff\_set\_t**

Parameter of Light LC Light OnOff state change event

**Public Members****uint8\_t onoff**

The value of Light LC Light OnOff state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_property\_set\_t**

Parameters of Light LC Property state change event

**Public Members****uint16\_t property\_id**

The property id of Light LC Property state

**struct net\_buf\_simple \*property\_value**

The property value of Light LC Property state

**struct esp\_ble\_mesh\_state\_change\_sensor\_status\_t**

Parameters of Sensor Status state change event

**Public Members****uint16\_t property\_id**

The value of Sensor Property ID

**uint8\_t occupancy**

The value of Light LC Occupancy state

**uint32\_t set\_occupancy\_to\_1\_delay**

The value of Light LC Set Occupancy to 1 Delay state

**uint32\_t ambient\_luxlevel**

The value of Light LC Ambient Luxlevel state

**union esp\_ble\_mesh\_state\_change\_sensor\_status\_t::[anonymous] state**

Parameters of Sensor Status related state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_get\_t**

Context of the received Light LC Property Get message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Light LC Property

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_set\_t**  
Context of the received Light Lightness Set message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t lightness`  
Target value of light lightness actual state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_linear\_set\_t**  
Context of the received Light Lightness Linear Set message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t lightness`  
Target value of light lightness linear state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_default\_set\_t**  
Context of the received Light Lightness Default Set message

**Public Members**

`uint16_t lightness`  
The value of the Light Lightness Default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lightness\_range\_set\_t**  
Context of the received Light Lightness Range Set message

**Public Members**

`uint16_t range_min`  
Value of range min field of light lightness range state

**uint16\_t range\_max**  
Value of range max field of light lightness range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_set\_t**  
Context of the received Light CTL Set message

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t lightness**  
Target value of light ctl lightness state

**uint16\_t temperature**  
Target value of light ctl temperature state

**int16\_t delta\_uv**  
Target value of light ctl delta UV state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_temperature\_set\_t**  
Context of the received Light CTL Temperature Set message

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t temperature**  
Target value of light ctl temperature state

**int16\_t delta\_uv**  
Target value of light ctl delta UV state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_temperature\_range\_set\_t**  
Context of the received Light CTL Temperature Range Set message

### Public Members

**uint16\_t range\_min**  
Value of temperature range min field of light ctl temperature range state

**uint16\_t range\_max**  
Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_default\_set\_t**  
Context of the received Light CTL Default Set message

#### Public Members

**uint16\_t lightness**  
Value of light lightness default state

**uint16\_t temperature**  
Value of light temperature default state

**int16\_t delta\_uv**  
Value of light delta UV default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_set\_t**  
Context of the received Light HSL Set message

#### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t lightness**  
Target value of light hsl lightness state

**uint16\_t hue**  
Target value of light hsl hue state

**uint16\_t saturation**  
Target value of light hsl saturation state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_hue\_set\_t**  
Context of the received Light HSL Hue Set message

#### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint16\_t hue**  
Target value of light hsl hue state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_saturation\_set\_t**  
Context of the received Light HSL Saturation Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **saturation**  
Target value of light hsl hue state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_default\_set\_t**  
Context of the received Light HSL Default Set message

**Public Members**

uint16\_t **lightness**  
Value of light lightness default state

uint16\_t **hue**  
Value of light hue default state

uint16\_t **saturation**  
Value of light saturation default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_range\_set\_t**  
Context of the received Light HSL Range Set message

**Public Members**

uint16\_t **hue\_range\_min**  
Value of hue range min field of light hsl hue range state

uint16\_t **hue\_range\_max**  
Value of hue range max field of light hsl hue range state

uint16\_t **saturation\_range\_min**  
Value of saturation range min field of light hsl saturation range state

uint16\_t **saturation\_range\_max**  
Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_set\_t**  
Context of the received Light xyL Set message

**Public Members**

bool **op\_en**  
Indicate whether optional parameters included

uint16\_t **lightness**  
The target value of the Light xyL Lightness state

uint16\_t **x**  
The target value of the Light xyL x state

**uint16\_t y**  
The target value of the Light xyL y state

**uint8\_t tid**  
Transaction Identifier

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_default\_set\_t**  
Context of the received Light xyL Default Set message

### Public Members

**uint16\_t lightness**  
The value of the Light Lightness Default state

**uint16\_t x**  
The value of the Light xyL x Default state

**uint16\_t y**  
The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_range\_set\_t**  
Context of the received Light xyL Range Set message

### Public Members

**uint16\_t x\_range\_min**  
The value of the xyL x Range Min field of the Light xyL x Range state

**uint16\_t x\_range\_max**  
The value of the xyL x Range Max field of the Light xyL x Range state

**uint16\_t y\_range\_min**  
The value of the xyL y Range Min field of the Light xyL y Range state

**uint16\_t y\_range\_max**  
The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_mode\_set\_t**  
Context of the received Light LC Mode Set message

### Public Members

**uint8\_t mode**  
The target value of the Light LC Mode state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_om\_set\_t**  
Context of the received Light OM Set message

### Public Members

**uint8\_t mode**  
The target value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_light\_onoff\_set\_t**  
Context of the received Light LC Light OnOff Set message

**Public Members**

**bool op\_en**  
Indicate whether optional parameters included

**uint8\_t light\_onoff**  
The target value of the Light LC Light OnOff state

**uint8\_t tid**  
Transaction Identifier

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_set\_t**  
Context of the received Light LC Property Set message

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the Light LC Property

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_status\_t**  
Context of the received Sensor Status message

**Public Members**

**struct net\_buf\_simple \*data**  
Value of sensor data state (optional)

**struct esp\_ble\_mesh\_lighting\_server\_cb\_param\_t**  
Lighting Server Model callback parameters

**Public Members**

***esp\_ble\_mesh\_model\_t* \*model**  
Pointer to Lighting Server Models

***esp\_ble\_mesh\_msg\_ctx\_t* ctx**  
Context of the received messages

***esp\_ble\_mesh\_lighting\_server\_cb\_value\_t* value**  
Value of the received Lighting Messages

**Macros**

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_CLI** (cli\_pub, cli\_data)  
Define a new Light Lightness Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

**Parameters**

- **cli\_pub**: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data**: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_CLI** (cli\_pub, cli\_data)

Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_CLI** (cli\_pub, cli\_data)

Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_CLI** (cli\_pub, cli\_data)

Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_CLI** (cli\_pub, cli\_data)

Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SRV** (srv\_pub, srv\_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light CTL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_TEMP\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Server Model.

**Note** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

**Return** New Light HSL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Setup Server Model.

**Note** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light HSL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_HUE\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Hue Server Model.

**Note** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Hue Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SAT\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Saturation Server Model.

**Note** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Saturation Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light xyL Server Model.

**Note** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light xyL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_xyl\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light xyL Setup Server Model.

**Note** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light xyL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SRV** (`srv_pub`, `srv_data`)

Define a new Light LC Server Model.

**Note** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Return** New Light LC Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_light\_lc\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light LC Setup Server Model.

- Note**
1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
    1. This model shall support model publication and model subscription.
    2. This model may be used to configure setup parameters for the Light LC Server model.

**Return** New Light LC Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

### Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t) (esp_ble_mesh_light_client_cb_event_t
                                              event, esp_ble_mesh_light_client_cb_param_t
                                              *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t) (esp_ble_mesh_lighting_server_cb_event_t
                                                  event,
                                                  esp_ble_mesh_lighting_server_cb_param_t
                                                  *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
This enum value is the event of Lighting Client Model
```

*Values:*

```
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states
```

*Values:*

```
ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL
```

**enum esp\_ble\_mesh\_lighting\_server\_cb\_event\_t**

This enum value is the event of Lighting Server Model

Values:

**ESP\_BLE\_MESH\_LIGHTING\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

**ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

**ESP\_BLE\_MESH\_LIGHTING\_SERVER\_EVT\_MAX****Time and Scenes Client/Server Models****Header File**

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_sensor\\_model\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_sensor\_client\_callback** (*esp\_ble\_mesh\_sensor\_client\_cb\_t* callback)

Register BLE Mesh Sensor Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_sensor\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_sensor\_client\_get\_state\_t* \*get\_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to sensor get message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_sensor\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_sensor\_client\_set\_state\_t* \*set\_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to sensor set message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_register\_sensor\_server\_callback** (*esp\_ble\_mesh\_sensor\_server\_cb\_t* callback)

Register BLE Mesh Sensor Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

## Unions

**union esp\_ble\_mesh\_sensor\_client\_get\_state\_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.  
Parameters of Sensor Descriptor Get

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID of a sensor (optional)

**struct esp\_ble\_mesh\_sensor\_cadence\_get\_t**  
Parameter of Sensor Cadence Get

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_cadence\_set\_t**  
Parameters of Sensor Cadence Set

### Public Members

uint16\_t **property\_id**  
Property ID for the sensor

uint8\_t **fast\_cadence\_period\_divisor** : 7  
Divisor for the publish period

uint8\_t **status\_trigger\_type** : 1  
The unit and format of the Status Trigger Delta fields

**struct net\_buf\_simple \*status\_trigger\_delta\_down**  
Delta down value that triggers a status message

**struct net\_buf\_simple \*status\_trigger\_delta\_up**  
Delta up value that triggers a status message

uint8\_t **status\_min\_interval**  
Minimum interval between two consecutive Status messages

**struct net\_buf\_simple \*fast\_cadence\_low**  
Low value for the fast cadence range

**struct net\_buf\_simple \*fast\_cadence\_high**  
Fast value for the fast cadence range

**struct esp\_ble\_mesh\_sensor\_settings\_get\_t**  
Parameter of Sensor Settings Get

#### Public Members

uint16\_t **sensor\_property\_id**  
Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_get\_t**  
Parameters of Sensor Setting Get

#### Public Members

uint16\_t **sensor\_property\_id**  
Property ID of a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_set\_t**  
Parameters of Sensor Setting Set

#### Public Members

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

**struct net\_buf\_simple \*sensor\_setting\_raw**  
Raw value for the setting

**struct esp\_ble\_mesh\_sensor\_get\_t**  
Parameters of Sensor Get

#### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID for the sensor (optional)

**struct esp\_ble\_mesh\_sensor\_column\_get\_t**  
Parameters of Sensor Column Get

#### Public Members

uint16\_t **property\_id**  
Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x**  
Raw value identifying a column

**struct esp\_ble\_mesh\_sensor\_series\_get\_t**  
Parameters of Sensor Series Get

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x1**  
Raw value identifying a starting column (optional)

struct net\_buf\_simple \***raw\_value\_x2**  
Raw value identifying an ending column (C.1)

struct **esp\_ble\_mesh\_sensor\_descriptor\_status\_cb\_t**  
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

Parameter of Sensor Descriptor Status

**Public Members**

struct net\_buf\_simple \***descriptor**  
Sequence of 8-octet sensor descriptors (optional)

struct **esp\_ble\_mesh\_sensor\_cadence\_status\_cb\_t**  
Parameters of Sensor Cadence Status

**Public Members**

uint16\_t **property\_id**  
Property for the sensor

struct net\_buf\_simple \***sensor\_cadence\_value**  
Value of sensor cadence state

struct **esp\_ble\_mesh\_sensor\_settings\_status\_cb\_t**  
Parameters of Sensor Settings Status

**Public Members**

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

struct net\_buf\_simple \***sensor\_setting\_property\_ids**  
A sequence of N sensor setting property IDs (optional)

struct **esp\_ble\_mesh\_sensor\_setting\_status\_cb\_t**  
Parameters of Sensor Setting Status

**Public Members**

bool **op\_en**  
Indicate id optional parameters are included

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

`uint8_t sensor_setting_access`  
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`  
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`  
Parameter of Sensor Status

### Public Members

`struct net_buf_simple *marshalled_sensor_data`  
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`  
Parameters of Sensor Column Status

### Public Members

`uint16_t property_id`  
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`  
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`  
Parameters of Sensor Series Status

### Public Members

`uint16_t property_id`  
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`  
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`  
Sensor Client Model callback parameters

### Public Members

`int error_code`  
0: success, otherwise failure. For the error code values please refer to `errno.h` file. A negative sign is added to the standard error codes in `errno.h`.

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters.

`esp_ble_mesh_sensor_client_status_cb_t status_cb`  
The sensor status message callback values

`struct esp_ble_mesh_sensor_descriptor_t`  
Parameters of Sensor Descriptor state

### Public Members

`uint32_t positive_tolerance : 12`  
The value of Sensor Positive Tolerance field

**uint32\_t negative\_tolerance** : 12  
The value of Sensor Negative Tolerance field

**uint32\_t sampling\_function** : 8  
The value of Sensor Sampling Function field

**uint8\_t measure\_period**  
The value of Sensor Measurement Period field

**uint8\_t update\_interval**  
The value of Sensor Update Interval field

**struct esp\_ble\_mesh\_sensor\_setting\_t**  
Parameters of Sensor Setting state

### Public Members

**uint16\_t property\_id**  
The value of Sensor Setting Property ID field

**uint8\_t access**  
The value of Sensor Setting Access field

**struct net\_buf\_simple \*raw**  
The value of Sensor Setting Raw field

**struct esp\_ble\_mesh\_sensor\_cadence\_t**  
Parameters of Sensor Cadence state

### Public Members

**uint8\_t period\_divisor** : 7  
The value of Fast Cadence Period Divisor field

**uint8\_t trigger\_type** : 1  
The value of Status Trigger Type field

**struct net\_buf\_simple \*trigger\_delta\_down**  
Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

**struct net\_buf\_simple \*trigger\_delta\_up**  
The value of Status Trigger Delta Up field

**uint8\_t min\_interval**  
The value of Status Min Interval field

**struct net\_buf\_simple \*fast\_cadence\_low**  
The value of Fast Cadence Low field

**struct net\_buf\_simple \*fast\_cadence\_high**  
The value of Fast Cadence High field

**struct esp\_ble\_mesh\_sensor\_data\_t**  
Parameters of Sensor Data state

### Public Members

**uint8\_t format** : 1  
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).

Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

**uint8\_t length** : 7  
The value of the Sensor Data length

**struct net\_buf\_simple \*raw\_value**  
The value of Sensor Data raw value

**struct esp\_ble\_mesh\_sensor\_series\_column\_t**  
Parameters of Sensor Series Column state

### Public Members

**struct net\_buf\_simple \*raw\_value\_x**  
The value of Sensor Raw Value X field

**struct net\_buf\_simple \*column\_width**  
The value of Sensor Column Width field

**struct net\_buf\_simple \*raw\_value\_y**  
The value of Sensor Raw Value Y field

**struct esp\_ble\_mesh\_sensor\_state\_t**  
Parameters of Sensor states

### Public Members

**uint16\_t sensor\_property\_id**  
The value of Sensor Property ID field

*esp\_ble\_mesh\_sensor\_descriptor\_t* **descriptor**  
Parameters of the Sensor Descriptor state

**const uint8\_t setting\_count**  
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

*esp\_ble\_mesh\_sensor\_setting\_t* \***settings**  
Parameters of the Sensor Setting state

*esp\_ble\_mesh\_sensor\_cadence\_t* \***cadence**  
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

*esp\_ble\_mesh\_sensor\_data\_t* **sensor\_data**  
Parameters of the Sensor Data state

*esp\_ble\_mesh\_sensor\_series\_column\_t* **series\_column**  
Parameters of the Sensor Series Column state

**struct esp\_ble\_mesh\_sensor\_srv\_t**  
User data of Sensor Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Sensor Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

**const uint8\_t state\_count**  
Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**  
Parameters of the Sensor states

**struct esp\_ble\_mesh\_sensor\_setup\_srv\_t**  
User data of Sensor Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Sensor Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

**const uint8\_t state\_count**  
Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**  
Parameters of the Sensor states

**struct esp\_ble\_mesh\_state\_change\_sensor\_cadence\_set\_t**  
Parameters of Sensor Cadence Set state change event

### Public Members

uint16\_t **property\_id**  
The value of Sensor Property ID state

uint8\_t **period\_divisor** : 7  
The value of Fast Cadence Period Divisor state

uint8\_t **trigger\_type** : 1  
The value of Status Trigger Type state

**struct net\_buf\_simple** \***trigger\_delta\_down**  
The value of Status Trigger Delta Down state

**struct net\_buf\_simple** \***trigger\_delta\_up**  
The value of Status Trigger Delta Up state

uint8\_t **min\_interval**  
The value of Status Min Interval state

**struct net\_buf\_simple** \***fast\_cadence\_low**  
The value of Fast Cadence Low state

**struct net\_buf\_simple** \***fast\_cadence\_high**  
The value of Fast Cadence High state

**struct esp\_ble\_mesh\_state\_change\_sensor\_setting\_set\_t**  
Parameters of Sensor Setting Set state change event

### Public Members

uint16\_t **property\_id**  
The value of Sensor Property ID state

uint16\_t **setting\_property\_id**  
The value of Sensor Setting Property ID state

**struct** net\_buf\_simple \***setting\_value**

The value of Sensor Property Value state

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_descriptor\_get\_t

Context of the received Sensor Descriptor Get message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID of a sensor (optional)

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_get\_t

Context of the received Sensor Cadence Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_settings\_get\_t

Context of the received Sensor Settings Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_get\_t

Context of the received Sensor Setting Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

uint16\_t **setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_get\_t

Context of the received Sensor Get message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID for the sensor (optional)

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_column\_get\_t

Context of the received Sensor Column Get message

**Public Members****uint16\_t property\_id**

Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x**

Raw value identifying a column

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_series\_get\_t**

Context of the received Sensor Series Get message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property identifying a sensor

**struct net\_buf\_simple \*raw\_value**

Raw value containing X1 and X2 (optional)

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_set\_t**

Context of the received Sensor Cadence Set message

**Public Members****uint16\_t property\_id**

Property ID for the sensor

**struct net\_buf\_simple \*cadence**

Value of Sensor Cadence state

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_set\_t**

Context of the received Sensor Setting Set message

**Public Members****uint16\_t property\_id**

Property ID identifying a sensor

**uint16\_t setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct net\_buf\_simple \*setting\_raw**

Raw value for the setting

**struct esp\_ble\_mesh\_sensor\_server\_cb\_param\_t**

Sensor Server Model callback parameters

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to Sensor Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_sensor\_server\_cb\_value\_t* **value**

Value of the received Sensor Messages

**Macros****ESP\_BLE\_MESH\_MODEL\_SENSOR\_CLI** (cli\_pub, cli\_data)

Define a new Sensor Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Sensor Client Model.**Return** New Sensor Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SRV** (srv\_pub, srv\_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

**Note** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Sensor Server Model instance.**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_sensor\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Sensor Setup Server Model.

**Note** 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

**Return** New Sensor Setup Server Model instance.**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_sensor\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_PROPERTY\_ID**

Invalid Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_PROPERTY\_ID\_LEN**

Length of Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_DESCRIPTOR\_LEN**

Length of Sensor Descriptor state

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_POS\_TOLERANCE**

Unspecified Sensor Positive Tolerance

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_NEG\_TOLERANCE**

Unspecified Sensor Negative Tolerance

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_MEASURE\_PERIOD**

Not applicable Sensor Measurement Period

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_UPDATE\_INTERVAL**

Not applicable Sensor Update Interval

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_SETTING\_PROPERTY\_ID**

Invalid Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_PROPERTY\_ID\_LEN**

Length of Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_LEN**

Length of Sensor Setting Access

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ**

Sensor Setting Access - Read

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ\_WRITE**

Sensor Setting Access - Read &amp; Write

**ESP\_BLE\_MESH\_SENSOR\_DIVISOR\_TRIGGER\_TYPE\_LEN**

Length of Sensor Divisor Trigger Type

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_LEN**

Length of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_PERIOD\_DIVISOR\_MAX\_VALUE**

Maximum value of Sensor Period Divisor

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_MAX**

Maximum value of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_CHAR**

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_UINT16**

Sensor Status Trigger Type - Format Type “uint16”

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A**

Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B**

Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MP\_ID\_LEN**

MPID length of Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MP\_ID\_LEN**

MPID length of Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_ZERO\_LEN**

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_FORMAT** (\_data)

Get format of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the format of the corresponding sensor data.

**Return** Format of the sensor data.

**Parameters**

- \_data: Pointer to the start of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_LENGTH** (\_data, \_fmt)

Get length of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the length of the corresponding sensor data.

**Return** Length (zero-based) of the sensor data.

**Parameters**

- \_data: Pointer to the start of the sensor data.
- \_fmt: Format of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_PROPERTY\_ID** (\_data, \_fmt)

Get Sensor Property ID of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Return** Sensor Property ID of the sensor data.

**Parameters**

- \_data: Pointer to the start of the sensor data.
- \_fmt: Format of the sensor data.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID** (*\_len*, *\_id*)

Generate a MPID value for sensor data with Format A.

**Note** 1. The Format field is 0b0 and indicates that Format A is used.

1. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
2. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
3. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return** 2-octet MPID value for sensor data with Format A.

**Parameters**

- *\_len*: Length of Sensor Raw value.
- *\_id*: Sensor Property ID.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID** (*\_len*, *\_id*)

Generate a MPID value for sensor data with Format B.

**Note** 1. The Format field is 0b1 and indicates Format B is used.

1. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
2. The Property ID is a 16-bit bit field representing a Property ID.
3. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
4. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return** 3-octet MPID value for sensor data with Format B.

**Parameters**

- *\_len*: Length of Sensor Raw value.
- *\_id*: Sensor Property ID.

**Type Definitions**

```
typedef void (*esp_ble_mesh_sensor_client_cb_t) (esp_ble_mesh_sensor_client_cb_event_t
                                                event, esp_ble_mesh_sensor_client_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Parameters**

- *event*: Event type
- *param*: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t) (esp_ble_mesh_sensor_server_cb_event_t
                                                event, esp_ble_mesh_sensor_server_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

**Parameters**

- *event*: Event type
- *param*: Pointer to callback parameter

**Enumerations**

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

*Values:*

```
ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
```

**ESP\_BLE\_MESH\_SENSOR\_CLIENT\_EVT\_MAX**  
**enum esp\_ble\_mesh\_sensor\_sample\_func**  
 This enum value is value of Sensor Sampling Function

*Values:*

**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_UNSPECIFIED**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_INSTANTANEOUS**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ARITHMETIC\_MEAN**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_RMS**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MAXIMUM**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MINIMUM**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ACCUMULATED**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_COUNT**

**enum esp\_ble\_mesh\_sensor\_server\_cb\_event\_t**  
 This enum value is the event of Sensor Server Model

*Values:*

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_EVT\_MAX**

## Lighting Client/Server Models

### Header File

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

### Functions

`esp_err_t esp_ble_mesh_register_time_scene_client_callback` (`esp_ble_mesh_time_scene_client_cb_t callback`)

Register BLE Mesh Time Scene Client Model callback.

**Return** `ESP_OK` on success or error code otherwise.

#### Parameters

- `[in] callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_time_scene_client_get_state` (`esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state`)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to time scene get message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t
                                                *params,
                                                esp_ble_mesh_time_scene_client_set_state_t
                                                *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to time scene set message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t
                                                         callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

## Unions

**Structures****struct esp\_ble\_mesh\_time\_set\_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

**Public Members****uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t sub\_second**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

**uint16\_t time\_authority : 1**

0 = No Time Authority, 1 = Time Authority

**uint16\_t tai\_utc\_delta : 15**

Current difference between TAI and UTC in seconds

**uint8\_t time\_zone\_offset**

The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_zone\_set\_t**

Parameters of Time Zone Set

**Public Members****uint8\_t time\_zone\_offset\_new**

Upcoming local time zone offset

**uint8\_t tai\_zone\_change[5]**

TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_tai\_utc\_delta\_set\_t**

Parameters of TAI-UTC Delta Set

**Public Members****uint16\_t tai\_utc\_delta\_new : 15**

Upcoming difference between TAI and UTC in seconds

**uint16\_t padding : 1**

Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**

TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_time\_role\_set\_t**

Parameter of Time Role Set

**Public Members****uint8\_t time\_role**

The Time Role for the element

**struct esp\_ble\_mesh\_scene\_store\_t**

Parameter of Scene Store

**Public Members**

`uint16_t scene_number`  
The number of scenes to be stored

**struct esp\_ble\_mesh\_scene\_recall\_t**  
Parameters of Scene Recall

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t scene_number`  
The number of scenes to be recalled

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_scene\_delete\_t**  
Parameter of Scene Delete

**Public Members**

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_scheduler\_act\_get\_t**  
Parameter of Scheduler Action Get

**Public Members**

`uint8_t index`  
Index of the Schedule Register entry to get

**struct esp\_ble\_mesh\_scheduler\_act\_set\_t**  
Parameters of Scheduler Action Set

**Public Members**

`uint64_t index : 4`  
Index of the Schedule Register entry to set

`uint64_t year : 7`  
Scheduled year for the action

`uint64_t month : 12`  
Scheduled month for the action

`uint64_t day : 5`  
Scheduled day of the month for the action

`uint64_t hour : 5`  
Scheduled hour for the action

`uint64_t minute` : 6  
Scheduled minute for the action

`uint64_t second` : 6  
Scheduled second for the action

`uint64_t day_of_week` : 7  
Schedule days of the week for the action

`uint64_t action` : 4  
Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
Transition time for this action

`uint16_t scene_number`  
Transition time for this action

**struct esp\_ble\_mesh\_time\_status\_cb\_t**  
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.  
Parameters of Time Status

### Public Members

`uint8_t tai_seconds[5]`  
The current TAI time in seconds

`uint8_t sub_second`  
The sub-second time in units of 1/256 second

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority` : 1  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta` : 15  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_zone\_status\_cb\_t**  
Parameters of Time Zone Status

### Public Members

`uint8_t time_zone_offset_curr`  
Current local time zone offset

`uint8_t time_zone_offset_new`  
Upcoming local time zone offset

`uint8_t tai_zone_change[5]`  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_tai\_utc\_delta\_status\_cb\_t**  
Parameters of TAI-UTC Delta Status

### Public Members

`uint16_t tai_utc_delta_curr` : 15  
Current difference between TAI and UTC in seconds

`uint16_t padding_1 : 1`  
Always 0b0. Other values are Prohibited.

`uint16_t tai_utc_delta_new : 15`  
Upcoming difference between TAI and UTC in seconds

`uint16_t padding_2 : 1`  
Always 0b0. Other values are Prohibited.

`uint8_t tai_delta_change[5]`  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_time\_role\_status\_cb\_t**  
Parameter of Time Role Status

### Public Members

`uint8_t time_role`  
The Time Role for the element

**struct esp\_ble\_mesh\_scene\_status\_cb\_t**  
Parameters of Scene Status

### Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint8_t status_code`  
Status code of the last operation

`uint16_t current_scene`  
Scene Number of the current scene

`uint16_t target_scene`  
Scene Number of the target scene (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_scene\_register\_status\_cb\_t**  
Parameters of Scene Register Status

### Public Members

`uint8_t status_code`  
Status code for the previous operation

`uint16_t current_scene`  
Scene Number of the current scene

**struct net\_buf\_simple \*scenes**  
A list of scenes stored within an element

**struct esp\_ble\_mesh\_scheduler\_status\_cb\_t**  
Parameter of Scheduler Status

### Public Members

`uint16_t schedules`  
Bit field indicating defined Actions in the Schedule Register

**struct esp\_ble\_mesh\_scheduler\_act\_status\_cb\_t**  
Parameters of Scheduler Action Status

### Public Members

uint64\_t **index** : 4  
Enumerates (selects) a Schedule Register entry

uint64\_t **year** : 7  
Scheduled year for the action

uint64\_t **month** : 12  
Scheduled month for the action

uint64\_t **day** : 5  
Scheduled day of the month for the action

uint64\_t **hour** : 5  
Scheduled hour for the action

uint64\_t **minute** : 6  
Scheduled minute for the action

uint64\_t **second** : 6  
Scheduled second for the action

uint64\_t **day\_of\_week** : 7  
Schedule days of the week for the action

uint64\_t **action** : 4  
Action to be performed at the scheduled time

uint64\_t **trans\_time** : 8  
Transition time for this action

uint16\_t **scene\_number**  
Transition time for this action

**struct esp\_ble\_mesh\_time\_scene\_client\_cb\_param\_t**  
Time Scene Client Model callback parameters

### Public Members

int **error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**  
The client common parameters.

*esp\_ble\_mesh\_time\_scene\_client\_status\_cb\_t* **status\_cb**  
The scene status message callback values

**struct esp\_ble\_mesh\_time\_state\_t**  
Parameters of Time state

### Public Members

uint8\_t **tai\_seconds**[5]  
The value of the TAI Seconds state

uint8\_t **subsecond**  
The value of the Subsecond field

**uint8\_t uncertainty**  
The value of the Uncertainty field

**uint8\_t time\_zone\_offset\_curr**  
The value of the Time Zone Offset Current field

**uint8\_t time\_zone\_offset\_new**  
The value of the Time Zone Offset New state

**uint8\_t tai\_zone\_change[5]**  
The value of the TAI of Zone Chaneg field

**uint16\_t time\_authority : 1**  
The value of the Time Authority bit

**uint16\_t tai\_utc\_delta\_curr : 15**  
The value of the TAI-UTC Delta Current state

**uint16\_t tai\_utc\_delta\_new : 15**  
The value of the TAI-UTC Delta New state

**uint8\_t tai\_delta\_change[5]**  
The value of the TAI of Delta Change field

**struct esp\_ble\_mesh\_time\_state\_t::[anonymous] time**  
Parameters of the Time state

**uint8\_t time\_role**  
The value of the Time Role state

**struct esp\_ble\_mesh\_time\_srv\_t**  
User data of Time Server Model

### Public Members

**esp\_ble\_mesh\_model\_t \*model**  
Pointer to the Time Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**  
Response control of the server model received messages

**esp\_ble\_mesh\_time\_state\_t \*state**  
Parameters of the Time state

**struct esp\_ble\_mesh\_time\_setup\_srv\_t**  
User data of Time Setup Server Model

### Public Members

**esp\_ble\_mesh\_model\_t \*model**  
Pointer to the Time Setup Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**  
Response control of the server model received messages

**esp\_ble\_mesh\_time\_state\_t \*state**  
Parameters of the Time state

**struct esp\_ble\_mesh\_scene\_register\_t**

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.

4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

### Public Members

`uint16_t scene_number`

The value of the Scene Number

`uint8_t scene_type`

The value of the Scene Type

`struct net_buf_simple *scene_value`

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

`struct esp_ble_mesh_scenes_state_t`

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

### Public Members

`const uint16_t scene_count`

The Scenes state's scene count

`esp_ble_mesh_scene_register_t *scenes`

Parameters of the Scenes state

`uint16_t current_scene`

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

`uint16_t target_scene`

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

`uint8_t status_code`

The status code of the last scene operation

`bool in_progress`

Indicate if the scene transition is in progress

`struct esp_ble_mesh_scene_srv_t`

User data of Scene Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Scene Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`

Parameters of the Scenes state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`

Parameters of state transition

`struct esp_ble_mesh_scene_setup_srv_t`

User data of Scene Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Scene Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`

Parameters of the Scenes state

`struct esp_ble_mesh_schedule_register_t`

Parameters of Scheduler Register state

### Public Members

`bool in_use`

Indicate if the registered schedule is in use

`uint64_t year : 7`

The value of Scheduled year for the action

`uint64_t month : 12`

The value of Scheduled month for the action

`uint64_t day : 5`

The value of Scheduled day of the month for the action

`uint64_t hour : 5`

The value of Scheduled hour for the action

`uint64_t minute` : 6  
The value of Scheduled minute for the action

`uint64_t second` : 6  
The value of Scheduled second for the action

`uint64_t day_of_week` : 7  
The value of Schedule days of the week for the action

`uint64_t action` : 4  
The value of Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
The value of Transition time for this action

`uint16_t scene_number`  
The value of Scene Number to be used for some actions

**struct esp\_ble\_mesh\_scheduler\_state\_t**  
Parameters of Scheduler state

### Public Members

`const uint8_t schedule_count`  
Scheduler count

`esp_ble_mesh_schedule_register_t *schedules`  
Up to 16 scheduled entries

**struct esp\_ble\_mesh\_scheduler\_srv\_t**  
User data of Scheduler Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Scheduler Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`  
Parameters of the Scheduler state

**struct esp\_ble\_mesh\_scheduler\_setup\_srv\_t**  
User data of Scheduler Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Scheduler Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`  
Parameters of the Scheduler state

**struct esp\_ble\_mesh\_state\_change\_time\_set\_t**  
Parameters of Time Set state change event

**Public Members**

`uint8_t tai_seconds[5]`  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr : 15`  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_state\_change\_time\_status\_t**  
Parameters of Time Status state change event

**Public Members**

`uint8_t tai_seconds[5]`  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr : 15`  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_state\_change\_time\_zone\_set\_t**  
Parameters of Time Zone Set state change event

**Public Members**

`uint8_t time_zone_offset_new`  
Upcoming local time zone offset

`uint8_t tai_zone_change[5]`  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t**  
Parameters of TAI UTC Delta Set state change event

**Public Members**

`uint16_t tai_utc_delta_new : 15`  
Upcoming difference between TAI and UTC in seconds

`uint8_t tai_delta_change[5]`  
TAI Seconds time of the upcoming TAI-UTC Delta change

`struct esp_ble_mesh_state_change_time_role_set_t`  
Parameter of Time Role Set state change event

### Public Members

`uint8_t time_role`  
The Time Role for the element

`struct esp_ble_mesh_state_change_scene_store_t`  
Parameter of Scene Store state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be stored

`struct esp_ble_mesh_state_change_scene_recall_t`  
Parameter of Scene Recall state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be recalled

`struct esp_ble_mesh_state_change_scene_delete_t`  
Parameter of Scene Delete state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be deleted

`struct esp_ble_mesh_state_change_scheduler_act_set_t`  
Parameter of Scheduler Action Set state change event

### Public Members

`uint64_t index : 4`  
Index of the Schedule Register entry to set

`uint64_t year : 7`  
Scheduled year for the action

`uint64_t month : 12`  
Scheduled month for the action

`uint64_t day : 5`  
Scheduled day of the month for the action

`uint64_t hour : 5`  
Scheduled hour for the action

`uint64_t minute : 6`  
Scheduled minute for the action

`uint64_t second : 6`  
Scheduled second for the action

`uint64_t day_of_week : 7`  
Schedule days of the week for the action

`uint64_t action : 4`  
Action to be performed at the scheduled time

`uint64_t trans_time : 8`  
Transition time for this action

`uint16_t scene_number`  
Scene number to be used for some actions

**struct esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_get\_t**  
Context of the received Scheduler Action Get message

### Public Members

`uint8_t index`  
Index of the Schedule Register entry to get

**struct esp\_ble\_mesh\_server\_rcv\_time\_set\_t**  
Context of the received Time Set message

The number of scenes to be stored

**struct esp\_ble\_mesh\_server\_rcv\_scene\_recall\_t**  
Context of the received Scene Recall message

### Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint16_t scene_number`  
The number of scenes to be recalled

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_scene\_delete\_t**  
Context of the received Scene Delete message

### Public Members

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_set\_t**  
Context of the received Scheduler Action Set message

### Public Members

`uint64_t index` : 4  
Index of the Schedule Register entry to set

`uint64_t year` : 7  
Scheduled year for the action

`uint64_t month` : 12  
Scheduled month for the action

`uint64_t day` : 5  
Scheduled day of the month for the action

`uint64_t hour` : 5  
Scheduled hour for the action

`uint64_t minute` : 6  
Scheduled minute for the action

`uint64_t second` : 6  
Scheduled second for the action

`uint64_t day_of_week` : 7  
Schedule days of the week for the action

`uint64_t action` : 4  
Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
Transition time for this action

`uint16_t scene_number`  
Scene number to be used for some actions

**struct esp\_ble\_mesh\_server\_rcv\_time\_status\_t**  
Context of the received Time Status message

### Public Members

`uint8_t tai_seconds`[5]  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority` : 1  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta` : 15  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_scene\_server\_cb\_param\_t**  
Time Scene Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Time and Scenes Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_time_scene_server_cb_value_t value`  
Value of the received Time and Scenes Messages

**Macros****ESP\_BLE\_MESH\_MODEL\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Time Client Model.**Return** New Time Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI** (cli\_pub, cli\_data)

Define a new Scene Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scene Client Model.**Return** New Scene Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI** (cli\_pub, cli\_data)

Define a new Scheduler Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.**Return** New Scheduler Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SRV** (srv\_pub, srv\_data)

Time Scene Server Models related context.

Define a new Time Server Model.

**Note** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Time Server Model instance.**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_time\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SETUP\_SRV** (srv\_data)

Define a new Time Setup Server Model.

**Note** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
2. This model does not support subscribing nor publishing.

**Return** New Time Setup Server Model instance.**Parameters**

- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_time\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SRV** (srv\_pub, srv\_data)

Define a new Scene Server Model.

**Note** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scene Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Scene Setup Server Model.

**Note** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scene Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SRV** (`srv_pub`, `srv_data`)

Define a new Scheduler Server Model.

**Note** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.
3. The model requires the Time Server model shall be present on the element.

**Return** New Scheduler Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_SECONDS**

Unknown TAI Seconds

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_ZONE\_CHANGE**

Unknown TAI of Zone Change

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_DELTA\_CHANGE**

Unknown TAI of Delta Change

**ESP\_BLE\_MESH\_TAI\_UTC\_DELTA\_MAX\_VALUE**

Maximum TAI-UTC Delta value

**ESP\_BLE\_MESH\_TAI\_SECONDS\_LEN**

Length of TAI Seconds

**ESP\_BLE\_MESH\_TAI\_OF\_ZONE\_CHANGE\_LEN**

Length of TAI of Zone Change

**ESP\_BLE\_MESH\_TAI\_OF\_DELTA\_CHANGE\_LEN**

Length of TAI of Delta Change

**ESP\_BLE\_MESH\_INVALID\_SCENE\_NUMBER**

Invalid Scene Number

**ESP\_BLE\_MESH\_SCENE\_NUMBER\_LEN**

Length of the Scene Number

<b>ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR</b>	Any year of the Scheduled year
<b>ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY</b>	Any day of the Scheduled day
<b>ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR</b>	Any hour of the Scheduled hour
<b>ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY</b>	Any hour of the Scheduled Day
<b>ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR</b>	Any minute of the Scheduled hour
<b>ESP_BLE_MESH_SCHEDULE_SEC EVERY 15 MIN</b>	Every 15 minutes of the Scheduled hour
<b>ESP_BLE_MESH_SCHEDULE_SEC EVERY 20 MIN</b>	Every 20 minutes of the Scheduled hour
<b>ESP_BLE_MESH_SCHEDULE_SEC_ONCE AN HOUR</b>	Once of the Scheduled hour
<b>ESP_BLE_MESH_SCHEDULE_SEC ANY OF MIN</b>	Any second of the Scheduled minute
<b>ESP_BLE_MESH_SCHEDULE_SEC EVERY 15 SEC</b>	Every 15 seconds of the Scheduled minute
<b>ESP_BLE_MESH_SCHEDULE_SEC EVERY 20 SEC</b>	Every 20 seconds of the Scheduled minute
<b>ESP_BLE_MESH_SCHEDULE_SEC_ONCE AN MIN</b>	Once of the Scheduled minute
<b>ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF</b>	Scheduled Action - Turn Off
<b>ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON</b>	Scheduled Action - Turn On
<b>ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL</b>	Scheduled Action - Scene Recall
<b>ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION</b>	Scheduled Action - No Action
<b>ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE</b>	Scheduled Scene - No Scene
<b>ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX</b>	Maximum number of Scheduled entries
<b>ESP_BLE_MESH_TIME_NONE</b>	Time Role - None
<b>ESP_BLE_MESH_TIME_AUTHORITY</b>	Time Role - Mesh Time Authority
<b>ESP_BLE_MESH_TIME_RELAY</b>	Time Role - Mesh Time Relay
<b>ESP_BLE_MESH_TIME_CLINET</b>	Time Role - Mesh Time Client
<b>ESP_BLE_MESH_SCENE_SUCCESS</b>	Scene operation - Success

**ESP\_BLE\_MESH\_SCENE\_REG\_FULL**  
Scene operation - Scene Register Full

**ESP\_BLE\_MESH\_SCENE\_NOT\_FOUND**  
Scene operation - Scene Not Found

### Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t) (esp_ble_mesh_time_scene_client_cb_event_t
                                                    event,
                                                    esp_ble_mesh_time_scene_client_cb_param_t
                                                    *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t) (esp_ble_mesh_time_scene_server_cb_event_t
                                                    event,
                                                    esp_ble_mesh_time_scene_server_cb_param_t
                                                    *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_time_scene_client_cb_event_t
This enum value is the event of Time Scene Client Model
```

Values:

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_time_scene_server_cb_event_t
This enum value is the event of Time Scene Server Model
```

Values:

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_STATE\_CHANGE\_EVT**

1. When get\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
2. When set\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_GET\_MSG\_EVT**

When get\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Scene Get messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_SET\_MSG\_EVT**

When set\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_EVT\_MAX**

## 2.2 连网 API

[\[English\]](#)

### 2.2.1 Wi-Fi

#### Wi-Fi 库

[\[English\]](#)

**概述** Wi-Fi 库支持配置及监控 ESP32 Wi-Fi 连网功能。

支持配置：

- 基站模式（即 STA 模式或 Wi-Fi 客户端模式），此时 ESP32 连接到接入点 (AP)。
- AP 模式（即 Soft-AP 模式或接入点模式），此时基站连接到 ESP32。
- AP-STA 共存模式（ESP32 既是接入点，同时又作为基站连接到另外一个接入点）。
- 上述模式的各种安全模式（WPA、WPA2 及 WEP 等）。
- 扫描接入点（包括主动扫描及被动扫描）。
- 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

**应用示例** ESP-IDF 示例项目的 [wifi](#) 目录下包含以下应用程序：

- Wi-Fi 示例代码；
- 另外一个简单的应用程序 [esp-idf-template](#)，演示了如何将 ESP32 模组连接到 AP。

#### API 参考

##### Header File

- [esp\\_wifi/include/esp\\_wifi.h](#)

**Functions**

*esp\_err\_t* **esp\_wifi\_init** (const *wifi\_init\_config\_t* \*config)

Init WiFi Alloc resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc, this WiFi also start WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use WIFI\_INIT\_CONFIG\_DEFAULT macro to init the config to default values, this can guarantee all the fields got correct value when more fields are added into *wifi\_init\_config\_t* in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI\_INIT\_CONFIG\_DEFAULT, please be notified that the field 'magic' of *wifi\_init\_config\_t* should always be WIFI\_INIT\_CONFIG\_MAGIC!

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_NO\_MEM: out of memory
- others: refer to error code esp\_err.h

**Parameters**

- config: pointer to WiFi init configuration structure; can point to a temporary variable.

*esp\_err\_t* **esp\_wifi\_deinit** (void)

Deinit WiFi Free all resource allocated in esp\_wifi\_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_mode** (*wifi\_mode\_t* mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is soft-AP mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error code in esp\_err.h

**Parameters**

- mode: WiFi operating mode

*esp\_err\_t* **esp\_wifi\_get\_mode** (*wifi\_mode\_t* \*mode)

Get current operating mode of WiFi.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] mode: store current WiFi mode

*esp\_err\_t* **esp\_wifi\_start** (void)

Start WiFi according to current configuration If mode is WIFI\_MODE\_STA, it create station control block and start station If mode is WIFI\_MODE\_AP, it create soft-AP control block and start soft-AP If mode is WIFI\_MODE\_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_stop** (void)

Stop WiFi If mode is WIFI\_MODE\_STA, it stop station and free station control block If mode is

WIFI\_MODE\_AP, it stop soft-AP and free soft-AP control block If mode is WIFI\_MODE\_APSTA, it stop station/soft-AP and free station/soft-AP control block.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_get\_auto\_connect,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_connect** (void)

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If the ESP32 is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_start\_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn't exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI\_REASON\_NO\_AP\_FOUND.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_ERR\_WIFI\_SSID: SSID of AP which station connects is invalid

*esp\_err\_t* **esp\_wifi\_disconnect** (void)

Disconnect the ESP32 WiFi station from the AP.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi was not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_clear\_fast\_connect** (void)

Currently this API is just an stub API.

#### Return

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_wifi\_deauth\_sta** (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong

#### Parameters

- `aid`: when `aid` is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is `aid`

`esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)`

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in `esp_wifi_scan_get_ap_records`, so generally, call `esp_wifi_scan_get_ap_records` to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_WIFI_TIMEOUT`: blocking scan is timeout
- `ESP_ERR_WIFI_STATE`: wifi still connecting when invoke `esp_wifi_scan_start`
- others: refer to error code in `esp_err.h`

**Parameters**

- `config`: configuration of scanning
- `block`: if `block` is true, this API will block the caller until the scan is done, otherwise it will return immediately

`esp_err_t esp_wifi_scan_stop (void)`

Stop the scan in process.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`

`esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)`

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument

**Parameters**

- [out] `number`: store number of APIs found in last scan

`esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)`

Get AP list found in last scan.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NO_MEM`: out of memory

**Parameters**

- [inout] `number`: As input param, it stores max AP number `ap_records` can hold. As output param, it receives the actual AP number this API returns.
- `ap_records`: `wifi_ap_record_t` array to hold the found APs

`esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)`

Get information of AP which the ESP32 station is associated with.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_CONN`: The station interface don't initialized

- `ESP_ERR_WIFI_NOT_CONNECT`: The station is in disconnect status

**Parameters**

- `ap_info`: the `wifi_ap_record_t` to hold AP information sta can get the connected ap' s phy mode info through the struct member `phy_11b`, `phy_11g`, `phy_11n`, `phy_lr` in the `wifi_ap_record_t` struct. For example, `phy_11b = 1` imply that ap support 802.11b mode

`esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)`

Set current WiFi power save type.

**Attention** Default power save type is `WIFI_PS_MIN_MODEM`.

**Return** `ESP_OK`: succeed

**Parameters**

- `type`: power save type

`esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)`

Get current WiFi power save type.

**Attention** Default power save type is `WIFI_PS_MIN_MODEM`.

**Return** `ESP_OK`: succeed

**Parameters**

- `[out] type`: store current power save type

`esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)`

Set protocol type of specified interface The default protocol is (`WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROT`

**Attention** Currently we only support 802.11b or 802.11g or 802.11bgn mode

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_IF`: invalid interface
- others: refer to error codes in `esp_err.h`

**Parameters**

- `ifx`: interfaces
- `protocol_bitmap`: WiFi protocol bitmap

`esp_err_t esp_wifi_get_protocol (wifi_interface_t ifx, uint8_t *protocol_bitmap)`

Get the current protocol bitmap of the specified interface.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_INVALID_ARG`: invalid argument
- others: refer to error codes in `esp_err.h`

**Parameters**

- `ifx`: interface
- `[out] protocol_bitmap`: store current WiFi protocol bitmap of interface `ifx`

`esp_err_t esp_wifi_set_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t bw)`

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. `WIFI_BW_HT40` is supported only when the interface support 11N

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_INVALID_ARG`: invalid argument
- others: refer to error codes in `esp_err.h`

**Parameters**

- `ifx`: interface to be configured
- `bw`: bandwidth

*esp\_err\_t esp\_wifi\_get\_bandwidth (wifi\_interface\_t ifx, wifi\_bandwidth\_t \*bw)*

Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

*esp\_err\_t esp\_wifi\_set\_channel (uint8\_t primary, wifi\_second\_chan\_t second)*

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp\_wifi\_start()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
- second: for HT20, second is ignored, for HT40, second is the second channel

*esp\_err\_t esp\_wifi\_get\_channel (uint8\_t \*primary, wifi\_second\_chan\_t \*second)*

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- primary: store current primary channel
- [out] second: store current second channel

*esp\_err\_t esp\_wifi\_set\_country (const wifi\_country\_t \*country)*

configure country info

**Attention** 1. The default country is {.cc=" CN" , .schan=1, .nchan=13, policy=WIFI\_COUNTRY\_POLICY\_AUTO}

**Attention** 2. When the country policy is WIFI\_COUNTRY\_POLICY\_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=" USA" , .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=" JP" , .schan=1, .nchan=14} then the country info that will be used is {.cc=" JP" , .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back back to the country info of the station automatically, {.cc=" US" , .schan=1, .nchan=11} in the example.

**Attention** 3. When the country policy is WIFI\_COUNTRY\_POLICY\_MANUAL, always use the configured country info.

**Attention** 4. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is changed also.

**Attention** 5. The country configuration is not stored into flash

**Attention** 6. This API doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- country: the configured country info

*esp\_err\_t* esp\_wifi\_get\_country (*wifi\_country\_t* \*country)

get the current country info

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- country: country info

*esp\_err\_t* esp\_wifi\_set\_mac (*wifi\_interface\_t* ifx, const uint8\_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX” , but can not be “15:XX:XX:XX:XX:XX” .

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MAC: invalid mac address
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interface
- mac: the MAC address

*esp\_err\_t* esp\_wifi\_get\_mac (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

**Parameters**

- ifx: interface
- [out] mac: store mac of the interface ifx

*esp\_err\_t* esp\_wifi\_set\_promiscuous\_rx\_cb (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- cb: callback

*esp\_err\_t* esp\_wifi\_set\_promiscuous (bool en)

Enable the promiscuous mode.

**Return**

- ESP\_OK: succeed

- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- en: false - disable, true - enable

*esp\_err\_t* esp\_wifi\_get\_promiscuous (bool \*en)

Get the promiscuous mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] en: store the current status of promiscuous mode

*esp\_err\_t* esp\_wifi\_set\_promiscuous\_filter (const wifi\_promiscuous\_filter\_t \*filter)

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI\_PKT\_MISC

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- filter: the packet type filtered in promiscuous mode.

*esp\_err\_t* esp\_wifi\_get\_promiscuous\_filter (wifi\_promiscuous\_filter\_t \*filter)

Get the promiscuous filter.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of promiscuous filter

*esp\_err\_t* esp\_wifi\_set\_promiscuous\_ctrl\_filter (const wifi\_promiscuous\_filter\_t \*filter)

Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- filter: the subtype of the control packet filtered in promiscuous mode.

*esp\_err\_t* esp\_wifi\_get\_promiscuous\_ctrl\_filter (wifi\_promiscuous\_filter\_t \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

*esp\_err\_t* esp\_wifi\_set\_config (wifi\_interface\_t interface, wifi\_config\_t \*conf)

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the erro code in esp\_err.h

**Parameters**

- interface: interface
- conf: station or soft-AP configuration

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)  
Get configuration of specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

**Parameters**

- interface: interface
- [out] conf: station or soft-AP configuration

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_list** (*wifi\_sta\_list\_t* \*sta)  
Get STAs associated with soft-AP.

**Attention** SSC only API

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- [out] sta: station list ap can get the connected sta's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_1r in the *wifi\_sta\_info\_t* struct. For example, phy\_11b = 1 imply that sta support 802.11b mode

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_aid** (const uint8\_t mac[6], uint16\_t \*aid)  
Get AID of STA connected with soft-AP.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: Requested resource not found
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- mac: STA's mac address
- [out] aid: Store the AID corresponding to STA mac

*esp\_err\_t* **esp\_wifi\_set\_storage** (*wifi\_storage\_t* storage)  
Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI\_STORAGE\_FLASH

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- storage: : storage type

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie** (bool *enable*, *wifi\_vendor\_ie\_type\_t* *type*, *wifi\_vendor\_ie\_id\_t* *idx*, const void \**vnd\_ie*)

Set 802.11 Vendor-Specific Information Element.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init()
- ESP\_ERR\_INVALID\_ARG: Invalid argument, including if first byte of *vnd\_ie* is not WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD) or second byte is an invalid length.
- ESP\_ERR\_NO\_MEM: Out of memory

#### Parameters

- *enable*: If true, specified IE is enabled. If false, specified IE is removed.
- *type*: Information Element type. Determines the frame type to associate with the IE.
- *idx*: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- *vnd\_ie*: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *wifi\_vendor\_ie\_data\_t*. If *enable* is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie\_cb** (*esp\_vendor\_ie\_cb\_t* *cb*, void \**ctx*)

Register Vendor-Specific Information Element monitoring callback.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

#### Parameters

- *cb*: Callback function
- *ctx*: Context argument, passed to callback function.

*esp\_err\_t* **esp\_wifi\_set\_max\_tx\_power** (int8\_t *power*)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the *max\_tx\_power* of the structure *wifi\_country\_t* variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {78, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 78] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: +-----+-----+ | set value |  
actual value | +-----+-----+ | [8, 19] | 8 | +-----+-----+ | [20, 27] | 20  
| +-----+-----+ | [28, 33] | 28 | +-----+-----+ | [34, 43] | 34 | +-----+-----+ | [44,  
51] | 44 | +-----+-----+ | [52, 55] | 52 | +-----+-----+ | [56, 59] | 56 | +-----+-----+  
+ | [60, 65] | 60 | +-----+-----+ | [66, 71] | 66 | +-----+-----+ | [72, 77] | 72 | +-----+  
-----+ | 78 | 78 | +-----+-----+

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is out of range

#### Parameters

- *power*: Maximum WiFi transmitting power.

*esp\_err\_t* **esp\_wifi\_get\_max\_tx\_power** (int8\_t \**power*)

Get maximum transmitting power after WiFi start.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument

#### Parameters

- `power`: Maximum WiFi transmitting power, unit is 0.25dBm.

`esp_err_t esp_wifi_set_event_mask (uint32_t mask)`

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRECVED`.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `mask`: WiFi event mask.

`esp_err_t esp_wifi_get_event_mask (uint32_t *mask)`

Get mask of WiFi events.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument

**Parameters**

- `mask`: WiFi event mask.

`esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**

- `ESP_OK`: success
- `ESP_ERR_WIFI_IF`: Invalid interface
- `ESP_ERR_INVALID_ARG`: Invalid parameter
- `ESP_ERR_WIFI_NO_MEM`: out of memory

**Parameters**

- `ifx`: interface if the Wi-Fi mode is Station, the `ifx` should be `WIFI_IF_STA`. If the Wi-Fi mode is SoftAP, the `ifx` should be `WIFI_IF_AP`. If the Wi-Fi mode is Station+SoftAP, the `ifx` should be `WIFI_IF_STA` or `WIFI_IF_AP`. If the `ifx` is wrong, the API returns `ESP_ERR_WIFI_IF`.
- `buffer`: raw ieee80211 buffer
- `len`: the length of raw buffer, the `len` must be `<= 1500` Bytes and `>= 24` Bytes
- `en_sys_seq`: indicate whether use the internal sequence number. If `en_sys_seq` is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if `esp_wifi_80211_tx` is called before the Wi-Fi connection has been set up, both `en_sys_seq==true` and `en_sys_seq==false` are fine. However, if the API is called after the Wi-Fi connection has been set up, `en_sys_seq` must be true, otherwise `ESP_ERR_WIFI_ARG` is returned.

`esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)`

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `cb`: callback
- `ctx`: context argument, passed to callback function

`esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)`

Set CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

#### Parameters

- config: configuration

*esp\_err\_t* esp\_wifi\_set\_csi (bool en)

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

#### Parameters

- en: true - enable, false - disable

*esp\_err\_t* esp\_wifi\_set\_ant\_gpio (const wifi\_ant\_gpio\_config\_t \*config)

Set antenna GPIO configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

#### Parameters

- config: Antenna GPIO configuration.

*esp\_err\_t* esp\_wifi\_get\_ant\_gpio (wifi\_ant\_gpio\_config\_t \*config)

Get current antenna GPIO configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

#### Parameters

- config: Antenna GPIO configuration.

*esp\_err\_t* esp\_wifi\_set\_ant (const wifi\_ant\_config\_t \*config)

Set antenna configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

#### Parameters

- config: Antenna configuration.

*esp\_err\_t* esp\_wifi\_get\_ant (wifi\_ant\_config\_t \*config)

Get current antenna configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

#### Parameters

- config: Antenna configuration.

*esp\_err\_t* **esp\_wifi\_set\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t sec)

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force death the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

#### Parameters

- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

*esp\_err\_t* **esp\_wifi\_get\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t \*sec)

Get inactive time of specified interface.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

#### Parameters

- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

*esp\_err\_t* **esp\_wifi\_statdump** (uint32\_t modules)

Dump WiFi statistics.

#### Return

- ESP\_OK: succeed
- others: failed

#### Parameters

- modules: statistic modules to be dumped

## Structures

**struct wifi\_init\_config\_t**

WiFi stack configuration parameters passed to esp\_wifi\_init call.

## Public Members

*system\_event\_handler\_t* **event\_handler**

WiFi event handler

wifi\_osi\_funcs\_t \***osi\_funcs**

WiFi OS functions

wpa\_crypto\_funcs\_t **wpa\_crypto\_funcs**

WiFi station crypto functions when connect

int **static\_rx\_buf\_num**

WiFi static RX buffer number

int **dynamic\_rx\_buf\_num**

WiFi dynamic RX buffer number

int **tx\_buf\_type**

WiFi TX buffer type

**int static\_tx\_buf\_num**  
WiFi static TX buffer number

**int dynamic\_tx\_buf\_num**  
WiFi dynamic TX buffer number

**int csi\_enable**  
WiFi channel state information enable flag

**int ampdu\_rx\_enable**  
WiFi AMPDU RX feature enable flag

**int ampdu\_tx\_enable**  
WiFi AMPDU TX feature enable flag

**int nvs\_enable**  
WiFi NVS flash enable flag

**int nano\_enable**  
Nano option for printf/scan family enable flag

**int tx\_ba\_win**  
WiFi Block Ack TX window size

**int rx\_ba\_win**  
WiFi Block Ack RX window size

**int wifi\_task\_core\_id**  
WiFi Task Core ID

**int beacon\_max\_len**  
WiFi softAP maximum length of the beacon

**int mgmt\_sbuf\_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

**uint64\_t feature\_caps**  
Enables additional WiFi features and capabilities

**int magic**  
WiFi init magic number, it should be the last field

### Macros

**ESP\_ERR\_WIFI\_NOT\_INIT**  
WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**  
WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**  
WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**  
WiFi interface error

**ESP\_ERR\_WIFI\_MODE**  
WiFi mode error

**ESP\_ERR\_WIFI\_STATE**  
WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**  
WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**  
WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**  
MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**  
SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**  
Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**  
Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**  
WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**  
The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**  
Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**  
Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**  
Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**  
Returned when WiFi is stopping

**WIFI\_STATIC\_TX\_BUFFER\_NUM**

**WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

**WIFI\_CSI\_ENABLED**

**WIFI\_INIT\_CONFIG\_DEFAULT()**

### Type Definitions

**typedef** void (\***wifi\_promiscuous\_cb\_t**)(void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

#### Parameters

- **buf**: Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.
- **type**: promiscuous packet type.

```
typedef void (*esp_vendor_ie_cb_t) (void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],  
                                     const vendor_ie_data_t *vnd_ie, int rssi)
```

Function signature for received Vendor-Specific Information Element callback.

#### Parameters

- `ctx`: Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.
- `type`: Information element type, based on frame type received.
- `sa`: Source 802.11 address.
- `vnd_ie`: Pointer to the vendor specific element data received.
- `rssi`: Received signal strength indication.

```
typedef void (*wifi_csi_cb_t) (void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

#### Parameters

- `ctx`: context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.
- `data`: CSI data received. The memory that it points to will be deallocated after callback function returns.

### Header File

- [esp\\_wifi/include/esp\\_wifi\\_types.h](#)

### Unions

```
union wifi_config_t
```

*#include <esp\_wifi\_types.h>* Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

#### Public Members

*wifi\_ap\_config\_t* **ap**  
configuration of AP

*wifi\_sta\_config\_t* **sta**  
configuration of STA

### Structures

```
struct wifi_country_t
```

Structure describing WiFi country-based regional restrictions.

#### Public Members

char **cc**[3]  
country code string

uint8\_t **schan**  
start channel

uint8\_t **nchan**  
total channel number

int8\_t **max\_tx\_power**  
This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

*wifi\_country\_policy\_t* **policy**

country policy

**struct wifi\_active\_scan\_time\_t**

Range of active scan times per channel.

### Public Members

**uint32\_t min**

minimum active scan time per channel, units: millisecond

**uint32\_t max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

**struct wifi\_scan\_time\_t**

Aggregate of active & passive scan time per channel.

### Public Members

*wifi\_active\_scan\_time\_t* **active**

active scan time per channel, units: millisecond.

**uint32\_t passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

**struct wifi\_scan\_config\_t**

Parameters for an SSID scan.

### Public Members

**uint8\_t \*ssid**

SSID of AP

**uint8\_t \*bssid**

MAC address of AP

**uint8\_t channel**

channel, scan the specific channel

**bool show\_hidden**

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

scan time per channel

**struct wifi\_ap\_record\_t**

Description of a WiFi AP.

### Public Members

**uint8\_t bssid[6]**

MAC address of AP

**uint8\_t ssid[33]**

SSID of AP

`uint8_t primary`  
channel of AP

`wifi_second_chan_t second`  
secondary channel of AP

`int8_t rssi`  
signal strength of AP

`wifi_auth_mode_t authmode`  
authmode of AP

`wifi_cipher_type_t pairwise_cipher`  
pairwise cipher of AP

`wifi_cipher_type_t group_cipher`  
group cipher of AP

`wifi_ant_t ant`  
antenna used to receive beacon from AP

`uint32_t phy_11b` : 1  
bit: 0 flag to identify if 11b mode is enabled or not

`uint32_t phy_11g` : 1  
bit: 1 flag to identify if 11g mode is enabled or not

`uint32_t phy_11n` : 1  
bit: 2 flag to identify if 11n mode is enabled or not

`uint32_t phy_1r` : 1  
bit: 3 flag to identify if low rate is enabled or not

`uint32_t wps` : 1  
bit: 4 flag to identify if WPS is supported or not

`uint32_t reserved` : 27  
bit: 5..31 reserved

`wifi_country_t country`  
country information of AP

**struct wifi\_scan\_threshold\_t**  
Structure describing parameters for a WiFi fast scan.

### Public Members

`int8_t rssi`  
The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t authmode`  
The weakest authmode to accept in the fast scan mode

**struct wifi\_pmf\_config\_t**  
Configuration structure for Protected Management Frame

### Public Members

`bool capable`  
Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if other device also advertizes PMF capability.

`bool required`  
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi\_ap\_config\_t**

Soft-AP configuration settings for the ESP32.

**Public Members****uint8\_t ssid[32]**

SSID of ESP32 soft-AP. If ssid\_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid\_len.

**uint8\_t password[64]**

Password of ESP32 soft-AP. Null terminated string.

**uint8\_t ssid\_len**

Optional length of SSID field.

**uint8\_t channel**

Channel of ESP32 soft-AP

**wifi\_auth\_mode\_t authmode**

Auth mode of ESP32 soft-AP. Do not support AUTH\_WEP in soft-AP mode

**uint8\_t ssid\_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

**uint8\_t max\_connection**

Max number of stations allowed to connect in, default 4, max 10

**uint16\_t beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

**struct wifi\_sta\_config\_t**

STA configuration settings for the ESP32.

**Public Members****uint8\_t ssid[32]**

SSID of target AP. Null terminated string.

**uint8\_t password[64]**

Password of target AP. Null terminated string.

**wifi\_scan\_method\_t scan\_method**

do all channel scan or fast scan

**bool bssid\_set**

whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**uint8\_t bssid[6]**

MAC address of target AP

**uint8\_t channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16\_t listen\_interval**

Listen interval for ESP32 station to receive beacon when WIFI\_PS\_MAX\_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi\_sort\_method\_t sort\_method**

sort the connect AP in the list by rssi or security mode

**wifi\_scan\_threshold\_t threshold**

When `sort_method` is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi\_pmf\_config\_t pmf\_cfg**

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

**struct wifi\_sta\_info\_t**

Description of STA associated with AP.

**Public Members**

uint8\_t **mac**[6]

mac address

int8\_t **rss**

current average rssi of sta connected

uint32\_t **phy\_11b** : 1

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g** : 1

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n** : 1

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_lr** : 1

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **reserved** : 28

bit: 4..31 reserved

**struct wifi\_sta\_list\_t**

List of stations associated with the ESP32 Soft-AP.

**Public Members**

wifi\_sta\_info\_t **sta**[ESP\_WIFI\_MAX\_CONN\_NUM]

station list

int **num**

number of stations in the list (other entries are invalid)

**struct vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

uint8\_t **element\_id**

Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]

Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**

Vendor-specific OUI type.

`uint8_t payload[0]`

Payload. Length is equal to value in 'length' field, minus 4.

**struct wifi\_pkt\_rx\_ctrl\_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

### Public Members

signed **rss\_i** : 8

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate** : 5

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **\_\_pad0\_\_** : 1

reserve

unsigned **sig\_mode** : 2

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **\_\_pad1\_\_** : 16

reserve

unsigned **mcs** : 7

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb** : 1

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **\_\_pad2\_\_** : 16

reserve

unsigned **smoothing** : 1

reserve

unsigned **not\_sounding** : 1

reserve

unsigned **\_\_pad3\_\_** : 1

reserve

unsigned **aggregation** : 1

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc** : 2

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec\_coding** : 1

Flag is set for 11n packets which are LDPC

unsigned **sgi** : 1

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **ampdu\_cnt** : 8

ampdu cnt

unsigned **channel** : 4

primary channel on which this packet is received

unsigned **secondary\_channel** : 4

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **\_\_pad4\_\_** : 8

reserve

unsigned **timestamp** : 32  
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **\_\_pad5\_\_** : 32  
reserve

unsigned **\_\_pad6\_\_** : 31  
reserve

unsigned **ant** : 1  
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **sig\_len** : 12  
length of packet including Frame Check Sequence(FCS)

unsigned **\_\_pad7\_\_** : 12  
reserve

unsigned **rx\_state** : 8  
state of the packet. 0: no error; others: error numbers which are not public

**struct wifi\_promiscuous\_pkt\_t**

Payload passed to 'buf' parameter of promiscuous mode RX callback.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**  
metadata header

uint8\_t **payload**[0]  
Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

**struct wifi\_promiscuous\_filter\_t**

Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**  
OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

**struct wifi\_csi\_config\_t**

Channel state information(CSI) configuration type.

### Public Members

bool **lltf\_en**  
enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf\_en**  
enable to receive HT long training field(htltf) data. Default enabled

bool **stbc\_htltf2\_en**  
enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf\_merge\_en**  
enable to generate htltf data by averaging lltf and ht\_ltf data when receiving HT packet. Otherwise, use ht\_ltf data directly. Default enabled

bool **channel\_filter\_en**  
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu\_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8\_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

**struct wifi\_csi\_info\_t**

CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

received packet radio metadata header of the CSI data

uint8\_t **mac**[6]

source MAC address of the CSI data

bool **first\_word\_invalid**

first four bytes of the CSI data is invalid or not

int8\_t \***buf**

buffer of CSI data

uint16\_t **len**

length of CSI data

**struct wifi\_ant\_gpio\_t**

WiFi GPIO configuration for antenna selection.

### Public Members

uint8\_t **gpio\_select** : 1

Whether this GPIO is connected to external antenna switch

uint8\_t **gpio\_num** : 7

The GPIO number that connects to external antenna switch

**struct wifi\_ant\_gpio\_config\_t**

WiFi GPIOs configuration for antenna selection.

### Public Members

*wifi\_ant\_gpio\_t* **gpio\_cfg**[4]

The configurations of GPIOs that connect to external antenna switch

**struct wifi\_ant\_config\_t**

WiFi antenna configuration.

### Public Members

*wifi\_ant\_mode\_t* **rx\_ant\_mode**

WiFi antenna mode for receiving

*wifi\_ant\_t* **rx\_ant\_default**

Default antenna mode for receiving, it's ignored if rx\_ant\_mode is not WIFI\_ANT\_MODE\_AUTO

*wifi\_ant\_mode\_t* **tx\_ant\_mode**

WiFi antenna mode for transmission, it can be set to WIFI\_ANT\_MODE\_AUTO only if rx\_ant\_mode is set to WIFI\_ANT\_MODE\_AUTO

`uint8_t enabled_ant0` : 4  
Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT0

`uint8_t enabled_ant1` : 4  
Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT1

**struct wifi\_event\_sta\_scan\_done\_t**  
Argument structure for WIFI\_EVENT\_SCAN\_DONE event

### Public Members

`uint32_t status`  
status of scanning APs: 0 — success, 1 - failure

`uint8_t number`  
number of scan results

`uint8_t scan_id`  
scan sequence number, used for block scan

**struct wifi\_event\_sta\_connected\_t**  
Argument structure for WIFI\_EVENT\_STA\_CONNECTED event

### Public Members

`uint8_t ssid[32]`  
SSID of connected AP

`uint8_t ssid_len`  
SSID length of connected AP

`uint8_t bssid[6]`  
BSSID of connected AP

`uint8_t channel`  
channel of connected AP

`wifi_auth_mode_t authmode`  
authentication mode used by AP

**struct wifi\_event\_sta\_disconnected\_t**  
Argument structure for WIFI\_EVENT\_STA\_DISCONNECTED event

### Public Members

`uint8_t ssid[32]`  
SSID of disconnected AP

`uint8_t ssid_len`  
SSID length of disconnected AP

`uint8_t bssid[6]`  
BSSID of disconnected AP

`uint8_t reason`  
reason of disconnection

**struct wifi\_event\_sta\_authmode\_change\_t**  
Argument structure for WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE event

**Public Members**

*wifi\_auth\_mode\_t* **old\_mode**  
the old auth mode of AP

*wifi\_auth\_mode\_t* **new\_mode**  
the new auth mode of AP

**struct wifi\_event\_sta\_wps\_er\_pin\_t**  
Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_PIN event

**Public Members**

uint8\_t **pin\_code**[8]  
PIN code of station in enrollee mode

**struct wifi\_event\_sta\_wps\_er\_success\_t**  
Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event

**Public Members**

uint8\_t **ap\_cred\_cnt**  
Number of AP credentials received

uint8\_t **ssid**[MAX\_SSID\_LEN]  
SSID of AP

uint8\_t **passphrase**[MAX\_PASSPHRASE\_LEN]  
Passphrase for the AP

**struct** *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] **ap\_cred**[MAX\_WPS\_AP\_CRED]  
All AP credentials received from WPS handshake

**struct wifi\_event\_ap\_staconnected\_t**  
Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

**Public Members**

uint8\_t **mac**[6]  
MAC address of the station connected to ESP32 soft-AP

uint8\_t **aid**  
the aid that ESP32 soft-AP gives to the station connected to

**struct wifi\_event\_ap\_stadisconnected\_t**  
Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

**Public Members**

uint8\_t **mac**[6]  
MAC address of the station disconnects to ESP32 soft-AP

uint8\_t **aid**  
the aid that ESP32 soft-AP gave to the station disconnects to

**struct wifi\_event\_ap\_probe\_req\_rx\_t**  
Argument structure for WIFI\_EVENT\_AP\_PROBEREQRCVED event

### Public Members

`int rssi`  
Received probe request signal strength

`uint8_t mac[6]`  
MAC address of the station which send probe request

### Macros

`WIFI_IF_STA`

`WIFI_IF_AP`

`WIFI_PROTOCOL_11B`

`WIFI_PROTOCOL_11G`

`WIFI_PROTOCOL_11N`

`WIFI_PROTOCOL_LR`

`ESP_WIFI_MAX_CONN_NUM`  
max number of stations which can connect to ESP32 soft-AP

`WIFI_VENDOR_IE_ELEMENT_ID`

`WIFI_PROMIS_FILTER_MASK_ALL`  
filter all packets

`WIFI_PROMIS_FILTER_MASK_MGMT`  
filter the packets with type of `WIFI_PKT_MGMT`

`WIFI_PROMIS_FILTER_MASK_CTRL`  
filter the packets with type of `WIFI_PKT_CTRL`

`WIFI_PROMIS_FILTER_MASK_DATA`  
filter the packets with type of `WIFI_PKT_DATA`

`WIFI_PROMIS_FILTER_MASK_MISC`  
filter the packets with type of `WIFI_PKT_MISC`

`WIFI_PROMIS_FILTER_MASK_DATA_MPDU`  
filter the MPDU which is a kind of `WIFI_PKT_DATA`

`WIFI_PROMIS_FILTER_MASK_DATA_AMPDU`  
filter the AMPDU which is a kind of `WIFI_PKT_DATA`

`WIFI_PROMIS_CTRL_FILTER_MASK_ALL`  
filter all control packets

`WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER`  
filter the control packets with subtype of Control Wrapper

`WIFI_PROMIS_CTRL_FILTER_MASK_BAR`  
filter the control packets with subtype of Block Ack Request

`WIFI_PROMIS_CTRL_FILTER_MASK_BA`  
filter the control packets with subtype of Block Ack

`WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL`  
filter the control packets with subtype of PS-Poll

`WIFI_PROMIS_CTRL_FILTER_MASK_RTS`  
filter the control packets with subtype of RTS

`WIFI_PROMIS_CTRL_FILTER_MASK_CTS`  
filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**  
filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**  
filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**  
filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**  
mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**  
mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED**  
mask SYSTEM\_EVENT\_AP\_PROBEREQRECVED event

**MAX\_SSID\_LEN**

**MAX\_PASSPHRASE\_LEN**

**MAX\_WPS\_AP\_CRED**

**WIFI\_STATIS\_BUFFER**

**WIFI\_STATIS\_RXTX**

**WIFI\_STATIS\_HW**

**WIFI\_STATIS\_DIAG**

**WIFI\_STATIS\_ALL**

### Type Definitions

```
typedef esp_interface_t wifi_interface_t
```

### Enumerations

```
enum wifi_mode_t
```

*Values:*

**WIFI\_MODE\_NULL** = 0  
null mode

**WIFI\_MODE\_STA**  
WiFi station mode

**WIFI\_MODE\_AP**  
WiFi soft-AP mode

**WIFI\_MODE\_APSTA**  
WiFi station + soft-AP mode

**WIFI\_MODE\_MAX**

```
enum wifi_country_policy_t
```

*Values:*

**WIFI\_COUNTRY\_POLICY\_AUTO**  
Country policy is auto, use the country info of AP to which the station is connected

**WIFI\_COUNTRY\_POLICY\_MANUAL**  
Country policy is manual, always use the configured country info

```
enum wifi_auth_mode_t
```

*Values:*

**WIFI\_AUTH\_OPEN** = 0  
authenticate mode : open

```
WIFI_AUTH_WEP
    authenticate mode : WEP

WIFI_AUTH_WPA_PSK
    authenticate mode : WPA_PSK

WIFI_AUTH_WPA2_PSK
    authenticate mode : WPA2_PSK

WIFI_AUTH_WPA_WPA2_PSK
    authenticate mode : WPA_WPA2_PSK

WIFI_AUTH_WPA2_ENTERPRISE
    authenticate mode : WPA2_ENTERPRISE

WIFI_AUTH_WPA3_PSK
    authenticate mode : WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
    authenticate mode : WPA2_WPA3_PSK

WIFI_AUTH_MAX
```

```
enum wifi_err_reason_t
```

*Values:*

```
WIFI_REASON_UNSPECIFIED = 1
WIFI_REASON_AUTH_EXPIRE = 2
WIFI_REASON_AUTH_LEAVE = 3
WIFI_REASON_ASSOC_EXPIRE = 4
WIFI_REASON_ASSOC_TOOMANY = 5

WIFI_REASON_802_1X_AUTH_FAILED = 23
WIFI_REASON_CIPHER_SUITE_REJECTED = 24
WIFI_REASON_INVALID_PMKID = 53
WIFI_REASON_BEACON_TIMEOUT = 200
```

**WIFI\_REASON\_NO\_AP\_FOUND** = 201

**WIFI\_REASON\_AUTH\_FAIL** = 202

**WIFI\_REASON\_ASSOC\_FAIL** = 203

**WIFI\_REASON\_HANDSHAKE\_TIMEOUT** = 204

**WIFI\_REASON\_CONNECTION\_FAIL** = 205

**WIFI\_REASON\_AP\_TSF\_RESET** = 206

**enum wifi\_second\_chan\_t**

*Values:*

**WIFI\_SECOND\_CHAN\_NONE** = 0

the channel width is HT20

**WIFI\_SECOND\_CHAN\_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

**WIFI\_SECOND\_CHAN\_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

**enum wifi\_scan\_type\_t**

*Values:*

**WIFI\_SCAN\_TYPE\_ACTIVE** = 0

active scan

**WIFI\_SCAN\_TYPE\_PASSIVE**

passive scan

**enum wifi\_cipher\_type\_t**

*Values:*

**WIFI\_CIPHER\_TYPE\_NONE** = 0

the cipher type is none

**WIFI\_CIPHER\_TYPE\_WEP40**

the cipher type is WEP40

**WIFI\_CIPHER\_TYPE\_WEP104**

the cipher type is WEP104

**WIFI\_CIPHER\_TYPE\_TKIP**

the cipher type is TKIP

**WIFI\_CIPHER\_TYPE\_CCMP**

the cipher type is CCMP

**WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**

the cipher type is TKIP and CCMP

**WIFI\_CIPHER\_TYPE\_AES\_CMAC128**

the cipher type is AES-CMAC-128

**WIFI\_CIPHER\_TYPE\_UNKNOWN**

the cipher type is unknown

**enum wifi\_ant\_t**

WiFi antenna.

*Values:*

**WIFI\_ANT\_ANT0**

WiFi antenna 0

**WIFI\_ANT\_ANT1**

WiFi antenna 1

**WIFI\_ANT\_MAX**

Invalid WiFi antenna

**enum wifi\_scan\_method\_t***Values:***WIFI\_FAST\_SCAN = 0**

Do fast scan, scan will end after find SSID match AP

**WIFI\_ALL\_CHANNEL\_SCAN**

All channel scan, scan will end after scan all the channel

**enum wifi\_sort\_method\_t***Values:***WIFI\_CONNECT\_AP\_BY\_SIGNAL = 0**

Sort match AP in scan list by RSSI

**WIFI\_CONNECT\_AP\_BY\_SECURITY**

Sort match AP in scan list by security mode

**enum wifi\_ps\_type\_t***Values:***WIFI\_PS\_NONE**

No power save

**WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

**WIFI\_PS\_MAX\_MODEM**Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi\\_sta\\_config\\_t](#)**enum wifi\_bandwidth\_t***Values:***WIFI\_BW\_HT20 = 1****WIFI\_BW\_HT40****enum wifi\_storage\_t***Values:***WIFI\_STORAGE\_FLASH**

all configuration will store in both memory and flash

**WIFI\_STORAGE\_RAM**

all configuration will only store in the memory

**enum wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:***WIFI\_VND\_IE\_TYPE\_BEACON****WIFI\_VND\_IE\_TYPE\_PROBE\_REQ****WIFI\_VND\_IE\_TYPE\_PROBE\_RESP****WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ****WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP****enum wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

**WIFI\_VND\_IE\_ID\_0**

**WIFI\_VND\_IE\_ID\_1**

**enum wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

**WIFI\_PKT\_MGMT**

Management frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

**WIFI\_PKT\_CTRL**

Control frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

**WIFI\_PKT\_DATA**

Data frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

**WIFI\_PKT\_MISC**

Other type, such as MIMO etc. ‘buf’ argument is *wifi\_promiscuous\_pkt\_t* but the payload is zero length.

**enum wifi\_ant\_mode\_t**

WiFi antenna mode.

Values:

**WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

**WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

**WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

**WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

**enum wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

Values:

**WIFI\_PHY\_RATE\_1M\_L** = 0x00

1 Mbps with long preamble

**WIFI\_PHY\_RATE\_2M\_L** = 0x01

2 Mbps with long preamble

**WIFI\_PHY\_RATE\_5M\_L** = 0x02

5.5 Mbps with long preamble

**WIFI\_PHY\_RATE\_11M\_L** = 0x03

11 Mbps with long preamble

**WIFI\_PHY\_RATE\_2M\_S** = 0x05

2 Mbps with short preamble

**WIFI\_PHY\_RATE\_5M\_S** = 0x06

5.5 Mbps with short preamble

**WIFI\_PHY\_RATE\_11M\_S** = 0x07

11 Mbps with short preamble

**WIFI\_PHY\_RATE\_48M** = 0x08

48 Mbps

**WIFI\_PHY\_RATE\_24M** = 0x09  
24 Mbps

**WIFI\_PHY\_RATE\_12M** = 0x0A  
12 Mbps

**WIFI\_PHY\_RATE\_6M** = 0x0B  
6 Mbps

**WIFI\_PHY\_RATE\_54M** = 0x0C  
54 Mbps

**WIFI\_PHY\_RATE\_36M** = 0x0D  
36 Mbps

**WIFI\_PHY\_RATE\_18M** = 0x0E  
18 Mbps

**WIFI\_PHY\_RATE\_9M** = 0x0F  
9 Mbps

**WIFI\_PHY\_RATE\_MCS0\_LGI** = 0x10  
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS1\_LGI** = 0x11  
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS2\_LGI** = 0x12  
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS3\_LGI** = 0x13  
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS4\_LGI** = 0x14  
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS5\_LGI** = 0x15  
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS6\_LGI** = 0x16  
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS7\_LGI** = 0x17  
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS0\_SGI** = 0x18

**WIFI\_PHY\_RATE\_MCS2\_SGI** = 0x1A  
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS3\_SGI** = 0x1B  
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS4\_SGI** = 0x1C  
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS5\_SGI** = 0x1D  
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS6\_SGI** = 0x1E  
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

**WIFI\_PHY\_RATE\_MCS7\_SGI** = 0x1F  
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

**WIFI\_PHY\_RATE\_LORA\_250K** = 0x29  
250 Kbps

**WIFI\_PHY\_RATE\_LORA\_500K** = 0x2A  
500 Kbps

**WIFI\_PHY\_RATE\_MAX**

**enum wifi\_event\_t**

WiFi event declarations

*Values:*

**WIFI\_EVENT\_WIFI\_READY** = 0  
ESP32 WiFi ready

**WIFI\_EVENT\_SCAN\_DONE**  
ESP32 finish scanning AP

**WIFI\_EVENT\_STA\_START**  
ESP32 station start

**WIFI\_EVENT\_STA\_STOP**  
ESP32 station stop

**WIFI\_EVENT\_STA\_CONNECTED**  
ESP32 station connected to AP

**WIFI\_EVENT\_STA\_DISCONNECTED**  
ESP32 station disconnected from AP

**WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**  
the auth mode of AP connected by ESP32 station changed

**WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**  
ESP32 station wps succeeds in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**  
ESP32 station wps fails in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**  
ESP32 station wps timeout in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_PIN**  
ESP32 station wps pin code in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**  
ESP32 station wps overlap in enrollee mode

**WIFI\_EVENT\_AP\_START**  
ESP32 soft-AP start

**WIFI\_EVENT\_AP\_STOP**  
ESP32 soft-AP stop

**WIFI\_EVENT\_AP\_STACONNECTED**  
a station connected to ESP32 soft-AP

**WIFI\_EVENT\_AP\_STADISCONNECTED**  
a station disconnected from ESP32 soft-AP

**WIFI\_EVENT\_AP\_PROBEREQRCVD**  
Receive probe request packet in soft-AP interface

**WIFI\_EVENT\_MAX**  
Invalid WiFi event ID

**enum wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for **WIFI\_EVENT\_STA\_WPS\_ER\_FAILED** event

Values:

```
WPS_FAIL_REASON_NORMAL = 0
    ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
    ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX
```

## SmartConfig

[English]

## API 参考

### Header File

- `esp_wifi/include/esp_smartconfig.h`

### Functions

**const** char \***esp\_smartconfig\_get\_version** (void)  
Get the version of SmartConfig.

#### Return

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (**const** *smartconfig\_start\_config\_t* \*config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

#### Return

- ESP\_OK: succeed
- others: fail

#### Parameters

- config: pointer to smartconfig start configure structure

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

#### Return

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

#### Return

- ESP\_OK: succeed
- others: fail

#### Parameters

- time\_s: range 15s~255s, offset:45s.

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Return**

- ESP\_OK: succeed
- others: fail

**Parameters**

- type: Choose from the smartconfig\_type\_t.

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool *enable*)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API esp\_smartconfig\_start.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

**Return**

- ESP\_OK: succeed
- others: fail

**Parameters**

- enable: false-disable(default); true-enable;

**Structures**

**struct smartconfig\_event\_got\_ssid\_pswd\_t**

Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

**Public Members**

uint8\_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8\_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid\_set**

whether set MAC address of target AP or not.

uint8\_t **bssid**[6]

MAC address of target AP.

*smartconfig\_type\_t* **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]

IP address of cellphone.

**struct smartconfig\_start\_config\_t**

Configure structure for esp\_smartconfig\_start

**Public Members**

bool **enable\_log**

Enable smartconfig logs.

**Macros**

**SMARTCONFIG\_START\_CONFIG\_DEFAULT** ()

**Enumerations**

**enum smartconfig\_type\_t**

*Values:*

```

SC_TYPE_ESPTOUCH = 0
    protocol: ESPTouch

SC_TYPE_AIRKISS
    protocol: AirKiss

SC_TYPE_ESPTOUCH_AIRKISS
    protocol: ESPTouch and AirKiss
enum smartconfig_event_t
    Smartconfig event declarations

    Values:

SC_EVENT_SCAN_DONE
    ESP32 station smartconfig has finished to scan for APs

SC_EVENT_FOUND_CHANNEL
    ESP32 station smartconfig has found the channel of the target AP

SC_EVENT_GOT_SSID_PSWD
    ESP32 station smartconfig got the SSID and password

SC_EVENT_SEND_ACK_DONE
    ESP32 station smartconfig has sent ACK to cellphone

```

## ESP-NOW

[英文]

**概述** ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用于保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

**帧格式** ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为：

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示：

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。
- 长度：长度是组织标识符、类型、版本和正文的总长度。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。

- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

## 安全

**ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始**

- PMK 可使用 AES-128 算法加密 LMK。请调用 `esp_now_set_pmk()` 设置 PMK。如果未设置 PMK，将使用默认 PMK。
- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密，最多拥有 6 个不同的 LMK。如果未设置配对设备的 LMK，则动作帧不进行加密。

目前，不支持加密组播供应商特定的动作帧。

**初始化和反初始化** 调用 `esp_now_init()` 初始化 ESP-NOW，调用 `esp_now_deinit()` 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 `esp_now_deinit()` 时，配对设备的所有信息都将被删除。

**添加配对设备** 在将数据发送到其他设备之前，请先调用 `esp_now_add_peer()` 将其添加到配对设备列表中。配对设备的最大数量是 20。如果启用了加密，则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 ~ 14。如果信道设置为 0，数据将在当前信道上发送。否则，必须使用本地设备所在的通道。

**发送 ESP-NOW 数据** 调用 `esp_now_send()` 发送 ESP-NOW 数据，调用 `esp_now_register_send_cb` 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则，它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，则调用 `esp_now_send()` 一次性发送不大于 250 字节的数据。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此，建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数发布到队列，并交给优先级较低的任务处理。

**接收 ESP-NOW 数据** 调用 `esp_now_register_rcv_cb` 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数发布到队列，并交给优先级较低的任务处理。

## API 参考

### Header File

- [esp\\_wifi/include/esp\\_now.h](#)

## Functions

*esp\_err\_t* **esp\_now\_init** (void)

Initialize ESPNOW function.

### Return

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_INTERNAL : Internal error

*esp\_err\_t* **esp\_now\_deinit** (void)

De-initialize ESPNOW function.

### Return

- ESP\_OK : succeed

*esp\_err\_t* **esp\_now\_get\_version** (uint32\_t \**version*)

Get the version of ESPNOW.

### Return

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

### Parameters

- *version*: ESPNOW version

*esp\_err\_t* **esp\_now\_register\_recv\_cb** (*esp\_now\_recv\_cb\_t* *cb*)

Register callback function of receiving ESPNOW data.

### Return

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

### Parameters

- *cb*: callback function of receiving ESPNOW data

*esp\_err\_t* **esp\_now\_unregister\_recv\_cb** (void)

Unregister callback function of receiving ESPNOW data.

### Return

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_register\_send\_cb** (*esp\_now\_send\_cb\_t* *cb*)

Register callback function of sending ESPNOW data.

### Return

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

### Parameters

- *cb*: callback function of sending ESPNOW data

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

### Return

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (const uint8\_t \**peer\_addr*, const uint8\_t \**data*, size\_t *len*)

Send ESPNOW data.

**Attention** 1. If *peer\_addr* is not NULL, send data to the peer whose MAC address matches *peer\_addr*

**Attention** 2. If *peer\_addr* is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of *data* must be less than ESP\_NOW\_MAX\_DATA\_LEN

**Attention** 4. The buffer pointed to by *data* argument does not need to be valid after *esp\_now\_send* returns

### Return

- ESP\_OK : succeed

- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

**Parameters**

- `peer_addr`: peer MAC address
- `data`: data to send
- `len`: length of data

`esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)`

Add a peer to peer list.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

**Parameters**

- `peer`: peer information

`esp_err_t esp_now_del_peer (const uint8_t *peer_addr)`

Delete a peer from peer list.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

**Parameters**

- `peer_addr`: peer MAC address

`esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)`

Modify a peer.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

**Parameters**

- `peer`: peer information

`esp_err_t esp_now_get_peer (const uint8_t *peer_addr, esp_now_peer_info_t *peer)`

Get a peer whose MAC address matches `peer_addr` from peer list.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

**Parameters**

- `peer_addr`: peer MAC address
- `peer`: peer information

`esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)`

Fetch a peer from peer list.

**Return**

- `ESP_OK` : succeed

- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

**Parameters**

- `from_head`: fetch from head of list or not
- `peer`: peer information

bool **esp\_now\_is\_peer\_exist** (`const` uint8\_t \**peer\_addr*)

Peer exists or not.

**Return**

- true : peer exists
- false : peer not exists

**Parameters**

- `peer_addr`: peer MAC address

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t* \**num*)

Get the number of peers.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument

**Parameters**

- `num`: number of peers

*esp\_err\_t* **esp\_now\_set\_pmk** (`const` uint8\_t \**pmk*)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument

**Parameters**

- `pmk`: primary master key

**Structures**

**struct esp\_now\_peer\_info**

ESPNOW peer information parameters.

**Public Members**

uint8\_t **peer\_addr**[`ESP_NOW_ETH_ALEN`]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[`ESP_NOW_KEY_LEN`]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

**struct esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

**Public Members**

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

**Macros****ESP\_ERR\_ESPNOW\_BASE**

ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT**

ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG**

Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM**

Out of memory

**ESP\_ERR\_ESPNOW\_FULL**

ESPNOW peer list is full

**ESP\_ERR\_ESPNOW\_NOT\_FOUND**

ESPNOW peer is not found

**ESP\_ERR\_ESPNOW\_INTERNAL**

Internal error

**ESP\_ERR\_ESPNOW\_EXIST**

ESPNOW peer has existed

**ESP\_ERR\_ESPNOW\_IF**

Interface error

**ESP\_NOW\_ETH\_ALEN**

Length of ESPNOW peer MAC address

**ESP\_NOW\_KEY\_LEN**

Length of ESPNOW peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNOW total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of ESPNOW data which is sent very time

**Type Definitions**

**typedef struct esp\_now\_peer\_info esp\_now\_peer\_info\_t**

ESPNOW peer information parameters.

**typedef struct esp\_now\_peer\_num esp\_now\_peer\_num\_t**

Number of ESPNOW peers which exist currently.

**typedef void (\*esp\_now\_recv\_cb\_t)(const uint8\_t \*mac\_addr, const uint8\_t \*data, int data\_len)**

Callback function of receiving ESPNOW data.

**Parameters**

- `mac_addr`: peer MAC address
- `data`: received data
- `data_len`: length of received data

```
typedef void (*esp_now_send_cb_t) (const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

#### Parameters

- `mac_addr`: peer MAC address
- `status`: status of sending ESPNOW data (succeed or fail)

#### Enumerations

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

Values:

```
ESP_NOW_SEND_SUCCESS = 0
```

Send ESPNOW data successfully

```
ESP_NOW_SEND_FAIL
```

Send ESPNOW data fail

## ESP-MESH 编程指南

[English]

这是 ESP-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. [ESP-MESH 编程模型](#)
2. [编写 ESP-MESH 应用程序](#)
3. [自组网](#)
4. [应用实例](#)
5. [API 参考](#)

有关 ESP-MESH 协议的文档，请见[ESP-MESH API 指南](#)。有关 ESP-MESH 开发框架的更多内容，请见[ESP-MESH 开发框架](#)。

### ESP-MESH 编程模型

**软件栈** ESP-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-MESH 软件栈。

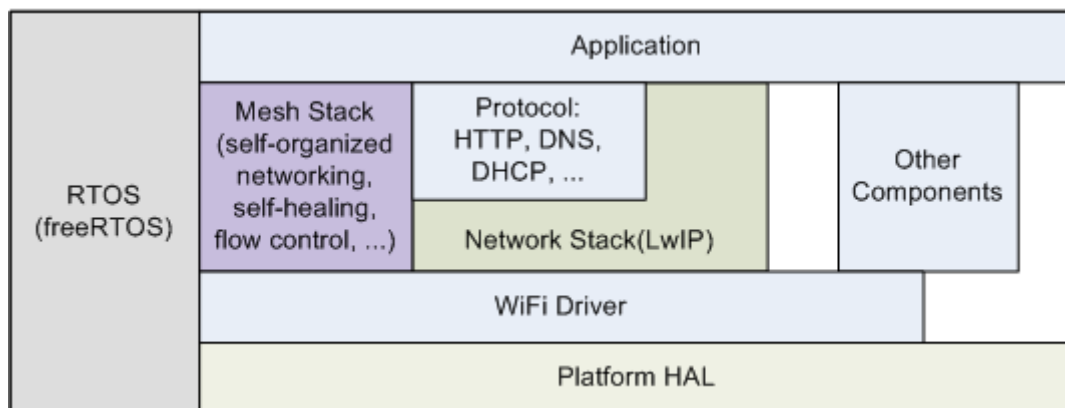

图 2: ESP-MESH 软件栈

**系统事件** 应用程序可通过 **ESP-MESH 事件** 与 ESP-MESH 交互。由于 ESP-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 **Wi-Fi 事件任务** 与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-MESH 应用程序中各种系统事件的接口。

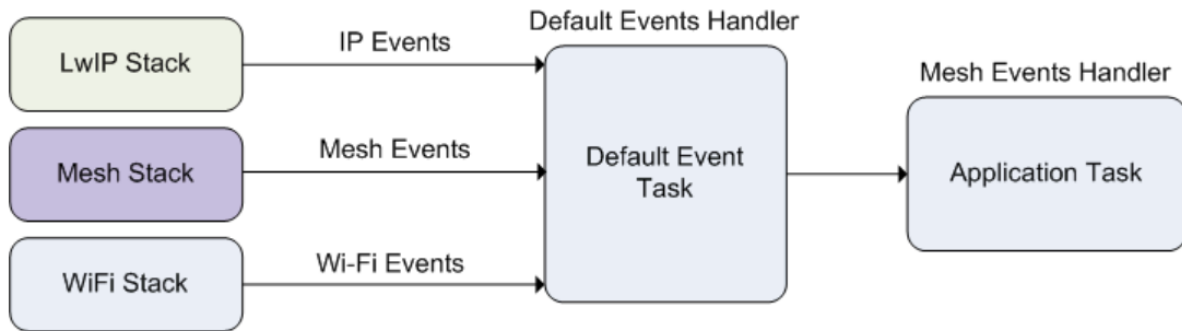

图 3: ESP-MESH 系统事件交付

`mesh_event_id_t` 定义了所有可能的 ESP-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-MESH 事件，则必须通过 `esp_event_handler_register()` 将 **Mesh 事件处理程序** 注册在默认事件任务中。注册完成后，ESP-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

Mesh 事件的典型应用场景包括：使用 `MESH_EVENT_PARENT_CONNECTED` 和 `MESH_EVENT_CHILD_CONNECTED` 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用 `IP_EVENT_STA_GOT_IP` 和 `IP_EVENT_STA_LOST_IP` 事件来指示根节点何时可以向外部 IP 网络传输数据。

**警告：** 在自组网模式下使用 ESP-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-MESH 的自组网行为。因此，用户不应该在 `esp_mesh_start()` 和 `esp_mesh_stop()` 之间调用 Wi-Fi API。

**LwIP & ESP-MESH** 应用程序无需通过 LwIP 层便可直接访问 ESP-MESH 软件栈，LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

每个节点都需要通过调用 `tcpip_adapter_init()` 初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序应该在 LwIP 初始化完成后停止以下服务：

- SoftAP 接口上的 DHCP 服务器服务。
- Station 接口上的 DHCP 客户端服务。

下方代码片段展示如何为 ESP-MESH 应用程序进行 LwIP 初始化。

```

/* tcpip 初始化 */
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
 * 默认情况下，在 Station 接口上停止 DHCP 客户端
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
  
```

**注解：** ESP-MESH 的根节点必须与路由器连接。因此，当一个节点成为根节点时，该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址。这样做将允许其他节点开始向/从外部 IP 网络发

送/接收数据包。但是，如果使用静态 IP 设置，则不需要执行此步骤。

**编写 ESP-MESH 应用程序** ESP-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-MESH 在开始自身初始化前必须完成的步骤。

```
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
 * 默认情况下，在 Station 接口上停止 DHCP 客户端
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

/* 事件初始化 */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/*Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* 注册 IP 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↵event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

在完成 LwIP 和 Wi-Fi 的初始化后，需完成以下三个步骤以启动并运行 ESP-MESH。

1. 初始化 Mesh
2. 配置 ESP-MESH 网络
3. 启动 Mesh

**初始化 Mesh** 下方代码片段展示如何初始化 ESP-MESH。

```
/*Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/* 注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↵event_handler, NULL));
```

**配置 ESP-MESH 网络** ESP-MESH 可通过 `esp_mesh_set_config()` 进行配置，并使用 `mesh_cfg_t` 结构体传递参数。该结构体包含以下 ESP-MESH 的配置参数：

参数	描述
Channel (信道)	1 到 14 信道
Mesh ID	ESP-MESH 网络的 ID，见 <code>mesh_addr_t</code> 。
Router (路由器)	路由器配置，见 <code>mesh_router_t</code> 。
Mesh AP	Mesh AP 配置，见 <code>mesh_ap_cfg_t</code>
Crypto Functions (加密函数)	Mesh IE 的加密函数，见 <code>mesh_crypto_funcs_t</code> 。

下方代码片段展示如何配置 ESP-MESH。

```
/* 默认启用 MESH IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* Mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 信道 (需与路由器信道匹配) */
```

(下页继续)

```

cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
        strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
        strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

**启动 Mesh** 下方代码片段展示如何启动 ESP-MESH。

```

/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());

```

启动 ESP-MESH 后，应用程序应检查 ESP-MESH 事件，以确定它是何时连接到网络的。连接后，应用程序可使用 `esp_mesh_send()` 和 `esp_mesh_recv()` 在 ESP-MESH 网络中发送、接收数据包。

**自组网** 自组网是 ESP-MESH 的功能之一，允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-MESH 网络具有很高的自主性，可适应变化的动态网络拓扑结构和环境。启用自组网功能后，ESP-MESH 网络中的节点能够自主完成以下操作：

- 选择或选举根节点（见 [Building a Network](#) 中的 **自动根节点选择**）
- 选择首选的父节点（见 [Building a Network](#) 中的 **父节点选择**）
- 网络断开时自动重新连接（见 [Managing a Network](#) 中的 **中间父节点失败**）

启用自组网功能后，ESP-MESH 软件栈将内部调用 Wi-Fi API。因此，在启用自组网功能时，应用层不得调用 Wi-Fi API，否则会干扰 ESP-MESH 的工作。

**开关自组网** 应用程序可以在运行时通过调用 `esp_mesh_set_self_organized()` 函数，启用或禁用自组网功能。该函数具有以下两个参数：

- `bool enable` 指定启用或禁用自组网功能。
- `bool select_parent` 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态，选择新的父节点具有不同的作用。在禁用自组网功能时，此参数不使用。

**禁用自组网** 下方代码片段展示了如何禁用自组网功能。

```

//禁用自组网
esp_mesh_set_self_organized(false, false);

```

ESP-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

**启用自组网** ESP-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

是否选择父节点	是否为根节点	作用
N	N	已连接到父节点的节点将保持连接。 之前扫描父节点的节点将停止扫描。调用 <code>esp_mesh_connect()</code> 重新启动。
	Y	已连接到路由器的根节点将保持连接。
		从路由器断开的根节点需调用 <code>esp_mesh_connect()</code> 进行重连。
Y	N	没有父节点的节点将自动选择首选父节点并连接。 已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。
	Y	根节点在连接至父节点前必须放弃“根节点”的角色。因此，根节点将断开与路由器和所有子节点连接，选择首选父节点并进行连接。

下方代码片段展示了如何启用自组网功能。

```
//启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...

//启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**调用 Wi-Fi API** 在有些情况下，应用程序可能希望在使用 ESP-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描邻近的接入点 (AP)。但在应用程序调用任何 Wi-Fi API 之前，必须先禁用自组网。否则，ESP-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。

应用程序不应在 `esp_mesh_set_self_organized()` 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-MESH 运行期间安全地调用 `esp_wifi_scan_start()`。

```
//禁用自组网
esp_mesh_set_self_organized(0, 0);

//停止任何正在进行的扫描
esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();

//进程扫描结果

...

//如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

...

//如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

...

//如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0); //不选择新的父节点
esp_mesh_connect(); //手动重新连接到路由器
```

**应用实例** ESP-IDF 包含以下 ESP-MESH 示例项目：

**内部通信示例** 展示了如何搭建 ESP-MESH 网络，并让根节点向网络中的每个节点发送数据包。

**手动连网示例** 展示了如何在禁用自组网功能的情况下使用 ESP-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

## API 参考

### Header File

- [esp\\_wifi/include/esp\\_mesh.h](#)

### Functions

*esp\_err\_t* **esp\_mesh\_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

#### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

#### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

#### Return

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.

#### Return

- ESP\_OK
- ESP\_FAIL

```
esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const
                        mesh_opt_t opt[], int opt_count)
```

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

#### Return

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

#### Parameters

- [in] to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- [in] data: pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
- [in] flag: bitmap for data sent
  - Speed up the route search
    - \* If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ( “to” parameter isn’ t NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - \* If needs non-block, MESH\_DATA\_NONBLOCK should be set.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’ t read out in time by esp\_mesh\_rcv\_toDS(). Generally, we suggest esp\_mesh\_rcv\_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp\_mesh\_rcv\_toDS() which avoids unnecessary memory copy.
- [in] opt: options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- [in] opt\_count: option count
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

```
esp_err_t esp_mesh_rcv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t
                       opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

#### Return

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

#### Parameters

- [out] `from`: the address of the original source of the packet
- [out] `data`: pointer to the received mesh packet
  - Field `proto` is the data protocol in use. Should follow it to parse the received data.
  - Field `tos` is the transmission tos (type of service) in use.
- [in] `timeout_ms`: wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- [out] `flag`: bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network

#### Parameters

- [out] `opt`: options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- [in] `opt_count`: option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

#### Return

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

#### Parameters

- [out] `from`: the address of the original source of the packet
- [out] `to`: the address contains remote IP address and port (IPv4:PORT)
- [out] `data`: pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.

- [in] `timeout_ms`: wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- [out] `flag`: bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

**Parameters**

- [out] `opt`: options desired to receive
- [in] `opt_count`: option count desired to receive

*esp\_err\_t* **esp\_mesh\_set\_config** (**const** *mesh\_cfg\_t* \**config*)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. `max_connection` of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] `config`: pointer to mesh stack configuration

*esp\_err\_t* **esp\_mesh\_get\_config** (*mesh\_cfg\_t* \**config*)

Get mesh stack configuration.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] `config`: pointer to mesh stack configuration

*esp\_err\_t* **esp\_mesh\_set\_router** (**const** *mesh\_router\_t* \**router*)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] `router`: pointer to router configuration

*esp\_err\_t* **esp\_mesh\_get\_router** (*mesh\_router\_t* \**router*)

Get router configuration.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] router: pointer to router configuration

*esp\_err\_t* **esp\_mesh\_set\_id**(const *mesh\_addr\_t* \*id)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

**Parameters**

- [in] id: pointer to mesh network ID

*esp\_err\_t* **esp\_mesh\_get\_id**(*mesh\_addr\_t* \*id)

Get mesh network ID.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] id: pointer to mesh network ID

*esp\_err\_t* **esp\_mesh\_set\_type**(*mesh\_type\_t* type)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] type: device type

*mesh\_type\_t* **esp\_mesh\_get\_type**(void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return** mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer**(int *max\_layer*)

Set network max layer value (max:25, default:25)

- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] max\_layer: max layer value

int **esp\_mesh\_get\_max\_layer**(void)

Get max layer value.

**Return** max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password**(const uint8\_t \*pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK

- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] pwd: pointer to the password
- [in] len: password length

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] authmode: authentication mode

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

**Return** authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int connections)

Set mesh softAP max connection value.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] connections: the number of max connections

int **esp\_mesh\_get\_ap\_connections** (void)

Get mesh softAP max connection configuration.

**Return** the number of max connections

int **esp\_mesh\_get\_layer** (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return** layer value

*esp\_err\_t* **esp\_mesh\_get\_parent\_bssid** (*mesh\_addr\_t* \*bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] bssid: pointer to parent BSSID

bool **esp\_mesh\_is\_root** (void)

Return whether the device is the root node of the network.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_self\_organized** (bool enable, bool select\_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.

- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `enable`: enable or disable self-organized networking
- [in] `select_parent`: Only valid when self-organized networking is enabled.
  - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

bool `esp_mesh_get_self_organized` (void)

Return whether enable self-organized networking or not.

**Return** true/false

*esp\_err\_t* `esp_mesh_waive_root` (const *mesh\_vote\_t* \*`vote`, int `reason`)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

**Parameters**

- [in] `vote`: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field `is_rc_specified` shall be false.
  - Field attempts shall be at least 15 times.
- [in] `reason`: only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

*esp\_err\_t* `esp_mesh_set_vote_percentage` (float `percentage`)

Set vote percentage threshold for approval of being a root.

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `percentage`: vote percentage threshold

float `esp_mesh_get_vote_percentage` (void)

Get vote percentage threshold for approval of being a root.

**Return** percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int *seconds*)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *seconds*: the expired time

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

**Return** seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Return** total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

**Return** the number of devices over this device's sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \**mac*, int *len*, int \**size*)

Get routing table of this device's sub-network (including itself)

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] *mac*: pointer to routing table
- [in] *len*: routing table size(in bytes)
- [out] *size*: pointer to the number of devices in routing table (including itself)

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool *reachable*)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *reachable*: this state represents whether the root is able to access external IP network

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \**pending*)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] *pending*: pointer to the TX pending

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \**pending*)

Return the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] pending: pointer to the RX pending

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \*addr, uint32\_t \*xseqno\_in)

Return the number of packets could be accepted from the specified address.

**Return** the number of upQ for a certain address

**Parameters**

- [in] addr: self address or an associate children address
- [out] xseqno\_in: sequence number of the last received packet from the specified address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int qsize)

Set the number of queue.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] qsize: default:32 (min:16)

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**Return** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

**Return**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

**Parameters**

- [in] allowed: allow or not

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)

Check whether allow more than one root to exist in one network.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Set group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] addr: pointer to new group ID addresses
- [in] num: the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Delete group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] addr: pointer to deleted group ID address
- [in] num: the number of group ID addresses

int **esp\_mesh\_get\_group\_num** (void)

Get the number of group ID addresses.

**Return** the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \*addr, int num)

Get group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [out] *addr*: pointer to group ID addresses
- [in] *num*: the number of group ID addresses

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \**addr*)

Check whether the specified group address is my group.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int *num*)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] *num*: mesh network capacity

int **esp\_mesh\_get\_capacity\_num** (void)

Get mesh network capacity.

**Return** mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (const *mesh\_crypto\_funcs\_t* \**crypto\_funcs*)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return**

- ESP\_OK

**Parameters**

- [in] *crypto\_funcs*: crypto functions for mesh IE
  - If *crypto\_funcs* is set to NULL, mesh IE is no longer encrypted.

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (const char \**key*, int *len*)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] *key*: ASCII crypto key
- [in] *len*: length in bytes, range:8~64

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \**key*, int *len*)

Get mesh IE crypto key.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [out] *key*: ASCII crypto key
- [in] *len*: length in bytes, range:8~64

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int *delay\_ms*)

Set delay time before starting root healing.

**Return**

- ESP\_OK

**Parameters**

- [in] `delay_ms`: delay time in milliseconds

int `esp_mesh_get_root_healing_delay` (void)

Get delay time before network starts root healing.

**Return** delay time in milliseconds

*esp\_err\_t* `esp_mesh_fix_root` (bool *enable*)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Return**

- ESP\_OK

**Parameters**

- [in] `enable`: enable or not

bool `esp_mesh_is_root_fixed` (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root`().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Return** true/false

*esp\_err\_t* `esp_mesh_set_parent` (const *wifi\_config\_t* \**parent*, const *mesh\_addr\_t* \**parent\_mesh\_id*, *mesh\_type\_t* *my\_type*, int *my\_layer*)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Return**

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

**Parameters**

- [in] `parent`: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- [in] `parent_mesh_id`: parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- [in] `my_type`: mesh type
  - If the parent set for the device is the same as the router in the network configuration, then `my_type` shall set MESH\_ROOT and `my_layer` shall set MESH\_ROOT\_LAYER.
- [in] `my_layer`: mesh layer
  - `my_layer` of the device may change after joining the network.
  - If `my_type` is set MESH\_NODE, `my_layer` shall be greater than MESH\_ROOT\_LAYER.
  - If `my_type` is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

*esp\_err\_t* `esp_mesh_scan_get_ap_ie_len` (int \**len*)

Get mesh networking IE length of one AP.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

**Parameters**

- [out] `len`: mesh networking IE length

*esp\_err\_t* `esp_mesh_scan_get_ap_record` (*wifi\_ap\_record\_t* \**ap\_record*, void \**buffer*)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual\_networking” example.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

**Parameters**

- [out] `ap_record`: pointer to one AP record
- [out] `buffer`: pointer to the mesh networking IE of this AP

*esp\_err\_t* **esp\_mesh\_flush\_upstream\_packets** (void)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_num** (const *mesh\_addr\_t* \*`child_mac`, int \*`nodes_num`)

Get the number of nodes in the subnet of a specific child.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] `child_mac`: an associated child address of this device
- [out] `nodes_num`: pointer to the number of nodes in the subnet of a specific child

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_list** (const *mesh\_addr\_t* \*`child_mac`, *mesh\_addr\_t* \*`nodes`, int `nodes_num`)

Get nodes in the subnet of a specific child.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] `child_mac`: an associated child address of this device
- [out] `nodes`: pointer to nodes in the subnet of a specific child
- [in] `nodes_num`: the number of nodes in the subnet of a specific child

*esp\_err\_t* **esp\_mesh\_disconnect** (void)

Disconnect from current parent.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_connect** (void)

Connect to current parent.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_flush\_scan\_result** (void)

Flush scan result.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_switch\_channel** (const uint8\_t \*`new_bssid`, int `csa_newchan`, int `csa_count`)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**

- ESP\_OK

**Parameters**

- [in] `new_bssid`: the new router BSSID if the router changes
- [in] `csa_newchan`: the new channel number to which the whole network is moving
- [in] `csa_count`: channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

`esp_err_t esp_mesh_get_router_bssid (uint8_t *router_bssid)`

Get the router BSSID.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG

**Parameters**

- [out] `router_bssid`: pointer to the router BSSID

`int64_t esp_mesh_get_tsf_time (void)`

Get the TSF time.

**Return** the TSF time

## Unions

`union mesh_addr_t`

`#include <esp_mesh.h>` Mesh address.

### Public Members

`uint8_t addr[6]`  
mac address

`mip_t mip`  
mip address

`union mesh_event_info_t`

`#include <esp_mesh.h>` Mesh event information.

### Public Members

`mesh_event_channel_switch_t channel_switch`  
channel switch

`mesh_event_child_connected_t child_connected`  
child connected

`mesh_event_child_disconnected_t child_disconnected`  
child disconnected

`mesh_event_routing_table_change_t routing_table`  
routing table change

`mesh_event_connected_t connected`  
parent connected

`mesh_event_disconnected_t disconnected`  
parent disconnected

`mesh_event_no_parent_found_t no_parent`  
no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**  
layer change

*mesh\_event\_toDS\_state\_t* **toDS\_state**  
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

*mesh\_event\_vote\_started\_t* **vote\_started**  
vote started

*mesh\_event\_root\_address\_t* **root\_addr**  
root address

*mesh\_event\_root\_switch\_req\_t* **switch\_req**  
root switch request

*mesh\_event\_root\_conflict\_t* **root\_conflict**  
other powerful root

*mesh\_event\_root\_fixed\_t* **root\_fixed**  
fixed root

*mesh\_event\_scan\_done\_t* **scan\_done**  
scan done

*mesh\_event\_network\_state\_t* **network\_state**  
network state, such as whether current mesh network has a root.

*mesh\_event\_find\_network\_t* **find\_network**  
network found that can join

*mesh\_event\_router\_switch\_t* **router\_switch**  
new router information

**union mesh\_rc\_config\_t**  
*#include <esp\_mesh.h>* Vote address configuration.

### Public Members

int **attempts**  
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

*mesh\_addr\_t* **rc\_addr**  
a new root address specified by users for API `esp_mesh_waive_root()`

### Structures

**struct mip\_t**  
IP address and port.

### Public Members

ip4\_addr\_t **ip4**  
IP address

uint16\_t **port**  
port

**struct mesh\_event\_channel\_switch\_t**  
Channel switch information.

**Public Members**

`uint8_t channel`  
new channel

**struct mesh\_event\_connected\_t**  
Parent connected information.

**Public Members**

*wifi\_event\_sta\_connected\_t* **connected**  
parent information, same as Wi-Fi event SYSTEM\_EVENT\_STA\_CONNECTED does

`uint8_t self_layer`  
layer

**struct mesh\_event\_no\_parent\_found\_t**  
No parent found information.

**Public Members**

`int scan_times`  
scan times being through

**struct mesh\_event\_layer\_change\_t**  
Layer change information.

**Public Members**

`uint8_t new_layer`  
new layer

**struct mesh\_event\_vote\_started\_t**  
vote started information

**Public Members**

`int reason`  
vote reason, vote could be initiated by children or by the root itself

`int attempts`  
max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**  
root address specified by users via API esp\_mesh\_waive\_root()

**struct mesh\_event\_find\_network\_t**  
find a mesh network that this device can join

**Public Members**

`uint8_t channel`  
channel number of the new found network

`uint8_t router_bssid[6]`  
router BSSID

**struct mesh\_event\_root\_switch\_req\_t**  
Root switch request information.

**Public Members****int reason**root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`***mesh\_addr\_t* rc\_addr**

the address of root switch requester

**struct mesh\_event\_root\_conflict\_t**

Other powerful root address.

**Public Members****int8\_t rssi**

rssi with router

**uint16\_t capacity**

the number of devices in current network

**uint8\_t addr[6]**

other powerful root address

**struct mesh\_event\_routing\_table\_change\_t**

Routing table change.

**Public Members****uint16\_t rt\_size\_new**

the new value

**uint16\_t rt\_size\_change**

the changed value

**struct mesh\_event\_root\_fixed\_t**

Root fixed.

**Public Members****bool is\_fixed**

status

**struct mesh\_event\_scan\_done\_t**

Scan done event information.

**Public Members****uint8\_t number**

the number of APs scanned

**struct mesh\_event\_network\_state\_t**

Network state information.

**Public Members****bool is\_rootless**

whether current mesh network has a root

**struct mesh\_opt\_t**

Mesh option.

**Public Members**

**uint8\_t type**  
option type

**uint16\_t len**  
option length

**uint8\_t \*val**  
option value

**struct mesh\_data\_t**  
Mesh data for esp\_mesh\_send() and esp\_mesh\_recv()

**Public Members**

**uint8\_t \*data**  
data

**uint16\_t size**  
data size

*mesh\_proto\_t* **proto**  
data protocol

*mesh\_tos\_t* **tos**  
data type of service

**struct mesh\_router\_t**  
Router configuration.

**Public Members**

**uint8\_t ssid[32]**  
SSID

**uint8\_t ssid\_len**  
length of SSID

**uint8\_t bssid[6]**  
BSSID, if this value is specified, users should also specify “allow\_router\_switch” .

**uint8\_t password[64]**  
password

**bool allow\_router\_switch**  
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh\_attempts\_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh\_ap\_cfg\_t**  
Mesh softAP configuration.

**Public Members**

**uint8\_t password[64]**  
mesh softAP password

**uint8\_t max\_connection**  
max number of stations allowed to connect in, max 10

**struct mesh\_cfg\_t**

Mesh initialization configuration.

**Public Members****uint8\_t channel**

channel, the mesh network on

**bool allow\_channel\_switch**

if this value is set, when “fail” (mesh\_attempts\_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

**mesh\_addr\_t mesh\_id**

mesh network identification

**mesh\_router\_t router**

router configuration

**mesh\_ap\_cfg\_t mesh\_ap**

mesh softAP configuration

**const mesh\_crypto\_funcs\_t \*crypto\_funcs**

crypto functions

**struct mesh\_vote\_t**

Vote.

**Public Members****float percentage**

vote percentage threshold for approval of being a root

**bool is\_rc\_specified**

if true, rc\_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

**mesh\_rc\_config\_t config**

vote address configuration

**struct mesh\_tx\_pending\_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members****int to\_parent**

to parent queue

**int to\_parent\_p2p**

to parent (P2P) queue

**int to\_child**

to child queue

**int to\_child\_p2p**

to child (P2P) queue

**int mgmt**

management queue

**int broadcast**

broadcast and multicast queue

**struct mesh\_rx\_pending\_t**

The number of packets available in the queue waiting to be received by applications.

**Public Members**

int **toDS**  
to external DS

int **toSelf**  
to self

**Macros****MESH\_ROOT\_LAYER**

root layer value

**MESH\_MTU**

max transmit unit(in bytes)

**MESH\_MPS**

max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**

Mesh error code definition.

Wi-Fi isn't started

**ESP\_ERR\_MESH\_NOT\_INIT**

mesh isn't initialized

**ESP\_ERR\_MESH\_NOT\_CONFIG**

mesh isn't configured

**ESP\_ERR\_MESH\_NOT\_START**

mesh isn't started

**ESP\_ERR\_MESH\_NOT\_SUPPORT**

not supported yet

**ESP\_ERR\_MESH\_NOT\_ALLOWED**

operation is not allowed

**ESP\_ERR\_MESH\_NO\_MEMORY**

out of memory

**ESP\_ERR\_MESH\_ARGUMENT**

illegal argument

**ESP\_ERR\_MESH\_EXCEED\_MTU**

packet size exceeds MTU

**ESP\_ERR\_MESH\_TIMEOUT**

timeout

**ESP\_ERR\_MESH\_DISCONNECTED**

disconnected with parent on station interface

**ESP\_ERR\_MESH\_QUEUE\_FAIL**

queue fail

**ESP\_ERR\_MESH\_QUEUE\_FULL**

queue full

**ESP\_ERR\_MESH\_NO\_PARENT\_FOUND**

no parent found to join the mesh network

**ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND**

no route found to forward the packet

**ESP\_ERR\_MESH\_OPTION\_NULL**

no option found

**ESP\_ERR\_MESH\_OPTION\_UNKNOWN**

unknown option

**ESP\_ERR\_MESH\_XON\_NO\_WINDOW**

no window for software flow control on upstream

**ESP\_ERR\_MESH\_INTERFACE**

low-level Wi-Fi interface error

**ESP\_ERR\_MESH\_DISCARD\_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP\_ERR\_MESH\_DISCARD**

discard the packet

**ESP\_ERR\_MESH\_VOTING**

vote in progress

**ESP\_ERR\_MESH\_XMIT**

XMIT

**ESP\_ERR\_MESH\_QUEUE\_READ**

error in reading queue

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_rcv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_rcv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_rcv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with esp\_mesh\_send() and esp\_mesh\_rcv()

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

Flag of mesh networking IE.

vote in progress

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

root conflict is found

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

fixed root

**MESH\_INIT\_CONFIG\_DEFAULT** ()

### Type Definitions

**typedef** *mesh\_addr\_t* mesh\_event\_root\_address\_t

Root address.

**typedef** *wifi\_event\_sta\_disconnected\_t* mesh\_event\_disconnected\_t

Parent disconnected information.

**typedef** *wifi\_event\_ap\_staconnected\_t* mesh\_event\_child\_connected\_t

Child connected information.

**typedef** *wifi\_event\_ap\_stadisconnected\_t* mesh\_event\_child\_disconnected\_t

Child disconnected information.

**typedef** *wifi\_event\_sta\_connected\_t* mesh\_event\_router\_switch\_t

New router information.

### Enumerations

**enum** mesh\_event\_id\_t

Enumerated list of mesh event id.

*Values:*

**MESH\_EVENT\_STARTED**

mesh is started

**MESH\_EVENT\_STOPPED**

mesh is stopped

**MESH\_EVENT\_CHANNEL\_SWITCH**

channel switch

**MESH\_EVENT\_CHILD\_CONNECTED**

a child is connected on softAP interface

**MESH\_EVENT\_CHILD\_DISCONNECTED**

a child is disconnected on softAP interface

**MESH\_EVENT\_ROUTING\_TABLE\_ADD**

routing table is changed by adding newly joined children

**MESH\_EVENT\_ROUTING\_TABLE\_REMOVE**

routing table is changed by removing leave children

**MESH\_EVENT\_PARENT\_CONNECTED**

parent is connected on station interface

**MESH\_EVENT\_PARENT\_DISCONNECTED**

parent is disconnected on station interface

**MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

**MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

**MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network

**MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

**MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

**MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

**MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

**MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

**MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

**MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

**MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH\_EVENT\_MAX**

**enum mesh\_type\_t**

Device type.

*Values:*

**MESH\_IDLE**

hasn't joined the mesh network yet

**MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

**MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

**MESH\_LEAF**

has no forwarding ability

**MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

**enum mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

**MESH\_PROTO\_BIN**  
binary

**MESH\_PROTO\_HTTP**  
HTTP protocol

**MESH\_PROTO\_JSON**  
JSON format

**MESH\_PROTO\_MQTT**  
MQTT protocol

**enum mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

**MESH\_TOS\_P2P**  
provide P2P (point-to-point) retransmission on mesh stack by default

**MESH\_TOS\_E2E**  
provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

**MESH\_TOS\_DEF**  
no retransmission on mesh stack

**enum mesh\_vote\_reason\_t**

Vote reason.

*Values:*

**MESH\_VOTE\_REASON\_ROOT\_INITIATED = 1**  
vote is initiated by the root

**MESH\_VOTE\_REASON\_CHILD\_INITIATED**  
vote is initiated by children

**enum mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:*

**MESH\_REASON\_CYCLIC = 100**  
cyclic is detected

**MESH\_REASON\_PARENT\_IDLE**  
parent is idle

**MESH\_REASON\_LEAF**  
the connected device is changed to a leaf

**MESH\_REASON\_DIFF\_ID**  
in different mesh ID

**MESH\_REASON\_ROOTS**  
root conflict is detected

**MESH\_REASON\_PARENT\_STOPPED**  
parent has stopped the mesh

**MESH\_REASON\_SCAN\_FAIL**  
scan fail

**MESH\_REASON\_IE\_UNKNOWN**  
unknown IE

**MESH\_REASON\_WAIVE\_ROOT**  
waive root

**MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

**MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

**MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

**enum mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:***MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

**MESH\_TODS\_REACHABLE**

the root is able to access external IP network

本部分的 Wi-Fi API 示例代码存放在 ESP-IDF 示例项目的 [wifi](#) 目录下。

ESP-MESH 的示例代码存放在 ESP-IDF 示例项目的 [mesh](#) 目录下。

## 2.2.2 以太网

### 以太网

[\[英文\]](#)

#### 应用示例

- 以太网基本示例: [ethernet/ethernet](#).
- 以太网 iperf 示例: [ethernet/iperf](#).

#### 以太网驱动程序模型

- [esp\\_eth/include/esp\\_eth.h](#)

#### 以太网通用接口

- [esp\\_eth/include/esp\\_eth\\_com.h](#)

#### 以太网 MAC 接口

- [esp\\_eth/include/esp\\_eth\\_mac.h](#)

#### 以太网 PHY 接口

- [esp\\_eth/include/esp\\_eth\\_phy.h](#)

#### 以太网 PHY 公共寄存器

- [esp\\_eth/include/eth\\_phy\\_regs\\_struct.h](#)

#### API 参考-驱动程序模型

**Header File**

- [esp\\_eth/include/esp\\_eth.h](#)

**Functions**

*esp\_err\_t* **esp\_eth\_driver\_install** (**const** *esp\_eth\_config\_t* \**config*, *esp\_eth\_handle\_t* \**out\_hdl*)

Install Ethernet driver.

**Return**

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

**Parameters**

- [in] *config*: configuration of the Ethernet driver
- [out] *out\_hdl*: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_driver\_uninstall** (*esp\_eth\_handle\_t* *hdl*)

Uninstall Ethernet driver.

**Note** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**

- ESP\_OK: uninstall esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: uninstall esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: uninstall esp\_eth driver failed because it has more than one reference
- ESP\_FAIL: uninstall esp\_eth driver failed because some other error occurred

**Parameters**

- [in] *hdl*: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* *hdl*)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**

- ESP\_OK: start esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: start esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: start esp\_eth driver failed because driver has started already
- ESP\_FAIL: start esp\_eth driver failed because some other error occurred

**Parameters**

- [in] *hdl*: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* *hdl*)

Stop Ethernet driver.

**Note** This function does the oppsite operation of `esp_eth_start`.

**Return**

- ESP\_OK: stop esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: stop esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: stop esp\_eth driver failed because driver has not started yet
- ESP\_FAIL: stop esp\_eth driver failed because some other error occurred

**Parameters**

- [in] *hdl*: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* *hdl*, *esp\_err\_t* (\**stack\_input*)) *esp\_eth\_handle\_t* *hdl*, *uint8\_t* \**buffer*, *uint32\_t* *length*, *void* \**priv*)

, *void* \**priv* Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**

- ESP\_OK: update input path successfully
- ESP\_ERR\_INVALID\_ARG: update input path failed because of some invalid argument
- ESP\_FAIL: update input path failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [in] stack\_input: function pointer, which does the actual process on incoming packets
- [in] priv: private resource, which gets passed to stack\_input callback without any modification

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, uint32\_t length)

General Transmit.

**Return**

- ESP\_OK: transmit frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: transmit frame buffer failed because of some invalid argument
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

*esp\_err\_t* **esp\_eth\_receive** (*esp\_eth\_handle\_t* hdl, uint8\_t \*buf, uint32\_t \*length)

General Receive.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Return**

- ESP\_OK: receive frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: receive frame buffer failed because of some invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive frame buffer failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Ethernet driver.

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver
- [in] cmd: IO control command
- [in] data: specified data for command

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

**Note** Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

**Return**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Return**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] hdl: handle of Ethernet driver

**Structures**

**struct esp\_eth\_config\_t**

Configuration of Ethernet driver.

**Public Members**

*esp\_eth\_mac\_t* \*mac

Ethernet MAC object.

*esp\_eth\_phy\_t* \*phy

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (**\*stack\_input**) (*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

**Parameters**

- [in] eth\_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

*esp\_err\_t* (**\*on\_lowlevel\_init\_done**) (*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

**Parameters**

- [in] eth\_handle: handle of Ethernet driver

*esp\_err\_t* (**\*on\_lowlevel\_deinit\_done**) (*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

**Parameters**

- [in] eth\_handle: handle of Ethernet driver

**Macros**

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

### Type Definitions

**typedef** void \***esp\_eth\_handle\_t**  
Handle of Ethernet driver.

### API 参考-通用接口

#### Header File

- [esp\\_eth/include/esp\\_eth\\_com.h](#)

#### Functions

*esp\_err\_t* **esp\_eth\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, uint32\_t \*detected\_addr)  
Detect PHY address.

##### Return

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

##### Parameters

- [in] eth: mediator of Ethernet driver
- [out] detected\_addr: a valid address after detection

#### Structures

**struct esp\_eth\_mediator\_s**  
Ethernet mediator.

#### Public Members

*esp\_err\_t* (\***phy\_reg\_read**) (*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

##### Return

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

##### Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy\_addr: PHY Chip address (0~31)
- [in] phy\_reg: PHY register index code
- [out] reg\_value: PHY register value

*esp\_err\_t* (\***phy\_reg\_write**) (*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

##### Return

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

##### Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy\_addr: PHY Chip address (0~31)
- [in] phy\_reg: PHY register index code
- [in] reg\_value: PHY register value

*esp\_err\_t* (\***stack\_input**) (*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Return**

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] buffer: packet buffer
- [in] length: length of the packet

*esp\_err\_t* (\***on\_state\_changed**) (*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)  
Callback on Ethernet state changed.

**Return**

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

**Macros****ETH\_MAX\_PAYLOAD\_LEN**

Maximum Ethernet payload size.

**ETH\_MIN\_PAYLOAD\_LEN**

Minimum Ethernet payload size.

**ETH\_HEADER\_LEN**

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

**ETH\_CRC\_LEN**

Ethernet frame CRC length.

**ETH\_VLAN\_TAG\_LEN**

Optional 802.1q VLAN Tag length.

**ETH\_JUMBO\_FRAME\_PAYLOAD\_LEN**

Jumbo frame payload size.

**ETH\_MAX\_PACKET\_SIZE**

Maximum frame size (1522 Bytes)

**ETH\_MIN\_PACKET\_SIZE**

Minimum frame size (64 Bytes)

**Type Definitions**

```
typedef struct esp_eth_mediator_s esp_eth_mediator_t
```

Ethernet mediator.

**Enumerations**

```
enum esp_eth_state_t
```

Ethernet driver state.

*Values:*

**ETH\_STATE\_LLINIT**

Lowlevel init done

**ETH\_STATE\_DEINIT**

Deinit done

**ETH\_STATE\_LINK**

Link status changed

**ETH\_STATE\_SPEED**  
Speed updated

**ETH\_STATE\_DUPLEX**  
Duplex updated

**enum esp\_eth\_io\_cmd\_t**  
Command list for ioctl API.

*Values:*

**ETH\_CMD\_G\_MAC\_ADDR**  
Get MAC address

**ETH\_CMD\_S\_MAC\_ADDR**  
Set MAC address

**ETH\_CMD\_G\_PHY\_ADDR**  
Get PHY address

**ETH\_CMD\_S\_PHY\_ADDR**  
Set PHY address

**ETH\_CMD\_G\_SPEED**  
Get Speed

**ETH\_CMD\_S\_PROMISCUOUS**  
Set promiscuous mode

**enum eth\_link\_t**  
Ethernet link status.

*Values:*

**ETH\_LINK\_UP**  
Ethernet link is up

**ETH\_LINK\_DOWN**  
Ethernet link is down

**enum eth\_speed\_t**  
Ethernet speed.

*Values:*

**ETH\_SPEED\_10M**  
Ethernet speed is 10Mbps

**ETH\_SPEED\_100M**  
Ethernet speed is 100Mbps

**enum eth\_duplex\_t**  
Ethernet duplex mode.

*Values:*

**ETH\_DUPLEX\_HALF**  
Ethernet is in half duplex

**ETH\_DUPLEX\_FULL**  
Ethernet is in full duplex

**enum eth\_event\_t**  
Ethernet event declarations.

*Values:*

**ETHERNET\_EVENT\_START**  
Ethernet driver start

**ETHERNET\_EVENT\_STOP**

Ethernet driver stop

**ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

**ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

**API 参考-MAC 接口****Header File**

- [esp\\_eth/include/esp\\_eth\\_mac.h](#)

**Structures****struct esp\_eth\_mac\_s**

Ethernet MAC.

**Public Members***esp\_err\_t* (**\*set\_mediator**) (*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] eth: Ethernet mediator

*esp\_err\_t* (**\*init**) (*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (**\*deinit**) (*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (**\*start**) (*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***stop**) (*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***transmit**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_ARG: transmit packet failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: transmit packet failed because of wrong state of MAC
- ESP\_FAIL: transmit packet failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] buf: packet buffer to transmit
- [in] length: length of packet

*esp\_err\_t* (\***receive**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

**Note** Memory of buf is allocated in the Layer2, make sure it get free after process.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer.

After the function returned, the value of “length” means the real length of received data.

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [out] buf: packet buffer which will preserve the received frame
- [out] length: length of the received packet

*esp\_err\_t* (\***read\_phy\_reg**) (*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] phy\_addr: PHY chip address (0~31)
- [in] phy\_reg: PHY register index code
- [out] reg\_value: PHY register value

*esp\_err\_t* (\***write\_phy\_reg**) (*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout

- ESP\_FAIL: write PHY register failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] phy\_addr: PHY chip address (0~31)
- [in] phy\_reg: PHY register index code
- [in] reg\_value: PHY register value

*esp\_err\_t* (\***set\_addr**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

*esp\_err\_t* (\***get\_addr**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

*esp\_err\_t* (\***set\_speed**) (*esp\_eth\_mac\_t* \*mac, *eth\_speed\_t* speed)

Set speed of MAC.

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

*esp\_err\_t* (\***set\_duplex**) (*esp\_eth\_mac\_t* \*mac, *eth\_duplex\_t* duplex)

Set duplex mode of MAC.

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

*esp\_err\_t* (\***set\_link**) (*esp\_eth\_mac\_t* \*mac, *eth\_link\_t* link)

Set link status of MAC.

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] link: Link status

*esp\_err\_t* (\***set\_promiscuous**) (*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

*esp\_err\_t* (\*del) (*esp\_eth\_mac\_t* \*mac)

Free memory of Ethernet MAC.

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

**struct eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

**Public Members**

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

int **smi\_mdc\_gpio\_num**

SMI MDC GPIO number

int **smi\_mdio\_gpio\_num**

SMI MDIO GPIO number

uint32\_t **flags**

Flags that specify extra capability for mac driver

**Macros**

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG ()**

Default configuration for Ethernet MAC object.

**Type Definitions**

**typedef struct esp\_eth\_mac\_s esp\_eth\_mac\_t**

Ethernet MAC.

**API 参考-PHY 接口****Header File**

- [esp\\_eth/include/esp\\_eth\\_phy.h](#)

**Functions**

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ip101** (**const** *eth\_phy\_config\_t* \**config*)

Create a PHY instance of IP101.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] *config*: configuration of PHY

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_rt18201** (**const** *eth\_phy\_config\_t* \**config*)

Create a PHY instance of RTL8201.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] *config*: configuration of PHY

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan8720** (**const** *eth\_phy\_config\_t* \**config*)

Create a PHY instance of LAN8720.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] *config*: configuration of PHY

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_dp83848** (**const** *eth\_phy\_config\_t* \**config*)

Create a PHY instance of DP83848.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] *config*: configuration of PHY

**Structures**

**struct esp\_eth\_phy\_s**

Ethernet PHY.

**Public Members**

*esp\_err\_t* (\***set\_mediator**) (*esp\_eth\_phy\_t* \**phy*, *esp\_eth\_mediator\_t* \**mediator*)

Set mediator for PHY.

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

**Parameters**

- [in] *phy*: Ethernet PHY instance
- [in] *mediator*: mediator of Ethernet driver

*esp\_err\_t* (\***reset**) (*esp\_eth\_phy\_t* \**phy*)

Software Reset Ethernet PHY.

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**

- [in] *phy*: Ethernet PHY instance

*esp\_err\_t* (\***reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

**Note** Hardware reset is mostly done by pull down and up PHY's nRST pin

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***negotiate**)(*esp\_eth\_phy\_t* \*phy)

Start auto negotiation.

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***pwrctrl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

`esp_err_t (*get_addr) (esp_eth_phy_t *phy, uint32_t *addr)`

Get PHY chip address.

#### Return

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

#### Parameters

- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

`esp_err_t (*del) (esp_eth_phy_t *phy)`

Free memory of Ethernet PHY instance.

#### Return

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

#### Parameters

- [in] phy: Ethernet PHY instance

`struct eth_phy_config_t`

Ethernet PHY configuration.

### Public Members

`int32_t phy_addr`

PHY address, set -1 to enable PHY address detection at initialization stage

`uint32_t reset_timeout_ms`

Reset timeout value (Unit: ms)

`uint32_t autonego_timeout_ms`

Auto-negotiation timeout value (Unit: ms)

`int reset_gpio_num`

Reset GPIO number, -1 means no hardware reset

### Macros

`ESP_ETH_PHY_ADDR_AUTO`

`ETH_PHY_DEFAULT_CONFIG ()`

Default configuration for Ethernet PHY object.

### Type Definitions

`typedef struct esp_eth_phy_s esp_eth_phy_t`

Ethernet PHY.

### API 参考-esp\_netif 相关使用

#### Header File

- [esp\\_eth/include/esp\\_eth\\_netif\\_glue.h](#)

#### Functions

`void *esp_eth_new_netif_glue (esp_eth_handle_t eth_hdl)`

Create a netif glue for Ethernet driver.

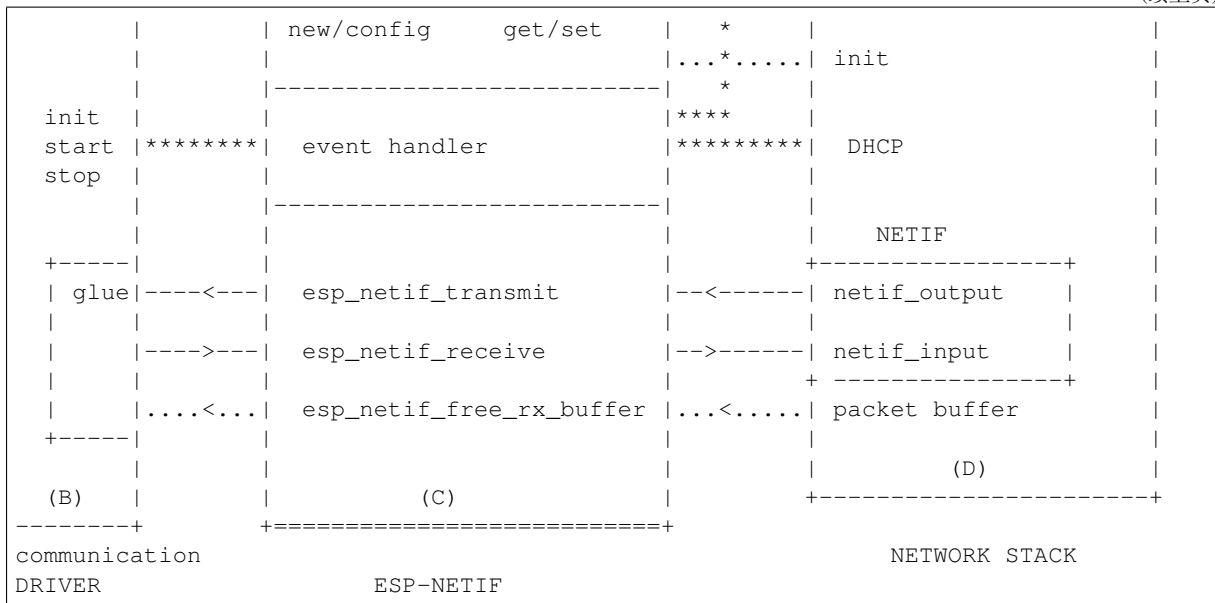

**Note** netif glue is used to attach io driver to TCP/IP netif

**Return** glue object, which inherits esp\_netif\_driver\_base\_t

#### Parameters

- eth\_hdl: Ethernet driver handle

**Data and event flow in the diagram**

- ..... Initialization line from user code to ESP-NETIF and communication driver
- --<--->-- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

**ESP-NETIF interaction**

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)

- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs `driver_transmit` to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF, former `tcpip_adapter`** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
- 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**ESP-NETIF programmer' s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [examples/wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- WiFi Access Point: [examples/wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- Ethernet [examples/ethernet/basic/main/ethernet\\_example\\_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- `esp_netif/include/esp_netif.h`

**Functions****esp\_err\_t esp\_netif\_init** (void)

Initialize the underlying TCP/IP stack.

**Return**

- ESP\_OK on success
- ESP\_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.**esp\_err\_t esp\_netif\_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

**Return**

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

**esp\_netif\_t \*esp\_netif\_new** (const esp\_netif\_config\_t \*esp\_netif\_config)

Creates an instance of new esp-netif object based on provided config.

**Return**

- pointer to esp-netif object on success
- NULL otherwise

**Parameters**

- [in] esp\_netif\_config: pointer esp-netif configuration

void **esp\_netif\_destroy** (esp\_netif\_t \*esp\_netif)

Destroys the esp\_netif object.

**Parameters**

- [in] esp\_netif: pointer to the object to be deleted

**esp\_err\_t esp\_netif\_set\_driver\_config** (esp\_netif\_t \*esp\_netif, const esp\_netif\_driver\_ifconfig\_t \*driver\_config)

Configures driver related options of esp\_netif object.

**Return**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

**Parameters**

- [inout] esp\_netif: pointer to the object to be configured
- [in] driver\_config: pointer esp-netif io driver related configuration

**esp\_err\_t esp\_netif\_attach** (esp\_netif\_t \*esp\_netif, esp\_netif\_io\_driver\_handle driver\_handle)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

**Return**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's post\_attach callback failed

**Parameters**

- [inout] esp\_netif: pointer to esp\_netif object to be attached
- [in] driver\_handle: pointer to the driver handle

**esp\_err\_t esp\_netif\_receive** (esp\_netif\_t \*esp\_netif, void \*buffer, size\_t len, void \*eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**

- ESP\_OK

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `buffer`: Received data
- [in] `len`: Length of the data frame
- [in] `eb`: Pointer to internal buffer (used in Wi-Fi driver)

void **esp\_netif\_action\_start** (void \**esp\_netif*, *esp\_event\_base\_t* base, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_stop** (void \**esp\_netif*, *esp\_event\_base\_t* base, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_connected** (void \**esp\_netif*, *esp\_event\_base\_t* base, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_disconnected** (void \**esp\_netif*, *esp\_event\_base\_t* base, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_got\_ip** (void \**esp\_netif*, *esp\_event\_base\_t* base, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \**esp\_netif*, uint8\_t *mac*[])

Set the mac address for the interface instance.

**Return** ESP\_OK

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

- [in] `mac`: Desired mac address for the related network interface

*esp\_err\_t* **esp\_netif\_set\_hostname** (*esp\_netif\_t* \**esp\_netif*, **const** char \**hostname*)

Set the hostname of an interface.

#### Return

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `hostname`: New hostname for the interface. Maximum length 32 bytes.

*esp\_err\_t* **esp\_netif\_get\_hostname** (*esp\_netif\_t* \**esp\_netif*, **const** char \*\**hostname*)

Get interface hostname.

#### Return

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `hostname`: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

bool **esp\_netif\_is\_netif\_up** (*esp\_netif\_t* \**esp\_netif*)

Test if supplied interface is up or down.

#### Return

- true - Interface is up
- false - Interface is down

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_ip\_info\_t* \**ip\_info*)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

#### Return

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `ip_info`: If successful, IP information will be returned in this argument.

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_ip\_info\_t* \**ip\_info*)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

#### Return

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `ip_info`: If successful, IP information will be returned in this argument.

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (*esp\_netif\_t* \**esp\_netif*, **const** *esp\_netif\_ip\_info\_t* \**ip\_info*)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED If DHCP server or client is still running

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: IP information to set on the specified interface

```
esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: Store the old IP information for the specified interface

```
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```

Get net interface index from network stack implementation.

**Note** This index could be used in `setsockopt()` to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied `esp_netif`

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance

```
esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op,
                                esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP server option.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `opt_op`: ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

```
esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op,
                                esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP client option.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [in] *opt\_op*: ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- [in] *opt\_id*: Option index to get or set, must be one of the supported enum values.
- [inout] *opt\_val*: Pointer to the option parameter.
- [in] *opt\_len*: Length of the option parameter.

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (*esp\_netif\_t* \**esp\_netif*)

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (*esp\_netif\_t* \**esp\_netif*)

Stop DHCP client (only if enabled in interface object)

**Note** Calling *action\_netif\_stop*() will also stop the DHCP Client if it is running.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_dhcp\_status\_t* \**status*)

Get DHCP client status.

**Return**

- ESP\_OK

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [out] *status*: If successful, the status of DHCP client will be returned in this argument.

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_dhcp\_status\_t* \**status*)

Get DHCP Server status.

**Return**

- ESP\_OK

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [out] *status*: If successful, the status of the DHCP server will be returned in this argument.

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \**esp\_netif*)

Start DHCP server (only if enabled in interface object)

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (`esp_netif_t *esp_netif`)

Stop DHCP server (only if enabled in interface object)

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (`esp_netif_t *esp_netif`, `esp_netif_dns_type_t type`, `esp_netif_dns_info_t *dns`)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the Wi-Fi AP interface.

**Return**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `type`: Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- [in] `dns`: DNS Server address to set

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (`esp_netif_t *esp_netif`, `esp_netif_dns_type_t type`, `esp_netif_dns_info_t *dns`)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `type`: Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- [out] `dns`: DNS Server result is written here on success

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (`esp_netif_t *esp_netif`)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (*esp\_netif\_t \*esp\_netif*, *esp\_ip6\_addr\_t \*if\_ip6*)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [out] *if\_ip6*: IPv6 information will be returned in this argument if successful.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (*esp\_netif\_t \*esp\_netif*, *esp\_ip6\_addr\_t \*if\_ip6*)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [out] *if\_ip6*: IPv6 information will be returned in this argument if successful.

void **esp\_netif\_set\_ip4\_addr** (*esp\_ip4\_addr\_t \*addr*, *uint8\_t a*, *uint8\_t b*, *uint8\_t c*, *uint8\_t d*)

Sets IPv4 address to the specified octets.

**Parameters**

- [out] *addr*: IP address to be set
- *a*: the first octet (127 for IP 127.0.0.1)
- *b*:
- *c*:
- *d*:

char\* **esp\_ip4addr\_ntoa** (**const** *esp\_ip4\_addr\_t \*addr*, *char \*buf*, *int buflen*)

Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to *buf* which now holds the ASCII representation of *addr* or NULL if *buf* was too small

**Parameters**

- *addr*: ip address in network order to convert
- *buf*: target buffer where the string is stored
- *buflen*: length of *buf*

*uint32\_t* **esp\_ip4addr\_aton** (**const** *char \*addr*)

Ascii internet address interpretation routine The value returned is in network order.

**Return** ip address in network order

**Parameters**

- *addr*: IP address in ascii representation (e.g. "127.0.0.1" )

*esp\_netif\_iodriver\_handle* **esp\_netif\_get\_io\_driver** (*esp\_netif\_t \*esp\_netif*)

Gets media driver handle for this esp-netif instance.

**Return** opaque pointer of related IO driver

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)`  
Searches over a list of created objects to find an instance with supplied if key.

**Return** Handle to esp-netif instance

**Parameters**

- `if_key`: Textual description of network interface

`esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)`  
Returns configured flags for this interface.

**Return** Configuration flags

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)`  
Returns configured interface key for this esp-netif instance.

**Return** Textual description of related interface

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`const char *esp_netif_get_desc (esp_netif_t *esp_netif)`  
Returns configured interface type for this esp-netif instance.

**Return** Enumerated type of this interface, such as station, AP, ethernet

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)`  
Returns configured event for this esp-netif instance and supplied event type.

**Return** specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event\_type is not known

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `event_type`: (either get or lost IP)

`esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)`  
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Return** First netif from the list if supplied parameter is NULL, next one otherwise

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

`size_t esp_netif_get_nr_of_ifs (void)`  
Returns number of registered esp\_netif objects.

**Return** Number of esp\_netifs

## WiFi default API reference

### Header File

- [esp\\_wifi/include/esp\\_wifi\\_default.h](#)

### Functions

`esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)`  
Attaches wifi station interface to supplied netif.

**Return**

- ESP\_OK on success
- ESP\_FAIL if attach failed

**Parameters**

- `esp_netif`: instance to attach the wifi station to

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (`esp_netif_t *esp_netif`)

Attaches wifi soft AP interface to supplied netif.

**Return**

- `ESP_OK` on success
- `ESP_FAIL` if attach failed

**Parameters**

- `esp_netif`: instance to attach the wifi AP to

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Return**

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Return**

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void \**esp\_netif*)

Clears default wifi event handlers for supplied network interface.

**Return**

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

**Parameters**

- `esp_netif`: instance of corresponding if object

`esp_netif_t *`**esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

**Return** pointer to `esp-netif` instance

`esp_netif_t *`**esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

**Return** pointer to `esp-netif` instance

*esp\_err\_t* **esp\_netif\_create\_default\_wifi\_mesh\_netifs** (`esp_netif_t` *esp\_netif\_t \*\*p\_netif\_sta*,  
`esp_netif_t **p_netif_ap`)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return** `ESP_OK` on success

**Parameters**

- [out] `p_netif_sta`: pointer where the resultant STA interface is saved (if non NULL)
- [out] `p_netif_ap`: pointer where the resultant AP interface is saved (if non NULL)

**TCP/IP 适配器迁移指南**

[英文]

TCP/IP 适配器是在 IDF V4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` 移出至其后继者 *ESP-NETIF* 的过程。

**更新网络连接代码**

**网络软件栈初始化** 只需将 `tcpip_adapter_init()` 替换为 `esp_netif_init()`。请注意, *ESP-NETIF* 初始化 API 可返回标准错误代码, 还可以使用 `esp_netif_deinit()` 进行去初始化。

此外, 还需将 `#include "tcpip_adapter.h"` 替换为 `#include "esp_netif.h"`。

**创建网络接口** TCP/IP 适配器静态定义了三个接口:

- Wi-Fi Station
- Wi-Fi AP
- 以太网

网络接口的设计应严格参考 *ESP-NETIF*, 以使其能够连接到 TCP/IP 软件栈。例如, 在 TCP/IP 软件栈和事件循环初始化完成后, Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`; 或 `esp_netif_create_default_wifi_ap()`。请参阅这三个接口的初始化代码示例:

- Wi-Fi Station: [examples/wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- Wi-Fi AP: [examples/wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- 以太网 [examples/ethernet/basic/main/ethernet\\_example\\_main.c](#)

**更换其他 tcpip\_adapter API** 所有 `tcpip_adapter` 函数都有对应的 `esp-netif`。具体请见 `esp_netif` 的内容:

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

**默认事件处理程序** 事件处理程序已经从 `tcpip_adapter` 移动到相应的驱动程序代码。从应用程序的角度来看, 这不会带来任何影响, 所有事件仍以相同的方式处理。请注意, 在与 IP 相关的事件处理程序中, 应用程序代码通常以 `esp-netif` 结构体的形式接收 IP 地址 (不是 LwIP 结构, 但兼容二进制格式)。这是打印地址的首选方式:

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

而不是

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

由于 `ip4addr_ntoa()` 为 LwIP API, 因此 `esp-netif` 还提供了替代函数 `esp_ip4addr_ntoa()`, 但整体而言仍推荐上述方法。

**IP 地址** 推荐使用 `esp-netif` 定义的 IP 结构。请注意, 在启用默认兼容性时, LwIP 结构体仍然可以工作。  
\* [esp-netif IP address definitions](#)

**下一步** 为了移植应用程序使其可以使用 *ESP-NETIF* 还需完成的步骤包括: 在组件配置中禁用 `tcpip_adapter` 兼容层。方法为: `ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface`, 并检查工程是否编译成功。TCP/IP 适配器涉及大量依赖项, 这一步可能有助于将应用程序与使用特定 TCP/IP 软件栈的 API 分离开来。

## ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with `esp-netif` connection capabilities. By convention the I/O driver has to register itself as an `esp-netif` driver and thus holds a dependency on `esp-netif` component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_io_driver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_io_driver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as_
↳esp-netif driver */
    driver_impl_t *h;                       /*!< handle of driver_
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}

```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

### Header File

- [esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)

### Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)`

Returns esp-netif handle.

**Return** handle to related esp-netif instance

#### Parameters

- [in] dev: opaque ptr to network interface of specific TCP/IP stack

`void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)`

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Return** handle to related network stack netif handle

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance

`esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Return** ESP\_OK on success, an error passed from the I/O driver otherwise

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame

`void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)`

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [in] buffer: Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 [protocols/sockets](#) 目录下。

## 2.2.4 应用层协议

应用层网络协议（IP 网络层协议之上）的相关文档存放在[应用层协议](#)。

## 2.3 外设 API

[English]

### 2.3.1 Analog to Digital Converter

#### Overview

The ESP32 integrates two 12-bit SAR ([Successive Approximation Register](#)) ADCs supporting a total of 18 measurement channels (analog enabled pins).

The ADC driver API supports ADC1 (8 channels, attached to GPIOs 32 - 39), and ADC2 (10 channels, attached to GPIOs 0, 2, 4, 12 - 15 and 25 - 27). However, the usage of ADC2 has some restrictions for the application:

1. ADC2 is used by the Wi-Fi driver. Therefore the application can only use ADC2 when the Wi-Fi driver has not started.
2. Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
  - [ESP32 DevKitC](#): GPIO 0 cannot be used due to external auto program circuits.
  - [ESP-WROVER-KIT](#): GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

#### Configuration and Reading ADC

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions [adc1\\_config\\_width\(\)](#) and [adc1\\_config\\_channel\\_atten\(\)](#).
- For ADC2, configure the attenuation by [adc2\\_config\\_channel\\_atten\(\)](#). The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see [adc1\\_channel\\_t](#) and [adc2\\_channel\\_t](#), set as a parameter of above functions.

Then it is possible to read ADC conversion result with [adc1\\_get\\_raw\(\)](#) and [adc2\\_get\\_raw\(\)](#). Reading width of ADC2 should be set as a parameter of [adc2\\_get\\_raw\(\)](#) instead of in the configuration functions.

---

**注解:** Since the ADC2 is shared with the WIFI module, which has higher priority, reading operation of [adc2\\_get\\_raw\(\)](#) will fail between [esp\\_wifi\\_start\(\)](#) and [esp\\_wifi\\_stop\(\)](#). Use the return code to see whether the reading is successful.

---

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function [hall\\_sensor\\_read\(\)](#). Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from *ULP*. To do so, call function [adc1\\_ulp\\_enable\(\)](#) and then set precision and attenuation as discussed above.

There is another specific function [adc2\\_vref\\_to\\_gpio\(\)](#) used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section [Minimizing Noise](#).

## Application Examples

Reading voltage on ADC1 channel 0 (GPIO 36):

```
#include <driver/adc.h>

...

adc1_config_width(ADC_WIDTH_BIT_12);
adc1_config_channel_atten(ADC1_CHANNEL_0, ADC_ATTEN_DB_0);
int val = adc1_get_raw(ADC1_CHANNEL_0);
```

The input voltage in above example is from 0 to 1.1V (0 dB attenuation). The input range can be extended by setting higher attenuation, see [adc\\_atten\\_t](#). An example using the ADC driver including calibration (discussed below) is available in esp-idf: [peripherals/adc](#)

Reading voltage on ADC2 channel 7 (GPIO 27):

```
#include <driver/adc.h>

...

int read_raw;
adc2_config_channel_atten( ADC2_CHANNEL_7, ADC_ATTEN_0db );

esp_err_t r = adc2_get_raw( ADC2_CHANNEL_7, ADC_WIDTH_12Bit, &read_raw);
if ( r == ESP_OK ) {
    printf("%d\n", read_raw );
} else if ( r == ESP_ERR_TIMEOUT ) {
    printf("ADC2 used by Wi-Fi.\n");
}
```

The reading may fail due to collision with Wi-Fi, should check it. An example using the ADC2 driver to read the output of DAC is available in esp-idf: [peripherals/adc2](#)

Reading the internal hall effect sensor:

```
#include <driver/adc.h>

...

adc1_config_width(ADC_WIDTH_BIT_12);
int val = hall_sensor_read();
```

The value read in both these examples is 12 bits wide (range 0-4095).

## Minimizing Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. To minimize noise, users may connect a 0.1uF capacitor to the ADC input pad in use. Multisampling may also be used to further mitigate the effects of noise.

## ADC Calibration

The [esp\\_adc\\_cal/include/esp\\_adc\\_cal.h](#) API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages ( $V_{ref}$ ) between chips. Per design the ADC reference voltage is 1100mV, however the true reference voltage can range from 1000mV to 1200mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of  $y = \text{coeff\_a} * x + \text{coeff\_b}$  and is used to convert ADC readings to

图 4: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

图 5: Graph illustrating effect of differing reference voltages on the ADC voltage curve.

voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values** Calibration values are used to generate characteristic curves that account for the unique ADC reference voltage of a particular ESP32. There are currently three sources of calibration values. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs' readings at 150mV and 850mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, **Default Vref** will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).

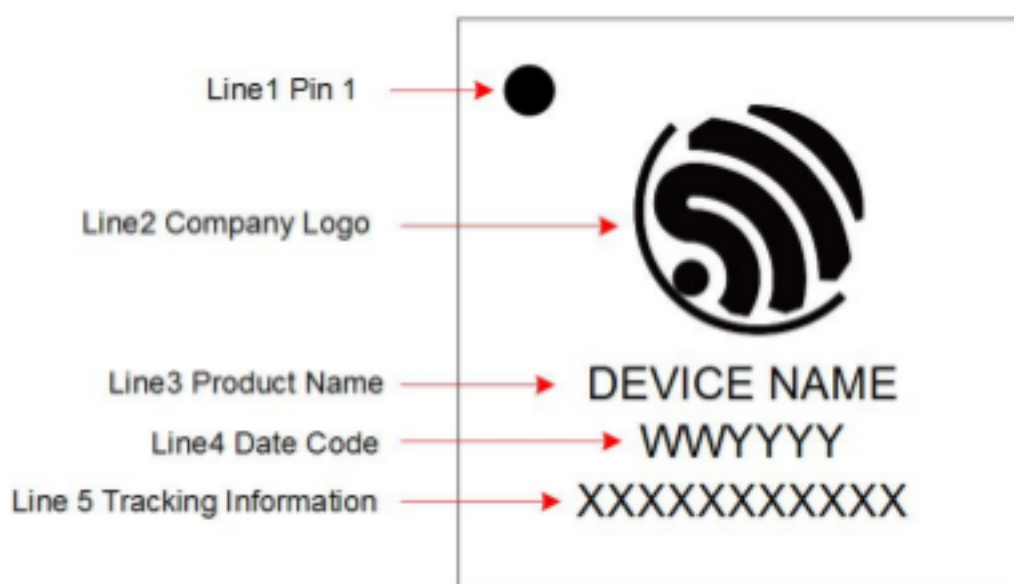

图 6: ESP32 Chip Surface Marking

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if **eFuse Vref** is present by running [espfuse.py](#) tool with `adc_info` parameter

```
$IDF_PATH/components/esptool_py/esptool/espfuse.py --port /dev/ttyUSB0 adc_info
```

Replace `/dev/ttyUSB0` with ESP32 board's port name.

A chip that has specific **eFuse Vref** value programmed (in this case 1093mV) will be reported as follows:

```
ADC VRef calibration: 1093mV
```

In another example below the **eFuse Vref** is not programmed:

```
ADC VRef calibration: None (1100mV nominal)
```

For a chip with two point calibration the message will look similar to:

```

ADC Vref calibration: 1149mV
ADC readings stored in efuse BLK3:
  ADC1 Low reading (150mV): 306
  ADC1 High reading (850mV): 3153
  ADC2 Low reading (150mV): 389
  ADC2 High reading (850mV): 3206

```

**Application Example** For a full example see esp-idf: [peripherals/adc](#)

Characterizing an ADC at a particular attenuation:

```

#include "driver/adc.h"
#include "esp_adc_cal.h"

...

    //Characterize ADC at particular atten
    esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_
↪characteristics_t));
    esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_
↪BIT_12, DEFAULT_VREF, adc_chars);
    //Check type of calibration value used to characterize ADC
    if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
        printf("eFuse Vref");
    } else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
        printf("Two Point");
    } else {
        printf("Default");
    }
}

```

Reading an ADC then converting the reading to a voltage:

```

#include "driver/adc.h"
#include "esp_adc_cal.h"

...

uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);

```

Routing ADC reference voltage to GPIO, so it can be manually measured (for **Default Vref**):

```

#include "driver/adc.h"

...

esp_err_t status = adc2_vref_to_gpio(GPIO_NUM_25);
if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
} else {
    printf("failed to route v_ref\n");
}

```

### GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. ADC1\_CHANNEL\_0\_GPIO\_NUM is the GPIO number of ADC1 channel 0 (36);
2. ADC1\_GPIO32\_CHANNEL is the ADC1 channel number of GPIO 32 (ADC1 channel 4).

## API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

## ADC driver

### Header File

- [driver/include/driver/adc.h](#)

### Functions

*esp\_err\_t* **adc1\_pad\_get\_io\_num** (*adc1\_channel\_t* channel, *gpio\_num\_t* \*gpio\_num)

Get the GPIO number of a specific ADC1 channel.

#### Return

- ESP\_OK if success
- ESP\_ERR\_INVALID\_ARG if channel not valid

#### Parameters

- channel: Channel to get the GPIO number
- gpio\_num: output buffer to hold the GPIO number

*esp\_err\_t* **adc1\_config\_width** (*adc\_bits\_width\_t* width\_bit)

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- width\_bit: Bit capture width for ADC1

*esp\_err\_t* **adc\_set\_data\_width** (*adc\_unit\_t* adc\_unit, *adc\_bits\_width\_t* width\_bit)

Configure ADC capture width.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- adc\_unit: ADC unit index
- width\_bit: Bit capture width for ADC unit.

*esp\_err\_t* **adc1\_config\_channel\_atten** (*adc1\_channel\_t* channel, *adc\_atten\_t* atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. `adc1_get_raw()` can then be called for any configured channel.

When VDD\_A is 3.3 V:

- 0 dB attenuation (ADC\_ATTEN\_DB\_0) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC\_ATTEN\_DB\_2\_5) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC\_ATTEN\_DB\_6) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC\_ATTEN\_DB\_11) gives full-scale voltage 3.9 V (see note below)

Due to ADC characteristics, most accurate results are obtained within the following approximate voltage ranges:

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC1 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11 dB attenuation the maximum voltage is limited by VDD\_A, not the full scale voltage.

- 0 dB attenuation (ADC\_ATTEN\_DB\_0) between 100 and 950 mV
- 2.5 dB attenuation (ADC\_ATTEN\_DB\_2\_5) between 100 and 1250 mV
- 6 dB attenuation (ADC\_ATTEN\_DB\_6) between 150 to 1750 mV
- 11 dB attenuation (ADC\_ATTEN\_DB\_11) between 150 to 2450 mV

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *channel*: ADC1 channel to configure
- *atten*: Attenuation level

int **adc1\_get\_raw** (*adc1\_channel\_t channel*)

Take an ADC1 reading from a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

#### Return

- -1: Parameter error
- Other: ADC1 channel reading.

#### Parameters

- *channel*: ADC1 channel to read

void **adc\_power\_on** (void)

Enable ADC power.

void **adc\_power\_off** (void)

Power off SAR ADC This function will force power down for ADC.

*esp\_err\_t* **adc\_gpio\_init** (*adc\_unit\_t adc\_unit, adc\_channel\_t channel*)

Initialize ADC pad.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *adc\_unit*: ADC unit index
- *channel*: ADC channel index

*esp\_err\_t* **adc\_set\_data\_inv** (*adc\_unit\_t adc\_unit, bool inv\_en*)

Set ADC data invert.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *adc\_unit*: ADC unit index
- *inv\_en*: whether enable data invert

*esp\_err\_t* **adc\_set\_clk\_div** (uint8\_t *clk\_div*)

Set ADC source clock.

**Return**

- ESP\_OK success

**Parameters**

- *clk\_div*: ADC clock divider, ADC clock is divided from APB clock

*esp\_err\_t* **adc\_set\_i2s\_data\_source** (*adc\_i2s\_source\_t* *src*)

Set I2S data source.

**Return**

- ESP\_OK success

**Parameters**

- *src*: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

*esp\_err\_t* **adc\_i2s\_mode\_init** (*adc\_unit\_t* *adc\_unit*, *adc\_channel\_t* *channel*)

Initialize I2S ADC mode.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *adc\_unit*: ADC unit index
- *channel*: ADC channel index

void **adc1\_ulp\_enable** (void)

Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw` function.

Note that `adc1_config_channel_atten`, `adc1_config_width` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

int **hall\_sensor\_read** (void)

Read Hall Sensor.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

**Note** The ADC1 module must be enabled by calling `adc1_config_width()` before calling `hall_sensor_read()`. ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

**Return** The hall sensor reading.

*esp\_err\_t* **adc2\_pad\_get\_io\_num** (*adc2\_channel\_t* *channel*, *gpio\_num\_t* \**gpio\_num*)

Get the GPIO number of a specific ADC2 channel.

**Return**

- ESP\_OK if success
- ESP\_ERR\_INVALID\_ARG if channel not valid

**Parameters**

- *channel*: Channel to get the GPIO number
- *gpio\_num*: output buffer to hold the GPIO number

*esp\_err\_t* **adc2\_config\_channel\_atten** (*adc2\_channel\_t* *channel*, *adc\_atten\_t* *atten*)

Configure the ADC2 channel, including setting attenuation.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

When VDD\_A is 3.3 V:

- 0 dB attenuation (`ADC_ATTEN_0db`) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (`ADC_ATTEN_2_5db`) gives full-scale voltage 1.5 V
- 6 dB attenuation (`ADC_ATTEN_6db`) gives full-scale voltage 2.2 V
- 11 dB attenuation (`ADC_ATTEN_11db`) gives full-scale voltage 3.9 V (see note below)

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC2 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11 dB attenuation the maximum voltage is limited by VDD\_A, not the full scale voltage.

**Return**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

*esp\_err\_t* `adc2_get_raw` (*adc2\_channel\_t* `channel`, *adc\_bits\_width\_t* `width_bit`, int \*`raw_out`)

Take an ADC2 reading on a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Note** For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with `ESP_ERR_TIMEOUT`.

**Return**

- `ESP_OK` if success
- `ESP_ERR_TIMEOUT` the WIFI is started, using the ADC2

**Parameters**

- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

*esp\_err\_t* `adc2_vref_to_gpio` (*gpio\_num\_t* `gpio`)

Output ADC2 reference voltage to GPIO 25 or 26 or 27.

This function utilizes the testing mux exclusive to ADC 2 to route the reference voltage one of ADC2's channels. Supported GPIOs are GPIOs 25, 26, and 27. This reference voltage can be manually read from the pin and used in the `esp_adc_cal` component.

**Return**

- `ESP_OK`: `v_ref` successfully routed to selected GPIO
- `ESP_ERR_INVALID_ARG`: Unsupported GPIO

**Parameters**

- [`in`] `gpio`: GPIO number (GPIOs 25, 26 and 27 are supported)

**Macros**

`ADC_ATTEN_0db`

`ADC_ATTEN_2_5db`

## ADC Calibration

### Header File

- [esp\\_adc\\_cal/include/esp\\_adc\\_cal.h](#)

### Functions

**esp\_err\_t esp\_adc\_cal\_check\_efuse** (*esp\_adc\_cal\_value\_t value\_type*)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

#### Return

- **ESP\_OK**: The calibration mode is supported in eFuse
- **ESP\_ERR\_NOT\_SUPPORTED**: Error, eFuse values are not burned
- **ESP\_ERR\_INVALID\_ARG**: Error, invalid argument (**ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF**)

#### Parameters

- **value\_type**: Type of calibration value (**ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF** or **ESP\_ADC\_CAL\_VAL\_EFUSE\_TP**)

*esp\_adc\_cal\_value\_t* **esp\_adc\_cal\_characterize** (*adc\_unit\_t* *adc\_num*, *adc\_atten\_t* *atten*,  
*adc\_bits\_width\_t* *bit\_width*, *uint32\_t* *default\_vref*, *esp\_adc\_cal\_characteristics\_t* \**chars*)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of  $y = \text{coeff\_a} * x + \text{coeff\_b}$ . Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** Two Point values and eFuse Vref can be enabled/disabled using menuconfig.

**Return**

- ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF: eFuse Vref used for characterization
- ESP\_ADC\_CAL\_VAL\_EFUSE\_TP: Two Point value used for characterization (only in Linear Mode)
- ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF: Default Vref used for characterization

**Parameters**

- [in] *adc\_num*: ADC to characterize (ADC\_UNIT\_1 or ADC\_UNIT\_2)
- [in] *atten*: Attenuation to characterize
- [in] *bit\_width*: Bit width configuration of ADC
- [in] *default\_vref*: Default ADC reference voltage in mV (used if eFuse values is not available)
- [out] *chars*: Pointer to empty structure used to store ADC characteristics

*uint32\_t* **esp\_adc\_cal\_raw\_to\_voltage** (*uint32\_t* *adc\_reading*, *const*  
*esp\_adc\_cal\_characteristics\_t* \**chars*)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC's characteristics.

**Note** Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

**Return** Voltage in mV

**Parameters**

- [in] *adc\_reading*: ADC reading
- [in] *chars*: Pointer to initialized structure containing ADC characteristics

*esp\_err\_t* **esp\_adc\_cal\_get\_voltage** (*adc\_channel\_t* *channel*, *const* *esp\_adc\_cal\_characteristics\_t*  
\**chars*, *uint32\_t* \**voltage*)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

**Return**

- ESP\_OK: ADC read and converted to mV
- ESP\_ERR\_TIMEOUT: Error, timed out attempting to read ADC
- ESP\_ERR\_INVALID\_ARG: Error due to invalid arguments

**Parameters**

- [in] *channel*: ADC Channel to read
- [in] *chars*: Pointer to initialized ADC characteristics structure
- [out] *voltage*: Pointer to store converted voltage

**Structures**

**struct** **esp\_adc\_cal\_characteristics\_t**

Structure storing characteristics of an ADC.

**Note** Call `esp_adc_cal_characterize()` to initialize the structure

### Public Members

`adc_unit_t` **adc\_num**  
ADC number

`adc_atten_t` **atten**  
ADC attenuation

`adc_bits_width_t` **bit\_width**  
ADC bit width

`uint32_t` **coeff\_a**  
Gradient of ADC-Voltage curve

## 2.3.2 Controller Area Network (CAN)

### Overview

The ESP32's peripherals contains a CAN Controller that supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID) of the CAN2.0B specification.

**警告:** The ESP32 CAN controller is not compatible with CAN FD frames and will interpret such frames as errors.

This programming guide is split into the following sections:

1. *Basic CAN Concepts*
2. *Signals Lines and Transceiver*
3. *Configuration*

4. *Driver Operation*
5. *Examples*

## Basic CAN Concepts

---

**注解:** The following section only covers the basic aspects of CAN. For full details, see the CAN2.0B specification

---

The CAN protocol is a multi-master, multi-cast communication protocol with error detection/signalling and inbuilt message prioritization. The CAN protocol is commonly used as a communication bus in automotive applications.

**Multi-master:** Any node in a CAN bus is allowed initiate the transfer of data.

**Multi-cast:** When a node transmits a message, all nodes are able to receive the message (broadcast). However some nodes can selective choose which messages to accept via the use of acceptance filtering (multi-cast).

**Error Detection and Signalling:** Every CAN node will constantly monitor the CAN bus. When any node detects an error, it will signal the error by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** If two nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID will win arbitration. All other nodes will become receivers ensuring there is at most one transmitter at any time.

**CAN Message Frames** The CAN2.0B specification contains two frame formats known as **Extended Frame** and **Standard Frame** which contain 29-bit IDs and 11-bit IDs respectively. A CAN message consists of the following components

- 29-bit or 11-bit ID
- Data Length Code (DLC) between 0 to 8
- Up to 8 bytes of data (should match DLC)

**Error States and Counters** The CAN2.0B specification implements fault confinement by requiring every CAN node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are used to determine a CAN node's **error state**, and the counters are incremented and decremented following a set of rules (see CAN2.0B specification). These error states are known as **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A CAN node is Error Active when **both TEC and REC are less than 128** and indicates a CAN node is operating normally. Error Active nodes are allowed to participate in CAN bus activities, and will actively signal any error conditions it detects by transmitting an **Active Error Flag** over the CAN bus.

**Error Passive:** A CAN node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in CAN bus activities, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A CAN node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable take part in CAN bus activity and will remain so until it undergoes bus recovery.

## Signals Lines and Transceiver

The CAN controller does not contain a internal transceiver and therefore **requires an external transceiver** to operate. The type of external transceiver will depend on the application's physical layer specification (e.g. using SN65HVD23X transceivers for ISO 11898-2 compatibility).

The CAN controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to GPIOs.

**TX and RX:** The TX and RX signal lines are required to interface with an external CAN transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

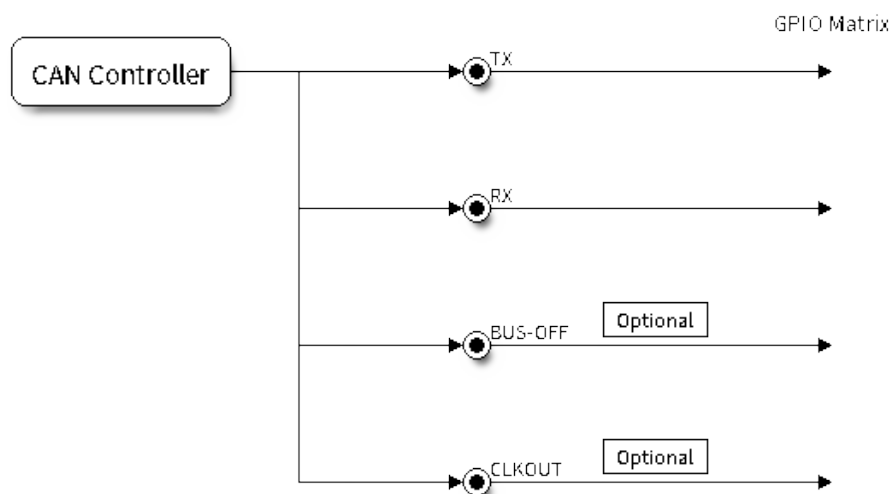

图 7: Signal lines of the CAN controller

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the CAN controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the CAN controller's source clock (APB Clock).

---

**注解:** An external transceiver **must internally tie the TX input and the RX output** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the CAN controller to interpret differences in logic levels between the two signal lines as a lost in arbitration or a bit error.

---

## Configuration

**Operating Modes** The CAN driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the CAN controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another CAN node is required when transmitting message frames.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required when transmitting message frames. This mode is useful when self testing the CAN controller.

**Listen Only Mode:** This mode will prevent the CAN controller from taking part in bus activities. Therefore transmissions of messages/acknowledgement/error frames will be disabled. However the the CAN controller will still be able to receive messages (without acknowledging). This mode is suited for applications such as CAN bus monitoring.

**Alerts** The CAN driver contains an alert feature which is used to notify the application level of certain CAN driver events. Alerts are selectively enabled when the CAN driver is installed, but can be reconfigured during runtime by calling `can_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `can_read_alerts()`. The CAN driver supports the following alerts:

Alert	Description
CAN_ALERT_TX_IDLE	No more messages queued for transmission
CAN_ALERT_TX_SUCCESS	The previous transmission was successful
CAN_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
CAN_ALERT_ERR_ACTIVE	CAN controller has become error active
CAN_ALERT_RECOVERY_IN_PROGRESS	CAN controller is undergoing bus recovery
CAN_ALERT_BUS_RECOVERED	CAN controller has successfully completed bus recovery
CAN_ALERT_ARB_LOST	The previous transmission lost arbitration
CAN_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
CAN_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
CAN_ALERT_TX_FAILED	The previous transmission has failed
CAN_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
CAN_ALERT_ERR_PASS	CAN controller has become error passive
CAN_ALERT_BUS_OFF	Bus-off condition occurred. CAN controller can no longer influence bus

**注解:** The **error warning limit** can be used to preemptively warn the application of bus errors before the error passive state is reached. By default the CAN driver sets the **error warning limit** to **96**. The CAN\_ALERT\_ABOVE\_ERR\_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The CAN\_ALERT\_BELOW\_ERR\_WARN is raised when both TEC and REC return back to values below **96**.

**注解:** When enabling alerts, the CAN\_ALERT\_AND\_LOG flag can be used to cause the CAN driver to log any raised alerts to UART. The CAN\_ALERT\_ALL and CAN\_ALERT\_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the CAN controller is configured using the `can_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quanta** is determined by a prescaled version of the CAN controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quanta
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quanta by dividing the CAN controller's source clock (80 MHz APB clock). The `brp` can be **any even number from 2 to 128**. If the ESP32 is a revision 2 or later chip, the `brp` will also support **any multiple of 4 from 132 to 256**, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

图 8: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can range from **1 to 4**.

**注解:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their CAN bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used CAN bus bit rates. The following macro initializers are provided by the CAN driver.

- `CAN_TIMING_CONFIG_12_5KBITS()`
- `CAN_TIMING_CONFIG_16KBITS()`
- `CAN_TIMING_CONFIG_20KBITS()`
- `CAN_TIMING_CONFIG_25KBITS()`
- `CAN_TIMING_CONFIG_50KBITS()`
- `CAN_TIMING_CONFIG_100KBITS()`
- `CAN_TIMING_CONFIG_125KBITS()`
- `CAN_TIMING_CONFIG_250KBITS()`
- `CAN_TIMING_CONFIG_500KBITS()`
- `CAN_TIMING_CONFIG_800KBITS()`
- `CAN_TIMING_CONFIG_1MBITS()`

**注解:** The macro initializers for 12.5K, 16K, and 20K bit rates are only available for ESP32 revision 2 or later.

**Acceptance Filter** The CAN controller contains a hardware acceptance filter which can be used to filter CAN messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the CAN bus that are irrelevant to the CAN node in question. The CAN controller's acceptance filter is configured using two 32-bit values within `can_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the CAN controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

图 9: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

图 10: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `can_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the CAN driver.

### Driver Operation

The CAN driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

图 11: State transition diagram of the CAN driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>can_driver_install()</code>
B	Stopped -> Uninstalled	<code>can_driver_uninstall()</code>
C	Stopped -> Running	<code>can_start()</code>
D	Running -> Stopped	<code>can_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off -> Uninstalled	<code>can_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>can_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of bus-free signal

**Driver States Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the CAN controller is powered OFF.

**Stopped:** In this state, the CAN controller is powered ON and the CAN driver has been installed. However the CAN controller will be unable to take part in any CAN bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the CAN controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the CAN controller will be able to transmit error frames upon detection of errors on the CAN bus.

**Bus-Off:** The bus-off state is automatically entered when the CAN controller's Transmit Error Counter becomes greater than or equal to 256 (see CAN2.0B specification regarding error counter rules). The bus-off state indicates

the occurrence of severe errors on the CAN bus or in the CAN controller. Whilst in the bus-off state, the CAN controller will be unable to take part in any CAN bus activities. To exit the bus-off state, the CAN controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the CAN driver undergoes bus recovery. The CAN driver/controller will remain in the recovering state until the 128 occurrences of the bus-free signal (see CAN2.0B specification) is observed on the CAN bus.

**Message Flags** The CAN driver distinguishes different types of CAN messages by using the various bit field members of the `can_message_t` structure. These bit field members help distinguish whether a message is in standard or extended format, an RTR, and the type of transmission to use when transmitting such a message. These bit field members can also be toggled using the the `flags` member of `can_message_t` and the following message flags:

Flag	Description
CAN_MSG_FLAG_EXTENDED	Message is in Extended Frame Format (29bit ID)
CAN_MSG_FLAG_RTR	Message is a Remote Transmit Request
CAN_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.
CAN_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.
CAN_MSG_FLAG_DLC	Message Data length code is larger than 8. This will break compliance with CAN2.0B
CAN_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the CAN driver via the use of the various configuration structures, macro initializers, the `can_driver_install()` function, and the `can_start()` function.

```
#include "driver/gpio.h"
#include "driver/can.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    can_general_config_t g_config = CAN_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
↪NUM_22, CAN_MODE_NORMAL);
    can_timing_config_t t_config = CAN_TIMING_CONFIG_500KBITS();
    can_filter_config_t f_config = CAN_FILTER_CONFIG_ACCEPT_ALL();

    //Install CAN driver
    if (can_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start CAN driver
    if (can_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers are not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `can_message_t` type and `can_transmit()` function.

```
#include "driver/can.h"

...

//Configure message to transmit
can_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (can_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `can_message_t` type and `can_receive()` function.

```
#include "driver/can.h"

...

//Wait for message to be received
can_message_t message;
if (can_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read CAN driver alerts via the use of the `can_reconfigure_alerts()` and `can_read_alerts()` functions.

```
#include "driver/can.h"
```

(下页继续)

```

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = CAN_ALERT_ERR_PASS | CAN_ALERT_BUS_OFF;
if (can_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
can_read_alerts(&alerts_triggered, portMAX_DELAY);

```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the CAN driver via the use of the `can_stop()` and `can_driver_uninstall()` functions.

```

#include "driver/can.h"

...

//Stop the CAN driver
if (can_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the CAN driver
if (can_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

**Multiple ID Filter Configuration** The acceptance mask in `can_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

**Application Examples** **Network Example:** The CAN Network example demonstrates communication between two ESP32s using the CAN driver API. One CAN node acts as a network master initiate and ceasing the transfer of a data from another CAN node acting as a network slave. The example can be found via [peripherals/can/can\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the CAN driver's alert and bus recovery API. The example purposely introduces errors on the CAN bus to put the CAN controller into the Bus-Off state.

An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/can/can\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the CAN controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the CAN controller and the external transceiver are working correctly. The example can be found via [peripherals/can/can\\_self\\_test](#).

## API Reference

### Header File

- [soc/include/hal/can\\_types.h](#)

### Structures

#### **struct can\_message\_t**

Structure to store a CAN message.

#### **Note**

**Note** The flags member is deprecated

### Public Members

uint32\_t **extd** : 1

Extended Frame Format (29bit ID)

uint32\_t **rtr** : 1

Message is a Remote Transmit Request

uint32\_t **ss** : 1

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self** : 1

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp** : 1

Message's Data length code is larger than 8. This will break compliance with CAN2.0B.

uint32\_t **reserved** : 27

Reserved bits

uint32\_t **flags**

Alternate way to set message flags using message flag macros (see documentation)

uint32\_t **identifier**

11 or 29 bit identifier

uint8\_t **data\_length\_code**

Data length code

uint8\_t **data**[CAN\_FRAME\_MAX\_DLC]

Data bytes (not relevant in RTR frame)

#### **struct can\_timing\_config\_t**

Structure for bit timing configuration of the CAN driver.

**Note** Macro initializers are available for this structure

### Public Members

uint32\_t **brp**

Baudrate prescaler (i.e., APB clock divider) can be any even number from 2 to 128. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

`uint8_t tseg_1`  
Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`  
Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`  
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

`bool triple_sampling`  
Enables triple sampling when the CAN controller samples a bit

`struct can_filter_config_t`  
Structure for acceptance filter configuration of the CAN driver (see documentation)

**Note** Macro initializers are available for this structure

### Public Members

`uint32_t acceptance_code`  
32-bit acceptance code

`uint32_t acceptance_mask`  
32-bit acceptance mask

`bool single_filter`  
Use Single Filter Mode (see documentation)

### Macros

`CAN_EXTD_ID_MASK`  
CAN2.0B Constants.  
Bit mask for 29 bit Extended Frame Format ID

`CAN_STD_ID_MASK`  
Bit mask for 11 bit Standard Frame Format ID

`CAN_FRAME_MAX_DLC`  
Max data bytes allowed in CAN2.0

`CAN_FRAME_EXTD_ID_LEN_BYTES`  
EFF ID requires 4 bytes (29bit)

`CAN_FRAME_STD_ID_LEN_BYTES`  
SFF ID requires 2 bytes (11bit)

`CAN_ERR_PASS_THRESH`  
Error counter threshold for error passive

### Enumerations

`enum can_mode_t`  
CAN Controller operating modes.

*Values:*

`CAN_MODE_NORMAL`  
Normal operating mode where CAN controller can send/receive/acknowledge messages

`CAN_MODE_NO_ACK`  
Transmission does not require acknowledgment. Use this mode for self testing

`CAN_MODE_LISTEN_ONLY`  
The CAN controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**Header File**

- [driver/include/driver/can.h](#)

**Functions**

*esp\_err\_t* **can\_driver\_install** (**const** *can\_general\_config\_t* \*g\_config, **const** *can\_timing\_config\_t* \*t\_config, **const** *can\_filter\_config\_t* \*f\_config)

Install CAN driver.

This function installs the CAN driver using three configuration structures. The required memory is allocated and the CAN driver is placed in the stopped state after running this function.

**Note** Macro initializers are available for the configuration structures (see documentation)

**Note** To reinstall the CAN driver, call `can_driver_uninstall()` first

**Return**

- ESP\_OK: Successfully installed CAN driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

**Parameters**

- [in] g\_config: General configuration structure
- [in] t\_config: Timing configuration structure
- [in] f\_config: Filter configuration structure

*esp\_err\_t* **can\_driver\_uninstall** (void)

Uninstall the CAN driver.

This function uninstalls the CAN driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**

- ESP\_OK: Successfully uninstalled CAN driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t* **can\_start** (void)

Start the CAN driver.

This function starts the CAN driver, putting the CAN driver into the running state. This allows the CAN driver to participate in CAN bus activities such as transmitting/receiving messages. The RX queue is reset in this function, clearing any unread messages. This function can only be called when the CAN driver is in the stopped state.

**Return**

- ESP\_OK: CAN driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t* **can\_stop** (void)

Stop the CAN driver.

This function stops the CAN driver, preventing any further message from being transmitted or received until `can_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the CAN driver is in the running state.

**Warning** A message currently being transmitted/received on the CAN bus will be ceased immediately. This may lead to other CAN nodes interpreting the unfinished message as an error.

**Return**

- ESP\_OK: CAN driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

*esp\_err\_t* **can\_transmit** (**const** *can\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a CAN message.

This function queues a CAN message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it timesout. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the CAN driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

#### Return

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: CAN driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

#### Parameters

- [in] message: Message to transmit
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block on the TX queue

*esp\_err\_t can\_receive (can\_message\_t \*message, TickType\_t ticks\_to\_wait)*

Receive a CAN message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

#### Return

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

#### Parameters

- [out] message: Received message
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block on RX queue

*esp\_err\_t can\_read\_alerts (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)*

Read CAN driver alerts.

This function will read the alerts raised by the CAN driver. If no alert has been when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

#### Return

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

#### Parameters

- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block for alert

*esp\_err\_t can\_reconfigure\_alerts (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)*

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

#### Return

- ESP\_OK: Alerts reconfigured

- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

#### Parameters

- [in] `alerts_enabled`: Bit field of alerts to enable (see documentation for alert flags)
- [out] `current_alerts`: Bit field of currently raised alerts. Set to NULL if unused

*esp\_err\_t* **can\_initiate\_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the CAN driver is in the bus-off state. Once initiated, the CAN driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the CAN bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS\_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

#### Return

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: CAN driver is not in the bus-off state, or is not installed

*esp\_err\_t* **can\_get\_status\_info** (*can\_status\_info\_t* \**status\_info*)

Get current status information of the CAN driver.

#### Return

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

#### Parameters

- [out] `status_info`: Status information

*esp\_err\_t* **can\_clear\_transmit\_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when `can_stop()` or `can_initiate_recovery()` is called.

#### Return

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed or TX queue is disabled

*esp\_err\_t* **can\_clear\_receive\_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when `can_start()` is called.

#### Return

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: CAN driver is not installed

## Structures

**struct can\_general\_config\_t**

Structure for general configuration of the CAN driver.

**Note** Macro initializers are available for this structure

## Public Members

*can\_mode\_t* **mode**

Mode of CAN controller

*gpio\_num\_t* **tx\_io**

Transmit GPIO number

`gpio_num_t rx_io`

Receive GPIO number

`gpio_num_t clkout_io`

CLKOUT GPIO number (optional, set to -1 if unused)

`gpio_num_t bus_off_io`

Bus off indicator GPIO number (optional, set to -1 if unused)

`uint32_t tx_queue_len`

Number of messages TX queue can hold (set to 0 to disable TX Queue)

`uint32_t rx_queue_len`

Number of messages RX queue can hold

`uint32_t alerts_enabled`

Bit field of alerts to enable (see documentation)

`uint32_t clkout_divider`

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

**struct can\_status\_info\_t**

Structure to store status information of CAN driver.

### Public Members

`can_state_t state`

Current state of CAN controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`

Number of messages queued for transmission or awaiting transmission completion

`uint32_t msgs_to_rx`

Number of messages in RX queue waiting to be read

`uint32_t tx_error_counter`

Current value of Transmit Error Counter

`uint32_t rx_error_counter`

Current value of Receive Error Counter

`uint32_t tx_failed_count`

Number of messages that failed transmissions

`uint32_t rx_missed_count`

Number of messages that were lost due to a full RX queue

`uint32_t arb_lost_count`

Number of instances arbitration was lost

`uint32_t bus_error_count`

Number of instances a bus error has occurred

### Macros

**CAN\_IO\_UNUSED**

Marks GPIO as unused in CAN configuration

### Enumerations

**enum can\_state\_t**

CAN driver states.

*Values:*

**CAN\_STATE\_STOPPED**

Stopped state. The CAN controller will not participate in any CAN bus activities

**CAN\_STATE\_RUNNING**

Running state. The CAN controller can transmit and receive messages

**CAN\_STATE\_BUS\_OFF**

Bus-off state. The CAN controller cannot participate in bus activities until it has recovered

**CAN\_STATE\_RECOVERING**

Recovering state. The CAN controller is undergoing bus recovery

### 2.3.3 Digital To Analog Converter

#### Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data, via the *I2S driver* when using the “built-in DAC mode” .

For other analog output options, see the *Sigma-delta Modulation module* and the *LED Control module*. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

#### Application Example

Setting DAC channel 1 (GPIO 25) voltage to approx 0.78 of VDD\_A voltage ( $VDD * 200 / 255$ ). For VDD\_A 3.3V, this is 2.59V:

```
#include <driver/dac.h>

...

dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

#### API Reference

##### Header File

- [driver/include/driver/dac.h](#)

##### Functions

*esp\_err\_t* **dac\_pad\_get\_io\_num** (*dac\_channel\_t* channel, *gpio\_num\_t* \**gpio\_num*)

Get the gpio number of a specific DAC channel.

##### Return

- ESP\_OK if success

##### Parameters

- channel: Channel to get the gpio number
- gpio\_num: output buffer to hold the gpio number

*esp\_err\_t* **dac\_output\_voltage** (*dac\_channel\_t* channel, *uint8\_t* *dac\_value*)

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3\_RTC.

**Note** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

##### Return

- ESP\_OK success

**Parameters**

- channel: DAC channel
- dac\_value: DAC output value

*esp\_err\_t* **dac\_output\_enable** (*dac\_channel\_t* channel)

DAC pad output enable.

**Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

**Parameters**

- channel: DAC channel

*esp\_err\_t* **dac\_output\_disable** (*dac\_channel\_t* channel)

DAC pad output disable.

**Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Return**

- ESP\_OK success

**Parameters**

- channel: DAC channel

*esp\_err\_t* **dac\_i2s\_enable** (void)

Enable DAC output data from I2S.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_i2s\_disable** (void)

Disable DAC output data from I2S.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_enable** (void)

Enable cosine wave generator output.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_disable** (void)

Disable cosine wave generator output.

**Return**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_config** (*dac\_cw\_config\_t* \*cw)

Config the cosine wave generator function in DAC module.

**Return**

- ESP\_OK success

**Parameters**

- cw: Configuration.

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. DAC\_CHANNEL\_1\_GPIO\_NUM is the GPIO number of channel 1 (25);
2. DAC\_GPIO26\_CHANNEL is the channel number of GPIO 26 (channel 2).

**Header File**

- soc/esp32/include/soc/dac\_channel.h

### Macros

**DAC\_GPIO25\_CHANNEL**  
**DAC\_CHANNEL\_1\_GPIO\_NUM**  
**DAC\_GPIO26\_CHANNEL**  
**DAC\_CHANNEL\_2\_GPIO\_NUM**

### Header File

- [soc/include/hal/dac\\_types.h](#)

### Structures

**struct dac\_cw\_config\_t**  
Config the cosine wave generator function in DAC module.

#### Public Members

*dac\_channel\_t* **en\_ch**  
Enable the cosine wave generator of DAC channel.

*dac\_cw\_scale\_t* **scale**  
Set the amplitude of the cosine wave generator output.

*dac\_cw\_phase\_t* **phase**  
Set the phase of the cosine wave generator output.

*uint32\_t* **freq**  
Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

*int8\_t* **offset**  
Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

### Enumerations

**enum dac\_channel\_t**

*Values:*

**DAC\_CHANNEL\_1** = 0  
DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2BETA)

**DAC\_CHANNEL\_2** = 1  
DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2BETA)

**DAC\_CHANNEL\_MAX**

**enum dac\_cw\_scale\_t**

The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3\_RTC.

*Values:*

**DAC\_CW\_SCALE\_1** = 0x0  
1/1. Default.

**DAC\_CW\_SCALE\_2** = 0x1  
1/2.

**DAC\_CW\_SCALE\_4** = 0x2  
1/4.

**DAC\_CW\_SCALE\_8** = 0x3  
1/8.

**enum dac\_cw\_phase\_t**

Set the phase of the cosine wave generator output.

Values:

**DAC\_CW\_PHASE\_0** = 0x2

Phase shift +0°

**DAC\_CW\_PHASE\_180** = 0x3

Phase shift +180°

## 2.3.4 GPIO & RTC GPIO

### Overview

The ESP32 chip features 40 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package (refer to technical reference manual). Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

- Note that GPIO6-11 are usually used for SPI flash.
- GPIO34-39 can only be set as input mode and do not have software pullup or pulldown functions.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when in deep sleep, when the *Ultra Low Power co-processor* is running, or when analog functions such as ADC/DAC/etc are in use.

### Application Example

GPIO output and input interrupt example: [peripherals/gpio](#).

### API Reference - Normal GPIO

#### Header File

- [driver/include/driver/gpio.h](#)

#### Functions

*esp\_err\_t* **gpio\_config** (*const gpio\_config\_t* \*pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- pGPIOConfig: Pointer to GPIO configure struct

*esp\_err\_t* **gpio\_reset\_pin** (*gpio\_num\_t* gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP\_OK.

#### Parameters

- gpio\_num: GPIO number.

*esp\_err\_t* **gpio\_set\_intr\_type** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `intr_type`: Interrupt type, select from `gpio_int_type_t`

*esp\_err\_t* **gpio\_intr\_enable** (*gpio\_num\_t* `gpio_num`)

Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC. Please refer to the comments of `adc1_get_raw`. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

*esp\_err\_t* **gpio\_intr\_disable** (*gpio\_num\_t* `gpio_num`)

Disable GPIO module interrupt signal.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

*esp\_err\_t* **gpio\_set\_level** (*gpio\_num\_t* `gpio_num`, *uint32\_t* `level`)

GPIO set output level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

**Parameters**

- `gpio_num`: GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level`: Output level. 0: low ; 1: high

*int* **gpio\_get\_level** (*gpio\_num\_t* `gpio_num`)

GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**

- `gpio_num`: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

*esp\_err\_t* **gpio\_set\_direction** (*gpio\_num\_t* `gpio_num`, *gpio\_mode\_t* `mode`)

GPIO set direction.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

**Parameters**

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode`: GPIO direction

*esp\_err\_t* **gpio\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

#### Parameters

- gpio\_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- pull: GPIO pull up/down mode.

*esp\_err\_t* **gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO wake-up function.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- gpio\_num: GPIO number.
- intr\_type: GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

*esp\_err\_t* **gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO wake-up function.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- gpio\_num: GPIO number

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)) void \*

, void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

#### Parameters

- fn: Interrupt handler function.
- intr\_alloc\_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- arg: Parameter for handler function
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### Return

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-up on GPIO.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- gpio\_num: GPIO number

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* *gpio\_num*)

Disable pull-up on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: GPIO number

*esp\_err\_t* **gpiopulldown\_en** (*gpio\_num\_t* *gpio\_num*)

Enable pull-down on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: GPIO number

*esp\_err\_t* **gpiopulldown\_dis** (*gpio\_num\_t* *gpio\_num*)

Disable pull-down on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: GPIO number

*esp\_err\_t* **gpio\_install\_isr\_service** (int *intr\_alloc\_flags*)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

**Parameters**

- *intr\_alloc\_flags*: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* *gpio\_num*, *gpio\_isr\_t* *isr\_handler*, void \**args*)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *gpio\_num*: GPIO number

- `isr_handler`: ISR handler function for the corresponding GPIO number.
- `args`: parameter for ISR handler.

*esp\_err\_t* `gpio_isr_handler_remove` (*gpio\_num\_t* `gpio_num`)

Remove ISR handler for the corresponding GPIO pin.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `gpio_num`: GPIO number

*esp\_err\_t* `gpio_set_drive_capability` (*gpio\_num\_t* `gpio_num`, *gpio\_drive\_cap\_t* `strength`)

Set GPIO pad drive capability.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad

*esp\_err\_t* `gpio_get_drive_capability` (*gpio\_num\_t* `gpio_num`, *gpio\_drive\_cap\_t* \*`strength`)

Get GPIO pad drive capability.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Pointer to accept drive capability of the pad

*esp\_err\_t* `gpio_hold_en` (*gpio\_num\_t* `gpio_num`)

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

#### Return

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

#### Parameters

- `gpio_num`: GPIO number, only support output-capable GPIOs

*esp\_err\_t* `gpio_hold_dis` (*gpio\_num\_t* `gpio_num`)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

#### Return

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

**Parameters**

- `gpio_num`: GPIO number, only support output-capable GPIOs

void **gpio\_deep\_sleep\_hold\_en** (void)

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void **gpio\_deep\_sleep\_hold\_dis** (void)

Disable all digital gpio pad hold function during Deep-sleep.

void **gpio\_iomux\_in** (uint32\_t *gpio\_num*, uint32\_t *signal\_idx*)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- `gpio_num`: GPIO number of the pad.
- `signal_idx`: Peripheral signal id to input. One of the `*_IN_IDX` signals in `soc/gpio_sig_map.h`.

void **gpio\_iomux\_out** (uint8\_t *gpio\_num*, int *func*, bool *oen\_inv*)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- `gpio_num`: `gpio_num` GPIO number of the pad.
- `func`: The function number of the peripheral pin to output pin. One of the `FUNC_X_*` of specified pin (X) in `soc/io_mux_reg.h`.
- `oen_inv`: True if the output enable needs to be inverted, otherwise False.

**Type Definitions**

```
typedef intr_handle_t gpio_isr_handle_t
```

**Header File**

- [soc/include/hal/gpio\\_types.h](#)

**Structures**

```
struct gpio_config_t
```

Configuration parameters of GPIO pad for `gpio_config` function.

**Public Members**

```

GPIO mode : output and input mode

**enum gpio\_pullup\_t**

*Values:*

**GPIO\_PULLUP\_DISABLE = 0x0**  
Disable GPIO pull-up resistor

**GPIO\_PULLUP\_ENABLE = 0x1**  
Enable GPIO pull-up resistor

**enum gpiopulldown\_t**

*Values:*

**GPIO\_PULLDOWN\_DISABLE = 0x0**  
Disable GPIO pull-down resistor

**GPIO\_PULLDOWN\_ENABLE = 0x1**  
Enable GPIO pull-down resistor

**enum gpio\_pull\_mode\_t**

*Values:*

**GPIO\_PULLUP\_ONLY**  
Pad pull up

**GPIO\_PULLDOWN\_ONLY**  
Pad pull down

**GPIO\_PULLUP\_PULLDOWN**  
Pad pull up + pull down

**GPIO\_FLOATING**  
Pad floating

**enum gpio\_drive\_cap\_t**

*Values:*

**GPIO\_DRIVE\_CAP\_0 = 0**  
Pad drive capability: weak

**GPIO\_DRIVE\_CAP\_1** = 1  
Pad drive capability: stronger

**GPIO\_DRIVE\_CAP\_2** = 2  
Pad drive capability: medium

**GPIO\_DRIVE\_CAP\_DEFAULT** = 2  
Pad drive capability: medium

**GPIO\_DRIVE\_CAP\_3** = 3  
Pad drive capability: strongest

**GPIO\_DRIVE\_CAP\_MAX**

## API Reference - RTC GPIO

### Header File

- `driver/include/driver/rtc_io.h`

### Functions

**static bool** `rtc_gpio_is_valid_gpio` (*gpio\_num\_t* gpio\_num)  
Determine if the specified GPIO is a valid RTC GPIO.

**Return** true if GPIO is valid for RTC GPIO use. false otherwise.

#### Parameters

- `gpio_num`: GPIO number

**static int** `rtc_io_number_get` (*gpio\_num\_t* gpio\_num)  
Get RTC IO index number by gpio number.

**Return**  $\geq 0$ : Index of rtcio. -1 : The gpio is not rtcio.

#### Parameters

- `gpio_num`: GPIO number

*esp\_err\_t* `rtc_gpio_init` (*gpio\_num\_t* gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

#### Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` GPIO is not an RTC IO

#### Parameters

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t* `rtc_gpio_deinit` (*gpio\_num\_t* gpio\_num)

Init a GPIO as digital GPIO.

#### Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` GPIO is not an RTC IO

#### Parameters

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*uint32\_t* `rtc_gpio_get_level` (*gpio\_num\_t* gpio\_num)

Get the RTC IO input level.

#### Return

- 1 High level
- 0 Low level
- `ESP_ERR_INVALID_ARG` GPIO is not an RTC IO

#### Parameters

- `gpio_num`: GPIO number (e.g. `GPIO_NUM_12`)

*esp\_err\_t rtc\_gpio\_set\_level* (*gpio\_num\_t* *gpio\_num*, *uint32\_t* *level*)

Set the RTC IO output level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- *gpio\_num*: GPIO number (e.g. GPIO\_NUM\_12)
- *level*: output level

*esp\_err\_t rtc\_gpio\_set\_direction* (*gpio\_num\_t* *gpio\_num*, *rtc\_gpio\_mode\_t* *mode*)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- *gpio\_num*: GPIO number (e.g. GPIO\_NUM\_12)
- *mode*: GPIO direction

*esp\_err\_t rtc\_gpio\_set\_direction\_in\_sleep* (*gpio\_num\_t* *gpio\_num*, *rtc\_gpio\_mode\_t* *mode*)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT\_ONLY mode. ESP32S2 support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- *gpio\_num*: GPIO number (e.g. GPIO\_NUM\_12)
- *mode*: GPIO direction

*esp\_err\_t rtc\_gpio\_pullup\_en* (*gpio\_num\_t* *gpio\_num*)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- *gpio\_num*: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpiopulldown\_en* (*gpio\_num\_t* *gpio\_num*)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpiopulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- *gpio\_num*: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_pullup\_dis* (*gpio\_num\_t* *gpio\_num*)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_pulldown\_dis (gpio\_num\_t gpio\_num)*

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_hold\_en (gpio\_num\_t gpio\_num)*

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_hold\_dis (gpio\_num\_t gpio\_num)*

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12)

*esp\_err\_t rtc\_gpio\_isolate (gpio\_num\_t gpio\_num)*

Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call `rtc_gpio_isolate(GPIO_NUM_12)` before entering deep sleep, to reduce deep sleep current.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if GPIO is not an RTC IO

**Parameters**

- `gpio_num`: GPIO number (e.g. GPIO\_NUM\_12).

*esp\_err\_t rtc\_gpio\_force\_hold\_all (void)*

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t rtc\_gpio\_force\_hold\_dis\_all (void)*

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)  
Set RTC GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)  
Get RTC GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)  
Enable wakeup from sleep mode using specific GPIO.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

**Parameters**

- gpio\_num: GPIO number
- intr\_type: Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)  
Disable wakeup from sleep mode using specific GPIO.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO

**Parameters**

- gpio\_num: GPIO number

**Macros**

**RTC\_GPIO\_IS\_VALID\_GPIO** (gpio\_num)

**Header File**

- soc/include/hal/rtc\_io\_types.h

**Enumerations**

**enum rtc\_gpio\_mode\_t**  
RTCIO output/input mode type.

Values:

**RTC\_GPIO\_MODE\_INPUT\_ONLY**

Pad input

**RTC\_GPIO\_MODE\_OUTPUT\_ONLY**

Pad output

**RTC\_GPIO\_MODE\_INPUT\_OUTPUT**

Pad input + output

<code>RTC_GPIO_MODE_DISABLED</code>	Pad (output + input) disable
<code>RTC_GPIO_MODE_OUTPUT_OD</code>	Pad open-drain output
<code>RTC_GPIO_MODE_INPUT_OUTPUT_OD</code>	Pad input + open-drain output

## 2.3.5 I2C Driver

### Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has two I2C controllers (also referred to as ports) which are responsible for handling communications on two I2C buses. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

### Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

### Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
  - a) *Communication as Master* - handle communications (master)
  - b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver*- release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32's internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp32/include/esp_intr_alloc.h`)

**Communication as Master** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

ESP32's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write** The example below shows how to build a command link for an I2C master to send  $n$  bytes to a slave.

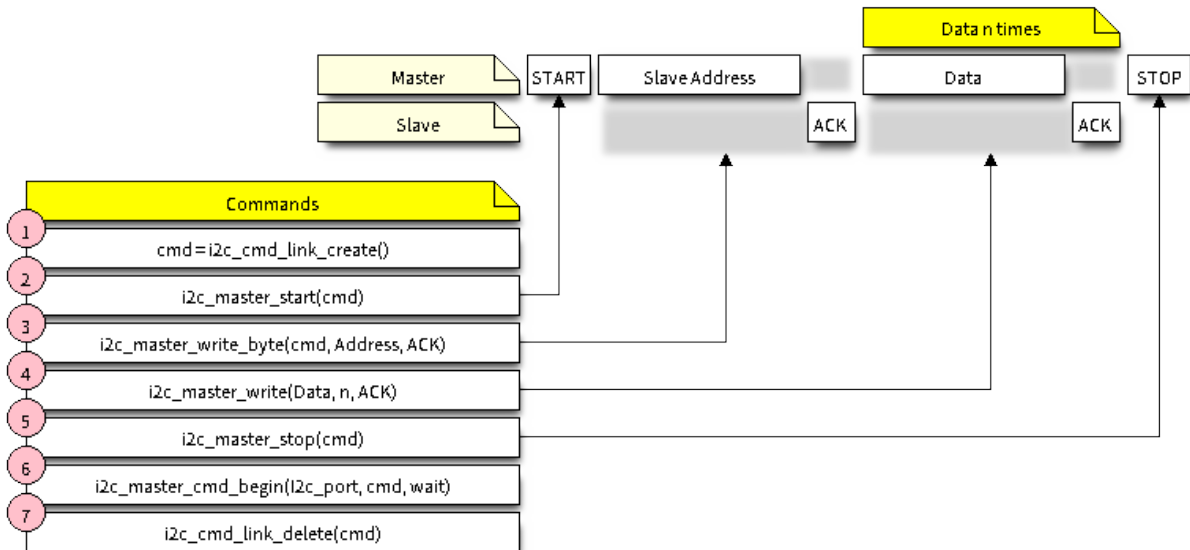

图 12: I2C command link - master write example

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
Then, populate it with the series of data to be sent to the slave:
  - a) **Start bit** - `i2c_master_start()`
  - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
  - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
  - d) **Stop bit** - `i2c_master_stop()`

Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read  $n$  bytes from a slave.

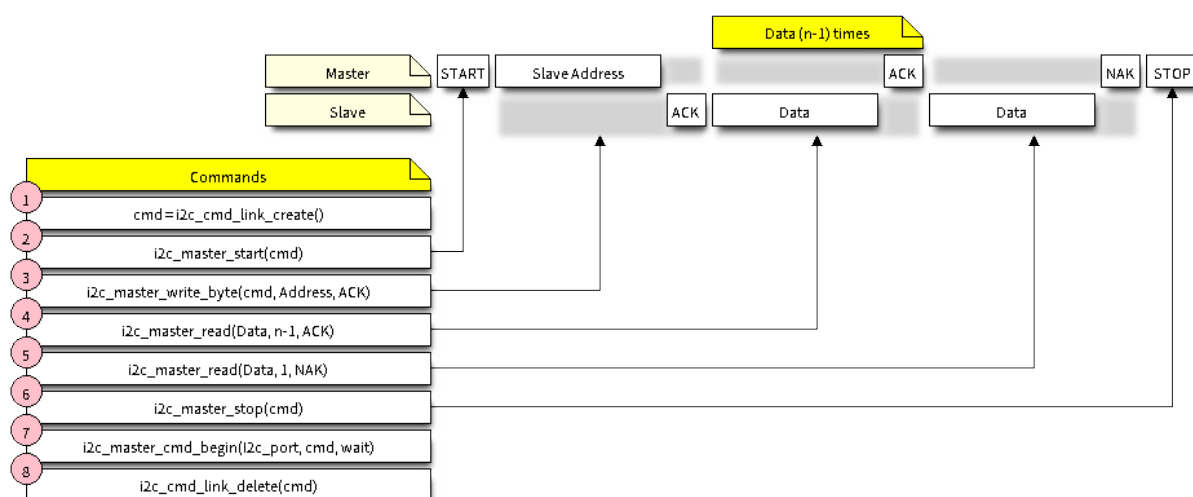

图 13: I2C command link - master read example

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave's address.

For this reason, the command link sent by the master to write data to the slave contains the address  $(ESP\_SLAVE\_ADDR \ll 1) \mid I2C\_MASTER\_WRITE$  and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`  
Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.
- `i2c_slave_write_buffer()`

The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

**Interrupt Handling** During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to the [ESP32 Technical Reference Manual](#) for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration** As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the [I2C specification](#). Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

表 1: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<code>i2c_set_period()</code>
SCL and SDA signal timing used during generation of <b>start</b> signals	<code>i2c_set_start_timing()</code>
SCL and SDA signal timing used during generation of <b>stop</b> signals	<code>i2c_set_stop_timing()</code>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<code>i2c_set_data_timing()</code>
I2C timeout	<code>i2c_set_timeout()</code>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code>	<code>i2c_set_data_mode()</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file [driver/i2c.c](#) and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

---

**注解:** ESP32's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the [I2C specification](#).

---

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file [driver/i2c.c](#) and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

### Application Example

I2C master and slave example: [peripherals/i2c](#).

### API Reference

#### Header File

- `driver/include/driver/i2c.h`

#### Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

I2C driver install.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver install error

#### Parameters

- `i2c_num`: I2C port number
- `mode`: I2C mode (master or slave)
- `slv_rx_buf_len`: receiving buffer size for slave mode

#### Parameters

- `slv_tx_buf_len`: sending buffer size for slave mode

#### Parameters

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`OR`) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

`esp_err_t i2c_driver_delete(i2c_port_t i2c_num)`

I2C driver delete.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number

`esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`

I2C parameter initialization.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number

- `i2c_conf`: pointer to I2C parameter settings

*esp\_err\_t* `i2c_reset_tx_fifo` (*i2c\_port\_t* *i2c\_num*)

reset I2C tx hardware fifo

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number

*esp\_err\_t* `i2c_reset_rx_fifo` (*i2c\_port\_t* *i2c\_num*)

reset I2C rx fifo

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number

*esp\_err\_t* `i2c_isr_register` (*i2c\_port\_t* *i2c\_num*, void (\*fn)) void \*, void \*arg, int *intr\_alloc\_flags*, *intr\_handle\_t* \*handle) I2C isr handler register.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number
- `fn`: isr handler function
- `arg`: parameter for isr handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: handle return from `esp_intr_alloc`.

*esp\_err\_t* `i2c_isr_free` (*intr\_handle\_t* handle)

to delete and free I2C isr.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `handle`: handle of isr.

*esp\_err\_t* `i2c_set_pin` (*i2c\_port\_t* *i2c\_num*, int *sda\_io\_num*, int *scl\_io\_num*, bool *sda\_pullup\_en*, bool *scl\_pullup\_en*, *i2c\_mode\_t* mode)

Configure GPIO signal for I2C sck and sda.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number
- `sda_io_num`: GPIO number for I2C sda signal
- `scl_io_num`: GPIO number for I2C scl signal
- `sda_pullup_en`: Whether to enable the internal pullup for sda pin
- `scl_pullup_en`: Whether to enable the internal pullup for scl pin
- `mode`: I2C mode

*i2c\_cmd\_handle\_t* `i2c_cmd_link_create` (void)

Create and init I2C command link.

**Note** Before we build I2C command link, we need to call `i2c_cmd_link_create()` to create a command link. After we finish sending the commands, we need to call `i2c_cmd_link_delete()` to release and return the resources.

**Return** i2c command link handler

void **i2c\_cmd\_link\_delete** (*i2c\_cmd\_handle\_t cmd\_handle*)

Free I2C command link.

**Note** Before we build I2C command link, we need to call `i2c_cmd_link_create()` to create a command link. After we finish sending the commands, we need to call `i2c_cmd_link_delete()` to release and return the resources.

**Parameters**

- `cmd_handle`: I2C command handle

*esp\_err\_t* **i2c\_master\_start** (*i2c\_cmd\_handle\_t cmd\_handle*)

Queue command for I2C master to generate a start signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link

*esp\_err\_t* **i2c\_master\_write\_byte** (*i2c\_cmd\_handle\_t cmd\_handle*, *uint8\_t data*, *bool ack\_en*)

Queue command for I2C master to write one byte to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: I2C one byte command to write to bus
- `ack_en`: enable ack check for master

*esp\_err\_t* **i2c\_master\_write** (*i2c\_cmd\_handle\_t cmd\_handle*, *uint8\_t \*data*, *size\_t data\_len*, *bool ack\_en*)

Queue command for I2C master to write buffer to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and `intr_flag` is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: data to send

**Parameters**

- `data_len`: data length
- `ack_en`: enable ack check for master

*esp\_err\_t* **i2c\_master\_read\_byte** (*i2c\_cmd\_handle\_t cmd\_handle*, *uint8\_t \*data*, *i2c\_ack\_type\_t ack*)

Queue command for I2C master to read one byte from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and `intr_flag` is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: pointer accept the data byte

**Parameters**

- `ack`: ack value for read command

`esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)`

Queue command for I2C master to read data from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and `intr_flag` is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link
- `data`: data buffer to accept the data from bus

**Parameters**

- `data_len`: read data length
- `ack`: ack value for read command

`esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)`

Queue command for I2C master to generate a stop signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`

I2C master send queued commands. This function will trigger sending all queued commands. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue.

**Note** Only call this function in I2C master mode

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave doesn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

**Parameters**

- `i2c_num`: I2C port number
- `cmd_handle`: I2C command handler
- `ticks_to_wait`: maximum wait ticks.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, uint8_t *data, int size, TickType_t ticks_to_wait)`

I2C slave write data to internal ringbuffer, when tx fifo empty, isr will fill the hardware fifo from the internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**

- `ESP_FAIL`(-1) Parameter error
- Others(>=0) The number of data bytes that pushed to the I2C slave buffer.

**Parameters**

- `i2c_num`: I2C port number
- `data`: data pointer to write into internal buffer
- `size`: data size
- `ticks_to_wait`: Maximum waiting ticks

`int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)`

I2C slave read data from internal buffer. When I2C slave receive data, isr will copy received data from hardware rx fifo to internal ringbuffer. Then users can read from internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**

- ESP\_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes that read from I2C slave buffer.

**Parameters**

- *i2c\_num*: I2C port number
- *data*: data pointer to accept data from internal buffer
- *max\_size*: Maximum data size to read
- *ticks\_to\_wait*: Maximum waiting ticks

*esp\_err\_t* **i2c\_set\_period** (*i2c\_port\_t* *i2c\_num*, int *high\_period*, int *low\_period*)  
set I2C master clock period

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *high\_period*: clock cycle number during SCL is high level, *high\_period* is a 14 bit value
- *low\_period*: clock cycle number during SCL is low level, *low\_period* is a 14 bit value

*esp\_err\_t* **i2c\_get\_period** (*i2c\_port\_t* *i2c\_num*, int \**high\_period*, int \**low\_period*)  
get I2C master clock period

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *high\_period*: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- *low\_period*: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

*esp\_err\_t* **i2c\_filter\_enable** (*i2c\_port\_t* *i2c\_num*, uint8\_t *cyc\_num*)  
enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine broken. enable hardware filter can filter out high frequency interference and make the master more stable.

**Note** Enable filter will slow the SCL clock.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *cyc\_num*: the APB cycles need to be filtered( $0 \leq cyc\_num \leq 7$ ). When the period of a pulse is less than  $cyc\_num * APB\_cycle$ , the I2C controller will ignore this pulse.

*esp\_err\_t* **i2c\_filter\_disable** (*i2c\_port\_t* *i2c\_num*)  
disable filter on I2C bus

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number

*esp\_err\_t* **i2c\_set\_start\_timing** (*i2c\_port\_t* *i2c\_num*, int *setup\_time*, int *hold\_time*)  
set I2C master start signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- `hold_time`: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

`esp_err_t i2c_get_start_timing (i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master start signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time
- `hold_time`: pointer to get hold time

`esp_err_t i2c_set_stop_timing (i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master stop signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- `hold_time`: clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

`esp_err_t i2c_get_stop_timing (i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master stop signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time.
- `hold_time`: pointer to get hold time.

`esp_err_t i2c_set_data_timing (i2c_port_t i2c_num, int sample_time, int hold_time)`

set I2C data signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `sample_time`: clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- `hold_time`: clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

`esp_err_t i2c_get_data_timing (i2c_port_t i2c_num, int *sample_time, int *hold_time)`

get I2C data signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `sample_time`: pointer to get sample time

- `hold_time`: pointer to get hold time

`esp_err_t i2c_set_timeout (i2c_port_t i2c_num, int timeout)`  
set I2C timeout value

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `timeout`: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

`esp_err_t i2c_get_timeout (i2c_port_t i2c_num, int *timeout)`  
get I2C timeout value

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `timeout`: pointer to get timeout value

`esp_err_t i2c_set_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)`  
set I2C data transfer mode

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `tx_trans_mode`: I2C sending data mode
- `rx_trans_mode`: I2C receiving data mode

`esp_err_t i2c_get_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)`  
get I2C data transfer mode

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `tx_trans_mode`: pointer to get I2C sending data mode
- `rx_trans_mode`: pointer to get I2C receiving data mode

**Macros**

**I2C\_APB\_CLK\_FREQ**

I2C source clock is APB clock, 80MHz

**I2C\_NUM\_0**

I2C port 0

**I2C\_NUM\_1**

I2C port 1

**I2C\_NUM\_MAX**

I2C port max

**Type Definitions**

`typedef void *i2c_cmd_handle_t`  
I2C command handle

## Header File

- [soc/include/hal/i2c\\_types.h](#)

## Structures

**struct i2c\_config\_t**  
I2C initialization parameters.

### Public Members

*i2c\_mode\_t* **mode**

I2C mode

int **sda\_io\_num**

GPIO number for I2C sda signal

int **scl\_io\_num**

GPIO number for I2C scl signal

bool **sda\_pullup\_en**

Internal GPIO pull mode for I2C sda signal

bool **scl\_pullup\_en**

Internal GPIO pull mode for I2C scl signal

uint32\_t **clk\_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

uint8\_t **addr\_10bit\_en**

I2C 10bit address mode enable for slave mode

uint16\_t **slave\_addr**

I2C address for slave mode

## Type Definitions

**typedef int i2c\_port\_t**  
I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).

## Enumerations

**enum i2c\_mode\_t**

*Values:*

**I2C\_MODE\_SLAVE** = 0

I2C slave mode

**I2C\_MODE\_MASTER**

I2C master mode

**I2C\_MODE\_MAX**

**enum i2c\_rw\_t**

*Values:*

**I2C\_MASTER\_WRITE** = 0

I2C write data

**I2C\_MASTER\_READ**

I2C read data

**enum i2c\_opmode\_t**

*Values:*

**I2C\_CMD\_RESTART** = 0

I2C restart command

**I2C\_CMD\_WRITE**  
I2C write command

**I2C\_CMD\_READ**  
I2C read command

**I2C\_CMD\_STOP**  
I2C stop command

**I2C\_CMD\_END**  
I2C end command

**enum i2c\_trans\_mode\_t**

*Values:*

**I2C\_DATA\_MODE\_MSB\_FIRST = 0**  
I2C data msb first

**I2C\_DATA\_MODE\_LSB\_FIRST = 1**  
I2C data lsb first

**I2C\_DATA\_MODE\_MAX**

**enum i2c\_addr\_mode\_t**

*Values:*

**I2C\_ADDR\_BIT\_7 = 0**  
I2C 7bit address for slave mode

**I2C\_ADDR\_BIT\_10**  
I2C 10bit address for slave mode

**I2C\_ADDR\_BIT\_MAX**

**enum i2c\_ack\_type\_t**

*Values:*

**I2C\_MASTER\_ACK = 0x0**  
I2C ack for each byte read

**I2C\_MASTER\_NACK = 0x1**  
I2C nack for each byte read

**I2C\_MASTER\_LAST\_NACK = 0x2**  
I2C nack for the last byte

**I2C\_MASTER\_ACK\_MAX**

**enum i2c\_sclk\_t**

*Values:*

**I2C\_SCLK\_REF\_TICK**  
I2C source clock from REF\_TICK

**I2C\_SCLK\_APB**  
I2C source clock from APB

## 2.3.6 I2S

### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 integrates two I2S controllers, referred to as I2S0 and I2S1, both of which can be used for streaming audio and video digital data.

An I2S bus consists of the following lines:

- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- Dedicated DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter's (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

For more information, see the [ESP32 Technical Reference Manual](#).

---

**注解:** For high accuracy clock applications, use the APLL\_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL\_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll` = TRUE and `i2s_config_t::fixed_mclk` > 0, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true:  $0 < \text{MCLK/LRCK/channels/bits\_per\_sample} < 64$ .

---

## Functional Overview

**Installing the Driver** Install the I2S driver by calling the function `cpp:func'i2s_driver_install'` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Configuration example:

```
static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};
```

(下页继续)

```
i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins** Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `cpp:func'i2s_set_pin'` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```
static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication** To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the I2S DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the I2S DMA Rx buffer, once the data is received by the I2S controller.

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func'i2s_driver_install'` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

### Application Example

A code example for the I2S driver can be found in the directory [peripherals/i2s](#).

In addition, there are two short configuration examples for the I2S driver.

#### I2S configuration

```
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
```

(下页继续)

```

        .bits_per_sample = 16,
        .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
        .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
        .intr_alloc_flags = 0, // default interrupt priority
        .dma_buf_count = 8,
        .dma_buf_len = 64,
        .use_apll = false
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};

...

    i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↳driver

    i2s_set_pin(i2s_num, &pin_config);

    i2s_set_sample_rates(i2s_num, 22050); //set sample rates

    i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

### Configuring I2S to use internal DAC for analog output

```

#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16, /* the DAC module will only take the 8bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

...

    i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↳driver

    i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the_
↳internal channels

    //You can call i2s_set_dac_mode to set built-in DAC output mode.
    //i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

    i2s_set_sample_rates(i2s_num, 22050); //set sample rates

    i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

## API Reference

### Header File

- [driver/include/driver/i2s.h](#)

### Functions

*esp\_err\_t* **i2s\_set\_pin** (*i2s\_port\_t* *i2s\_num*, **const** *i2s\_pin\_config\_t* \**pin*)

Set I2S pin number.

Inside the pin configuration structure, set I2S\_PIN\_NO\_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

#### Parameters

- *i2s\_num*: I2S\_NUM\_0 or I2S\_NUM\_1
- *pin*: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if \**pin* is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL IO error

*esp\_err\_t* **i2s\_set\_dac\_mode** (*i2s\_dac\_mode\_t* *dac\_mode*)

Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *dac\_mode*: DAC mode configurations - see `i2s_dac_mode_t`

*esp\_err\_t* **i2s\_driver\_install** (*i2s\_port\_t* *i2s\_num*, **const** *i2s\_config\_t* \**i2s\_config*, *int* *queue\_size*, *void* \**i2s\_queue*)

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

#### Parameters

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *i2s\_config*: I2S configurations - see `i2s_config_t` struct
- *queue\_size*: I2S event queue size/depth.
- *i2s\_queue*: I2S event queue handle, if set NULL, driver will not use an event queue.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

*esp\_err\_t* **i2s\_driver\_uninstall** (*i2s\_port\_t* *i2s\_num*)

Uninstall I2S driver.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_write** (*i2s\_port\_t* *i2s\_num*, **const** void \**src*, size\_t *size*, size\_t \**bytes\_written*, TickType\_t *ticks\_to\_wait*)

Write data to I2S DMA transmit buffer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *src*: Source address to write from
- *size*: Size of data in bytes
- [out] *bytes\_written*: Number of bytes written, if timeout, the result will be less than the size passed in.
- *ticks\_to\_wait*: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

*esp\_err\_t* **i2s\_write\_expand** (*i2s\_port\_t* *i2s\_num*, **const** void \**src*, size\_t *size*, size\_t *src\_bits*, size\_t *aim\_bits*, size\_t \**bytes\_written*, TickType\_t *ticks\_to\_wait*)

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see [i2s\\_config\\_t](#)).

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *src*: Source address to write from
- *size*: Size of data in bytes
- *src\_bits*: Source audio bit
- *aim\_bits*: Bit wanted, no more than 32, and must be greater than *src\_bits*
- [out] *bytes\_written*: Number of bytes written, if timeout, the result will be less than the size passed in.
- *ticks\_to\_wait*: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2s\_read** (*i2s\_port\_t* *i2s\_num*, void \**dest*, size\_t *size*, size\_t \**bytes\_read*, TickType\_t *ticks\_to\_wait*)

Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call `i2s_adc_start` and `i2s_adc_stop` around the whole reading process, to prevent the data getting corrupted.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *dest*: Destination address to read into
- *size*: Size of data in bytes
- [out] *bytes\_read*: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- *ticks\_to\_wait*: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

*esp\_err\_t* **i2s\_set\_sample\_rates** (*i2s\_port\_t* *i2s\_num*, *uint32\_t* *rate*)

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and *i2s\_config\_t* configuration parameters (number of channels, *bits\_per\_sample*).

```
bit_clock = rate * (number of channels) * bits_per_sample
```

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *rate*: I2S sample rate (ex: 8000, 44100...)

*esp\_err\_t* **i2s\_stop** (*i2s\_port\_t* *i2s\_num*)

Stop I2S driver.

There is no need to call *i2s\_stop*() before calling *i2s\_driver\_uninstall*().

Disables I2S TX/RX, until *i2s\_start*() is called.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_start** (*i2s\_port\_t* *i2s\_num*)

Start I2S driver.

It is not necessary to call this function after *i2s\_driver\_install*() (it is started automatically), however it is necessary to call it after *i2s\_stop*().

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_zero\_dma\_buffer** (*i2s\_port\_t* *i2s\_num*)

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_set\_clk** (*i2s\_port\_t* *i2s\_num*, *uint32\_t* *rate*, *i2s\_bits\_per\_sample\_t* *bits*, *i2s\_channel\_t* *ch*)

Set clock & bit width used for I2S RX and TX.

Similar to *i2s\_set\_sample\_rates*(), but also sets bit width.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

**Parameters**

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *rate*: I2S sample rate (ex: 8000, 44100...)
- *bits*: I2S bit width (I2S\_BITS\_PER\_SAMPLE\_16BIT, I2S\_BITS\_PER\_SAMPLE\_24BIT, I2S\_BITS\_PER\_SAMPLE\_32BIT)

- ch: I2S channel, (I2S\_CHANNEL\_MONO, I2S\_CHANNEL\_STEREO)

float **i2s\_get\_clk** (*i2s\_port\_t* i2s\_num)  
get clock set on particular port number.

**Return**

- actual clock set by i2s driver

**Parameters**

- i2s\_num: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_set\_adc\_mode** (*adc\_unit\_t* adc\_unit, *adc1\_channel\_t* adc\_channel)

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- adc\_unit: SAR ADC unit index
- adc\_channel: ADC channel index

*esp\_err\_t* **i2s\_adc\_enable** (*i2s\_port\_t* i2s\_num)

Start to use I2S built-in ADC mode.

**Note** This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver state error

**Parameters**

- i2s\_num: i2s port index

*esp\_err\_t* **i2s\_adc\_disable** (*i2s\_port\_t* i2s\_num)

Stop to use I2S built-in ADC mode.

**Note** This function would release the lock of ADC so that other tasks can use ADC.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver state error

**Parameters**

- i2s\_num: i2s port index

**Type Definitions**

```
typedef intr_handle_t i2s_isr_handle_t
```

**Header File**

- [soc/include/hal/i2s\\_types.h](#)

**Structures**

```
struct i2s_config_t
```

I2S configuration parameters for i2s\_param\_config function.

**Public Members**

```
i2s_mode_t mode
```

I2S work mode

int **sample\_rate**

I2S sample rate

*i2s\_bits\_per\_sample\_t* **bits\_per\_sample**

I2S bits per sample

*i2s\_channel\_fmt\_t* **channel\_format**

I2S channel format

*i2s\_comm\_format\_t* **communication\_format**

I2S communication format

int **intr\_alloc\_flags**

Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info

int **dma\_buf\_count**

I2S DMA Buffer Count

int **dma\_buf\_len**

I2S DMA Buffer Length

bool **use\_apll**

I2S using APLL as main I2S clock, enable it to get accurate clock

bool **tx\_desc\_auto\_clear**

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int **fixed\_mclk**

I2S using fixed MCLK output. If use\_apll = true and fixed\_mclk > 0, then the clock output for i2s is fixed and equal to the fixed\_mclk value.

**struct i2s\_event\_t**

Event structure used in I2S event queue.

### Public Members

*i2s\_event\_type\_t* **type**

I2S event type

size\_t **size**

I2S data size for I2S\_DATA event

**struct i2s\_pin\_config\_t**

I2S pin number for i2s\_set\_pin.

### Public Members

int **bck\_io\_num**

BCK in out pin

int **ws\_io\_num**

WS in out pin

int **data\_out\_num**

DATA out pin

int **data\_in\_num**

DATA in pin

### Macros

**I2S\_PIN\_NO\_CHANGE**

Use in *i2s\_pin\_config\_t* for pins which should not be changed

**Type Definitions****typedef int i2s\_port\_t**

I2S port number, the max port number is (I2S\_NUM\_MAX -1).

**Enumerations****enum i2s\_bits\_per\_sample\_t**

I2S bit width per sample.

*Values:***I2S\_BITS\_PER\_SAMPLE\_8BIT = 8**

I2S bits per sample: 8-bits

**I2S\_BITS\_PER\_SAMPLE\_16BIT = 16**

I2S bits per sample: 16-bits

**I2S\_BITS\_PER\_SAMPLE\_24BIT = 24**

I2S bits per sample: 24-bits

**I2S\_BITS\_PER\_SAMPLE\_32BIT = 32**

I2S bits per sample: 32-bits

**enum i2s\_channel\_t**

I2S channel.

*Values:***I2S\_CHANNEL\_MONO = 1**

I2S 1 channel (mono)

**I2S\_CHANNEL\_STEREO = 2**

I2S 2 channel (stereo)

**enum i2s\_comm\_format\_t**

I2S communication standard format.

*Values:***I2S\_COMM\_FORMAT\_I2S = 0x01**

I2S communication format I2S

**I2S\_COMM\_FORMAT\_I2S\_MSB = 0x02**

I2S format MSB

**I2S\_COMM\_FORMAT\_I2S\_LSB = 0x04**

I2S format LSB

**I2S\_COMM\_FORMAT\_PCM = 0x08**

I2S communication format PCM

**I2S\_COMM\_FORMAT\_PCM\_SHORT = 0x10**

PCM Short

**I2S\_COMM\_FORMAT\_PCM\_LONG = 0x20**

PCM Long

**enum i2s\_channel\_fmt\_t**

I2S channel format type.

*Values:***I2S\_CHANNEL\_FMT\_RIGHT\_LEFT = 0x00****I2S\_CHANNEL\_FMT\_ALL\_RIGHT****I2S\_CHANNEL\_FMT\_ALL\_LEFT****I2S\_CHANNEL\_FMT\_ONLY\_RIGHT****I2S\_CHANNEL\_FMT\_ONLY\_LEFT**

**enum pdm\_sample\_rate\_ratio\_t**

PDM sample rate ratio, measured in Hz.

*Values:*

**PDM\_SAMPLE\_RATE\_RATIO\_64**

**PDM\_SAMPLE\_RATE\_RATIO\_128**

**enum pdm\_pcm\_conv\_t**

PDM PCM convter enable/disable.

*Values:*

**PDM\_PCM\_CONV\_ENABLE**

**PDM\_PCM\_CONV\_DISABLE**

**enum i2s\_mode\_t**

I2S Mode, default is I2S\_MODE\_MASTER | I2S\_MODE\_TX.

**Note** PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

*Values:*

**I2S\_MODE\_MASTER = 1**

**I2S\_MODE\_SLAVE = 2**

**I2S\_MODE\_TX = 4**

**I2S\_MODE\_RX = 8**

**I2S\_MODE\_DAC\_BUILT\_IN = 16**

Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB

**I2S\_MODE\_ADC\_BUILT\_IN = 32**

Input I2S data from built-in ADC, each data can be 12-bit width at most

**enum i2s\_event\_type\_t**

I2S event types.

*Values:*

**I2S\_EVENT\_DMA\_ERROR**

**I2S\_EVENT\_TX\_DONE**

I2S DMA finish sent 1 buffer

**I2S\_EVENT\_RX\_DONE**

I2S DMA finish received 1 buffer

**I2S\_EVENT\_MAX**

I2S event max index

**enum i2s\_dac\_mode\_t**

I2S DAC mode for i2s\_set\_dac\_mode.

**Note** PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

*Values:*

**I2S\_DAC\_CHANNEL\_DISABLE = 0**

Disable I2S built-in DAC signals

**I2S\_DAC\_CHANNEL\_RIGHT\_EN = 1**

Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

**I2S\_DAC\_CHANNEL\_LEFT\_EN = 2**

Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

```
I2S_DAC_CHANNEL_BOTH_EN = 0x3
    Enable both of the I2S built-in DAC channels.
```

```
I2S_DAC_CHANNEL_MAX = 0x4
    I2S built-in DAC mode max index
```

```
enum i2s_clock_src_t
    Values:
```

```
I2S_CLK_D2CLK = 0
```

```
I2S_CLK_APLL
```

## 2.3.7 LED Control

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes as well. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

A half of LEDC's channels operate in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other half of channels operate in low speed mode, where the moment of change depends on the application software. Each group of channels is also able to use different clock sources, but this feature is not yet supported in the LEDC driver.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Getting LEDC to work on a specific channel in either *high or low speed mode* is done in three steps:

1. *Configure Timer* by specifying the PWM signal's frequency and duty cycle resolution.
2. *Configure Channel* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on the fade end.

**Configure Timer** Setting the timer is done by calling the function `ledc_timer_config()` and passing to it a data structure `ledc_timer_config_t` that contains the following configuration settings:

- Timer number `ledc_timer_t`
- Speed mode `ledc_mode_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower duty resolution is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

**Configure Channel** When the timer is set up, configure a selected channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

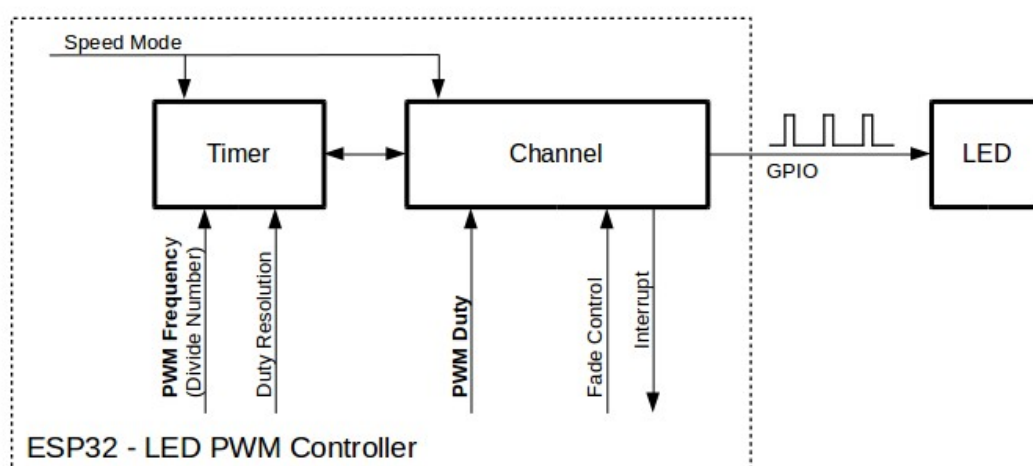

图 14: Key Settings of LED PWM Controller' s API

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal' s frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Configure Channel](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2 ** \text{duty\_resolution}) - 1$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a “clean” startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### LEDC High and Low Speed Mode

Of the total 8 timers and 16 channels available in the LED PWM Controller, half of them are dedicated to operation in high speed mode and the other half in low speed mode. Selection of a low or high speed timer or channel is done with the parameter `ledc_mode_t` that can be found in applicable function calls.

The advantage of high speed mode is hardware-supported, glitch-free changeover of the timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, refer to [ESP32 Technical Reference Manual \(PDF\)](#). Please note that the support for `SLOW_CLOCK` mentioned in this manual is not yet supported in the LEDC driver.

### Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a wide resolution for PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. It means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ( $2^{13} = 8192$  discrete levels of the LED intensity).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

### Application Example

The LEDC change duty cycle and fading control example: [peripherals/ledc](#).

### API Reference

#### Header File

- [driver/include/driver/ledc.h](#)

#### Functions

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

##### Parameters

- ledc\_conf: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

##### Parameters

- timer\_conf: Pointer of LEDC timer configure struct

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

##### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

##### Parameters

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode,
- channel: LEDC channel (0-7), select from `ledc_channel_t`

`esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)`

Set LEDC output gpio.

##### Return

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: The LEDC output gpio
- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `ledc_channel`: LEDC channel (0-7), select from `ledc_channel_t`

`esp_err_t ledc_stop` (`ledc_mode_t speed_mode`, `ledc_channel_t channel`, `uint32_t idle_level`)

LEDC stop. Disable LEDC output, and set idle level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `idle_level`: Set output idle level after LEDC stops.

`esp_err_t ledc_set_freq` (`ledc_mode_t speed_mode`, `ledc_timer_t timer_num`, `uint32_t freq_hz`)

LEDC set channel frequency (Hz)

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_num`: LEDC timer index (0-3), select from `ledc_timer_t`
- `freq_hz`: Set the LEDC frequency

`uint32_t ledc_get_freq` (`ledc_mode_t speed_mode`, `ledc_timer_t timer_num`)

LEDC get channel frequency (Hz)

**Return**

- 0 error
- Others Current LEDC frequency

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_num`: LEDC timer index (0-3), select from `ledc_timer_t`

`esp_err_t ledc_set_duty_with_hpoint` (`ledc_mode_t speed_mode`, `ledc_channel_t channel`, `uint32_t duty`, `uint32_t hpoint`)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is `[0, (2**duty_resolution)]`
- `hpoint`: Set the LEDC hpoint value(max: `0xffff`)

`int ledc_get_hpoint` (`ledc_mode_t speed_mode`, `ledc_channel_t channel`)

LEDC get hpoint value, the counter value when the output is set high level.

**Return**

- LEDC\_ERR\_VAL if parameter error

- Others Current hpoint value of LEDC channel

**Parameters**

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t* `speed_mode`, *ledc\_channel\_t* `channel`, *uint32\_t* `duty`)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$

*uint32\_t* **ledc\_get\_duty** (*ledc\_mode\_t* `speed_mode`, *ledc\_channel\_t* `channel`)

LEDC get duty.

**Return**

- `LEDC_ERR_DUTY` if parameter error
- Others Current LEDC duty

**Parameters**

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* `speed_mode`, *ledc\_channel\_t* `channel`, *uint32\_t* `duty`, *ledc\_duty\_direction\_t* `fade_direction`, *uint32\_t* `step_num`, *uint32\_t* `duty_cycle_num`, *uint32\_t* `duty_scale`)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the start of the gradient duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$
- `fade_direction`: Set the direction of the gradient
- `step_num`: Set the number of the gradient
- `duty_cycle_num`: Set how many LEDC tick each time the gradient lasts
- `duty_scale`: Set gradient change amplitude

*esp\_err\_t* **ledc\_isr\_register** (*void (\*fn)*) *void \**  
*, void \*arg, int intr\_alloc\_flags, ledc\_isr\_handle\_t \*handle* Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**

- `fn`: Interrupt handler function.
- `arg`: User-supplied argument passed to the handler function.

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

`esp_err_t ledc_timer_set` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

#### Return

- (-1) Parameter error
- Other Current LEDC duty

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: Timer index (0-3), there are 4 timers in LEDC module
- `clock_divider`: Timer clock divide value, the timer clock is divided from the selected clock source
- `duty_resolution`: Resolution of duty setting in number of bits. The range of duty values is [0, (2\*\*duty\_resolution)]
- `clk_src`: Select LEDC source clock.

`esp_err_t ledc_timer_rst` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

`esp_err_t ledc_timer_pause` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

`esp_err_t ledc_timer_resume` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

`esp_err_t ledc_bind_channel_timer` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `speed_mode`: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

`esp_err_t ledc_set_fade_with_step` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

**Parameters**

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [ $0, (2^{**}duty\_resolution) - 1$ ]
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *uint32\_t* target\_duty, *int* max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

**Parameters**

- `speed_mode`: Select the LEDC `speed_mode`, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading.(  $0 - (2^{**} duty\_resolution - 1)$ ))
- `max_fade_time_ms`: The maximum time of the fading ( ms ).

*esp\_err\_t* **ledc\_fade\_func\_install** (*int* intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function already installed.

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`ORred`) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

*void* **ledc\_fade\_func\_uninstall** (*void*)

Uninstall LEDC fade function.

*esp\_err\_t* **ledc\_fade\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_ERR\_INVALID\_ARG Parameter error.

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- channel: LEDC channel number
- fade\_mode: Whether to block until fading done.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc\_channel\_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- hpoint: Set the LEDC hpoint value(max: 0xffff)

*esp\_err\_t* **ledc\_set\_fade\_time\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call ledc\_fade\_func\_install() once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode,
- channel: LEDC channel index (0-7), select from ledc\_channel\_t
- target\_duty: Target duty of fading.(0 - (2 \*\* duty\_resolution - 1))
- max\_fade\_time\_ms: The maximum time of the fading ( ms ).
- fade\_mode: choose blocking or non-blocking mode

*esp\_err\_t* **ledc\_set\_fade\_step\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function.

**Note** Call ledc\_fade\_func\_install() once before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

**Parameters**

- speed\_mode: Select the LEDC speed\_mode, high-speed mode and low-speed mode,
- channel: LEDC channel index (0-7), select from ledc\_channel\_t
- target\_duty: Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle\_num: increase or decrease the duty every cycle\_num cycles

- `fade_mode`: choose blocking or non-blocking mode

### Macros

`LEDC_APB_CLK_HZ`

`LEDC_REF_CLK_HZ`

`LEDC_ERR_DUTY`

`LEDC_ERR_VAL`

### Type Definitions

```
typedef intr_handle_t ledc_isr_handle_t
```

### Header File

- [soc/include/hal/ledc\\_types.h](#)

### Structures

```
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for `ledc_channel_config` function.

#### Public Members

`int gpio_num`

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

`ledc_mode_t speed_mode`

LEDC speed `speed_mode`, high-speed mode or low-speed mode

`ledc_channel_t channel`

LEDC channel (0 - 7)

`ledc_intr_type_t intr_type`

configure interrupt, Fade interrupt enable or Fade interrupt disable

`ledc_timer_t timer_sel`

Select the timer source of channel (0 - 3)

`uint32_t duty`

LEDC channel duty, the range of duty setting is [0, (2\*\*`duty_resolution`)]

`int hpoint`

LEDC channel `hpoint` value, the max value is 0xffff

```
struct ledc_timer_config_t
```

Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

#### Public Members

`ledc_mode_t speed_mode`

LEDC speed `speed_mode`, high-speed mode or low-speed mode

`ledc_timer_bit_t duty_resolution`

LEDC channel duty resolution

`ledc_timer_bit_t bit_num`

Deprecated in ESP-IDF 3.0. This is an alias to ‘`duty_resolution`’ for backward compatibility with ESP-IDF 2.1

`ledc_timer_t timer_num`

The timer source of channel (0 - 3)

`uint32_t freq_hz`  
LEDC timer frequency (Hz)

`ledc_clk_cfg_t clk_cfg`

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel's source clock must be `RTC8M_CLK`

### Enumerations

`enum ledc_mode_t`

*Values:*

`LEDC_LOW_SPEED_MODE`  
LEDC low speed speed\_mode

`LEDC_SPEED_MODE_MAX`  
LEDC speed limit

`enum ledc_intr_type_t`

*Values:*

`LEDC_INTR_DISABLE = 0`  
Disable LEDC interrupt

`LEDC_INTR_FADE_END`  
Enable LEDC interrupt

`LEDC_INTR_MAX`

`enum ledc_duty_direction_t`

*Values:*

`LEDC_DUTY_DIR_DECREASE = 0`  
LEDC duty decrease direction

`LEDC_DUTY_DIR_INCREASE = 1`  
LEDC duty increase direction

`LEDC_DUTY_DIR_MAX`

`enum ledc_slow_clk_sel_t`

*Values:*

`LEDC_SLOW_CLK_RTC8M = 0`  
LEDC low speed timer clock source is 8MHz RTC clock

`LEDC_SLOW_CLK_APB`  
LEDC low speed timer clock source is 80MHz APB clock

`enum ledc_clk_cfg_t`

*Values:*

`LEDC_AUTO_CLK = 0`  
The driver will automatically select the source clock(`REF_TICK` or `APB`) based on the giving resolution and duty parameter when init the timer

`LEDC_USE_REF_TICK`  
LEDC timer select `REF_TICK` clock as source clock

`LEDC_USE_APB_CLK`  
LEDC timer select `APB` clock as source clock

`LEDC_USE_RTC8M_CLK`  
LEDC timer select `RTC8M_CLK` as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

**enum ledc\_clk\_src\_t**

*Values:*

**LEDC\_REF\_TICK** = *LEDC\_USE\_REF\_TICK*

LEDC timer clock divided from reference tick (1Mhz)

**LEDC\_APB\_CLK** = *LEDC\_USE\_APB\_CLK*

LEDC timer clock divided from APB clock (80Mhz)

**enum ledc\_timer\_t**

*Values:*

**LEDC\_TIMER\_0** = 0

LEDC timer 0

**LEDC\_TIMER\_1**

LEDC timer 1

**LEDC\_TIMER\_2**

LEDC timer 2

**LEDC\_TIMER\_3**

LEDC timer 3

**LEDC\_TIMER\_MAX**

**enum ledc\_channel\_t**

*Values:*

**LEDC\_CHANNEL\_0** = 0

LEDC channel 0

**LEDC\_CHANNEL\_1**

LEDC channel 1

**LEDC\_CHANNEL\_2**

LEDC channel 2

**LEDC\_CHANNEL\_3**

LEDC channel 3

**LEDC\_CHANNEL\_4**

LEDC channel 4

**LEDC\_CHANNEL\_5**

LEDC channel 5

**LEDC\_CHANNEL\_6**

LEDC channel 6

**LEDC\_CHANNEL\_7**

LEDC channel 7

**LEDC\_CHANNEL\_MAX**

**enum ledc\_timer\_bit\_t**

*Values:*

**LEDC\_TIMER\_1\_BIT** = 1

LEDC PWM duty resolution of 1 bits

**LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

**LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

**LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

**LEDC\_TIMER\_5\_BIT**  
LEDC PWM duty resolution of 5 bits

**LEDC\_TIMER\_6\_BIT**  
LEDC PWM duty resolution of 6 bits

**LEDC\_TIMER\_7\_BIT**  
LEDC PWM duty resolution of 7 bits

**LEDC\_TIMER\_8\_BIT**  
LEDC PWM duty resolution of 8 bits

**LEDC\_TIMER\_9\_BIT**  
LEDC PWM duty resolution of 9 bits

**LEDC\_TIMER\_10\_BIT**  
LEDC PWM duty resolution of 10 bits

**LEDC\_TIMER\_11\_BIT**  
LEDC PWM duty resolution of 11 bits

**LEDC\_TIMER\_12\_BIT**  
LEDC PWM duty resolution of 12 bits

**LEDC\_TIMER\_13\_BIT**  
LEDC PWM duty resolution of 13 bits

**LEDC\_TIMER\_14\_BIT**  
LEDC PWM duty resolution of 14 bits

**LEDC\_TIMER\_15\_BIT**  
LEDC PWM duty resolution of 15 bits

**LEDC\_TIMER\_16\_BIT**  
LEDC PWM duty resolution of 16 bits

**LEDC\_TIMER\_17\_BIT**  
LEDC PWM duty resolution of 17 bits

**LEDC\_TIMER\_18\_BIT**  
LEDC PWM duty resolution of 18 bits

**LEDC\_TIMER\_19\_BIT**  
LEDC PWM duty resolution of 19 bits

**LEDC\_TIMER\_20\_BIT**  
LEDC PWM duty resolution of 20 bits

**LEDC\_TIMER\_BIT\_MAX**

**enum ledc\_fade\_mode\_t**

*Values:*

**LEDC\_FADE\_NO\_WAIT** = 0  
LEDC fade function will return immediately

**LEDC\_FADE\_WAIT\_DONE**  
LEDC fade function will block until fading to the target duty

**LEDC\_FADE\_MAX**

### 2.3.8 MCPWM

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled PWMxA / PWMxB.

图 15: MCPWM Overview

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM's **Timer** and **Generator** submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a **Fault Handler**, signal **Capture**, **Carrier** and **Interrupts**.

### Contents

- *Configure* a basic functionality of the outputs
- *Operate* the outputs to drive a motor
- *Adjust* how the motor is driven
- *Capture* external signals to provide additional control over the outputs
- Use *Fault Handler* to detect and manage faults
- Add a higher frequency *Carrier*, if output signals are passed through an isolation transformer
- Configuration and handling of *Interrupts*.

### Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM's resources. An example circuit is shown below. It includes a **H-Bridge** to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

1. Selection of a MPWn unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.

图 16: MCPWM Block Diagram

图 17: Example of Brushed DC Motor Control with MCPWM

4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

## Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit's outputs. The outputs are organized into three pairs. Within a pair they are labeled "A" and "B" and each driven by a submodule called a "Generator". To provide a PWM signal, the Operator itself, which contains two Generators, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM's duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of options from `mcpwm_duty_type_t`.

---

**注解:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

---

## Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the *block diagram* of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_enable()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

---

**注解:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_enable()` or `mcpwm_sync_disable()`.

---

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`,

as discussed in section *Configure*, and selecting one of counter types from *mcpwm\_counter\_type\_t*. For explanation of how A/B PWM output signals are generated please refer to *ESP32 Technical Reference Manual*.

## Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal's edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

图 18: Example of Brushless DC Motor Control with MCPWM

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions *mcpwm\_gpio\_init()* or *mcpwm\_set\_pin()*, that were described in section *Configure*.
2. Enabling of the functionality itself by invoking *mcpwm\_capture\_enable()*, selecting desired signal input from *mcpwm\_capture\_signal\_t*, setting the signal edge with *mcpwm\_capture\_on\_edge\_t* and the signal count prescaler.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer's value is stored in time-stamp register that may be then checked by calling *mcpwm\_capture\_signal\_get\_value()*. The edge of the last signal may be checked with *mcpwm\_capture\_signal\_get\_edge()*.

If not required anymore, the capture functionality may be disabled with *mcpwm\_capture\_disable()*.

## Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output

- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
  - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
  - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

## Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then alerted at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details please refer to “PWM Carrier Submodule” section of the [ESP32 Technical Reference Manual](#).

To disable carrier functionality call `mcpwm_carrier_disable()`.

## Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`.

## Application Example

Examples of using MCPWM for motor control: [peripherals/mcpwm](#):

- Demonstration how to use each submodule of the MCPWM - [peripherals/mcpwm/mcpwm\\_basic\\_config](#)
- Control of BLDC (brushless DC) motor with hall sensor feedback - [peripherals/mcpwm/mcpwm\\_bldc\\_control](#)
- Brushed DC motor control - [peripherals/mcpwm/mcpwm\\_brushed\\_dc\\_control](#)
- Servo motor control - [peripherals/mcpwm/mcpwm\\_servo\\_control](#)

## API Reference

### Header File

- [soc/include/hal/mcpwm\\_types.h](#)

### Enumerations

**enum mcpwm\_intr\_t**

Interrupts for MCPWM.

*Values:*

**MCPWM\_LL\_INTR\_CAP0** = BIT(27)

Capture 0 happened.

**MCPWM\_LL\_INTR\_CAP1** = BIT(28)

Capture 1 happened.

**MCPWM\_LL\_INTR\_CAP2** = BIT(29)

Capture 2 happened.

**enum mcpwm\_counter\_type\_t**

Select type of MCPWM counter.

*Values:*

**MCPWM\_UP\_COUNTER** = 1

For asymmetric MCPWM

**MCPWM\_DOWN\_COUNTER**

For asymmetric MCPWM

**MCPWM\_UP\_DOWN\_COUNTER**

For symmetric MCPWM, frequency is half of MCPWM frequency set

**MCPWM\_COUNTER\_MAX**

Maximum counter mode

**enum mcpwm\_duty\_type\_t**

Select type of MCPWM duty cycle mode.

*Values:*

**MCPWM\_DUTY\_MODE\_0** = 0

Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

**MCPWM\_DUTY\_MODE\_1**

Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

**MCPWM\_HAL\_GENERATOR\_MODE\_FORCE\_LOW**

**MCPWM\_HAL\_GENERATOR\_MODE\_FORCE\_HIGH**

**MCPWM\_DUTY\_MODE\_MAX**

Num of duty cycle modes

**enum mcpwm\_output\_action\_t**

MCPWM select action to be taken on the output when event happens.

*Values:*

**MCPWM\_ACTION\_NO\_CHANGE** = 0

No change in the output

**MCPWM\_ACTION\_FORCE\_LOW**

Make output low

**MCPWM\_ACTION\_FORCE\_HIGH**

Make output high

**MCPWM\_ACTION\_TOGGLE**

Make output toggle

**enum mcpwm\_deadtime\_type\_t**

MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

*Values:*

**MCPWM\_DEADTIME\_BYPASS = 0**

Bypass the deadtime

**MCPWM\_BYPASS\_RED**

MCPWMXA = no change, MCPWMXB = falling edge delay

**MCPWM\_BYPASS\_FED**

MCPWMXA = rising edge delay, MCPWMXB = no change

**MCPWM\_ACTIVE\_HIGH\_MODE**

MCPWMXA = rising edge delay, MCPWMXB = falling edge delay

**MCPWM\_ACTIVE\_LOW\_MODE**

MCPWMXA = compliment of rising edge delay, MCPWMXB = compliment of falling edge delay

**MCPWM\_ACTIVE\_HIGH\_COMPLIMENT\_MODE**

MCPWMXA = rising edge delay, MCPWMXB = compliment of falling edge delay

**MCPWM\_ACTIVE\_LOW\_COMPLIMENT\_MODE**

MCPWMXA = compliment of rising edge delay, MCPWMXB = falling edge delay

**MCPWM\_ACTIVE\_RED\_FED\_FROM\_PWMXA**

MCPWMXA = MCPWMXB = rising edge delay as well as falling edge delay, generated from MCPWMXA

**MCPWM\_ACTIVE\_RED\_FED\_FROM\_PWMXB**

MCPWMXA = MCPWMXB = rising edge delay as well as falling edge delay, generated from MCPWMXB

**MCPWM\_DEADTIME\_TYPE\_MAX**

**enum mcpwm\_sync\_signal\_t**

MCPWM select sync signal input.

*Values:*

**MCPWM\_SELECT\_SYNC0 = 4**

Select SYNC0 as input

**MCPWM\_SELECT\_SYNC1**

Select SYNC1 as input

**MCPWM\_SELECT\_SYNC2**

Select SYNC2 as input

**enum mcpwm\_capture\_on\_edge\_t**

MCPWM select capture starts from which edge.

*Values:*

**MCPWM\_NEG\_EDGE = BIT(0)**

Capture the negative edge

**MCPWM\_POS\_EDGE = BIT(1)**

Capture the positive edge

**Header File**

- `driver/include/driver/mcpwm.h`

**Functions**

`esp_err_t mcpwm_gpio_init` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_io_signals_t` `io_signal`, `int` `gpio_num`)

This function initializes each gpio signal for MCPWM.

**Note** This function initializes one gpio at a time.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `io_signal`: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC\_X, FAULT\_X, CAP\_X) 'X' is timer\_num(0-2)
- `gpio_num`: set this to configure gpio for MCPWM, if you want to use gpio16, `gpio_num = 16`

`esp_err_t mcpwm_set_pin` (`mcpwm_unit_t` `mcpwm_num`, `const mcpwm_pin_config_t` `*mcpwm_pin`)

Initialize MCPWM gpio structure.

**Note** This function can be used to initialize more than one gpio at a time.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `mcpwm_pin`: MCPWM pin structure

`esp_err_t mcpwm_init` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `const mcpwm_config_t` `*mcpwm_conf`)

Initialize MCPWM parameters.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- `mcpwm_conf`: configure structure `mcpwm_config_t`

`esp_err_t mcpwm_set_frequency` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `uint32_t` `frequency`)

Set frequency(in Hz) of MCPWM timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `frequency`: set the frequency in Hz of each timer

`esp_err_t mcpwm_set_duty` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `mcpwm_generator_t` `gen`, `float` `duty`)

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

- `gen`: set the generator(MCPWMXA/MCPWMB), 'X' is operator number selected
- `duty`: set duty cycle in % (i.e for 62.3% duty cycle, `duty = 62.3`) of each operator

`esp_err_t mcpwm_set_duty_in_us` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`,  
`mcpwm_generator_t` `gen`, `uint32_t` `duty_in_us`)

Set duty cycle of each operator(MCPWMXA/MCPWMB) in us.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected
- `duty_in_us`: set duty value in microseconds of each operator

`esp_err_t mcpwm_set_duty_type` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`,  
`mcpwm_generator_t` `gen`, `mcpwm_duty_type_t` `duty_type`)

Set duty either active high or active low(out of phase/inverted)

**Note** Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected
- `duty_type`: set active low or active high duty type

`uint32_t mcpwm_get_frequency` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`)

Get frequency of timer.

#### Return

- frequency of timer

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`float mcpwm_get_duty` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `mcpwm_operator_t` `gen`)

Get duty cycle of each operator.

#### Return

- duty cycle in % of each operator(56.7 means duty is 56.7%)

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected

`esp_err_t mcpwm_set_signal_high` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`,  
`mcpwm_generator_t` `gen`)

Use this function to set MCPWM signal high.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMB), 'x' is timer number selected

*esp\_err\_t* **mcpwm\_set\_signal\_low** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen)

Use this function to set MCPWM signal low.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMB), 'x' is timer number selected

*esp\_err\_t* **mcpwm\_start** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Start MCPWM signal on timer 'x' .

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_stop** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Start MCPWM signal on timer 'x' .

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, **const** *mcpwm\_carrier\_config\_t* \*carrier\_conf)

Initialize carrier configuration.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier\_conf: configure structure *mcpwm\_carrier\_config\_t*

*esp\_err\_t* **mcpwm\_carrier\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Enable MCPWM carrier submodule, for respective timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Disable MCPWM carrier submodule, for respective timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_set\_period** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *uint8\_t* carrier\_period)

Set period of carrier.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier\_period: set the carrier period of each timer, carrier period = (carrier\_period + 1)\*800ns (carrier\_period <= 15)

*esp\_err\_t* **mcpwm\_carrier\_set\_duty\_cycle** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *uint8\_t* carrier\_duty)

Set duty\_cycle of carrier.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier\_duty: set duty\_cycle of carrier , carrier duty cycle = carrier\_duty\*12.5% (chop\_duty <= 7)

*esp\_err\_t* **mcpwm\_carrier\_oneshot\_mode\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *uint8\_t* pulse\_width)

Enable and set width of first pulse in carrier oneshot mode.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- pulse\_width: set pulse width of first pulse in oneshot mode, width = (carrier period)\*(pulse\_width + 1) (pulse\_width <= 15)

*esp\_err\_t* **mcpwm\_carrier\_oneshot\_mode\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Disable oneshot mode, width of first pulse = carrier period.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_carrier\_output\_invert** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_carrier\_out\_ivt\_t* carrier\_ivt\_mode)

Enable or disable carrier output inversion.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- mcpwm\_num: set MCPWM unit(0-1)
- timer\_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier\_ivt\_mode: enable or disable carrier output inversion

*esp\_err\_t* **mcpwm\_deadtime\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_deadtime\_type\_t* dt\_mode, *uint32\_t* red, *uint32\_t* fed)

Enable and initialize deadtime for each MCPWM timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `dt_mode`: set deadtime mode
- `red`: set rising edge delay = `red`\*100ns
- `fed`: set rising edge delay = `fed`\*100ns

*esp\_err\_t* `mcpwm_deadtime_disable` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`)

Disable deadtime on MCPWM timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* `mcpwm_fault_init` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_fault\_input\_level\_t* `input_level`, *mcpwm\_fault\_signal\_t* `fault_sig`)

Initialize fault submodule, currently low level triggering is not supported.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `input_level`: set fault signal level, which will cause fault to occur
- `fault_sig`: set the fault pin, which needs to be enabled

*esp\_err\_t* `mcpwm_fault_set_oneshot_mode` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, *mcpwm\_fault\_signal\_t* `fault_sig`, *mcpwm\_output\_action\_t* `action_on_pwmxa`, *mcpwm\_output\_action\_t* `action_on_pwmxb`)

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note** currently low level triggering is not supported

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

*esp\_err\_t* `mcpwm_fault_set_cyc_mode` (*mcpwm\_unit\_t* `mcpwm_num`, *mcpwm\_timer\_t* `timer_num`, *mcpwm\_fault\_signal\_t* `fault_sig`, *mcpwm\_output\_action\_t* `action_on_pwmxa`, *mcpwm\_output\_action\_t* `action_on_pwmxb`)

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

**Note** currently low level triggering is not supported

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for cyc mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_deinit` (`mcpwm_unit_t mcpwm_num`, `mcpwm_fault_signal_t fault_sig`)

Disable fault signal.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `fault_sig`: fault pin, which needs to be disabled

`esp_err_t mcpwm_capture_enable` (`mcpwm_unit_t mcpwm_num`, `mcpwm_capture_signal_t cap_sig`, `mcpwm_capture_on_edge_t cap_edge`, `uint32_t num_of_pulse`)

Initialize capture submodule.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_edge`: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- `cap_sig`: capture pin, which needs to be enabled
- `num_of_pulse`: count time between rising/falling edge between 2 \*(pulses mentioned), counter uses APB\_CLK

`esp_err_t mcpwm_capture_disable` (`mcpwm_unit_t mcpwm_num`, `mcpwm_capture_signal_t cap_sig`)

Disable capture signal.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin, which needs to be disabled

`uint32_t mcpwm_capture_signal_get_value` (`mcpwm_unit_t mcpwm_num`, `mcpwm_capture_signal_t cap_sig`)

Get capture value.

**Return** Captured value

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin on which value is to be measured

`uint32_t mcpwm_capture_signal_get_edge` (`mcpwm_unit_t mcpwm_num`, `mcpwm_capture_signal_t cap_sig`)

Get edge of capture signal.

**Return** Capture signal edge: 1 - positive edge, 2 - negative edge

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin of whose edge is to be determined

*esp\_err\_t* **mcpwm\_sync\_enable** (*mcpwm\_unit\_t* *mcpwm\_num*, *mcpwm\_timer\_t* *timer\_num*, *mcpwm\_sync\_signal\_t* *sync\_sig*, *uint32\_t* *phase\_val*)

Initialize sync submodule.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *mcpwm\_num*: set MCPWM unit(0-1)
- *timer\_num*: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- *sync\_sig*: set the synchronization pin, which needs to be enabled
- *phase\_val*: phase value in 1/1000 (for 86.7%, *phase\_val* = 867) which timer moves to on sync signal

*esp\_err\_t* **mcpwm\_sync\_disable** (*mcpwm\_unit\_t* *mcpwm\_num*, *mcpwm\_timer\_t* *timer\_num*)

Disable sync submodule on given timer.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- *mcpwm\_num*: set MCPWM unit(0-1)
- *timer\_num*: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

*esp\_err\_t* **mcpwm\_isr\_register** (*mcpwm\_unit\_t* *mcpwm\_num*, void (\**fn*)) void \*

, void \**arg*, int *intr\_alloc\_flags*, *intr\_handle\_t* \**handle* Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

#### Parameters

- *mcpwm\_num*: set MCPWM unit(0-1)
- *fn*: interrupt handler function.
- *arg*: user-supplied argument passed to the handler function.
- *intr\_alloc\_flags*: flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. see *esp\_intr\_alloc.h* for more info.
- *handle*: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

## Structures

**struct mcpwm\_pin\_config\_t**

MCPWM pin number for.

#### Public Members

int **mcpwm0a\_out\_num**  
MCPWM0A out pin

int **mcpwm0b\_out\_num**  
MCPWM0A out pin

int **mcpwm1a\_out\_num**  
MCPWM0A out pin

int **mcpwm1b\_out\_num**  
MCPWM0A out pin

int **mcpwm2a\_out\_num**  
MCPWM0A out pin

int **mcpwm2b\_out\_num**

CAP1 in pin

int **mcpwm\_cap2\_in\_num**  
CAP2 in pin

**struct mcpwm\_config\_t**  
MCPWM config structure.

### Public Members

uint32\_t **frequency**  
Set frequency of MCPWM in Hz

float **cmp\_r\_a**  
Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty\_a = 62.3

float **cmp\_r\_b**  
Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty\_b = 48.0

*mcpwm\_duty\_type\_t* **duty\_mode**  
Set type of duty cycle

*mcpwm\_counter\_type\_t* **counter\_mode**  
Set type of MCPWM counter

**struct mcpwm\_carrier\_config\_t**  
MCPWM config carrier structure.

### Public Members

uint8\_t **carrier\_period**  
Set carrier period = (carrier\_period + 1)\*800ns, carrier\_period should be < 16

uint8\_t **carrier\_duty**  
Set carrier duty cycle, carrier\_duty should be less than 8 (increment every 12.5%)

uint8\_t **pulse\_width\_in\_os**  
Set pulse width of first pulse in one shot mode = (carrier period)\*(pulse\_width\_in\_os + 1), should be less than 16

*mcpwm\_carrier\_os\_t* **carrier\_os\_mode**  
Enable or disable carrier oneshot mode

*mcpwm\_carrier\_out\_ivt\_t* **carrier\_ivt\_mode**  
Invert output of carrier

### Macros

**MCPWM\_NO\_CHANGE\_IN\_MCPWMXB**  
**MCPWM\_FORCE\_MCPWMXB\_LOW**  
**MCPWM\_FORCE\_MCPWMXB\_HIGH**  
**MCPWM\_TOG\_MCPWMXB**

### Type Definitions

**typedef** *mcpwm\_generator\_t* **mcpwm\_operator\_t**  
**typedef** *mcpwm\_output\_action\_t* **mcpwm\_action\_on\_pwmxa\_t**  
**typedef** *mcpwm\_output\_action\_t* **mcpwm\_action\_on\_pwmxb\_t**

### Enumerations

**enum** **mcpwm\_io\_signals\_t**  
IO signals for the MCPWM.

- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

*Values:*

**MCPWM0A** = 0  
PWM0A output pin

**MCPWM0B**  
PWM0B output pin

**MCPWM1A**  
PWM1A output pin

**MCPWM1B**  
PWM1B output pin

**MCPWM2A**  
PWM2A output pin

**MCPWM2B**  
PWM2B output pin

**MCPWM\_SYNC\_0**  
SYNC0 input pin

**MCPWM\_SYNC\_1**  
SYNC1 input pin

**MCPWM\_SYNC\_2**  
SYNC2 input pin

**MCPWM\_FAULT\_0**  
FAULT0 input pin

**MCPWM\_FAULT\_1**  
FAULT1 input pin

**MCPWM\_FAULT\_2**  
FAULT2 input pin

**MCPWM\_CAP\_0 = 84**  
CAP0 input pin

**MCPWM\_CAP\_1**  
CAP1 input pin

**MCPWM\_CAP\_2**  
CAP2 input pin

**enum mcpwm\_unit\_t**  
Select MCPWM unit.

*Values:*

**MCPWM\_UNIT\_0 = 0**  
MCPWM unit0 selected

**MCPWM\_UNIT\_1**  
MCPWM unit1 selected

**MCPWM\_UNIT\_MAX**  
Num of MCPWM units on ESP32

**enum mcpwm\_timer\_t**  
Select MCPWM timer.

*Values:*

**MCPWM\_TIMER\_0 = 0**  
Select MCPWM timer0

**MCPWM\_TIMER\_1**  
Select MCPWM timer1

**MCPWM\_TIMER\_2**  
Select MCPWM timer2

**MCPWM\_TIMER\_MAX**  
Num of MCPWM timers on ESP32

**enum mcpwm\_generator\_t**  
Select MCPWM operator.

*Values:*

**MCPWM\_GEN\_A = 0**  
Select MCPWMXA, where 'X' is operator number

**MCPWM\_GEN\_B**  
Select MCPWMXB, where 'X' is operator number

**MCPWM\_GEN\_MAX**  
Num of generators to each operator of MCPWM

**enum mcpwm\_carrier\_os\_t**  
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

*Values:*

**MCPWM\_ONESHOT\_MODE\_DIS = 0**  
Enable oneshot mode

**MCPWM\_ONESHOT\_MODE\_EN**  
Disable oneshot mode

**enum mcpwm\_carrier\_out\_ivt\_t**  
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

*Values:*

**MCPWM\_CARRIER\_OUT\_IVT\_DIS = 0**  
Enable carrier output inversion

**MCPWM\_CARRIER\_OUT\_IVT\_EN**  
Disable carrier output inversion

**enum mcpwm\_fault\_signal\_t**  
MCPWM select fault signal input.

*Values:*

**MCPWM\_SELECT\_F0 = 0**  
Select F0 as input

**MCPWM\_SELECT\_F1**  
Select F1 as input

**MCPWM\_SELECT\_F2**  
Select F2 as input

**enum mcpwm\_fault\_input\_level\_t**  
MCPWM select triggering level of fault signal.

*Values:*

**MCPWM\_LOW\_LEVEL\_TGR = 0**  
Fault condition occurs when fault input signal goes from high to low, currently not supported

**MCPWM\_HIGH\_LEVEL\_TGR**  
Fault condition occurs when fault input signal goes low to high

**enum mcpwm\_capture\_signal\_t**  
MCPWM select capture signal input.

*Values:*

**MCPWM\_SELECT\_CAP0 = 0**  
Select CAP0 as input

**MCPWM\_SELECT\_CAP1**  
Select CAP1 as input

**MCPWM\_SELECT\_CAP2**  
Select CAP2 as input

## 2.3.9 Pulse Counter

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

## Functionality Overview

Description of functionality of this API has been broken down into four sections:

- *Configuration* - describes counter's configuration parameters and how to setup the counter.
- *Operating the Counter* - provides information on control functions to pause, measure and clear the counter.
- *Filtering Pulses* - describes options to filtering pulses and the counter control signals.
- *Using Interrupts* - presents how to trigger interrupts on specific states of the counter.

## Configuration

The PCNT module has eight independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit's channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

## Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter's operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

---

**注解:** For the counter not to miss any pulses, the pulse duration should be longer than one APB\_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB\_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a *filer*.

---

## Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB\_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB\_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

### Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`. and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

### Application Example

Pulse counter with control signal and event interrupt example: [peripherals/pcnt](#).

### API Reference

#### Header File

- [driver/include/driver/pcnt.h](#)

#### Functions

`esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)`

Configure Pulse Counter unit.

**Note** This function will disable three events: PCNT\_EVT\_L\_LIM, PCNT\_EVT\_H\_LIM, PCNT\_EVT\_ZERO.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver already initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `pcnt_config`: Pointer of Pulse Counter unit configure parameter

`esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)`

Get pulse counter value.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `pcnt_unit`: Pulse Counter unit number
- `count`: Pointer to accept counter value

`esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)`

Pause PCNT counter of PCNT unit.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `pcnt_unit`: PCNT unit number

*esp\_err\_t* **pcnt\_counter\_resume** (*pcnt\_unit\_t* *pcnt\_unit*)

Resume counting for PCNT counter.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `pcnt_unit`: PCNT unit number, select from `pcnt_unit_t`

*esp\_err\_t* **pcnt\_counter\_clear** (*pcnt\_unit\_t* *pcnt\_unit*)

Clear and reset PCNT counter value to zero.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `pcnt_unit`: PCNT unit number, select from `pcnt_unit_t`

*esp\_err\_t* **pcnt\_intr\_enable** (*pcnt\_unit\_t* *pcnt\_unit*)

Enable PCNT interrupt for PCNT unit.

**Note** Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with `pcnt_event_enable()` and `pcnt_event_disable()`

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `pcnt_unit`: PCNT unit number

*esp\_err\_t* **pcnt\_intr\_disable** (*pcnt\_unit\_t* *pcnt\_unit*)

Disable PCNT interrupt for PCNT unit.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `pcnt_unit`: PCNT unit number

*esp\_err\_t* **pcnt\_event\_enable** (*pcnt\_unit\_t* *unit*, *pcnt\_evt\_type\_t* *evt\_type*)

Enable PCNT event of PCNT unit.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

*esp\_err\_t* **pcnt\_event\_disable** (*pcnt\_unit\_t* *unit*, *pcnt\_evt\_type\_t* *evt\_type*)

Disable PCNT event of PCNT unit.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_set_event_value` (`pcnt_unit_t unit`, `pcnt_evt_type_t evt_type`, `int16_t value`)

Set PCNT event value of PCNT unit.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Counter value for PCNT event

`esp_err_t pcnt_get_event_value` (`pcnt_unit_t unit`, `pcnt_evt_type_t evt_type`, `int16_t *value`)

Get PCNT event value of PCNT unit.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Pointer to accept counter value for PCNT event

`esp_err_t pcnt_isr_register` (`void (*fn)`) `void *`

, `void *arg`, `int intr_alloc_flags`, `pcnt_isr_handle_t *handle` Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

**Return**

- `ESP_OK` Success
- `ESP_ERR_NOT_FOUND` Can not find the interrupt that matches the flags.
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**

- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`OR`ed) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `esp_intr_free` to unregister this ISR service if needed, but only if the handle is not NULL.

`esp_err_t pcnt_set_pin` (`pcnt_unit_t unit`, `pcnt_channel_t channel`, `int pulse_io`, `int ctrl_io`)

Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to `PCNT_PIN_NOT_USED` if unused.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `unit`: PCNT unit number
- `channel`: PCNT channel number
- `pulse_io`: Pulse signal input GPIO
- `ctrl_io`: Control signal input GPIO

*esp\_err\_t* **pcnt\_filter\_enable** (*pcnt\_unit\_t* unit)

Enable PCNT input filter.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- unit: PCNT unit number

*esp\_err\_t* **pcnt\_filter\_disable** (*pcnt\_unit\_t* unit)

Disable PCNT input filter.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- unit: PCNT unit number

*esp\_err\_t* **pcnt\_set\_filter\_value** (*pcnt\_unit\_t* unit, uint16\_t filter\_val)

Set PCNT filter value.

**Note** filter\_val is a 10-bit value, so the maximum filter\_val should be limited to 1023.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- unit: PCNT unit number
- filter\_val: PCNT signal filter value, counter in APB\_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

*esp\_err\_t* **pcnt\_get\_filter\_value** (*pcnt\_unit\_t* unit, uint16\_t \*filter\_val)

Get PCNT filter value.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- unit: PCNT unit number
- filter\_val: Pointer to accept PCNT filter value.

*esp\_err\_t* **pcnt\_set\_mode** (*pcnt\_unit\_t* unit, *pcnt\_channel\_t* channel, *pcnt\_count\_mode\_t* pos\_mode, *pcnt\_count\_mode\_t* neg\_mode, *pcnt\_ctrl\_mode\_t* hctrl\_mode, *pcnt\_ctrl\_mode\_t* lctrl\_mode)

Set PCNT counter mode.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- unit: PCNT unit number
- channel: PCNT channel number
- pos\_mode: Counter mode when detecting positive edge
- neg\_mode: Counter mode when detecting negative edge
- hctrl\_mode: Counter mode when control signal is high level
- lctrl\_mode: Counter mode when control signal is low level

*esp\_err\_t* **pcnt\_isr\_handler\_add** (*pcnt\_unit\_t* unit, void (\*isr\_handler)) void \*, void \*args Add ISR handler for specified unit.

Call this function after using `pcnt_isr_service_install()` to install the PCNT driver's ISR handler service.

The ISR handlers do not need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `pcnt_isr_service_install()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in `menuconfig`). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `unit`: PCNT unit number
- `isr_handler`: Interrupt handler function.
- `args`: Parameter for handler function

*esp\_err\_t* `pcnt_isr_service_install` (int *intr\_alloc\_flags*)

Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handle service, Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed

#### Parameters

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

void `pcnt_isr_service_uninstall` (void)

Uninstall PCNT ISR service, freeing related resources.

*esp\_err\_t* `pcnt_isr_handler_remove` (*pcnt\_unit\_t* *unit*)

Delete ISR handler for specified unit.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `unit`: PCNT unit number

### Type Definitions

```
typedef intr_handle_t pcnt_isr_handle_t
```

### Header File

- `soc/include/hal/pcnt_types.h`

### Structures

```
struct pcnt_config_t
```

Pulse Counter configuration for a single channel.

**Public Members**

`int pulse_gpio_num`  
Pulse input GPIO number, if you want to use GPIO16, enter `pulse_gpio_num = 16`, a negative value will be ignored

`int ctrl_gpio_num`  
Control signal input GPIO number, a negative value will be ignored

`pcnt_ctrl_mode_t lctrl_mode`  
PCNT low control mode

`pcnt_ctrl_mode_t hctrl_mode`  
PCNT high control mode

`pcnt_count_mode_t pos_mode`  
PCNT positive edge count mode

`pcnt_count_mode_t neg_mode`  
PCNT negative edge count mode

`int16_t counter_h_lim`  
Maximum counter value

`int16_t counter_l_lim`  
Minimum counter value

`pcnt_unit_t unit`  
PCNT unit number

`pcnt_channel_t channel`  
the PCNT channel

**Type Definitions**

`typedef int pcnt_port_t`  
PCNT port number, the max port number is (PCNT\_PORT\_MAX - 1).

`typedef int pcnt_unit_t`  
Selection of all available PCNT units.

**Enumerations**

`enum pcnt_ctrl_mode_t`  
Selection of available modes that determine the counter's action depending on the state of the control signal's input GPIO.

**Note** Configuration covers two actions, one for high, and one for low level on the control input

*Values:*

`PCNT_MODE_KEEP = 0`  
Control mode: won't change counter mode

`PCNT_MODE_REVERSE = 1`  
Control mode: invert counter mode(increase -> decrease, decrease -> increase)

`PCNT_MODE_DISABLE = 2`  
Control mode: Inhibit counter(counter value will not change in this condition)

`PCNT_MODE_MAX`

`enum pcnt_count_mode_t`  
Selection of available modes that determine the counter's action on the edge of the pulse signal's input GPIO.

**Note** Configuration covers two actions, one for positive, and one for negative edge on the pulse input

*Values:*

**PCNT\_COUNT\_DIS = 0**  
Counter mode: Inhibit counter(counter value will not change in this condition)

**PCNT\_COUNT\_INC = 1**  
Counter mode: Increase counter value

**PCNT\_COUNT\_DEC = 2**  
Counter mode: Decrease counter value

**PCNT\_COUNT\_MAX**

**enum pcnt\_channel\_t**  
Selection of channels available for a single PCNT unit.

*Values:*

**PCNT\_CHANNEL\_0 = 0x00**  
PCNT channel 0

**PCNT\_CHANNEL\_1 = 0x01**  
PCNT channel 1

**PCNT\_CHANNEL\_MAX**

**enum pcnt\_evt\_type\_t**  
Selection of counter' s events the may trigger an interrupt.

*Values:*

**PCNT\_EVT\_THRES\_1 = BIT(2)**  
PCNT watch point event: threshold1 value event

**PCNT\_EVT\_THRES\_0 = BIT(3)**  
PCNT watch point event: threshold0 value event

**PCNT\_EVT\_L\_LIM = BIT(4)**  
PCNT watch point event: Minimum counter value

**PCNT\_EVT\_H\_LIM = BIT(5)**  
PCNT watch point event: Maximum counter value

**PCNT\_EVT\_ZERO = BIT(6)**  
PCNT watch point event: counter value zero event

**PCNT\_EVT\_MAX**

### 2.3.10 RMT

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT' s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. [Configure Driver](#)
2. [Transmit Data](#) or [Receive Data](#)
3. [Change Operation Parameters](#)
4. [Use Interrupts](#)

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure [rmt\\_channel\\_t](#).

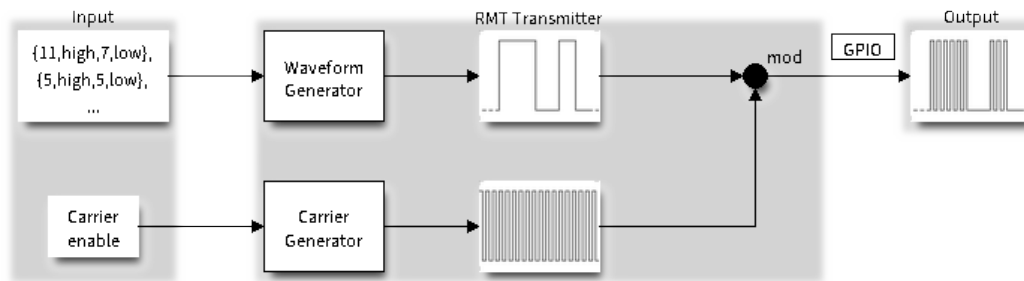

图 19: RMT Transmitter Overview

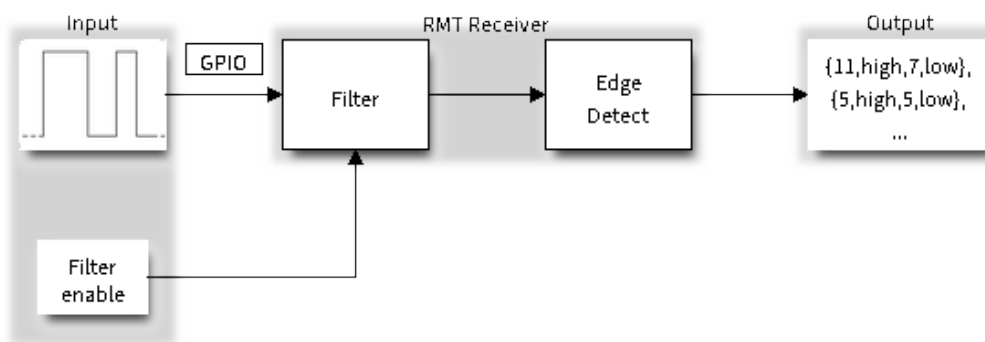

图 20: RMT Receiver Overview

## Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

### Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt\_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio\_num**.
- How many **memory blocks** will be used by the channel, set with **mem\_block\_num**.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk\_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default.

---

**注解:** The period of a square wave after the clock divider is called a ‘tick’ . The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’ .

---

There are also couple of specific parameters that should be set up depending if selected channel is configured in *Transmit Mode* or *Receive Mode*:

**Transmit Mode** When configuring channel in transmit mode, set **tx\_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop\_en**
- Enable the RMT carrier signal - **carrier\_en**
- Frequency of the carrier in Hz - **carrier\_freq\_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier\_duty\_percent**
- Level of the RMT output, when the carrier is applied - **carrier\_level**
- Enable the RMT output if idle - **idle\_output\_en**
- Set the signal level on the RMT output if idle - **idle\_level**

**Receive Mode** In receive mode, set **rx\_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter\_en**
- A threshold of the filter, set in the number of ticks - **filter\_ticks\_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle\_threshold**. The receiver will ignore pulses longer than this setting.

**Finalize Configuration** Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in *Use Interrupts*.

Now, depending on how the channel is configured, we are ready to either *Transmit Data* or *Receive Data*. This is described in next two sections.

### Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’ , is provided in a structure `rmt_item32_t`, see

### Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_pin()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

### Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

### Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

### Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

---

**注解:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

---

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32/include/soc/rmt_struct.h`, where N is the RMT channel number [0, 7] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

### Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

### Application Examples

- A simple RMT TX example: [peripherals/rmt/morse\\_code](#).
- Another RMT TX example, specific to drive a common RGB LED strip: [peripherals/rmt/led\\_strip](#).

- NEC remote control TX and RX example: [peripherals/rmt/ir\\_protocols](#).

## API Reference

### Header File

- [driver/include/driver/rmt.h](#)

### Functions

*esp\_err\_t* **rmt\_set\_clk\_div** (*rmt\_channel\_t* channel, *uint8\_t* div\_cnt)

Set RMT clock divider, channel clock is divided from source clock.

#### Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

#### Parameters

- channel: RMT channel
- div\_cnt: RMT counter clock divider

*esp\_err\_t* **rmt\_get\_clk\_div** (*rmt\_channel\_t* channel, *uint8\_t* \*div\_cnt)

Get RMT clock divider, channel clock is divided from source clock.

#### Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

#### Parameters

- channel: RMT channel
- div\_cnt: pointer to accept RMT counter divider

*esp\_err\_t* **rmt\_set\_rx\_idle\_thresh** (*rmt\_channel\_t* channel, *uint16\_t* thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thresh channel clock cycles, the receive process is finished.

#### Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

#### Parameters

- channel: RMT channel
- thresh: RMT RX idle threshold

*esp\_err\_t* **rmt\_get\_rx\_idle\_thresh** (*rmt\_channel\_t* channel, *uint16\_t* \*thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thresh channel clock cycles, the receive process is finished.

#### Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

#### Parameters

- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

*esp\_err\_t* **rmt\_set\_mem\_block\_num** (*rmt\_channel\_t* channel, *uint8\_t* rmt\_mem\_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start\_addr\_CHn to end\_addr\_CHn, which are defined by: Memory block start address is RMT\_CHANNEL\_MEM(n) (in soc/rmt\_reg.h), that is, start\_addr\_chn = RMT base

address + 0x800 + 64 \* 4 \* n, and end\_addr\_chn = RMT base address + 0x800 + 64 \* 4 \* n + 64 \* 4 \* RMT\_MEM\_SIZE\_CHn mod 512 \* 4

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rmt\_mem\_num: RMT RX memory block number, one block has 64 \* 32 bits.

*esp\_err\_t* **rmt\_get\_mem\_block\_num** (*rmt\_channel\_t* channel, uint8\_t \*rmt\_mem\_num)

Get RMT memory block number.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rmt\_mem\_num: Pointer to accept RMT RX memory block number

*esp\_err\_t* **rmt\_set\_tx\_carrier** (*rmt\_channel\_t* channel, bool carrier\_en, uint16\_t high\_level, uint16\_t low\_level, *rmt\_carrier\_level\_t* carrier\_level)

Configure RMT carrier for TX signal.

Set different values for carrier\_high and carrier\_low to set different frequency of carrier. The unit of carrier\_high/low is the source clock tick, not the divided channel counter clock.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- carrier\_en: Whether to enable output carrier.
- high\_level: High level duration of carrier
- low\_level: Low level duration of carrier.
- carrier\_level: Configure the way carrier wave is modulated for channel.
  - 1' b1:transmit on low output level
  - 1' b0:transmit on high output level

*esp\_err\_t* **rmt\_set\_mem\_pd** (*rmt\_channel\_t* channel, bool pd\_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- pd\_en: RMT memory low power enable.

*esp\_err\_t* **rmt\_get\_mem\_pd** (*rmt\_channel\_t* channel, bool \*pd\_en)

Get RMT memory low power mode.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- pd\_en: Pointer to accept RMT memory low power mode.

`esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)`

Set RMT start sending data from memory.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `tx_idx_rst`: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

`esp_err_t rmt_tx_stop(rmt_channel_t channel)`

Set RMT stop sending.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel

`esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)`

Set RMT start receiving data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `rx_idx_rst`: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

`esp_err_t rmt_rx_stop(rmt_channel_t channel)`

Set RMT stop receiving data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel

`esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)`

Reset RMT TX/RX memory index.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel

`esp_err_t rmt_set_memory_owner(rmt_channel_t channel, rmt_mem_owner_t owner)`

Set RMT memory owner.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `owner`: To set when the transmitter or receiver can process the memory of channel.

`esp_err_t rmt_get_memory_owner(rmt_channel_t channel, rmt_mem_owner_t *owner)`

Get RMT memory owner.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `owner`: Pointer to get memory owner.

*esp\_err\_t* **rmt\_set\_tx\_loop\_mode** (*rmt\_channel\_t* channel, bool loop\_en)

Set RMT tx loop mode.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `loop_en`: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

*esp\_err\_t* **rmt\_get\_tx\_loop\_mode** (*rmt\_channel\_t* channel, bool \*loop\_en)

Get RMT tx loop mode.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `loop_en`: Pointer to accept RMT transmitter loop sending mode.

*esp\_err\_t* **rmt\_set\_rx\_filter** (*rmt\_channel\_t* channel, bool rx\_filter\_en, uint8\_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `rx_filter_en`: To enable RMT receiver filter.
- `thresh`: Threshold of pulse width for receiver.

*esp\_err\_t* **rmt\_set\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* base\_clk)

Set RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `base_clk`: To choose source clock for RMT module.

*esp\_err\_t* **rmt\_get\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* \*src\_clk)

Get RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `src_clk`: Pointer to accept source clock for RMT module.

*esp\_err\_t* **rmt\_set\_idle\_level** (*rmt\_channel\_t* channel, bool *idle\_out\_en*, *rmt\_idle\_level\_t* level)

Set RMT idle output level for transmitter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `idle_out_en`: To enable idle level output.
- `level`: To set the output signal's level for channel in idle state.

*esp\_err\_t* **rmt\_get\_idle\_level** (*rmt\_channel\_t* channel, bool \**idle\_out\_en*, *rmt\_idle\_level\_t* \**level*)

Get RMT idle output level for transmitter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `idle_out_en`: Pointer to accept value of enable idle.
- `level`: Pointer to accept value of output signal's level in idle state for specified channel.

*esp\_err\_t* **rmt\_get\_status** (*rmt\_channel\_t* channel, uint32\_t \**status*)

Get RMT status.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `status`: Pointer to accept channel status. Please refer to `RMT_CHnSTATUS_REG(n=0~7)` in `rmt_reg.h` for more details of each field.

void **rmt\_set\_intr\_enable\_mask** (uint32\_t *mask*)

Set mask value to RMT interrupt enable register.

**Parameters**

- `mask`: Bit mask to set to the register

void **rmt\_clr\_intr\_enable\_mask** (uint32\_t *mask*)

Clear mask value to RMT interrupt enable register.

**Parameters**

- `mask`: Bit mask to clear the register

*esp\_err\_t* **rmt\_set\_rx\_intr\_en** (*rmt\_channel\_t* channel, bool *en*)

Set RMT RX interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable RX interrupt.

*esp\_err\_t* **rmt\_set\_err\_intr\_en** (*rmt\_channel\_t* channel, bool *en*)

Set RMT RX error interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- channel: RMT channel
- en: enable or disable RX err interrupt.

*esp\_err\_t* **rmt\_set\_tx\_intr\_en**(*rmt\_channel\_t* channel, bool en)  
Set RMT TX interrupt enable.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- en: enable or disable TX interrupt.

*esp\_err\_t* **rmt\_set\_tx\_thr\_intr\_en**(*rmt\_channel\_t* channel, bool en, uint16\_t evt\_thresh)  
Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- en: enable or disable TX event interrupt.
- evt\_thresh: RMT event interrupt threshold value

*esp\_err\_t* **rmt\_set\_pin**(*rmt\_channel\_t* channel, *rmt\_mode\_t* mode, *gpio\_num\_t* gpio\_num)  
Set RMT pin.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- mode: TX or RX mode for RMT
- gpio\_num: GPIO number to transmit or receive the signal.

*esp\_err\_t* **rmt\_config**(const *rmt\_config\_t* \*rmt\_param)  
Configure RMT parameters.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- rmt\_param: RMT parameter struct

*esp\_err\_t* **rmt\_isr\_register**(void (\*fn)) void \*  
, void \*arg, int intr\_alloc\_flags, *rmt\_isr\_handle\_t* \*handle Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.
- ESP\_FAIL System driver installed, can not register ISR handler for RMT

**Parameters**

- fn: Interrupt handler function.
- arg: Parameter for the handler function
- intr\_alloc\_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

*esp\_err\_t* **rmt\_isr\_deregister** (*rmt\_isr\_handle\_t* handle)

Deregister previously registered RMT interrupt handler.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Handle invalid

**Parameters**

- handle: Handle obtained from `rmt_isr_register`

*esp\_err\_t* **rmt\_fill\_tx\_items** (*rmt\_channel\_t* channel, **const** *rmt\_item32\_t* \*item, *uint16\_t* item\_num, *uint16\_t* mem\_offset)

Fill memory data of channel with given RMT items.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- item: Pointer of items.
- item\_num: RMT sending items number.
- mem\_offset: Index offset of memory.

*esp\_err\_t* **rmt\_driver\_install** (*rmt\_channel\_t* channel, *size\_t* rx\_buf\_size, *int* intr\_alloc\_flags)

Initialize RMT driver.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver is already installed, call `rmt_driver_uninstall` first.
- ESP\_ERR\_NO\_MEM Memory allocation failure
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rx\_buf\_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr\_alloc\_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See `esp_intr_alloc.h` for details. If `ESP_INTR_FLAG_IRAM` is used, please do not use the memory allocated from psram when calling `rmt_write_items`.

*esp\_err\_t* **rmt\_driver\_uninstall** (*rmt\_channel\_t* channel)

Uninstall RMT driver.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_get\_channel\_status** (*rmt\_channel\_status\_result\_t* \*channel\_status)

Get the current status of eight channels.

**Note** Do not call this function if it is possible that `rmt_driver_uninstall` will be called at the same time.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

**Parameters**

- [out] channel\_status: store the current status of each channel

*esp\_err\_t* **rmt\_get\_counter\_clock** (*rmt\_channel\_t* channel, *uint32\_t* \*clock\_hz)

Get speed of channel's internal counter clock.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- [out] clock\_hz: counter clock speed, in hz

*esp\_err\_t* **rmt\_write\_items** (*rmt\_channel\_t* channel, const *rmt\_item32\_t* \*rmt\_item, int item\_num, bool wait\_tx\_done)

RMT send waveform from rmt\_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait\_tx\_done is set to true, this function will block and will not return until all items have been sent out. If wait\_tx\_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

#### Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

#### Parameters

- channel: RMT channel
- rmt\_item: head point of RMT items array. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.
- item\_num: RMT data item number.
- wait\_tx\_done:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

*esp\_err\_t* **rmt\_wait\_tx\_done** (*rmt\_channel\_t* channel, TickType\_t wait\_time)

Wait RMT TX finished.

#### Return

- ESP\_OK RMT Tx done successfully
- ESP\_ERR\_TIMEOUT Exceeded the 'wait\_time' given
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

#### Parameters

- channel: RMT channel
- wait\_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP\_ERR\_TIMEOUT if TX is busy (polling).

*esp\_err\_t* **rmt\_get\_ringbuf\_handle** (*rmt\_channel\_t* channel, RingbufHandle\_t \*buf\_handle)

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

#### Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

#### Parameters

- channel: RMT channel
- buf\_handle: Pointer to buffer handle to accept RX ringbuffer handle.

*esp\_err\_t* **rmt\_translator\_init** (*rmt\_channel\_t* channel, sample\_to\_rmt\_t fn)

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

#### Return

- ESP\_FAIL Init fail.
- ESP\_OK Init success.

#### Parameters

- channel: RMT channel .
- fn: Point to the data conversion function.

*esp\_err\_t* **rmt\_write\_sample** (*rmt\_channel\_t* channel, const uint8\_t \*src, size\_t src\_size, bool wait\_tx\_done)

Translate uint8\_t type of data into rmt format and send it out. Requires rmt\_translator\_init to init the translator first.

#### Return

- ESP\_FAIL Send fail
- ESP\_OK Send success

#### Parameters

- channel: RMT channel .
- src: Pointer to the raw data.
- src\_size: The size of the raw data.
- wait\_tx\_done: Set true to wait all data send done.

*rmt\_tx\_end\_callback\_t* **rmt\_register\_tx\_end\_callback** (*rmt\_tx\_end\_fn\_t* function, void \*arg)

Registers a callback that will be called when transmission ends.

Called by rmt\_driver\_isr\_default in interrupt context.

**Note** Requires rmt\_driver\_install to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

#### Parameters

- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

### Structures

**struct rmt\_tx\_config\_t**

Data struct of RMT TX configure parameters.

#### Public Members

uint32\_t **carrier\_freq\_hz**

RMT carrier frequency

*rmt\_carrier\_level\_t* **carrier\_level**

Level of the RMT output, when the carrier is applied

*rmt\_idle\_level\_t* **idle\_level**

RMT idle level

uint8\_t **carrier\_duty\_percent**

RMT carrier duty (%)

bool **carrier\_en**

RMT carrier enable

bool **loop\_en**

Enable sending RMT items in a loop

bool **idle\_output\_en**

RMT idle level output enable

**struct rmt\_rx\_config\_t**

Data struct of RMT RX configure parameters.

#### Public Members

uint16\_t **idle\_threshold**

RMT RX idle threshold

uint8\_t **filter\_ticks\_thresh**

RMT filter tick number

bool **filter\_en**

RMT receiver filter enable

**struct rmt\_config\_t**

Data struct of RMT configure parameters.

**Public Members***rmt\_mode\_t* **rmt\_mode**

RMT mode: transmitter or receiver

*rmt\_channel\_t* **channel**

RMT channel

*gpio\_num\_t* **gpio\_num**

RMT GPIO number

**uint8\_t clk\_div**

RMT channel counter divider

**uint8\_t mem\_block\_num**

RMT memory block number

*rmt\_tx\_config\_t* **tx\_config**

RMT TX parameter

*rmt\_rx\_config\_t* **rx\_config**

RMT RX parameter

**struct rmt\_tx\_end\_callback\_t**

Structure encapsulating a RMT TX end callback.

**Public Members***rmt\_tx\_end\_fn\_t* **function**

Function which is called on RMT TX end

**void \*arg**

Optional argument passed to function

**Macros****RMT\_MEM\_ITEM\_NUM**

Define memory space of each RMT channel (in words = 4 bytes)

**RMT\_DEFAULT\_CONFIG\_TX** (gpio, channel\_id)

Default configuration for Tx channel.

**RMT\_DEFAULT\_CONFIG\_RX** (gpio, channel\_id)

Default configuration for RX channel.

**Type Definitions****typedef intr\_handle\_t rmt\_isr\_handle\_t**

RMT interrupt handle.

**typedef void (\*rmt\_tx\_end\_fn\_t) (rmt\_channel\_t channel, void \*arg)**

Type of RMT Tx End callback function.

**typedef void (\*sample\_to\_rmt\_t) (const void \*src, rmt\_item32\_t \*dest, size\_t src\_size, size\_t wanted\_num, size\_t \*translated\_size, size\_t \*item\_num)**

User callback function to convert uint8\_t type data to rmt format(rmt\_item32\_t).

This function may be called from an ISR, so, the code should be short and efficient.

**Note** In fact, item\_num should be a multiple of translated\_size, e.g. : When we convert each byte of uint8\_t type data to rmt format data, the relation between item\_num and translated\_size should be item\_num = translated\_size\*8.

### Parameters

- `src`: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- `[out] dest`: Pointer to the buffer storing the rmt format data.
- `src_size`: The raw data size.
- `wanted_num`: The number of rmt format data that wanted to get.
- `[out] translated_size`: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- `[out] item_num`: The number of the rmt format data that actually converted to, it can be less than `wanted_num` if there is not enough raw data, but cannot exceed `wanted_num`. it should return 0 if no data was converted.

### Header File

- [soc/include/hal/rmt\\_types.h](#)

### Structures

**struct rmt\_channel\_status\_result\_t**  
Data struct of RMT channel status.

### Public Members

*rmt\_channel\_status\_t* **status**[**RMT\_CHANNEL\_MAX**]  
Store the current status of each channel

### Type Definitions

**typedef** rmt\_channel\_id\_t **rmt\_channel\_t**  
RMT Channel Type.

### Enumerations

**enum** rmt\_mem\_owner\_t  
RMT Internal Memory Owner.

*Values:*

**RMT\_MEM\_OWNER\_TX**  
RMT RX mode, RMT transmitter owns the memory block

**RMT\_MEM\_OWNER\_RX**  
RMT RX mode, RMT receiver owns the memory block

**RMT\_MEM\_OWNER\_MAX**

**enum** rmt\_source\_clk\_t  
Clock Source of RMT Channel.

*Values:*

**RMT\_BASECLK\_REF**  
RMT source clock system reference tick, 1MHz by default (not supported in this version)

**RMT\_BASECLK\_APB**  
RMT source clock is APB CLK, 80Mhz by default

**RMT\_BASECLK\_MAX**

**enum** rmt\_data\_mode\_t  
RMT Data Mode.

**Note** We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

*Values:*

**RMT\_DATA\_MODE\_FIFO**

**RMT\_DATA\_MODE\_MEM**

**RMT\_DATA\_MODE\_MAX**

**enum rmt\_mode\_t**

RMT Channel Working Mode (TX or RX)

*Values:*

**RMT\_MODE\_TX**

RMT TX mode

**RMT\_MODE\_RX**

RMT RX mode

**RMT\_MODE\_MAX**

**enum rmt\_idle\_level\_t**

RMT Idle Level.

*Values:*

**RMT\_IDLE\_LEVEL\_LOW**

RMT TX idle level: low Level

**RMT\_IDLE\_LEVEL\_HIGH**

RMT TX idle level: high Level

**RMT\_IDLE\_LEVEL\_MAX**

**enum rmt\_carrier\_level\_t**

RMT Carrier Level.

*Values:*

**RMT\_CARRIER\_LEVEL\_LOW**

RMT carrier wave is modulated for low Level output

**RMT\_CARRIER\_LEVEL\_HIGH**

RMT carrier wave is modulated for high Level output

**RMT\_CARRIER\_LEVEL\_MAX**

**enum rmt\_channel\_status\_t**

RMT Channel Status.

*Values:*

**RMT\_CHANNEL\_UNINIT**

RMT channel uninitialized

**RMT\_CHANNEL\_IDLE**

RMT channel status idle

**RMT\_CHANNEL\_BUSY**

RMT channel status busy

### 2.3.11 SDMMC Host Driver

#### Overview

ESP32's SDMMC host peripheral has two slots:

- Slot 0 (*SDMMC\_HOST\_SLOT\_0*) is an 8-bit slot. It uses HS1\_\* signals in the PIN MUX.
- Slot 1 (*SDMMC\_HOST\_SLOT\_1*) is a 4-bit slot. It uses HS2\_\* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.

Signal	Slot 0	Slot 1
CMD	GPIO11	GPIO15
CLK	GPIO6	GPIO14
D0	GPIO7	GPIO2
D1	GPIO8	GPIO4
D2	GPIO9	GPIO12
D3	GPIO10	GPIO13
D4	GPIO16	
D5	GPIO17	
D6	GPIO5	
D7	GPIO18	
CD	any input via GPIO matrix	
WP	any input via GPIO matrix	

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `gpio_cd` and `gpio_wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**警告:** Pins used by Slot 0 (`HS1_*`) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

## Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

### See also

See *SD/SDIO/MMC Driver* for the higher level driver which implements the protocol layer.

See *SD SPI Host Driver* for a similar driver which uses the SPI controller and is limited to SD protocol's SPI mode.

See *SD Pull-up Requirements* for pullup support and compatibilities of modules and development kits.

## API Reference

### Header File

- [driver/include/driver/sdmmc\\_host.h](#)

### Functions

`esp_err_t sdmmc_host_init` (void)

Initialize SDMMC host peripheral.

**Note** This function is not thread safe

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdmmc_host_init` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated

`esp_err_t sdmmc_host_init_slot` (int slot, const `sdmmc_slot_config_t` \*slot\_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1\_\* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2\_\* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if host has not been initialized using `sdmmc_host_init`

#### Parameters

- slot: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- slot\_config: additional configuration for the slot

`esp_err_t sdmmc_host_set_bus_width` (int slot, size\_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. `SD_APP_SET_BUS_WIDTH`)

**Note** This function is not thread safe

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if slot number or width is not valid

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `width`: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

`size_t sdmmc_host_get_slot_width` (int *slot*)

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

**Return** configured bus width of the specified slot.

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

`esp_err_t sdmmc_host_set_card_clk` (int *slot*, `uint32_t freq_khz`)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**

- `ESP_OK` on success
- other error codes may be returned in the future

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `freq_khz`: card clock frequency, in kHz

`esp_err_t sdmmc_host_set_bus_ddr_mode` (int *slot*, `bool ddr_enabled`)

Enable or disable DDR mode of SD interface.

**Return**

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if DDR mode is not supported on this slot

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `ddr_enabled`: enable or disable DDR mode

`esp_err_t sdmmc_host_do_transaction` (int *slot*, `sdmmc_command_t *cmdinfo`)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

**Attention** Data buffer passed in `cmdinfo->data` must be in DMA capable memory

**Return**

- `ESP_OK` on success
- `ESP_ERR_TIMEOUT` if response or data transfer has timed out
- `ESP_ERR_INVALID_CRC` if response or data transfer CRC check has failed
- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response
- `ESP_ERR_INVALID_SIZE` if the size of data transfer is not valid in SD protocol
- `ESP_ERR_INVALID_ARG` if the data buffer is not in DMA capable memory

**Parameters**

- `slot`: slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `cmdinfo`: pointer to structure describing command and data to transfer

`esp_err_t sdmmc_host_io_int_enable` (int *slot*)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns ESP\_OK, other errors possible in the future

**Parameters**

- `slot`: slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)

*esp\_err\_t* **sdmmc\_host\_io\_int\_wait** (int *slot*, TickType\_t *timeout\_ticks*)

Block until an SDIO interrupt is received, or timeout occurs.

**Return**

- ESP\_OK on success (interrupt received)
- ESP\_ERR\_TIMEOUT if the interrupt did not occur within `timeout_ticks`

**Parameters**

- `slot`: slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- `timeout_ticks`: number of RTOS ticks to wait for the interrupt

*esp\_err\_t* **sdmmc\_host\_deinit** (void)

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdmmc_host_init` function has not been called

*esp\_err\_t* **sdmmc\_host\_pullup\_en** (int *slot*, int *width*)

Enable the pull-ups of sd pins.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**

- ESP\_OK: if success
- ESP\_ERR\_INVALID\_ARG: if configured width larger than maximum the slot can support

**Parameters**

- `slot`: Slot to use, normally set it to 1.
- `width`: Bit width of your configuration, 1 or 4.

## Structures

**struct sdmmc\_slot\_config\_t**

Extra configuration for SDMMC peripheral slot

## Public Members

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*uint8\_t* **width**

Bus width used by the slot (might be less than the max width supported)

*uint32\_t* **flags**

Features used by this slot.

## Macros

**SDMMC\_HOST\_SLOT\_0**

SDMMC slot 0.

**SDMMC\_HOST\_SLOT\_1**

SDMMC slot 1.

**SDMMC\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

**SDMMC\_SLOT\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

**SDMMC\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDMMC\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDMMC\_SLOT\_WIDTH\_DEFAULT**

use the default width for the slot (8 for slot 0, 4 for slot 1)

**SDMMC\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SDMMC host slot

## 2.3.12 SD SPI Host Driver

### Overview

The SD SPI host driver allows using the SPI2 (HSPI) or SPI3 (VSPI) controller for communication with SD cards. This driver's naming pattern was adopted from the *SDMMC Host* driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

The SD SPI host driver has the following modes:

- **SPI mode:** offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral's signals can be routed to any ESP32 pin.
- **1-bit SD mode:** offers higher throughput but requires routing the signals through their dedicated IO\_MUX pins only.

The SD SPI driver uses software-controlled CS signal.

Currently, the SD SPI driver cannot handle multi-threaded environments as does not support time-division multiplexing on the same SPI bus. It means that if your application needs to communicate with an SD card and other devices on the same SPI bus, the application itself must ensure that its different tasks do not try to access the SPI slaves at the same time.

### How to Use

The state and configurations of the SD SPI host driver are stored in a *sdmmc\_host\_t* structure. This structure can be initialized using the *SDSPI\_HOST\_DEFAULT* macro.

The state and configurations of the SD slot are stored in a *sdmmc\_slot\_config\_t* structure. Use the macro *SDSPI\_SLOT\_CONFIG\_DEFAULT* to initialize the structure and to fill in the default pin mappings (SD mode pin mappings).

Only the following driver's API functions are normally used by most applications:

- *sdspi\_host\_init ()*
- *sdspi\_host\_init\_slot ()*
- *sdspi\_host\_deinit ()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the *sdmmc\_host\_t* structure. For more details, see *the SD/SDIO/MMC Driver*.

---

**注解:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

## API Reference

### Header File

- `driver/include/driver/sdsp_i_host.h`

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

**Note** This function is not thread safe

#### Return

- ESP\_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_slot` (int slot, const `sdspi_slot_config_t` \*slot\_config)

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_init_slot` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

#### Parameters

- slot: SPI controller to use (HSPI\_HOST or VSPI\_HOST)
- slot\_config: pointer to slot configuration structure

`esp_err_t sdspi_host_do_transaction` (int slot, `sdmmc_command_t` \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

#### Return

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

#### Parameters

- slot: SPI controller (HSPI\_HOST or VSPI\_HOST)
- cmdinfo: pointer to structure describing command and data to transfer

`esp_err_t sdspi_host_set_card_clk` (int slot, `uint32_t freq_khz`)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

#### Return

- ESP\_OK on success
- other error codes may be returned in the future

**Parameters**

- `slot`: SPI controller (HSPI\_HOST or VSPI\_HOST)
- `freq_khz`: card clock frequency, in kHz

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

**Note** This function is not thread safe

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (int *slot*)

Enable SDIO interrupt.

**Return**

- ESP\_OK on success

**Parameters**

- `slot`: SPI controller to use (HSPI\_HOST or VSPI\_HOST)

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (int *slot*, TickType\_t *timeout\_ticks*)

Wait for SDIO interrupt until timeout.

**Return**

- ESP\_OK on success

**Parameters**

- `slot`: SPI controller to use (HSPI\_HOST or VSPI\_HOST)
- `timeout_ticks`: Ticks to wait before timeout.

**Structures**

**struct** **sdspi\_slot\_config\_t**

Extra configuration for SPI host

**Public Members**

*gpio\_num\_t* **gpio\_miso**

GPIO number of MISO signal.

*gpio\_num\_t* **gpio\_mosi**

GPIO number of MOSI signal.

*gpio\_num\_t* **gpio\_sck**

GPIO number of SCK signal.

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

int **dma\_channel**

DMA channel to be used by SPI driver (1 or 2)

**Macros**

**SDSPI\_HOST\_DEFAULT ()**

Default `sdmmc_host_t` structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ can be set to one of HSPI\_HOST, VSPI\_HOST.

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SPI host

### 2.3.13 SDIO Card Slave Driver

#### Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

#### Connections

Pin Name	Corresponding pins in SPI mode	Slot1	Slot2
		GPIO Number	
CLK	SCLK	6	14
CMD	MOSI	11	15
DAT0	MISO	7	2
DAT1	Interrupt	8	4
DAT2	N.C. (pullup)	9	12
DAT3	#CS	10	13

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

**注解:** Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don't offer these pullups internally. If you are using official development boards, check [Overview of Compatibility](#) to see whether your development boards have such pullups.

**注解:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See [Overview of Compatibility](#) to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- Modules: ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB
- Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP23-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

---

Refer to [SD Pull-up Requirements](#) for more technical details of the pullups.

**SD Pull-up Requirements** Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see [MTDI Strapping Pin](#) below.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

**Overview of Compatibility** This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

### Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see [ESP32 datasheet](#)):
  - [No Pull-ups](#)
  - [Conflicts Between Bootstrap and SDIO on DAT2](#) for models with 3.3 V flash chip
- ESP32-D2WD:
  - [No Pull-ups](#)
  - [No Pull-up on GPIO12](#)

### Systems in Packages (SIP)

- ESP32-PICO-D4:
  - [No Pull-ups](#)
  - [Conflicts Between Bootstrap and SDIO on DAT2](#)

### Modules

- ESP32-WROOM-32 Series, including ESP32-WROOM-32, ESP32-WROOM-32D, ESP32-WROOM-32U, and ESP32-SOLO-1
  - [No Pull-ups](#)
  - [Conflicts Between Bootstrap and SDIO on DAT2](#)
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - [No Pull-ups](#)
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - [No Pull-ups](#)
  - [Conflicts Between Bootstrap and SDIO on DAT2](#)

## Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
  - *Download Mode Not Working (minor issue)*
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
  - *Download Mode Not Working (minor issue)*
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - *Pull-up Conflicts on GPIO13* (v4.1, v3, v2, and v1)
  - *Conflicts Between Bootstrap and SDIO on DAT2* (v4.1, v2, and v1)
  - *Download Mode Not Working (minor issue)* (v2, v1)

You can determine the version of your ESP23-WROVER-KIT by checking which module is mounted on it:

- ESP32-WROVER-B on v4.1
- ESP32-WROVER on v3
- ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSC
  - Required pull-ups are provided
  - *Conflicts Between Bootstrap and SDIO on DAT2*
- ESP32-LyraT
  - Required pull-ups are provided
  - *Pull-up Conflicts on GPIO13*

**Non-Espressif Hosts** Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

## Solutions

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13** If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device's DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2** There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see [MTDI Strapping Pin](#).

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator's output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

**警告:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on <http://www.espressif.com/>. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the *XPD\_SDIO\_TIEH*, *XPD\_SDIO\_FORCE*, and *XPD\_SDIO\_REG* eFuses. After all the three eFuses are burned to value 1, the internal VDD\_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....

Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
``components/esptool_py/esptool/espefuse.py summary``
```

If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`. For more details, see the [ESP32 Technical Reference Manual \(PDF\)](#).

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:
  - Leave the host's DAT2 floating and directly connect the slave's DAT2 to VDD.
  - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host's side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

## Related Information

**MTDI Strapping Pin** MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD\_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD\_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif's boards with the SD card operation, see [Overview of Compatibility](#).

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif's products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

表 2: Default pull-up and pull-down states of the CMD and DATA pins

GPIO number	Pin Name	Startup State	Strapping Requirement
15	CMD	WPU	
2	DAT0	WPD	Low for Download mode
4	DAT1	WPD	
12	DAT2	PU for 1.8 V flash; WPD for 3.3 V flash	High for 1.8 V flash; Low for 3.3 V flash
13	DAT3	WPU	

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology** The SDIO slave driver uses the following terms:

- **Transfer**: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending**: slave to host transfers.
- **Receiving**: host to slave transfers.

**注解**: Register names in ESP Rechnical Reference Manual are oriented from the point of view of the host, i.e. 'rx' registers refer to sending, while 'tx' registers refer to receiving. We're not using tx or rx in the driver to avoid

ambiguities.

- FIFO: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: *requested length* = 0x1F800-address.
- Ownership: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- Requested length: The length requested in one transfer determined by the FIFO address.
- Transfer length: The length requested in one transfer determined by the CMD53 byte/block count field.

**注解:** Requested length is different from the transfer length. ESP32 slave DMA base on the *requested length* rather than the *transfer length*. The *transfer length* should be no shorter than the *requested length*, and the rest part will be filled with 0 (sending) or discard (receiving).

- Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the `recv_buffer_size` member of `sdio_slave_config_t`.
- Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in [Interrupts](#).
- Registers: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of [SDIO Simplified Specification](#)), which is described briefly in [ESP SDIO slave initialization](#).

Furthermore, there' s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to [ESP SDIO slave protocol](#). There is also a component [ESP Serial Slave Link](#) for ESP32 master to communicate with ESP32 SDIO slave, see example [peripherals/sdio](#) when programming your host.

### Communication with ESP SDIO Slave

**ESP SDIO slave initialization** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of [SDIO Simplified Specification](#)). In this specification and below, the SDIO slave is also called an (SD)IO card. All the initialization CMD52 and CMD53 are sent to Func 0 (CIA region). Here is an brief example on how to do this:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000  
CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)  
**Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXXXFF00.  
Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)  
**Example:** Arg of R6 after CMD3 is 0x0001xxxx.  
Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)  
CMD52/53 (Write 0x10=0x00)  
CMD52/53 (Write 0x11=0x02)  
CMD52/53 (Read 0x10~0x11, read to check the final value)

11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)  
CMD52/53 (Write 0x110=0x00)  
CMD52/53 (Write 0x111=0x02)  
CMD52/53 (Read 0x110~0x111, read to check the final value)

**ESP SDIO slave protocol** The protocol is based on Function 1 access by CMD52 and CMD53, offering 3 services: (1) sending and receiving FIFO, (2) 52 8-bit R/W register shared by host and slave, (3) 8 general purpose interrupt sources from host to slave and 8 in the opposite direction.

There is a component *esp\_serial\_slave\_link* implementing the logic of this protocol for ESP32 master to communicate with the ESP32 slave. See [ESP Serial Slave Link](#).

The host should access the registers below as described to communicate with slave.

### Slave register table

#### 32-bit

- 0x044 (TOKEN\_RDATA): in which bit 27-16 holds the receiving buffer number.
- 0x058 (INT\_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT\_LEN): holds the accumulated length (by byte) to be sent from slave to host.
- 0x0D4 (INT\_CLR): write 1 to clear interrupt bits corresponding to INT\_ST.
- 0x0DC (INT\_ENA): mask bits for interrupts from slave to host.

**8-bit** Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE\_INT): bits for host to interrupt slave. auto clear.

**FIFO (sending and receiving)** 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from/write to the slave in a single transfer:

$$\text{requested length} = 0x1F800\text{-address}$$

The slave will respond with the length according to the length field in CMD53, with the data longer than *requested length* filled with 0 (sending) or discard (receiving).

---

**注解:** This includes both the block and the byte mode of CMD53.

The function number should be set to 1, OP Code should be set to 1 (for CMD53).

It is allowed to use CMD53 mode combination of block+byte to get higher efficiency when accessing the FIFO by arbitrary length. E.g. The block size is set to 512 by default, you can write/get 1031 bytes of data to/from the FIFO by:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-**1031**.
  2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.
-

**Interrupts** For the host interrupts, the slave raise the interrupt by pulling DAT1 line down at a proper time (level sensitive). The host detect this and read the INT\_ST register to see the source. Then the host can clear it by writing the INT\_CLR register and do something with the interrupt. The host can also mask unneeded sources by clearing the bits in INT\_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

`sdio_slave_hostint_t` (*SDIO Card Slave Driver*) shows the bit definition corresponding to host interrupt sources.

For the slave interrupts, the host send transfers to write the SLAVE\_INT register. Once a bit is written from 0 to 1, the slave hardware and driver will detect it and inform the app.

**Receiving FIFO** To write the receiving FIFO in the slave, host should work in the following steps:

1. Read the TOKEN1 field (bits 27-16) of TOKEN\_RDATA (0x044) register. The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (*recv\_buffer\_size \* buffer\_num* is greater than data to write, *recv\_buffer\_size* is pre-defined between the host and the slave before the communication starts). Or go back to step 1 until the buffer is enough.
3. Write to the FIFO address with CMD53. Note that the *requested length* should not be larger than calculated in step 2, and the FIFO address is related to *requested length*.
4. Calculate used buffers, note that non-full buffer at the tail should be seen as one that is used.

**Sending FIFO** To read the sending FIFO in the slave, host should work in the following steps:

1. Wait for the interrupt line to be active (optional, low by default).
2. Read (poll) the interrupt bits in INT\_ST register to see whether new packets exists.
3. If new packets are ready, reads the PKT\_LEN reg. The data length to read from slave is PKT\_LEN minuses the length that has been read from the host. If the PKT\_LEN is not larger than used, wait and poll until the slave is ready and update the PKT\_LEN.
4. Read from the FIFO with CMD53. Note that the *requested length* should not be larger than calculated in step3, and the FIFO address is related to *requested length*.
5. Recorded read length.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the `slave_intr_cb` member in the `sdio_slave_config_t` structure.

---

**注解:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

---

There' s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Call `sdio_slave_recv` to get the received data. If non-blocking call is needed, set `wait=0`.
4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**注解:** To avoid overhead from copying data, the driver itself doesn't have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- Stream Mode: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- Packet Mode: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**注解:** To avoid overhead from copying data, the driver itself doesn't have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```
typedef struct {
    uint8_t* buffer;
```

(下页继续)

```

    size_t    size;
    int       id;
}sdio_transfer_t;

//and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

//and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void*)&arg, portMAX_DELAY);
ESP_LOGI("tag", "(%d) successfully send %d bytes of %p", arg->id, arg->size,
↵arg->buffer);
some_post_callback(arg); //do more things

```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it's sent:

```

uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_rcv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

//and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void*)&handle, portMAX_DELAY);
sdio_slave_rcv_load_buf(handle);

```

More about this, see [peripherals/sdio](#).

## Application Example

Slave/master communication: [peripherals/sdio](#).

## API Reference

### Header File

- [soc/include/hal/sdio\\_slave\\_types.h](#)

### Enumerations

**enum sdio\_slave\_hostint\_t**

Mask of interrupts sending to the host.

*Values:*

**SDIO\_SLAVE\_HOSTINT\_BIT0** = BIT(0)

General purpose interrupt bit 0.

**SDIO\_SLAVE\_HOSTINT\_BIT1** = BIT(1)

**SDIO\_SLAVE\_HOSTINT\_BIT2** = BIT(2)

**SDIO\_SLAVE\_HOSTINT\_BIT3** = BIT(3)

```

SDIO_SLAVE_HOSTINT_BIT4 = BIT(4)
SDIO_SLAVE_HOSTINT_BIT5 = BIT(5)
SDIO_SLAVE_HOSTINT_BIT6 = BIT(6)
SDIO_SLAVE_HOSTINT_BIT7 = BIT(7)
SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET = BIT(23)

```

New packet available.

```
enum sdio_slave_timing_t
```

Timing of SDIO slave.

Values:

```

SDIO_SLAVE_TIMING_PSEND_PSAMPLE = 0
    Send at posedge, and sample at posedge. Default value for HS mode. Normally there's no problem
    using this to work in DS mode.

SDIO_SLAVE_TIMING_NSEND_PSAMPLE
    Send at negedge, and sample at posedge. Default value for DS mode and below.

SDIO_SLAVE_TIMING_PSEND_NSAMPLE
    Send at posedge, and sample at negedge.

SDIO_SLAVE_TIMING_NSEND_NSAMPLE
    Send at negedge, and sample at negedge.

```

```
enum sdio_slave_sending_mode_t
```

Configuration of SDIO slave mode.

Values:

```

SDIO_SLAVE_SEND_STREAM = 0
    Stream mode, all packets to send will be combined as one if possible.

SDIO_SLAVE_SEND_PACKET = 1
    Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

```

## Header File

- [driver/include/driver/sdio\\_slave.h](#)

## Functions

*esp\_err\_t* **sdio\_slave\_initialize** (*sdio\_slave\_config\_t* \*config)

Initialize the sdio slave driver

### Return

- ESP\_ERR\_NOT\_FOUND if no free interrupt found.
- ESP\_ERR\_INVALID\_STATE if already initialized.
- ESP\_ERR\_NO\_MEM if fail due to memory allocation failed.
- ESP\_OK if success

### Parameters

- config: Configuration of the sdio slave driver.

void **sdio\_slave\_deinit** (void)

De-initialize the sdio slave driver to release the resources.

*esp\_err\_t* **sdio\_slave\_start** (void)

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

**Note** The driver will continue sending from previous data and PKT\_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See `sdio_slave_reset`.

### Return

- ESP\_ERR\_INVALID\_STATE if already started.
- ESP\_OK otherwise.

void **sdio\_slave\_stop** (void)

Stop hardware from sending and receiving, also set IOREADY1 to 0.

**Note** this will not clear the data already in the driver, and also not reset the PKT\_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

*esp\_err\_t* **sdio\_slave\_reset** (void)

Clear the data still in the driver, as well as reset the PKT\_LEN and TOKEN1 counting.

**Return** always return ESP\_OK.

*sdio\_slave\_buf\_handle\_t* **sdio\_slave\_recv\_register\_buf** (uint8\_t \*start)

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note** The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Return** The buffer handle if success, otherwise NULL.

**Parameters**

- `start`: The start address of the buffer.

*esp\_err\_t* **sdio\_slave\_recv\_unregister\_buf** (*sdio\_slave\_buf\_handle\_t* handle)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Return** ESP\_OK if success, ESP\_ERR\_INVALID\_ARG if the handle is NULL or the buffer is being used.

**Parameters**

- `handle`: Handle to the buffer to release.

*esp\_err\_t* **sdio\_slave\_recv\_load\_buf** (*sdio\_slave\_buf\_handle\_t* handle)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Return**

- ESP\_ERR\_INVALID\_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- ESP\_OK if success

**Parameters**

- `handle`: Handle to the buffer ready to receive data.

*esp\_err\_t* **sdio\_slave\_recv** (*sdio\_slave\_buf\_handle\_t* \*handle\_ret, uint8\_t \*\*out\_addr, size\_t \*out\_len, TickType\_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Return**

- ESP\_ERR\_INVALID\_ARG if `handle_ret` is NULL
- ESP\_ERR\_TIMEOUT if timeout before receiving new data
- ESP\_OK if success

**Parameters**

- `handle_ret`: Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- [out] `out_addr`: Output of the start address, set to NULL if not needed.
- [out] `out_len`: Actual length of the data in the buffer, set to NULL if not needed.
- `wait`: Time to wait before data received.

uint8\_t \***sdio\_slave\_recv\_get\_buf** (*sdio\_slave\_buf\_handle\_t* handle, size\_t \*len\_o)

Retrieve the buffer corresponding to a handle.

**Return** buffer address if success, otherwise NULL.

**Parameters**

- `handle`: Handle to get the buffer.
- `len_o`: Output of buffer length

*esp\_err\_t* **sdio\_slave\_send\_queue** (uint8\_t \*addr, size\_t len, void \*arg, TickType\_t wait)

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Return**

- ESP\_ERR\_INVALID\_ARG if the length is not greater than 0.
- ESP\_ERR\_TIMEOUT if the queue is still full until timeout.
- ESP\_OK if success.

**Parameters**

- `addr`: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- `len`: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- `arg`: Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- `wait`: Time to wait if the buffer is full.

*esp\_err\_t* **sdio\_slave\_send\_get\_finished** (void \*\*out\_arg, TickType\_t wait)

Return the ownership of a finished transaction.

**Return** ESP\_ERR\_TIMEOUT if no transaction finished, or ESP\_OK if succeed.

**Parameters**

- `out_arg`: Argument of the finished transaction. Set to NULL if unused.
- `wait`: Time to wait if there's no finished sending transaction.

*esp\_err\_t* **sdio\_slave\_transmit** (uint8\_t \*addr, size\_t len)

Start a new sending transfer, and wait for it (blocked) to be finished.

**Return**

- ESP\_ERR\_INVALID\_ARG if the length of descriptor is not greater than 0.
- ESP\_ERR\_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP\_OK if success.

**Parameters**

- `addr`: Start address of the buffer to send
- `len`: Length of buffer to send.

uint8\_t **sdio\_slave\_read\_reg** (int pos)

Read the spi slave register shared with host.

**Note** register 28 to 31 are reserved for interrupt vector.

**Return** value of the register.

**Parameters**

- `pos`: register address, 0-27 or 32-63.

*esp\_err\_t* **sdio\_slave\_write\_reg** (int pos, uint8\_t reg)

Write the spi slave register shared with host.

**Note** register 29 and 31 are used for interrupt vector.

**Return** ESP\_ERR\_INVALID\_ARG if address wrong, otherwise ESP\_OK.

**Parameters**

- `pos`: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- `reg`: the value to write.

*sdio\_slave\_hostint\_t* **sdio\_slave\_get\_host\_intena** (void)

Get the interrupt enable for host.

**Return** the interrupt mask.

void **sdio\_slave\_set\_host\_intena** (*sdio\_slave\_hostint\_t* mask)

Set the interrupt enable for host.

**Parameters**

- `mask`: Enable mask for host interrupt.

*esp\_err\_t* **sdio\_slave\_send\_host\_int** (uint8\_t pos)

Interrupt the host by general purpose interrupt.

**Return**

- ESP\_ERR\_INVALID\_ARG if interrupt num error
- ESP\_OK otherwise

**Parameters**

- pos: Interrupt num, 0-7.

void **sdio\_slave\_clear\_host\_int** (*sdio\_slave\_hostint\_t mask*)

Clear general purpose interrupt to host.

**Parameters**

- mask: Interrupt bits to clear, by bit mask.

*esp\_err\_t* **sdio\_slave\_wait\_int** (int pos, TickType\_t wait)

Wait for general purpose interrupt from host.

**Note** this clears the interrupt at the same time.

**Return** ESP\_OK if success, ESP\_ERR\_TIMEOUT if timeout.

**Parameters**

- pos: Interrupt source number to wait for. is set.
- wait: Time to wait before interrupt triggered.

**Structures**

**struct sdio\_slave\_config\_t**

Configuration of SDIO slave.

**Public Members**

*sdio\_slave\_timing\_t* **timing**

timing of sdio\_slave. see sdio\_slave\_timing\_t.

*sdio\_slave\_sending\_mode\_t* **sending\_mode**

mode of sdio\_slave. SDIO\_SLAVE\_MODE\_STREAM if the data needs to be sent as much as possible; SDIO\_SLAVE\_MODE\_PACKET if the data should be sent in packets.

int **send\_queue\_size**

max buffers that can be queued before sending.

size\_t **recv\_buffer\_size**

If buffer\_size is too small, it costs more CPU time to handle larger number of buffers. If buffer\_size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

*sdio\_event\_cb\_t* **event\_cb**

when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32\_t **flags**

Features to be enabled for the slave, combinations of SDIO\_SLAVE\_FLAG\_\*.

**Macros**

**SDIO\_SLAVE\_RECV\_MAX\_BUFFER**

**SDIO\_SLAVE\_FLAG\_DAT2\_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

**SDIO\_SLAVE\_FLAG\_HOST\_INTR\_DISABLED**

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

**SDIO\_SLAVE\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

**Type Definitions**

```
typedef void (*sdio_event_cb_t) (uint8_t event)
```

```
typedef void *sdio_slave_buf_handle_t
```

Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

## 2.3.14 Sigma-delta Modulation

### Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

### Functionality Overview

There are eight independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the 'duty' input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of `sigmadelta_set_duty()`.

### Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

### API Reference

#### Header File

- [driver/include/driver/sigmadelta.h](#)

## Functions

**`esp_err_t sigmadelta_config(const sigmadelta_config_t *config)`**

Configure Sigma-delta channel.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver already initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

### Parameters

- `config`: Pointer of Sigma-delta channel configuration struct

**`esp_err_t sigmadelta_set_duty(sigmadelat_channel_t channel, int8_t duty)`**

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be  $V_{dc} = VDDIO / 256 * duty + VDDIO/2$ , where VDDIO is the power supply voltage.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

### Parameters

- `channel`: Sigma-delta channel number
- `duty`: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

**`esp_err_t sigmadelta_set_prescale(sigmadelat_channel_t channel, uint8_t prescale)`**

Set Sigma-delta channel's clock pre-scale value. The source clock is APP\_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP\_CLK / pre\_scale.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

### Parameters

- `channel`: Sigma-delta channel number
- `prescale`: The divider of source clock, ranges from 0 to 255

**`esp_err_t sigmadelta_set_pin(sigmadelat_channel_t channel, gpio_num_t gpio_num)`**

Set Sigma-delta signal output pin.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

### Parameters

- `channel`: Sigma-delta channel number
- `gpio_num`: GPIO number of output pin.

## Header File

- [soc/include/hal/sigmadelat\\_types.h](#)

## Structures

**`struct sigmadelta_config_t`**

Sigma-delta configure struct.

### Public Members

*sigmadelta\_channel\_t* **channel**

Sigma-delta channel number

**int8\_t sigmadelta\_duty**

Sigma-delta duty, duty ranges from -128 to 127.

**uint8\_t sigmadelta\_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

**uint8\_t sigmadelta\_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

### Type Definitions

**typedef int sigmadelta\_port\_t**

SIGMADELTA port number, the max port number is (SIGMADELTA\_NUM\_MAX -1).

**typedef int sigmadelta\_channel\_t**

Sigma-delta channel list.

## 2.3.15 SPI Master Driver

SPI Master driver is a program that controls ESP32' s SPI peripherals while they function as masters.

### Overview of ESP32' s SPI peripherals

ESP32 integrates four SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32' s attached flash memory and thus are currently not open to users. They share one signal bus via an arbiter.
- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. Each bus has three CS lines to drive up to three SPI slaves.

### Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master. This may be the SPI2 or SPI3 peripheral. (The driver will also support the SPI1 peripheral in the future.)
<b>Device</b>	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• <b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• <b>MOSI</b>	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
• <b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• <b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• <b>QUADWP</b>	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• <b>QUADHD</b>	Hold signal. Only used for 4-bit (qio/qout) transactions.
• <b>Assertion</b>	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

### Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus

**警告:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
<b>Com-mand</b>	In this phase, a command (0-16 bit) is written to the bus by the Host.
<b>Ad-dress</b>	In this phase, an address (0-64 bit) is transmitted over the bus by the Host.
<b>Write</b>	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
<b>Dummy</b>	This phase is configurable and is used to meet the timing requirements.
<b>Read</b>	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device*.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction intervals. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

---

注解: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see [Known Issues](#).

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

### Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:

- **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
- **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

**Transactions with Integers Other Than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

## GPIO Matrix and IO\_MUX

Most of ESP32's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO\_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO\_MUX pins are used.

---

**注解:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

---

The IO\_MUX pins for SPI buses are given below.

Pin Name	SPI2	SPI3
	GPIO Number	
CS0*	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

- Only the first Device attached to the bus can use the CS0 pin.

## Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Interval** Transaction interval is the time that software requires to set up SPI peripheral registers and to copy data to FIFOs, or to set up DMA links.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the interval. See [Interrupt Transactions](#). For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see [Polling Transactions](#).

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction interval timings for one byte of data are given below.

	Typical Transaction Time (us)	
	Interrupt	Polling
DMA	24	8
No DMA	22	7

**SPI Clock Frequency** Transferring each byte takes eight times the clock period  $8/f_{spi}$ . If the clock frequency is too high, the use of some functions might be limited. See [Timing Considerations](#).

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from the cache miss and will need to wait until the code is read from the flash. Select [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache miss.

For an interrupt transaction, the overall cost is  $20+8n/f_{spi}[MHz]$  [us] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/f_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

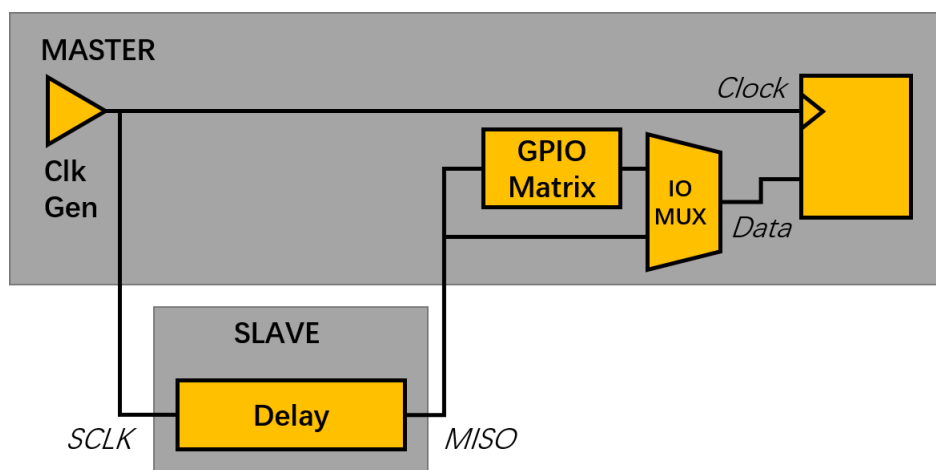

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#) and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM 安全中断处理程序](#).

### Timing Considerations

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is  $< 0$ , and the setup timing requirement is violated, which results in the failure to perform the reading correctly.

The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO\_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33~77% in comparison to the existing *input delay*. To retain a higher frequency, you have to use the IO\_MUX pins or the *dummy bit workaround*. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

Frequency Limit (MHz)		Dummy Bits Used By Driver	Comments
GPIO matrix	IO_MUX pins		
26.6	80	No	
40	–	Yes	Half-duplex, no DMA allowed

If the Host only writes data, the *dummy bit workaround* and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI master driver can work even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device's specification or measure the time on an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and the excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to the input delay values exceeding the values given in the Device specification or measured while the bus is floating.

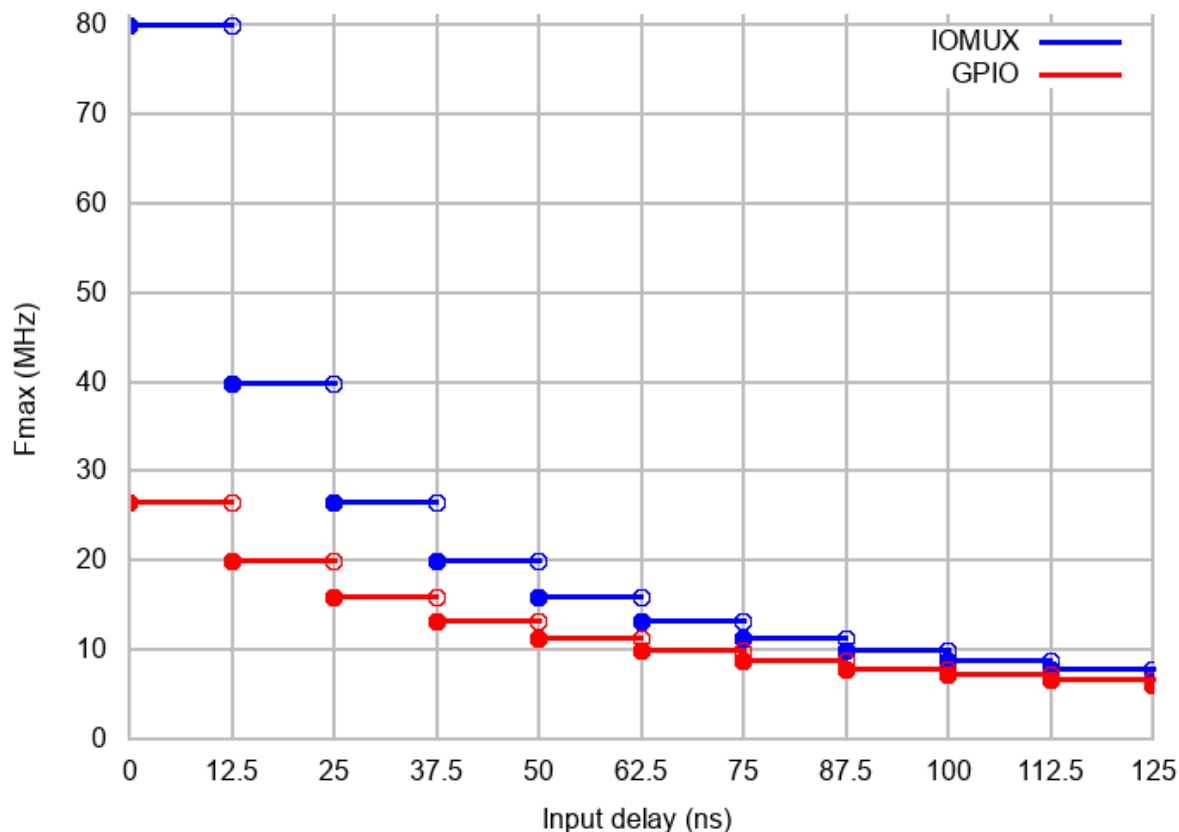

Some typical delay values are shown in the following table.

Device	Input delay (ns)
Ideal Device	0
ESP32 slave using IO_MUX*	50
ESP32 slave using GPIO_MUX*	75
ESP32's slave device is on a different physical chip.	

The MISO path delay (valid time) consists of a slave's *input delay* plus master's *GPIO matrix delay*. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

$$Freq\ limit\ [MHz] = 80 / (\text{floor}(MISO\ delay[ns]/12.5) + 1)$$

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different *input delay* times are shown in the table below.

Master	Input delay (ns)	MISO path delay (ns)	Freq. limit (MHz)
IO_MUX (0ns)	0	0	80
	50	50	16
	75	75	11.43
GPIO (25ns)	0	25	26.67
	50	75	11.43
	75	100	8.89

### Known Issues

- Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
  - Use full-duplex transactions instead.
  - Disable DMA by setting the bus initialization function's last parameter to 0 as follows:

```
ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
```

This can prohibit you from transmitting and receiving data longer than 64 bytes.
  - Try using the command and address fields to replace the write phase.
- Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See [dummy bit speed-up workaround](#).
- `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

## Application Example

The code example for displaying graphics on an ESP32-WROVER-KIT's 320x240 LCD screen can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- [soc/include/hal/spi\\_types.h](#)

### Enumerations

#### **enum spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

**SPI1\_HOST** = 0  
SPI1.

**SPI2\_HOST** = 1  
SPI2.

**SPI3\_HOST** = 2  
SPI3.

### Header File

- [driver/include/driver/spi\\_common.h](#)

### Functions

*esp\_err\_t* **spi\_bus\_initialize** (*spi\_host\_device\_t* host, **const** *spi\_bus\_config\_t* \*bus\_config, int dma\_chan)

Initialize a SPI bus.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Return

- **ESP\_ERR\_INVALID\_ARG** if configuration is invalid
- **ESP\_ERR\_INVALID\_STATE** if host already is in use
- **ESP\_ERR\_NO\_MEM** if out of memory
- **ESP\_OK** on success

#### Parameters

- **host**: SPI peripheral that controls this bus
- **bus\_config**: Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **dma\_chan**: Either channel 1 or 2, or 0 in the case when no DMA is required. Selecting a DMA channel for a SPI bus allows transfers on the bus to have sizes only limited by the amount of internal memory. Selecting no DMA channel (by passing the value 0) limits the amount of bytes transferred to a maximum of 64. Set to 0 if only the SPI flash uses this bus.

*esp\_err\_t* **spi\_bus\_free** (*spi\_host\_device\_t* host)

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

#### Return

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** if not all devices on the bus are freed

- ESP\_OK on success

#### Parameters

- `host`: SPI peripheral to free

### Structures

#### **struct spi\_bus\_config\_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

#### int `mosi_io_num`

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

#### int `miso_io_num`

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

#### int `sclk_io_num`

GPIO pin for Spi CLoCK signal, or -1 if not used.

#### int `quadwp_io_num`

GPIO pin for WP (Write Protect) signal which is used as D2 in 4-bit communication modes, or -1 if not used.

#### int `quadhd_io_num`

GPIO pin for HD (HoLD) signal which is used as D3 in 4-bit communication modes, or -1 if not used.

#### int `max_transfer_sz`

Maximum transfer size, in bytes. Defaults to 4094 if 0.

#### uint32\_t `flags`

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

#### int `intr_flags`

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

### Macros

#### **SPI\_MAX\_DMA\_LEN**

#### **SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

#### Parameters

- `DATA`: Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- `LEN`: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

**Parameters**

- DATA: Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****API Reference - SPI Master****Header File**

- [driver/include/driver/spi\\_master.h](#)

**Functions**

`esp_err_t spi_bus_add_device` (*spi\_host\_device\_t* host, **const** *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_FOUND if host doesn't have any free CS slots
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Parameters**

- `host`: SPI peripheral to allocate device on
- `dev_config`: SPI interface protocol config for the device
- `handle`: Pointer to variable to hold the device handle

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if device already is freed
- `ESP_OK` on success

#### Parameters

- `handle`: Device handle to free

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \**trans\_desc*, TickType\_t *ticks\_to\_wait*)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

#### Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\**trans\_desc*, TickType\_t *ticks\_to\_wait*)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

#### Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \**trans\_desc*)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

`esp_err_t spi_device_polling_start` (`spi_device_handle_t handle`, `spi_transaction_t *trans_desc`, `TickType_t ticks_to_wait`)

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

`esp_err_t spi_device_polling_end` (`spi_device_handle_t handle`, `TickType_t ticks_to_wait`)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

`esp_err_t spi_device_polling_transmit` (`spi_device_handle_t handle`, `spi_transaction_t *trans_desc`)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

**Parameters**

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

`esp_err_t spi_device_acquire_bus` (`spi_device_handle_t device`, `TickType_t wait`)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**

- `ESP_ERR_INVALID_ARG`: `wait` is not set to `portMAX_DELAY`.
- `ESP_OK`: Success.

**Parameters**

- `device`: The device to occupy the bus.

- `wait`: Time to wait before the the bus is occupied by the device. Currently MUST set to `port-MAX_DELAY`.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t dev*)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

#### Parameters

- `dev`: The device to release the bus.

int **spi\_cal\_clock** (int *fapb*, int *hz*, int *duty\_cycle*, uint32\_t \**reg\_o*)

Calculate the working frequency that is most close to desired frequency, and also the register value.

#### Parameters

- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock
- `reg_o`: Output of value to be set in clock register, or NULL if not needed.

**Return** Actual working frequency that most fit.

int **spi\_get\_actual\_clock** (int *fapb*, int *hz*, int *duty\_cycle*)

Calculate the working frequency that is most close to desired frequency.

**Return** Actual working frequency that most fit.

#### Parameters

- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock

void **spi\_get\_timing** (bool *gpio\_is\_used*, int *input\_delay\_ns*, int *eff\_clk*, int \**dummy\_o*, int \**cycles\_remain\_o*)

Calculate the timing settings of specified frequency and settings.

**Note** If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

#### Parameters

- `gpio_is_used`: True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.
- `eff_clk`: Effective clock frequency (in Hz) from `spi_cal_clock`.
- `dummy_o`: Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o`: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool *gpio\_is\_used*, int *input\_delay\_ns*)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

#### Parameters

- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

## Structures

**struct spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

## Public Members

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not

used, otherwise ignored.

**uint8\_t address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

**uint8\_t dummy\_bits**

Amount of dummy bits to insert between address and data phase.

**uint8\_t mode**

SPI mode (0-3)

**uint16\_t duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

**uint16\_t cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

**uint8\_t cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

**int clock\_speed\_hz**

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

**int input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

**int spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

**uint32\_t flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t pre\_cb***

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction\_cb\_t post\_cb***

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

**uint32\_t flags**

Bitwise OR of `SPI_TRANS_*` flags.

**uint16\_t cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**uint64\_t addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

**size\_t length**

Total data length, in bits.

**size\_t rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**uint8\_t tx\_data[4]**

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

**uint8\_t rx\_data[4]**

If `SPI_TRANS_USE_RXDATA` is set, data is received directly to this variable.

**struct spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.

**Public Members****struct spi\_transaction\_t base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

**uint8\_t command\_bits**

The command length in this transaction, in bits.

**uint8\_t address\_bits**

The address length in this transaction, in bits.

**uint8\_t dummy\_bits**

The dummy length in this transaction, in bits.

**Macros****SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz). 8MHz

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK****SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into rx\_data member of *spi\_transaction\_t* instead into memory at rx\_buffer.

**SPI\_TRANS\_USE\_TXDATA**

Transmit tx\_data member of *spi\_transaction\_t* instead of data at tx\_buffer. Do not set tx\_buffer when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by SPI\_MODE\_DIO/SPI\_MODE\_QIO.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the command\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the address\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the dummy\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_SET\_CD**

Set the CD pin.

**Type Definitions**

```
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t  
    Handle for a device on a SPI bus.
```

### 2.3.16 SPI Slave Driver

SPI Slave driver is a program that controls ESP32' s SPI peripherals while they function as slaves.

#### Overview of ESP32' s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

#### Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>Device</b>	SPI slave device, in this case the SPI2 and SPI3 controllers. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• MOSI	Master In, Slave Out, a.k.a. D. Data transmission from a Host to Device.
• SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
• Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

### Driver Features

The SPI slave driver allows using the SPI2 and/or SPI3 peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**注解:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

## Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to -1. If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

## Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**警告:** The ESP32 DMA hardware has a limit to the number of bytes sent by a Host and received by a Device. The transaction length must be longer than 8 bytes and a multiple of 4 bytes; otherwise, the SPI hardware might fail to receive the last 1 to 7 bytes.

## GPIO Matrix and IO\_MUX

Most of ESP32's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO\_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO\_MUX pins.

---

**注解:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

---

The IO\_MUX pins for SPI buses are given below.

Pin Name	SPI2	SPI3
	GPIO Number	
CS0*	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

- Only the first Device attached to the bus can use the CS0 pin.

### Speed and Timing Considerations

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

	Output delay of MISO (ns)	Freq. limit (MHz)
IO_MUX	43.75	<11.4
GPIO matrix	68.75	<7.2

**Note:**

1. If the frequency is equal to the limitation, it can lead to random errors.
2. The clock uncertainty between Host and Device (12.5ns) is included.
3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge than expected, or configurable latching time.

## Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.
2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

If DMA is enabled, a Device's launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master's actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

## Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

## API Reference

### Header File

- [driver/include/driver/spi\\_slave.h](#)

### Functions

```
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,
                             const spi_slave_interface_config_t *slave_config, int dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Return

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

#### Parameters

- `host`: SPI peripheral to use as a SPI slave interface
- `bus_config`: Pointer to a [spi\\_bus\\_config\\_t](#) struct specifying how the host should be initialized
- `slave_config`: Pointer to a [spi\\_slave\\_interface\\_config\\_t](#) struct specifying the details for the slave interface
- `dma_chan`: Either 1 or 2. A SPI bus used by this driver must have a DMA channel associated with it. The SPI hardware has two DMA channels to share. This parameter indicates which one to use.

```
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if not all devices on the bus are freed
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral to free

*esp\_err\_t spi\_slave\_queue\_trans* (*spi\_host\_device\_t host*, **const** *spi\_slave\_transaction\_t \*trans\_desc*, TickType\_t *ticks\_to\_wait*)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral that is acting as a slave
- *trans\_desc*: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- *ticks\_to\_wait*: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

*esp\_err\_t spi\_slave\_get\_trans\_result* (*spi\_host\_device\_t host*, *spi\_slave\_transaction\_t \*\*trans\_desc*, TickType\_t *ticks\_to\_wait*)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral to that is acting as a slave
- [*out*] *trans\_desc*: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- *ticks\_to\_wait*: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

*esp\_err\_t spi\_slave\_transmit* (*spi\_host\_device\_t host*, *spi\_slave\_transaction\_t \*trans\_desc*, TickType\_t *ticks\_to\_wait*)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- *host*: SPI peripheral to that is acting as a slave
- *trans\_desc*: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.

- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

### Structures

#### **struct spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

#### Public Members

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of `SPI_SLAVE_*` flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

uint8\_t **mode**

SPI mode (0-3)

*slave\_transaction\_cb\_t* **post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

*slave\_transaction\_cb\_t* **post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

#### **struct spi\_slave\_transaction\_t**

This structure describes one SPI transaction

#### Public Members

size\_t **length**

Total data length, in bits.

size\_t **trans\_len**

Transaction data length, in bits.

const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void \***rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void \***user**

User-defined variable. Can be used to store eg transaction ID.

### Macros

#### **SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

#### **SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**Type Definitions**

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t) (spi_slave_transaction_t *trans)
```

**2.3.17 ESP32-S2 Temperature Sensor****Overview**

The ESP32-S2 has a built-in temperature sensor. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a temperature offset DAC. The conversion relationship is the first columns of the table below. Among them, offset = 0 is the main measurement option, and other values are extended measurement options.

offset	measure range(Celsius)	measure error(Celsius)
-2	50 ~ 125	< 3
-1	20 ~ 100	< 2
0	-10 ~ 80	< 1
1	-30 ~ 50	< 2
2	-40 ~ 20	< 3

**Application Example**

Temperature sensor reading example: [peripherals/temp\\_sensor\\_esp32s2](#).

**API Reference - Normal Temp Sensor****Header File**

- [driver/esp32s2beta/include/temp\\_sensor.h](#)

**Functions**

*esp\_err\_t* **temp\_sensor\_set\_config** (*temp\_sensor\_config\_t* tsens)

Set parameter of temperature sensor.

**Return**

- ESP\_OK Success

**Parameters**

- tsens:

*esp\_err\_t* **temp\_sensor\_get\_config** (*temp\_sensor\_config\_t* \*tsens)

Get parameter of temperature sensor.

**Return**

- ESP\_OK Success

**Parameters**

- tsens:

*esp\_err\_t* **temp\_sensor\_start** (void)

Start temperature sensor measure.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **temp\_sensor\_stop** (void)

Stop temperature sensor measure.

**Return**

- ESP\_OK Success

*esp\_err\_t* **temp\_sensor\_read\_raw** (uint32\_t \**tsens\_out*)

Read temperature sensor raw data.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG *tsens\_out* is NULL
- ESP\_ERR\_INVALID\_STATE temperature sensor dont start

**Parameters**

- *tsens\_out*: Pointer to raw data, Range: 0 ~ 255

*esp\_err\_t* **temp\_sensor\_read\_celsius** (float \**celsius*)

Read temperature sensor data that is converted to degrees Celsius.

**Note** Should not be called from interrupt.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG ARG is NULL.
- ESP\_ERR\_INVALID\_STATE The ambient temperature is out of range.

**Parameters**

- *celsius*: The measure output value.

**Structures**

**struct temp\_sensor\_config\_t**

Configuration for temperature sensor reading.

**Public Members**

*temp\_sensor\_dac\_offset\_t* **dac\_offset**

The temperature measurement range is configured with a built-in temperature offset DAC.

uint8\_t **clk\_div**

Default: 6

**Macros**

**TSENS\_CONFIG\_DEFAULT** ()

**Enumerations**

**enum temp\_sensor\_dac\_offset\_t**

*Values:*

**TSENS\_DAC\_L0** = 0

offset = -2, measure range: 50°C ~ 125°C, error < 3°C.

**TSENS\_DAC\_L1**

offset = -1, measure range: 20°C ~ 100°C, error < 2°C.

**TSENS\_DAC\_L2**

offset = 0, measure range:-10°C ~ 80°C, error < 1°C.

**TSENS\_DAC\_L3**

offset = 1, measure range:-30°C ~ 50°C, error < 2°C.

**TSENS\_DAC\_L4**

offset = 2, measure range:-40°C ~ 20°C, error < 3°C.

**TSENS\_DAC\_MAX**

**TSENS\_DAC\_DEFAULT** = *TSENS\_DAC\_L2*

## 2.3.18 定时器

[English]

### 简介

ESP32 芯片提供两组硬件定时器，每组包含两个通用硬件定时器。所有定时器均为 64 位通用定时器，包括 16 位预分频器和 64 位自动重载向上/向下计数器。

### 功能概述

下文介绍了配置和操作定时器的常规步骤：

- **定时器初始化** - 启动定时器前应设置的参数，以及每个设置提供的具体功能。
- **定时器控制** - 如何读取定时器的值，如何暂停/启动定时器以及如何改变定时器的操作方式。
- **警报** - 如何设置和使用警报。
- **中断** - 如何使能和使用中断。

**定时器初始化** 两个 ESP32 定时器组中，每组都有两个定时器，两组共有四个定时器供使用。ESP32 定时器组应使用 `timer_group_t` 识别，而每组中的个体定时器则应使用 `timer_idx_t` 识别。

首先调用 `timer_init()` 函数，并将 `timer_config_t` 结构体传递给此函数，用于定义定时器的工作方式，实现定时器初始化。特别注意以下定时器参数可设置为：

- **分频器**: 设置定时器中计数器计数的速度，`divider` 的设置将用作输入的 80 MHz APB\_CLK 时钟的除数。
- **模式**: 设置计数器是递增还是递减。可通过从 `timer_count_dir_t` 中选取一个值，后使用 `counter_dir` 来选择模式。
- **计数器使能**: 如果计数器已使能，则在调用 `timer_init()` 后计数器将立即开始递增/递减。您可通过从 `timer_start_t` 中选取一个值，后使用 `counter_en` 改变此行为。
- **报警使能**: 可使用 `alarm_en` 设置。
- **自动重载**: 设置计数器是否应该在定时器警报上使用 `auto_reload` 自动重载首个计数值，还是继续递增或递减。
- **中断类型**: 选择定时器警报上应触发的中断类型，请设置 `timer_intr_mode_t` 中定义的值。

要获取定时器设置的当前值，请使用函数 `timer_get_config()`。

**定时器控制** 定时器使能后便开始计数。要使能定时器，可首先设置 `counter_en` 为 `true`，然后调用函数 `timer_init()`，或者直接调用函数 `timer_start()`。您可通过调用函数 `timer_set_counter_value()` 来指定定时器的首个计数值。要检查定时器的当前值，调用函数 `timer_get_counter_value()` 或 `timer_get_counter_time_sec()`。

可通过调用函数 `timer_pause()` 随时暂停定时器。要再次启动它，调用函数 `timer_start()`。

要重新配置定时器，可调用函数 `timer_init()`，该函数详细介绍见**定时器初始化**。

除此之外，还可通过使用专有函数更改个别设置来重新配置定时器：

设置	专有函数	描述
分频器	<code>timer_set_divider()</code>	更改计数频率。为避免发生不可预测情况，更改分频器时应暂停定时器。如果定时器正在运行，则使用 <code>timer_set_divider()</code> 将其暂停并更改设置，然后重启定时器。
模式	<code>timer_set_counter_dir_t</code>	设置计数器应递增还是递减
自动重载	<code>timer_set_auto_reload_t</code>	设置是否应在定时器警报上重载首个计数值

**警报** 要设置警报，先调用函数 `timer_set_alarm_value()`，然后使用 `timer_set_alarm()` 使能警报。当调用函数 `timer_init()` 时，也可以在定时器初始化阶段使能警报。

警报已使能且定时器达到警报值后，根据配置，可能会出现以下两种行为：

- 如果先前已配置，此时将触发中断。有关如何配置中断，请参见 [中断](#)。
- 如 `auto_reload` 已使能，定时器的计数器将重新加载，从先前配置好的值开始再次计数。应使用函数 `timer_set_counter_value()` 预先设置该值。

#### 注解：

- 如果已设置警报值且定时器已超过该值，则将立即触发警报。
- 一旦触发后，警报将自动关闭，需要重新使能以再次触发。

要检查某特定的警报值，调用函数 `timer_get_alarm_value()`。

**中断** 可通过调用函数 `timer_isr_register()` 为特定定时器组和定时器注册中断处理程序。

调用 `timer_group_intr_enable()` 使能定时器组的中断程序，调用 `timer_enable_intr()` 使能某定时器的中断程序。调用 `timer_group_intr_disable()` 关闭定时器组的中断程序，调用 `timer_disable_intr()` 关闭某定时器的中断程序。

在中断服务程序（ISR）中处理中断时，需要明确地清除中断状态位。为此，请设置定义在 `soc/esp32/include/soc/timer_group_struct.h` 中的 `TIMERGN.int_clr_timers.tM` 结构。该结构中 `N` 是定时器组别编号 [0, 1]，`M` 是定时器编号 [0, 1]。例如，要清除定时器组别 0 中定时器 1 的中断状态位，请调用以下命令：

```
TIMERG0.int_clr_timers.t1 = 1
```

有关如何使用中断，请参阅应用示例。

### 应用示例

64 位硬件定时器示例：[peripherals/timer\\_group](#)。

### API 参考

#### Header File

- [driver/include/driver/timer.h](#)

#### Functions

`esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

Read the counter value of hardware timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `timer_val`: Pointer to accept timer counter value.

`esp_err_t timer_get_counter_time_sec(timer_group_t group_num, timer_idx_t timer_num, double *time)`

Read the counter value of hardware timer, in unit of a given scale.

#### Return

- `ESP_OK` Success

- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `time`: Pointer, type of `double*`, to accept timer counter value, in seconds.

`esp_err_t timer_set_counter_value` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, `uint64_t` load\_val)

Set counter value to hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `load_val`: Counter value to write to the hardware timer.

`esp_err_t timer_start` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Start the counter of hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

`esp_err_t timer_pause` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Pause the counter of hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

`esp_err_t timer_set_counter_mode` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_count\_dir\_t* counter\_dir)

Set counting mode for hardware timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `counter_dir`: Counting direction of timer, count-up or count-down

`esp_err_t timer_set_auto_reload` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_autoreload\_t* reload)

Enable or disable counter reload function when alarm event occurs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `reload`: Counter reload mode.

`esp_err_t timer_set_divider` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, `uint32_t` divider)

Set hardware timer source clock divider. Timer groups clock are divider from APB clock.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `divider`: Timer clock divider value. The divider's range is from 2 to 65536.

`esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)`

Set timer alarm value.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: A 64-bit value to set the alarm value.

`esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)`

Get timer alarm value.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: Pointer of A 64-bit value to accept the alarm value.

`esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)`

Enable or disable generation of timer alarm events.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_en`: To enable or disable timer alarm function.

`esp_err_t timer_isr_callback_add(timer_group_t group_num, timer_idx_t timer_num, timer_isr_t isr_handler, void *arg, int intr_alloc_flags)`

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

**Note** This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call `timer_isr_register(...)` to register ISR.

**Parameters**

- `group_num`: Timer group number
- `timer_num`: Timer index of timer group
- `isr_handler`: Interrupt handler function, it is a callback function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_isr\_callback\_remove** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Remove ISR handle callback for the corresponding timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number
- timer\_num: Timer index of timer group

*esp\_err\_t* **timer\_isr\_register** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, void (\*fn)) void \*, void \*arg, int intr\_alloc\_flags, *timer\_isr\_handle\_t* \*handle Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the intr\_alloc\_flags value ESP\_INTR\_FLAG\_IRAM is set, the handler function must be declared with IRAM\_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

**Note** If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call timer\_spinlock\_take(..) before your handling, and call timer\_spinlock\_give(...) after your handling.

**Parameters**

- group\_num: Timer group number
- timer\_num: Timer index of timer group
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr\_alloc\_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_init** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, const *timer\_config\_t* \*config)

Initializes and configure the timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- config: Pointer to timer initialization parameters.

*esp\_err\_t* **timer\_deinit** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Deinitializes the timer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- group\_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer\_num: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]

*esp\_err\_t* **timer\_get\_config** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_config\_t* \*config)

Get timer configure value.

**Return**

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer of struct to accept timer parameters.

`esp_err_t timer_group_intr_enable` (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Enable timer group interrupt, by enable mask.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt enable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

`esp_err_t timer_group_intr_disable` (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Disable timer group interrupt, by disable mask.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt disable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

`esp_err_t timer_enable_intr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Enable timer interrupt.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

`esp_err_t timer_disable_intr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Disable timer interrupt.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_intr_clr_in_isr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Clear timer interrupt status, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_clr_intr_status_in_isr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Clear timer interrupt status, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

void `timer_group_enable_alarm_in_isr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)  
Enable alarm interrupt, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

uint64\_t `timer_group_get_counter_value_in_isr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Get the current counter value, just used in ISR.

**Return**

- Counter value

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

void `timer_group_set_alarm_value_in_isr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, uint64\_t alarm\_val)

Set the alarm threshold for the timer, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.
- `alarm_val`: Alarm threshold.

void `timer_group_set_counter_enable_in_isr` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_start\_t* counter\_en)

Enable/disable a counter, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.
- `counter_en`: Enable/disable.

*timer\_intr\_t* `timer_group_intr_get_in_isr` (*timer\_group\_t* group\_num)

Get the masked interrupt status, just used in ISR.

**Return**

- Interrupt status

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

uint32\_t `timer_group_get_intr_status_in_isr` (*timer\_group\_t* group\_num)

Get interrupt status, just used in ISR.

**Return**

- Interrupt status

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

void `timer_group_clr_intr_sta_in_isr` (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Clear the masked interrupt status, just used in ISR.

**Return**

- None

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Masked interrupt.

bool `timer_group_get_auto_reload_in_isr` (*timer\_group\_t* *group\_num*, *timer\_idx\_t* *timer\_num*)

Get auto reload enable status, just used in ISR.

**Return**

- True Auto reload enabled
- False Auto reload disabled

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index

*esp\_err\_t* `timer_spinlock_take` (*timer\_group\_t* *group\_num*)

Take timer spinlock to enter critical protect.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

*esp\_err\_t* `timer_spinlock_give` (*timer\_group\_t* *group\_num*)

Give timer spinlock to exit critical protect.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

**Macros****TIMER\_BASE\_CLK**

Frequency of the clock on the input of the timer groups

**Type Definitions**

`typedef` bool (\**timer\_isr\_t*) (void \*)

Interrupt handle callback function. User need to retrun a bool value in callback.

**Return**

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

**Note** If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

`typedef` *intr\_handle\_t* **timer\_isr\_handle\_t**

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

**Header File**

- `soc/include/hal/timer_types.h`

**Structures**

`struct` **timer\_config\_t**

Data structure with timer' s configuration settings.

### Public Members

*timer\_alarm\_t* **alarm\_en**

Timer alarm enable

*timer\_start\_t* **counter\_en**

Counter enable

*timer\_intr\_mode\_t* **intr\_type**

Interrupt mode

*timer\_count\_dir\_t* **counter\_dir**

Counter direction

*timer\_autoreload\_t* **auto\_reload**

Timer auto-reload

uint32\_t **divider**

Counter clock divider. The divider's range is from 2 to 65536.

### Enumerations

**enum timer\_group\_t**

Selects a Timer-Group out of 2 available groups.

*Values:*

**TIMER\_GROUP\_0 = 0**

Hw timer group 0

**TIMER\_GROUP\_1 = 1**

Hw timer group 1

**TIMER\_GROUP\_MAX**

**enum timer\_idx\_t**

Select a hardware timer from timer groups.

*Values:*

**TIMER\_0 = 0**

Select timer0 of GROUPx

**TIMER\_1 = 1**

Select timer1 of GROUPx

**TIMER\_MAX**

**enum timer\_count\_dir\_t**

Decides the direction of counter.

*Values:*

**TIMER\_COUNT\_DOWN = 0**

Descending Count from cnt.hightcnt.low

**TIMER\_COUNT\_UP = 1**

Ascending Count from Zero

**TIMER\_COUNT\_MAX**

**enum timer\_start\_t**

Decides whether timer is on or paused.

*Values:*

**TIMER\_PAUSE = 0**

Pause timer counter

**TIMER\_START = 1**  
Start timer counter

**enum timer\_intr\_t**  
Interrupt types of the timer.

*Values:*

**TIMER\_INTR\_T0 = BIT(0)**  
interrupt of timer 0

**TIMER\_INTR\_T1 = BIT(1)**  
interrupt of timer 1

**TIMER\_INTR\_WDT = BIT(2)**  
interrupt of watchdog

**TIMER\_INTR\_NONE = 0**

**enum timer\_wdt\_behavior\_t**  
Behavior of the watchdog if a stage times out.

*Values:*

**TIMER\_WDT\_OFF = 0**  
The stage is turned off

**TIMER\_WDT\_INT = 1**  
The stage will trigger an interrupt

**TIMER\_WDT\_RESET\_CPU = 2**  
The stage will reset the CPU

**TIMER\_WDT\_RESET\_SYSTEM = 3**  
The stage will reset the whole system

**enum timer\_alarm\_t**  
Decides whether to enable alarm mode.

*Values:*

**TIMER\_ALARM\_DIS = 0**  
Disable timer alarm

**TIMER\_ALARM\_EN = 1**  
Enable timer alarm

**TIMER\_ALARM\_MAX**

**enum timer\_intr\_mode\_t**  
Select interrupt type if running in alarm mode.

*Values:*

**TIMER\_INTR\_LEVEL = 0**  
Interrupt mode: level mode

**TIMER\_INTR\_MAX**

**enum timer\_autoreload\_t**  
Select if Alarm needs to be loaded by software or automatically reload by hardware.

*Values:*

**TIMER\_AUTORELOAD\_DIS = 0**  
Disable auto-reload: hardware will not load counter value after an alarm event

**TIMER\_AUTORELOAD\_EN = 1**  
Enable auto-reload: hardware will load counter value after an alarm event

**TIMER\_AUTORELOAD\_MAX**

### 2.3.19 触摸传感器

[English]

#### 概述

触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成，保护覆盖层位于最上层，绝缘基板上设有电极及走线。用户触摸覆盖层将产生电容变化，根据电容变化判断此次触摸是否为有效触摸行为。

ESP32 可支持最多 10 个电容式触摸板/GPIO，触摸板可以以矩阵或滑条等方式组合使用，从而覆盖更大触感区域及更多触点。触摸传感由有限状态机 (FSM) 硬件控制，由软件或专用硬件计时器发起。

如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32 技术参考手册》(PDF)，您也可以从《ESP32 技术参考手册》中查看这一子系统是如何运行的。

请参考 [触摸传感器应用方案简介](#)，查看触摸传感器设计详情和固件开发指南。如果不想亲自在多种配置环境下测试触摸传感器，请查看 [ESP32 触摸功能开发套件](#)。

#### 功能介绍

下面将 API 分解成几个函数组进行介绍，帮助您快速了解以下功能：

- 初始化触摸板驱动程序
- 配置触摸板 GPIO 管脚
- 触摸状态测量
- 调整测量参数（优化测量）
- 过滤触摸测量
- 触摸监测方式
- 设置中断信号监测触碰动作
- 中断触发

请前往 [API 参考](#) 章节，查看某一函数的具体描述。[应用示例](#) 章节则介绍了此 API 的具体实现。

**初始化触摸板驱动程序** 使用触摸板之前，需要先调用 `touch_pad_init()` 函数初始化触摸板驱动程序。此函数设置了 [API 参考](#) 项下的 *Macros* 中列出的几项 `.._DEFAULT` 驱动程序参数，同时删除之前设置过的触摸板信息（如有），并禁用中断。

如果不再需要该驱动程序，可以调用 `touch_pad_deinit()` 释放已初始化的驱动程序。

**配置触摸板 GPIO 管脚** 调用 `touch_pad_config()` 使能某一 GPIO 的触感功能。

使用 `touch_pad_set_fsm_mode()` 选择触摸板测量（由 FSM 操作）是由硬件计时器自动启动，还是由软件自动启动。如果选择软件模式，请使用 `touch_pad_sw_start()` 启动 FSM。

**触摸状态测量** 借助以下两个函数从传感器读取原始数据或过滤后的数据：

- `touch_pad_read()`
- `touch_pad_read_filtered()`

这两个函数也可以用于检查触碰和释放触摸板时传感器读数变化范围，来评估触摸板设计，然后根据这些信息设定触摸阈值。

---

**注解：** 使用 `touch_pad_read_filtered()` 之前，需要先调用 [过滤触摸测量](#) 中特定的滤波器函数初始化并配置该滤波器。

---

请参考应用示例 [peripherals/touch\\_pad\\_read](#)，查看如何使用这两个读值函数。

**优化测量** 触摸传感器设有数个可配置参数，以适应触摸板设计特点。例如，如果需要感知较细微的电容变化，则可以缩小触摸板充放电的参考电压范围。您可以使用 `touch_pad_set_voltage()` 函数设置电压参考低值和参考高值。

优化测量除了可以识别细微的电容变化之外，还可以降低应用程序功耗，但可能会增加测量噪声干扰。如果得到的动态读数范围结果比较理想，则可以调用 `touch_pad_set_meas_time()` 函数来减少测量时间，从而进一步降低功耗。

可用的测量参数及相应的 ‘set’ 函数总结如下：

- 触摸板充放电参数：
  - 电压门限： `touch_pad_set_voltage()`
  - 速率（斜率） `touch_pad_set_cnt_mode()`
- 测量时间： `touch_pad_set_meas_time()`

电压门限（参考低值/参考高值）、速率（斜率）与测量时间的关系如下图所示：

图 22: 触摸板 - 测量参数之间的关系

上图中的 *Output* 代表触摸传感器读值，即一个测量周期内测得的脉冲计数值。

所有函数均成对出现，用于设定某一特定参数，并获取当前参数值。例如：`touch_pad_set_voltage()` 和 `touch_pad_get_voltage()`。

**过滤触摸测量** 如果测量中存在噪声，可以使用提供的 API 函数对测量进行过滤。使用滤波器之前，请先调用 `touch_pad_filter_start()` 启动该滤波器。

滤波器类型为 IIR（无限脉冲响应滤波器），您可以调用 `touch_pad_set_filter_period()` 配置此类滤波器的采样周期。

如需停止滤波器，请调用 `touch_pad_filter_stop()` 函数。如果不再使用该滤波器，请调用 `touch_pad_filter_delete()` 删除此滤波器。

**触摸监测** 触摸监测基于用户配置的阈值和 FSM 执行的原始测量，并由 ESP32 硬件实现。你可以调用 `touch_pad_get_status()` 查看被触碰的触摸板，或调用 `touch_pad_clear_status()` 清除触摸状态信息。

您也可以将硬件触摸监测连接至中断，详细介绍见下一章节。

如果测量中存在噪声，且电容变化幅度较小，硬件触摸监测结果可能就不太理想。如需解决这一问题，不建议使用硬件监测或中断信号，建议您在自己的应用程序中采用测量过滤，并执行触摸监测。请参考 [peripherals/touch\\_pad\\_interrupt](#)，查看以上两种触摸监测的实现方式。

**中断触发** 在对触摸监测启用中断之前，请先设置一个触摸监测阈值。然后使用[触摸状态测量](#)中所述的函数读取并显示触摸和释放触摸板时测得的结果。如果测量中存在噪声且相对电容变化较小，请使用滤波器。您也可以根据应用程序和环境条件，测试温度和电源电压变化对测量值的影响。

确定监测阈值后就可以在初始化时调用 `touch_pad_config()` 设置此阈值，或在运行时调用 `touch_pad_set_thresh()` 设置此阈值。

下一步就是设置如何触发中断。您可以设置在阈值以下或以上触发中断，具体触发模式由函数 `touch_pad_set_trigger_mode()` 设置。

最后您可以使用以下函数配置和管理中断调用：

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

中断配置完成后，您可以调用 `touch_pad_get_status()` 查看中断信号来自哪个触摸板，也可以调用 `touch_pad_clear_status()` 清除触摸板状态信息。

---

**注解：** 触摸监测中的中断信号基于原始/未经过滤的测量值（对比用户设置的阈值），并在硬件中实现。启用软件滤波 API 并不会影响这一过程，见[过滤触摸测量](#)。

---

**从睡眠模式唤醒** 如果使用触摸板中断将芯片从睡眠模式唤醒，您可以选择配置一些触摸板，例如 SET1 或 SET1 和 SET2，触摸这些触摸板将触发中断并唤醒芯片。请调用 `touch_pad_set_trigger_source()` 实现上述操作。

您可以使用以下函数管理‘SET’中触摸板所需的位模式配置：

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

## 2.3.20 UART

### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adapted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (UART0, UART1, and UART2) that feature an identical set of registers for ease of programming and flexibility. Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

### Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the three UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const int uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

表 3: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins(TX: IO16 (UART2 default), RX: IO17 (UART2 default), RTS: IO18,
↪CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE,
↪18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required ESP32 resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
```

(下页继续)

(续上页)

```
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const int uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const int uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in [ESP32 Technical Reference Manual \(PDF\)](#). You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in [Driver Installation](#). An example of using Event detection can be found in [peripherals/uart\\_events](#).
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example [peripherals/uart/uart\\_events](#). It can be used, e.g., to detect a command string followed by a specific number of identical characters (the 'pattern') added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

### Overview of RS485 specific communication options

**注解:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. To find more information on a specific option bit, open [Register Summary in the ESP32 Technical Reference Manual \(PDF\)](#), use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section [Interface Connection Options](#)). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32's UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the  $\sim$ RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32's RS485 interface connection.

**注解:**

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

#### Circuit A: Collision Detection Circuit

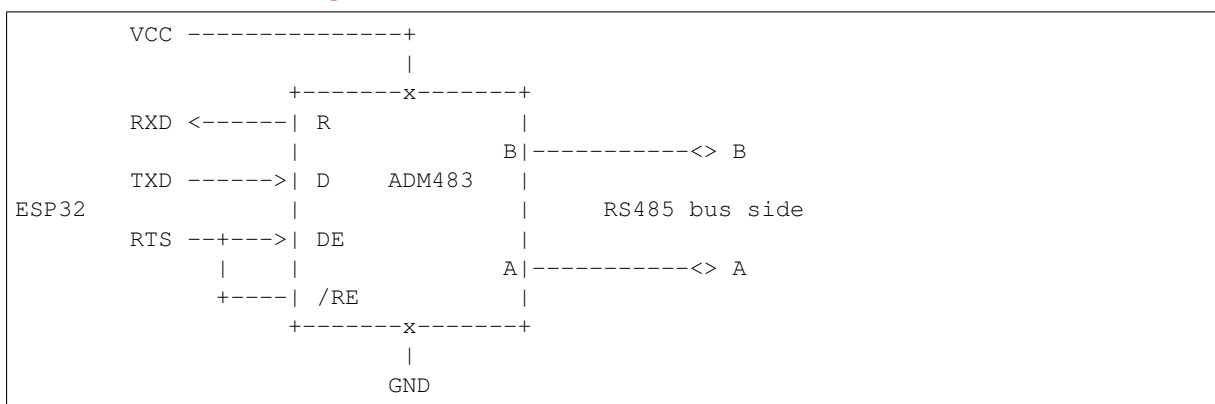

(下页继续)

(续上页)

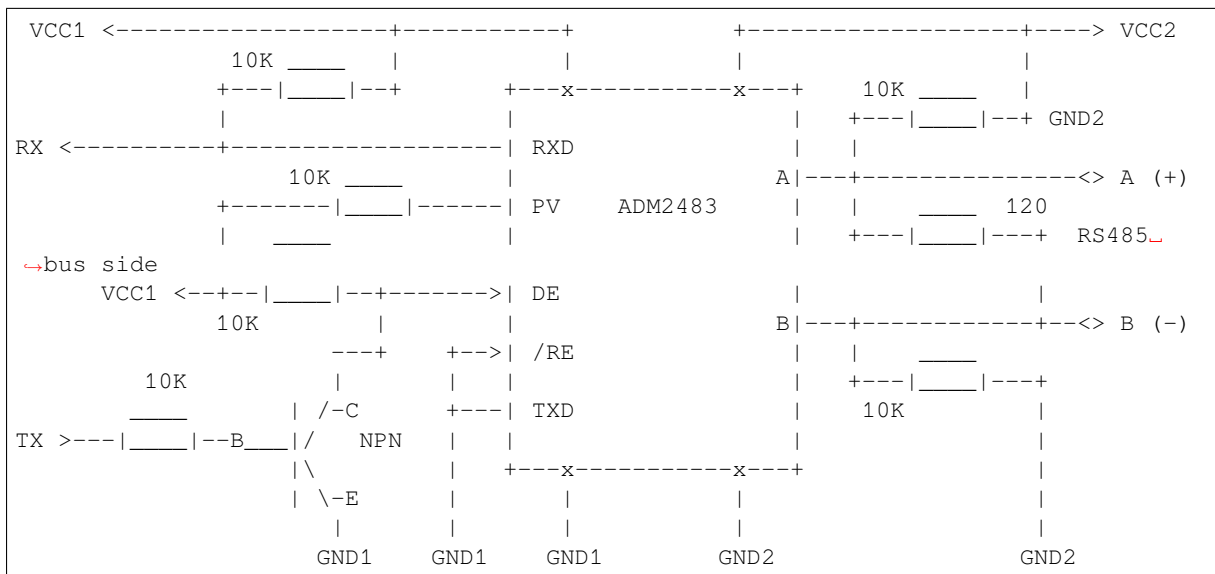

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the ESP32 hardware when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

## Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## API Reference

### Header File

- [driver/include/driver/uart.h](#)

### Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx\_buffer\_size should be greater than UART\_FIFO\_LEN. Tx\_buffer\_size should be either zero or greater than UART\_FIFO\_LEN.

#### Return

- ESP\_OK Success
- ESP\_FAIL Parameter error

#### Parameters

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX - 1).
- `rx_buffer_size`: UART RX ring buffer size.
- `tx_buffer_size`: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size`: UART event queue size/depth.
- `uart_queue`: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

`esp_err_t uart_driver_delete(uart_port_t uart_num)`

Uninstall UART driver.

#### Return

- ESP\_OK Success
- ESP\_FAIL Parameter error

#### Parameters

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX - 1).

`bool uart_is_driver_installed(uart_port_t uart_num)`

Checks whether the driver is installed or not.

**Return**

- true driver is installed
- false driver is not installed

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* `uart_num`, *uart\_word\_length\_t* `data_bit`)

Set UART data bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit`: UART data bits

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* `uart_num`, *uart\_word\_length\_t* `*data_bit`)

Get the UART data bit configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*data_bit`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit`: Pointer to accept value of UART data bits.

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* `uart_num`, *uart\_stop\_bits\_t* `stop_bits`)

Set UART stop bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Fail

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits`: UART stop bits

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* `uart_num`, *uart\_stop\_bits\_t* `*stop_bits`)

Get the UART stop bit configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*stop_bit`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits`: Pointer to accept value of UART stop bits.

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* `uart_num`, *uart\_parity\_t* `parity_mode`)

Set UART parity mode.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `parity_mode`: the enum of uart parity configuration

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* `uart_num`, *uart\_parity\_t* `*parity_mode`)

Get the UART parity mode configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*parity_mode`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

- `parity_mode`: Pointer to accept value of UART parity mode.

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* *uart\_num*, *uint32\_t* *baudrate*)

Set UART baud rate.

#### Return

- `ESP_FAIL` Parameter error
- `ESP_OK` Success

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `baudrate`: UART baud rate.

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* *uart\_num*, *uint32\_t* *\*baudrate*)

Get the UART baud rate configuration.

#### Return

- `ESP_FAIL` Parameter error
- `ESP_OK` Success, result will be put in (*\*baudrate*)

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `baudrate`: Pointer to accept value of UART baud rate

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* *uart\_num*, *uint32\_t* *inverse\_mask*)

Set UART line inverse mode.

#### Return

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `inverse_mask`: Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *uart\_hw\_flowcontrol\_t* *flow\_ctrl*, *uint8\_t* *rx\_thresh*)

Set hardware flow control.

#### Return

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ `UART_FIFO_LEN`). Only when `UART_HW_FLOWCTRL_RTS` is set, will the `rx_thresh` value be set.

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *bool* *enable*, *uint8\_t* *rx\_thresh\_xon*, *uint8\_t* *rx\_thresh\_xoff*)

Set software flow control.

#### Return

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

#### Parameters

- `uart_num`: `UART_NUM_0`, `UART_NUM_1` or `UART_NUM_2`
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *uart\_hw\_flowcontrol\_t* *\*flow\_ctrl*)

Get the UART hardware flow control configuration.

#### Return

- `ESP_FAIL` Parameter error

- ESP\_OK Success, result will be put in (\*flow\_ctrl)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `flow_ctrl`: Option for different flow control mode.

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* `uart_num`, *uint32\_t* `clr_mask`)

Clear UART interrupt status.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `clr_mask`: Bit mask of the interrupt status to be cleared.

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* `uart_num`, *uint32\_t* `enable_mask`)

Set UART interrupt enable.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `enable_mask`: Bit mask of the enable bits.

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* `uart_num`, *uint32\_t* `disable_mask`)

Clear UART interrupt enable bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `disable_mask`: Bit mask of the disable bits.

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* `uart_num`)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* `uart_num`)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* `uart_num`)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* `uart_num`, *int* `enable`, *int* `thresh`)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `enable`: 1: enable; 0: disable
- `thresh`: Threshold of TX interrupt, 0 ~ UART\_FIFO\_LEN

*esp\_err\_t* **uart\_isr\_register** (*uart\_port\_t* `uart_num`, void (\**fn*)) void \*  
*arg*, int *intr\_alloc\_flags*, *uart\_isr\_handle\_t* \**handle*) Register UART interrupt handler (ISR).

**Note** UART ISR handler will be attached to the same CPU core that this function is running on.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `fn`: Interrupt handler function.
- `arg`: parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

*esp\_err\_t* **uart\_isr\_free** (*uart\_port\_t* `uart_num`)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* `uart_num`, int `tx_io_num`, int `rx_io_num`, int `rts_io_num`, int  
`cts_io_num`)

Set UART pin number.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Note** Instead of GPIO number a macro 'UART\_PIN\_NO\_CHANGE' may be provided to keep the currently allocated pin.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `tx_io_num`: UART TX pin GPIO number.
- `rx_io_num`: UART RX pin GPIO number.
- `rts_io_num`: UART RTS pin GPIO number.
- `cts_io_num`: UART CTS pin GPIO number.

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* `uart_num`, int `level`)

Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `level`: 1: RTS output low (active); 0: RTS output high (block)

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* `uart_num`, int `level`)

Manually set the UART DTR pin level.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `level`: 1: DTR output low; 0: DTR output high

`esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)`

Set UART idle interval after tx FIFO is empty.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `idle_num`: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

`esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)`

Set UART configuration parameters.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `uart_config`: UART parameter settings

`esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)`

Configure UART interrupts.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `intr_conf`: UART interrupt settings

`esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)`

Wait until UART TX FIFO is empty.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `ticks_to_wait`: Timeout, count in RTOS ticks

`int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)`

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note** This function should only be used when UART TX buffer is not enabled.

**Return**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `buffer`: data buffer address
- `len`: data length to send

int **uart\_write\_bytes** (*uart\_port\_t* *uart\_num*, const char \**src*, size\_t *size*)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

#### Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *src*: data buffer address
- *size*: data length to send

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* *uart\_num*, const char \**src*, size\_t *size*, int *brk\_len*)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

#### Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *src*: data buffer address
- *size*: data length to send
- *brk\_len*: break signal duration(unit: the time it takes to send one bit at current baudrate)

int **uart\_read\_bytes** (*uart\_port\_t* *uart\_num*, uint8\_t \**buf*, uint32\_t *length*, TickType\_t *ticks\_to\_wait*)

UART read bytes from UART buffer.

#### Return

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *buf*: pointer to the buffer.
- *length*: data length
- *ticks\_to\_wait*: sTimeout, count in RTOS ticks

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* *uart\_num*)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

#### Return

- ESP\_OK Success
- ESP\_FAIL Parameter error

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* *uart\_num*)

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

#### Return

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

`esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)`

UART get RX ring buffer cached data length.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `size`: Pointer of `size_t` to accept cached data length

`esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)`

UART disable pattern detect function. Designed for applications like ‘AT commands’ . When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

`esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)`

UART enable pattern detect function. Designed for applications like ‘AT commands’ . When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as `at_cmd` char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last `at_cmd` char
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first `at_cmd` char.

`int uart_pattern_pop_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

`int uart_pattern_get_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

`esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

#### Return

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `queue_length`: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

`esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)`

UART set communication mode.

**Note** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `uart_num`: Uart number to configure, the max port number is (`UART_NUM_MAX - 1`).
- `mode`: UART UART mode to set

`esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)`

Set uart threshold value for RX fifo full.

**Note** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Driver is not installed

#### Parameters

- `uart_num`: `UART_NUM_0`, `UART_NUM_1` or `UART_NUM_2`
- `threshold`: Threshold value above which RX fifo full interrupt is generated

`esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)`

Set uart threshold values for TX fifo empty.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Driver is not installed

**Parameters**

- `uart_num`: UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- `threshold`: Threshold value below which TX fifo empty interrupt is generated

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* *uart\_num*, **const** *uint8\_t* *tout\_thresh*)

UART set threshold timeout for TOUT feature.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

**Parameters**

- `uart_num`: Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `tout_thresh`: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tout_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* *uart\_num*, *bool* \**collision\_flag*)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by `collision_flag`. \*`collision_flag` = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `uart_num`: Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- `collision_flag`: Pointer to variable of type `bool` to return collision flag.

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* *uart\_num*, *int* *wakeup\_threshold*)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF\_TICK as UART clock source, by setting `use_ref_tick` field in `uart_config_t` to true.

**Note** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

**Parameters**

- `uart_num`: UART number, the max port number is (UART\_NUM\_MAX -1).
- `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* *uart\_num*, *int* \**out\_wakeup\_threshold*)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if out\_wakeup\_threshold is NULL

**Parameters**

- uart\_num: UART number, the max port number is (UART\_NUM\_MAX -1).
- [out] out\_wakeup\_threshold: output, set to the current value of wakeup threshold for the given UART.

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* uart\_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

- **Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- uart\_num: UART number

*esp\_err\_t* **uart\_set\_loop\_back** (*uart\_port\_t* uart\_num, bool loop\_back\_en)

Configure TX signal loop back to RX module, just for the test usage.

- **Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- uart\_num: UART number
- loop\_back\_en: Set ture to enable the loop back function, else set it false.

**Structures**

**struct** **uart\_intr\_config\_t**

UART interrupt configuration parameters for uart\_intr\_config function.

**Public Members**

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from UART\_XXXX\_INT\_ENA\_M under UART\_INT\_ENA\_REG(i), connect with bit-or operator

uint8\_t **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8\_t **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

uint8\_t **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

**struct** **uart\_event\_t**

Event structure used in UART event queue.

**Public Members**

*uart\_event\_type\_t* **type**

UART event type

size\_t **size**

UART data size for UART\_DATA event

### Macros

**UART\_NUM\_0**

UART port 0

**UART\_NUM\_1**

UART port 1

**UART\_NUM\_MAX**

UART port max

**UART\_PIN\_NO\_CHANGE**

Constant for `uart_set_pin` function which indicates that UART pin should not be changed

### Type Definitions

**typedef** *intr\_handle\_t* **uart\_isr\_handle\_t**

### Enumerations

**enum** **uart\_event\_type\_t**

UART event types used in the ring buffer.

*Values:*

**UART\_DATA**

UART data event

**UART\_BREAK**

UART break event

**UART\_BUFFER\_FULL**

UART RX buffer full event

**UART\_FIFO\_OVF**

UART FIFO overflow event

**UART\_FRAME\_ERR**

UART RX frame error event

**UART\_PARITY\_ERR**

UART RX parity event

**UART\_DATA\_BREAK**

UART TX data and break event

**UART\_PATTERN\_DET**

UART pattern detected

**UART\_EVENT\_MAX**

UART event max index

### Header File

- [soc/include/hal/uart\\_types.h](#)

### Structures

**struct** **uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

### Public Members

**uint8\_t** **cmd\_char**

UART AT cmd char

`uint8_t char_num`  
AT cmd char repeat number

`uint32_t gap_tout`  
gap time(in baud-rate) between AT cmd char

`uint32_t pre_idle`  
the idle time(in baud-rate) between the non AT char and first AT char

`uint32_t post_idle`  
the idle time(in baud-rate) between the last AT char and the none AT char

**struct** `uart_sw_flowctrl_t`  
UART software flow control configuration parameters.

### Public Members

`uint8_t xon_char`  
Xon flow control char

`uint8_t xoff_char`  
Xoff flow control char

`uint8_t xon_thrd`  
If the software flow control is enabled and the data amount in rxfifo is less than `xon_thrd`, an `xon_char` will be sent

`uint8_t xoff_thrd`  
If the software flow control is enabled and the data amount in rxfifo is more than `xoff_thrd`, an `xoff_char` will be sent

**struct** `uart_config_t`  
UART configuration parameters for `uart_param_config` function.

### Public Members

`int baud_rate`  
UART baud rate

`uart_word_length_t data_bits`  
UART byte size

`uart_parity_t parity`  
UART parity mode

`uart_stop_bits_t stop_bits`  
UART stop bits

`uart_hw_flowcontrol_t flow_ctrl`  
UART HW flow control mode (cts/rts)

`uint8_t rx_flow_ctrl_thresh`  
UART HW RTS threshold

`uart_sclk_t source_clk`  
UART source clock selection

### Type Definitions

**typedef** `int uart_port_t`  
UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX - 1)`.

**Enumerations****enum uart\_mode\_t**

UART mode selection.

*Values:***UART\_MODE\_UART** = 0x00

mode: regular UART mode

**UART\_MODE\_RS485\_HALF\_DUPLEX** = 0x01

mode: half duplex RS485 UART mode control by RTS pin

**UART\_MODE\_IRDA** = 0x02

mode: IRDA UART mode

**UART\_MODE\_RS485\_COLLISION\_DETECT** = 0x03

mode: RS485 collision detection UART mode (used for test purposes)

**UART\_MODE\_RS485\_APP\_CTRL** = 0x04

mode: application control RS485 UART mode (used for test purposes)

**enum uart\_word\_length\_t**

UART word length constants.

*Values:***UART\_DATA\_5\_BITS** = 0x0

word length: 5bits

**UART\_DATA\_6\_BITS** = 0x1

word length: 6bits

**UART\_DATA\_7\_BITS** = 0x2

word length: 7bits

**UART\_DATA\_8\_BITS** = 0x3

word length: 8bits

**UART\_DATA\_BITS\_MAX** = 0x4**enum uart\_stop\_bits\_t**

UART stop bits number.

*Values:***UART\_STOP\_BITS\_1** = 0x1

stop bit: 1bit

**UART\_STOP\_BITS\_1\_5** = 0x2

stop bit: 1.5bits

**UART\_STOP\_BITS\_2** = 0x3

stop bit: 2bits

**UART\_STOP\_BITS\_MAX** = 0x4**enum uart\_parity\_t**

UART parity constants.

*Values:***UART\_PARITY\_DISABLE** = 0x0

Disable UART parity

**UART\_PARITY\_EVEN** = 0x2

Enable UART even parity

**UART\_PARITY\_ODD** = 0x3

Enable UART odd parity

**enum uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:***UART\_HW\_FLOWCTRL\_DISABLE** = 0x0  
disable hardware flow control**UART\_HW\_FLOWCTRL\_RTS** = 0x1  
enable RX hardware flow control (rts)**UART\_HW\_FLOWCTRL\_CTS** = 0x2  
enable TX hardware flow control (cts)**UART\_HW\_FLOWCTRL\_CTS\_RTS** = 0x3  
enable hardware flow control**UART\_HW\_FLOWCTRL\_MAX** = 0x4**enum uart\_signal\_inv\_t**

UART signal bit map.

*Values:***UART\_SIGNAL\_IRDA\_TX\_INV** = (0x1 << 0)  
inverse the UART irda\_tx signal**UART\_SIGNAL\_IRDA\_RX\_INV** = (0x1 << 1)  
inverse the UART irda\_rx signal**UART\_SIGNAL\_RXD\_INV** = (0x1 << 2)  
inverse the UART rxd signal**UART\_SIGNAL\_CTS\_INV** = (0x1 << 3)  
inverse the UART cts signal**UART\_SIGNAL\_DSR\_INV** = (0x1 << 4)  
inverse the UART dsr signal**UART\_SIGNAL\_TXD\_INV** = (0x1 << 5)  
inverse the UART txd signal**UART\_SIGNAL\_RTS\_INV** = (0x1 << 6)  
inverse the UART rts signal**UART\_SIGNAL\_DTR\_INV** = (0x1 << 7)  
inverse the UART dtr signal**enum uart\_sclk\_t**

UART source clock.

*Values:***UART\_SCLK\_APB** = 0x0  
UART source clock from APB**UART\_SCLK\_REF\_TICK** = 0x01  
UART source clock from REF\_TICK

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

---

**注解:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is UART\_NUM\_0)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is UART\_NUM\_0). Similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### Header File

- `soc/esp32/include/soc/uart_channel.h`

### Macros

```

UART_GPIO1_DIRECT_CHANNEL
UART_NUM_0_TXD_DIRECT_GPIO_NUM
UART_GPIO3_DIRECT_CHANNEL
UART_NUM_0_RXD_DIRECT_GPIO_NUM
UART_GPIO19_DIRECT_CHANNEL
UART_NUM_0_CTS_DIRECT_GPIO_NUM
UART_GPIO22_DIRECT_CHANNEL
UART_NUM_0_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO1_DIRECT_CHANNEL
UART_RXD_GPIO3_DIRECT_CHANNEL
UART_CTS_GPIO19_DIRECT_CHANNEL
UART_RTS_GPIO22_DIRECT_CHANNEL
UART_GPIO10_DIRECT_CHANNEL
UART_NUM_1_TXD_DIRECT_GPIO_NUM
UART_GPIO9_DIRECT_CHANNEL
UART_NUM_1_RXD_DIRECT_GPIO_NUM
UART_GPIO6_DIRECT_CHANNEL
UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM

```

UART\_GPIO16\_DIRECT\_CHANNEL  
UART\_NUM\_2\_RXD\_DIRECT\_GPIO\_NUM  
UART\_GPIO8\_DIRECT\_CHANNEL  
UART\_NUM\_2\_CTS\_DIRECT\_GPIO\_NUM  
UART\_GPIO7\_DIRECT\_CHANNEL  
UART\_NUM\_2\_RTS\_DIRECT\_GPIO\_NUM  
UART\_TXD\_GPIO17\_DIRECT\_CHANNEL  
UART\_RXD\_GPIO16\_DIRECT\_CHANNEL  
UART\_CTS\_GPIO8\_DIRECT\_CHANNEL  
UART\_RTS\_GPIO7\_DIRECT\_CHANNEL

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 [peripherals](#) 目录下。

## 2.4 应用层协议

[English]

### 2.4.1 mDNS 服务

[English]

#### 概述

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

绝大多数的操作系统默认都会安装 mDNS 服务，或者提供单独的安装包。Mac OS 默认会安装名为 Bonjour 的服务（该服务基于 mDNS），此外 Apple 还发布了适用于 Windows 系统的安装程序，可以在 [官方支持](#) 找到。在 Linux 上，mDNS 服务由 [avahi](#) 提供，通常也会被默认安装。

#### mDNS 属性

- `hostname`: 设备会去响应的主机名，如果没有设置，会根据设备的网络接口名定义 `hostname`。例如，`my-esp32` 会被解析为 `my-esp32.local`。
- `default_instance`: 默认实例名（即易记的设备名），例如 `Jhon's ESP32 Thing`。如果没有设置，将会使用 `hostname`。

以下为 STA 接口启动 mDNS 服务并设置 `hostname` 和 `default_instance` 的示例方法：

```
void start_mdns_service()
{
    // 初始化 mDNS 服务
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    // 设置 hostname
    mdns_hostname_set("my-esp32");
    // 设置默认实例
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

**mDNS 服务** mDNS 可以广播设备能够提供的网络服务的相关信息，每个服务会由以下属性构成。

- `instance_name`: 实例名 (即易记的服务名), 例如 Jhon's ESP32 Web Server。如果没有定义, 会使用 `default_instance`。
- `service_type`: (必需) 服务类型, 以下划线为前缀, [这里](#) 列出了常见的类型。
- `proto`: (必需) 服务运行所依赖的协议, 以下划线为前缀, 例如 `_tcp` 或者 `_udp`。
- `port`: (必需) 服务运行所用的端口号。
- `txt`: 形如 `{var, val}` 的字符串数组, 用于定义服务的属性。

添加一些服务和不同属性的示例方法:

```
void add_mdns_services()
{
    // 添加服务
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    // 注意: 必须先添加服务, 然后才能设置其属性
    // web 服务器使用自定义的实例名
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32"},
        {"u", "user"},
        {"p", "password"}
    };
    // 设置服务的文本数据 (会释放并替换当前数据)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    // 修改服务端口号
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

**mDNS 查询** mDNS 提供查询服务和解析主机 IP/IPv6 地址的方法。

服务查询的结果会作为 `mdns_result_t` 类型对象的链表返回。

解析主机 IP 地址的示例方法:

```
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

解析本地服务的示例方法:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
↪protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}

```

使用上述方法的示例:

```

void my_app_some_method(){
    // 搜索 esp32-mdns.local
    resolve_mdns_host("esp32-mdns");
}

```

(下页继续)

```
// 搜索 HTTP 服务器
find_mdns_service("_http", "_tcp");
// 或者搜索文件服务器
find_mdns_service("_smb", "_tcp"); // Windows 系统的共享服务
find_mdns_service("_afpovertcp", "_tcp"); // Apple AFP 文件共享服务
find_mdns_service("_nfs", "_tcp"); // NFS 服务器
find_mdns_service("_ftp", "_tcp"); // FTP 服务器
// 或者网络打印机
find_mdns_service("_printer", "_tcp");
find_mdns_service("_ipp", "_tcp");
}
```

## 应用示例

有关 mDNS 服务器和查询器的应用示例请参考 [protocols/mdns](#)。

## API 参考

### Header File

- [mdns/include/mdns.h](#)

### Functions

*esp\_err\_t* **mdns\_init** (void)

Initialize mDNS on given interface.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE when failed to register event handler
- ESP\_ERR\_NO\_MEM on memory error
- ESP\_FAIL when failed to start mdns task

void **mdns\_free** (void)

Stop and free mDNS server.

*esp\_err\_t* **mdns\_hostname\_set** (const char \*hostname)

Set the hostname for mDNS server required if you want to advertise services.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error

#### Parameters

- hostname: Hostname to set

*esp\_err\_t* **mdns\_instance\_name\_set** (const char \*instance\_name)

Set the default instance name for mDNS server.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error

#### Parameters

- instance\_name: Instance name to set

*esp\_err\_t* **mdns\_service\_add** (const char \*instance\_name, const char \*service\_type, const char \*proto, uint16\_t port, *mdns\_txt\_item\_t* txt[], size\_t num\_items)

Add service to mDNS server.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error
- ESP\_FAIL failed to add service

**Parameters**

- *instance\_name*: instance name to set. If NULL, global instance name or hostname will be used
- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *port*: service port
- *txt*: string array of TXT data (eg. `{{ "var" , " val" },{ "other" , " 2" }}`)
- *num\_items*: number of items in TXT data

`esp_err_t mdns_service_remove (const char *service_type, const char *proto)`

Remove service from mDNS server.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)

`esp_err_t mdns_service_instance_name_set (const char *service_type, const char *proto, const char *instance_name)`

Set instance name for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *instance\_name*: instance name to set

`esp_err_t mdns_service_port_set (const char *service_type, const char *proto, uint16_t port)`

Set service port.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *port*: service port

`esp_err_t mdns_service_txt_set (const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)`

Replace all TXT items for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)

- `txt`: array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- `num_items`: number of items in TXT data

*esp\_err\_t* **mdns\_service\_txt\_item\_set** (**const** char \**service\_type*, **const** char \**proto*, **const** char \**key*, **const** char \**value*)

Set/Add TXT item for service TXT record.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

#### Parameters

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *key*: the key that you want to add/update
- *value*: the new value of the key

*esp\_err\_t* **mdns\_service\_txt\_item\_remove** (**const** char \**service\_type*, **const** char \**proto*, **const** char \**key*)

Remove TXT item for service TXT record.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

#### Parameters

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *key*: the key that you want to remove

*esp\_err\_t* **mdns\_service\_remove\_all** (void)

Remove and free all services from mDNS server.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mdns\_query** (**const** char \**name*, **const** char \**service\_type*, **const** char \**proto*, `uint16_t` *type*, `uint32_t` *timeout*, `size_t` *max\_results*, `mdns_result_t` \*\**results*)

Query mDNS for host or service All following query methods are derived from this one.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG timeout was not given

#### Parameters

- *name*: service instance or host name (NULL for PTR queries)
- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.) (NULL for host queries)
- *proto*: service protocol (`_tcp`, `_udp`, etc.) (NULL for host queries)
- *type*: type of query (`MDNS_TYPE_*`)
- *timeout*: time in milliseconds to wait for answers.
- *max\_results*: maximum results to be collected
- *results*: pointer to the results of the query results must be freed using `mdns_query_results_free` below

void **mdns\_query\_results\_free** (`mdns_result_t` \**results*)

Free query results.

#### Parameters

- *results*: linked list of results to be freed

`esp_err_t mdns_query_ptr` (`const` char \**service\_type*, `const` char \**proto*, uint32\_t *timeout*, size\_t *max\_results*, `mdns_result_t` \*\**results*)

Query mDNS for service.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

#### Parameters

- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *max\_results*: maximum results to be collected
- *results*: pointer to the results of the query

`esp_err_t mdns_query_srv` (`const` char \**instance\_name*, `const` char \**service\_type*, `const` char \**proto*, uint32\_t *timeout*, `mdns_result_t` \*\**result*)

Query mDNS for SRV record.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

#### Parameters

- *instance\_name*: service instance name
- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *result*: pointer to the result of the query

`esp_err_t mdns_query_txt` (`const` char \**instance\_name*, `const` char \**service\_type*, `const` char \**proto*, uint32\_t *timeout*, `mdns_result_t` \*\**result*)

Query mDNS for TXT record.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

#### Parameters

- *instance\_name*: service instance name
- *service\_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *result*: pointer to the result of the query

`esp_err_t mdns_query_a` (`const` char \**host\_name*, uint32\_t *timeout*, `esp_ip4_addr_t` \**addr*)

Query mDNS for A record.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

#### Parameters

- *host\_name*: host name to look for
- *timeout*: time in milliseconds to wait for answer.
- *addr*: pointer to the resulting IP4 address

`esp_err_t mdns_query_aaaa` (`const` char \**host\_name*, uint32\_t *timeout*, `esp_ip6_addr_t` \**addr*)

Query mDNS for A record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer. If 0, `max_results` needs to be defined
- `addr`: pointer to the resulting IP6 address

*esp\_err\_t* `mdns_handle_system_event` (void \**ctx*, *system\_event\_t* \**event*)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

**Parameters**

- `ctx`: The system event context
- `event`: The system event

**Structures**

**struct** `mdns_txt_item_t`

mDNS basic text item structure Used in `mdns_service_add()`

**Public Members**

**const** char \*`key`  
item key name

**const** char \*`value`  
item value string

**struct** `mdns_ip_addr_s`

mDNS query linked list IP item

**Public Members**

`esp_ip_addr_t` `addr`  
IP address

**struct** *mdns\_ip\_addr\_s* \*`next`  
next IP, or NULL for the last IP in the list

**struct** `mdns_result_s`

mDNS query result structure

**Public Members**

**struct** *mdns\_result\_s* \*`next`  
next result, or NULL for the last result in the list

*mdns\_if\_t* `tcpip_if`  
interface index

*mdns\_ip\_protocol\_t* `ip_protocol`  
ip\_protocol type of the interface (v4/v6)

char \*`instance_name`  
instance name

char \*`hostname`  
hostname

`uint16_t port`  
service port

`mdns_txt_item_t *txt`  
txt record

`size_t txt_count`  
number of txt items

`mdns_ip_addr_t *addr`  
linked list of IP addresses found

### Macros

`MDNS_TYPE_A`  
`MDNS_TYPE_PTR`  
`MDNS_TYPE_TXT`  
`MDNS_TYPE_AAAA`  
`MDNS_TYPE_SRV`  
`MDNS_TYPE_OPT`  
`MDNS_TYPE_NSEC`  
`MDNS_TYPE_ANY`

### Type Definitions

`typedef struct mdns_ip_addr_s mdns_ip_addr_t`  
mDNS query linked list IP item

`typedef enum mdns_if_internal mdns_if_t`

`typedef struct mdns_result_s mdns_result_t`  
mDNS query result structure

### Enumerations

`enum mdns_ip_protocol_t`  
mDNS enum to specify the ip\_protocol type

*Values:*

`MDNS_IP_PROTOCOL_V4`  
`MDNS_IP_PROTOCOL_V6`  
`MDNS_IP_PROTOCOL_MAX`

`enum mdns_if_internal`

*Values:*

`MDNS_IF_STA = 0`  
`MDNS_IF_AP = 1`  
`MDNS_IF_ETH = 2`  
`MDNS_IF_MAX`

## 2.4.2 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection

among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use `mbedtls` or `wolfssl` as their underlying SSL/TLS library. By default only `mbedtls` is available and is used, `wolfssl` SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides `wolfssl` component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository `README.md` for information on licensing and other options. Please see below option for using `wolfssl` in your project.

---

**注解:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use `wolfssl` in your project

- 1) Directly add `wolfssl` as a component in your project with following three commands.:

```

(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git

```

- 2) Add `wolfssl` as an extra component in your project.

- Download `wolfssl` with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA\_COMPONENT\_DIRS in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

注解: These values are subject to change with change in configuration options and version of respective libraries.

## API Reference

### Header File

- [esp-tls/esp\\_tls.h](#)

### Functions

`esp_tls_t *esp_tls_init` (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Return** tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

`esp_tls_t *esp_tls_conn_new` (const char \*hostname, int hostlen, int port, const esp\_tls\_cfg\_t \*cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_new_sync` (and its asynchronous version `esp_tls_conn_new_async`)

**Return** pointer to esp\_tls\_t, or NULL if connection couldn't be opened.

#### Parameters

- [in] hostname: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp\_tls\_cfg\_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp\_tls\_cfg\_t. At a minimum, this structure should be zero-initialized.

`int esp_tls_conn_new_sync` (const char \*hostname, int hostlen, int port, const esp\_tls\_cfg\_t \*cfg, esp\_tls\_t \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

**Return**

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

**Parameters**

- [in] *hostname*: Hostname of the host.
- [in] *hostlen*: Length of hostname.
- [in] *port*: Port number of the host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- [in] *tls*: Pointer to esp-tls as esp-tls handle.

*esp\_tls\_t* \***esp\_tls\_conn\_http\_new**(const char \**url*, const *esp\_tls\_cfg\_t* \**cfg*)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as *esp\_tls\_conn\_new*() API. However this API accepts host’s url.

**Return** pointer to *esp\_tls\_t*, or NULL if connection couldn’t be opened.

**Parameters**

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp\_tls\_cfg\_t*’. At a minimum, this structure should be zero-initialized.

int **esp\_tls\_conn\_new\_async**(const char \**hostname*, int *hostlen*, int *port*, const *esp\_tls\_cfg\_t* \**cfg*,  
*esp\_tls\_t* \**tls*)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Return**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**

- [in] *hostname*: Hostname of the host.
- [in] *hostlen*: Length of hostname.
- [in] *port*: Port number of the host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*. *non\_block* member of this structure should be set to be true.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

int **esp\_tls\_conn\_http\_new\_async**(const char \**url*, const *esp\_tls\_cfg\_t* \**cfg*, *esp\_tls\_t* \**tls*)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as *esp\_tls\_conn\_new*() API. However this API accepts host’s url.

**Return**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

static ssize\_t **esp\_tls\_conn\_write**(*esp\_tls\_t* \**tls*, const void \**data*, size\_t *datalen*)

Write from buffer ‘data’ into specified tls connection.

**Return**

- >0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.

- 0 if write operation was not successful. The underlying connection was closed.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer from which data will be written.
- [in] `datalen`: Length of data buffer.

**static** `ssize_t esp_tls_conn_read` (*esp\_tls\_t* \*`tls`, void \*`data`, `size_t datalen`)

Read from specified tls connection into the buffer 'data' .

**Return**

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer to hold read data.
- [in] `datalen`: Length of data buffer.

void `esp_tls_conn_delete` (*esp\_tls\_t* \*`tls`)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new()` or `esp_tls_conn_http_new()` APIs.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.

`ssize_t esp_tls_get_bytes_avail` (*esp\_tls\_t* \*`tls`)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

**Return**

- -1 in case of invalid arg
- bytes available in the application data record read buffer

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.

*esp\_err\_t* `esp_tls_init_global_ca_store` (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

**Return**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* `esp_tls_set_global_ca_store` (const unsigned char \*`cacert_pem_buf`, const unsigned int `cacert_pem_bytes`)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

**Return**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] `cacert_pem_buf`: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- [in] `cacert_pem_bytes`: Length of the buffer.

void **esp\_tls\_free\_global\_ca\_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error** (*esp\_tls\_error\_handle\_t* h, int \**esp\_tls\_code*, int \**esp\_tls\_flags*)

Returns last error in *esp\_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Return**

- `ESP_ERR_INVALID_STATE` if invalid parameters
- `ESP_OK` (0) if no error occurred
- specific error code (based on `ESP_ERR_ESP_TLS_BASE`) otherwise

**Parameters**

- [in] `h`: esp-tls error handle.
- [out] `esp_tls_code`: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`
- [out] `esp_tls_flags`: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

**Structures**

**struct esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

**Public Members**

*esp\_err\_t* **last\_error**

error code (based on `ESP_ERR_ESP_TLS_BASE`) of the last occurred error

int **esp\_tls\_error\_code**

*esp\_tls* error code from last *esp\_tls* failed api

int **esp\_tls\_flags**

last certification verification flags

**struct psk\_key\_hint**

ESP-TLS preshared key and hint structure.

**Public Members**

const uint8\_t \***key**

key in PSK authentication mode in binary format

const size\_t **key\_size**

length of the key

const char \***hint**

hint in PSK authentication mode in string format

**struct esp\_tls\_cfg**

ESP-TLS configuration parameters.

**Note** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.

## Public Members

### **const** char \*\***alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2" , NULL };

- where 'h2' is the protocol name

### **const** unsigned char \***cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

### **const** unsigned char \***cacert\_pem\_buf**

CA certificate buffer legacy name

### unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

### unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

### **const** unsigned char \***clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

### **const** unsigned char \***clientcert\_pem\_buf**

Client certificate legacy name

### unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

### unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

### **const** unsigned char \***clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

### **const** unsigned char \***clientkey\_pem\_buf**

Client key legacy name

### unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

### unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

### **const** unsigned char \***clientkey\_password**

Client key decryption password string

### unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

int **timeout\_ms**

Network timeout in milliseconds

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

const *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

**struct esp\_tls**

ESP-TLS Connection Handle.

### Public Members

int **sockfd**

Underlying socket file descriptor.

ssize\_t (\***read**) (**struct esp\_tls** \*tls, char \*data, size\_t datalen)

Callback function for reading data from TLS/SSL connection.

ssize\_t (\***write**) (**struct esp\_tls** \*tls, const char \*data, size\_t datalen)

Callback function for writing data to TLS/SSL connection.

*esp\_tls\_conn\_state\_t* **conn\_state**

ESP-TLS Connection state

fd\_set **rset**

read file descriptors

fd\_set **wset**

write file descriptors

bool **is\_tls**

indicates connection type (TLS or NON-TLS)

*esp\_tls\_role\_t* **role**

esp-tls role

- ESP\_TLS\_CLIENT
- ESP\_TLS\_SERVER

*esp\_tls\_error\_handle\_t* **error\_handle**

handle to error descriptor

### Macros

**ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

**ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

**ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

**ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

**ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

**ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set socket option

**ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

**ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

**Type Definitions****typedef struct esp\_tls\_last\_error \*esp\_tls\_error\_handle\_t****typedef struct esp\_tls\_last\_error esp\_tls\_last\_error\_t**

Error structure containing relevant errors in case tls error occurred.

**typedef enum esp\_tls\_conn\_state esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

**typedef enum esp\_tls\_role esp\_tls\_role\_t****typedef struct psk\_key\_hint psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

**typedef struct esp\_tls\_cfg esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

**Note** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.

```
typedef struct esp_tls esp_tls_t
    ESP-TLS Connection Handle.
```

### Enumerations

```
enum esp_tls_conn_state
    ESP-TLS Connection State.
```

Values:

```
ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
```

```
ESP_TLS_DONE
```

```
enum esp_tls_role
```

Values:

```
ESP_TLS_CLIENT = 0
ESP_TLS_SERVER
```

## 2.4.3 ESP HTTP Client

### Overview

esp\_http\_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- `esp_http_client_init()`: To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the `esp_http_client_config_t` configurations. Which configuration values we do not define, the library will use default.
- `esp_http_client_perform()`: The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event\_handle (defined by `esp_http_client_config_t`). This function performs its job and blocks the current task until it's done
- `esp_http_client_cleanup()`: After completing our `esp_http_client`'s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

### Application Example

```
esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
```

(下页继续)

```

    case HTTP_EVENT_ON_CONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
        break;
    case HTTP_EVENT_HEADER_SENT:
        ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
        break;
    case HTTP_EVENT_ON_HEADER:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
        printf("%.s", evt->data_len, (char*)evt->data);
        break;
    case HTTP_EVENT_ON_DATA:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
        if (!esp_http_client_is_chunked_response(evt->client)) {
            printf("%.s", evt->data_len, (char*)evt->data);
        }

        break;
    case HTTP_EVENT_ON_FINISH:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
}
return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

## Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with same ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

## Persistent Connections example

```

esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

```

(下页继续)

```
// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);
```

## HTTPS

The HTTP client supports SSL connections using **mbedtls**, with the **url** configuration starting with **https** scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via `CONFIG_ENABLE_HTTPS` (enabled by default).

**注解:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`

## HTTPS example

```
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

## HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-`

length from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.

- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

**Perform HTTP request as Stream reader** Check the example function `http_perform_as_stream_reader` at [protocols/esp\\_http\\_client](#).

## HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of `config` entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

### Config authentication example with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

### Config authentication example with username, password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp\\_http\\_client](#).

## API Reference

### Header File

- [esp\\_http\\_client/include/esp\\_http\\_client.h](#)

### Functions

`esp_http_client_handle_t esp_http_client_init (const esp_http_client_config_t *config)`

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

#### Return

- `esp_http_client_handle_t`
- NULL if any errors

#### Parameters

- [in] `config`: The configurations, see `http_client_config_t`

`esp_err_t esp_http_client_perform (esp_http_client_handle_t client)`

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as

the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if `EAGAIN/EWOULDBLOCK` or `EINPROGRESS` is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

**Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

#### Return

- `ESP_OK` on successful
- `ESP_FAIL` on error

#### Parameters

- `client`: The `esp_http_client` handle

*esp\_err\_t* `esp_http_client_set_url` (*esp\_http\_client\_handle\_t* *client*, **const** char \**url*)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

#### Return

- `ESP_OK`
- `ESP_FAIL`

#### Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `url`: The url

*esp\_err\_t* `esp_http_client_set_post_field` (*esp\_http\_client\_handle\_t* *client*, **const** char \**data*,  
int *len*)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

#### Return

- `ESP_OK`
- `ESP_FAIL`

#### Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `data`: post data pointer
- [in] `len`: post length

int `esp_http_client_get_post_field` (*esp\_http\_client\_handle\_t* *client*, char \*\**data*)

Get current post field information.

**Return** Size of post data

#### Parameters

- [in] `client`: The client
- [out] `data`: Point to post data pointer

*esp\_err\_t* `esp_http_client_set_header` (*esp\_http\_client\_handle\_t* *client*, **const** char \**key*, **const** char \**value*)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

#### Return

- `ESP_OK`
- `ESP_FAIL`

#### Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `key`: The header key
- [in] `value`: The header value

*esp\_err\_t* **esp\_http\_client\_get\_header** (*esp\_http\_client\_handle\_t* `client`, **const** `char *key`, `char **value`)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `key`: The header key
- [out] `value`: The header value

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* `client`, `char **value`)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [out] `value`: The username value

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* `client`, **const** `char *username`)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `username`: The username value

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* `client`, `char **value`)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [out] `value`: The password value

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* `client`, `char *password`)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [in] `password`: The password value

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* *client*, *esp\_http\_client\_auth\_type\_t* *auth\_type*)

Set http request auth\_type.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] *client*: The *esp\_http\_client* handle
- [in] *auth\_type*: The *esp\_http\_client* auth type

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* *client*, *esp\_http\_client\_method\_t* *method*)

Set http request method.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] *client*: The *esp\_http\_client* handle
- [in] *method*: The method

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* *client*, **const** char \**key*)

Delete http request header.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The *esp\_http\_client* handle
- [in] *key*: The key

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* *client*, int *write\_len*)

This function will be open the connection, write all header strings and return.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The *esp\_http\_client* handle
- [in] *write\_len*: HTTP Content length need to write to the server

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* *client*, **const** char \**buffer*, int *len*)

This function will write data to the HTTP connection previously opened by *esp\_http\_client\_open*()

**Return**

- (-1) if any errors
- Length of data written

**Parameters**

- [in] *client*: The *esp\_http\_client* handle
- *buffer*: The buffer
- [in] *len*: This value must not be larger than the *write\_len* parameter provided to *esp\_http\_client\_open*()

int **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* *client*)

This function need to call after *esp\_http\_client\_open*, it will read from http stream, process all receive headers.

**Return**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by *esp\_http\_client\_is\_chunked* response)
- (-1: ESP\_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**

- [in] *client*: The *esp\_http\_client* handle

bool **esp\_http\_client\_is\_chunked\_response** (*esp\_http\_client\_handle\_t client*)

Check response data is chunked.

**Return** true or false

**Parameters**

- [in] *client*: The `esp_http_client` handle

int **esp\_http\_client\_read** (*esp\_http\_client\_handle\_t client*, char \**buffer*, int *len*)

Read data from http stream.

**Return**

- (-1) if any errors
- Length of data was read

**Parameters**

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: The length

int **esp\_http\_client\_get\_status\_code** (*esp\_http\_client\_handle\_t client*)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**Return** Status code

**Parameters**

- [in] *client*: The `esp_http_client` handle

int **esp\_http\_client\_get\_content\_length** (*esp\_http\_client\_handle\_t client*)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Return**

- (-1) Chunked transfer
- Content-Length value as bytes

**Parameters**

- [in] *client*: The `esp_http_client` handle

*esp\_err\_t* **esp\_http\_client\_close** (*esp\_http\_client\_handle\_t client*)

Close http connection, still kept all http request resources.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The `esp_http_client` handle

*esp\_err\_t* **esp\_http\_client\_cleanup** (*esp\_http\_client\_handle\_t client*)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The `esp_http_client` handle

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t client*)

Get transport type.

**Return**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

**Parameters**

- [in] `client`: The `esp_http_client` handle

`esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)`

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

#### Return

- `ESP_OK`
- `ESP_FAIL`

#### Parameters

- [in] `client`: The `esp_http_client` handle

void `esp_http_client_add_auth(esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

#### Parameters

- [in] `client`: The `esp_http_client` handle

bool `esp_http_client_is_complete_data_received(esp_http_client_handle_t client)`

Checks if entire data in the response has been read without any error.

#### Return

- `true`
- `false`

#### Parameters

- [in] `client`: The `esp_http_client` handle

## Structures

**struct** `esp_http_client_event`

HTTP Client events data.

### Public Members

`esp_http_client_event_id_t event_id`

`event_id`, to know the cause of the event

`esp_http_client_handle_t client`

`esp_http_client_handle_t` context

void `*data`

data of the event

int `data_len`

data length of data

void `*user_data`

`user_data` context, from `esp_http_client_config_t` `user_data`

char `*header_key`

For `HTTP_EVENT_ON_HEADER` `event_id`, it' s store current http header key

char `*header_value`

For `HTTP_EVENT_ON_HEADER` `event_id`, it' s store current http header value

**struct** `esp_http_client_config_t`

HTTP configuration.

**Public Members**

- const char \*url**  
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any
- const char \*host**  
Domain or IP as string
- int port**  
Port to connect, default depend on `esp_http_client_transport_t` (80 or 443)
- const char \*username**  
Using for Http authentication
- const char \*password**  
Using for Http authentication
- esp\_http\_client\_auth\_type\_t* **auth\_type**  
Http authentication type, see `esp_http_client_auth_type_t`
- const char \*path**  
HTTP Path, if not set, default is /
- const char \*query**  
HTTP query
- const char \*cert\_pem**  
SSL server certification, PEM format as string, if the client requires to verify server
- const char \*client\_cert\_pem**  
SSL client certification, PEM format as string, if the server requires to verify client
- const char \*client\_key\_pem**  
SSL client key, PEM format as string, if the server requires to verify client
- esp\_http\_client\_method\_t* **method**  
HTTP Method
- int timeout\_ms**  
Network timeout in milliseconds
- bool disable\_auto\_redirect**  
Disable HTTP automatic redirects
- int max\_redirection\_count**  
Max redirection number, using default value if zero
- http\_event\_handle\_cb* **event\_handler**  
HTTP Event Handle
- esp\_http\_client\_transport\_t* **transport\_type**  
HTTP transport type, see `esp_http_client_transport_t`
- int buffer\_size**  
HTTP receive buffer size
- int buffer\_size\_tx**  
HTTP transmit buffer size
- void \*user\_data**  
HTTP user\_data context
- bool is\_async**  
Set asynchronous mode, only supported with HTTPS for now
- bool use\_global\_ca\_store**  
Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**  
Skip any validation of server certificate CN field

### Macros

**DEFAULT\_HTTP\_BUF\_SIZE**  
**ESP\_ERR\_HTTP\_BASE**  
Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**  
The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**  
Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**  
Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**  
Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**  
There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**  
HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**  
Mapping of errno EAGAIN to esp\_err\_t

### Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t
typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

### Enumerations

```
enum esp_http_client_event_id_t
    HTTP Client events id.

    Values:

    HTTP_EVENT_ERROR = 0
        This event occurs when there are any errors during execution

    HTTP_EVENT_ON_CONNECTED
        Once the HTTP has been connected to the server, no data exchange has been performed

    HTTP_EVENT_HEADERS_SENT
        After sending all the headers to the server

    HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
        This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

    HTTP_EVENT_ON_HEADER
        Occurs when receiving each header sent from the server

    HTTP_EVENT_ON_DATA
        Occurs when receiving data from the server, possibly multiple portions of the packet

    HTTP_EVENT_ON_FINISH
        Occurs when finish a HTTP session
```

**HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

**enum esp\_http\_client\_transport\_t**

HTTP Client transport.

*Values:***HTTP\_TRANSPORT\_UNKNOWN** = 0x0

Unknown

**HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

**HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

**enum esp\_http\_client\_method\_t**

HTTP method.

*Values:***HTTP\_METHOD\_GET** = 0

HTTP GET Method

**HTTP\_METHOD\_POST**

HTTP POST Method

**HTTP\_METHOD\_PUT**

HTTP PUT Method

**HTTP\_METHOD\_PATCH**

HTTP PATCH Method

**HTTP\_METHOD\_DELETE**

HTTP DELETE Method

**HTTP\_METHOD\_HEAD**

HTTP HEAD Method

**HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

**HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

**HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

**HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

**HTTP\_METHOD\_MAX****enum esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:***HTTP\_AUTH\_TYPE\_NONE** = 0

No authentication

**HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

**HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

**enum HttpStatus\_Code**

Enum for the HTTP status codes.

Values:

`HttpStatus_MovedPermanently` = 301

`HttpStatus_Found` = 302

`HttpStatus_TemporaryRedirect` = 307

`HttpStatus_Unauthorized` = 401

## 2.4.4 ESP WebSocket Client

### Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32

### Features

- supports WebSocket over TCP, SSL with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

### Configuration

#### URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
  - `ws://websocket.org`: WebSocket over TCP, default port 80
  - `wss://websocket.org`: WebSocket over SSL, default port 443
- Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
};
```

- If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

#### SSL

- Get certificate from server, example: `websocket.org openssl s_client -showcerts -connect websocket.org:443 </dev/null 2>/dev/null|openssl x509 -outform PEM >websocket_org.pem`
- Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

For more options on `esp_websocket_client_config_t`, please refer to API reference below

## Application Example

Simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the [websocket.org](https://websocket.org) Server: [protocols/websocket](https://protocols.websocket.org).

## API Reference

### Header File

- [esp\\_websocket\\_client/include/esp\\_websocket\\_client.h](#)

### Functions

*esp\_websocket\_client\_handle\_t* **esp\_websocket\_client\_init** (**const** *esp\_websocket\_client\_config\_t* \**config*)

Start a WebSocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

#### Return

- `esp_websocket_client_handle_t`
- NULL if any errors

#### Parameters

- [in] `config`: The configuration

*esp\_err\_t* **esp\_websocket\_client\_set\_uri** (*esp\_websocket\_client\_handle\_t* *client*, **const** char \**uri*)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client
- [in] `uri`: The uri

*esp\_err\_t* **esp\_websocket\_client\_start** (*esp\_websocket\_client\_handle\_t* *client*)

Open the WebSocket connection.

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client

*esp\_err\_t* **esp\_websocket\_client\_stop** (*esp\_websocket\_client\_handle\_t* *client*)

Close the WebSocket connection.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client

*esp\_err\_t* **esp\_websocket\_client\_destroy** (*esp\_websocket\_client\_handle\_t* *client*)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client

int **esp\_websocket\_client\_send** (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Generic write data to the WebSocket connection; defaults to binary send.

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

int **esp\_websocket\_client\_send\_bin** (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

int **esp\_websocket\_client\_send\_text** (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

bool **esp\_websocket\_client\_is\_connected** (*esp\_websocket\_client\_handle\_t* client)

Check the WebSocket connection status.

**Return**

- true
- false

**Parameters**

- [in] client: The client handle

*esp\_err\_t* **esp\_websocket\_register\_events** (*esp\_websocket\_client\_handle\_t* client, *esp\_websocket\_event\_id\_t* event, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Register the Websocket Events.

**Return** esp\_err\_t

**Parameters**

- client: The client handle
- event: The event id
- event\_handler: The callback function
- event\_handler\_arg: User context

**Structures**

**struct esp\_websocket\_event\_data\_t**  
Websocket event data.

**Public Members**

**const char \*data\_ptr**  
Data pointer

**int data\_len**  
Data length

**uint8\_t op\_code**  
Received opcode

*esp\_websocket\_client\_handle\_t* **client**  
esp\_websocket\_client\_handle\_t context

**void \*user\_context**  
user\_data context, from *esp\_websocket\_client\_config\_t* user\_data

**int payload\_len**  
Total payload length, payloads exceeding buffer will be posted through multiple events

**int payload\_offset**  
Actual offset for the data associated with this event

**struct esp\_websocket\_client\_config\_t**  
Websocket client setup configuration.

**Public Members**

**const char \*uri**  
Websocket URI, the information on the URI can be overrides the other fields below, if any

**const char \*host**  
Domain or IP as string

**int port**  
Port to connect, default depend on esp\_websocket\_transport\_t (80 or 443)

**const char \*username**  
Using for Http authentication - Not supported for now

**const char \*password**  
Using for Http authentication - Not supported for now

**const char \*path**  
HTTP Path, if not set, default is /

**bool disable\_auto\_reconnect**  
Disable the automatic reconnect function when disconnected

**void \*user\_context**  
HTTP user data context

**int task\_prio**  
Websocket task priority

**int task\_stack**  
Websocket task stack

**int buffer\_size**  
Websocket buffer size

**const char \*cert\_pem**  
SSL Certification, PEM format as string, if the client requires to verify server

*esp\_websocket\_transport\_t* **transport**  
Websocket transport type, see 'esp\_websocket\_transport\_t'

```

char *subprotocol
    Websocket subprotocol

char *user_agent
    Websocket user-agent

char *headers
    Websocket additional headers

```

### Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

### Enumerations

```
enum esp_websocket_event_id_t
    Websocket Client events id.
```

*Values:*

```
WEBSOCKET_EVENT_ANY = -1
```

```
WEBSOCKET_EVENT_ERROR = 0
```

This event occurs when there are any errors during execution

```
WEBSOCKET_EVENT_CONNECTED
```

Once the Websocket has been connected to the server, no data exchange has been performed

```
WEBSOCKET_EVENT_DISCONNECTED
```

The connection has been disconnected

```
WEBSOCKET_EVENT_DATA
```

When receiving data from the server, possibly multiple portions of the packet

```
WEBSOCKET_EVENT_MAX
```

```
enum esp_websocket_transport_t
    Websocket Client transport.
```

*Values:*

```
WEBSOCKET_TRANSPORT_UNKNOWN = 0x0
```

Transport unknown

```
WEBSOCKET_TRANSPORT_OVER_TCP
```

Transport over tcp

```
WEBSOCKET_TRANSPORT_OVER_SSL
```

Transport over ssl

## 2.4.5 HTTP 服务器

[English]

### 概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- `httpd_start()`：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 `httpd_start()` 传递 `httpd_config_t` 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。

- `httpd_stop()`: 根据传入的句柄停止服务器, 并释放相关联的内存和资源。这是一个阻塞函数, 首先给服务器任务发送停止信号, 然后等待其终止。期间服务器任务会关闭所有已打开的连接, 删除已注册的 URI 处理程序, 并将所有会话的上下文数据重置为空。
- `httpd_register_uri_handler()`: 通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员: `uri` 名字, `method` 类型 (比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等), `esp_err_t *handler (httpd_req_t *req)` 类型的函数指针, 指向用户上下文数据的 `user_ctx` 指针。

## 应用示例

```

/* URI 处理函数, 在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char[] resp = "URI GET Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* URI 处理函数, 在客户端发起 POST /uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区
     * httpd_req_recv() 只接收 char* 数据, 但也可以是任意二进制数据 (需要类型转换)
     * 对于字符串数据, null 终止符会被省略, content_len 会给出字符串的长度 */
    char[100] content;

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时, 可以调用 httpd_req_recv() 重试
             * 简单起见, 这里我们直接响应 HTTP 408 (请求超时) 错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误, 返回 ESP_FAIL 可以确保底层套接字被关闭 */
        return ESP_FAIL;
    }

    /* 发送简单的响应数据包 */
    const char[] resp = "URI POST Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST /uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,

```

(下页继续)

```

    .handler = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

    /* 启动 httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* 注册 URI 处理程序 */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* 如果服务器启动失败, 返回的句柄是 NULL */
    return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}

```

**简单 HTTP 服务器示例** 请查看位于 [protocols/http\\_server/simple](protocols/http_server/simple) 的 HTTP 服务器示例, 该示例演示了如何处理任意内容长度的数据, 读取请求头和 URL 查询参数, 设置响应头。

## HTTP 长连接

HTTP 服务器具有长连接的功能, 允许重复使用同一个连接 (会话) 进行多次传输, 同时保持会话的上下文数据。上下文数据可由处理程序动态分配, 在这种情况下需要提前指定好自定义的回调函数, 以便在连接/会话被关闭时释放这部分内存资源。

### 长连接示例

```

/* 自定义函数, 用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 如果会话上下文还不存在则新建一个 */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func; /*!< 释放上下文数据的函数 */
    }
}

```

(下页继续)

```

/* 访问上下文数据 */
ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

/* 响应 */
.....
.....
.....

return ESP_OK;
}

```

详情请参考位于 [protocols/http\\_server/persistent\\_sockets](#) 的示例代码。

## API 参考

### Header File

- [esp\\_http\\_server/include/esp\\_http\\_server.h](#)

### Functions

***esp\_err\_t* httpd\_register\_uri\_handler** (*httpd\_handle\_t* handle, **const** *httpd\_uri\_t* \*uri\_handler)  
Registers a URI handler.

Example usage:

```

esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (...) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

```

**Note** URI handlers can be registered in real time as long as the server handle is valid.

### Return

- **ESP\_OK** : On successfully registering the handler

- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_HANDLERS_FULL` : If no slots left for new handler
- `ESP_ERR_HTTPD_HANDLER_EXISTS` : If handler with same URI and method is already registered

**Parameters**

- `[in] handle`: handle to HTTPD server instance
- `[in] uri_handler`: pointer to handler that needs to be registered

*esp\_err\_t* `httpd_unregister_uri_handler` (*httpd\_handle\_t* handle, **const** char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

**Return**

- `ESP_OK` : On successfully deregistering the handler
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_FOUND` : Handler with specified URI and method not found

**Parameters**

- `[in] handle`: handle to HTTPD server instance
- `[in] uri`: URI string
- `[in] method`: HTTP method

*esp\_err\_t* `httpd_unregister_uri` (*httpd\_handle\_t* handle, **const** char \*uri)

Unregister all URI handlers with the specified uri string.

**Return**

- `ESP_OK` : On successfully deregistering all such handlers
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_FOUND` : No handler registered with specified uri string

**Parameters**

- `[in] handle`: handle to HTTPD server instance
- `[in] uri`: uri string specifying all handlers that need to be deregistered

*esp\_err\_t* `httpd_sess_set_recv_override` (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Return**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- `[in] hd`: HTTPD instance handle
- `[in] sockfd`: Session socket FD
- `[in] recv_func`: The receive function to be set for this session

*esp\_err\_t* `httpd_sess_set_send_override` (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`

**Return**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- [in] `hd`: HTTPD instance handle
- [in] `sockfd`: Session socket FD
- [in] `send_func`: The send function to be set for this session

*esp\_err\_t* `httpd_sess_set_pending_override` (*httpd\_handle\_t* `hd`, *int* `sockfd`,  
*httpd\_pending\_func\_t* `pending_func`)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of

- an http session APIs where `sockfd` is a valid parameter
- a URI handler where `sockfd` is obtained using `httpd_req_to_sockfd()`

**Return**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- [in] `hd`: HTTPD instance handle
- [in] `sockfd`: Session socket FD
- [in] `pending_func`: The receive function to be set for this session

*int* `httpd_req_to_sockfd` (*httpd\_req\_t* \**r*)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Return**

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**

- [in] `r`: The request whose socket descriptor should be found

*int* `httpd_req_recv` (*httpd\_req\_t* \**r*, *char* \**buf*, *size\_t* *buf\_len*)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling `socket recv()`
- `HTTPD SOCK_ERR_FAIL` : Unrecoverable error while calling `socket recv()`

**Parameters**

- [in] `r`: The request being responded to
- [in] `buf`: Pointer to a buffer that the data will be read into
- [in] `buf_len`: Length of the buffer

`size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)`

Search for a field in request headers and return the string length of it' s value.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

**Parameters**

- [in] `r`: The request being responded to
- [in] `field`: The header field to be searched in the request

`esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)`

Get the value string of a field from the request headers.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use `httpd_req_get_hdr_value_len()` to know the right buffer length

**Return**

- `ESP_OK` : Field found in the request header and value string copied
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

**Parameters**

- [in] `r`: The request being responded to
- [in] `field`: The field to be searched in the header
- [out] `val`: Pointer to the buffer into which the value will be copied if the field is found
- [in] `val_size`: Size of the user buffer "val"

`size_t httpd_req_get_url_query_len (httpd_req_t *r)`

Get Query string length from the request URL.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid

**Return**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

**Parameters**

- [in] `r`: The request being responded to

`esp_err_t httpd_req_get_url_query_str (httpd_req_t *r, char *buf, size_t buf_len)`

Get Query string from the request URL.

**Note**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value

- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

**Parameters**

- `[in]` `r`: The request being responded to
- `[out]` `buf`: Pointer to the buffer into which the query string will be copied (if found)
- `[in]` `buf_len`: Length of output buffer

*esp\_err\_t* **httpd\_query\_key\_value** (`const` char \**qry*, `const` char \**key*, char \**val*, `size_t` *val\_size*)

Helper function to get a URL query tag from a query string of the type `param1=val1&param2=val2`.

**Note**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

**Return**

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

**Parameters**

- `[in]` `qry`: Pointer to query string
- `[in]` `key`: The key to be searched in the query string
- `[out]` `val`: Pointer to the buffer into which the value will be copied if the key is found
- `[in]` `val_size`: Size of the user buffer “val”

`bool` **httpd\_uri\_match\_wildcard** (`const` char \**uri\_template*, `const` char \**uri\_to\_match*, `size_t` *match\_upto*)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “\*” for a wildcard match, and “?\*” to make the previous character optional, and if present, allow anything to follow.

Example:

- `*` matches everything
- `/foo/?` matches `/foo` and `/foo/`
- `/foo/*` (sans the backslash) matches `/foo/` and `/foo/bar`, but not `/foo` or `/fo`
- `/foo/?*` or `/foo/*?` (sans the backslash) matches `/foo/`, `/foo/bar`, and also `/foo`, but not `/foox` or `/fo`

The special characters “?” and “\*” anywhere else in the template will be taken literally.

**Return** true if a match was found

**Parameters**

- `[in]` `uri_template`: URI template (pattern)
- `[in]` `uri_to_match`: URI to be matched
- `[in]` `match_upto`: how many characters of the URI buffer to test (there may be trailing query string etc.)

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \**r*, `const` char \**buf*, `ssize_t` *buf\_len*)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

**Parameters**

- `[in] r`: The request being responded to
- `[in] buf`: Buffer from where the content is to be fetched
- `[in] buf_len`: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

`esp_err_t httpd_resp_send_chunk (httpd_req_t *r, const char *buf, ssize_t buf_len)`

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to
- `[in] buf`: Pointer to a buffer that stores the data
- `[in] buf_len`: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

`static esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)`

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer

- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `str`: String to be sent as response body

**static** *esp\_err\_t* `httpd_resp_sendstr_chunk` (*httpd\_req\_t* \**r*, **const** char \**str*)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `str`: String to be sent as response body (NULL to finish response packet)

*esp\_err\_t* `httpd_resp_set_status` (*httpd\_req\_t* \**r*, **const** char \**status*)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the status to this value. The status isn’ t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `status`: The HTTP status code of this response

*esp\_err\_t* `httpd_resp_set_type` (*httpd\_req\_t* \**r*, **const** char \**type*)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’ .

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the content type to this value. The type isn’ t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `type`: The Content Type of the response

*esp\_err\_t* `httpd_resp_set_hdr` (*httpd\_req\_t* \**r*, **const** char \**field*, **const** char \**value*)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- The header isn't sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

#### Return

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

#### Parameters

- `[in] r`: The request being responded to
- `[in] field`: The field name of the HTTP header
- `[in] value`: The value of this HTTP header

`esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

#### Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

#### Parameters

- `[in] req`: Pointer to the HTTP request for which the response needs to be sent
- `[in] error`: Error type to send
- `[in] msg`: Error message string (pass NULL for default message)

`static esp_err_t httpd_resp_send_404 (httpd_req_t *r)`

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

#### Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

#### Parameters

- `[in] r`: The request being responded to

`static esp_err_t httpd_resp_send_408 (httpd_req_t *r)`

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the

lower-level functions directly.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

#### Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

#### Parameters

- `[in] r`: The request being responded to

**static** `esp_err_t httpd_resp_send_500` (`httpd_req_t *r`)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

#### Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

#### Parameters

- `[in] r`: The request being responded to

**int** `httpd_send` (`httpd_req_t *r`, **const** `char *buf`, `size_t buf_len`)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`

#### Return

- `Bytes` : Number of bytes that were sent successfully
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket send()

#### Parameters

- `[in] r`: The request being responded to
- `[in] buf`: Buffer from where the fully constructed packet is to be read
- `[in] buf_len`: Length of the buffer

`esp_err_t httpd_register_err_handler` (`httpd_handle_t handle`, `httpd_err_code_t error`, `httpd_err_handler_func_t handler_fn`)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

#### Return

- `ESP_OK` : handler registered successfully
- `ESP_ERR_INVALID_ARG` : invalid error code or server handle

#### Parameters

- `[in] handle`: HTTP server handle
- `[in] error`: Error type
- `[in] handler_fn`: User implemented handler function (Pass `NULL` to unset any previously set handler)

`esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)`

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

#### Return

- `ESP_OK` : Instance created successfully
- `ESP_ERR_INVALID_ARG` : Null argument(s)
- `ESP_ERR_HTTPD_ALLOC_MEM` : Failed to allocate memory for instance
- `ESP_ERR_HTTPD_TASK` : Failed to launch server task

#### Parameters

- `[in] config`: Configuration for new instance of the server
- `[out] handle`: Handle to newly created instance of the server. `NULL` on error

`esp_err_t httpd_stop(httpd_handle_t handle)`

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

(下页继续)

```

    }
}

```

**Return**

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`

*esp\_err\_t* `httpd_queue_work` (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

**Note** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

**Return**

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] work: Pointer to the function to be executed in the HTTPD' s context
- [in] arg: Pointer to the arguments that should be passed to this function

void \*`httpd_sess_get_ctx` (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Return**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.

void `httpd_sess_set_ctx` (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free\_fn: Function that should be called to free the context

void \*`httpd_sess_get_transport_ctx` (*httpd\_handle\_t* handle, int sockfd)

Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

**Return**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.

```
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx,
                                httpd_free_ctx_fn_t free_fn)
```

Set session 'transport' context by socket descriptor.

See `httpd_sess_set_ctx()`

#### Parameters

- [in] `handle`: Handle to server returned by `httpd_start`
- [in] `sockfd`: The socket descriptor for which the context should be extracted.
- [in] `ctx`: Transport context object to assign to the session
- [in] `free_fn`: Function that should be called to free the transport context

```
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```

Get HTTPD global user context (it was set in the server config struct)

**Return** global user context

#### Parameters

- [in] `handle`: Handle to server returned by `httpd_start`

```
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```

Get HTTPD global transport context (it was set in the server config struct)

**Return** global transport context

#### Parameters

- [in] `handle`: Handle to server returned by `httpd_start`

```
esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```

Trigger an httpd session close externally.

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

#### Return

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

#### Parameters

- [in] `handle`: Handle to server returned by `httpd_start`
- [in] `sockfd`: The socket descriptor of the session to be closed

```
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

#### Return

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

#### Parameters

- [in] `handle`: Handle to server returned by `httpd_start`
- [in] `sockfd`: The socket descriptor of the session for which LRU counter is to be updated

## Structures

```
struct httpd_config
```

HTTP Server Configuration Structure.

**Note** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

### Public Members

unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge “Least Recently Used” connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

uint16\_t **send\_wait\_timeout**

Timeout for send function (in seconds)

void \***global\_user\_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_user\_ctx\_free\_fn**

Free function for global user context

void \***global\_transport\_ctx**

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_transport\_ctx\_free\_fn**

Free function for global transport context

[\*httpd\\_open\\_func\\_t\*](#) **open\_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

#### *httpd\_close\_func\_t* **close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

#### *httpd\_uri\_match\_func\_t* **uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

### **struct httpd\_req**

HTTP Request Data Structure.

#### **Public Members**

#### *httpd\_handle\_t* **handle**

Handle to server instance

#### int **method**

The type of HTTP request, -1 if unsupported method

#### const char **uri**[`HTTPD_MAX_URI_LEN` + 1]

The URI of this request (1 byte extra for null termination)

#### size\_t **content\_len**

Length of the request body

#### void \***aux**

Internally used members

#### void \***user\_ctx**

User context pointer passed during URI registration.

#### void \***sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is `NULL`. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-`NULL`, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

*httpd\_free\_ctx\_fn\_t* **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

**struct httpd\_uri**

Structure for URI handler.

### Public Members

**const** char \***uri**

The URI to handle

*httpd\_method\_t* **method**

Method supported by the URI

*esp\_err\_t* (\***handler**) (*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

void \***user\_ctx**

Pointer to user context data which will be available to handler

### Macros

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD SOCK\_ERR\_FAIL**

**HTTPD SOCK\_ERR\_INVALID**

**HTTPD SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**HTTPD\_DEFAULT\_CONFIG ()****ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN****Type Definitions****typedef struct *httpd\_req* httpd\_req\_t**

HTTP Request Data Structure.

**typedef struct *httpd\_uri* httpd\_uri\_t**

Structure for URI handler.

**typedef int (\*httpd\_send\_func\_t) (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)**

Prototype for HTTPDs low-level send function.

**Note** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

**Return**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

**Parameters**

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

```
typedef int (*httpd_recv_func_t) (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level recv function.

**Note** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

**Parameters**

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

```
typedef int (*httpd_pending_func_t) (httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

**Note** User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

**Return**

- Bytes : The number of bytes waiting to be received
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `pending()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `pending()`

**Parameters**

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor

```
typedef esp_err_t (*httpd_err_handler_func_t) (httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

**Return**

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

**Parameters**

- [in] `req`: HTTP request for which the error needs to be handled
- [in] `error`: Error type

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

```
typedef enum http_method httpd_method_t
```

HTTP Method Type wrapper over “enum http\_method” available in “http\_parser” library.

```
typedef void (*httpd_free_ctx_fn_t) (void *ctx)
```

Prototype for freeing context data (if any)

#### Parameters

- [in] ctx: object to free

```
typedef esp_err_t (*httpd_open_func_t) (httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

#### Return

- ESP\_OK : On success
- Any value other than ESP\_OK will signal the server to close the socket immediately

#### Parameters

- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```
typedef void (*httpd_close_func_t) (httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

#### Parameters

- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```
typedef bool (*httpd_uri_match_func_t) (const char *reference_uri, const char  
*uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

**Return** true on match

#### Parameters

- [in] reference\_uri: URI/template with respect to which the other URI is matched
- [in] uri\_to\_match: URI/template being matched to the reference URI/template
- [in] match\_upto: For specifying the actual length of uri\_to\_match up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of reference\_uri)

```
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

**Note** Use HTTPD\_DEFAULT\_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```
typedef void (*httpd_work_fn_t) (void *arg)
```

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

#### Parameters

- [in] arg: The arguments for this work function

### Enumerations

```
enum httpd_err_code_t
```

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

```
HTTPD_500_INTERNAL_SERVER_ERROR = 0
```

```
HTTPD_501_METHOD_NOT_IMPLEMENTED
```

```
HTTPD_505_VERSION_NOT_SUPPORTED
```

```
HTTPD_400_BAD_REQUEST
HTTPD_404_NOT_FOUND
HTTPD_405_METHOD_NOT_ALLOWED
HTTPD_408_REQ_TIMEOUT
HTTPD_411_LENGTH_REQUIRED
HTTPD_414_URI_TOO_LONG
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
HTTPD_ERR_CODE_MAX
```

## 2.4.6 HTTPS server

### Overview

This component is built on top of *esp\_http\_server*. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for *esp\_http\_server* applies also to a server you create this way.

### Used APIs

The following API of *esp\_http\_server* should not be used with *esp\_https\_server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config_t.global_transport_ctx`
  - `httpd_config_t.global_transport_ctx_free_fn`
  - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

### Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

### Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- [esp\\_https\\_server/include/esp\\_https\\_server.h](#)

### Functions

*esp\_err\_t* **httpd\_ssl\_start** (*httpd\_handle\_t* \*handle, *httpd\_ssl\_config\_t* \*config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

#### Parameters

- [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] handle: - storage for the server handle, must be a valid pointer

void **httpd\_ssl\_stop** (*httpd\_handle\_t* handle)

Stop the server. Blocks until the server is shut down.

#### Parameters

- [in] handle:

### Structures

**struct httpd\_ssl\_config**

HTTPS server config struct

Please use HTTPD\_SSL\_CONFIG\_DEFAULT() to initialize it.

### Public Members

*httpd\_config\_t* **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

**const** uint8\_t \***cacert\_pem**

CA certificate

size\_t **cacert\_len**

CA certificate byte length

**const** uint8\_t \***prvtkey\_pem**

Private key

size\_t **prvtkey\_len**

Private key byte length

*httpd\_ssl\_transport\_mode\_t* **transport\_mode**

Transport Mode (default secure)

uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

### Macros

**HTTPD\_SSL\_CONFIG\_DEFAULT** ()

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

### Type Definitions

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

### Enumerations

```
enum httpd_ssl_transport_mode_t
```

Values:

```
HTTPD_SSL_TRANSPORT_SECURE
```

```
HTTPD_SSL_TRANSPORT_INSECURE
```

## 2.4.7 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}
```

(下页继续)

```

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↪
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    getaddrinfo("www.espressif.com", NULL, &hint, &res) == 0);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called

`esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- [lwip/include/apps/ping/ping\\_sock.h](#)

### Functions

`esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)`

Create a ping session.

#### Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

#### Parameters

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

`esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)`

Delete a ping session.

#### Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: delete ping session successfully

#### Parameters

- `hdl`: handle of ping session

`esp_err_t esp_ping_start(esp_ping_handle_t hdl)`

Start the ping session.

#### Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: start ping session successfully

#### Parameters

- `hdl`: handle of ping session

`esp_err_t esp_ping_stop(esp_ping_handle_t hdl)`

Stop the ping session.

#### Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: stop ping session successfully

#### Parameters

- `hdl`: handle of ping session

`esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)`

Get runtime profile of ping session.

**Return**

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_ERR_INVALID_SIZE`: the actual profile data size doesn't match the "size" parameter
- `ESP_OK`: get profile successfully

**Parameters**

- `hdl`: handle of ping session
- `profile`: type of profile
- `data`: profile data
- `size`: profile data size

**Structures****struct esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

**Public Members**`void *cb_args`

arguments for callback functions

`void (*on_ping_success) (esp_ping_handle_t hdl, void *args)`

Invoked by internal ping thread when received ICMP echo reply packet.

`void (*on_ping_timeout) (esp_ping_handle_t hdl, void *args)`

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

`void (*on_ping_end) (esp_ping_handle_t hdl, void *args)`

Invoked by internal ping thread when a ping session is finished.

**struct esp\_ping\_config\_t**

Type of "ping" configuration.

**Public Members**`uint32_t count`

A "ping" session contains count procedures

`uint32_t interval_ms`

Milliseconds between each ping procedure

`uint32_t timeout_ms`

Timeout value (in milliseconds) of each ping procedure

`uint32_t data_size`

Size of the data next to ICMP packet header

`uint8_t tos`

Type of Service, a field specified in the IP header

`ip_addr_t target_addr`

Target IP address, either IPv4 or IPv6

`uint32_t task_stack_size`

Stack size of internal ping task

`uint32_t task_prio`

Priority of internal ping task

**Macros****ESP\_PING\_DEFAULT\_CONFIG()**

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

**Type Definitions**

```
typedef void *esp_ping_handle_t
```

Type of “ping” session handle.

**Enumerations**

```
enum esp_ping_profile_t
```

Profile of ping session.

*Values:*

```
ESP_PING_PROF_SEQNO
```

Sequence number of a ping procedure

```
ESP_PING_PROF_TTL
```

Time to live of a ping procedure

```
ESP_PING_PROF_REQUEST
```

Number of request packets sent out

```
ESP_PING_PROF_REPLY
```

Number of reply packets received

```
ESP_PING_PROF_IPADDR
```

IP address of replied target

```
ESP_PING_PROF_SIZE
```

Size of received packet

```
ESP_PING_PROF_TIMEGAP
```

Elapsed time between request and reply packet

```
ESP_PING_PROF_DURATION
```

Elapsed time of the whole ping session

## 2.4.8 ASIO port

**Overview**

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

**Supported features** ESP platform port currently supports only network asynchronous socket operations; does not support serial port and ssl. Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

## Application Example

ESP examples are based on standard asio [examples/protocols/asio](#):

- [examples/protocols/asio/udp\\_echo\\_server](#)
- [examples/protocols/asio/tcp\\_echo\\_server](#)
- [examples/protocols/asio/chat\\_client](#)
- [examples/protocols/asio/chat\\_server](#)

Please refer to the specific example README.md for details

## 2.4.9 ESP-MQTT

### Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

### Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

### Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

### Configuration

#### URI

- Curently support `mqtt`, `mqttts`, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipse.org`: MQTT over TCP, default port 1883:
  - `mqtt://mqtt.eclipse.org:1884` MQTT over TCP, port 1884:
  - `mqtt://username:password@mqtt.eclipse.org:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqttts://mqtt.eclipse.org`: MQTT over SSL, port 8883
  - `mqttts://mqtt.eclipse.org:8884`: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - `ws://mqtt.eclipse.org:80/mqtt`
- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipse.org:443/mqtt`
- Minimal configurations:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipse.org",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↵client);
esp_mqtt_client_start(client);

```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

## SSL

- Get certificate from server, example: `mqtt.eclipse.org openssl s_client -showcerts -connect mqtt.eclipse.org:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipse.org:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};

```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see `esp-tls.h` for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_cert_len`: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

## Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects

- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from `menu-config`
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

**Change settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- [`CONFIG\_MQTT\_PROTOCOL\_311`](#): Enables 3.1.1 version of MQTT protocol
- [`CONFIG\_MQTT\_TRANSPORT\_SSL`](#), [`CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET`](#): Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET\_SECURE
- [`CONFIG\_MQTT\_CUSTOM\_OUTBOX`](#): Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

## Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- [mqtt/esp-mqtt/include/mqtt\\_client.h](#)

**Functions**

*esp\_mqtt\_client\_handle\_t* **esp\_mqtt\_client\_init** (**const** *esp\_mqtt\_client\_config\_t* \**config*)

Creates mqtt client handle based on the configuration.

**Return** mqtt\_client\_handle if successfully created, NULL on error

**Parameters**

- *config*: mqtt configuration structure

*esp\_err\_t* **esp\_mqtt\_client\_set\_uri** (*esp\_mqtt\_client\_handle\_t* *client*, **const** char \**uri*)

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp\_mqtt\_client\_init.

**Return** ESP\_FAIL if URI parse error, ESP\_OK on success

**Parameters**

- *client*: mqtt client handle
- *uri*:

*esp\_err\_t* **esp\_mqtt\_client\_start** (*esp\_mqtt\_client\_handle\_t* *client*)

Starts mqtt client with already created client handle.

**Return** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL on other error

**Parameters**

- *client*: mqtt client handle

*esp\_err\_t* **esp\_mqtt\_client\_reconnect** (*esp\_mqtt\_client\_handle\_t* *client*)

This api is typically used to force reconnection upon a specific event.

**Return** ESP\_OK on success ESP\_FAIL if client is in invalid state

**Parameters**

- *client*: mqtt client handle

*esp\_err\_t* **esp\_mqtt\_client\_disconnect** (*esp\_mqtt\_client\_handle\_t* *client*)

This api is typically used to force disconnection from the broker.

**Return** ESP\_OK on success

**Parameters**

- *client*: mqtt client handle

*esp\_err\_t* **esp\_mqtt\_client\_stop** (*esp\_mqtt\_client\_handle\_t* *client*)

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

**Return** ESP\_OK on success ESP\_FAIL if client is in invalid state

**Parameters**

- *client*: mqtt client handle

int **esp\_mqtt\_client\_subscribe** (*esp\_mqtt\_client\_handle\_t* *client*, **const** char \**topic*, int *qos*)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Return** message\_id of the subscribe message on success -1 on failure

**Parameters**

- *client*: mqtt client handle
- *topic*:
- *qos*:

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* *client*, **const** char \**topic*)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message

- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** `message_id` of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
- `topic`:

`int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)`

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected to send publish message (although it would drop all qos=0 messages, qos>1 messages would be enqueued)
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** `message_id` of the publish message (for QoS 0 `message_id` will always be zero) on success. -1 on failure.

**Parameters**

- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag

`esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)`

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

**Return** `ESP_OK`

**Parameters**

- `client`: mqtt client handle

`esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)`

Set configuration structure, typically used when updating the config (i.e. on “before\_connect” event.

**Return** `ESP_ERR_NO_MEM` if failed to allocate `ESP_OK` on success

**Parameters**

- `client`: mqtt client handle
- `config`: mqtt configuration structure

`esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)`

Registers mqtt event.

**Return** `ESP_ERR_NO_MEM` if failed to allocate `ESP_OK` on success

**Parameters**

- `client`: mqtt client handle
- `event`: event type
- `event_handler`: handler callback
- `event_handler_arg`: handlers context

`int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)`

Get outbox size.

**Return** outbox size

**Parameters**

- `client`: mqtt client handle

## Structures

### struct `esp_mqtt_error_codes`

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from tcp\_transport/esp-tls | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from MQTT broker on connection |

## Public Members

### `esp_err_t esp_tls_last_esp_err`

last `esp_err` code reported from esp-tls component

### int `esp_tls_stack_err`

tls specific error code reported from underlying tls stack

### int `esp_tls_cert_verify_flags`

tls flags reported from underlying tls stack during certificate verification

### `esp_mqtt_error_type_t error_type`

error type referring to the source of the error

### `esp_mqtt_connect_return_code_t connect_return_code`

connection refused error code reported from MQTT broker on connection

### int `esp_transport_sock_errno`

errno from the underlying socket

### struct `esp_mqtt_event_t`

MQTT event configuration structure

## Public Members

### `esp_mqtt_event_id_t event_id`

MQTT event type

### `esp_mqtt_client_handle_t client`

MQTT client handle for this event

### void \*`user_context`

User context passed from MQTT client config

### char \*`data`

Data associated with this event

### int `data_len`

Length of the data for this event

### int `total_data_len`

Total length of the data (longer data are supplied with multiple events)

### int `current_data_offset`

Actual offset for the data associated with this event

**char \*topic**  
Topic associated with this event

**int topic\_len**  
Length of the topic for this event associated with this event

**int msg\_id**  
MQTT messaged id of message

**int session\_present**  
MQTT session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* \***error\_handle**  
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

**struct esp\_mqtt\_client\_config\_t**  
MQTT client configuration structure

### Public Members

*mqtt\_event\_callback\_t* **event\_handle**  
handle for MQTT events as a callback in legacy mode

*esp\_event\_loop\_handle\_t* **event\_loop\_handle**  
handle for MQTT event loop library

**const char \*host**  
MQTT server domain (ipv4 as string)

**const char \*uri**  
Complete MQTT broker URI

**uint32\_t port**  
MQTT server port

**const char \*client\_id**  
default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

**const char \*username**  
MQTT username

**const char \*password**  
MQTT password

**const char \*lwt\_topic**  
LWT (Last Will and Testament) message topic (NULL by default)

**const char \*lwt\_msg**  
LWT message (NULL by default)

**int lwt\_qos**  
LWT message qos

**int lwt\_retain**  
LWT retained message flag

**int lwt\_msg\_len**  
LWT message length

**int disable\_clean\_session**  
mqtt clean session, default clean\_session is true

**int keepalive**  
mqtt keepalive, default is 120 seconds

**bool `disable_auto_reconnect`**  
 this mqtt client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

**void `*user_context`**  
 pass user context to this option, then can receive that context in `event->user_context`

**int `task_prio`**  
 MQTT task priority, default is 5, can be changed in `make menuconfig`

**int `task_stack`**  
 MQTT task stack size, default is 6144 bytes, can be changed in `make menuconfig`

**int `buffer_size`**  
 size of MQTT send/receive buffer, default is 1024 (only receive buffer size if `out_buffer_size` defined)

**const char `*cert_pem`**  
 Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

**size\_t `cert_len`**  
 Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

**const char `*client_cert_pem`**  
 Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

**size\_t `client_cert_len`**  
 Length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem

**const char `*client_key_pem`**  
 Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

**size\_t `client_key_len`**  
 Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

***esp\_mqtt\_transport\_t* `transport`**  
 overrides URI transport

**int `refresh_connection_after_ms`**  
 Refresh connection after this value (in milliseconds)

**const struct *psk\_key\_hint* `*psk_hint_key`**  
 Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

**bool `use_global_ca_store`**  
 Use a global `ca_store` for all the connections in which this bool is set.

**int `reconnect_timeout_ms`**  
 Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

**const char `**alpn_protos`**  
 NULL-terminated list of supported application protocols to be used for ALPN

**const char `*clientkey_password`**  
 Client key decryption password string

**int `clientkey_password_len`**  
 String length of the password pointed to by `clientkey_password`

***esp\_mqtt\_protocol\_ver\_t* protocol\_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

**int out\_buffer\_size**

size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

**bool skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

**bool use\_secure\_element**

enable secure element for enabling SSL connection

**void \*ds\_data**

carrier of handle for digital signature parameters

**int network\_timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

**bool disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

**Macros****MQTT\_ERROR\_TYPE\_ESP\_TLS**

`MQTT_ERROR_TYPE_TCP_TRANSPORT` error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from `MQTT_ERROR_TYPE_ESP_TLS` layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

**Type Definitions**

```
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
```

```
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
<code>MQTT_ERROR_TYPE_TCP_TRANSPORT</code>	<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from tcp_transport/esp-tls
<code>MQTT_ERROR_TYPE_CONNECTION_REFUSED</code>	<code>connect_return_code</code>	Internal error reported from MQTT broker on connection

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

**Enumerations**

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

Values:

**MQTT\_EVENT\_ANY** = -1

**MQTT\_EVENT\_ERROR** = 0

on error event, additional context: connection return code, error handle from *esp\_tls* (if supported)

**MQTT\_EVENT\_CONNECTED**

connected event, additional context: session\_present flag

**MQTT\_EVENT\_DISCONNECTED**

disconnected event

**MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context: msg\_id

**MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event

**MQTT\_EVENT\_PUBLISHED**

published event, additional context: msg\_id

**MQTT\_EVENT\_DATA**

data event, additional context:

- msg\_id message id
- topic pointer to the received topic
- topic\_len length of the topic
- data pointer to the received data
- data\_len length of the data for this event
- current\_data\_offset offset of the current data for this event
- total\_data\_len total length of the data received Note: Multiple MQTT\_EVENT\_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

**enum esp\_mqtt\_connect\_return\_code\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

**MQTT\_CONNECTION\_ACCEPTED** = 0

Connection accepted

**MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

MQTT connection refused reason: Wrong protocol

**MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

MQTT connection refused reason: ID rejected

**MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

**MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

MQTT connection refused reason: Wrong user

**MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

**enum esp\_mqtt\_error\_type\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

**MQTT\_ERROR\_TYPE\_NONE** = 0

**MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

**MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

**enum esp\_mqtt\_transport\_t***Values:*

- MQTT\_TRANSPORT\_UNKNOWN** = 0x0
- MQTT\_TRANSPORT\_OVER\_TCP**  
MQTT over TCP, using scheme: `mqtt`
- MQTT\_TRANSPORT\_OVER\_SSL**  
MQTT over SSL, using scheme: `mqttssl`
- MQTT\_TRANSPORT\_OVER\_WS**  
MQTT over Websocket, using scheme: `ws`
- MQTT\_TRANSPORT\_OVER\_WSS**  
MQTT over Websocket Secure, using scheme: `wss`

**enum esp\_mqtt\_protocol\_ver\_t**

MQTT protocol version used for connection

*Values:*

- MQTT\_PROTOCOL\_UNDEFINED** = 0
- MQTT\_PROTOCOL\_V\_3\_1**
- MQTT\_PROTOCOL\_V\_3\_1\_1**

## 2.4.10 ESP-Modbus

### Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- **Modbus RTU** —This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
- **Modbus ASCII** —This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon ( “:” ) and trailing newline (CR/LF).
- **Modbus TCP/IP or Modbus TCP** —This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

**Modbus common interface API overview** The API functions below provide common functionality to setup Modbus stack for slave and master implementation accordingly. ISP-IDF supports Modbus serial slave and master protocol stacks and provides `modbus_controller` interface API to interact with user application.

`esp_err_t mbc_slave_init` (`mb_port_type_t port_type`, `void **handler`)

Initialize Modbus controller and stack.

**Return**

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` Parameter error

**Parameters**

- [out] handler: handler(pointer) to master data structure
- [in] port\_type: type of stack

*esp\_err\_t* **mbc\_master\_init** (mb\_port\_type\_t port\_type, void \*\*handler)

Initialize Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error

**Parameters**

- [out] handler: handler(pointer) to master data structure
- [in] port\_type: the type of port

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

*esp\_err\_t* **mbc\_slave\_setup** (void \*comm\_info)

Set Modbus communication parameters for the controller.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Incorrect parameter data

**Parameters**

- comm\_info: Communication parameters structure.

*esp\_err\_t* **mbc\_master\_setup** (void \*comm\_info)

Set Modbus communication parameters for the controller.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Incorrect parameter data

**Parameters**

- comm\_info: Communication parameters structure.

The function is used to setup communication parameters of the Modbus stack. See the Modbus controller API documentation for more information.

*mbc\_slave\_set\_descriptor*(): Initialization of slave descriptor.

*mbc\_master\_set\_descriptor*(): Initialization of master descriptor.

The Modbus stack uses parameter description tables (descriptors) for communication. These are different for master and slave implementation of stack and should be assigned by the API call before start of communication.

*esp\_err\_t* **mbc\_slave\_start** (void)

Start Modbus communication stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

*esp\_err\_t* **mbc\_master\_start** (void)

Start Modbus communication stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

Modbus controller start function. Starts stack and interface and allows communication.

*esp\_err\_t* **mbc\_slave\_destroy** (void)

Destroy Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

*esp\_err\_t* **mbc\_master\_destroy** (void)

Destroy Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

This function stops Modbus communication stack and destroys controller interface.

There are some configurable parameters of modbus\_controller interface and Modbus stack that can be configured using KConfig values in “Modbus configuration” menu. The most important option in KConfig menu is “Selection of Modbus stack support mode” that allows to select master or slave stack for implementation. See the examples for more information about how to use these API functions.

**Modbus serial slave interface API overview** The slave stack requires the user defined structures which represent Modbus parameters accessed by stack. These structures should be prepared by user and be assigned to the modbus\_controller interface using *mbc\_slave\_set\_descriptor()* API call before start of communication. The interface API functions below are used for Modbus slave application:

*esp\_err\_t* **mbc\_slave\_set\_descriptor** (mb\_register\_area\_descriptor\_t *descr\_data*)

Set Modbus area descriptor.

**Return**

- ESP\_OK: The appropriate descriptor is set
- ESP\_ERR\_INVALID\_ARG: The argument is incorrect

**Parameters**

- *descr\_data*: Modbus registers area descriptor structure

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the *mbc\_slave\_start()* API is called the Modbus stack can access the data in user data structures by request from master. See the *mb\_register\_area\_descriptor\_t* and example for more information.

*mb\_event\_group\_t* **mbc\_slave\_check\_event** (mb\_event\_group\_t *group*)

Wait for specific event on parameter change.

**Return**

- *mb\_event\_group\_t* event bits triggered

**Parameters**

- *group*: Group event bit mask to wait for change

The blocking call to function waits for event specified in the input parameter as event mask. Once master access the parameter and event mask matches the parameter the application task will be unblocked and function will return ESP\_OK. See the *mb\_event\_group\_t* for more information about Modbus event masks.

*esp\_err\_t* **mbc\_slave\_get\_param\_info** (mb\_param\_info\_t \**reg\_info*, uint32\_t *timeout*)

Get parameter information.

**Return**

- ESP\_OK Success
- ESP\_ERR\_TIMEOUT Can not get data from parameter queue or queue overflow

**Parameters**

- [out] *reg\_info*: parameter info structure
- *timeout*: Timeout in milliseconds to read information from parameter queue

The function gets information about accessed parameters from modbus controller event queue. The KConfig ‘CONFIG\_FMB\_CONTROLLER\_NOTIFY\_QUEUE\_SIZE’ key can be used to configure the notification queue size. The timeout parameter allows to specify timeout for waiting notification. The *mb\_param\_info\_t* structure contain information about accessed parameter.

**Modbus serial master interface API overview** The Modbus master implementation requires parameter description table be defined before start of stack. This table describes characteristics (physical parameters like temperature, humidity, etc.) and links them to Modbus registers in specific slave device in the Modbus segment. The table has to

be assigned to the modbus\_controller interface using `mbc_master_set_descriptor()` API call before start of communication.

Below are the interface API functions that are used to setup and use Modbus master stack from user application and can be executed in next order:

`esp_err_t mbc_master_set_descriptor(const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)`

Assign parameter description table for Modbus controller interface.

#### Return

- `esp_err_t ESP_OK` - set descriptor successfully
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument in function call

#### Parameters

- `[in] descriptor`: pointer to parameter description table
- `num_elements`: number of elements in the table

Assigns parameter description table for Modbus controller interface. The table has to be prepared by user according to particular

`esp_err_t mbc_master_send_request(mb_param_request_t *request, void *data_ptr)`

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

#### Return

- `esp_err_t ESP_OK` - request was successful
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave
- `esp_err_t ESP_ERR_TIMEOUT` - operation timeout or no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- `[in] request`: pointer to request structure of type `mb_param_request_t`
- `[in] data_ptr`: pointer to data buffer to send or received data (dependent of command field in request)

This function sends data request as defined in parameter request, waits response from corresponded slave and returns status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

`esp_err_t mbc_master_get_cid_info(uint16_t cid, const mb_parameter_descriptor_t **param_info)`

Get information about supported characteristic defined as `cid`. Uses parameter description table to get this information. The function will check if characteristic defined as a `cid` parameter is supported and returns its description in `param_info`. Returns `ESP_ERR_NOT_FOUND` if characteristic is not supported.

#### Return

- `esp_err_t ESP_OK` - request was successful and buffer contains the supported characteristic name
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_NOT_FOUND` - the characteristic (`cid`) not found
- `esp_err_t ESP_FAIL` - unknown error during lookup table processing

#### Parameters

- `[in] cid`: characteristic id
- `param_info`: pointer to pointer of characteristic data.

The function gets information about supported characteristic defined as `cid`. It will check if characteristic is supported and returns its description.

`esp_err_t mbc_master_get_parameter(uint16_t cid, char *name, uint8_t *value, uint8_t *type)`

Read parameter from modbus slave device whose name is defined by `name` and has `cid`. The additional data for request is taken from parameter description (lookup) table.

#### Return

- `esp_err_t ESP_OK` - request was successful and value buffer contains representation of actual parameter data from slave
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_ERR_NOT_FOUND` - the parameter is not found in the parameter description table
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- `[in] cid`: id of the characteristic for parameter
- `[in] name`: pointer into string name (key) of parameter (null terminated)
- `[out] value`: pointer to data buffer of parameter
- `[out] type`: parameter type associated with the name returned from parameter description table.

The function reads data of characteristic defined in parameters from Modbus slave device and returns its data. The additional data for request is taken from parameter description table.

`esp_err_t mbc_master_set_parameter` (`uint16_t cid`, `char *name`, `uint8_t *value`, `uint8_t *type`)

Set characteristic's value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

#### Return

- `esp_err_t ESP_OK` - request was successful and value was saved in the slave device registers
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave during processing of parameter
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- `[in] cid`: id of the characteristic for parameter
- `[in] name`: pointer into string name (key) of parameter (null terminated)
- `[out] value`: pointer to data buffer of parameter (actual representation of json value field in binary form)
- `[out] type`: pointer to parameter type associated with the name returned from parameter lookup table.

The function writes characteristic's value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

### Application Example

The examples below use the FreeModbus library port for serial slave and master implementation accordingly. The selection of stack is performed through KConfig menu "Selection of Modbus stack support mode" and related configuration keys.

[protocols/modbus/serial/mb\\_slave](#)

[protocols/modbus/serial/mb\\_master](#)

Please refer to the specific example README.md for details.

### Modbus Readme File

# Modbus assumptions, dependencies and constraints

1. Current implementation of Modbus has limitation: maximum frame size should be less than 120 bytes (default UART receive FIFO full threshold value). This limitation is removed in ESP-IDF v4.2.

2. The only one instance of Modbus port can be initialized at the same time.

## 2.4.11 ESP Local Control

### Overview

ESP Local Control (**esp\_local\_ctrl**) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp\_local\_ctrl** service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
```

(下页继续)

(续上页)

```

.transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
.transport_config = {
    .httpd = &https_conf
},
.handlers = {
    /* User defined handler functions */
    .get_prop_values = get_property_values,
    .set_prop_values = set_property_values,
    .usr_ctx         = NULL,
    .usr_ctx_free_fn = NULL
},
/* Maximum number of properties that may be set */
.max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

### Creating a property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the *type* and *flags* fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name         = "timestamp",
    .type         = TYPE_TIMESTAMP,
    .size         = sizeof(int32_t),
    .flags        = READONLY,
    .ctx          = func_get_time,
    .ctx_free_fn  = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```

static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
    }
}

```

(下页继续)

(续上页)

```

    if (props[i].type == TYPE_TIMESTAMP) {
        /* Obtain the timer function from ctx */
        int32_t (*func_get_time)(void) = props[i].ctx;

        /* Use static variable for saving the value.
         * This is essential because the value has to be
         * valid even after this function returns.
         * Alternative is to use dynamic allocation
         * and set the free_fn field */
        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t
↪ *prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↪ props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

## Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created

mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

表 4: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl_version	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl_control	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- [esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)

### Functions

**const esp\_local\_ctrl\_transport\_t \*esp\_local\_ctrl\_get\_transport\_ble** (void)

Function for obtaining BLE transport mode.

**const esp\_local\_ctrl\_transport\_t \*esp\_local\_ctrl\_get\_transport\_httpd** (void)

Function for obtaining HTTPD transport mode.

**esp\_err\_t esp\_local\_ctrl\_start** (const esp\_local\_ctrl\_config\_t \*config)

Start local control service.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

#### Parameters

- [in] config: Pointer to configuration structure

**esp\_err\_t esp\_local\_ctrl\_stop** (void)

Stop local control service.

**esp\_err\_t esp\_local\_ctrl\_add\_property** (const esp\_local\_ctrl\_prop\_t \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

#### Parameters

- [in] prop: Property description structure

**esp\_err\_t esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

#### Parameters

- [in] name: Name of the property to remove

**const** *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (**const** char \*name)

Get property description structure by name.

This API may be used to get a property's context structure *esp\_local\_ctrl\_prop\_t* when its name is known

#### Return

- Pointer to property
- NULL if not found

#### Parameters

- [in] name: Name of the property to find

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (**const** char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the *protocomm\_ble\_config\_t* structure set in *esp\_local\_ctrl\_config\_t*, and passed to *esp\_local\_ctrl\_start()*.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

#### Parameters

- [in] ep\_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user\_ctx: User data

## Unions

**union** *esp\_local\_ctrl\_transport\_config\_t*

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

### Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \*ble

This is same as *protocomm\_ble\_config\_t*. See *protocomm\_ble.h* for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \*httpd

This is same as *httpd\_ssl\_config\_t*. See *esp\_https\_server.h* for available configuration parameters.

## Structures

**struct** *esp\_local\_ctrl\_prop*

Property description data structure, which is to be populated and passed to the *esp\_local\_ctrl\_add\_property()* function.

Once a property is added, its structure is available for read-only access inside *get\_prop\_values()* and *set\_prop\_values()* handlers.

### Public Members

char \*name

Unique name of property

**uint32\_t type**

Type of property. This may be set to application defined enums

**size\_t size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

**uint32\_t flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

**void \*ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

**void (\*ctx\_free\_fn) (void \*ctx)**

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members****void \*data**

Pointer to memory holding property value

**size\_t size**

Size of property value

**void (\*free\_fn) (void \*data)**

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

**esp\_err\_t (\*get\_prop\_values) (size\_t props\_count, const esp\_local\_ctrl\_prop\_t props[], esp\_local\_ctrl\_prop\_val\_t prop\_values[], void \*usr\_ctx)**

Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

**Return** Returning different error codes will convey the corresponding protocol level errors to the client

:

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : InvalidArgument
- `ESP_ERR_INVALID_STATE` : InvalidProto
- All other error codes : InternalError

**Parameters**

- [in] `props_count`: Total elements in the `props` array
- [in] `props`: Array of properties, the current values for which have been requested by the client

- [out] `prop_values`: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by `props` argument
- [in] `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

`esp_err_t (*set_prop_values)` (`size_t props_count`, `const esp_local_ctrl_prop_t props[]`, `const esp_local_ctrl_prop_val_t prop_values[]`, `void *usr_ctx`)

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : InvalidArgument
- `ESP_ERR_INVALID_STATE` : InvalidProto
- All other error codes : InternalError

#### Parameters

- [in] `props_count`: Total elements in the `props` array
- [in] `props`: Array of properties, the values for which the client requests to change
- [in] `prop_values`: Array of property values, the elements of which need to be used for updating those properties specified by `props` argument
- [in] `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

`void *usr_ctx`

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

`void (*usr_ctx_free_fn)` (`void *usr_ctx`)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

#### Public Members

`const esp_local_ctrl_transport_t *transport`

Transport layer over which service will be provided

`esp_local_ctrl_transport_config_t transport_config`

Transport layer over which service will be provided

`esp_local_ctrl_handlers_t handlers`

Register handlers for responding to get/set requests on properties

`size_t max_properties`

This limits the number of properties that are available at a time

#### Macros

`ESP_LOCAL_CTRL_TRANSPORT_BLE`

`ESP_LOCAL_CTRL_TRANSPORT_HTTPD`

#### Type Definitions

`typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t`

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

```
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
```

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

```
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
```

Handlers for receiving and responding to local control commands for getting and setting properties.

```
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
```

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

```
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
```

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

```
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
```

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`.

```
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
```

Configuration structure to pass to `esp_local_ctrl_start()`

## 2.4.12 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

For more details about ESP32 SDIO slave protocol, see document [Communication with ESP SDIO Slave](#).

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the `esp_serial_slave_link` component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

## Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line.
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

## Initialization of ESP SDIO Slave Link

The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:' Document of SDMMC driver </api-reference/storage/sdmmc>') structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

## APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

### Interrupts

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.
5. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.

### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.

2. Call `essl_get_packet ()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt ()` to reset the internal counter if you find the slave has reset its counter.

### Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

### API Reference

#### Header File

- `esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

#### Functions

`esp_err_t` **essl\_init** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Initialize the slave.

**Return** ESP\_OK if success, or other value returned from lower layer `init`.

#### Parameters

- handle: Handle of a `essl` device.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t` **essl\_wait\_for\_ready** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Wait for interrupt of a ESP32 slave device.

#### Return

- ESP\_OK if success
- One of the error codes from SDMMC host controller

#### Parameters

- handle: Handle of a `essl` device.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t` **essl\_get\_tx\_buffer\_num** (`essl_handle_t` handle, `uint32_t` \*out\_tx\_num, `uint32_t` wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Return

- ESP\_OK Success
- One of the error codes from SDMMC host controller

#### Parameters

- handle: Handle of a `essl` device.
- out\_tx\_num: Output of buffer num that host can send data to ESP32 slave.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t` **essl\_get\_rx\_data\_size** (`essl_handle_t` handle, `uint32_t` \*out\_rx\_size, `uint32_t` wait\_ms)

Get amount of data the ESP32 slave preparing to send to host.

#### Return

- ESP\_OK Success
- One of the error codes from SDMMC host controller

#### Parameters

- handle: Handle of a `essl` device.
- out\_rx\_size: Output of data size to read from slave.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_reset_cnt (essl_handle_t handle)`

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

#### Parameters

- `handle`: Handle of a `essl` device.

`esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)`

Send a packet to the ESP32 slave. The slave receive the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Return

- `ESP_OK` Success
- `ESP_ERR_TIMEOUT` No buffer to use, or error from SDMMC host controller
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `start`: Start address of the packet to send
- `length`: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)`

Get a packet from ESP32 slave.

#### Return

- `ESP_OK` Success, all the data are read from the slave.
- `ESP_ERR_NOT_FINISHED` Read success, while there're data remaining.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `[out] out_data`: Data output address
- `size`: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- `[out] out_length`: Output of length the data actually received from slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)`

Write general purpose R/W registers (8-bit) of ESP32 slave.

**Note** `sdio 28-31` are reserved, the lower API helps to skip.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Address not valid.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `addr`: Address of register to write. Valid address: 0-59.
- `value`: Value to write to the register.
- `value_o`: Output of the returned written value.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_read_reg (essl_handle_t handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)`

Read general purpose R/W registers (8-bit) of ESP32 slave.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Address not valid.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.

- `add`: Address of register to read. Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read).
- `value_o`: Output value read from the register.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)`

wait for an interrupt of the slave

#### Return

- `ESP_ERR_NOT_SUPPORTED` Currently our driver doesnot support SDIO with SPI interface.
- `ESP_OK` If interrupt triggered.
- `ESP_ERR_TIMEOUT` No interrupts before timeout.

#### Parameters

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)`

Clear interrupt bits of ESP32 slave. All the bits set in the mask will be cleared, while other bits will stay the same.

#### Return

- `ESP_OK` Success
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `intr_mask`: Mask of interrupt bits to clear.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)`

Get interrupt bits of ESP32 slave.

#### Return

- `ESP_OK` Success
- `ESP_INVALID_ARG` if both `intr_raw` and `intr_st` are `NULL`.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `intr_raw`: Output of the raw interrupt bits. Set to `NULL` if only masked bits are read.
- `intr_st`: Output of the masked interrupt bits. set to `NULL` if only raw bits are read.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)`

Set interrupt enable bits of ESP32 slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

#### Return

- `ESP_OK` Success
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)`

Get interrupt enable bits of ESP32 slave.

#### Return

- `ESP_OK` Success
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)  
Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of a *essl* device.
- intr\_mask: Mask of interrupt bits to send to slave.
- wait\_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Macros****ESP\_ERR\_NOT\_FINISHED**

There is still remaining data.

**Type Definitions**

**typedef struct** *essl\_dev\_t* \***essl\_handle\_t**  
Handle of an ESSL device.

**Header File**

- *esp\_serial\_slave\_link/include/esp\_serial\_slave\_link/essl\_sdio.h*

**Functions**

*esp\_err\_t* **essl\_sdio\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_sdio\_config\_t* \*config)  
Initialize the ESSL SDIO device and get its handle.

**Return**

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

**Parameters**

- out\_handle: Output of the handle.
- config: Configuration for the ESSL SDIO device.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)  
Deinitialize and free the space used by the ESSL SDIO device.

**Return**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

**Parameters**

- handle: Handle of the ESSL SDIO device to deinit.

**Structures**

**struct** *essl\_sdio\_config\_t*  
Configuration for the *essl* SDIO device.

**Public Members**

*sdmmc\_card\_t* \***card**

The initialized *sdmmc* card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated *recv* buffer size used by both the host and the slave.

此 API 部分的示例代码在 ESP-IDF 示例工程的 *protocols* 目录下提供。

### 2.4.13 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档位于[连网 API](#)。

## 2.5 配网 API

[English]

### 2.5.1 Unified Provisioning

#### Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

#### Typical Provisioning Process

#### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases

图 23: Typical Provisioning Process

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

### Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*security1*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

### Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

### Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

### Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

图 24: Unified Provisioning Architecture

Security1 scheme details are shown in the below sequence diagram

### Sample Code

Please refer to [Protocol Communication](#) and [Wi-Fi Provisioning](#) for API guides and code snippets on example usage. Various use case implementations can be found as examples under [provisioning](#).

### Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- Android : [esp-idf-provisioning-android](#)
- iOS : [esp-idf-provisioning-ios](#)
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## 2.5.2 Protocol Communication

### Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning :

- **Communication security at application level -**
  - `protocomm_security0` (no security)

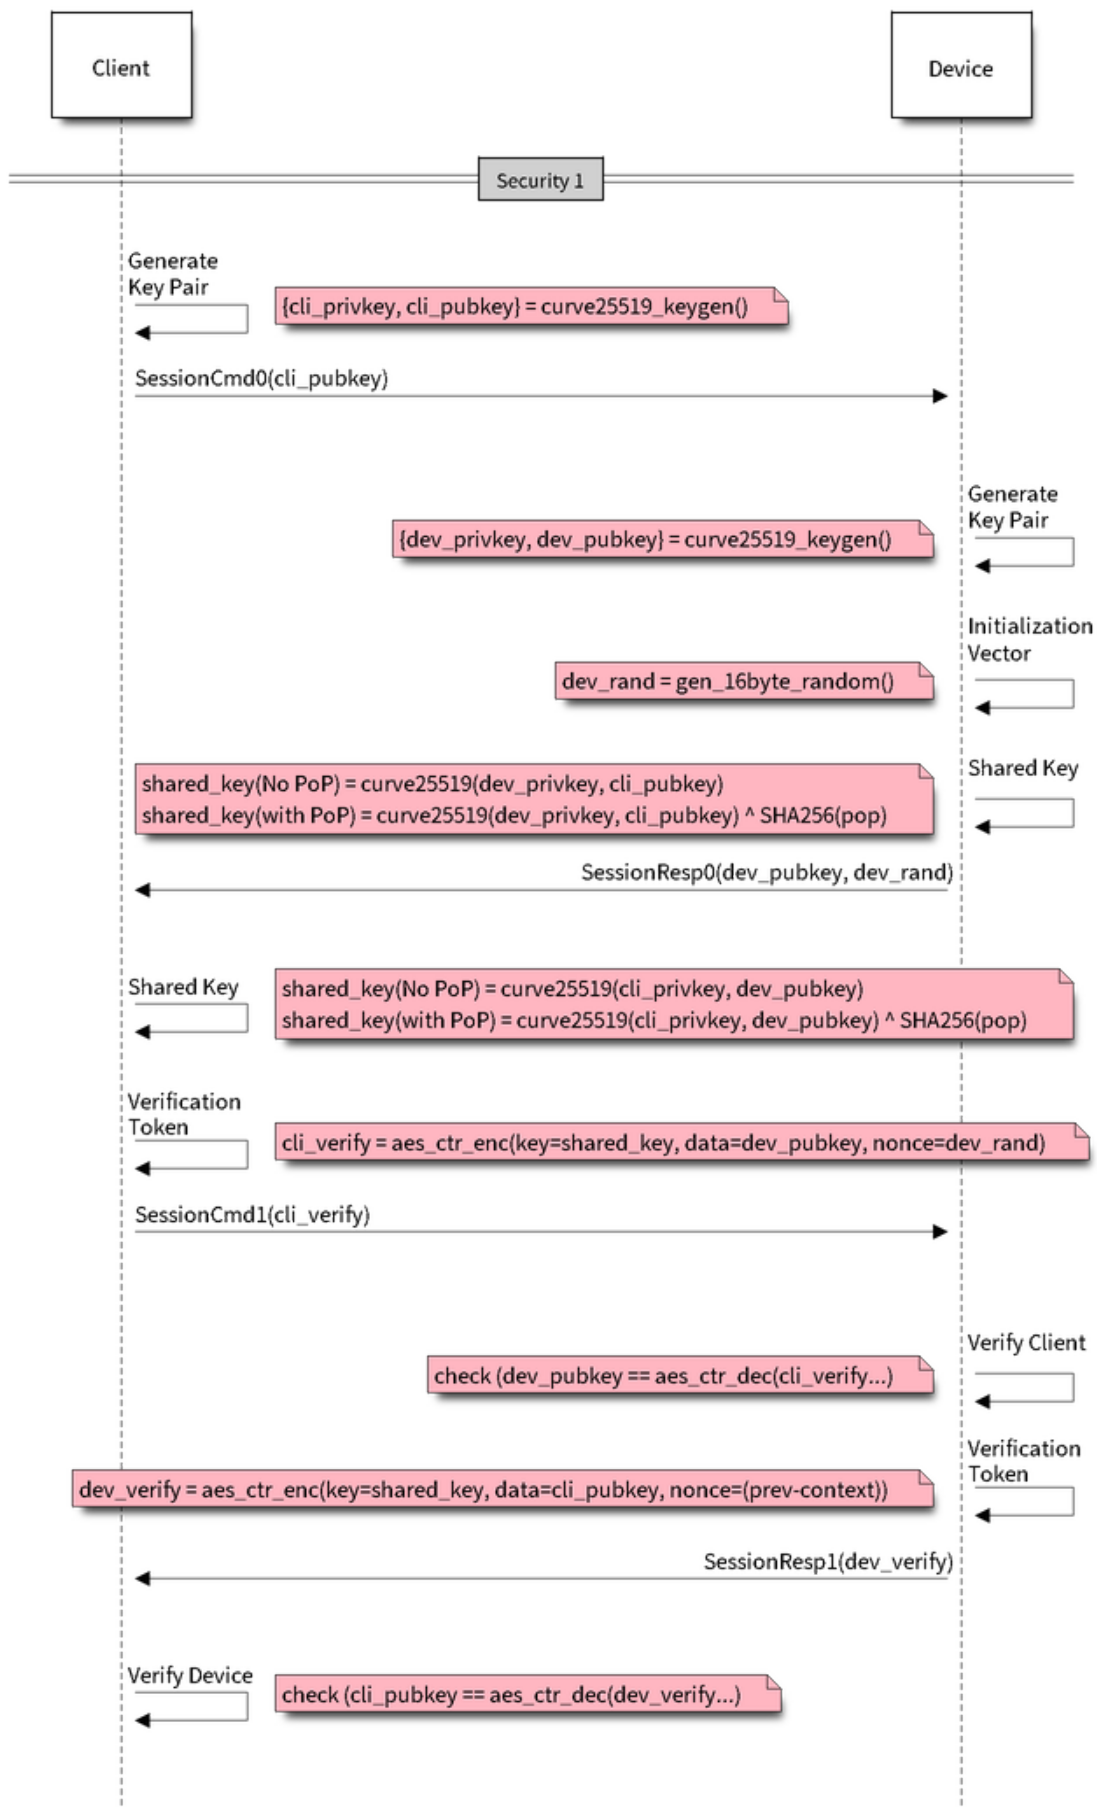

图 25: Security1

- protocomm\_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm\_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm\_security1) by performing the two way handshake. See *Unified Provisioning* for more details about the secure handshake logic.

### Transport Example (SoftAP + HTTP) with Security 1

For complete example see [provisioning/softap\\_prov](#)

```

/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
     * throughout the scope of protocomm endpoint. This need not be_
     ↪static,
     * ie. could be dynamically allocated and freed at the time of_
     ↪endpoint
     * removal */
}

```

(下页继续)

(续上页)

```

const static protocomm_security_pop_t pop_obj = {
    .data = (const uint8_t *) strdup(pop_string),
    .len = strlen(pop_string)
};

/* Set security for communication at application level. Just like for
 * request handlers, setting security creates an endpoint and
↳registers
 * the handler provided by protocomm_security1. One can similarly use
 * protocomm_security0. Only one type of security can be set for a
 * protocomm instance at a time. */
protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
↳&pop_obj);

/* Private data passed to the endpoint must be valid throughout the
↳scope
 * of protocomm endpoint. This need not be static, ie. could be
↳dynamically
 * allocated and freed at the time of endpoint removal */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a
↳unique name
 * and register a handler function along with private data to be
↳passed at the
 * time of handler execution. Multiple endpoints can be added as long
↳as they
 * are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);

return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

```

### Transport Example (BLE) with Security 0

For complete example see [provisioning/ble\\_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {

```

(下页继续)

```

        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <-----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
→table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can_
→be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
→NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
→NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

## API Reference

### Header File

- [protocomm/include/common/protocomm.h](#)

### Functions

***protocomm\_t*\*protocomm\_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm\_t structure initialized to NULL.

#### Return

- *protocomm\_t*\* : On success
- NULL : No memory for allocating new instance

void **protocomm\_delete** (*protocomm\_t*\*pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

#### Parameters

- [in] `pc`: Pointer to the protocomm instance to be deleted

`esp_err_t protocomm_add_endpoint(protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)`

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

#### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

#### Return

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

#### Parameters

- [in] `pc`: Pointer to the protocomm instance
- [in] `ep_name`: Endpoint identifier(name) string
- [in] `h`: Endpoint handler function
- [in] `priv_data`: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

`esp_err_t protocomm_remove_endpoint(protocomm_t *pc, const char *ep_name)`

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

#### Note

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

#### Return

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

#### Parameters

- [in] `pc`: Pointer to the protocomm instance
- [in] `ep_name`: Endpoint identifier(name) string

`esp_err_t protocomm_open_session(protocomm_t *pc, uint32_t session_id)`

Allocates internal resources for new transport session.

#### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

#### Return

- `ESP_OK` : Request handled successfully
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

#### Parameters

- [in] `pc`: Pointer to the protocomm instance
- [in] `session_id`: Unique ID for a communication session

`esp_err_t protocomm_close_session(protocomm_t *pc, uint32_t session_id)`

Frees internal resources used by a transport session.

#### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

#### Return

- `ESP_OK` : Request handled successfully

- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] session\_id: Unique ID for a communication session

*esp\_err\_t* **protocomm\_req\_handle** (*protocomm\_t* \*pc, const char \*ep\_name, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Return**

- ESP\_OK : Request handled successfully
- ESP\_FAIL : Internal error in execution of registered handler
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] session\_id: Unique ID for a communication session
- [in] inbuf: Input buffer contains input request data which is to be processed by the registered handler
- [in] inlen: Length of the input buffer
- [out] outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- [out] outlen: Buffer length of the allocated output buffer

*esp\_err\_t* **protocomm\_set\_security** (*protocomm\_t* \*pc, const char \*ep\_name, const *protocomm\_security\_t* \*sec, const *protocomm\_security\_pop\_t* \*pop)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Security endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] sec: Pointer to endpoint security instance
- [in] pop: Pointer to proof of possession for authenticating a client

*esp\_err\_t* **protocomm\_unset\_security** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Return**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist

- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string

*esp\_err\_t* **protocomm\_set\_version** (*protocomm\_t* \*pc, const char \*ep\_name, const char \*version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

#### Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Version endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] version: Version identifier(name) string

*esp\_err\_t* **protocomm\_unset\_version** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

#### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string

### Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf,
                                             ssize_t inlen, uint8_t **outbuf, ssize_t *outlen,
                                             void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**Note** Structure of the protocomm object is kept private

### Header File

- [protocomm/include/security/protocomm\\_security.h](#)

### Structures

```
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

### Public Members

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

`uint16_t len`

Length (in bytes) of the proof of possession data

**struct protocomm\_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Public Members

`int ver`

Unique version number of security implementation

`esp_err_t (*init) (protocomm_security_handle_t *handle)`

Function for initializing/allocating security infrastructure

`esp_err_t (*cleanup) (protocomm_security_handle_t handle)`

Function for deallocating security infrastructure

`esp_err_t (*new_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)`

Starts new secure transport session with specified ID

`esp_err_t (*close_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)`

Closes a secure transport session with specified ID

`esp_err_t (*security_req_handler) (protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Handler function for authenticating connection request and establishing secure session

`esp_err_t (*encrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)`

Function which implements the encryption algorithm

`esp_err_t (*decrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)`

Function which implements the decryption algorithm

### Type Definitions

`typedef struct protocomm_security_pop protocomm_security_pop_t`

Proof Of Possession for authenticating a secure session.

`typedef void *protocomm_security_handle_t`

`typedef struct protocomm_security protocomm_security_t`

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Header File

- [protocomm/include/security/protocomm\\_security0.h](#)

### Header File

- [protocomm/include/security/protocomm\\_security1.h](#)

## Header File

- `protocomm/include/transport/protocomm_httpd.h`

## Functions

`esp_err_t protocomm_httpd_start` (*protocomm\_t* \*pc, const *protocomm\_httpd\_config\_t* \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

### Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_SUPPORTED` : Transport layer bound to another protocomm instance
- `ESP_ERR_INVALID_STATE` : Transport layer already bound to this protocomm instance
- `ESP_ERR_NO_MEM` : Memory allocation for server resource failed
- `ESP_ERR_HTTPD_*` : HTTP server error on start

### Parameters

- [in] pc: Protocomm instance pointer obtained from `protocomm_new()`
- [in] config: Pointer to config structure for initializing HTTP server

`esp_err_t protocomm_httpd_stop` (*protocomm\_t* \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

### Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance pointer

### Parameters

- [in] pc: Same protocomm instance that was passed to `protocomm_httpd_start()`

## Unions

`union protocomm_httpd_config_data_t`

`#include <protocomm_httpd.h>` Protocomm HTTPD Configuration Data

## Public Members

void \***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

*protocomm\_http\_server\_config\_t* **config**

HTTP Server Configuration, if a server is not already active

## Structures

`struct protocomm_http_server_config_t`

Config parameters for protocomm HTTP server.

## Public Members

uint16\_t **port**

Port on which the HTTP server will listen

size\_t **stack\_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task\_priority**

Priority of server task

**struct protocomm\_httpd\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

bool **ext\_handle\_provided**

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

*protocomm\_httpd\_config\_data\_t* **data**

Protocomm HTTPD Configuration Data

### Macros

**PROTOCOLM\_HTTPD\_DEFAULT\_CONFIG()**

### Header File

- [protocomm/include/transport/protocomm\\_ble.h](#)

### Functions

*esp\_err\_t* **protocomm\_ble\_start** (*protocomm\_t* \*pc, const *protocomm\_ble\_config\_t* \*config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Simple BLE start error
- ESP\_ERR\_NO\_MEM : Error allocating memory for internal resources
- ESP\_ERR\_INVALID\_STATE : Error in ble config
- ESP\_ERR\_INVALID\_ARG : Null arguments

#### Parameters

- [in] pc: Protocomm instance pointer obtained from `protocomm_new()`
- [in] config: Pointer to config structure for initializing BLE

*esp\_err\_t* **protocomm\_ble\_stop** (*protocomm\_t* \*pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

**Note** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Simple BLE stop error
- ESP\_ERR\_INVALID\_ARG : Null / incorrect protocomm instance

#### Parameters

- [in] pc: Same protocomm instance that was passed to `protocomm_ble_start()`

### Structures

**struct name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

**const char \*name**  
Name of the handler, which is passed to protocomm layer

**uint16\_t uuid**  
UUID to be assigned to the BLE characteristic which is mapped to the handler

**struct protocomm\_ble\_config**  
Config parameters for protocomm BLE service.

**Public Members**

**char device\_name[MAX\_BLE\_DEVNAME\_LEN]**  
BLE device name being broadcast at the time of provisioning

**uint8\_t service\_uuid[BLE\_UUID128\_VAL\_LENGTH]**  
128 bit UUID of the provisioning service

**ssize\_t nu\_lookup\_count**  
Number of entries in the Name-UUID lookup table

*protocomm\_ble\_name\_uuid\_t* \***nu\_lookup**  
Pointer to the Name-UUID lookup table

**Macros**

**MAX\_BLE\_DEVNAME\_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

**BLE\_UUID128\_VAL\_LENGTH**

**Type Definitions**

**typedef struct name\_uuid protocomm\_ble\_name\_uuid\_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**typedef struct protocomm\_ble\_config protocomm\_ble\_config\_t**

Config parameters for protocomm BLE service.

**2.5.3 Wi-Fi Provisioning****Overview**

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure *Protocol Communication (protocomm)* sessions. The set of *wifi\_prov\_mgr\_* APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization** *wifi\_prov\_mgr\_init()* is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other *wifi\_prov\_mgr\_* APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to *wifi\_prov\_mgr\_deinit()*.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options :
  - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- *scheme\_event\_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app\_event\_handler* (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT` `s` that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↳*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                        "\n\tSSID      : %s\n\tPassword : %s",
                        (const char *) wifi_sta_cfg->ssid,
                        (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↳reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                        "\n\tPlease reset to factory and retry_
↳provisioning",
```

(下页继续)

```

        (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
        "Wi-Fi station authentication failed" : "Wi-Fi_
↪access-point not found");
        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses *protocomm*, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```

const char *service_name = "my_device";
const char *service_key  = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**注解:** If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning( security, pop, service_
↳ name, service_key ) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`s` and call `:cpp:func:`wifi_prov_mgr_deinit()`` when event ID is ``WIFI_PROV_END:`

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

表 5: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<a href="http://&lt;mdns-hostname&gt;.local/prov-session">http://&lt;mdns-hostname&gt;.local/prov-session</a>	Security endpoint used for session establishment
prov-scan	<a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a>	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<a href="http://&lt;mdns-hostname&gt;.local/prov-config">http://&lt;mdns-hostname&gt;.local/prov-config</a>	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://&lt;mdns-hostname&gt;.local/proto-ver">http://&lt;mdns-hostname&gt;.local/proto-ver</a>	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the *proto-ver* endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no\_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my\_app* in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the *.proto* files found under `protocomm/proto`, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi\_config* commands, serialized as Protobuf messages (the corresponding *.proto* files can be found under `wifi_provisioning/proto`):

- *get\_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set\_config* - For setting the Wi-Fi connection credentials
- *apply\_config* - For applying the credentials saved during *set\_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi\_config* commands described above. The *wifi\_scan* endpoint supports the following protobuf commands:

- *scan\_start* - For starting Wi-Fi scan with various options:
  - *blocking* (input) - If true, the command returns only when the scanning is finished
  - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - *group\_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting *group\_channels* to 4, will create 5 groups, with each group having 3 channels, except the last one which will have  $14 \% 3 = 2$  channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been

scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- *period\_ms* (input) - Scan parameter specifying how long to wait on each channel
- *scan\_status* - Gives the status of scanning process :
  - *scan\_finished* (output) - When scan has finished this returns true
  - *result\_count* (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- *scan\_result* - For fetching scan results. This can be called even if scan is still on going
  - *start\_index* (input) - Starting index from where to fetch the entries from the results list
  - *count* (input) - Number of entries to fetch from the starting index
  - *entries* (output) - List of entries returned. Each entry consists of *ssid*, *channel* and *rssi* information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call [wifi\\_prov\\_mgr\\_endpoint\\_unregister\(\)](#) to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the [apply\\_config](#) command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next [get\\_status](#) command. If [get\\_status](#) command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and [get\\_status](#) will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling [wifi\\_prov\\_mgr\\_disable\\_auto\\_stop\(\)](#). Now the provisioning service will only be stopped after an explicit call to [wifi\\_prov\\_mgr\\_stop\\_provisioning\(\)](#), which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI\_PROV\_END event gets emitted. This delay is specified by the argument to [wifi\\_prov\\_mgr\\_disable\\_auto\\_stop\(\)](#).

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling [wifi\\_prov\\_mgr\\_stop\\_provisioning\(\)](#) inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

## Application Examples

For complete example implementation see [provisioning/manager](#)

## API Reference

### Header File

- [wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)

### Functions

*esp\_err\_t* **wifi\_prov\_mgr\_init** (*wifi\_prov\_mgr\_config\_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Fail

#### Parameters

- [in] config: Configuration structure

void **wifi\_prov\_mgr\_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI\_PROV\_END, and then performs the de-initialization

*esp\_err\_t* **wifi\_prov\_mgr\_is\_provisioned** (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp\_wifi component

If one were to call esp\_wifi\_set\_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note** Calling wifi\_prov\_mgr\_start\_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

#### Return

- ESP\_OK : Retrieved provision state successfully
- ESP\_FAIL : Wi-Fi not initialized
- ESP\_ERR\_INVALID\_ARG : Null argument supplied
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

#### Parameters

- [out] provisioned: True if provisioned, else false

*esp\_err\_t* **wifi\_prov\_mgr\_start\_provisioning** (*wifi\_prov\_security\_t* security, const char \*pop, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi\_prov\_scheme\_ble : This starts protocomm\_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi\_prov\_scheme\_softap : This activates SoftAP mode of Wi-Fi and starts protocomm\_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type \_esp\_wifi\_prov.\_tcp)

Event WIFI\_PROV\_START is emitted right after provisioning starts without failure

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

**Return**

- ESP\_OK : Provisioning started successfully
- ESP\_FAIL : Failed to start provisioning service
- ESP\_ERR\_INVALID\_STATE : Provisioning manager not initialized or already started

**Parameters**

- [in] `security`: Specify which protocomm security scheme to use :
  - WIFI\_PROV\_SECURITY\_0 : For no security
  - WIFI\_PROV\_SECURITY\_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- [in] `pop`: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- [in] `service_name`: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- [in] `service_key`: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

void **wifi\_prov\_mgr\_stop\_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleaup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (uint32\_t *cleanup\_delay*)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Return**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_STATE : Manager not initialized or provisioning service already started

**Parameters**

- [in] `cleanup_delay`: Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

*esp\_err\_t* `wifi_prov_mgr_set_app_info` (`const` char \**label*, `const` char \**version*, `const` char \*\**capabilities*, `size_t` *total\_capabilities*)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Return**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_STATE : Manager not initialized or provisioning service already started
- ESP\_ERR\_NO\_MEM : Failed to allocate memory for version string
- ESP\_ERR\_INVALID\_ARG : Null argument

**Parameters**

- [in] `label`: String indicating the application name.
- [in] `version`: String indicating the application version. There is no constraint on format.
- [in] `capabilities`: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] `total_capabilities`: Size of capabilities array

*esp\_err\_t* `wifi_prov_mgr_endpoint_create` (`const` char \**ep\_name*)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Failure

**Parameters**

- [in] `ep_name`: unique name of the endpoint

*esp\_err\_t* `wifi_prov_mgr_endpoint_register` (`const` char \**ep\_name*, *proto-comm\_req\_handler\_t* *handler*, void \**user\_ctx*)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service

is stopped and hence all endpoints are unregistered

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

#### Parameters

- [in] ep\_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user\_ctx: User data

void **wifi\_prov\_mgr\_endpoint\_unregister** (const char \*ep\_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

#### Parameters

- [in] ep\_name: Name of the endpoint

*esp\_err\_t* **wifi\_prov\_mgr\_event\_handler** (void \*ctx, *system\_event\_t* \*event)

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

**Note** : This function is DEPRECATED, because events are now handled internally using the event loop library, esp\_event. Calling this will do nothing and simply return ESP\_OK.

#### Return

- ESP\_OK : Event handled successfully

#### Parameters

- [in] ctx: Event context data
- [in] event: Event info

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_state** (*wifi\_prov\_sta\_state\_t* \*state)

Get state of Wi-Fi Station during provisioning.

#### Return

- ESP\_OK : Successfully retrieved Wi-Fi state
- ESP\_FAIL : Provisioning app not running

#### Parameters

- [out] state: Pointer to wifi\_prov\_sta\_state\_t variable to be filled

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_disconnect\_reason** (*wifi\_prov\_sta\_fail\_reason\_t* \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

#### Return

- ESP\_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP\_FAIL : Provisioning app not running

#### Parameters

- [out] reason: Pointer to wifi\_prov\_sta\_fail\_reason\_t variable to be filled

*esp\_err\_t* **wifi\_prov\_mgr\_configure\_sta** (*wifi\_config\_t* \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI\_PROV\_CRED\_RECV is emitted after credentials have been applied and Wi-Fi station started

#### Return

- ESP\_OK : Wi-Fi configured and started successfully
- ESP\_FAIL : Failed to set configuration

**Parameters**

- [in] `wifi_cfg`: Pointer to Wi-Fi configuration structure

**Structures****struct wifi\_prov\_event\_handler\_t**

Event handler that is used by the manager while provisioning service is active.

**Public Members***wifi\_prov\_cb\_func\_t* **event\_cb**

Callback function to be executed on provisioning events

void **\*user\_data**

User context data to pass as parameter to callback function

**struct wifi\_prov\_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

**Public Members***esp\_err\_t* (**\*prov\_start**) (*protocomm\_t* \*pc, void \*config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

*esp\_err\_t* (**\*prov\_stop**) (*protocomm\_t* \*pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void **(\*new\_config)** (void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov\_start()*

void **(\*delete\_config)** (void \*config)

Function which is to be called by the manager to delete a configuration generated using *new\_config()*

*esp\_err\_t* (**\*set\_config\_service**) (void \*config, **const** char \*service\_name, **const** char \*service\_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

*esp\_err\_t* (**\*set\_config\_endpoint**) (void \*config, **const** char \*endpoint\_name, uint16\_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

*wifi\_mode\_t* **wifi\_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- `WIFI_MODE_APSTA` for SoftAP transport
- `WIFI_MODE_STA` for BLE transport

**struct wifi\_prov\_mgr\_config\_t**

Structure for specifying the manager configuration.

## Public Members

### *wifi\_prov\_scheme\_t* **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

### *wifi\_prov\_event\_handler\_t* **scheme\_event\_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

### *wifi\_prov\_event\_handler\_t* **app\_event\_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

## Macros

### **WIFI\_PROV\_EVENT\_HANDLER\_NONE**

Event handler can be set to none if not used.

## Type Definitions

```
typedef void (*wifi_prov_cb_func_t) (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

## Enumerations

```
enum wifi_prov_cb_event_t
```

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

*Values:*

```
WIFI_PROV_INIT
```

Emitted when the manager is initialized

```
WIFI_PROV_START
```

Indicates that provisioning has started

```
WIFI_PROV_CRED_RECV
```

Emitted when Wi-Fi AP credentials are received via protocomm endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

**WIFI\_PROV\_CRED\_FAIL**

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

**WIFI\_PROV\_CRED\_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

**WIFI\_PROV\_END**

Signals that provisioning service has stopped

**WIFI\_PROV\_DEINIT**

Signals that manager has been de-initialized

**enum wifi\_prov\_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by `protocomm`

Values:

**WIFI\_PROV\_SECURITY\_0 = 0**

No security (plain-text communication)

**WIFI\_PROV\_SECURITY\_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_ble.h](#)

**Functions**

```
void wifi_prov_scheme_ble_event_cb_free_bt(dm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
```

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

**Return**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

**Parameters**

- `[in] uuid128`: A custom 128 bit UUID

**Macros**

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
```

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
```

**WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BT****Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_softap.h](#)

**Functions**

void **wifi\_prov\_scheme\_softap\_set\_httpd\_handle** (void \**handle*)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note** This API should be called before `wifi_prov_mgr_start_provisioning()`

**Parameters**

- [in] *handle*: Handle to HTTPD server instance

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_console.h](#)

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/wifi\\_config.h](#)

**Functions**

*esp\_err\_t* **wifi\_prov\_config\_data\_handler** (uint32\_t *session\_id*, const uint8\_t \**inbuf*, ssize\_t *inlen*, uint8\_t \*\**outbuf*, ssize\_t \**outlen*, void \**priv\_data*)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

**Structures**

**struct wifi\_prov\_sta\_conn\_info\_t**

WiFi STA connected status information.

**Public Members**

char **ip\_addr**[IP4ADDR\_STRLEN\_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8\_t **channel**

Channel of the AP

uint8\_t **auth\_mode**

Authorization mode of the AP

**struct wifi\_prov\_config\_get\_data\_t**

WiFi status data to be sent in response to `get_status` request from master.

**Public Members***wifi\_prov\_sta\_state\_t* **wifi\_state**

WiFi state of the station

*wifi\_prov\_sta\_fail\_reason\_t* **fail\_reason**Reason for disconnection (valid only when *wifi\_state* is `WIFI_STATION_DISCONNECTED`)*wifi\_prov\_sta\_conn\_info\_t* **conn\_info**Connection information (valid only when *wifi\_state* is `WIFI_STATION_CONNECTED`)**struct** *wifi\_prov\_config\_set\_data\_t*WiFi config data received by slave during `set_config` request from master.**Public Members**char **ssid**[33]

SSID of the AP to which the slave is to be connected

char **password**[64]

Password of the AP

char **bssid**[6]

BSSID of the AP

uint8\_t **channel**

Channel of the AP

**struct** *wifi\_prov\_config\_handlers*

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.**Public Members***esp\_err\_t* (**\*get\_status\_handler**) (*wifi\_prov\_config\_get\_data\_t* \*resp\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

*esp\_err\_t* (**\*set\_config\_handler**) (**const** *wifi\_prov\_config\_set\_data\_t* \*req\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

*esp\_err\_t* (**\*apply\_config\_handler**) (*wifi\_prov\_ctx\_t* \*\*ctx)Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.*wifi\_prov\_ctx\_t* \*ctx

Context pointer to be passed to above handler functions upon invocation

**Type Definitions****typedef struct** *wifi\_prov\_ctx* **wifi\_prov\_ctx\_t**Type of context data passed to each `get/set/apply` handler function set in *wifi\_prov\_config\_handlers* structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

**typedef struct** *wifi\_prov\_config\_handlers* **wifi\_prov\_config\_handlers\_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for `protocomm` request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Enumerations

#### `enum wifi_prov_sta_state_t`

WiFi STA status for conveying back to the provisioning master.

Values:

`WIFI_PROV_STA_CONNECTING`

`WIFI_PROV_STA_CONNECTED`

`WIFI_PROV_STA_DISCONNECTED`

#### `enum wifi_prov_sta_fail_reason_t`

WiFi STA connection fail reason.

Values:

`WIFI_PROV_STA_AUTH_ERROR`

`WIFI_PROV_STA_AP_NOT_FOUND`

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 `provisioning` 目录下。

## 2.6 存储 API

[English]

### 2.6.1 SPI Flash API

[English]

#### 概述

SPI Flash 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数，同时也提供了更高层级的，面向分区的 API 函数（定义在分区表中）。

与 ESP-IDF V4.0 之前的 API 不同，这一版 API 功能并不局限于主 SPI Flash 芯片（即运行程序的 SPI Flash 芯片）。使用不同的芯片指针，您可以通过 SPI0/1 或 HSPI/VSPI 总线访问外部 flash。

---

**注解：**ESP-IDF V4.0 之后的 flash API 不再是原子的。因此，如果 flash 操作地址有重叠，且写操作与读操作同时执行，读操作可能会返回一部分写入之前的数据，返回一部分写入之后的数据。

---

Kconfig 选项 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 可将 `spi_flash_*` 函数切换至 ESP-IDF V4.0 之前的实现。但是，如果同时使用新旧 API，代码量可能会增多。

即便未启用 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`，加密读取和加密写入操作也均使用旧实现。因此，仅有主 flash 芯片支持加密操作，其他不同片选（经 SPI1 访问的 flash 芯片）则不支持加密操作。

#### 初始化 Flash 设备

在使用 `esp_flash_*` API 之前，您需要在 SPI 总线上初始化芯片。

1. 调用 `spi_bus_initialize()` 初始化 SPI 总线，此函数将初始化总线上设备间共享的资源，如 I/O、DMA 及中断等。
2. 调用 `spi_bus_add_flash_device()` 将 flash 设备连接到总线上。然后分配内存，填充 `esp_flash_t` 结构体，同时初始化 CS I/O。

3. 调用 `esp_flash_init()` 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

**注解：**目前，多个 flash 芯片可连接到同一总线。但尚不支持在同一个 SPI 总线上使用 `esp_flash_*` 和 `spi_device_*` 设备。

## SPI Flash 访问 API

如下所示为处理 flash 中数据的函数集：

- `esp_flash_read()`：将数据从 flash 读取到 RAM；
- `esp_flash_write()`：将数据从 RAM 写入到 flash；
- `esp_flash_erase_region()`：擦除 flash 中指定区域的数据；
- `esp_flash_erase_chip()`：擦除整个 flash；
- `esp_flash_get_chip_size()`：返回 menuconfig 中设置的 flash 芯片容量（以字节为单位）。

一般来说，请尽量避免对主 SPI flash 芯片直接使用原始 SPI flash 函数，如需对主 SPI flash 芯片进行操作，请使用分区专用函数。

## SPI Flash 容量

SPI flash 容量存储于引导程序映像头部（烧录偏移量为 0x1000）的一个字段。

默认情况下，引导程序写入 flash 时，`esptool.py` 将引导程序写入 flash 时，会自动检测 SPI flash 容量，同时使用正确容量更新引导程序的头部。您也可以工程配置中设置 `CONFIG_ESPTOOLPY_FLASHSIZE`，生成固定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量，请配置 `g_rom_flashchip` 结构中的 `chip_size`。`esp_flash_*` 函数使用此容量（于软件和 ROM 中）进行边界检查。

## SPI1 Flash 并发约束

由于 SPI1 flash 也被用于执行固件（通过指令 cache 或数据 cache），因此在执行读取、写入及擦除操作时，必须禁用这些 cache。这意味着在执行 flash 写操作时，两个 CPU 必须从 IRAM 运行代码，且只能从 DRAM 中读取数据。

如果您使用本文中 API 函数，上述限制将自动生效且透明（无需您额外关注），但这些限制可能会影响系统中的其他任务的性能。

除 SPI0/1 以外的 SPI 总线上的其它 flash 芯片则不受这种限制。

请参阅[应用程序内存分布](#)，查看 IRAM、DRAM 和 flash cache 的区别。

为避免意外读取 flash cache，一个 CPU 在启动 flash 写入或擦除操作时，另一个 CPU 将阻塞，并且在 flash 操作完成前，两个 CPU 上的所有的非 IRAM 安全的中断都会被禁用。

**IRAM 安全中断处理程序** 如果您需要在 flash 操作期间运行中断处理程序（比如低延迟操作），请在[注册中断处理程序](#)时设置 `ESP_INTR_FLAG_IRAM`。

请确保中断处理程序访问的所有数据和函数（包括其调用的数据和函数）都存储在 IRAM 或 DRAM 中。

为函数添加 `IRAM_ATTR` 属性：

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

为常量添加 DRAM\_ATTR 和 DRAM\_STR 属性:

```
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

辨别哪些数据应标记为 DRAM\_ATTR 可能会比较困难, 除非明确标记为 DRAM\_ATTR, 否则编译器依然可能将某些变量或表达式当做常量 (即便没有 const 标记), 并将其放入 flash。

如果函数或符号未被正确放入 IRAM/DRAM 中, 当中断处理程序在 flash 操作期间从 flash cache 中读取数据, 则会产生非法指令异常 (这是因为代码未被正确放入 IRAM) 或读取垃圾数据 (这是因为常数未被正确放入 DRAM), 而导致崩溃。

## 分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息, 包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参考[分区表](#), 查看详细信息。

该组件在 esp\_partition.h 中声明了一些 API 函数, 用以枚举在分区表中找到的分区, 并对这些分区执行操作:

- `esp_partition_find()`: 在分区表中查找特定类型的条目, 返回一个不透明迭代器;
- `esp_partition_get()`: 返回一个结构, 描述给定迭代器的分区;
- `esp_partition_next()`: 将迭代器移至下一个找到的分区;
- `esp_partition_iterator_release()`: 释放 `esp_partition_find` 中返回的迭代器;
- `esp_partition_find_first()`: 返回一个结构, 描述 `esp_partition_find` 中找到的第一个分区;
- `esp_partition_read()`、`esp_partition_write()` 和 `esp_partition_erase_range()` 在分区边界内执行, 等同于 `spi_flash_read()`、`spi_flash_write()` 和 `spi_flash_erase_range()`。

**注解:** 请在应用程序代码中使用上述 `esp_partition_*` API 函数, 而非低层级的 `spi_flash_*` API 函数。分区表 API 函数根据存储在分区表中的数据, 进行边界检查并计算在 flash 中的正确偏移量。

## SPI Flash 加密

您可以对 SPI flash 内容进行加密, 并在硬件层对其进行透明解密。

请参阅[Flash 加密](#), 查看详细信息。

## 内存映射 API

ESP32 内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间, 此映射仅用于读操作。不能通过写入 flash 映射的存储区域来改变 flash 中内容。

Flash 以 64 KB 页为单位进行地址映射。内存映射硬件最多可将 4 MB flash 映射到数据地址空间, 将 16 MB flash 映射到指令地址空间。请参考《ESP32 技术参考手册》查看内存映射硬件的详细信息。

请注意, 有些 64 KB 页还用于将应用程序映射到内存中, 因此实际可用的 64 KB 页会更少一些。

[Flash 加密](#) 启用时, 使用内存映射区域从 flash 读取数据是解密 flash 的唯一方法, 解密需在硬件层进行。

内存映射 API 在 `esp_spi_flash.h` 和 `esp_partition.h` 中声明:

- `spi_flash_mmap()`: 将 flash 物理地址区域映射到 CPU 指令空间或数据空间;
- `spi_flash_munmap()`: 取消上述区域的映射;
- `esp_partition_mmap()`: 将分区的一部分映射至 CPU 指令空间或数据空间;

`spi_flash_mmap()` 和 `esp_partition_mmap()` 的区别如下:

- `spi_flash_mmap()`: 需要给定一个 64 KB 对齐的物理地址;
- `esp_partition_mmap()`: 给定分区内任意偏移量即可, 此函数根据需要将返回的指针调整至指向映射内存。

内存映射在 64 KB 块中进行, 如果分区已传递给 `esp_partition_mmap`, 则可读取分区外数据。

## 实现

`esp_flash_t` 结构包含芯片数据和该 API 的三个重要部分:

1. 主机驱动, 为访问芯片提供硬件支持;
2. 芯片驱动, 为不同芯片提供兼容性服务;
3. OS 函数, 在不同阶段 (一级或二级 Boot 或者应用程序阶段) 为部分 OS 函数提供支持 (如一些锁、延迟)。

**主机驱动** 主机驱动依赖 `soc/include/hal` 文件夹下 `spi_flash_host_drv.h` 定义的 `spi_flash_host_driver_t` 接口。该接口提供了一些与芯片通信常用的函数。

在 SPI HAL 文件中, 有些函数是基于现有的 ESP32 `memory-spi` 来实现的。但是, 由于 ESP32 速度限制, HAL 层无法提供某些读命令的高速实现 (所以这些命令根本没有在 HAL 的文件中被实现)。`memspi_host_driver.h` 和 `.c` 文件使用 HAL 提供的 `common_command` 函数实现上述读命令的高速版本, 并将所有它实现的及 HAL 函数封装为 `spi_flash_host_driver_t` 供更上层调用。

您也可以实现自己的主机驱动, 甚至只通过简单的 GPIO。只要实现了 `spi_flash_host_driver_t` 中所有函数, 不管底层硬件是什么, `esp_flash` API 都可以访问 flash。

**芯片驱动** 芯片驱动在 `spi_flash_chip_driver.h` 中进行定义, 并将主机驱动提供的基本函数进行封装以供 API 层使用。

有些操作需在执行前先发送命令, 或在执行后读取状态, 因此有些芯片需要不同的命令或值以及通信方式。

`generic chip` 芯片代表了常见的 flash 芯片, 其他芯片驱动可以在通用芯片的基础上进行开发。

芯片驱动依赖主机驱动。

**OS 函数** OS 函数层提供访问锁和延迟的方法。

该锁定用于解决 SPI Flash 芯片访问和其他函数之间的冲突。例如, 经 SPI0/1 访问 flash 芯片时, 应当禁用 cache (平时用于取代码和 PSRAM 数据)。另一种情况是, 一些没有 CS 线或者 CS 线受软件控制的设备 (如通过 SPI 接口的 SD 卡控制) 需要在一段时间内独占总线。

延时则用于某些长时操作, 需要主机处于等待状态或执行轮询。

顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件, 并提供参数检查。

## 另请参考

- [分区表](#)
- [OTA API](#) 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- [NVS API](#) 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

## 实现细节

必须确保操作期间, 两个 CPU 均未从 flash 运行代码, 实现细节如下:

- 单核模式下, SDK 在执行 flash 操作前将禁用中断或调度算法。
- 双核模式下, 实现细节更为复杂, SDK 需确保两个 CPU 均未运行 flash 代码。

如果有 SPI flash API 在 CPU A (PRO 或 APP) 上调用, 它使用 `esp_ipc_call` API 在 CPU B 上运行 `s_flash_op_block_func` 函数。`esp_ipc_call` API 在 CPU B 上唤醒一个高优先级任务, 即运行 `s_flash_op_block_func` 函数。运行该函数将禁用 CPU B 上的 cache, 并使用 `s_flash_op_can_start` 旗帜来标志 cache 已禁用。然后, CPU A 上的任务也会禁用 cache 并继续执行 flash 操作。

执行 flash 操作时, CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中, 如果新添加了中断分配 API, 则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

Flash 操作完成后, CPU A 上的函数将设置另一标志位, 即 `s_flash_op_complete`, 用以通知 CPU B 上的任务可以重新启用 cache 并释放 CPU。接着, CPU A 上的函数也重新启用 cache, 并将控制权返还给调用者。

另外, 所有 API 函数均受互斥量 `s_flash_op_mutex` 保护。

在单核环境中 (启用 `CONFIG_FREERTOS_UNICORE`), 您需要禁用上述两个 cache 以防发生 CPU 间通信。

## SPI Flash API 参考

### Header File

- `s_flash/include/esp_flash_spi_init.h`

### Functions

`esp_err_t spi_bus_add_flash_device` (`esp_flash_t` `out_chip`, `const esp_flash_spi_device_config_t` `config`)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

#### Return

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

#### Parameters

- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

`esp_err_t spi_bus_remove_flash_device` (`esp_flash_t` `chip`)

Remove a SPI Flash device from the SPI bus.

#### Return

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

#### Parameters

- `chip`: The flash device to remove.

### Structures

`struct esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

#### Public Members

`spi_host_device_t` `host_id`

Bus to use.

`int` `cs_id`

CS pin (signal) to use.

`int` `cs_io_num`

GPIO pin to output the CS signal.

*esp\_flash\_io\_mode\_t* **io\_mode**  
IO mode to read from the Flash.

*esp\_flash\_speed\_t* **speed**  
Speed of the Flash clock.

int **input\_delay\_ns**  
Input delay of the data pins, in ns. Set to 0 if unknown.

## Header File

- [spi\\_flash/include/esp\\_flash.h](#)

## Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)  
Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

**Note** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

**Note** If the `chip->drv` pointer is NULL, chip `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

**Return** ESP\_OK on success, or a flash error code if initialisation fails.

### Parameters

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)  
Check if appropriate chip driver is set.

**Return** true if set, otherwise false.

### Parameters

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

*esp\_err\_t* **esp\_flash\_read\_id** (*esp\_flash\_t* \*chip, uint32\_t \*out\_id)  
Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] `out_id`: Pointer to receive ID value.

**Return** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_size** (*esp\_flash\_t* \*chip, uint32\_t \*out\_size)  
Detect flash size based on flash ID.

**Note** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

**Return** ESP\_OK on success, or a flash error code if operation failed.

### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] `out_size`: Detected size in bytes.

*esp\_err\_t* **esp\_flash\_erase\_chip** (*esp\_flash\_t* \*chip)  
Erase flash chip contents.

**Return** ESP\_OK on success, or a flash error code if operation failed.

### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

*esp\_err\_t* **esp\_flash\_erase\_region** (*esp\_flash\_t* \*chip, uint32\_t start, uint32\_t len)  
Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) `ESP_ERR_INVALID_ARG` will be returned if the start & length are not a multiple of this size.

#### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `start`: Address to start erasing flash. Must be sector aligned.
- `len`: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Return** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* `esp_flash_get_chip_write_protect` (*esp\_flash\_t* \**chip*, bool \**write\_protected*)

Read if the entire chip is write protected.

**Note** A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the ‘`chip->drv`’ field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

#### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] `write_protected`: Pointer to boolean, set to the value of the write protect flag.

*esp\_err\_t* `esp_flash_set_chip_write_protect` (*esp\_flash\_t* \**chip*, bool *write\_protect*)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the ‘`chip->drv`’ field).

#### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `write_protect`: Boolean value for the write protect flag

**Return** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* `esp_flash_get_protectable_regions` (const *esp\_flash\_t* \**chip*, const *esp\_flash\_region\_t* \*\**out\_regions*, uint32\_t *out\_num\_regions*)

Read the list of individually protectable regions of this SPI flash chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the ‘`chip->drv`’ field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

#### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] `out_regions`: Pointer to receive a pointer to the array of protectable regions of the chip.
- [out] `out_num_regions`: Pointer to an integer receiving the count of protectable regions in the array returned in ‘`regions`’.

*esp\_err\_t* `esp_flash_get_protected_region` (*esp\_flash\_t* \**chip*, const *esp\_flash\_region\_t* \**region*, bool \**out\_protected*)

Detect if a region of the SPI flash chip is protected.

**Note** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the ‘`chip->drv`’ field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

#### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- `[out] out_protected`: Pointer to a flag which is set based on the protected status for this region.

*esp\_err\_t* **esp\_flash\_set\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool protect)

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- `protect`: Write protection flag to set.

*esp\_err\_t* **esp\_flash\_read** (*esp\_flash\_t* \*chip, void \*buffer, uint32\_t address, uint32\_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `buffer`: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- `address`: Address on flash to read from. Must be less than `chip->size` field.
- `length`: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Return**

- `ESP_OK`: success
- `ESP_ERR_NO_MEM`: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write** (*esp\_flash\_t* \*chip, const void \*buffer, uint32\_t address, uint32\_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `address`: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- `length`: Length (in bytes) of data to write.

**Return** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, const void \*buffer, uint32\_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both address & length must be 16 byte aligned, as this is the encryption block size

**Return**

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: encrypted write not supported for this chip.
- `ESP_ERR_INVALID_ARG`: Either the address, buffer or length is invalid.

- or other flash error code from `spi_flash_write_encrypted()`.

#### Parameters

- `chip`: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- `address`: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write.
- `length`: Length (in bytes) of data to write. 16 byte aligned.

```
esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer,
                                     uint32_t length)
```

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

#### Return

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: encrypted read not supported for this chip.
- or other flash error code from `spi_flash_read_encrypted()`.

#### Parameters

- `chip`: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- `address`: Address on flash to read from.
- `out_buffer`: Pointer to a buffer for the data to read to.
- `length`: Length (in bytes) of data to read.

```
static bool esp_flash_is_quad_mode(const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Return** true if flash works in quad mode, otherwise false

#### Parameters

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

### Structures

```
struct esp_flash_region_t
```

Structure for describing a region of flash.

#### Public Members

```
uint32_t offset
```

Start address of this region.

```
uint32_t size
```

Size of the region.

```
struct esp_flash_os_functions_t
```

OS-level integration hooks for accessing flash chips inside a running OS

#### Public Members

```
esp_err_t (*start)(void *arg)
```

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

```
esp_err_t (*end)(void *arg)
```

Called after completing any flash operation.

```
esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)
```

Called before any erase/write operations to check whether the region is limited by the OS

```
esp_err_t (*delay_us)(void *arg, unsigned us)
```

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

*esp\_err\_t* (\*yield) (void \*arg)

Yield to other tasks. Called during erase operations.

### **struct esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`).

#### **Public Members**

*spi\_flash\_host\_driver\_t* \*host

Pointer to hardware-specific “host\_driver” structure. Must be initialized before used.

const *spi\_flash\_chip\_t* \*chip\_drv

Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const *esp\_flash\_os\_functions\_t* \*os\_func

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void \*os\_func\_data

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

*esp\_flash\_io\_mode\_t* read\_mode

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32\_t size

Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32\_t chip\_id

Detected chip id.

#### **Type Definitions**

```
typedef struct spi_flash_chip_t spi_flash_chip_t
```

```
typedef struct esp_flash_t esp_flash_t
```

#### **Header File**

- [soc/include/hal/spi\\_flash\\_types.h](#)

#### **Structures**

**struct spi\_flash\_trans\_t**

Definition of a common transaction. Also holds the return value.

#### **Public Members**

uint8\_t command

Command to send, always 8bits.

uint8\_t mosi\_len

Output data length, in bytes.

uint8\_t miso\_len

Input data length, in bytes.

uint8\_t address\_bitlen

Length of address in bits, set to 0 if command does not need an address.

uint32\_t address

Address to perform operation on.

**const uint8\_t \*mosi\_data**

Output data to salve.

**uint8\_t \*miso\_data**

[out] Input data from slave, little endian

**struct spi\_flash\_host\_driver\_t**

Host driver configuration and context structure.

### Public Members

**void \*driver\_data**

Configuration and static data used by the specific host driver. The type is determined by the host driver.

**esp\_err\_t (\*dev\_config) (spi\_flash\_host\_driver\_t \*driver)**

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

**esp\_err\_t (\*common\_command) (spi\_flash\_host\_driver\_t \*driver, spi\_flash\_trans\_t \*t)**

Send an user-defined spi transaction to the device.

**esp\_err\_t (\*read\_id) (spi\_flash\_host\_driver\_t \*driver, uint32\_t \*id)**

Read flash ID.

**void (\*erase\_chip) (spi\_flash\_host\_driver\_t \*driver)**

Erase whole flash chip.

**void (\*erase\_sector) (spi\_flash\_host\_driver\_t \*driver, uint32\_t start\_address)**

Erase a specific sector by its start address.

**void (\*erase\_block) (spi\_flash\_host\_driver\_t \*driver, uint32\_t start\_address)**

Erase a specific block by its start address.

**esp\_err\_t (\*read\_status) (spi\_flash\_host\_driver\_t \*driver, uint8\_t \*out\_sr)**

Read the status of the flash chip.

**esp\_err\_t (\*set\_write\_protect) (spi\_flash\_host\_driver\_t \*driver, bool wp)**

Disable write protection.

**void (\*program\_page) (spi\_flash\_host\_driver\_t \*driver, const void \*buffer, uint32\_t address, uint32\_t length)**

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

**bool (\*supports\_direct\_write) (spi\_flash\_host\_driver\_t \*driver, const void \*p)**

Check whether need to allocate new buffer to write

**bool (\*supports\_direct\_read) (spi\_flash\_host\_driver\_t \*driver, const void \*p)**

Check whether need to allocate new buffer to read

**int max\_write\_bytes**

maximum length of program\_page

**esp\_err\_t (\*read) (spi\_flash\_host\_driver\_t \*driver, void \*buffer, uint32\_t address, uint32\_t read\_len)**

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

**int max\_read\_bytes**

maximum length of read

**bool (\*host\_idle) (spi\_flash\_host\_driver\_t \*driver)**

Check whether the host is idle to perform new operations.

**esp\_err\_t (\*configure\_host\_io\_mode) (spi\_flash\_host\_driver\_t \*driver, uint32\_t command, uint32\_t addr\_bitlen, int dummy\_bitlen\_base, esp\_flash\_io\_mode\_t io\_mode)**

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

`void (*poll_cmd_done) (spi_flash_host_driver_t *driver)`  
Internal use, poll the HW until the last operation is done.

`esp_err_t (*flush_cache) (spi_flash_host_driver_t *driver, uint32_t addr, uint32_t size)`  
For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

## Macros

**ESP\_FLASH\_SPEED\_MIN**  
Lowest speed supported by the driver, currently 5 MHz.

**SPI\_FLASH\_READ\_MODE\_MIN**  
Slowest io mode supported by ESP32, currently SlowRd.

## Type Definitions

`typedef struct spi_flash_host_driver_t spi_flash_host_driver_t`

## Enumerations

**enum esp\_flash\_speed\_t**  
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

*Values:*

**ESP\_FLASH\_5MHZ = 0**  
The flash runs under 5MHz.

**ESP\_FLASH\_10MHZ**  
The flash runs under 10MHz.

**ESP\_FLASH\_20MHZ**  
The flash runs under 20MHz.

**ESP\_FLASH\_26MHZ**  
The flash runs under 26MHz.

**ESP\_FLASH\_40MHZ**  
The flash runs under 40MHz.

**ESP\_FLASH\_80MHZ**  
The flash runs under 80MHz.

**ESP\_FLASH\_SPEED\_MAX**  
The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

**enum esp\_flash\_io\_mode\_t**  
Mode used for reading from SPI flash.

*Values:*

**SPI\_FLASH\_SLOWRD = 0**  
Data read using single I/O, some limits on speed.

**SPI\_FLASH\_FASTRD**  
Data read using single I/O, no limit on speed.

**SPI\_FLASH\_DOUT**  
Data read using dual I/O.

**SPI\_FLASH\_DIO**  
Both address & data transferred using dual I/O.

**SPI\_FLASH\_QOUT**

Data read using quad I/O.

**SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

**SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is ESP\_FLASH\_READ\_MODE\_MAX-1.

## 分区表 API 参考

## Header File

- `spi_flash/include/esp_partition.h`

## Functions

`esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)`

Find partition based on one or more parameters.

**Return** iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found.

Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

**Parameters**

- `type`: Partition type, one of `esp_partition_type_t` values
- `subtype`: Partition subtype, one of `esp_partition_subtype_t` values. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- `label`: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

`const esp_partition_t *esp_partition_find_first(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)`

Find first partition based on one or more parameters.

**Return** pointer to `esp_partition_t` structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

**Parameters**

- `type`: Partition type, one of `esp_partition_type_t` values
- `subtype`: Partition subtype, one of `esp_partition_subtype_t` values. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- `label`: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

`const esp_partition_t *esp_partition_get(esp_partition_iterator_t iterator)`

Get `esp_partition_t` structure for given partition.

**Return** pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

**Parameters**

- `iterator`: Iterator obtained using `esp_partition_find`. Must be non-NULL.

`esp_partition_iterator_t esp_partition_next(esp_partition_iterator_t iterator)`

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Return** NULL if no partition was found, valid `esp_partition_iterator_t` otherwise.

**Parameters**

- `iterator`: Iterator obtained using `esp_partition_find`. Must be non-NULL.

`void esp_partition_iterator_release(esp_partition_iterator_t iterator)`

Release partition iterator.

**Parameters**

- `iterator`: Iterator obtained using `esp_partition_find`. Must be non-NULL.

**const** *esp\_partition\_t* \***esp\_partition\_verify** (**const** *esp\_partition\_t* \**partition*)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

#### Return

- If partition not found, returns NULL.
- If found, returns a pointer to the *esp\_partition\_t* structure in flash. This pointer is always valid for the lifetime of the application.

#### Parameters

- `partition`: Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

*esp\_err\_t* **esp\_partition\_read** (**const** *esp\_partition\_t* \**partition*, *size\_t* *src\_offset*, **void** \**dst*, *size\_t* *size*)

Read data from the partition.

**Return** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

#### Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst`: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- `src_offset`: Address of the data to be read, relative to the beginning of the partition.
- `size`: Size of data to be read, in bytes.

*esp\_err\_t* **esp\_partition\_write** (**const** *esp\_partition\_t* \**partition*, *size\_t* *dst\_offset*, **const** **void** \**src*, *size\_t* *size*)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `spi_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `spi_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

**Note** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Return** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

#### Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset`: Address where the data should be written, relative to the beginning of the partition.
- `src`: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- `size`: Size of data to be written, in bytes.

*esp\_err\_t* **esp\_partition\_erase\_range** (**const** *esp\_partition\_t* \**partition*, *size\_t* *offset*, *size\_t* *size*)

Erase part of the partition.

**Return** ESP\_OK, if the range was erased successfully; ESP\_ERR\_INVALID\_ARG, if `iterator` or `dst` are NULL; ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset`: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- `size`: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

```
esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size,
                             spi_flash_mmap_memory_t memory, const void **out_ptr,
                             spi_flash_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `spi_flash_munmap` function.

**Return** `ESP_OK`, if successful

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset`: Offset from the beginning of partition where mapping should start.
- `size`: Size of the area to be mapped.
- `memory`: Memory space where the region should be mapped
- `out_ptr`: Output, pointer to the mapped memory region
- `out_handle`: Output, handle which should be used for `spi_flash_munmap` call

```
esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns `ESP_ERR_IMAGE_INVALID`. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Return**

- `ESP_OK`: In case of successful operation.
- `ESP_ERR_INVALID_ARG`: The size was 0 or the `sha_256` was NULL.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for sha256 operation.
- `ESP_ERR_IMAGE_INVALID`: App partition doesn't contain a valid app image.
- `ESP_FAIL`: An allocation error occurred.

**Parameters**

- `[in] partition`: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- `[out] sha_256`: Returned SHA-256 digest for a given partition.

```
bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t
                                 *partition_2)
```

Check for the identity of two partitions by SHA-256 digest.

**Return**

- `True`: In case of the two firmware is equal.
- `False`: Otherwise

**Parameters**

- `[in] partition_1`: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- `[in] partition_2`: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

```
esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t
size, const char *label, esp_partition_type_t
type, esp_partition_subtype_t subtype, const
esp_partition_t **out_partition)
```

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp\_flash\_t* structure) as partitions. This allows using them with components which access SPI flash through the *esp\_partition* API.

#### Return

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL is enabled
- ESP\_ERR\_NO\_MEM if memory allocation has failed
- ESP\_ERR\_INVALID\_ARG if the new partition overlaps another partition on the same flash chip
- ESP\_ERR\_INVALID\_SIZE if the partition doesn't fit into the flash chip size

#### Parameters

- flash\_chip: Pointer to the structure identifying the flash chip
- offset: Address in bytes, where the partition starts
- size: Size of the partition in bytes
- label: Partition name
- type: One of the partition types (ESP\_PARTITION\_TYPE\_\*). Note that applications can not be booted from external flash chips, so using ESP\_PARTITION\_TYPE\_APP is not supported.
- subtype: One of the partition subtypes (ESP\_PARTITION\_SUBTYPE\_\*)
- [out] out\_partition: Output, if non-NULL, receives the pointer to the resulting *esp\_partition\_t* structure

```
esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)
```

Deregister the partition previously registered using *esp\_partition\_register\_external*.

#### Return

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition pointer is not found
- ESP\_ERR\_INVALID\_ARG if the partition comes from the partition table
- ESP\_ERR\_INVALID\_ARG if the partition was not registered using *esp\_partition\_register\_external* function.

#### Parameters

- partition: pointer to the partition structure obtained from *esp\_partition\_register\_external*,

### Structures

```
struct esp_partition_t
partition information structure
```

This is not the format in flash, that format is *esp\_partition\_info\_t*.

However, this is the format used by this API.

#### Public Members

```
esp_flash_t *flash_chip
SPI flash chip on which the partition resides
```

```
esp_partition_type_t type
partition type (app/data)
```

```
esp_partition_subtype_t subtype
partition subtype
```

```
uint32_t address
starting address of the partition in flash
```

`uint32_t size`  
size of the partition, in bytes

char `label[17]`  
partition label, zero-terminated ASCII string

bool `encrypted`  
flag is set to true if partition is encrypted

### Macros

`ESP_PARTITION_SUBTYPE_OTA` (i)  
Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

### Type Definitions

`typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t`  
Opaque partition iterator type.

### Enumerations

`enum esp_partition_type_t`  
Partition type.

**Note** Keep this enum in sync with PartitionDefinition class `gen_esp32part.py`

*Values:*

`ESP_PARTITION_TYPE_APP` = 0x00  
Application partition type.

`ESP_PARTITION_TYPE_DATA` = 0x01  
Data partition type.

`enum esp_partition_subtype_t`  
Partition subtype.

**Note** Keep this enum in sync with PartitionDefinition class `gen_esp32part.py`

*Values:*

`ESP_PARTITION_SUBTYPE_APP_FACTORY` = 0x00  
Factory application partition.

`ESP_PARTITION_SUBTYPE_APP_OTA_MIN` = 0x10  
Base for OTA partition subtypes.

`ESP_PARTITION_SUBTYPE_APP_OTA_0` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 0  
OTA partition 0.

`ESP_PARTITION_SUBTYPE_APP_OTA_1` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 1  
OTA partition 1.

`ESP_PARTITION_SUBTYPE_APP_OTA_2` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 2  
OTA partition 2.

`ESP_PARTITION_SUBTYPE_APP_OTA_3` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 3  
OTA partition 3.

`ESP_PARTITION_SUBTYPE_APP_OTA_4` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 4  
OTA partition 4.

`ESP_PARTITION_SUBTYPE_APP_OTA_5` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 5  
OTA partition 5.

`ESP_PARTITION_SUBTYPE_APP_OTA_6` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 6  
OTA partition 6.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_7** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 7  
OTA partition 7.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_8** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 8  
OTA partition 8.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_9** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 9  
OTA partition 9.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_10** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 10  
OTA partition 10.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_11** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 11  
OTA partition 11.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_12** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 12  
OTA partition 12.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_13** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 13  
OTA partition 13.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_14** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 14  
OTA partition 14.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_15** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 15  
OTA partition 15.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MAX** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 16  
Max subtype of OTA partition.

**ESP\_PARTITION\_SUBTYPE\_APP\_TEST** = 0x20  
Test application partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_OTA** = 0x00  
OTA selection partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_PHY** = 0x01  
PHY init data partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_NVS** = 0x02  
NVS partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_COREDUMP** = 0x03  
COREDUMP partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_NVS\_KEYS** = 0x04  
Partition for NVS keys.

**ESP\_PARTITION\_SUBTYPE\_DATA\_EFUSE\_EM** = 0x05  
Partition for emulate eFuse bits.

**ESP\_PARTITION\_SUBTYPE\_DATA\_ESPHTTPD** = 0x80  
ESPHTTPD partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_FAT** = 0x81  
FAT partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_SPIFFS** = 0x82  
SPIFFS partition.

**ESP\_PARTITION\_SUBTYPE\_ANY** = 0xff  
Used to search for partitions with any subtype.

## Flash 加密 API 参考

### Header File

- [bootloader\\_support/include/esp\\_flash\\_encrypt.h](#)

**Functions**

**static bool esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**Return** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t *src\_addr*, size\_t *data\_length*)

Encrypt-in-place a block of flash sectors.

**Note** This function resets RTC\_WDT between operations with sectors.

**Return** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

**Parameters**

- *src\_addr*: Source offset in flash. Should be multiple of 4096 bytes.
- *data\_length*: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

**Note** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp\_efuse\_disable\_rom\_download\_mode() before calling this function.

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Return**

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

**Note** This function is called automatically during app startup, it doesn't need to be called from the app.

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

**Enumerations**

enum **esp\_flash\_enc\_mode\_t**

*Values:*

ESP\_FLASH\_ENC\_MODE\_DISABLED

ESP\_FLASH\_ENC\_MODE\_DEVELOPMENT

ESP\_FLASH\_ENC\_MODE\_RELEASE

**2.6.2 SD/SDIO/MMC 驱动程序**

[English]

## 概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动 (`driver/include/driver/sdmmc_host.h`) 为以下功能提供 API:

- 发送命令至从设备
- 接收和发送数据
- 处理总线错误

初始化函数及配置函数:

- 如需初始化和配置 SDMMC 主机, 请参阅 [SDMMC 主机 API](#)
- 如需初始化和配置 SD SPI 主机, 请参阅 [SD SPI 主机 API](#)

本档中所述的 SDMMC 协议层仅处理 SD 协议相关事项, 例如卡初始化和数据传输命令。

协议层通过 `sdmmc_host_t` 结构体和主机协同工作, 该结构体包含指向主机各类函数的指针。

## 应用示例

ESP-IDF `storage/sd_card` 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例, 演示了先初始化卡, 然后使用 POSIX 和 C 库 API 向卡读写数据。请参考示例目录下 README.md 文件, 查看更多详细信息。

## 协议层 API

协议层具备 `sdmmc_host_t` 结构体, 此结构体描述了 SD/MMC 主机驱动, 列出了其功能, 并提供指向驱动程序函数的指针。协议层将卡信息储存于 `sdmmc_card_t` 结构体中。向 SD/MMC 主机发送命令时, 协议层调用时需要一个 `sdmmc_command_t` 结构体来描述命令、参数、预期返回值和需传输的数据 (如有)。

### 用于 SD 存储卡的 API

1. 初始化主机, 请调用主机驱动函数, 例如 `sdmmc_host_init()` 和 `sdmmc_host_init_slot()`;
2. 初始化卡, 请调用 `sdmmc_card_init()`, 并将参数 `host` (即主机驱动信息) 和参数 `card` (指向 `sdmmc_card_t` 结构体的指针) 传递给此函数。函数运行结束后, 将会向 `sdmmc_card_t` 结构体填充该卡的信息;
3. 读取或写入卡的扇区, 请分别调用 `sdmmc_read_sectors()` 和 `sdmmc_write_sectors()`, 并将参数 `card` (指向卡信息结构的指针) 传递给函数;
4. 如果不再使用该卡, 请调用主机驱动函数, 例如 `sdmmc_host_deinit()`, 以禁用主机外设, 并释放驱动程序分配的资源。

**用于 eMMC 芯片的 API** 从协议层的角度而言, eMMC 存储芯片与 SD 存储卡相同。尽管 eMMC 是芯片, 不具备卡的外形, 但由于协议相似 (`sdmmc_card_t`, `sdmmc_card_init`), 用于 SD 卡的一些概念同样适用于 eMMC 芯片。注意, eMMC 芯片不可通过 SPI 使用, 因此它与 SD API 主机驱动不兼容。

如需初始化 eMMC 内存并执行读/写操作, 请参照上一章节 SD 卡操作步骤。

**用于 SDIO 卡的 API** SDIO 卡初始化和检测过程与 SD 存储卡相同, 唯一的区别是 SDIO 模式下数据传输命令不同。

在卡初始化和卡检测 (通过运行 `sdmmc_card_init()`) 期间, 驱动仅配置 SDIO 卡如下寄存器:

1. I/O 中止 (0x06) 寄存器: 在该寄存器中设置 RES 位可重置卡的 I/O 部分;
2. 总线接口控制 (0x07) 寄存器: 如果主机和插槽配置中启用 4 线模式, 则驱动程序会尝试在该寄存器中设置总线宽度字段。如果字段设置成功, 则从机支持 4 线模式, 主机也切换至 4 线模式;
3. 高速 (0x13) 寄存器: 如果主机配置中启用高速模式, 则会在该寄存器中设置 SHS 位。

注意，驱动程序不会在 (1) I/O 使能寄存器和 Int 使能寄存器，及 (2) I/O 块大小中，设置任何位。应用程序可通过调用 `sdmmc_io_write_byte()` 来设置相关位。

如需设置卡配置或传输数据，请根据您的具体情况选择下表中的函数：

操作	读函数	写函数
使用 IO_RW_DIRECT (CMD52) 读写单个字节。	<code>sd- mmc_io_read_byte()</code>	<code>sd- mmc_io_write_byte()</code>
使用 IO_RW_EXTENDED (CMD53) 的字节模式读写多个字节。	<code>sd- mmc_io_read_bytes()</code>	<code>sd- mmc_io_write_bytes()</code>
块模式下，使用 IO_RW_EXTENDED (CMD53) 读写数据块。	<code>sd- mmc_io_read_blocks()</code>	<code>sd- mmc_io_write_blocks()</code>

使用 `sdmmc_io_enable_int()` 函数，应用程序可启用 SDIO 中断。

在单线模式下使用 SDIO 时，还需要连接 D1 线来启用 SDIO 中断。

如果您需要应用程序保持等待直至发生 SDIO 中断，请使用 `sdmmc_io_wait_int()` 函数。

**复合卡 (存储 + SDIO)** 该驱动程序不支持 SDIO 复合卡，复合卡会被视为 SDIO 卡。

**线程安全** 多数应用程序仅需在一个任务中使用协议层。因此，协议层在 `sdmmc_card_t` 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时不使用任何类型的锁。这种锁通常在较高级别实现，例如文件系统驱动程序。

## API 参考

### Header File

- `sdmmc/include/sdmmc_cmd.h`

### Functions

`esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)`

Probe and initialize SD/MMC card using given host

**Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

#### Return

- ESP\_OK on success
- One of the error codes from SDMMC host controller

#### Parameters

- `host`: pointer to structure defining host controller
- `out_card`: pointer to structure which will receive information about the card when the function completes

void `sdmmc_card_print_info`(FILE \*stream, const sdmmc\_card\_t \*card)

Print information about the card to a stream.

#### Parameters

- `stream`: stream obtained using `fopen` or `fdopen`
- `card`: card information structure initialized using `sdmmc_card_init`

`esp_err_t sdmmc_write_sectors`(sdmmc\_card\_t \*card, const void \*src, size\_t start\_sector, size\_t sector\_count)

Write given number of sectors to SD/MMC card

#### Return

- ESP\_OK on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmcard_init`
- `src`: pointer to data buffer to read data from; data size must be equal to `sector_count * card->csd.sector_size`
- `start_sector`: sector where to start writing
- `sector_count`: number of sectors to write

*esp\_err\_t* `sdmcard_read_sectors` (*sdmcard\_t* \*`card`, void \*`dst`, size\_t `start_sector`, size\_t `sector_count`)

Write given number of sectors to SD/MMC card

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmcard_init`
- `dst`: pointer to data buffer to write into; buffer size must be at least `sector_count * card->csd.sector_size`
- `start_sector`: sector where to start reading
- `sector_count`: number of sectors to read

*esp\_err\_t* `sdmcard_io_read_byte` (*sdmcard\_t* \*`card`, uint32\_t `function`, uint32\_t `reg`, uint8\_t \*`out_byte`)

Read one byte from an SDIO card using `IO_RW_DIRECT` (CMD52)

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmcard_init`
- `function`: IO function number
- `reg`: byte address within IO function
- [out] `out_byte`: output, receives the value read from the card

*esp\_err\_t* `sdmcard_io_write_byte` (*sdmcard\_t* \*`card`, uint32\_t `function`, uint32\_t `reg`, uint8\_t `in_byte`, uint8\_t \*`out_byte`)

Write one byte to an SDIO card using `IO_RW_DIRECT` (CMD52)

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmcard_init`
- `function`: IO function number
- `reg`: byte address within IO function
- `in_byte`: value to be written
- [out] `out_byte`: if not NULL, receives new byte value read from the card (read-after-write).

*esp\_err\_t* `sdmcard_io_read_bytes` (*sdmcard\_t* \*`card`, uint32\_t `function`, uint32\_t `addr`, void \*`dst`, size\_t `size`)

Read multiple bytes from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using `CMD53` in byte mode. For block mode, see `sdmcard_io_read_blocks`.

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if `size` exceeds 512 bytes
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmcard_init`
- `function`: IO function number
- `addr`: byte address within IO function where reading starts
- `dst`: buffer which receives the data read from card

- `size`: number of bytes to read

`esp_err_t sdmmc_io_write_bytes` (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write multiple bytes to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `src`: data to be written
- `size`: number of bytes to write

`esp_err_t sdmmc_io_read_blocks` (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read blocks of data from an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `dst`: buffer which receives the data read from card
- `size`: number of bytes to read, must be divisible by the card block size.

`esp_err_t sdmmc_io_write_blocks` (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write blocks of data to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `src`: data to be written
- `size`: number of bytes to read, must be divisible by the card block size.

`esp_err_t sdmmc_io_enable_int` (*sdmmc\_card\_t* \*card)

Enable SDIO interrupt in the SDMMC host

#### Return

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`

*esp\_err\_t* **sdmmc\_io\_wait\_int** (*sdmmc\_card\_t* \*card, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

#### Return

- ESP\_OK if the interrupt is received
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts
- ESP\_ERR\_TIMEOUT if the interrupt does not happen in timeout\_ticks

#### Parameters

- card: pointer to card information structure previously initialized using sdmmc\_card\_init
- timeout\_ticks: time to wait for the interrupt, in RTOS ticks

*esp\_err\_t* **sdmmc\_io\_get\_cis\_data** (*sdmmc\_card\_t* \*card, uint8\_t \*out\_buffer, size\_t buffer\_size, size\_t \*inout\_cis\_size)

Get the data of CIS region of a SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this functions store as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

#### Return

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_RESPONSE: if the card does not (correctly) support CIS.
- ESP\_ERR\_INVALID\_SIZE: CIS\_CODE\_END found, but buffer\_size is less than required size, which is stored in the inout\_cis\_size then.
- ESP\_ERR\_NOT\_FOUND: if the CIS\_CODE\_END not found. Increase input value of inout\_cis\_size or set it to 0, if you still want to search for the end; output value of inout\_cis\_size is invalid in this case.
- and other error code return from sdmmc\_io\_read\_bytes

#### Parameters

- card: pointer to card information structure previously initialized using sdmmc\_card\_init
- out\_buffer: Output buffer of the CIS data
- buffer\_size: Size of the buffer.
- inout\_cis\_size: Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer\_size. The function searches for CIS\_CODE\_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS\_CODE\_END is found.

*esp\_err\_t* **sdmmc\_io\_print\_cis\_info** (uint8\_t \*buffer, size\_t buffer\_size, FILE \*fp)

Parse and print the CIS information of a SDIO card.

**Note** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc\_io.c and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

#### Return

- ESP\_OK: on success
- ESP\_ERR\_NOT\_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP\_ERR\_INVALID\_SIZE: if the CIS size fields are not correct.

#### Parameters

- buffer: Buffer to parse
- buffer\_size: Size of the buffer.
- fp: File pointer to print to, set to NULL to print to stdout.

### Header File

- [driver/include/driver/sdmmc\\_types.h](#)

### Structures

**struct** **sdmmc\_csd\_t**

Decoded values from SD card Card Specific Data register

**Public Members**

int **csd\_ver**  
CSD structure format

int **mmc\_ver**  
MMC version (for CID format)

int **capacity**  
total number of sectors

int **sector\_size**  
sector size in bytes

int **read\_block\_len**  
block length for reads

int **card\_command\_class**  
Card Command Class for SD

int **tr\_speed**  
Max transfer speed

**struct sdmmc\_cid\_t**  
Decoded values from SD card Card IDentification register

**Public Members**

int **mfg\_id**  
manufacturer identification number

int **oem\_id**  
OEM/product identification number

char **name**[8]  
product name (MMC v1 has the longest)

int **revision**  
product revision

int **serial**  
product serial number

int **date**  
manufacturing date

**struct sdmmc\_scr\_t**  
Decoded values from SD Configuration Register

**Public Members**

int **sd\_spec**  
SD Physical layer specification version, reported by card

int **bus\_width**  
bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

**struct sdmmc\_ext\_csd\_t**  
Decoded values of Extended Card Specific Data

**Public Members**

uint8\_t **power\_class**  
Power class used by the card

**struct sdmmc\_switch\_func\_rsp\_t**  
SD SWITCH\_FUNC response buffer

### Public Members

uint32\_t **data**[512 / 8 / sizeof(uint32\_t)]  
response data

**struct sdmmc\_command\_t**  
SD/MMC command information

### Public Members

uint32\_t **opcode**  
SD or MMC command index

uint32\_t **arg**  
SD/MMC command argument

*sdmmc\_response\_t* **response**  
response buffer

void \***data**  
buffer to send or read into

size\_t **datalen**  
length of data buffer

size\_t **blklen**  
block length

int **flags**  
see below

*esp\_err\_t* **error**  
error returned from transfer

int **timeout\_ms**  
response timeout, in milliseconds

**struct sdmmc\_host\_t**  
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

### Public Members

uint32\_t **flags**  
flags defining host properties

int **slot**  
slot number, to be passed to host functions

int **max\_freq\_khz**  
max frequency supported by the host

float **io\_voltage**  
I/O voltage used by the controller (voltage switching is not supported)

*esp\_err\_t* (\***init**) (void)  
Host function to initialize the driver

*esp\_err\_t* (\***set\_bus\_width**) (int slot, size\_t width)  
host function to set bus width

size\_t (\***get\_bus\_width**) (int slot)  
host function to get bus width

*esp\_err\_t* (\***set\_bus\_ddr\_mode**) (int slot, bool ddr\_enable)  
host function to set DDR mode

*esp\_err\_t* (\***set\_card\_clk**) (int slot, uint32\_t freq\_khz)  
host function to set card clock frequency

*esp\_err\_t* (\***do\_transaction**) (int slot, *sdmmc\_command\_t* \*cmdinfo)  
host function to do a transaction

*esp\_err\_t* (\***deinit**) (void)  
host function to deinitialize the driver

*esp\_err\_t* (\***io\_int\_enable**) (int slot)  
Host function to enable SDIO interrupt line

*esp\_err\_t* (\***io\_int\_wait**) (int slot, TickType\_t timeout\_ticks)  
Host function to wait for SDIO interrupt line to be active

int **command\_timeout\_ms**  
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

**struct sdmmc\_card\_t**  
SD/MMC card information structure

### Public Members

*sdmmc\_host\_t* **host**  
Host with which the card is associated

uint32\_t **ocr**  
OCR (Operation Conditions Register) value

*sdmmc\_cid\_t* **cid**  
decoded CID (Card IDentification) register value

*sdmmc\_response\_t* **raw\_cid**  
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

*sdmmc\_csd\_t* **csd**  
decoded CSD (Card-Specific Data) register value

*sdmmc\_scr\_t* **scr**  
decoded SCR (SD card Configuration Register) value

*sdmmc\_ext\_csd\_t* **ext\_csd**  
decoded EXT\_CSD (Extended Card Specific Data) register value

uint16\_t **rca**  
RCA (Relative Card Address)

uint16\_t **max\_freq\_khz**  
Maximum frequency, in kHz, supported by the card

uint32\_t **is\_mem** : 1  
Bit indicates if the card is a memory card

uint32\_t **is\_sdio** : 1  
Bit indicates if the card is an IO card

uint32\_t **is\_mmc** : 1  
Bit indicates if the card is MMC

`uint32_t num_io_functions` : 3  
If `is_sdio` is 1, contains the number of IO functions on the card

`uint32_t log_bus_width` : 2  
 $\log_2$ (bus width supported by card)

`uint32_t is_ddr` : 1  
Card supports DDR mode

`uint32_t reserved` : 23  
Reserved for future expansion

### Macros

**SDMMC\_HOST\_FLAG\_1BIT**  
host supports 1-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_4BIT**  
host supports 4-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_8BIT**  
host supports 8-line MMC protocol

**SDMMC\_HOST\_FLAG\_SPI**  
host supports SPI protocol

**SDMMC\_HOST\_FLAG\_DDR**  
host supports DDR mode for SD/MMC

**SDMMC\_FREQ\_DEFAULT**  
SD/MMC Default speed (limited by clock divider)

**SDMMC\_FREQ\_HIGHSPEED**  
SD High speed (limited by clock divider)

**SDMMC\_FREQ\_PROBING**  
SD/MMC probing speed

**SDMMC\_FREQ\_52M**  
MMC 52MHz speed

**SDMMC\_FREQ\_26M**  
MMC 26MHz speed

### Type Definitions

**typedef uint32\_t sdmmc\_response\_t[4]**  
SD/MMC command response buffer

## 2.6.3 非易失性存储库

[\[English\]](#)

### 简介

非易失性存储 (NVS) 库主要用于在 `flash` 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

**底层存储** NVS 通过调用 `spi_flash_{read|write|erase}` API 对主 `flash` 的部分空间进行读、写、擦除操作，包括 `data` 类型和 `nvs` 子类型的所有分区。应用程序可调用 `nvs_open` API 选择使用带有 `nvs` 标签的分区，也可以通过调用 `nvs_open_from_part` API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端，实现将数据保存至其他 flash 芯片（SPI 或 I2C 接口）、RTC 或 FRAM 中。

---

**注解：**如果 NVS 分区被截断（例如，更改分区表布局时），则应擦除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase_flash` 命令擦除 flash 上的所有内容。

---

---

**注解：**NVS 最适合存储一些较小的数据，而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串，请考虑使用基于磨损均衡库的 FAT 文件系统。

---

**键值对** NVS 的操作对象为键值对，其中键是 ASCII 字符串，当前支持最大键长为 15 个字符，值可以为以下几种类型：

- 整数型：uint8\_t、int8\_t、uint16\_t、int16\_t、uint32\_t、int32\_t、uint64\_t 和 int64\_t；
- 以 \0 结尾的字符串；
- 可变长度的二进制数据 (BLOB)

---

**注解：**字符串值当前上限为 4000 字节，其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小减去 4000 字节的 97.6%，以较低值为准。

---

后续可能会增加对 float 和 double 等其他类型数据的支持。

键必须唯一。为现有的键写入新的值可能产生如下结果：

- 如果新旧值数据类型相同，则更新值；
- 如果新旧值数据类型不同，则返回错误。

读取值时也会执行数据类型检查。如果读取操作的数据类型与该值的数据类型不匹配，则返回错误。

**命名空间** 为了减少不同组件之间键名的潜在冲突，NVS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则，即最多可占 15 个字符。命名空间的名称在调用 `nvs_open` 或 `nvs_open_from_part` 中指定，调用后将返回一个不透明句柄，用于后续调用 `nvs_get_*`、`nvs_set_*` 和 `nvs_commit` 函数。这样，一个句柄关联一个命名空间，键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVS 分区中具有相同名称的命名空间将被视为不同的命名空间。

**安全性、篡改性及鲁棒性** NVS 与 ESP32 flash 加密系统不直接兼容。但如果 NVS 加密与 ESP32 flash 加密一起使用时，数据仍可以加密形式存储。更多详情请参阅 [NVS 加密](#)。

如果未启用 NVS 加密，任何对 flash 芯片有物理访问权限的人都可以修改、擦除或添加键值对。NVS 加密启用后，如果不知道相应的 NVS 加密密钥，则无法修改或添加键值对并将其识别为有效键值。但是，针对擦除操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVS 库会尝试恢复。在任何时间点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库还应当能对 flash 中的任意数据进行正确初始化。

## 内部实现

**键值对日志** NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在日志最后增加一对新的键值对，同时将旧的键值对标记为已擦除。

**页面和条目** NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分的整体日志。逻辑页面对应 flash 的一个物理扇区，正在使用中的页面具有与之相关联的序列号。序列号赋予了页面顺序，较高的序列号对应较晚创建的页面。页面有以下几种状态：

**空或未初始化** 页面对应的 flash 扇区为空白状态（所有字节均为 0xff）。此时，页面未存储任何数据且没有关联的序列号。

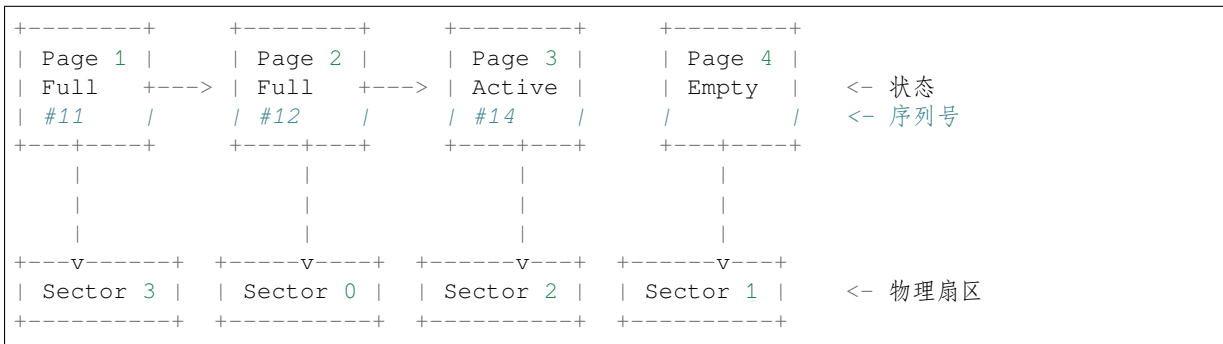

**活跃状态** 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，可写入数据。任意时刻，至多有一个页面处于活跃状态。

**写满状态** Flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入新键值对，但仍可将一些键值对标记为已擦除。

**擦除状态** 未擦除的键值对将移至其他页面，以便擦除当前页面。这一状态仅为暂时性状态，即 API 调用返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未擦除的键值对移至其他页面，并继续擦除当前页面。

**损坏状态** 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无法访问。相应的 flash 扇区并不会被立即擦除，而是与其他处于未初始化状态的扇区一起等待后续使用。这一状态可能对调试有用。

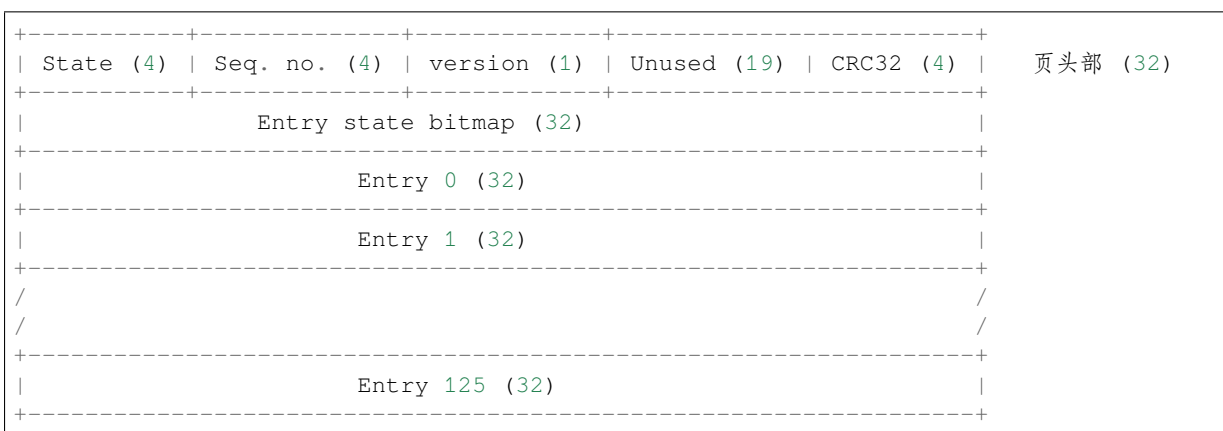

Flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序列号组织页面。

**页面结构** 当前，我们假设 flash 扇区大小为 4096 字节，并且 ESP32 flash 加密硬件在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适配具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息详见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）：

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其变更为擦除状态。

头部中的 `version` 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 `0xff` 开始依次递减（例如，`version-1` 为 `0xff`，`version-2` 为 `0xfe` 等）。

头部中 CRC32 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 `0xff` 字节填充。

条目结构和条目状态位图详细信息见下文描述。

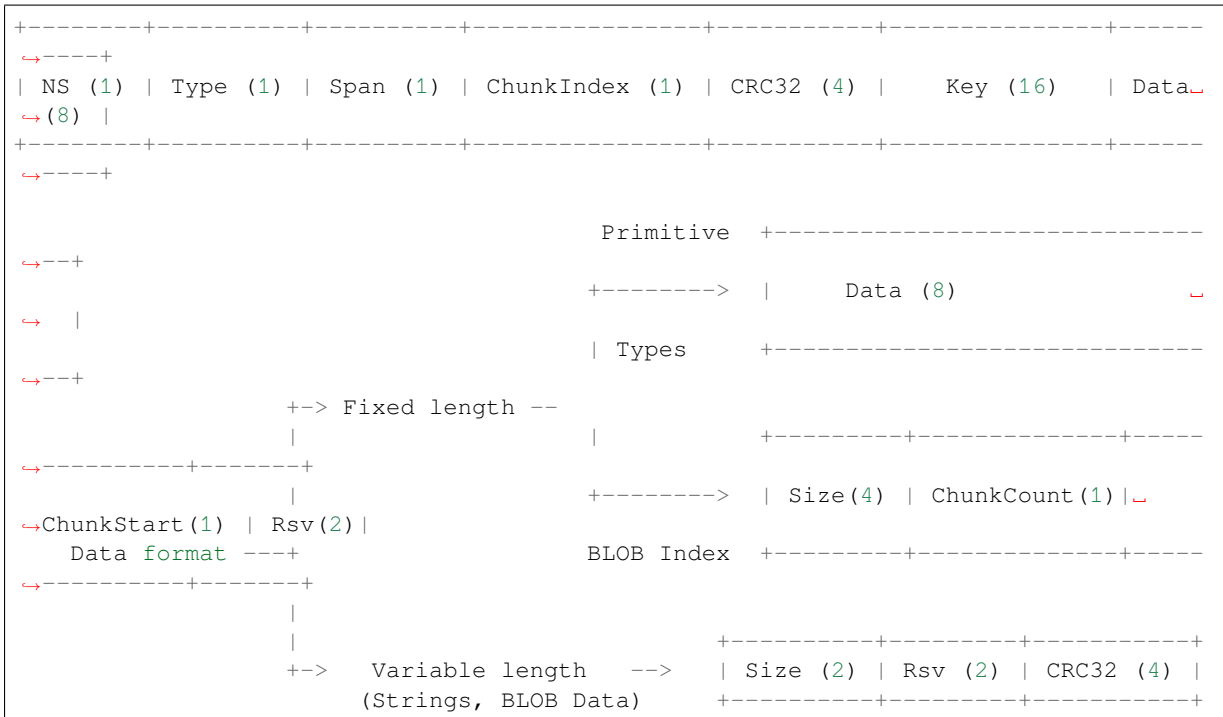

**条目和条目状态位图** 每个条目可处于以下三种状态之一，每个状态在条目状态位图中用两位表示。位图中的最后四位（ $256 - 2 * 126$ ）未使用。

**空 (2' b11)** 条目还未写入任何内容，处于未初始化状态（全部字节为 `0xff`）。

**写入 (2' b10)** 一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。

**擦除 (2' b00)** 条目中的键值对已丢弃，条目内容不再解析。

**条目结构** 如果键值类型为基础类型，即 1 - 8 个字节长度的整数型，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，即以新格式储存至条目。

条目结构中各个字段含义如下：

**命名空间 (NS, NameSpace)** 该条目的命名空间索引，详细信息见命名空间实现章节。

**类型 (Type)** 一个字节表示的值的的数据类型，可能的类型见 `nvs_types.h` 中 `ItemType` 枚举。

**跨度 (Span)** 该键值对所用的条目数量。如果键值为整数型，条目数量即为 1。如果键值为字符串或 BLOB，则条目数量取决于值的长度。

**块索引 (ChunkIndex)** 用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 `0xff`。

**CRC32** 对条目下所有字节进行校验，所得的校验和（CRC32 字段不计算在内）。

**键 (Key)** 即以零结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字节的 NULL (`\0`) 终止符。

**数据 (Data)** 如果键值类型为整数型，则数据字段仅包含键值。如果键值小于八个字节，使用 `0xff` 填充未使用的部分（右侧）。

如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- **块大小** 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。

- **ChunkCount** 存储过程中 BLOB 分成的数据块数量。该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块索引，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：

- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，此字段也应将零终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字节的校验和，该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 `span` 字段将指明使用了多少条目。

**命名空间** 如上所述，每个键值对属于一个命名空间。命名空间标识符（字符串）也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。

+-----+-----+-----+-----+-----+-----+	
NS=0 Type=uint8_t Key="wifi" Value=1	Entry describing namespace "wifi"
+-----+-----+-----+-----+-----+-----+	
NS=1 Type=uint32_t Key="channel" Value=6	Key "channel" in namespace "wifi"
+-----+-----+-----+-----+-----+-----+	
NS=0 Type=uint8_t Key="pwm" Value=2	Entry describing namespace "pwm"
+-----+-----+-----+-----+-----+-----+	
NS=2 Type=uint16_t Key="channel" Value=20	Key "channel" in namespace "pwm"
+-----+-----+-----+-----+-----+-----+	

**条目哈希列表** 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。Page::findItem 首先从哈希列表中检索条目哈希值，如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目、两个链表指针和一个 32 位计数字段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

## NVS 加密

NVS 分区内存存储的数据可使用 AES-XTS 进行加密，类似于 IEEE P1619 磁盘加密标准中提到的加密方式。为了实现加密，每个条目被均视为一个扇区，并将条目相对地址（相对于分区开头）传递给加密算法，用作扇区号。NVS 加密所需的密钥存储于其他分区，并进行了 *flash 加密*。因此，在使用 NVS 加密前应先启用 *flash 加密*。

**NVS 密钥分区** 应用程序如果想使用 NVS 加密，则需要编译进一个类型为 data，子类型为 key 的密钥分区。该分区应标记为已加密，且最小为 4096 字节，具体结构见下表。如需了解更多详细信息，请参考 *分区表*。

+-----+-----+-----+-----+-----+-----+	
XTS encryption key (32)	
+-----+-----+-----+-----+-----+-----+	
XTS tweak key (32)	
+-----+-----+-----+-----+-----+-----+	
CRC32 (4)	
+-----+-----+-----+-----+-----+-----+	

使用 NVS 分区生成程序生成上述分区表，并烧录至设备。由于分区已标记为已加密，而且启用了 *flash 加密*，引导程序在首次启动时将使用 flash 加密对密钥分区进行加密。您也可以设备启动后调用

`nvs_flash.h` 提供的 `nvs_flash_generate_keys` API 生成加密密钥，然后再将密钥以加密形式写入密钥分区。

应用程序可以使用不同的密钥对不同的 NVS 分区进行加密，这样就会需要多个加密密钥分区。应用程序应为加解密操作提供正确的密钥或密钥分区。

**加密读取/写入** `nvs_get_*` 和 `nvs_set_*` 等 NVS API 函数同样可以对 NVS 加密分区执行读写操作。但用于初始化 NVS 非加密分区和加密分区的 API 则有所不同：初始化 NVS 非加密分区可以使用 `nvs_flash_init` 和 `nvs_flash_init_partition`，但初始化 NVS 加密分区则需调用 `nvs_flash_secure_init` 和 `nvs_flash_secure_init_partition`。上述 API 函数所需的 `nvs_sec_cfg_t` 结构可使用 `nvs_flash_generate_keys` 或者 `nvs_flash_read_security_cfg` 进行填充。

应用程序如需在加密状态下执行 NVS 读写操作，应遵循以下步骤：

1. 使用 `esp_partition_find*` API 查找密钥分区和 NVS 数据分区；
2. 使用 `nvs_flash_read_security_cfg` 或 `nvs_flash_generate_keys` API 填充 `nvs_sec_cfg_t` 结构；
3. 使用 `nvs_flash_secure_init` 或 `nvs_flash_secure_init_partition` API 初始化 NVS flash 分区；
4. 使用 `nvs_open` 或 `nvs_open_from_part` API 打开命名空间；
5. 使用 `nvs_get_*` 或 `nvs_set_*` API 执行 NVS 读取/写入操作；
6. 使用 `nvs_flash_deinit` API 释放已初始化的 NVS 分区。

**NVS 迭代器** 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVS 中存储的键值对。

您可以使用以下函数，执行相关操作：

- `nvs_entry_find`: 返回一个不透明句柄，用于后续调用 `nvs_entry_next` 和 `nvs_entry_info` 函数；
- `nvs_entry_next`: 返回指向下一个键值对的迭代器；
- `nvs_entry_info`: 返回每个键值对的信息。

如果未找到符合标准的键值对，`nvs_entry_find` 和 `nvs_entry_next` 将返回 NULL，此时不必释放迭代器。若不再需要迭代器，可使用 `nvs_release_iterator` 释放迭代器。

## NVS 分区生成程序

NVS 分区生成程序帮助生成 NVS 分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由 CSV 文件提供，详情请参考 [NVS 分区生成程序](#)。

## 应用示例

ESP-IDF `storage` 目录下提供了两个代码示例：

### [storage/nvs\\_rw\\_value](#)

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。诊断程序以纯文本形式提供，帮助您追踪程序流程，及时发现问题。

### [storage/nvs\\_rw\\_blob](#)

演示如何读取及写入 NVS 单个整数值和 Blob（二进制大对象），并在 NVS 中存储这一数值，即便 ESP32 模组重启也不会消失。

- `value` - 记录 ESP32 模组软重启次数和硬重启次数。

- `blob` - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。每次手动软重启后，表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉 GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

## API 参考

### Header File

- `nvs_flash/include/nvs_flash.h`

### Functions

`esp_err_t nvs_flash_init` (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

#### Return

- `ESP_OK` if storage was successfully initialized.
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_NOT_FOUND` if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_init_partition` (const char \*partition\_label)

Initialize NVS flash storage for the specified partition.

#### Return

- `ESP_OK` if storage was successfully initialized.
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_NOT_FOUND` if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

#### Parameters

- [in] `partition_label`: Label of the partition. Must be no longer than 16 characters.

`esp_err_t nvs_flash_init_partition_ptr` (const esp\_partition\_t \*partition)

Initialize NVS flash storage for the partition specified by partition pointer.

#### Return

- `ESP_OK` if storage was successfully initialized
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_INVALID_ARG` in case partition is NULL
- one of the error codes from the underlying flash storage driver

#### Parameters

- [in] `partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_deinit` (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

#### Return

- `ESP_OK` on success (storage was deinitialized)
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition` (const char \*partition\_label)

Deinitialize NVS storage for the given NVS partition.

#### Return

- `ESP_OK` on success

- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage for given partition was not initialized prior to this call

**Parameters**

- `[in]` `partition_label`: Label of the partition

`esp_err_t nvs_flash_erase` (void)

Erase the default NVS partition.

This function erases all contents of the default NVS partition (one with label “nvs” )

**Return**

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if there is no NVS partition labeled “nvs” in the partition table

`esp_err_t nvs_flash_erase_partition` (const char \*`part_name`)

Erase specified NVS partition.

This function erases all contents of specified NVS partition

**Return**

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if there is no NVS partition with the specified name in the partition table

**Parameters**

- `[in]` `part_name`: Name (label) of the partition to be erased

`esp_err_t nvs_flash_erase_partition_ptr` (const `esp_partition_t` \*`partition`)

Erase custom partition.

Erase all content of specified custom partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if there is no partition with the specified parameters in the partition table
- `ESP_ERR_INVALID_ARG` in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**

- `[in]` `partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_secure_init` (`nvs_sec_cfg_t` \*`cfg`)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**

- `ESP_OK` if storage was successfully initialized.
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_NOT_FOUND` if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- `[in]` `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is NULL, no encryption is used.

`esp_err_t nvs_flash_secure_init_partition` (const char \*`partition_label`, `nvs_sec_cfg_t` \*`cfg`)

Initialize NVS flash storage for the specified partition.

**Return**

- `ESP_OK` if storage was successfully initialized.
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_NOT_FOUND` if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] `partition_label`: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations
- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is null, no encryption/decryption is used.

*esp\_err\_t* **nvs\_flash\_generate\_keys** (**const** *esp\_partition\_t* \**partition*, *nvs\_sec\_cfg\_t* \**cfg*)

Generate and store NVS keys in the provided esp partition.

**Return** -ESP\_OK, if `cfg` was read successfully; -or error codes from `esp_partition_write/erase` APIs.

**Parameters**

- [in] `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- [out] `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

*esp\_err\_t* **nvs\_flash\_read\_security\_cfg** (**const** *esp\_partition\_t* \**partition*, *nvs\_sec\_cfg\_t* \**cfg*)

Read NVS security configuration from a partition.

**Note** Provided partition is assumed to be marked 'encrypted' .

**Return** -ESP\_OK, if `cfg` was read successfully; -ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED, if the partition is not yet written with keys. -ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

**Parameters**

- [in] `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- [out] `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Structures**

**struct nvs\_sec\_cfg\_t**

Key for encryption and decryption.

**Public Members**

`uint8_t eky[NVS_KEY_SIZE]`  
XTS encryption and decryption key

`uint8_t tky[NVS_KEY_SIZE]`  
XTS tweak key

**Macros**

**NVS\_KEY\_SIZE**

**Header File**

- `nvs_flash/include/nvs.h`

**Functions**

*esp\_err\_t* **nvs\_set\_i8** (*nvs\_handle\_t* *handle*, **const** char \**key*, `int8_t` *value*)

set value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

**Return**

- ESP\_OK if value was set successfully
- ESP\_ERR\_NVS\_INVALID\_HANDLE if `handle` has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if storage handle was opened as read only

- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

#### Parameters

- `[in] handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- `[in] key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- `[in] value`: The value to set. For strings, the maximum length (including null character) is 4000 bytes.

`esp_err_t nvs_set_u8(nvs_handle_t handle, const char *key, uint8_t value)`

`esp_err_t nvs_set_i16(nvs_handle_t handle, const char *key, int16_t value)`

`esp_err_t nvs_set_u16(nvs_handle_t handle, const char *key, uint16_t value)`

`esp_err_t nvs_set_i32(nvs_handle_t handle, const char *key, int32_t value)`

`esp_err_t nvs_set_u32(nvs_handle_t handle, const char *key, uint32_t value)`

`esp_err_t nvs_set_i64(nvs_handle_t handle, const char *key, int64_t value)`

`esp_err_t nvs_set_u64(nvs_handle_t handle, const char *key, uint64_t value)`

`esp_err_t nvs_set_str(nvs_handle_t handle, const char *key, const char *value)`

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`

get value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

#### Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

#### Parameters

- `[in] handle`: Handle obtained from `nvs_open` function.
- `[in] key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- `out_value`: Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`

```
esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)
```

```
esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)
```

```
esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)
```

```
esp_err_t nvs_get_u64(nvs_handle_t handle, const char *key, uint64_t *out_value)
```

```
esp_err_t nvs_get_str(nvs_handle_t handle, const char *key, char *out_value, size_t *length)
```

get value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, out\_value is not modified.

All functions expect out\_value to be a pointer to an already allocated variable of the given type.

nvs\_get\_str and nvs\_get\_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs\_get\_str or nvs\_get\_blob with zero out\_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs\_get\_str, this length includes the zero terminator. When calling nvs\_get\_str and nvs\_get\_blob with non-zero out\_value, length has to be non-zero and has to point to the length available in out\_value. It is suggested that nvs\_get/set\_str is used for zero-terminated C strings, and nvs\_get/set\_blob used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

### Return

- ESP\_OK if the value was retrieved successfully
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints
- ESP\_ERR\_NVS\_INVALID\_LENGTH if length is not sufficient to store data

### Parameters

- [in] handle: Handle obtained from nvs\_open function.
- [in] key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- out\_value: Pointer to the output value. May be NULL for nvs\_get\_str and nvs\_get\_blob, in this case required length will be returned in length argument.
- [inout] length: A non-zero pointer to the variable holding the length of out\_value. In case out\_value a zero, will be set to the length required to hold the value. In case out\_value is not zero, will be set to the actual length of the value written. For nvs\_get\_str this includes zero terminator.

```
esp_err_t nvs_get_blob(nvs_handle_t handle, const char *key, void *out_value, size_t *length)
```

```
esp_err_t nvs_open(const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

### Return

- ESP\_OK if storage handle was opened successfully

- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label “nvs” is not found
- `ESP_ERR_NVS_NOT_FOUND` id namespace doesn't exist yet and mode is `NVS_READONLY`
- `ESP_ERR_NVS_INVALID_NAME` if namespace name doesn't satisfy constraints
- other error codes from the underlying storage driver

#### Parameters

- `[in] name`: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- `[in] open_mode`: `NVS_READWRITE` or `NVS_READONLY`. If `NVS_READONLY`, will open a handle for reading only. All write requests will be rejected for this handle.
- `[out] out_handle`: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_open_from_partition(const char *part_name, const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)`

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

#### Return

- `ESP_OK` if storage handle was opened successfully
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with specified name is not found
- `ESP_ERR_NVS_NOT_FOUND` id namespace doesn't exist yet and mode is `NVS_READONLY`
- `ESP_ERR_NVS_INVALID_NAME` if namespace name doesn't satisfy constraints
- other error codes from the underlying storage driver

#### Parameters

- `[in] part_name`: Label (name) of the partition of interest for object read/write/erase
- `[in] name`: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.
- `[in] open_mode`: `NVS_READWRITE` or `NVS_READONLY`. If `NVS_READONLY`, will open a handle for reading only. All write requests will be rejected for this handle.
- `[out] out_handle`: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)`

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

#### Parameters

- `[in] handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- `[in] key`: Key name. Maximal length is 15 characters. Shouldn't be empty.
- `[in] value`: The value to set.
- `[in] length`: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)`

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if erase operation was successful
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- other error codes from the underlying storage driver

#### Parameters

- `[in]` `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- `[in]` `key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn't be empty.

`esp_err_t nvs_erase_all(nvs_handle_t handle)`

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if erase operation was successful
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- other error codes from the underlying storage driver

#### Parameters

- `[in]` `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

`esp_err_t nvs_commit(nvs_handle_t handle)`

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

#### Return

- `ESP_OK` if the changes have been written successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- other error codes from the underlying storage driver

#### Parameters

- `[in]` `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

void `nvs_close(nvs_handle_t handle)`

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

#### Parameters

- `[in]` `handle`: Storage handle to close

`esp_err_t nvs_get_stats(const char *part_name, nvs_stats_t *nvs_stats)`

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free_
↪entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↪entries);
```

(下页继续)

**Return**

- ESP\_OK if the changes have been written successfully. Return param `nvs_stats` will be filled.
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label “name” is not found. Return param `nvs_stats` will be filled 0.
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- ESP\_ERR\_INVALID\_ARG if `nvs_stats` equal to NULL.
- ESP\_ERR\_INVALID\_STATE if there is page with the status of INVALID. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

**Parameters**

- [in] `part_name`: Partition name NVS in the partition table. If pass a NULL than will use `NVS_DEFAULT_PART_NAME` (“nvs”).
- [out] `nvs_stats`: Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

*esp\_err\_t* **nvs\_get\_used\_entry\_count** (*nvs\_handle\_t* handle, size\_t \*used\_entries)

Calculate all entries in a namespace.

Note that to find out the total number of records occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs.
→in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if (nvs_get_used_entry_count(handle, &used_entries) == ESP_OK) {
    // the total number of records occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

**Return**

- ESP\_OK if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- ESP\_ERR\_NVS\_INVALID\_HANDLE if `handle` has been closed or is NULL. Return param `used_entries` will be filled 0.
- ESP\_ERR\_INVALID\_ARG if `used_entries` equal to NULL.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

**Parameters**

- [in] `handle`: Handle obtained from `nvs_open` function.
- [out] `used_entries`: Returns amount of used entries from a namespace.

*nvs\_iterator\_t* **nvs\_entry\_find** (const char \*part\_name, const char \*namespace\_name, *nvs\_type\_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified.
→partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
}
```

(下页继续)

```

        printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
//       nvs_entry_find or nvs_entry_next function return NULL, indicating no
//       other
//       element for specified criteria was found.
}

```

**Return** Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any more.

#### Parameters

- [in] `part_name`: Partition name
- [in] `namespace_name`: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- [in] `type`: One of `nvs_type_t` values.

`nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)`

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

**Return** NULL if no entry was found, valid `nvs_iterator_t` otherwise.

#### Parameters

- [in] `iterator`: Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

void `nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)`

Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

#### Parameters

- [in] `iterator`: Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- [out] `out_info`: Structure to which entry information is copied.

void `nvs_release_iterator (nvs_iterator_t iterator)`

Release iterator.

#### Parameters

- [in] `iterator`: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

## Structures

**struct nvs\_entry\_info\_t**

information about entry obtained from `nvs_entry_info` function

### Public Members

char `namespace_name`[16]

Namespace to which key-value belong

char `key`[16]

Key of stored key-value pair

`nvs_type_t type`

Type of stored key-value pair

**struct nvs\_stats\_t**

**Note** Info about storage space NVS.

### Public Members

`size_t used_entries`

Amount of used entries.

`size_t free_entries`

Amount of free entries.

`size_t total_entries`

Amount all available entries.

`size_t namespace_count`

Amount name space.

### Macros

**ESP\_ERR\_NVS\_BASE**

Starting number of error codes

**ESP\_ERR\_NVS\_NOT\_INITIALIZED**

The storage driver is not initialized

**ESP\_ERR\_NVS\_NOT\_FOUND**

Id namespace doesn't exist yet and mode is NVS\_READONLY

**ESP\_ERR\_NVS\_TYPE\_MISMATCH**

The type of set or get operation doesn't match the type of value stored in NVS

**ESP\_ERR\_NVS\_READ\_ONLY**

Storage handle was opened as read only

**ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE**

There is not enough space in the underlying storage to save the value

**ESP\_ERR\_NVS\_INVALID\_NAME**

Namespace name doesn't satisfy constraints

**ESP\_ERR\_NVS\_INVALID\_HANDLE**

Handle has been closed or is NULL

**ESP\_ERR\_NVS\_REMOVE\_FAILED**

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

**ESP\_ERR\_NVS\_KEY\_TOO\_LONG**

Key name is too long

**ESP\_ERR\_NVS\_PAGE\_FULL**

Internal error; never returned by nvs API functions

**ESP\_ERR\_NVS\_INVALID\_STATE**

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

**ESP\_ERR\_NVS\_INVALID\_LENGTH**

String or blob length is not sufficient to store data

**ESP\_ERR\_NVS\_NO\_FREE\_PAGES**

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

**ESP\_ERR\_NVS\_VALUE\_TOO\_LONG**

String or blob length is longer than supported by the implementation

**ESP\_ERR\_NVS\_PART\_NOT\_FOUND**

Partition with specified name is not found in the partition table

**ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND**

NVS partition contains data in new format and cannot be recognized by this version of code

**ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED**

XTS encryption failed while writing NVS entry

**ESP\_ERR\_NVS\_XTS\_DECR\_FAILED**

XTS decryption failed while reading NVS entry

**ESP\_ERR\_NVS\_XTS\_CFG\_FAILED**

XTS configuration setting failed

**ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND**

XTS configuration not found

**ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED**

NVS encryption is not supported in this version

**ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED**

NVS key partition is uninitialized

**ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART**

NVS key partition is corrupt

**ESP\_ERR\_NVS\_CONTENT\_DIFFERS**

Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS\_DEFAULT\_PART\_NAME**

Default partition name of the NVS partition in the partition table

**NVS\_PART\_NAME\_MAX\_SIZE**

maximum length of partition name (excluding null terminator)

**Type Definitions****typedef** uint32\_t **nvs\_handle\_t**

Opaque pointer type representing non-volatile storage handle

**typedef** *nvs\_handle\_t* **nvs\_handle****typedef** *nvs\_open\_mode\_t* **nvs\_open\_mode****typedef** struct nvs\_opaque\_iterator\_t \***nvs\_iterator\_t**

Opaque pointer type representing iterator to nvs entries

**Enumerations****enum** **nvs\_open\_mode\_t**

Mode of opening the non-volatile storage.

*Values:***NVS\_READONLY**

Read only

**NVS\_READWRITE**

Read and write

**enum** **nvs\_type\_t**

Types of variables.

*Values:***NVS\_TYPE\_U8** = 0x01

Type uint8\_t

**NVS\_TYPE\_I8** = 0x11

Type int8\_t

**NVS\_TYPE\_U16** = 0x02

Type uint16\_t

```
NVS_TYPE_I16 = 0x12
    Type int16_t
NVS_TYPE_U32 = 0x04
    Type uint32_t
NVS_TYPE_I32 = 0x14
    Type int32_t
NVS_TYPE_U64 = 0x08
    Type uint64_t
NVS_TYPE_I64 = 0x18
    Type int64_t
NVS_TYPE_STR = 0x21
    Type string
NVS_TYPE_BLOB = 0x42
    Type blob
NVS_TYPE_ANY = 0xff
    Must be last
```

## 2.6.4 NVS 分区生成程序

[\[English\]](#)

### 介绍

NVS 分区生成程序 (`nvs_flash/nvs_partition_generator/nvs_partition_gen.py`) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与非易失性存储器 (NVS) 中定义的 NVS 结构兼容。NVS 分区生成程序适合用于生成二进制数据 (Blob)，其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个固件的基础上，通过自定义参数，如序列号等，为每个设备生成不同配置。

### 准备工作

在加密模式下使用该程序，需安装下列软件包：

- cryptography package

根目录下的 `requirements.txt` 包含必需 python 包，请预先安装。

### CSV 文件格式

.csv 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表：

序号	参数	描述	说明
1	Key	主键，应用程序可通过查询此键来获取数据。	
2	Type	支持 file、data 和 namespace。	
3	Encoding	支持 u8、i8、u16、u32、i32、string、hex2bin、base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。	file 类型当前仅支持 hex2bin、base64、string 和 binary 编码。
4	Value	Data value	namespace 字段的 encoding 和 value 应为空。namespace 的 encoding 和 value 为固定值，不可设置。这些单元格中的所有值都会被忽视。

**注解：** CSV 文件的第一行应为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下：

```
key,type,encoding,value      <-- 列标题
namespace_name,namespace,,  <-- 第一个条目为 "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**注解：**

**请确保：**

- 逗号 ‘,’ 前后无空格；
- CSV 文件每行末尾无空格。

### NVS 条目和命名空间 (namespace)

如 CSV 文件中出现命名空间条目，后续条目均会被视为该命名空间的一部分，直至找到下一个命名空间条目。找到新命名空间条目后，后续所有条目都会被视为新命名空间的一部分。

**注解：** CSV 文件中第一个条目应始终为 namespace。

### 支持多页 Blob

默认情况下，二进制 Blob 可跨多页，格式参考[条目结构](#) 章节。如需使用旧版格式，可在程序中禁用该功能。

### 支持加密

NVS 分区生成程序还可使用 AES-XTS 加密生成二进制加密文件。更多信息详见[NVS 加密](#)。

### 支持解密

如果 NVS 二进制文件采用了 AES-XTS 加密，该程序还可对此类文件进行解密，更多信息详见[NVS 加密](#)。

## 运行程序

### 使用方法:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

### 可选参数:

序号	参数	描述
1	-h, -help	显示帮助信息并退出

### 命令:

```
运行 nvs_partition_gen.py {command} -h 查看更多帮助信息
```

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥
3	encrypt	加密 NVS 分区
4	decrypt	解密 NVS 分区

## 生成 NVS 分区 (默认模式)

### 使用方法:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
                                     input output size
```

### 位置参数:

参数	描述
input	待解析的 CSV 文件路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小 (以字节为单位, 且为 4096 的整数倍)

### 可选参数:

参数	描述
-h, -help	显示帮助信息并退出
--version {1,2}	<ul style="list-style-type: none"> <li>设置多页 Blob 版本。</li> <li>版本 1: 禁用多页 Blob;</li> <li>版本 2: 启用多页 Blob;</li> <li>默认版本: 版本 2。</li> </ul>
--outdir OUTDIR	输出目录, 用于存储创建的文件。(默认当前目录)

运行如下命令创建 NVS 分区, 该程序同时会提供 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

## 仅生成加密密钥

### 使用方法:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                         [--outdir OUTDIR]
```

可选参数:

参数	描述
-h, -help	显示帮助信息并退出
-keyfile KEYFILE	加密密钥文件的输出路径
-outdir OUTDIR	输出目录，用于存储创建的文件。(默认当前目录)

运行以下命令仅生成加密密钥:

```
python nvs_partition_gen.py generate-key
```

**生成 NVS 加密分区 使用方法:**

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                     [--keyfile KEYFILE] [--inputkey INPUTKEY]
                                     [--outdir OUTDIR]
                                     input output size
```

位置参数:

参数	描述
input	待解析 CSV 文件的路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小 (以字节为单位，且为 4096 的整数倍)

可选参数:

参数	描述
-h, -help	显示帮助信息并退出
-version {1,2}	<ul style="list-style-type: none"> <li>• 设置多页 Blob 版本。</li> <li>• 版本 1: 禁用多页 Blob;</li> <li>• 版本 2: 启用多页 Blob;</li> <li>• 默认版本: 版本 2。</li> </ul>
-keygen	生成 NVS 分区加密密钥
-keyfile KEYFILE	密钥文件的输出路径
-inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
-outdir OUTDIR	输出目录，用于存储创建的文件 (默认当前目录)

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen
```

**注解:** 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

- 通过 NVS 分区生成程序生成加密密钥，并将密钥存储于自定义的文件中:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen --keyfile sample_keys.bin
```

**注解：** 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

**注解：** 加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 将加密密钥用作二进制输入文件来进行加密：

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --inputkey sample_keys.bin
```

### 解密 NVS 分区 使用方法：

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

#### 位置参数：

参数	描述
input	待解析的 NVS 加密分区文件路径
key	含有解密密钥的文件路径
output	已解密的二进制文件输出路径

#### 可选参数：

参数	描述
-h, -help	显示帮助信息并退出
--outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令解密已加密的 NVS 分区：

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

您可以自定义格式版本号：

- 版本 1：禁用多页 Blob
- 版本 2：启用多页 Blob

**版本 1：禁用多页 Blob** 如需禁用多页 Blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件：

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -
↪-version 1
```

**版本 2：启用多页 Blob** 如需启用多页 Blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件：

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↪version 2
```

---

**注解:** NVS 分区最小为 0x3000 字节。

---

**注解:** 将二进制文件烧录至设备时，请确保与应用的 `sdkconfig` 设置一致。

---

### 说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键；
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

## 2.6.5 虚拟文件系统组件

[English]

### 概述

虚拟文件系统 (VFS) 组件可为一些驱动提供一个统一接口。有了该接口，用户可像操作普通文件一样操作虚拟文件。这类驱动程序可以是 FAT、SPIFFS 等真实文件系统，也可以是有文件类接口的设备驱动程序。

VFS 组件支持 C 库函数（如 `fopen` 和 `fprintf` 等）与文件系统 (FS) 驱动程序协同工作。在高层级，每个 FS 驱动程序均与某些路径前缀相关联。当一个 C 库函数需要打开文件时，VFS 组件将搜索与该文件所在文件路径相关联的 FS 驱动程序，并将调用传递给该驱动程序。针对该文件的读取、写入等其他操作的调用也将传递给这个驱动程序。

例如，您可以使用 `/fat` 前缀注册 FAT 文件系统驱动，之后即可调用 `fopen("/fat/file.txt", "w")`。之后，VFS 将调用 FAT 驱动的 `open` 函数，并将参数 `/file.txt` 和合适的打开模式传递给 `open` 函数；后续对返回的 `FILE*` 数据流调用 C 库函数也同样会传递给 FAT 驱动。

### 注册 FS 驱动程序

如需注册 FS 驱动程序，首先要定义一个 `esp_vfs_t` 结构体实例，并用指向 FS API 的函数指针填充它。

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

在上述代码中需要用到 `read`、`write` 或 `read_p`、`write_p`，具体使用哪组函数由 FS 驱动程序 API 的声明方式决定。

示例 1: 声明 API 函数时不带额外的上下文指针参数，即 FS 驱动程序为单例模式，此时使用 `write`

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
```

(下页继续)

(续上页)

```

        .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));

```

示例 2: 声明 API 函数时需要一个额外的上下文指针作为参数, 即可支持多个 FS 驱动程序实例, 此时使用 write\_p

```

ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));

```

**同步输入/输出多路复用** 如需通过 select() 使用同步输入/输出多路复用, 首先需要把 start\_select() 和 end\_select() 注册到 VFS, 如下所示:

```

// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized

```

调用 start\_select() 设置环境, 用以检测某一 VFS 文件描述符的读取/写入/错误条件。调用 end\_select() 终止、析构或释放 start\_select() 设置的资源。请在 `vfs/vfs_uart.c` 中查看 UART 外设参考实现、`esp_vfs_dev_uart_register()`、`uart_start_select()` 和 `uart_end_select()` 函数。

请参考以下示例, 查看如何使用 VFS 文件描述符调用 select():

- [peripherals/uart\\_select](#)
- [system/select](#)

如果 select() 用于套接字文件描述符, 您可以启用 `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` 选项来减少代码量, 提高性能。

## 路径

已注册的 FS 驱动程序均有一个路径前缀与之关联, 此路径前缀即为分区的挂载点。

如果挂载点中嵌套了其他挂载点, 则在打开文件时使用具有最长匹配路径前缀的挂载点。例如, 假设以下文件系统已在 VFS 中注册:

- 在 /data 下注册 FS 驱动程序 1
- 在 /data/static 下注册 FS 驱动程序 2

那么:

- 打开 /data/log.txt 会调用驱动程序 FS 1;
- 打开 /data/static/index.html 需调用 FS 驱动程序 2;

- 即便 FS 驱动程序 2 中没有 /index.html，也不会 FS 驱动程序 1 中查找 /static/index.html。

挂载点名称必须以路径分隔符 (/) 开头，且分隔符后至少包含一个字符。但在以下情况中，VFS 同样支持空的挂载点名称：1. 应用程序需要提供一个“最后方案”下使用的文件系统；2. 应用程序需要同时覆盖 VFS 功能。如果没有与路径匹配的前缀，就会使用到这种文件系统。

VFS 不会对路径中的点 (.) 进行特殊处理，也不会将 .. 视为对父目录的引用。在上述示例中，使用 /data/static/./log.txt 路径不会调用 FS 驱动程序 1 打开 /log.txt。特定的 FS 驱动程序（如 FATFS）可能以不同的方式处理文件名中的点。

执行打开文件操作时，FS 驱动程序仅得到文件的相对路径（挂载点前缀已经被去除）：

1. 以 /data 为路径前缀注册 myfs 驱动；
2. 应用程序调用 `fopen("/data/config.json", ...)`；
3. VFS 调用 `myfs_open("/config.json", ...)`；
4. myfs 驱动打开 /config.json 文件。

VFS 对文件路径长度没有限制，但文件系统路径前缀受 `ESP_VFS_PATH_MAX` 限制，即路径前缀上限为 `ESP_VFS_PATH_MAX`。各个文件系统驱动则可能会对自己的文件名长度设置一些限制。

## 文件描述符

文件描述符是一组很小的正整数，从 0 到 `FD_SETSIZE - 1`，`FD_SETSIZE` 在 `newlib sys/types.h` 中定义。最大文件描述符由 `CONFIG_LWIP_MAX_SOCKETS` 定义，且为套接字保留。VFS 中包含一个名为 `s_fd_table` 的查找表，用于将全局文件描述符映射至 `s_vfs` 数组中注册的 VFS 驱动索引。

## 标准 IO 流 (stdin, stdout, stderr)

如果 `menuconfig` 中 `UART for console output` 选项没有设置为 `None`，则 `stdin`、`stdout` 和 `stderr` 将默认从 UART 读取或写入。UART0 或 UART1 可用作标准 IO。默认情况下，UART0 使用 115200 波特率，TX 管脚为 GPIO1，RX 管脚为 GPIO3。您可以在 `menuconfig` 中更改上述参数。

对 `stdout` 或 `stderr` 执行写入操作将会向 UART 发送 FIFO 发送字符，对 `stdin` 执行读取操作则会从 UART 接收 FIFO 中取出字符。

默认情况下，VFS 使用简单的函数对 UART 进行读写操作。在所有数据放进 UART FIFO 之前，写操作将处于 `busy-wait` 状态，读操作处于非阻塞状态，仅返回 FIFO 中已有数据。由于读操作为非阻塞，高层级 C 库函数调用（如 `fscanf("%d\n", &var);`）可能获取不到所需结果。

如果应用程序使用 UART 驱动，则可以调用 `esp_vfs_dev_uart_use_driver` 函数来指导 VFS 使用驱动中断、读写阻塞功能等。您也可以调用 `esp_vfs_dev_uart_use_nonblocking` 来恢复非阻塞函数。

VFS 还为输入和输出提供换行符转换功能（可选）。多数应用程序在程序内部发送或接收以 LF (‘\n’) 结尾的行，但不同的终端程序可能需要不同的换行符，比如 CR 或 CRLF。应用程序可以通过 `menuconfig` 或者调用 `esp_vfs_dev_uart_port_set_rx_line_endings` 和 `esp_vfs_dev_uart_port_set_tx_line_endings` 为输入输出配置换行符。

**标准流和 FreeRTOS 任务** `stdin`、`stdout` 和 `stderr` 的 `FILE` 对象在所有 FreeRTOS 任务之间共享，指向这些对象的指针分别存储在每个任务的 `struct _reent` 中。

预处理器把如下代码：

```
fprintf(stderr, "42\n");
```

解释为：

```
fprintf(__getreent()->_stderr, "42\n");
```

其中 `__getreent()` 函数将为每个任务返回一个指向 `struct _reent` 的指针 ([newlib/include/sys/reent.h#L370-L417](#))。每个任务的 TCB 均拥有一个 `struct _reent` 结构体，任务初始化后，`struct _reent` 结构体中的 `_stdin`、`_stdout` 和 `_stderr` 将会被赋予 `_GLOBAL_REENT` 中 `_stdin`、`_stdout` 和 `_stderr` 的值，`_GLOBAL_REENT` 即为 FreeRTOS 启动之前所用结构体。

这样设计带来的结果是：

- 允许重定向给定任务的 `stdin`、`stdout` 和 `stderr`，而不影响其他任务，例如通过 `stdin = fopen("/dev/uart/1", "r");`
- 但使用 `fclose` 关闭默认 `stdin`、`stdout` 或 `stderr` 将同时关闭相应的 FILE 流对象，因此会影响其他任务；
- 如需更改新任务的默认 `stdin`、`stdout` 和 `stderr` 流，请在创建新任务之前修改 `_GLOBAL_REENT->_stdin(_stdout, _stderr)`。

## 应用示例

指南 (未完成)

## API 参考

### Header File

- [vfs/include/esp\\_vfs.h](#)

### Functions

`ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)`

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)`

`ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)`

`int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)`

`int esp_vfs_close (struct _reent *r, int fd)`

`int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)`

`int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)`

`int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)`

`int esp_vfs_unlink (struct _reent *r, const char *path)`

`int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)`

`int esp_vfs_utime (const char *path, const struct utimbuf *times)`

`esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)`

Register a virtual filesystem for given path prefix.

**Return** ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSEs are registered.

#### Parameters

- `base_path`: file path prefix associated with the filesystem. Must be a zero-terminated C string, up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a `“/”` and must not end with `“/”`. For example, `“/data”` or `“/dev/spi”` are valid. These VFSEs would then be called to handle file paths such as `“/data/myfile.txt”` or `“/dev/spi/0”`.
- `vfs`: Pointer to `esp_vfs_t`, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- `ctx`: If `vfs->flags` has `ESP_VFS_FLAG_CONTEXT_PTR` set, a pointer which should be passed to VFS functions. Otherwise, NULL.

*esp\_err\_t* **esp\_vfs\_register\_fd\_range** (const *esp\_vfs\_t* \*vfs, void \*ctx, int min\_fd, int max\_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min\_fd; max\_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

**Return** ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

**Parameters**

- *vfs*: Pointer to *esp\_vfs\_t*. Meaning is the same as for esp\_vfs\_register().
- *ctx*: Pointer to context structure. Meaning is the same as for esp\_vfs\_register().
- *min\_fd*: The smallest file descriptor this VFS will use.
- *max\_fd*: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

*esp\_err\_t* **esp\_vfs\_register\_with\_id** (const *esp\_vfs\_t* \*vfs, void \*ctx, *esp\_vfs\_id\_t* \*vfs\_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp\_vfs\_register\_fd\_range, this function doesn't pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp\_vfs\_register\_fd.

**Return** ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

**Parameters**

- *vfs*: Pointer to *esp\_vfs\_t*. Meaning is the same as for esp\_vfs\_register().
- *ctx*: Pointer to context structure. Meaning is the same as for esp\_vfs\_register().
- *vfs\_id*: Here will be written the VFS ID which can be passed to esp\_vfs\_register\_fd for registering file descriptors.

*esp\_err\_t* **esp\_vfs\_unregister** (const char \*base\_path)

Unregister a virtual filesystem for given path prefix

**Return** ESP\_OK if successful, ESP\_ERR\_INVALID\_STATE if VFS for given prefix hasn't been registered

**Parameters**

- *base\_path*: file prefix previously used in esp\_vfs\_register call

*esp\_err\_t* **esp\_vfs\_register\_fd** (*esp\_vfs\_id\_t* vfs\_id, int \*fd)

Special function for registering another file descriptor for a VFS registered by esp\_vfs\_register\_with\_id.

**Return** ESP\_OK if the registration is successful, ESP\_ERR\_NO\_MEM if too many file descriptors are registered, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

**Parameters**

- *vfs\_id*: VFS identifier returned by esp\_vfs\_register\_with\_id.
- *fd*: The registered file descriptor will be written to this address.

*esp\_err\_t* **esp\_vfs\_unregister\_fd** (*esp\_vfs\_id\_t* vfs\_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by esp\_vfs\_register\_with\_id.

**Return** ESP\_OK if the registration is successful, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

**Parameters**

- *vfs\_id*: VFS identifier returned by esp\_vfs\_register\_with\_id.
- *fd*: File descriptor which should be unregistered.

int **esp\_vfs\_select** (int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, struct timeval \*timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

**Return** The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

**Parameters**

- *nfds*: Specifies the range of descriptors which should be checked. The first *nfds* descriptors will be checked in each set.
- *readfds*: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.

- `writelfds`: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- `errorfds`: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- `timeout`: If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out.

void **esp\_vfs\_select\_triggered** (*esp\_vfs\_select\_sem\_t sem*)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

#### Parameters

- `sem`: semaphore structure which was passed to the driver by the `start_select` call

void **esp\_vfs\_select\_triggered\_isr** (*esp\_vfs\_select\_sem\_t sem*, BaseType\_t \**woken*)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

#### Parameters

- `sem`: semaphore structure which was passed to the driver by the `start_select` call
- `woken`: is set to `pdTRUE` if the function wakes up a task with higher priority

int **esp\_vfs\_poll** (**struct** pollfd \**fds*, nfds\_t *nfds*, int *timeout*)

Implements the VFS layer for synchronous I/O multiplexing by `poll()`

The implementation is based on `esp_vfs_select`. The parameters and return values are compatible with POSIX `poll()`.

**Return** A positive return value indicates the number of file descriptors that have been selected. The 0 return value indicates a timed-out poll. -1 is return on failure and `errno` is set accordingly.

#### Parameters

- `fds`: Pointer to the array containing file descriptors and events `poll()` should consider.
- `nfds`: Number of items in the array `fds`.
- `timeout`: `Poll()` should wait at least `timeout` milliseconds. If the value is 0 then it should return immediately. If the value is -1 then it should wait (block) until the event occurs.

ssize\_t **esp\_vfs\_pread** (int *fd*, void \**dst*, size\_t *size*, off\_t *offset*)

Implements the VFS layer of POSIX `pread()`

**Return** A positive return value indicates the number of bytes read. -1 is return on failure and `errno` is set accordingly.

#### Parameters

- `fd`: File descriptor used for read
- `dst`: Pointer to the buffer where the output will be written
- `size`: Number of bytes to be read
- `offset`: Starting offset of the read

ssize\_t **esp\_vfs\_pwrite** (int *fd*, const void \**src*, size\_t *size*, off\_t *offset*)

Implements the VFS layer of POSIX `pwrite()`

**Return** A positive return value indicates the number of bytes written. -1 is return on failure and `errno` is set accordingly.

#### Parameters

- `fd`: File descriptor used for write
- `src`: Pointer to the buffer from where the output will be read
- `size`: Number of bytes to write
- `offset`: Starting offset of the write

**Structures****struct esp\_vfs\_select\_sem\_t**

VFS semaphore type for select()

**Public Members**bool **is\_sem\_local**

type of “sem” is SemaphoreHandle\_t when true, defined by socket driver otherwise

void \***sem**

semaphore instance

**struct esp\_vfs\_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to NULL.

**Public Members**int **flags**`ESP_VFS_FLAG_CONTEXT_PTR` or `ESP_VFS_FLAG_DEFAULT`*esp\_err\_t* (**\*start\_select**) (int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*exceptfds, *esp\_vfs\_select\_sem\_t* sem, void \*\*end\_select\_args)

start\_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (**\*socket\_select**) (int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, **struct** timeval \*timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (**\*stop\_socket\_select**) (void \*sem)

called by VFS to interrupt the socket\_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (**\*stop\_socket\_select\_isr**) (void \*sem, BaseType\_t \*woken)

stop\_socket\_select which can be called from ISR; set only for the socket driver

void (**\*get\_socket\_select\_semaphore**) (void)

end\_select is called to stop the I/O multiplexing and deinitialize the environment created by start\_select for the given VFS

*esp\_err\_t* (**\*end\_select**) (void \*end\_select\_args)

get\_socket\_select\_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

**Macros****MAX\_FDS**

Maximum number of (global) file descriptors.

**ESP\_VFS\_PATH\_MAX**

Maximum length of path prefix (not including zero terminator)

**ESP\_VFS\_FLAG\_DEFAULT**

Default value of flags member in *esp\_vfs\_t* structure.

**ESP\_VFS\_FLAG\_CONTEXT\_PTR**

Flag which indicates that FS needs extra context pointer in syscalls.

**Type Definitions**

```
typedef int esp_vfs_id_t
```

**Header File**

- [vfs/include/esp\\_vfs\\_dev.h](#)

**Functions**

void **esp\_vfs\_dev\_uart\_register** (void)

add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

void **esp\_vfs\_dev\_uart\_set\_rx\_line\_endings** (*esp\_line\_endings\_t mode*)

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines ( ‘ ’ , LF) passed into stdin:

- ESP\_LINE\_ENDINGS\_CRLF: convert CRLF to LF
- ESP\_LINE\_ENDINGS\_CR: convert CR to LF
- ESP\_LINE\_ENDINGS\_LF: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Parameters**

- mode: line endings expected on UART

void **esp\_vfs\_dev\_uart\_set\_tx\_line\_endings** (*esp\_line\_endings\_t mode*)

Set the line endings to sent to UART.

This specifies the conversion between newlines ( ‘ ’ , LF) on stdout and line endings sent over UART:

- ESP\_LINE\_ENDINGS\_CRLF: convert LF to CRLF
- ESP\_LINE\_ENDINGS\_CR: convert LF to CR
- ESP\_LINE\_ENDINGS\_LF: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Parameters**

- mode: line endings to send to UART

int **esp\_vfs\_dev\_uart\_port\_set\_rx\_line\_endings** (int *uart\_num*, *esp\_line\_endings\_t mode*)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines ( ‘ ’ , LF) passed into stdin:

- ESP\_LINE\_ENDINGS\_CRLF: convert CRLF to LF
- ESP\_LINE\_ENDINGS\_CR: convert CR to LF
- ESP\_LINE\_ENDINGS\_LF: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Return** 0 if succeeded, or -1 when an error (specified by errno) have occurred.

**Parameters**

- *uart\_num*: the UART number
- mode: line endings to send to UART

int **esp\_vfs\_dev\_uart\_port\_set\_tx\_line\_endings** (int *uart\_num*, *esp\_line\_endings\_t mode*)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines ( ‘ ’ , LF) on stdout and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Return** 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

**Parameters**

- `uart_num`: the UART number
- `mode`: line endings to send to UART

void `esp_vfs_dev_uart_use_nonblocking` (int `uart_num`)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**

- `uart_num`: UART peripheral number

void `esp_vfs_dev_uart_use_driver` (int `uart_num`)

set VFS to use UART driver for reading and writing

**Note** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

**Parameters**

- `uart_num`: UART peripheral number

## Enumerations

enum `esp_line_endings_t`

Line ending settings.

Values:

`ESP_LINE_ENDINGS_CRLF`  
CR + LF.

`ESP_LINE_ENDINGS_CR`  
CR.

`ESP_LINE_ENDINGS_LF`  
LF.

## 2.6.6 FAT 文件系统

[English]

ESP-IDF 使用 `FatFs` 库来实现 FAT 文件系统。`FatFs` 库位于 `fatfs` 组件中，您可以直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS（虚拟文件系统）使用 `FatFs` 库的大多数功能。

此外，我们对 `FatFs` 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 `FatFs` 驱动映射到物理磁盘。

### FatFs 与 VFS 配合使用

`fatfs/vfs/esp_vfs_fat.h` 头文件定义了连接 `FatFs` 和 VFS 的函数。

函数 `esp_vfs_fat_register()` 分配一个 `FATFS` 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 `FatFs` API。函数 `esp_vfs_fat_unregister_path()` 删除在 VFS 中的注册，并释放 `FATFS` 结构。

多数应用程序在使用 `esp_vfs_fat_` 函数时，采用如下步骤：

1. 调用 `esp_vfs_fat_register()`，指定：

- 挂载文件系统的路径前缀（例如，"/sdcard" 或 "/spiflash"）
  - FatFs 驱动编号
  - 一个用于接收指向 FATFS 结构指针的变量
2. 调用 `ff_diskio_register()` 为上述步骤中的驱动编号注册磁盘 I/O 驱动；
  3. 调用 FatFs 函数 `f_mount`，或 `f_fdisk`，`f_mkfs`，并使用与传递到 `esp_vfs_fat_register()` 相同的驱动编号挂载文件系统。请参考 [FatFs 文档](#)，查看更多信息；
  4. 调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，"/sdcard/hello.txt"）执行打开、读取、写入、擦除、复制等操作。
  5. 您可以选择直接调用 FatFs 库函数，但需要使用没有 VFS 前缀的路径（例如，"/hello.txt"）；
  6. 关闭所有打开的文件；
  7. 调用 `f_mount` 并使用 `NULL` `FATFS*` 参数为与上述编号相同的驱动卸载文件系统；
  8. 调用 FatFs 函数 `ff_diskio_register()` 并使用 `NULL` `ff_diskio_impl_t*` 参数和相同的驱动编号来释放注册的磁盘 I/O 驱动。
  9. 调用 `esp_vfs_fat_unregister_path()` 并使用文件系统挂载的路径将 FatFs 从 NVS 中移除，并释放步骤 1 中分配的 FatFs 结构。

`esp_vfs_fat_sdmmc_mount` 和 `esp_vfs_fat_sdmmc_unmount` 这两个便捷函数对上述步骤进行了封装，并加入对 SD 卡初始化的处理，非常便捷。我们将在下一章节详细介绍这两个函数。

**`esp_err_t esp_vfs_fat_register(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)`**

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

**Note** This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

#### Parameters

- `base_path`: path prefix where FATFS should be registered
- `fat_drive`: FATFS drive specification; if only one drive is used, can be an empty string
- `max_files`: maximum number of files which can be open at the same time
- `[out] out_fs`: pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

**`esp_err_t esp_vfs_fat_unregister_path(const char *base_path)`**

Un-register FATFS from VFS.

**Note** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_path`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if FATFS is not registered in VFS

#### Parameters

- `base_path`: path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

## FatFs 与 VFS 和 SD 卡配合使用

`fatfs/vfs/esp_vfs_fat.h` 头文件定义了两个便捷函数 `esp_vfs_fat_sdmmc_mount()` 和 `esp_vfs_fat_sdmmc_unmount()`。这两个函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码并将更多高级功能集成到产品应用中。

`esp_vfs_fat_sdmmc_unmount()` 函数用于卸载文件系统并释放从 `esp_vfs_fat_sdmmc_mount()` 函数获取的资源。

```
esp_err_t esp_vfs_fat_sdmmc_mount (const char *base_path, const sdmmc_host_t *host_config,
                                   const void *slot_config, const esp_vfs_fat_mount_config_t
                                   *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

#### Parameters

- `base_path`: path where partition should be registered (e.g. `"/sdcard"` )
- `host_config`: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: if not NULL, pointer to the card information structure will be returned via this argument

```
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

#### Public Members

```
bool format_if_mount_failed
```

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

```
int max_files
```

Max number of open files.

```
size_t allocation_unit_size
```

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and `128 * sector size`. For SD cards, sector size is always 512 bytes. For wear\_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```
esp_err_t esp_vfs_fat_sdmmc_unmount (void)
```

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_sdmmc\_mount hasn't been called

**FatFs 与 VFS 配合使用 (只读模式下)**

fatfs/vfs/esp\_vfs\_fat.h 头文件也定义了两个便捷函数 `esp_vfs_fat_rawflash_mount()` 和 `esp_vfs_fat_rawflash_unmount()`。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂时写入一次，之后在整个硬件生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

```
esp_err_t esp_vfs_fat_rawflash_mount(const char *base_path, const char *partition_label,
                                     const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_rawflash\_mount was already called for the same partition
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**

- base\_path: path where FATFS partition should be mounted (e.g. "/spiflash" )
- partition\_label: label of the partition which should be used
- mount\_config: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflash_unmount(const char *base_path, const char
                                       *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp\_vfs\_fat\_rawflash\_mount.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_spiflash\_mount hasn't been called

**Parameters**

- base\_path: path where partition should be registered (e.g. "/spiflash" )
- partition\_label: label of partition to be unmounted

**FatFs 磁盘 I/O 层**

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 注册指定的 FatFs 驱动编号。

```
void ff_diskio_register(BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk\_xxx functions for driver number pdrv, corresponding function in discio\_impl for given pdrv will be called.

**Parameters**

- pdrv: drive number

- `discio_impl`: pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

**struct ff\_diskio\_impl\_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

### Public Members

DSTATUS (**\*init**) (unsigned char pdrv)  
disk initialization function

DSTATUS (**\*status**) (unsigned char pdrv)  
disk status check function

DRESULT (**\*read**) (unsigned char pdrv, unsigned char \*buff, uint32\_t sector, unsigned count)  
sector read function

DRESULT (**\*write**) (unsigned char pdrv, **const** unsigned char \*buff, uint32\_t sector, unsigned count)  
sector write function

DRESULT (**\*ioctl**) (unsigned char pdrv, unsigned char cmd, void \*buff)  
function to get info about disk and do some misc operations

void **ff\_diskio\_register\_sdmmc** (unsigned char pdrv, `sdmmc_card_t` \*card)  
Register SD/MMC diskio driver

#### Parameters

- pdrv: drive number
- card: pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

`esp_err_t` **ff\_diskio\_register\_wl\_partition** (unsigned char pdrv, `wl_handle_t` flash\_handle)  
Register spi flash partition

#### Parameters

- pdrv: drive number
- flash\_handle: handle of the wear levelling partition.

`esp_err_t` **ff\_diskio\_register\_raw\_partition** (unsigned char pdrv, **const** `esp_partition_t` \*part\_handle)  
Register spi flash partition

#### Parameters

- pdrv: drive number
- part\_handle: pointer to raw flash partition.

## 2.6.7 磨损均衡 API

[English]

### 概述

ESP32 所使用的 flash，特别是 SPI flash 多数具备扇区结构，且每个扇区仅允许有限次数的擦除/修改操作。为了避免过度使用某一扇区，乐鑫提供了磨损均衡组件，无需用户介入即可帮助用户均衡各个扇区之间的磨损。

磨损均衡组件包含了通过分区组件对外部 SPI flash 进行数据读取、写入、擦除和存储器映射相关的 API 函数。磨损均衡组件还具有软件上更高级别的 API 函数，与 [FAT 文件系统](#) 协同工作。

磨损均衡组件与 FAT 文件系统组件共用 FAT 文件系统的扇区，扇区大小为 4096 字节，是标准 flash 扇区的大小。在这种模式下，磨损均衡组件性能达到最佳，但需要在 RAM 中占用更多内存。

为了节省内存，磨损均衡组件还提供了另外两种模式，均使用 512 字节大小的扇区：

- **性能模式**：先将数据保存在 RAM 中，擦除扇区，然后将数据存储回 flash。如果设备在扇区擦写过程中突然断电，则整个扇区（4096 字节）数据将全部丢失。
- **安全模式**：数据先保存在 flash 中空余扇区，擦除扇区后，数据即存储回去。如果设备断电，上电后可立即恢复数据。

设备默认设置如下：

- 定义扇区大小为 512 字节
- 默认使用性能模式

您可以使用配置菜单更改设置。

磨损均衡组件不会将数据缓存在 RAM 中。写入和擦除函数直接修改 flash，函数返回后，flash 即完成修改。

## 磨损均衡访问 API

处理 flash 数据常用的 API 如下所示：

- `wl_mount` - 为指定分区挂载并初始化磨损均衡模块
- `wl_unmount` - 卸载分区并释放磨损均衡模块
- `wl_erase_range` - 擦除 flash 中指定的地址范围
- `wl_write` - 将数据写入分区
- `wl_read` - 从分区读取数据
- `wl_size` - 返回可用内存的大小（以字节为单位）
- `wl_sector_size` - 返回一个扇区的大小

请尽量避免直接使用原始磨损均衡函数，建议您使用文件系统特定的函数。

## 内存大小

内存大小是根据分区参数在磨损均衡模块中计算所得，由于模块使用 flash 部分扇区存储内部数据，因此计算所得内存大小有少许偏差。

## 另请参阅

- [FAT 文件系统](#)
- [分区表](#)

## 应用示例

[storage/wear\\_levelling](#) 中提供了一款磨损均衡驱动与 FatFs 库结合使用的示例。该示例初始化磨损均衡驱动，挂载 FAT 文件系统分区，并使用 POSIX（可移植操作系统接口）和 C 库 API 从中写入和读取数据。如需了解更多信息，请参考 [storage/wear\\_levelling/README.md](#)。

## 高级 API 参考

### 头文件

- [fatfs/src/esp\\_vfs\\_fat.h](#)

**函数**

```
esp_err_t esp_vfs_fat_spiflash_mount (const char *base_path, const char *partition_label,
                                     const esp_vfs_fat_mount_config_t *mount_config,
                                     wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined *partition\_label*. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by *base\_prefix* variable

This function is intended to make example code more compact.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

**Parameters**

- *base\_path*: path where FATFS partition should be mounted (e.g. “/spiflash” )
- *partition\_label*: label of the partition which should be used
- *mount\_config*: pointer to structure with extra parameters for mounting FATFS
- [out] *wl\_handle*: wear levelling driver handle

```
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

**Public Members**

```
bool format_if_mount_failed
```

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

```
int max_files
```

Max number of open files.

```
size_t allocation_unit_size
```

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and  $128 * \text{sector size}$ . For SD cards, sector size is always 512 bytes. For wear\_levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```
esp_err_t esp_vfs_fat_spiflash_unmount (const char *base_path, wl_handle_t wl_handle)
```

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount` hasn't been called

**Parameters**

- *base\_path*: path where partition should be registered (e.g. “/spiflash” )
- *wl\_handle*: wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount`

**中层 API 参考****Header File**

- [wear\\_levelling/include/wear\\_levelling.h](#)

## Functions

*esp\_err\_t* **wl\_mount** (**const** *esp\_partition\_t* \*partition, *wl\_handle\_t* \*out\_handle)

Mount WL for defined partition.

### Return

- ESP\_OK, if the allocation was successfully;
- ESP\_ERR\_INVALID\_ARG, if WL allocation was unsuccessful;
- ESP\_ERR\_NO\_MEM, if there was no memory to allocate WL components;

### Parameters

- partition: that will be used for access
- out\_handle: handle of the WL instance

*esp\_err\_t* **wl\_unmount** (*wl\_handle\_t* handle)

Unmount WL for defined partition.

### Return

- ESP\_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

### Parameters

- handle: WL partition handle

*esp\_err\_t* **wl\_erase\_range** (*wl\_handle\_t* handle, *size\_t* start\_addr, *size\_t* size)

Erase part of the WL storage.

### Return

- ESP\_OK, if the range was erased successfully;
- ESP\_ERR\_INVALID\_ARG, if iterator or dst are NULL;
- ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

### Parameters

- handle: WL handle that are related to the partition
- start\_addr: Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.
- size: Size of the range which should be erased, in bytes. Must be divisible by result of function `wl_sector_size(...)`.

*esp\_err\_t* **wl\_write** (*wl\_handle\_t* handle, *size\_t* dest\_addr, **const** void \*src, *size\_t* size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

**Note** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

### Return

- ESP\_OK, if data was written successfully;
- ESP\_ERR\_INVALID\_ARG, if dst\_offset exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

### Parameters

- handle: WL handle that are related to the partition
- dest\_addr: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- size: Size of data to be written, in bytes.

*esp\_err\_t* **wl\_read** (*wl\_handle\_t* handle, *size\_t* src\_addr, void \*dest, *size\_t* size)

Read data from the WL storage.

### Return

- ESP\_OK, if data was read successfully;
- ESP\_ERR\_INVALID\_ARG, if src\_offset exceeds partition size;

- ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- `handle`: WL module instance that was initialized before
- `dest`: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- `src_addr`: Address of the data to be read, relative to the beginning of the partition.
- `size`: Size of data to be read, in bytes.

`size_t wl_size (wl_handle_t handle)`

Get size of the WL storage.

**Return** usable size, in bytes

**Parameters**

- `handle`: WL module handle that was initialized before

`size_t wl_sector_size (wl_handle_t handle)`

Get sector size of the WL instance.

**Return** sector size, in bytes

**Parameters**

- `handle`: WL module handle that was initialized before

**Macros**

**WL\_INVALID\_HANDLE**

**Type Definitions**

```
typedef int32_t wl_handle_t
    wear levelling handle
```

## 2.6.8 SPIFFS 文件系统

[\[English\]](#)

**概述**

SPIFFS 是一个用于 SPI NOR flash 设备的嵌入式文件系统，支持磨损均衡、文件系统一致性检查等功能。

**说明**

- 目前，SPIFFS 尚不支持目录，但可以生成扁平结构。如果 SPIFFS 挂载在 /spiffs 下，在 /spiffs/tmp/myfile.txt 路径下创建一个文件则会在 SPIFFS 中生成一个名为 /tmp/myfile.txt 的文件，而不是在 /spiffs/tmp 下生成名为 myfile.txt 的文件；
- SPIFFS 并非实时栈，每次写操作耗时不等；
- 目前，SPIFFS 尚不支持检测或处理已损坏的块。

**工具**

**spiffsgen.py** [spiffsgen.py](#):

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

参数（必选）说明如下：

- **image\_size**: 分区大小，用于烧录生成的 SPIFFS 映像；
- **base\_dir**: 创建 SPIFFS 映像的目录；

- **output\_file**: SPIFFS 映像输出文件。

其他参数（可选）也参与控制映像的生成，您可以运行以下帮助命令，查看这些参数的具体信息：

```
python spiffsgen.py --help
```

上述可选参数对应 SPIFFS 构建配置选项。若想顺利生成可用的映像，请确保使用的参数或配置与构建 SPIFFS 时所用的参数或配置相同。运行帮助命令将显示参数所对应的 SPIFFS 构建配置。如未指定参数，将使用帮助信息中的默认值。

映像生成后，您可以使用 `esptool.py` 或 `parttool.py` 烧录映像。

您可以在命令行或脚本中手动单独调用 `spiffsgen.py`，也可以直接从构建系统调用 `spiffs_create_partition_image` 来使用 `spiffsgen.py`。

在 Make 构建系统中运行：

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

在 CMake 构建系统中运行：

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_
→dep dep dep...])
```

在构建系统中使用 `spiffsgen.py` 更为方便，构建配置自动传递给 `spiffsgen.py` 工具，确保生成的映像可用于构建。比如，单独调用 `spiffsgen.py` 时需要用到 `image_size` 参数，但在构建系统中调用 `spiffs_create_partition_image` 时，仅需要 `partition` 参数，映像大小将直接从工程分区表中获取。

Make 构建系统和 CMake 构建系统结构有所不同，请注意以下几点：

- 在 Make 构建系统中使用 `spiffs_create_partition_image`，需从工程 Makefile 中调用；
- 在 CMake 构建系统中使用 `spiffs_create_partition_image`，需从组件 CMakeLists.txt 文件调用。

您也可以指定 `FLASH_IN_PROJECT`，然后使用 `idf.py flash` 或 `make flash` 将映像与应用程序二进制文件、分区表等一起自动烧录至设备，例如：

在 Make 构建系统中运行：

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

在 CMake 构建系统中运行：

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

不指定 `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` 也可以生成映像，但须使用 `esptool.py`、`parttool.py` 或自定义构建系统目标手动烧录。

有时基本目录中的内容是在构建时生成的，您可以使用 `DEPENDS/SPIFFS_IMAGE_DEPENDS` 指定目标，因此可以在生成映像之前执行此目标。

在 Make 构建系统中运行：

```
dep:
    ...

SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

在 CMake 构建系统中运行：

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

请参考 [examples/storage/spiffsgen](#)>，查看示例。

**mkspiffs** 您也可以使用 **mkspiffs** 工具创建 SPIFFS 分区映像。与 `spiffsgen.py` 相似，**mkspiffs** 也可以用于从指定文件夹中生成映像，然后使用 `esptool.py` 烧录映像。

该工具需要获取以下参数：

- **Block Size**: 4096 (SPI flash 标准)
- **Page Size**: 256 (SPI flash 标准)
- **Image Size**: 分区大小 (以字节为单位，可从分区表中获取)
- **Partition Offset**: 分区起始地址 (可从分区表内获取)

运行以下命令，将文件夹打包成 1 MB 大小的映像：

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

运行以下命令，将映像烧录到 ESP32 (偏移量: 0x110000)：

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000_
↪spiffs.bin
```

**选择合适的 SPIFFS 工具** 上面介绍的两款 SPIFFS 工具功能相似，需根据实际情况，选择合适的一款。

以下情况优先选用 `spiffsgen.py` 工具：

1. 仅需在构建时简单生成 SPIFFS 映像，请选择使用 `spiffsgen.py`，`spiffsgen.py` 可以直接在构建系统中使用函数或命令生成 SPIFFS 映像。
2. 主机没有可用的 C/C++ 编译器时，可以选择使用 `spiffsgen.py` 工具，`spiffsgen.py` 不需要编译。

以下情况优先选用 `mkspiffs` 工具：

1. 如果您除了需要生成映像外，还需要拆包 SPIFFS 映像，请选择使用 `mkspiffs` 工具。`spiffsgen.py` 目前尚不支持此功能。
2. 如果您当前环境中 Python 解释器不可用，但主机编译器可用，或者有预编译的 `mkspiffs` 二进制文件，此时请选择使用 `mkspiffs` 工具。但是，`mkspiffs` 没有集成到构建系统，用户必须自己完成以下工作：在构建期间编译 `mkspiffs` (如果未使用预编译的二进制文件)，为输出文件创建构建规则或目标，将适当的参数传递给工具等。

## 另请参阅

- [分区表](#)

## 应用示例

`storage/spiffs` 目录下提供了 SPIFFS 应用示例。该示例初始化并挂载了一个 SPIFFS 分区，然后使用 POSIX 和 C 库 API 写入和读取数据。请参考 `example` 目录下的 `README.md` 文件，查看详细信息。

- [spiffs/include/esp\\_spiffs.h](#)

## Functions

*esp\_err\_t* **esp\_vfs\_spiffs\_register** (**const** *esp\_vfs\_spiffs\_conf\_t* \*conf)

Register and mount SPIFFS to VFS with given path prefix.

### Return

- ESP\_OK if success
- ESP\_ERR\_NO\_MEM if objects could not be allocated
- ESP\_ERR\_INVALID\_STATE if already mounted or partition is encrypted
- ESP\_ERR\_NOT\_FOUND if partition for SPIFFS was not found
- ESP\_FAIL if mount or format fails

### Parameters

- conf: Pointer to *esp\_vfs\_spiffs\_conf\_t* configuration structure

*esp\_err\_t* **esp\_vfs\_spiffs\_unregister** (**const** char \*partition\_label)

Unregister and unmount SPIFFS from VFS

### Return

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE already unregistered

### Parameters

- partition\_label: Same label as passed to *esp\_vfs\_spiffs\_register*.

bool **esp\_spiffs\_mounted** (**const** char \*partition\_label)

Check if SPIFFS is mounted

### Return

- true if mounted
- false if not mounted

### Parameters

- partition\_label: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

*esp\_err\_t* **esp\_spiffs\_format** (**const** char \*partition\_label)

Format the SPIFFS partition

### Return

- ESP\_OK if successful
- ESP\_FAIL on error

### Parameters

- partition\_label: Same label as passed to *esp\_vfs\_spiffs\_register*.

*esp\_err\_t* **esp\_spiffs\_info** (**const** char \*partition\_label, size\_t \*total\_bytes, size\_t \*used\_bytes)

Get information for SPIFFS

### Return

- ESP\_OK if success
- ESP\_ERR\_INVALID\_STATE if not mounted

### Parameters

- partition\_label: Same label as passed to *esp\_vfs\_spiffs\_register*
- [out] total\_bytes: Size of the file system
- [out] used\_bytes: Current used bytes in the file system

## Structures

**struct** **esp\_vfs\_spiffs\_conf\_t**

Configuration structure for *esp\_vfs\_spiffs\_register*.

### Public Members

**const** char \***base\_path**

File path prefix associated with the filesystem.

**const char \*partition\_label**

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

**size\_t max\_files**

Maximum files that could be open at the same time.

**bool format\_if\_mount\_failed**

If true, it will format the file system if it fails to mount.

## 2.6.9 量产程序

[English]

### 介绍

这一程序主要用于量产时为每一设备创建工厂 NVS（非易失性存储器）分区映像。NVS 分区映像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制映像，您需要使用以下工具将映像烧录到设备上：

- esptool.py
- Flash 下载工具（仅适用于 Windows）
- 直接烧录程序

### 准备工作

该程序需要用到分区公用程序。

- 操作系统要求：
  - Linux、MacOS 或 Windows（标准版）
- 安装依赖包：
  - Python: <https://www.python.org/downloads/>。

### 注解：

使用该程序之前，请确保：

- Python 路径已添加到 PATH 环境变量中；
- 已经安装 *requirement.txt* 中的软件包，*requirement.txt* 在 esp-idf 根目录下。

### 具体流程

### CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。例如定义 `firmware_key` (key) 的 `type` 为 `data`，`encoding` 为 `hex2bin`。

配置文件中数据格式如下（*REPEAT* 标签可选）：

```
name1,namespace, <-- 第一行为 "namespace" 条目
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

**注解：** 文件第一行应始终为 namespace 条目。

每行应包含三个参数：key、type 和 encoding，并以逗号分隔。如果有 REPEAT 标签，则主 CSV 文件中所有设备此键值均相同。

有关各个参数的详细说明，请参阅 NVS 分区生成程序的 *README* 文件。

CSV 配置文件示例如下：

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT <-- "serial_no" 被标记为 "REPEAT"
device_no,data,i32
```

**注解：**

**请确保：**

- 逗号 ‘,’ 前后无空格；
- CSV 文件每行末尾无空格。

## 主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行均对应一个设备实体。主 CSV 文件中的 key 应首先在 CSV 配置文件中定义。

主 CSV 文件的数据格式如下：

```
key1,key2,key3,....
value1,value2,value3,.... <-- 对应一个设备实体
value4,value5,value6,.... <-- 对应一个设备实体
value7,value8,value9,.... <-- 对应一个设备实体
```

**注解：** 文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列 (键)，这些列将被视为元数据，而不会编译进最终二进制文件。

每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行 (即第一个条目) 输入对应的值，后面其他行为空。

参数描述如下：

**value** Data value

value 是与键对应的键值。

主 CSV 文件示例如下：

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101 <-- 对应一个设备实体 (在 CSV 配置文件中标记为 `REPEAT` 的键，除第一个条目外，其他均为空)
```

(下页继续)

(续上页)

```
2,1a2b3c4d5e6fccdd,,102 <-- 对应一个设备实体
3,1a2b3c4d5e6feeff,,103 <-- 对应一个设备实体
```

**注解：**如果出现 *REPEAT* 标签，则会在相同目录下生成一个新的主 CSV 文件用作主输入文件，并在每行为带有 *REPEAT* 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。中间 CSV 文件的格式如下：

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

## 运行量产程序

### 使用方法：

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

### 可选参数：

序号	参数	描述
1	-h, -help	显示帮助信息并退出

### 命令：

运行 `mfg_gen.py {command} -h` 查看更多帮助信息

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥

## 为每个设备生成工厂映像（默认）

### 使用方法：

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                             [--keyfile KEYFILE] [--inputkey INPUTKEY]
                             [--outdir OUTDIR]
                             conf values prefix size
```

### 位置参数：

参数	描述
conf	待解析的 CSV 配置文件路径
values	待解析的主 CSV 文件路径
prefix	每个输出文件名前缀的唯一名称
size	NVS 分区大小（以字节为单位，且为 4096 的整数倍）

### 可选参数：

参数	描述
-h, -help	显示帮助信息并退出
-fileid FILEID	每个文件名后缀的唯一文件标识符（主 CSV 文件中的任意键），默认为数值 1、2、3...
-version {1,2}	<ul style="list-style-type: none"> <li>• 设置多页 Blob 版本。</li> <li>• 版本 1 - 禁用多页 Blob；</li> <li>• 版本 2 - 启用多页 Blob；</li> <li>• 默认版本：版本 2</li> </ul>
-keygen	生成 NVS 分区加密密钥
-inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
-outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

请运行以下命令为每个设备生成工厂映像，量产程序同时提供了一个 CSV 示例文件：

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_
↳blob.csv Sample 0x3000
```

主 CSV 文件应在 file 类型下设置一个相对路径，指向运行该程序的当前目录。

### 为每个设备生成工厂加密映像

运行以下命令为每一设备生成工厂加密映像，量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密：

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000 --keygen
```

**注解：** 创建的加密密钥格式为 <outdir>/keys/keys-<prefix>-<fileid>.bin。

**注解：** 加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 提供加密密钥用作二进制输入文件来进行加密：

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

### 仅生成加密密钥

#### 使用方法：

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

#### 可选参数：

参数	描述
-h, -help	显示帮助信息并退出
-keyfile KEYFILE	加密密钥文件的输出路径
-outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令仅生成加密密钥：

```
python mfg_gen.py generate-key
```

**注解：** 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。时间戳格式为：`%m-%d_%H-%M`。

**注解：** 如需自定义目标文件名，请使用 `-keyfile` 参数。

生成的加密密钥二进制文件还可以用于为每个设备的工厂映像加密。

`fileid` 参数的默认值为 1、2、3...，与主 CSV 文件中的行一一对应，内含设备配置值。

运行量产程序时，将在指定的 `outdir` 目录下创建以下文件夹：

- `bin/` 存储生成的二进制文件
- `csv/` 存储生成的中间 CSV 文件
- `keys/` 存储加密密钥（创建工厂加密映像时会用到）

此部分 API 代码示例详见 ESP-IDF 项下 [storage](#) 目录。

## 2.7 System API

### 2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32's memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
  - offset for 0 Segment = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.
  - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
  - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
  - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM
Segment 2: len 0x00000 load 0x3ff80000 file_offs 0x00013d00 SOC_RTC_DRAM
Segment 3: len 0x00000 load 0x3ff80000 file_offs 0x00013d08 SOC_RTC_DRAM

↵0) load
```

For more details on the type of memory segments and their address ranges, see the ESP32 Technical Reference Manual, Section 1.3.2 *Embedded Memory*.

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.
4. If the `hash_appended` field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.
5. If the options `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
  - version word (4 bytes),
  - signature data (64 bytes).

### Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `secure_version` - see *Anti-rollback*.
- `version` - see *App version*. \*
- `project_name` is filled from `PROJECT_NAME`. \*
- `time and date` - compile time and date.
- `idf_ver` - version of ESP-IDF. \*
- `app_elf_sha256` - contains sha256 for the elf application file.

\* - The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

### Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↪app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into `component.mk`
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`

## API Reference

### Header File

- [bootloader\\_support/include/esp\\_app\\_format.h](#)

### Structures

**struct esp\_image\_header\_t**

Main header of binary image.

#### Public Members

**uint8\_t magic**

Magic word `ESP_IMAGE_HEADER_MAGIC`

**uint8\_t segment\_count**

Count of memory segments

**uint8\_t spi\_mode**

flash read mode (`esp_image_spi_mode_t` as `uint8_t`)

**uint8\_t spi\_speed : 4**

flash frequency (`esp_image_spi_freq_t` as `uint8_t`)

**uint8\_t spi\_size : 4**

flash chip size (`esp_image_flash_size_t` as `uint8_t`)

**uint32\_t entry\_addr**

Entry address

**uint8\_t wp\_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to `0xEE`=disabled)

**uint8\_t spi\_pin\_drv[3]**

Drive settings for the SPI flash pins (read by ROM bootloader)

**esp\_chip\_id\_t chip\_id**

Chip identification number

`uint8_t min_chip_rev`

Minimum chip revision supported by image

`uint8_t reserved[8]`

Reserved bytes in additional header space, currently unused

`uint8_t hash_appended`

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

**struct esp\_image\_segment\_header\_t**

Header of binary image segment.

### Public Members

`uint32_t load_addr`

Address of segment

`uint32_t data_len`

Length of data

**struct esp\_app\_desc\_t**

Description about application.

### Public Members

`uint32_t magic_word`

Magic word `ESP_APP_DESC_MAGIC_WORD`

`uint32_t secure_version`

Secure version

`uint32_t reserv1[2]`

reserv1

`char version[32]`

Application version

`char project_name[32]`

Project name

`char time[16]`

Compile time

`char date[16]`

Compile date

`char idf_ver[32]`

Version IDF

`uint8_t app_elf_sha256[32]`

sha256 of elf file

`uint32_t reserv2[20]`

reserv2

### Macros

**ESP\_IMAGE\_HEADER\_MAGIC**

The magic word for the *esp\_image\_header\_t* structure.

**ESP\_IMAGE\_MAX\_SEGMENTS**

Max count of segments in the image.

**ESP\_APP\_DESC\_MAGIC\_WORD**

The magic word for the `esp_app_desc` structure that is in DROM.

**Enumerations****enum esp\_chip\_id\_t**

ESP chip ID.

*Values:*

**ESP\_CHIP\_ID\_ESP32** = 0x0000

chip ID: ESP32

**ESP\_CHIP\_ID\_INVALID** = 0xFFFF

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

**enum esp\_image\_spi\_mode\_t**

SPI flash mode, used in `esp_image_header_t`.

*Values:*

**ESP\_IMAGE\_SPI\_MODE\_QIO**

SPI mode QIO

**ESP\_IMAGE\_SPI\_MODE\_QOUT**

SPI mode QOUT

**ESP\_IMAGE\_SPI\_MODE\_DIO**

SPI mode DIO

**ESP\_IMAGE\_SPI\_MODE\_DOUT**

SPI mode DOUT

**ESP\_IMAGE\_SPI\_MODE\_FAST\_READ**

SPI mode FAST\_READ

**ESP\_IMAGE\_SPI\_MODE\_SLOW\_READ**

SPI mode SLOW\_READ

**enum esp\_image\_spi\_freq\_t**

SPI flash clock frequency.

*Values:*

**ESP\_IMAGE\_SPI\_SPEED\_40M**

SPI clock frequency 40 MHz

**ESP\_IMAGE\_SPI\_SPEED\_26M**

SPI clock frequency 26 MHz

**ESP\_IMAGE\_SPI\_SPEED\_20M**

SPI clock frequency 20 MHz

**ESP\_IMAGE\_SPI\_SPEED\_80M** = 0xF

SPI clock frequency 80 MHz

**enum esp\_image\_flash\_size\_t**

Supported SPI flash sizes.

*Values:*

**ESP\_IMAGE\_FLASH\_SIZE\_1MB** = 0

SPI flash size 1 MB

**ESP\_IMAGE\_FLASH\_SIZE\_2MB**

SPI flash size 2 MB

**ESP\_IMAGE\_FLASH\_SIZE\_4MB**

SPI flash size 4 MB

**ESP\_IMAGE\_FLASH\_SIZE\_8MB**

SPI flash size 8 MB

**ESP\_IMAGE\_FLASH\_SIZE\_16MB**

SPI flash size 16 MB

**ESP\_IMAGE\_FLASH\_SIZE\_MAX**

SPI flash size MAX

## 2.7.2 Application Level Tracing

### Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [特定应用程序的跟踪](#)
2. Lightweight logging to the host, see [记录日志到主机](#)
3. System behaviour analysis, see [基于 SEGGER SystemView 的系统行为分析](#)

### API Reference

#### Header File

- [app\\_trace/include/esp\\_app\\_trace.h](#)

#### Functions

*esp\_err\_t* **esp\_apptrace\_init** (void)

Initializes application tracing module.

**Note** Should be called before any esp\_apptrace\_xxx call.

**Return** ESP\_OK on success, otherwise see esp\_err\_t

void **esp\_apptrace\_down\_buffer\_config** (uint8\_t \*buf, uint32\_t size)

Configures down buffer.

**Note** Needs to be called before initiating any data transfer using esp\_apptrace\_buffer\_get and esp\_apptrace\_write. This function does not protect internal data by lock.

#### Parameters

- buf: Address of buffer to use for down channel (host to target) data.
- size: Size of the buffer.

uint8\_t \***esp\_apptrace\_buffer\_get** (*esp\_apptrace\_dest\_t* dest, uint32\_t size, uint32\_t tmo)

Allocates buffer for trace data. After data in buffer are ready to be sent off esp\_apptrace\_buffer\_put must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

#### Parameters

- dest: Indicates HW interface to send data.
- size: Size of data to write to trace buffer.
- tmo: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

*esp\_err\_t* **esp\_apptrace\_buffer\_put** (*esp\_apptrace\_dest\_t* dest, uint8\_t \*ptr, uint32\_t tmo)

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be preceded by esp\_apptrace\_buffer\_get.

**Return** ESP\_OK on success, otherwise see esp\_err\_t

#### Parameters

- `dest`: Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_apptrace_buffer_get`.
- `ptr`: Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_buffer_get`.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_apptrace_write(esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)`

Writes data to trace buffer.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to send data.
- `data`: Address of data to write to trace buffer.
- `size`: Size of data to write to trace buffer.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)`  
vprintf-like function to sent log messages to host via specified HW interface.

**Return** Number of bytes written.

**Parameters**

- `dest`: Indicates HW interface to send data.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- `fmt`: Address of format string.
- `ap`: List of arguments.

`int esp_apptrace_vprintf(const char *fmt, va_list ap)`  
vprintf-like function to sent log messages to host.

**Return** Number of bytes written.

**Parameters**

- `fmt`: Address of format string.
- `ap`: List of arguments.

`esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)`  
Flushes remaining data in trace buffer to host.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to flush data on.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)`  
Flushes remaining data in trace buffer to host without locking internal data. This is special version of `esp_apptrace_flush` which should be called from panic handler.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to flush data on.
- `min_sz`: Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)`  
Reads host data from trace buffer.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to read the data on.
- `data`: Address of buffer to put data from trace buffer.
- `size`: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`uint8_t *esp_apptrace_down_buffer_get (esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)`  
Retrieves incoming data buffer if any. After data in buffer are processed `esp_apptrace_down_buffer_put` must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

**Parameters**

- `dest`: Indicates HW interface to receive data.
- `size`: Address to store size of available data in down buffer. Must be initialized with requested value.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_apptrace_down_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)`  
Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by `esp_apptrace_down_buffer_get`.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to receive data. Should be identical to the same parameter in call to `esp_apptrace_down_buffer_get`.
- `ptr`: Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_down_buffer_get`.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTTRACE_TMO_INFINITE` to wait indefinitely.

`bool esp_apptrace_host_is_connected (esp_apptrace_dest_t dest)`

Checks whether host is connected.

**Return** true if host is connected, otherwise false

**Parameters**

- `dest`: Indicates HW interface to use.

`void *esp_apptrace_fopen (esp_apptrace_dest_t dest, const char *path, const char *mode)`  
Opens file on host. This function has the same semantic as ‘`fopen`’ except for the first argument.

**Return** non zero file handle on success, otherwise 0

**Parameters**

- `dest`: Indicates HW interface to use.
- `path`: Path to file.
- `mode`: Mode string. See `fopen` for details.

`int esp_apptrace_fclose (esp_apptrace_dest_t dest, void *stream)`  
Closes file on host. This function has the same semantic as ‘`fclose`’ except for the first argument.

**Return** Zero on success, otherwise non-zero. See `fclose` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.

`size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)`

Writes to file on host. This function has the same semantic as ‘`fwrite`’ except for the first argument.

**Return** Number of written items. See `fwrite` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `ptr`: Address of data to write.
- `size`: Size of an item.
- `nmemb`: Number of items to write.
- `stream`: File handle returned by `esp_apptrace_fopen`.

`size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)`

Read file on host. This function has the same semantic as ‘`fread`’ except for the first argument.

**Return** Number of read items. See `fread` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `ptr`: Address to store read data.
- `size`: Size of an item.
- `nmemb`: Number of items to read.
- `stream`: File handle returned by `esp_apptrace_fopen`.

int **esp\_apptrace\_fseek** (*esp\_apptrace\_dest\_t* *dest*, void \**stream*, long *offset*, int *whence*)

Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

**Return** Zero on success, otherwise non-zero. See `fseek` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.
- `offset`: Offset. See `fseek` for details.
- `whence`: Position in file. See `fseek` for details.

int **esp\_apptrace\_ftell** (*esp\_apptrace\_dest\_t* *dest*, void \**stream*)

Get current position indicator for file on host. This function has the same semantic as ‘ftell’ except for the first argument.

**Return** Current position in file. See `ftell` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.

int **esp\_apptrace\_fstop** (*esp\_apptrace\_dest\_t* *dest*)

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to use.

void **esp\_gcov\_dump** (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

## Enumerations

enum **esp\_apptrace\_dest\_t**

Application trace data destinations bits.

*Values:*

**ESP\_APPTRACE\_DEST\_TRAX** = 0x1  
JTAG destination.

**ESP\_APPTRACE\_DEST\_UART0** = 0x2  
UART destination.

## Header File

- [app\\_trace/include/esp\\_sysview\\_trace.h](#)

## Functions

static *esp\_err\_t* **esp\_sysview\_flush** (uint32\_t *tmo*)

Flushes remaining data in SystemView trace buffer to host.

**Return** `ESP_OK`.

**Parameters**

- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

int **esp\_sysview\_vprintf** (const char \**format*, va\_list *args*)

vprintf-like function to sent log messages to the host.

**Return** Number of bytes written.

**Parameters**

- `format`: Address of format string.
- `args`: List of arguments.

`esp_err_t esp_sysview_heap_trace_start` (uint32\_t *tmo*)

Starts SystemView heap tracing.

**Return** ESP\_OK on success, ESP\_ERR\_TIMEOUT if operation has been timed out.

**Parameters**

- `tmo`: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

`esp_err_t esp_sysview_heap_trace_stop` (void)

Stops SystemView heap tracing.

**Return** ESP\_OK.

void `esp_sysview_heap_trace_alloc` (void \**addr*, uint32\_t *size*, const void \**callers*)

Sends heap allocation event to the host.

**Parameters**

- `addr`: Address of allocated block.
- `size`: Size of allocated block.
- `callers`: Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

void `esp_sysview_heap_trace_free` (void \**addr*, const void \**callers*)

Sends heap de-allocation event to the host.

**Parameters**

- `addr`: Address of de-allocated block.
- `callers`: Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

## 2.7.3 eFuse Manager

### Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

### Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE\_BLK0). For more details see [ESP32 Technical Reference Manual](#) in part 20 eFuse controller. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE\_BLK0 is used entirely for system purposes;
- EFUSE\_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- EFUSE\_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- EFUSE\_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

## eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool *efuse\_table\_gen.py*. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility will check with the *common* CSV file.

CSV files:

- *common* (*esp\_efuse\_table.csv*) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse_common_table`). Note that changes in this file can lead to incorrect operation.
- *custom* - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse_custom_table`.

### Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_
↪count(1..256), comment
```

Individual params in CSV file the following meanings:

**field\_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table).

**efuse\_block** Block number. It determines where the eFuse bits will be placed for this field. Available `EFUSE_BLK0..EFUSE_BLK3`.

**bit\_start** Start bit number (0..255). The `bit_start` field can be omitted. In this case, it will be set to `bit_start + bit_count` from the previous record, if it has the same `efuse_block`. Otherwise (if `efuse_block` is different, or this is the first entry), an error will be generated.

**bit\_count** The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for `ESP_EFUSE_SECURE_BOOT_KEY` and `ESP_EFUSE_ENCRYPT_FLASH_KEY` fields). The value `MAX_BLK_LEN` depends on `CONFIG_EFUSE_MAX_BLK_LEN`, will be replaced with "None" - 256, "3/4" - 192, "REPEAT" - 128.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This field will available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

## efuse\_table\_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional *custom* file is used, it will be checked with the existing *common* file (*esp\_efuse\_table.csv*). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type *esp\_efuse\_desc\_t*.

To generate a *common* files, use the following command `idf.py efuse_common_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv
```

After generation in the folder *esp32* create:

- *esp\_efuse\_table.c* file.
- In *include* folder *esp\_efuse\_table.c* file.

To generate a *custom* files, use the following command `idf.py efuse_custom_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_
↪table.csv
```

After generation in the folder *PROJECT\_PATH/main* create:

- *esp\_efuse\_custom\_table.c* file.
- In *include* folder *esp\_efuse\_custom\_table.c* file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

## Support coding scheme

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE\_BLK1, EFUSE\_BLK2 and EFUSE\_BLK3 blocks. EUSE\_BLK0 block always has a coding scheme *None*. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and are not used.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter *coding\_scheme*):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p COM4 summary` command.
- from `esptool` utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE\_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with *None* encoding and 3/4 is used in the chip, then the `ESP_ERR_CODING` error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. To write some fields in one time need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual use the `esp_efuse_write_...` functions. At the end to burn they, need to call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the efuse blocks and disable the batch recording mode. The batch writing mode blocks `esp_efuse_read_...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

## eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1” .
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1” .
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

## How add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show_efuse_table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
eFuse coding scheme: NONE
#      field_name          efuse_block    bit_start      bit_count
1      WR_DIS_FLASH_CRYPT_CNT  EFUSE_BLK0    2              1
2      WR_DIS_BLK1            EFUSE_BLK0    7              1
3      WR_DIS_BLK2            EFUSE_BLK0    8              1
4      WR_DIS_BLK3            EFUSE_BLK0    9              1
5      RD_DIS_BLK1            EFUSE_BLK0    16             1
6      RD_DIS_BLK2            EFUSE_BLK0    17             1
7      RD_DIS_BLK3            EFUSE_BLK0    18             1
8      FLASH_CRYPT_CNT        EFUSE_BLK0    20             7
9      MAC_FACTORY            EFUSE_BLK0    32             8
```

00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
EFUSE block 3:
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
```

## Header File

- [efuse/include/esp\\_efuse.h](#)

## Functions

***esp\_err\_t* esp\_efuse\_read\_field\_blob(const *esp\_efuse\_desc\_t* \*field[], void \*dst, size\_t dst\_size\_bits)**  
Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst\_size\_bits” required size. Use “esp\_efuse\_get\_field\_size()” function to determine the length of the field.

#### Return

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

#### Parameters

- [in] field: A pointer to the structure describing the fields of efuse.
- [out] dst: A pointer to array that will contain the result of reading.
- [in] dst\_size\_bits: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

bool **esp\_efuse\_read\_field\_bit** (const *esp\_efuse\_desc\_t* \*field[])

Read a single bit eFuse field as a boolean value.

**Note** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp\_efuse\_read\_field\_blob() and check the returned value instead.

**Note** If assertions are enabled and the parameter is invalid, execution will abort

#### Return

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

#### Parameters

- [in] field: A pointer to the structure describing the fields of efuse.

*esp\_err\_t* **esp\_efuse\_read\_field\_cnt** (const *esp\_efuse\_desc\_t* \*field[], size\_t \*out\_cnt)

Reads bits from EFUSE field and returns number of bits programmed as “1” .

If the bits are set not sequentially, they will still be counted.

#### Return

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

#### Parameters

- [in] field: A pointer to the structure describing the fields of efuse.
- [out] out\_cnt: A pointer that will contain the number of programmed as “1” bits.

*esp\_err\_t* **esp\_efuse\_write\_field\_blob** (const *esp\_efuse\_desc\_t* \*field[], const void \*src, size\_t src\_size\_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src\_size\_bits” required size. Use “esp\_efuse\_get\_field\_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

#### Return

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

#### Parameters

- [in] field: A pointer to the structure describing the fields of efuse.
- [in] src: A pointer to array that contains the data for writing.
- [in] src\_size\_bits: The number of bits required to write.

*esp\_err\_t* **esp\_efuse\_write\_field\_cnt** (const *esp\_efuse\_desc\_t* \*field[], size\_t cnt)

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1” , ESP\_ERR\_EFUSE\_CNT\_IS\_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

#### Return

- ESP\_OK: The operation was successfully completed.

- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.

**Parameters**

- [in] *field*: A pointer to the structure describing the fields of efuse.
- [in] *cnt*: Required number of programmed as “1” bits.

*esp\_err\_t* **esp\_efuse\_write\_field\_bit** (const *esp\_efuse\_desc\_t* \**field*[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling `esp_efuse_write_field_cnt()` with the `cnt` parameter equal to 1, except that it will return ESP\_OK if the field is already set to 1.

**Return**

- ESP\_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

**Parameters**

- [in] *field*: Pointer to the structure describing the efuse field.

*esp\_err\_t* **esp\_efuse\_set\_write\_protect** (*esp\_efuse\_block\_t* *blk*)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.
- ESP\_ERR\_NOT\_SUPPORTED: The block does not support this command.

**Parameters**

- [in] *blk*: Block number of eFuse. (EFUSE\_BLK1, EFUSE\_BLK2 and EFUSE\_BLK3)

*esp\_err\_t* **esp\_efuse\_set\_read\_protect** (*esp\_efuse\_block\_t* *blk*)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.
- ESP\_ERR\_NOT\_SUPPORTED: The block does not support this command.

**Parameters**

- [in] *blk*: Block number of eFuse. (EFUSE\_BLK1, EFUSE\_BLK2 and EFUSE\_BLK3)

int **esp\_efuse\_get\_field\_size** (const *esp\_efuse\_desc\_t* \**field*[])

Returns the number of bits used by field.

**Return** Returns the number of bits used by field.

**Parameters**

- [in] *field*: A pointer to the structure describing the fields of efuse.

uint32\_t **esp\_efuse\_read\_reg** (*esp\_efuse\_block\_t* *blk*, unsigned int *num\_reg*)

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE\_BLK2\_RDATA3\_REG where (blk=2, num\_reg=3)

**Return** Value of register

**Parameters**

- [in] *blk*: Block number of eFuse.
- [in] *num\_reg*: The register number in the block.

*esp\_err\_t* **esp\_efuse\_write\_reg** (*esp\_efuse\_block\_t blk*, unsigned int *num\_reg*, uint32\_t *val*)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE\_BLK3\_WDATA0\_REG where (blk=3, num\_reg=0)

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**

- [in] blk: Block number of eFuse.
- [in] num\_reg: The register number in the block.
- [in] val: Value to write.

*esp\_efuse\_coding\_scheme\_t* **esp\_efuse\_get\_coding\_scheme** (*esp\_efuse\_block\_t blk*)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return** Return efuse coding scheme for blocks

**Parameters**

- [in] blk: Block number of eFuse.

*esp\_err\_t* **esp\_efuse\_read\_block** (*esp\_efuse\_block\_t blk*, void \**dst\_key*, *size\_t offset\_in\_bits*, *size\_t size\_bits*)

Read key to efuse block starting at the offset and the required size.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] blk: Block number of eFuse.
- [in] dst\_key: A pointer to array that will contain the result of reading.
- [in] offset\_in\_bits: Start bit in block.
- [in] size\_bits: The number of bits required to read.

*esp\_err\_t* **esp\_efuse\_write\_block** (*esp\_efuse\_block\_t blk*, const void \**src\_key*, *size\_t offset\_in\_bits*, *size\_t size\_bits*)

Write key to efuse block starting at the offset and the required size.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits

**Parameters**

- [in] blk: Block number of eFuse.
- [in] src\_key: A pointer to array that contains the key for writing.
- [in] offset\_in\_bits: Start bit in block.
- [in] size\_bits: The number of bits required to write.

uint8\_t **esp\_efuse\_get\_chip\_ver** (void)

Returns chip version from efuse.

**Return** chip version

uint32\_t **esp\_efuse\_get\_pkg\_ver** (void)

Returns chip package from efuse.

**Return** chip package

void **esp\_efuse\_burn\_new\_values** (void)

```
void esp_efuse_reset (void)
void esp_efuse_disable_basic_rom_console (void)
esp_err_t esp_efuse_disable_rom_download_mode (void)
void esp_efuse_write_random_key (uint32_t blk_wdata0_reg)
uint32_t esp_efuse_read_secure_version (void)
bool esp_efuse_check_secure_version (uint32_t secure_version)
esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)
void esp_efuse_init (uint32_t offset, uint32_t size)
esp_err_t esp_efuse_batch_write_begin (void)
esp_err_t esp_efuse_batch_write_cancel (void)
esp_err_t esp_efuse_batch_write_commit (void)
static bool soc_has_cache_lock_bug (void)
```

### Structures

```
struct esp_efuse_desc_t
    Structure eFuse field.
```

### Public Members

```
esp_efuse_block_t efuse_block : 8
    Block of eFuse

uint8_t bit_start
    Start bit [0..255]

uint16_t bit_count
    Length of bit field [1..-]
```

### Macros

```
ESP_ERR_EFUSE
    Base error code for efuse api.
ESP_OK_EFUSE_CNT
    OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL
    Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG
    Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING
    Error while a encoding operation.
```

## 2.7.4 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see [Error Handling](#).

For the full list of error codes defined in ESP-IDF, see [Error Code Reference](#).

## API Reference

### Header File

- [esp\\_common/include/esp\\_err.h](#)

### Functions

**const** char \***esp\_err\_to\_name** (*esp\_err\_t code*)

Returns string for esp\_err\_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

**Return** string error message

#### Parameters

- code: esp\_err\_t error code

**const** char \***esp\_err\_to\_name\_r** (*esp\_err\_t code*, char \**buf*, size\_t *buflen*)

Returns string for esp\_err\_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp\_err\_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

**Return** buf containing the string error message

#### Parameters

- code: esp\_err\_t error code
- [out] buf: buffer where the error message should be written
- buflen: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

### Macros

#### ESP\_OK

esp\_err\_t value indicating success (no error)

#### ESP\_FAIL

Generic esp\_err\_t code indicating failure

#### ESP\_ERR\_NO\_MEM

Out of memory

#### ESP\_ERR\_INVALID\_ARG

Invalid argument

#### ESP\_ERR\_INVALID\_STATE

Invalid state

#### ESP\_ERR\_INVALID\_SIZE

Invalid size

#### ESP\_ERR\_NOT\_FOUND

Requested resource not found

#### ESP\_ERR\_NOT\_SUPPORTED

Operation or feature not supported

#### ESP\_ERR\_TIMEOUT

Operation timed out

#### ESP\_ERR\_INVALID\_RESPONSE

Received response was invalid

**ESP\_ERR\_INVALID\_CRC**

CRC or checksum was invalid

**ESP\_ERR\_INVALID\_VERSION**

Version was invalid

**ESP\_ERR\_INVALID\_MAC**

MAC address was invalid

**ESP\_ERR\_WIFI\_BASE**

Starting number of WiFi error codes

**ESP\_ERR\_MESH\_BASE**

Starting number of MESH error codes

**ESP\_ERR\_FLASH\_BASE**

Starting number of flash error codes

**ESP\_ERROR\_CHECK** (x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP\_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

**ESP\_ERROR\_CHECK\_WITHOUT\_ABORT** (x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP\_ERROR\_CHECK(), this prints the same error message but isn't terminating the program.

**Type Definitions**

```
typedef int32_t esp_err_t
```

**2.7.5 ESP HTTPS OTA****Overview**

esp\_https\_ota provides simplified APIs to perform firmware upgrades over HTTPS. It's an abstraction layer over existing OTA APIs.

**Application Example**

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

## Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer [Secure OTA Updates Without Secure boot](#)

## API Reference

### Header File

- [esp\\_https\\_ota/include/esp\\_https\\_ota.h](#)

### Functions

*esp\_err\_t* **esp\_https\_ota** (**const** *esp\_http\_client\_config\_t* \**config*)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to *cert\_pem* member of *config*.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from *esp\_https\_ota* component should be called. If more information and control is needed during the HTTPS OTA process, then one can use *esp\_https\_ota\_begin* and subsequent APIs. If this API returns successfully, *esp\_restart()* must be called to boot from the new firmware image.

#### Return

- ESP\_OK: OTA data updated, next reboot will use specified partition.
- ESP\_FAIL: For generic failure.
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_OTA\_VALIDATE\_FAILED: Invalid app image
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for OTA operation.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app\_update component.

#### Parameters

- [in] *config*: pointer to *esp\_http\_client\_config\_t* structure.

*esp\_err\_t* **esp\_https\_ota\_begin** (*esp\_https\_ota\_config\_t* \**ota\_config*, *esp\_https\_ota\_handle\_t* \**handle*)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then *esp\_https\_ota\_perform* should be called to continue with the OTA process and there should be a call to *esp\_https\_ota\_finish* on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to *cert\_pem* member of *http\_config*, which is a part of *ota\_config*. In case of error, this API explicitly sets *handle* to NULL.

**Note** This API is blocking, so setting *is\_async* member of *http\_config* structure will result in an error.

#### Return

- ESP\_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP\_FAIL: For generic failure.
- ESP\_ERR\_INVALID\_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app\_update component and *esp\_http\_client* component in esp-idf.

#### Parameters

- [in] *ota\_config*: pointer to *esp\_https\_ota\_config\_t* structure
- [out] *handle*: pointer to an allocated data of type *esp\_https\_ota\_handle\_t* which will be initialised in this function

*esp\_err\_t* **esp\_https\_ota\_perform** (*esp\_https\_ota\_handle\_t* *https\_ota\_handle*)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

#### Return

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
- `ESP_OK`: OTA update was successful
- `ESP_FAIL`: OTA update failed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app\_update component.

#### Parameters

- [in] `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

bool `esp_https_ota_is_complete_data_received` (`esp_https_ota_handle_t https_ota_handle`)

Checks if complete data was received or not.

**Note** This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

#### Return

- false
- true

#### Parameters

- [in] `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

`esp_err_t esp_https_ota_finish` (`esp_https_ota_handle_t https_ota_handle`)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note** If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image

#### Return

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

#### Parameters

- [in] `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

`esp_err_t esp_https_ota_get_img_desc` (`esp_https_ota_handle_t https_ota_handle`, `esp_app_desc_t *new_app_info`)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note** This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

#### Return

- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_FAIL`: Failed to read image descriptor
- `ESP_OK`: Successfully read image descriptor

#### Parameters

- [in] `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure
- [out] `new_app_info`: pointer to an allocated `esp_app_desc_t` structure

int `esp_https_ota_get_image_len_read` (`esp_https_ota_handle_t https_ota_handle`)

## Structures

```
struct esp_https_ota_config_t
    ESP HTTPS OTA configuration.
```

### Public Members

```
const esp_http_client_config_t *http_config
    ESP HTTP client configuration
```

### Macros

```
ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS
```

### Type Definitions

```
typedef void *esp_https_ota_handle_t
```

## 2.7.6 ESP-pthread

### Overview

This module offers Espressif specific extensions to the pthread library that can be used to influence the behaviour of pthread.

- Stack size of the pthreads
- Priority of the created pthreads
- Inheriting this configuration across threads
- Thread name
- Core affinity / core pinning.

Example to tune the stack size of the pthread:

```
void * thread_func(void * p)
{
    printf("In thread_func\n");
    return NULL;
}

void app_main(void)
{
    pthread_t t1;

    esp_pthread_cfg_t cfg = esp_create_default_pthread_config();
    cfg.stack_size = (4 * 1024);
    esp_pthread_set_cfg(&cfg);

    pthread_create(&t1, NULL, thread_func);
}
```

The API can also be used for inheriting the settings across threads. For example:

```
void * my_thread2(void * p)
{
    /* This thread will inherit the stack size of 4K */
    printf("In my_thread2\n");

    return NULL;
}

void * my_thread1(void * p)
```

(下页继续)

```
{
    printf("In my_thread1\n");
    pthread_t t2;
    pthread_create(&t2, NULL, my_thread2);

    return NULL;
}

void app_main(void)
{
    pthread_t t1;

    esp_thread_cfg_t cfg = esp_create_default_thread_config();
    cfg.stack_size = (4 * 1024);
    cfg.inherit_cfg = true;
    esp_thread_set_cfg(&cfg);

    pthread_create(&t1, NULL, my_thread1);
}
```

## API Reference

### Header File

- [pthread/include/esp\\_thread.h](#)

### Functions

*esp\_err\_t* **esp\_thread\_get\_default\_config**(void)

Creates a default pthread configuration based on the values set via menuconfig.

**Return** A default configuration structure.

*esp\_err\_t* **esp\_thread\_set\_cfg**(const *esp\_thread\_cfg\_t* \*cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread\_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

**Note** Passing non-NULL attributes to pthread\_create() will override the stack\_size parameter set using this API

#### Return

- ESP\_OK if configuration was successfully set
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_ARG if stack\_size is less than PTHREAD\_STACK\_MIN

#### Parameters

- cfg: The pthread config parameters

*esp\_err\_t* **esp\_thread\_get\_cfg**(*esp\_thread\_cfg\_t* \*p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

#### Return

- ESP\_OK if the configuration was available
- ESP\_ERR\_NOT\_FOUND if a configuration wasn't previously set

#### Parameters

- p: Pointer to the pthread config structure that will be updated with the currently configured parameters

## Structures

### **struct esp\_thread\_cfg\_t**

pthread configuration structure that influences pthread creation

#### Public Members

##### **size\_t stack\_size**

The stack size of the pthread.

##### **size\_t prio**

The thread's priority.

##### **bool inherit\_cfg**

Inherit this configuration further.

##### **const char \*thread\_name**

The thread name.

##### **int pin\_to\_core**

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

## Macros

### **PTHREAD\_STACK\_MIN**

## 2.7.7 Event Loop Library

### Overview

The event loop library allows components to declare events to which other components can register handlers –code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

### Using esp\_event APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more [here](#). Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed [here](#).
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that [here](#).
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```

// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
↳specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is
↳needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
↳specifies a hypothetical
    // event that handler run_on_event should execute on when it gets posted to
↳the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At
↳some point in time
    // the event loop executes the event handler registered to the posted event,
↳in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but
↳posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event);

    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}

```

### Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person's last name and first name, respectively. A last name identifies a family, and the first name

identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE (EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE (EVENT_BASE)
```

**注解:** In IDF, the base identifiers for system events are uppercase and are postfixed with `_EVENT`. For example, the base for wifi events is declared and defined as `WIFI_EVENT`, the ethernet event base `ETHERNET_EVENT`, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event ID's, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

## Default Event Loop

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

User Event Loops	Default Event Loops
<code>esp_event_loop_create()</code>	<code>esp_event_loop_create_default()</code>
<code>esp_event_loop_delete()</code>	<code>esp_event_loop_delete_default()</code>
<code>esp_event_handler_register_with()</code>	<code>esp_event_handler_register()</code>
<code>esp_event_handler_unregister_with()</code>	<code>esp_event_handler_unregister()</code>
<code>esp_event_post_to()</code>	<code>esp_event_post()</code>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

## Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and

special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, `ESP_EVENT_ANY_ID` - handler executes when any event with base <event base> gets posted to the loop
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE`, `MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order** The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also gets executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

### Event loop profiling

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

### Application Example

Examples on using the `esp_event` library can be found in [system/esp\\_event](#). The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- [NMEA Parser](#), which will decode the statements received from GPS.

### API Reference

#### Header File

- [esp\\_event/include/esp\\_event.h](#)

**Functions**

*esp\_err\_t* **esp\_event\_loop\_create** (*const esp\_event\_loop\_args\_t \*event\_loop\_args,*  
*esp\_event\_loop\_handle\_t \*event\_loop*)

Create a new event loop.

**Return**

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- ESP\_FAIL: Failed to create task loop
- Others: Fail

**Parameters**

- [in] *event\_loop\_args*: configuration structure for the event loop to create
- [out] *event\_loop*: handle to the created event loop

*esp\_err\_t* **esp\_event\_loop\_delete** (*esp\_event\_loop\_handle\_t event\_loop*)

Delete an existing event loop.

**Return**

- ESP\_OK: Success
- Others: Fail

**Parameters**
