

ESP32-S3

ESP-IDF 编程指南

Release v4.4.1
乐鑫信息科技
2022年04月16日

Table of contents

Table of contents	i
1 快速入门	3
1.1 概述	3
1.2 准备工作	3
1.3 开发板简介	4
1.3.1 ESP32-S3-DevKitC-1	4
1.4 详细安装步骤	9
1.4.1 设置开发环境	9
1.4.2 创建您的第一个工程	9
1.5 第一步：安装准备	9
1.5.1 Windows 平台工具链的标准设置	9
1.5.2 Linux 平台工具链的标准设置	14
1.5.3 macOS 平台工具链的标准设置	15
1.6 第二步：获取 ESP-IDF	16
1.6.1 Linux 和 macOS 操作系统	17
1.6.2 Windows 操作系统	17
1.7 第三步：设置工具	17
1.7.1 Windows 操作系统	17
1.7.2 Linux 和 macOS 操作系统	17
1.7.3 下载工具备选方案	18
1.7.4 自定义工具安装路径	18
1.8 第四步：设置环境变量	18
1.8.1 Windows 操作系统	18
1.8.2 Linux 和 macOS 操作系统	19
1.9 第五步：开始创建工程	19
1.9.1 Linux 和 macOS 操作系统	19
1.9.2 Windows 操作系统	19
1.10 第六步：连接设备	19
1.11 第七步：配置	20
1.11.1 Linux 和 macOS 操作系统	20
1.11.2 Windows 操作系统	20
1.12 第八步：编译工程	21
1.13 第九步：烧录到设备	21
1.13.1 烧录过程中可能遇到的问题	21
1.13.2 常规操作	22
1.14 第十步：监视器	23
1.15 更新 ESP-IDF	24
1.16 相关文档	24
1.16.1 与 ESP32-S3 创建串口连接	24
1.16.2 Eclipse IDE 创建和烧录指南	30
1.16.3 VS Code IDE 快速入门	30
1.16.4 IDF 监视器	31
1.16.5 工具链的自定义设置	35
2 API 参考	41
2.1 蓝牙 API	41

2.1.1	Controller && VHCI	41
2.1.2	BT COMMON	48
2.1.3	BT LE	53
2.1.4	NimBLE-based host APIs	145
2.1.5	ESP-BLE-MESH	148
2.2	连网 API	360
2.2.1	Wi-Fi	360
2.2.2	以太网	442
2.2.3	Thread	459
2.2.4	IP 网络层协议	464
2.2.5	应用层协议	481
2.3	外设 API	481
2.3.1	Analog to Digital Converter (ADC)	481
2.3.2	通用定时器	501
2.3.3	GPIO & RTC GPIO	511
2.3.4	Dedicated GPIO	529
2.3.5	Hash-based Message Authentication Code (HMAC)	533
2.3.6	Digital Signature (DS)	537
2.3.7	I2C 驱动程序	541
2.3.8	Inter-IC Sound (I2S)	557
2.3.9	LCD	571
2.3.10	LED PWM 控制器	583
2.3.11	Motor Control Pulse Width Modulator (MCPWM)	596
2.3.12	Pulse Counter (PCNT)	620
2.3.13	Remote Control (RMT)	629
2.3.14	SD Pull-up Requirements	648
2.3.15	SDMMC Host Driver	649
2.3.16	SD SPI Host Driver	654
2.3.17	Sigma-delta Modulation	658
2.3.18	SPI Master Driver	660
2.3.19	SPI Slave Driver	678
2.3.20	触摸传感器	684
2.3.21	Two-Wire Automotive Interface (TWAI)	705
2.3.22	Universal Asynchronous Receiver/Transmitter (UART)	720
2.3.23	USB Device Driver	743
2.3.24	USB Host	750
2.4	应用层协议	778
2.4.1	mDNS 服务	778
2.4.2	ESP-TLS	791
2.4.3	OpenSSL-APIs	802
2.4.4	ESP HTTP Client	830
2.4.5	ESP WebSocket Client	843
2.4.6	HTTP 服务器	851
2.4.7	HTTPS server	872
2.4.8	ICMP Echo	875
2.4.9	ASIO port	879
2.4.10	ESP-MQTT	880
2.4.11	ESP-Modbus	891
2.4.12	ESP Local Control	912
2.4.13	ESP Serial Slave Link	920
2.4.14	ESP x509 Certificate Bundle	933
2.4.15	IP 网络层协议	935
2.5	配网 API	935
2.5.1	Unified Provisioning	935
2.5.2	Protocol Communication	939
2.5.3	Wi-Fi Provisioning	950
2.6	存储 API	966
2.6.1	FAT 文件系统	966

2.6.2	量产程序	971
2.6.3	非易失性存储库	975
2.6.4	NVS 分区生成程序	994
2.6.5	SD/SDIO/MMC 驱动程序	998
2.6.6	SPI Flash API	1007
2.6.7	SPIFFS 文件系统	1032
2.6.8	虚拟文件系统组件	1036
2.6.9	磨损均衡 API	1047
2.7	System API	1051
2.7.1	App Image Format	1051
2.7.2	Application Level Tracing	1056
2.7.3	The Async memcpy API	1060
2.7.4	控制台终端	1063
2.7.5	eFuse Manager	1071
2.7.6	Error Codes and Helper Functions	1090
2.7.7	ESP HTTPS OTA	1092
2.7.8	POSIX Threads Support	1096
2.7.9	Event Loop Library	1100
2.7.10	FreeRTOS	1116
2.7.11	FreeRTOS Additions	1220
2.7.12	Heap Memory Allocation	1238
2.7.13	Heap Memory Debugging	1249
2.7.14	High Resolution Timer	1259
2.7.15	Inter-Processor Call	1265
2.7.16	Call function with external stack	1269
2.7.17	Interrupt allocation	1270
2.7.18	Logging library	1276
2.7.19	Miscellaneous System APIs	1282
2.7.20	空中升级 (OTA)	1287
2.7.21	Performance Monitor	1297
2.7.22	电源管理	1300
2.7.23	Random Number Generation	1306
2.7.24	Sleep Modes	1308
2.7.25	Watchdogs	1317
2.7.26	System Time	1320
2.7.27	Internal and Unstable APIs	1324
2.8	API Conventions	1325
2.8.1	Error handling	1325
2.8.2	Configuration structures	1326
2.8.3	Private APIs	1327
2.8.4	Components in example projects	1327
2.8.5	API Stability	1327
2.9	Project Configuration	1328
2.9.1	Introduction	1328
2.9.2	Project Configuration Menu	1328
2.9.3	Using sdkconfig.defaults	1328
2.9.4	Kconfig Formatting Rules	1328
2.9.5	Backward Compatibility of Kconfig Options	1329
2.9.6	Configuration Options Reference	1329
2.9.7	Customisations	1578
2.10	Error Codes Reference	1578
3	ESP32-S3 H/W 硬件参考	1585
3.1	芯片系列对比	1585
3.1.1	相关文档	1587
4	API 指南	1589
4.1	应用层跟踪库	1589

4.1.1	概述	1589
4.1.2	运行模式	1589
4.1.3	配置选项与依赖项	1589
4.1.4	如何使用这个库	1590
4.2	应用程序的启动流程	1599
4.2.1	一级引导程序	1599
4.2.2	二级引导程序	1600
4.2.3	应用程序启动阶段	1600
4.3	BluFi	1601
4.3.1	概览	1601
4.3.2	BluFi 流程	1602
4.3.3	BluFi 流程图	1602
4.3.4	BluFi 中定义的帧格式	1602
4.3.5	ESP32-S3 端的安全实现	1607
4.3.6	GATT 相关说明	1608
4.4	引导加载程序 (Bootloader)	1608
4.4.1	引导加载程序兼容性	1608
4.4.2	日志级别	1609
4.4.3	恢复出厂设置	1609
4.4.4	从测试固件启动	1610
4.4.5	回滚	1610
4.4.6	看门狗	1610
4.4.7	引导加载程序大小	1610
4.4.8	从深度睡眠中快速启动	1611
4.4.9	自定义引导加载程序	1611
4.5	构建系统 (CMake 版)	1611
4.5.1	概述	1611
4.5.2	使用构建系统	1612
4.5.3	示例项目	1615
4.5.4	项目 CMakeLists 文件	1616
4.5.5	组件 CMakeLists 文件	1617
4.5.6	组件配置	1619
4.5.7	预处理器定义	1619
4.5.8	组件依赖	1620
4.5.9	组件 CMakeLists 示例	1624
4.5.10	自定义 sdkconfig 的默认值	1628
4.5.11	Flash 参数	1628
4.5.12	构建 Bootloader	1629
4.5.13	选择目标芯片	1629
4.5.14	编写纯 CMake 组件	1630
4.5.15	组件中使用第三方 CMake 项目	1630
4.5.16	组件中使用预建库	1631
4.5.17	在自定义 CMake 项目中使用 ESP-IDF	1631
4.5.18	ESP-IDF CMake 构建系统 API	1632
4.5.19	文件通配 & 增量构建	1635
4.5.20	构建系统的元数据	1636
4.5.21	构建系统内部	1636
4.5.22	从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统	1638
4.6	Deep Sleep Wake Stubs	1639
4.6.1	Rules for Wake Stubs	1639
4.6.2	Implementing A Stub	1639
4.6.3	Loading Code Into RTC Memory	1640
4.6.4	Loading Data Into RTC Memory	1640
4.6.5	CRC Check For Wake Stubs	1641
4.7	Device Firmware Upgrade through USB	1641
4.7.1	Building the DFU Image	1642
4.7.2	Flashing the Chip with the DFU Image	1642
4.8	错误处理	1643

4.8.1	概述	1643
4.8.2	错误码	1643
4.8.3	错误码到错误消息	1644
4.8.4	ESP_ERROR_CHECK 宏	1644
4.8.5	ESP_ERROR_CHECK_WITHOUT_ABORT 宏	1644
4.8.6	ESP_RETURN_ON_ERROR 宏	1645
4.8.7	ESP_GOTO_ON_ERROR 宏	1645
4.8.8	ESP_RETURN_ON_FALSE 宏	1645
4.8.9	ESP_GOTO_ON_FALSE 宏	1645
4.8.10	CHECK 宏使用示例	1645
4.8.11	错误处理模式	1646
4.8.12	C++ 异常	1646
4.9	ESP-BLE-MESH	1646
4.9.1	概述	1646
4.9.2	ESP-BLE-MESH 快速入门	1647
4.9.3	ESP-BLE-MESH 示例	1653
4.9.4	ESP-BLE-MESH 演示视频	1654
4.9.5	ESP-BLE-MESH 常见问题手册	1654
4.9.6	相关文档	1654
4.10	ESP-WIFI-MESH	1680
4.10.1	概述	1680
4.10.2	简介	1681
4.10.3	ESP-WIFI-MESH 概念	1682
4.10.4	建立网络	1686
4.10.5	管理网络	1691
4.10.6	数据传输	1693
4.10.7	信道切换	1696
4.10.8	性能	1698
4.10.9	更多注意事项	1699
4.11	Core Dump	1699
4.11.1	Overview	1699
4.11.2	Configurations	1699
4.11.3	Save core dump to flash	1700
4.11.4	Print core dump to UART	1700
4.11.5	ROM Functions in Backtraces	1700
4.11.6	Dumping variables on demand	1701
4.11.7	Running espcoredump.py	1701
4.12	Event Handling	1702
4.12.1	Wi-Fi, Ethernet, and IP Events	1702
4.12.2	Mesh Events	1703
4.12.3	Bluetooth Events	1704
4.13	片外 RAM	1704
4.13.1	简介	1704
4.13.2	硬件	1704
4.13.3	配置片外 RAM	1704
4.13.4	片外 RAM 使用限制	1705
4.13.5	初始化失败	1706
4.14	严重错误	1706
4.14.1	概述	1706
4.14.2	紧急处理程序	1706
4.14.3	寄存器转储与回溯	1707
4.14.4	GDB Stub	1709
4.14.5	Guru Meditation 错误	1710
4.14.6	其它严重错误	1711
4.15	Flash 加密	1713
4.15.1	概述	1713
4.15.2	相关 eFuses	1714
4.15.3	Flash 的加密过程	1714

4.15.4	Flash 加密设置	1715
4.15.5	可能出现的错误	1718
4.15.6	ESP32-S3 flash 加密状态	1719
4.15.7	在加密的 flash 中读写数据	1720
4.15.8	更新加密的 flash	1721
4.15.9	关闭 flash 加密	1721
4.15.10	Flash 加密的要点	1721
4.15.11	Flash 加密的局限性	1722
4.15.12	Flash 加密与安全启动	1722
4.15.13	Flash 加密的高级功能	1722
4.15.14	片外 RAM	1723
4.15.15	技术细节	1724
4.16	SPI Flash and External SPI RAM Configuration	1724
4.16.1	Terminology	1724
4.16.2	How to configure Flash and PSRAM	1724
4.16.3	All Supported Modes and Speeds	1725
4.16.4	Error handling	1726
4.17	ESP-IDF FreeRTOS (SMP)	1727
4.17.1	Overview	1727
4.17.2	Symmetric Multiprocessing	1727
4.17.3	Tasks	1728
4.17.4	SMP Scheduler	1730
4.17.5	Critical Sections	1733
4.17.6	Misc	1734
4.18	Hardware Abstraction	1735
4.18.1	Architecture	1736
4.18.2	LL (Low Level) Layer	1736
4.18.3	HAL (Hardware Abstraction Layer)	1737
4.19	High-Level Interrupts	1738
4.19.1	Interrupt Levels	1738
4.19.2	Notes	1739
4.20	JTAG 调试	1739
4.20.1	引言	1740
4.20.2	工作原理	1740
4.20.3	选择 JTAG 适配器	1741
4.20.4	安装 OpenOCD	1741
4.20.5	配置 ESP32-S3 目标板	1741
4.20.6	启动调试器	1744
4.20.7	调试范例	1744
4.20.8	从源码构建 OpenOCD	1744
4.20.9	注意事项和补充内容	1748
4.20.10	相关文档	1752
4.21	链接器脚本生成机制	1777
4.21.1	概述	1777
4.21.2	快速上手	1777
4.21.3	链接器脚本生成机制内核	1780
4.22	lwIP	1786
4.22.1	Supported APIs	1786
4.22.2	BSD Sockets API	1786
4.22.3	Netconn API	1790
4.22.4	lwIP FreeRTOS Task	1790
4.22.5	IPv6 Support	1790
4.22.6	esp-lwip custom modifications	1791
4.22.7	Performance Optimization	1792
4.23	OpenThread	1794
4.23.1	Mode of the OpenThread stack	1794
4.23.2	How To Write an OpenThread Application	1794
4.23.3	The OpenThread border router	1795

4.24	应用程序的内存布局	1795
4.24.1	IRAM (指令 RAM)	1796
4.24.2	IROM (代码从 Flash 中运行)	1796
4.24.3	RTC 快速内存	1796
4.24.4	DRAM (数据 RAM)	1796
4.24.5	DROM (数据存储在 Flash 中)	1797
4.24.6	RTC 慢速内存	1797
4.25	DMA 能力要求	1797
4.26	分区表	1798
4.26.1	概述	1798
4.26.2	内置分区表	1798
4.26.3	创建自定义分区表	1799
4.26.4	生成二进制分区表	1801
4.26.5	分区大小检查	1801
4.26.6	烧写分区表	1802
4.26.7	分区工具 (parttool.py)	1802
4.27	Performance	1803
4.27.1	How to Optimize Performance	1804
4.27.2	Guides	1804
4.28	RF calibration	1819
4.28.1	Partial calibration	1820
4.28.2	Full calibration	1820
4.28.3	No calibration	1820
4.28.4	PHY initialization data	1820
4.29	Secure Boot V2	1820
4.29.1	Background	1821
4.29.2	Advantages	1821
4.29.3	Secure Boot V2 Process	1821
4.29.4	Signature Block Format	1822
4.29.5	Verifying a Signature Block	1822
4.29.6	Verifying an Image	1822
4.29.7	Bootloader Size	1823
4.29.8	eFuse usage	1823
4.29.9	How To Enable Secure Boot V2	1823
4.29.10	Restrictions after Secure Boot is enabled	1824
4.29.11	Generating Secure Boot Signing Key	1824
4.29.12	Remote Signing of Images	1824
4.29.13	Secure Boot Best Practices	1825
4.29.14	Key Management	1825
4.29.15	Multiple Keys	1825
4.29.16	Key Revocation	1825
4.29.17	Technical Details	1826
4.29.18	Secure Boot & Flash Encryption	1826
4.29.19	Signed App Verification Without Hardware Secure Boot	1827
4.29.20	Advanced Features	1827
4.30	Thread Local Storage	1827
4.30.1	Overview	1828
4.30.2	FreeRTOS Native API	1828
4.30.3	Pthread API	1828
4.30.4	C11 Standard	1828
4.31	工具	1828
4.31.1	Downloadable Tools	1829
4.31.2	IDF Docker Image	1837
4.31.3	IDF Windows Installer	1839
4.31.4	IDF Component Manager	1840
4.32	ULP 协处理器编程	1841
4.32.1	Programming ULP coprocessor using C macros (legacy)	1841
4.32.2	安装工具链	1846

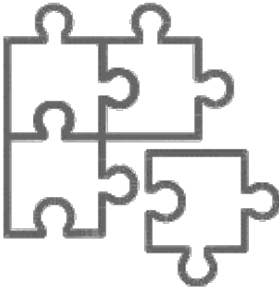

4.32.3	编译 ULP 代码	1846
4.32.4	访问 ULP 程序变量	1847
4.32.5	启动 ULP 程序	1847
4.33	ESP32-S3 中的单元测试	1848
4.33.1	添加常规测试用例	1849
4.33.2	添加多设备测试用例	1849
4.33.3	添加多阶段测试用例	1850
4.33.4	应用于不同芯片的单元测试	1851
4.33.5	编译单元测试程序	1851
4.33.6	运行单元测试	1852
4.33.7	带缓存补偿定时器的定时代码	1853
4.33.8	Mocks	1854
4.34	Unit Testing on Linux	1855
4.34.1	Embedded Software Tests	1855
4.34.2	IDF Unit Tests on Linux Host	1855
4.35	USB OTG Console	1856
4.35.1	Hardware Requirements	1856
4.35.2	Software Configuration	1857
4.35.3	Uploading the Application	1857
4.35.4	Limitations	1857
4.36	USB Serial/JTAG Controller Console	1858
4.36.1	Hardware Requirements	1858
4.36.2	Software Configuration	1859
4.36.3	Uploading the Application	1859
4.36.4	Limitations	1859
4.37	Wi-Fi 驱动程序	1859
4.37.1	ESP32-S3 Wi-Fi 功能列表	1859
4.37.2	如何编写 Wi-Fi 应用程序	1860
4.37.3	ESP32-S3 Wi-Fi API 错误代码	1860
4.37.4	初始化 ESP32-S3 Wi-Fi API 参数	1861
4.37.5	ESP32-S3 Wi-Fi 编程模型	1861
4.37.6	ESP32-S3 Wi-Fi 事件描述	1861
4.37.7	ESP32-S3 Wi-Fi station 一般情况	1864
4.37.8	ESP32-S3 Wi-Fi AP 一般情况	1867
4.37.9	ESP32-S3 Wi-Fi 扫描	1867
4.37.10	ESP32-S3 Wi-Fi station 连接场景	1874
4.37.11	找到多个 AP 时的 ESP32-S3 Wi-Fi station 连接	1878
4.37.12	Wi-Fi 重新连接	1878
4.37.13	Wi-Fi beacon 超时	1878
4.37.14	ESP32-S3 Wi-Fi 配置	1878
4.37.15	Wi-Fi 安全性	1883
4.37.16	ESP32-S3 Wi-Fi 节能模式	1883
4.37.17	ESP32-S3 Wi-Fi 吞吐量	1884
4.37.18	Wi-Fi 80211 数据包发送	1884
4.37.19	Wi-Fi Sniffer 模式	1887
4.37.20	Wi-Fi 多根天线	1887
4.37.21	Wi-Fi 信道状态信息	1888
4.37.22	Wi-Fi 信道状态信息配置	1889
4.37.23	Wi-Fi HT20/40	1890
4.37.24	Wi-Fi QoS	1890
4.37.25	Wi-Fi AMSDU	1890
4.37.26	Wi-Fi 分片	1891
4.37.27	WPS 注册	1891
4.37.28	Wi-Fi 缓冲区使用情况	1891

这里是乐鑫 IoT 开发框架 ([esp-idf](#)) 的文档中心。ESP-IDF 是 [ESP32](#)、[ESP32-S](#) 和 [ESP32-C](#) 系列芯片的官方开发框架。

本文档仅包含针对 ESP32-S3 芯片的 ESP-IDF 使用。

		
快速入门	API 参考	H/W 参考
		
API 指南	贡献代码	相关资源

Chapter 1

快速入门

本文档旨在指导用户搭建 ESP32-S3 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32-S3 开发板等步骤。

注解： 这是 ESP-IDF 稳定版本 v4.4.1 的文档，还有其他版本的文档[ESP-IDF 版本简介](#) 供参考。

1.1 概述

ESP32-S3 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 低功耗蓝牙
- 高性能 Xtensa® 32 位 LX7 双核处理器
- 运行 RISC-V 或 FSM 内核的超低功耗协处理器
- 多种外设
- 内置安全硬件
- USB OTG 接口
- USB 串口/JTAG 控制器

ESP32-S3 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32-S3 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

1.2 准备工作

硬件：

- 一款 **ESP32-S3** 开发板
- **USB 数据线** (A 转 Micro-B)
- 电脑 (Windows、Linux 或 Mac OS)

软件：

您可以选择下载并手动安装以下软件：

- 设置 **工具链**，用于编译 ESP32-S3 代码；
- **编译构建工具**——CMake 和 Ninja 编译构建工具，用于编译 ESP32-S3 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32-S3 使用的 API (软件库和源代码) 和运行 **工具链** 的脚本；

或者，您也可以通过以下集成开发环境 (IDE) 中的官方插件完成安装流程：

- [Eclipse 插件 \(安装\)](#)
- [VS Code 插件 \(安装\)](#)

图 1: ESP32-S3 应用程序开发

1.3 开发板简介

请点击下方连接，了解有关开发板的详细信息。

1.3.1 ESP32-S3-DevKitC-1

本指南将帮助您快速上手 ESP32-S3-DevKitC-1，并提供该款开发板的详细信息。

ESP32-S3-DevKitC-1 是一款入门级开发板，搭载的是 Wi-Fi + Bluetooth® LE 模组 ESP32-S3-WROOM-1 或 ESP32-S3-WROOM-1U。

板上模组的大部分管脚均已引出至开发板两侧排针，开发人员可根据实际需求，轻松通过跳线连接多种外围设备，也可将开发板插在面包板上使用。

图 2: ESP32-S3-DevKitC-1 (板载 ESP32-S3-WROOM-1 模组)

本指南包括如下内容：

- [入门指南](#)：简要介绍了开发板和硬件、软件设置指南。
- [硬件参考](#)：详细介绍了开发板的硬件。

- **硬件版本**：介绍硬件历史版本和已知问题，并提供链接至历史版本开发板的入门指南（如有）。
- **相关文档**：列出了相关文档的链接。

入门指南

本小节将简要介绍 ESP32-S3-DevKitC-1，说明如何在 ESP32-S3-DevKitC-1 上烧录固件及相关准备工作。

图 3: ESP32-S3-DevKitC-1 - 正面

组件介绍 以下按照逆时针的顺序依次介绍开发板上的主要组件。

主要组件	介绍
ESP32-S3-WROOM-1/1U	ESP32-S3-WROOM-1 和 ESP32-S3-WROOM-1U 是通用型 Wi-Fi + 低功耗蓝牙 MCU 模组，具有丰富的外设接口、强大的神经网络运算能力和信号处理能力，专为人工智能和 AIoT 市场打造。ESP32-S3-WROOM-1 采用 PCB 板载天线，ESP32-S3-WROOM-1U 采用连接器连接外部天线。
5 V to 3.3 V LDO (5 V 转 3.3 V LDO)	电源转换器，输入 5 V，输出 3.3 V。
Pin Headers (排针)	所有可用 GPIO 管脚（除 flash 的 SPI 总线）均已引出至开发板的排针。请查看 排针 获取更多信息。
USB-to-UART Port (USB 转 UART 接口)	Micro-USB 接口，可用作开发板的供电接口，可烧录固件至芯片，也可作为通信接口，通过板载 USB 转 UART 桥接器与芯片通信。
Boot Button (Boot 键)	下载按键。按住 Boot 键的同时按一下 Reset 键进入“固件下载”模式，通过串口下载固件。
Reset Button (Reset 键)	复位按键。
ESP32-S3 USB Port (ESP32-S3 USB 接口)	ESP32-S3 USB OTG 接口，支持全速 USB 1.1 标准。ESP32-S3 USB 接口可用作开发板的供电接口，可烧录固件至芯片，可通过 USB 协议与芯片通信，也可用于 JTAG 调试。
USB-to-UART Bridge (USB 转 UART 桥接器)	单芯片 USB 至 UART 桥接器，可提供高达 3 Mbps 的传输速率。
RGB LED	可寻址 RGB 发光二极管，由 GPIO48 驱动。
3.3 V Power On LED (3.3 V 电源指示灯)	开发板连接 USB 电源后，该指示灯亮起。

开始开发应用 通电前，请确保开发板完好无损。

必备硬件

- ESP32-S3-DevKitC-1
- USB 2.0 数据线（标准 A 型转 Micro-B 型）
- 电脑（Windows、Linux 或 macOS）

注解： 请确保使用适当的 USB 数据线。部分数据线仅可用于充电，无法用于数据传输和编程。

硬件设置 通过 **USB 转 UART 接口** 连接开发板与电脑。软件暂不支持通过 **ESP32-S3 USB 接口** 连接。在后续步骤中，默认使用 **USB 转 UART 接口**。

软件设置 请前往 [快速入门](#)，在 [详细安装步骤](#) 小节查看如何快速设置开发环境，将应用程序烧录至您的开发板。

内含组件和包装

零售订单 如购买样品，每个开发板将以防静电袋或零售商选择的其他方式包装。

零售订单请前往 <https://www.espressif.com/zh-hans/company/contact/buy-a-sample>。

批量订单 如批量购买，开发板将以大纸板箱包装。

批量订单请前往 <https://www.espressif.com/zh-hans/contact-us/sales-questions>。

硬件参考

功能框图 ESP32-S3-DevKitC-1 的主要组件和连接方式如下图所示。

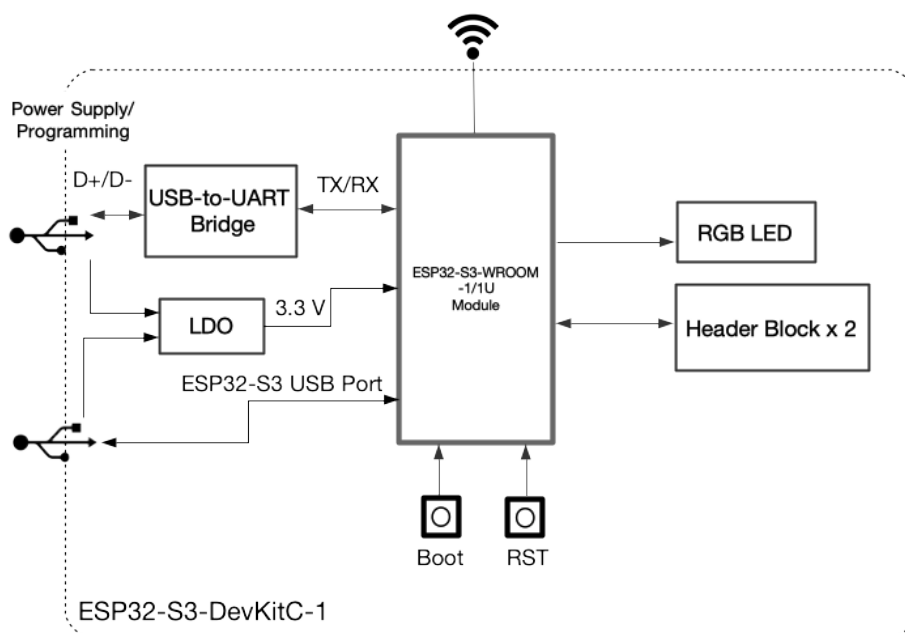

图 4: ESP32-S3-DevKitC-1（点击放大）

电源选项 您可从以下三种供电方式中任选其一给开发板供电：

- USB 转 UART 接口供电或 ESP32-S3 USB 接口供电（选择其一或同时供电），默认供电方式（推荐）
- 5V 和 G (GND) 排针供电
- 3V3 和 G (GND) 排针供电

排针 下表列出了开发板两侧排针（J1 和 J3）的 **名称** 和 **功能**，排针的名称如图 [ESP32-S3-DevKitC-1 - 正面](#) 所示，排针的序号与 [开发板原理图](#) (PDF) 一致。

J1

序号	名称	类型 ¹	功能
1	3V3	P	3.3 V 电源
2	3V3	P	3.3 V 电源
3	RST	I	EN
4	4	I/O/T	RTC_GPIO4, GPIO4, TOUCH4, ADC1_CH3
5	5	I/O/T	RTC_GPIO5, GPIO5, TOUCH5, ADC1_CH4
6	6	I/O/T	RTC_GPIO6, GPIO6, TOUCH6, ADC1_CH5
7	7	I/O/T	RTC_GPIO7, GPIO7, TOUCH7, ADC1_CH6
8	15	I/O/T	RTC_GPIO15, GPIO15, U0RTS, ADC2_CH4, XTAL_32K_P
9	16	I/O/T	RTC_GPIO16, GPIO16, U0CTS, ADC2_CH5, XTAL_32K_N
10	17	I/O/T	RTC_GPIO17, GPIO17, U1TXD, ADC2_CH6
11	18	I/O/T	RTC_GPIO18, GPIO18, U1RXD, ADC2_CH7, CLK_OUT3
12	8	I/O/T	RTC_GPIO8, GPIO8, TOUCH8, ADC1_CH7, SUBSPICS1
13	3	I/O/T	RTC_GPIO3, GPIO3, TOUCH3, ADC1_CH2
14	46	I/O/T	GPIO46
15	9	I/O/T	RTC_GPIO9, GPIO9, TOUCH9, ADC1_CH8, FSPIHD, SUBSPIHD
16	10	I/O/T	RTC_GPIO10, GPIO10, TOUCH10, ADC1_CH9, FSPICS0, FSPIIO4, SUBSPICS0
17	11	I/O/T	RTC_GPIO11, GPIO11, TOUCH11, ADC2_CH0, FSPID, FSPIIO5, SUBSPID
18	12	I/O/T	RTC_GPIO12, GPIO12, TOUCH12, ADC2_CH1, FSPICLK, FSPIIO6, SUBSPICLK
19	13	I/O/T	RTC_GPIO13, GPIO13, TOUCH13, ADC2_CH2, FSPIQ, FSPIIO7, SUBSPIQ
20	14	I/O/T	RTC_GPIO14, GPIO14, TOUCH14, ADC2_CH3, FSPIWP, FSPIDQS, SUBSPIWP
21	5V	P	5 V 电源
22	G	G	接地

¹P: 电源; I: 输入; O: 输出; T: 可设置为高阻。

J3

序号	名称	类型	功能
1	G	G	接地
2	TX	I/O/T	U0TXD, GPIO43, CLK_OUT1
3	RX	I/O/T	U0RXD, GPIO44, CLK_OUT2
4	1	I/O/T	RTC_GPIO1, GPIO1, TOUCH1, ADC1_CH0
5	2	I/O/T	RTC_GPIO2, GPIO2, TOUCH2, ADC1_CH1
6	42	I/O/T	MTMS, GPIO42
7	41	I/O/T	MTDI, GPIO41, CLK_OUT1
8	40	I/O/T	MTDO, GPIO40, CLK_OUT2
9	39	I/O/T	MTCK, GPIO39, CLK_OUT3, SUBSPICS1
10	38	I/O/T	GPIO38, FSPIWP, SUBSPIWP
11	37	I/O/T	SPIDQS, GPIO37, FSPIQ, SUBSPIQ
12	36	I/O/T	SPIIO7, GPIO36, FSPICLK, SUBSPICLK
13	35	I/O/T	SPIIO6, GPIO35, FSPID, SUBSPID
14	0	I/O/T	RTC_GPIO0, GPIO0
15	45	I/O/T	GPIO45
16	48	I/O/T	GPIO48, SPICLK_N, SUBSPICLK_N_DIFF, RGB LED
17	47	I/O/T	GPIO47, SPICLK_P, SUBSPICLK_P_DIFF
18	21	I/O/T	RTC_GPIO21, GPIO21
19	20	I/O/T	RTC_GPIO20, GPIO20, U1CTS, ADC2_CH9, CLK_OUT1, USB_D+
20	19	I/O/T	RTC_GPIO19, GPIO19, U1RTS, ADC2_CH8, CLK_OUT2, USB_D-
21	G	G	接地
22	G	G	接地

有关管脚功能名称的解释，请参考 [芯片规格书 \(PDF\)](#)。

有关本开发板的更多设计文档，请联系我们的商务部门 sales@espressif.com。

1.4 详细安装步骤

请根据下方详细步骤，完成安装过程。

1.4.1 设置开发环境

- 第一步：安装准备 ([Windows](#)、[Linux](#) 和 [macOS](#))
- 第二步：获取 [ESP-IDF](#)
- 第三步：设置工具
- 第四步：设置环境变量

1.4.2 创建您的第一个工程

- 第五步：开始创建工程
- 第六步：连接设备
- 第七步：配置
- 第八步：编译工程
- 第九步：烧录到设备
- 第十步：监视器

1.5 第一步：安装准备

在正式开始创建工程前，请先完成工具的安装，具体步骤见下：

1.5.1 Windows 平台工具链的标准设置

概述

ESP-IDF 需要安装一些必备工具，才能围绕 ESP32-S3 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过 **命令提示符** 进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 [Eclipse](#) 或其他支持 CMake 的图形化工具 IDE。

注解：限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致构建失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地域-勾选选项“Beta：使用 Unicode UTF-8 支持全球语言”-点击确定-重启电脑。

ESP-IDF 工具安装器

安装 ESP-IDF 必备工具最简易的方式是从 <https://dl.espressif.com/dl/esp-idf/?idf=4.4> 中下载 ESP-IDF 工具安装器。

在线安装与离线安装的区别 在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 [Git For Windows](#) 安装器。在线安装程序会将下载的文件存储在缓存目录 `%userprofile%/espressif` 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 [Git For Windows](#) 安装器。

安装内容 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 `%userprofile%\Desktop\esp-idf` 目录下，其中 `%userprofile%` 代表家目录。

启动 ESP-IDF 环境 安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (`cmd.exe`)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (`cmd.exe`):

使用命令提示符

在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 `cmd.exe`），并运行 `export.bat` 脚本以设置各环境变量（比如 `PATH`，`IDF_PATH` 等）。此外，您还可以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 `cmd.exe`，并切换至您希望使用的 ESP-IDF 目录，然后运行 `export.bat`。注意，这种方法要求 `PATH` 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

```

图 9: ESP-IDF 命令提示符窗口

后续步骤

当 ESP-IDF 工具安装器安装成功后，开发环境设置也到此结束。后续开发步骤，请前往[第五步：开始创建工程](#)查看。

相关文档

想要自定义安装流程的高阶用户可参照：

在 Windows 环境下更新 ESP-IDF 工具

使用脚本安装 ESP-IDF 工具 请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行：

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行：

```
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为：C:\Users\username\.espressif。

使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量 ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 ESP-IDF，您可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 `export.bat`，具体命令如下：

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 `export.ps1`，具体命令如下：

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

1.5.2 Linux 平台工具链的标准设置

安装准备

编译 ESP-IDF 需要以下软件包。请根据使用的系统，选择合适的安装命令，如下所示：

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-
↳setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.
↳0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3_
↳python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja_
↳ccache dfu-util libusb
```

注解:

- 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装“cmake”）。
- 如果上述列表中，并没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。

其他提示

权限问题 /dev/ttyUSB0 使用某些 Linux 版本向 ESP32-S3 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 [Linux Dialout 组](#)。

兼容的 Python 版本

ESP-IDF 支持 Python 3.6 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

后续步骤

继续设置开发环境，请前往 [第二步：获取 ESP-IDF 章节](#)。

1.5.3 macOS 平台工具链的标准设置

安装准备

ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 pip:

```
sudo easy_install pip
```

- 安装 CMake 和 Ninja 编译工具：
 - 若有 [HomeBrew](#)，您可以运行:

```
brew install cmake ninja dfu-util
```

- 若有 [MacPorts](#)，您可以运行:

```
sudo port install cmake ninja dfu-util
```

- 若以上均不适用，请访问 [CMake](#) 和 [Ninja](#) 主页，查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 [ccache](#) 以获得更快的编译速度。如有 [HomeBrew](#)，可通过 [MacPorts](#) 上的 `brew install ccache` 或 `sudo port install ccache` 完成安装。

注解: 如您在上述任何步骤中遇到以下错误:

```
``xcrun: error: invalid active developer path (/Library/Developer/
↳CommandLineTools), missing xcrun at:/Library/Developer/CommandLineTools/usr/bin/
↳xcrun``
```

则必须安装 XCode 命令行工具，具体可运行 `xcode-select --install`。

安装 Python 3 Catalina 10.15 发布说明中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本：

```
python --version
```

如果输出结果是 Python 2.7.17，则代表您的默认解析器是 Python 2.7。这时需要您运行以下命令检查电脑上是否已经安装过 Python 3：

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3：

- 使用 [HomeBrew](#) 进行安装的方法如下：

```
brew install python3
```

- 使用 [MacPorts](#) 进行安装的方法如下：

```
sudo port install python38
```

后续步骤

请前往 [第二步：获取 ESP-IDF](#) 章节继续设置开发环境。

注解：在本文档中，Linux 和 macOS 操作系统中 ESP-IDF 的默认安装路径为 `~/esp`；Windows 操作系统中的默认安装路径为 `%userprofile%\esp`。您也可以将 ESP-IDF 安装在任何其他路径下，但请注意在使用命令行时进行相应替换。注意，ESP-IDF 不支持带有空格的路径。

1.6 第二步：获取 ESP-IDF

在围绕 ESP32-S3 构建应用程序之前，请先获取乐鑫提供的软件库文件 [ESP-IDF 仓库](#)。

获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

1.6.1 Linux 和 macOS 操作系统

打开终端，后运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往[ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

1.6.2 Windows 操作系统

除了安装必要工具外，第一步中介绍的[ESP-IDF 工具安装器](#)也能同时下载 ESP-IDF 本地副本。

请前往[ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

除了使用 ESP-IDF 工具安装器，您也可以参考[指南](#)手动下载 ESP-IDF。

1.7 第三步：设置工具

除了 ESP-IDF 本身，您还需要安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

1.7.1 Windows 操作系统

请根据第一步中对 Windows ([ESP-IDF 工具安装器](#)) 的介绍，安装所有必需工具。

除了使用 ESP-IDF 工具安装器，您可以通过 **命令提示符**窗口手动安装这些工具。具体步骤见下：

```
cd %userprofile%\esp\esp-idf
install.bat esp32s3
```

或使用 Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32s3
```

1.7.2 Linux 和 macOS 操作系统

```
cd ~/esp/esp-idf
./install.sh esp32s3
```

或使用 Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32s3
```

注解：通过一次性指定多个目标，可为多个目标芯片同时安装工具，如运行 `./install.sh esp32, esp32c3, esp32s3`。通过运行 `./install.sh` 或 `./install.sh all` 可一次性为所有支持的目标芯片安装工具。

1.7.3 下载工具备选方案

ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，则可以设置一个环境变量，实现优先选择 Espressif 的下载服务器进行 Github 资源下载。

注解：该设置只影响从 Github 发布版本中下载的单一个工具，它并不会改变访问任何 Git 仓库的 URL。

Windows 操作系统

如果希望在运行 ESP-IDF 工具安装器时优先选择 Espressif 下载服务器，请在 **Select Components** 窗口中的 **Optimization** 部分勾选 **Use Espressif download mirror instead of GitHub** 选项。

Linux 和 macOS 操作系统

要在安装工具时优先选择 Espressif 下载服务器，请在运行 `install.sh` 时使用以下命令：

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

1.7.4 自定义工具安装路径

本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 和 macOS 系统中的 `$HOME/.espressif` 和 Windows 系统的 `%USERPROFILE%\espressif`。此外，您可以将工具安装到其他目录中，但在运行安装脚本前，重新设置环境变量 `IDF_TOOLS_PATH`。注意，请确保您的用户已经具备了读写该路径的权限。

如果修改了 `IDF_TOOLS_PATH` 变量，请确保该变量在每次执行安装脚本 (`install.bat`、`install.ps1` 或 `install.sh`) 和导出脚本 (`export.bat`、`export.ps1` 或 `export.sh`) 均保持一致。

1.8 第四步：设置环境变量

此时，您刚刚安装的工具尚未添加至 `PATH` 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量，这可以通过 ESP-IDF 提供的另一个脚本完成。

1.8.1 Windows 操作系统

Windows 安装器 (*ESP-IDF 工具安装器*) 可在“开始”菜单创建一个“ESP-IDF Command Prompt”快捷方式。该快捷方式可以打开命令提示符窗口，并设置所有环境变量。您可以点击该快捷方式，然后继续下一步。

此外，如果您希望在当下命令提示符窗口使用 ESP-IDF，请使用下方代码：

```
%userprofile%\esp\esp-idf\export.bat
```

或使用 Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

1.8.2 Linux 和 macOS 操作系统

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
. $HOME/esp/esp-idf/export.sh
```

对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
. $HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 `export.sh` 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中（`.profile`，`.bashrc`，`.zprofile` 等）

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 `esp-idf` 环境。

这里不建议您直接将 `export.sh` 添加到 shell 的配置文件。因为这会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的情况），从而破坏使用虚拟环境的目的，并可能影响其他软件的使用。

1.9 第五步：开始创建工程

现在，您可以开始准备开发 ESP32-S3 应用程序了。您可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

将 `get-started/hello_world` 工程复制至您本地的 `~/esp` 目录下：

1.9.1 Linux 和 macOS 操作系统

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 `examples` 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

重要：ESP-IDF 编译系统不支持带有空格的路径。

1.10 第六步：连接设备

现在，请将您的 ESP32-S3 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Windows 操作系统：** COM1 等

- **Linux 操作系统：**以 /dev/tty 开始
- **macOS 操作系统：**以 /dev/cu. 开始

有关如何查看串口名称的详细信息，请见与 [ESP32-S3 创建串口连接](#)。

注解：请记住串口名，您会在下面的步骤中用到。

1.11 第七步：配置

请进入 [第五步：开始创建工程](#) 中提到的 `hello_world` 目录，并运行工程配置工具 `menuconfig`。

1.11.1 Linux 和 macOS 操作系统

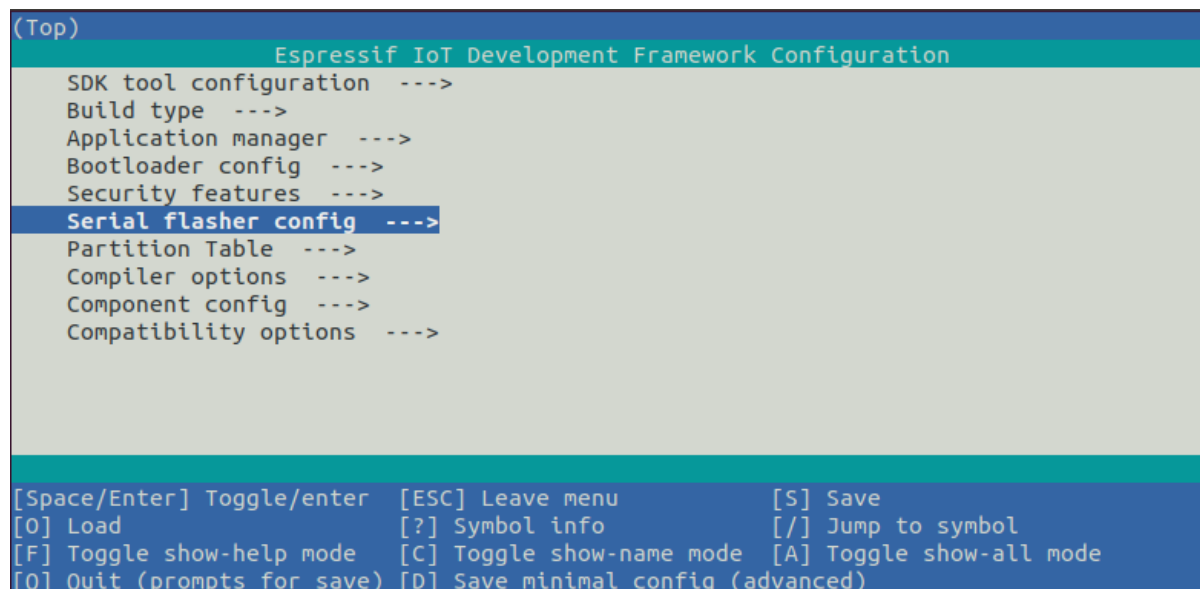

```
cd ~/esp/hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

1.11.2 Windows 操作系统

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

打开一个新项目后，应首先设置“目标”芯片 `idf.py set-target esp32s3`。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见 [选择目标芯片](#)。

如果之前的步骤都正确，则会显示下面的菜单：

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

图 10: 工程配置—主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。 `hello_world` 示例项目会以默认配置运行，因此可以跳过使用 `menuconfig` 进行项目配置这一步骤。

注解：您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。更多信息，请运行 `idf.py menuconfig --help` 命令。

1.12 第八步：编译工程

请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 `bootloader`、分区表和应用程序二进制文件。

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git:/usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

如果一切正常，编译完成后将生成 `.bin` 文件。

1.13 第九步：烧录到设备

请使用以下命令，将刚刚生成的二进制文件 (`bootloader.bin`, `partition-table.bin` 和 `hello_world.bin`) 烧录至您的 ESP32-S3 开发板：

```
idf.py -p PORT [-b BAUD] flash
```

请将 `PORT` 替换为 ESP32-S3 开发板的串口名称，具体可见 [第六步：连接设备](#)。

您还可以将 `BAUD` 替换为您希望的烧录波特率。默认波特率为 460800。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

注解：勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

1.13.1 烧录过程中可能遇到的问题

如果在运行给定命令时出现如“连接失败”这样的错误，原因之一则可能是运行 `esptool.py` 出现错误。`esptool.py` 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。解

解决该问题的一个简单的方法就是按照以下步骤进行手动复位。如果问题仍未解决，请参考 [Troubleshooting](#) 获取更多信息。

`esptool.py` 通过使 USB 转串口转换器芯片（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32-S3（请参考 [与 ESP32-S3 创建串口连接](#) 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32-S3 的 GPIO0 和 CHIP_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32-S3 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 [原理图](#)。

一般来说，使用官方的 `esp-idf` 开发板不会出现问题。但是，`esptool.py` 在以下情况下不能自动重置硬件。

- 您的硬件没有连接到 GPIO0 和 CHIP_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同
- 根本没有这样的串行控制线路

根据您的硬件的种类，也可以将您 ESP32-S3 开发板手动设置成固件下载模式（复位）。

- 对于 Espressif 的开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 **Boot** 按钮 (GPIO0) 再按住 **EN** 按钮 (CHIP_PU) 来手动复位 `esp-idf` 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

1.13.2 常规操作

在烧录过程中，您会看到类似如下的输出日志：

```
...
esptool.py esp32s3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
↪reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB 0x0_
↪bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
↪partition-table.bin
esptool.py v3.2-dev

↳kbit/s)...
Hash of data verified.

Leaving...
Hard resetting via RTS pin...
Done

```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考[Eclipse 指南](#)，以及[VS Code 指南](#)。

1.14 第十步：监视器

您可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 `PORT` 替换为您的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动：

```

$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]esp/hello_world/build
Executing "python [...]esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_
↳world/build/hello_world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```

...
Hello world!
Restarting in 10 seconds...
This is esp32s3 chip with 2 CPU core(s), This is esp32s3 chip with 2 CPU core(s),
↳WiFi/BLE, silicon revision 0, 2MB external flash
Minimum free heap size: 390684 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

您可使用快捷键 `Ctrl+]` ，退出 IDF 监视器。

注解：您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

注解：如果带有八线 flash 的开发板在二级引导加载程序之前复位，请参考[八线 flash 错误处理](#)。

此外，

- 请前往[IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往[idf.py](#)，查看更多 idf.py 命令和选项。

恭喜，您已完成 ESP32-S3 的入门学习！

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32-S3，因为 ESP32-S3 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32-S3，或者不存在这个表格，那么即表示 ESP32-S3 支持这个示例程序。

1.15 更新 ESP-IDF

乐鑫会不时推出更新版本的 ESP-IDF，修复 bug 或提供新的功能。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，然后按照 [第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

此外，您可以仅更新变更部分。具体方式，请前往 [更新](#) 章节查看。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考 [第三步：设置工具](#)。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考 [第四步：设置环境变量](#)。

1.16 相关文档

1.16.1 与 ESP32-S3 创建串口连接

本章节主要介绍如何创建 ESP32-S3 和 PC 之间的串口连接。

连接 ESP32-S3 和 PC

用 USB 线将 ESP32-S3 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32-S3 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32-S3 开发板驱动程序的链接：

- CP210x: [CP210x USB 至 UART 桥 VCP 驱动程序](#)
- FTDI: [FTDI 虚拟 COM 端口驱动程序](#)

以上驱动仅供参考，请参考开发板用户指南，查看开发板具体使用的 USB 转串口芯片。一般情况下，当 ESP32-S3 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

在 Windows 上查看端口

检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32-S3 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

在 Linux 和 macOS 上查看端口

查看 ESP32-S3 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32-S3 对应的串口：

Linux:

图 11: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

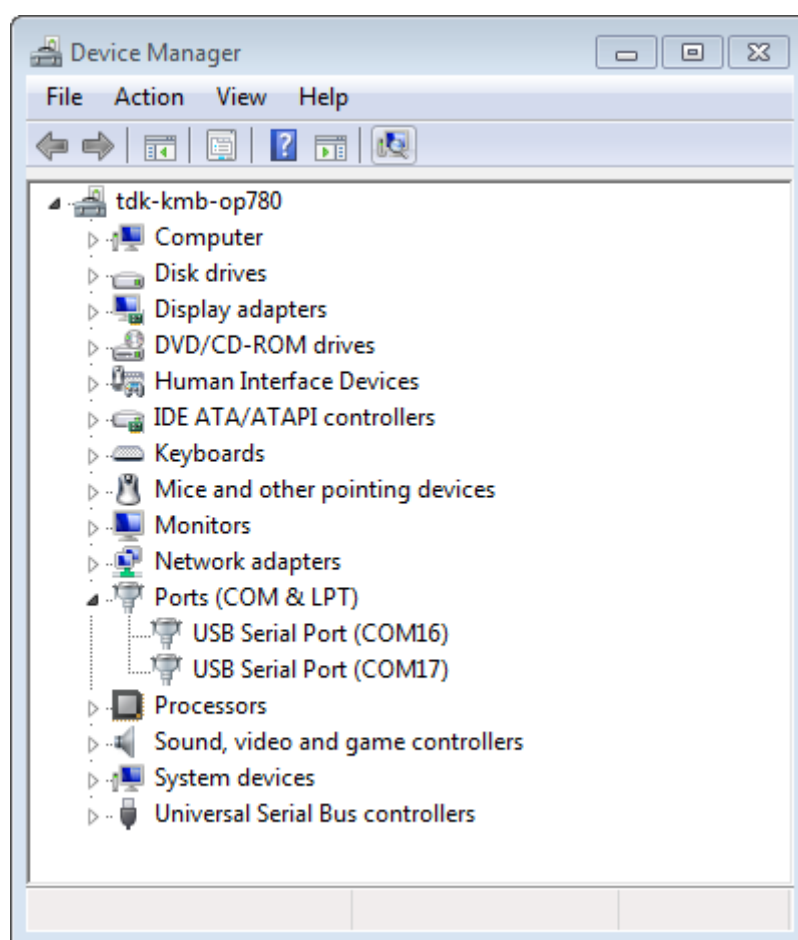

图 12: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

```
ls /dev/tty*
```

macOS:

```
ls /dev/cu.*
```

注解: 对于 macOS 用户: 若你没有看到串口, 请检查你是否已按照《入门指南》安装了适用于你特定开发板的 USB/串口驱动程序。对于 macOS High Sierra (10.13) 的用户, 你可能还需要手动允许驱动程序的加载, 具体可打开 系统偏好设置 -> 安全和隐私 -> 通用, 检查是否有信息显示: “来自开发人员的系统软件...”, 其中开发人员的名称为 Silicon Labs 或 FTDI。

在 Linux 中添加用户到 dialout

当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中, 您都可以通过以下命令, 将用户添加到 dialout 组, 从而获许读写权限:

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中, 需要通过以下命令将用户添加到 uucp 组中:

```
sudo usermod -a -G uucp $USER
```

请重新登录, 确保串口读写权限生效。

确认串口连接

现在, 请使用串口终端程序, 查看重置 ESP32-S3 后终端上是否有输出, 从而验证串口连接是否可用。

Windows 和 Linux 操作系统 在本示例中, 我们将使用 PuTTY SSH Client, PuTTY SSH Client 既可用于 Windows 也可用于 Linux。你也可以使用其他串口程序并设置如下的通信参数。

运行终端, 配置在上述步骤中确认的串口: 波特率 = 115200, 数据位 = 8, 停止位 = 1, 奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数 (如 115200-8-1-N)。注意, 这里一定要选择在上述步骤中确认的串口进行配置。

然后, 请检查 ESP32-S3 是否有打印日志。如有, 请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32-S3 的应用程序, 请参考[输出示例](#)。

注解: 请在验证完串口通信正常后, 关闭串口终端。如果您让终端一直保持打开的状态, 之后上传固件时将无法访问串口。

macOS 操作系统 macOS 提供了 屏幕命令, 因此您不用安装串口终端程序。

- 参考在 [Linux 和 macOS 上查看端口](#), 运行以下命令:

```
ls /dev/cu.*
```

- 您会看到类似如下输出:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- 根据您连接到电脑上的开发板类型和数量, 输出结果会有所不同。请选择开发板的设备名称, 并运行以下命令:

图 13: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

图 14: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

```
screen /dev/cu.device_name 115200
```

将 `device_name` 替换为运行 `ls /dev/cu.*` 后出现的设备串口号。

- 您需要的正是 **屏幕** 显示的日志。日志内容取决于加载到 ESP32-S3 的应用程序，请参考 [输出示例](#)。请使用 `Ctrl-A + \` 键退出 **屏幕** 会话。

注解：请在验证完串口通信正常后，关闭 **屏幕** 会话。如果直接关闭终端窗口而没有关闭 **屏幕**，之后上传固件时将无法访问串口。

输出示例 以下是 ESP32-S3 的一个日志示例。如果没看到任何输出，请尝试重置开发板。

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TGW0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32-S3。

注解：在某些串口接线方式下，在 ESP32-S3 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 [esptool 文档](#)。

如您在安装 ESP32-S3 硬件开发的软件环境时，从 [第六步：连接设备](#) 跳转到了这里，请从 [第七步：配置](#) 继续阅读。

1.16.2 Eclipse IDE 创建和烧录指南

ESP-IDF V4.0 默认采用基于 CMake 的构建系统。

针对 CMake 构建系统，ESP-IDF 有一款新的 Eclipse 插件。具体操作指南，请见 [ESP-IDF Eclipse 插件](#)。

注解：ESP-IDF Eclipse 插件中使用的是 macOS 截图，但安装指南对 Windows、Linux 和 macOS 均适用。

1.16.3 VS Code IDE 快速入门

我们支持 VS code，并且致力于为所有与 ESP-IDF 相关的操作提供完善的端到端支持，包括构建、烧录、监控、调试、追踪、core-dump、以及系统追踪查看器等操作。

快速安装指南

推荐您从 [VS Code 插件市场](#) 中下载 ESP-IDF VS Code 插件，或根据 [快速安装指南](#) 安装 ESP-IDF VS Code 插件。

查看 [ESP-IDF VS Code 插件教程](https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md) <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>> 了解如何使用所有功能。

支持如下功能

- **安装程序**: 帮助您迅速安装 ESP-IDF 及其相关工具链。
- **构建**: 通过一键构建和多目标构建，轻松构建并部署您的应用程序。
- **烧录**: UART 和 JTAG 均可完成烧录。
- **监控**: 内置终端带有监控功能，您可以在 VS Code 中启用 IDF 监控命令，操作方法和传统终端一样。
- **调试** <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>>: 提供立即可用的硬件调试功能，同时支持事后剖析调试如 core-dump 功能，分析 bug 更加方便。
- **GUI 菜单配置**: 提供简化的用户界面，用于配置您的芯片。
- **应用程序追踪 & 堆追踪**: 支持从应用程序中收集跟踪，并提供简化的用户界面分析跟踪。
- **系统视图查看器**: 读取并显示 `.svdat` 文件到用户追踪界面，同时支持多个内核追踪视图。
- **IDF 二进制大小分析**: 为分析二进制文件大小提供用户界面。
- **Rainmaker Cloud**: 我们有内置的 Rainmaker Cloud 支持，您可以轻松编辑/读取连接的物联网设备的状态。
- **代码覆盖**: 我们有内置的代码覆盖支持，将用颜色突出显示已经覆盖的行。我们也会在 IDE 内部直接渲染现有的 HTML 报告。

Bugs 问题 & 功能请求

如果您在使用 VS Code 或其某些功能上遇到问题，建议您在 [论坛](#) 或是 [github](#) 上提出您的问题，我们开发团队会对问题进行解答。

我们也欢迎您提出新的功能需求，正是由于用户要求新功能或是建议对现有功能进行改善，才成就我们今天所具备的大多数功能。欢迎您在 [github](#) 上提出功能请求。

1.16.4 IDF 监视器

IDF 监视器是一个串行终端程序，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用以下目标函数可以启用此监视器：

- 若使用 CMake 编译系统，则请调用：`idf.py monitor`
- 若使用传统 GNU Make 编译系统，请调用：`make monitor`

操作快捷键

为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。

快捷键	操作	描述
Ctrl+]]	退出监视器程序	
Ctrl+T	菜单退出键	按下如下给出的任意键之一，并按指示操作。
• Ctrl+T	将菜单字符发送至远程	
• Ctrl+]]	将 exit 字符发送至远程	
• Ctrl+P	重置目标设备，进入 Bootloader，通过 RTS 线暂停应用程序	重置目标设备，通过 RTS 线（如已连接）进入 Bootloader，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。
• Ctrl+R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl+F	编译并烧录此项目	暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+A (或者 A)	仅编译及烧录应用程序	暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+Y	停止/恢复在屏幕上打印日志输出	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl+L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）
• Ctrl+I (或者 I)	停止/恢复打印时间标记	IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 --timestamp-format 命令行参数来改变。
• Ctrl+H (或者 H)	显示所有快捷键	
• Ctrl+X (或者 X)	退出监视器程序	
Ctrl+C	中断正在运行的应用程序	暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启:ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

兼具 IDF 特性

自动解码地址 ESP-IDF 输出形式为 0x4_____ 的十六进制代码地址后，IDF 监视器将使用 `addr2line` 查找该地址在源代码中的位置和对应的函数名。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:
PC      : 0x400f360d  PS      : 0x00060330  A0      : 0x800dbf56  A1      :

```

IDF 监视器在后台运行以下命令, 解码各地址:

```
xtensa-esp32s3-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

注解: 将环境变量 ESP_MONITOR_DECODE 设置为 0 或者调用 `idf_monitor.py` 的特定命令行选项:

`idf_monitor.py --disable-address-decoding` 来禁止地址解码。

配置 GDBStub 以启用 GDB 默认情况下，如果 ESP-IDF 应用程序发生 crash 事件，panic 处理器将在串口上打印相关寄存器和堆栈转储（类似上述情况），然后重置开发板。

此外，可以配置应用程序在后台运行 GDBStub 并处理运行中的应用程序突然中断事件 (Ctrl+C)。

或者选择配置 panic 处理器以运行 GDBStub，GDBStub 工具可以与 GDB 项目调试器进行通信，允许读取内存、检查调用堆栈帧和变量等。GDBStub 虽然没有 JTAG 通用，但不需要使用特殊硬件。

如需在发生 panic 事件时启用 GDBStub，请运行 `idf.py menuconfig` 打开项目配置菜单，并将 `CONFIG_ESP_SYSTEM_PANIC` 选项设置为 GDBStub on panic，或者将 `CONFIG_ESP_SYSTEM_PANIC` 设置为 GDBStub on runtime。

在这种情况下，如果 panic 处理器被触发或应用程序突然中断 (Ctrl+C)，只要 IDF 监视器监控到 GDBStub 已经加载，panic 处理器就会自动暂停串行监控并使用必要的参数运行 GDB。GDB 退出后，通过 RTS 串口线复位开发板。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

IDF 监视器在后台运行如下命令：

```
xtensa-esp32s3-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex \
↳ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

输出筛选 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，可打印任何内容。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 {N, E, W, I, D, V, *} 集合中的一个字母，指的是日志级别。

例如，`PRINT_FILTER="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

注解：编译时，可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 *、冒号 :，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- * 可用于匹配任何类型标签。但 `PRINT_FILTER="*:I tag1:E"` 打印关于 tag1 的输出时会报错，这是因为 tag1 规则比 * 规则的优先级高。
- 默认规则（空）等价于 `*:V`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `*:N` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 详细度级别或更低级别打印 tag1，在 Warning 详细度级别或更低级别打印 tag2。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 tag3:N 指定 tag3 不打印。

- tag3:N 在规则 "tag1:I tag2:W tag3:N *:V" 中更有意义，这是因为如果没有 tag3:N，tag3 信息就可能打印出来了；tag1 和 tag2 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

高级筛选规则示例 如下日志是在没有设置任何筛选选项的情况下获得的：

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="wifi esp_image:E light_driver:I" 筛选选项捕获的输出如下所示：

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V" 选项的输出如下：

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

IDF 监视器已知问题

Windows 环境下已知问题

- 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
- 偶然情况下，idf.py 或 make 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
- GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

1.16.5 工具链的自定义设置

除了从乐鑫官网（请见 [第三步：设置工具](#)）下载二进制工具链外，您还可以自行编译工具链。

如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译工具链：

- 需要定制工具链编译配置
- 需要使用其他 GCC 版本（如 4.8.5）
- 需要破解 gcc、newlib 或 libstdc++
- 有相关兴趣或时间充裕
- 不信任从网站下载的 bin 文件

如需自行编译工具链，请查看以下文档：

从零开始设置 Windows 环境下的工具链

除了使用 [ESP-IDF 工具安装器](#)，用户也可以手动设置 Windows 环境下的工具链，这正是本文的主要内容。手动安装工具可以更好地控制安装流程，同时也方便高阶用户进行自定义安装。

使用 ESP-IDF 工具安装器对工具链及其他工具进行快速标准设置，请参照 [Windows 平台工具链的标准设置](#)。

注解： 基于 GNU Make 的构建系统要求 Windows 兼容 MSYS2 Unix，基于 CMake 的构建系统则无此要求。

获取 ESP-IDF

注解： 较早版本 ESP-IDF 使用了 MSYS2 bash 终端命令行。目前，基于 CMake 的编译系统可使用常见的 Windows 命令窗口，即本指南中使用的终端。

请注意，如果您使用基于 bash 的终端或 PowerShell 终端，一些命令语法将与下面描述有所不同。

打开命令提示符，运行以下命令：

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 %userprofile%\esp\esp-idf。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

注解： git clone 命令的 -b v4.4.1 选项告诉 git 从 ESP-IDF 仓库中克隆与此版本的文档对应的分支。

注解： 作为备份，还可以从 [Releases page](#) 下载此稳定版本的 zip 文件。不要下载由 GitHub 自动生成的“源代码”的 zip 文件，它们不适用于 ESP-IDF。

注解： 在克隆远程仓库时，请加上可选参数 --recursive。如果你已经克隆了 ESP-IDF 但没有加上此参数，请运行以下命令获取所有子模块

```
cd esp-idf
git submodule update --init
```

工具

CMake 工具 下载最新发布的 Windows 平台稳定版 CMake，并运行安装器。

当安装器询问“安装选项”时，选择“Add CMake to the system PATH for all users”（为所有用户的系统路径添加 CMake）或“Add CMake to the system PATH for the current user”（为当前用户的系统路径添加 CMake）。

Ninja 编译工具

注解： 目前，Ninja 仅提供支持 64 位 Windows 版本的 bin 文件。您也可以配合其他编译工具（如 mingw-make）在 32 位 Windows 版本中使用 CMake 和 idf.py。但是目前暂无关于此工具的说明文档。

请从 [下载页面](#) 下载最新发布的 Windows 平台稳定版 Ninja。

适用于 Windows 平台的 Ninja 下载文件是一个 .zip 文件，包含一个 ninja.exe 文件。您需要将该文件解压到目录，并添加到 [Path 环境变量](#)（或者选择解压到 Path 变量中已有的目录）。

Python 下载并运行适用于 Windows 安装器的最新版 Python。

Python 安装器的“自定义”菜单可为您提供一系列选项，最后一项为“Add python.exe to Path”（添加 python.exe 到 Path 环境变量中），请将该项更改为“Will be installed”（将会安装）。

Python 安装完成后，从 Windows 开始菜单中打开“命令提示符”窗口，并运行以下命令：

```
pip install --user pyserial
```

工具链设置 下载预编译的 Windows 工具链：

https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch3-win32.zip

将压缩包文件解压到 C:\Program Files\`（或其他位置）。压缩包文件包含一个 ``xtensa-esp32s3-elf 目录。

然后，请将该目录下的 bin 子目录添加到 *Path* 环境变量。例如，将目录 C:\Program Files\xtensa-esp32s3-elf\bin 添加到 Path 环境变量。

注解：如果您已安装 MSYS2 环境（适用“GNU Make”编译系统），则可以跳过下载那一步，直接添加目录 C:\msys32\opt\xtensa-esp32s3-elf\bin 到 Path 环境变量，因为 MSYS2 环境已包含工具链。

添加目录到 Path 环境变量 在 Windows 环境下，向 Path 环境变量增加任何新目录，请：

打开系统“控制面板”，找到环境变量对话框（Windows 10 用户请前往“高级系统设置”）。

双击 Path 变量（选择“用户路径”或“系统路径”，具体取决于您是否希望其他用户的 Path 中也存在该目录）。最后在值的末尾增加 ;<new value>。

后续步骤 请前往 [第三步：设置工具](#) 章节继续设置开发环境。

从零开始设置 Linux 环境下的工具链

除了从乐鑫官网直接下载已编译好的二进制工具链外，您还可以按照本文介绍，从头开始设置自己的工具链。如需快速使用已编译好的二进制工具链，可回到 [Linux 平台工具链的标准设置](#) 章节。

注解：设置自己的工具链可以解决 Y2K38 问题（time_t 从 32 位扩展到 64 位）。

安装准备 编译 ESP-IDF 需要以下软件包：

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf_
↳python3 python3-pip cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
↳pip python3-setuptools python3-serial python3-cryptography python3-future_
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev_
↳libssl-dev dfu-util libusb-1.0-0
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial
↳python-cryptography python-future python-pyparsing python-pyelftools cmake
↳ninja ccache dfu-util libusb
```

注解： 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装“cmake”）。

从源代码编译工具链 安装依赖项：

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel
↳automake bison flex texinfo help2man libtool make
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
↳automake bison flex texinfo help2man libtool make
```

- Ubuntu 16.04 或以上

```
sudo apt-get install gawk gperf grep gettext python python-dev automake bison
↳flex texinfo help2man libtool libtool-bin make
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
↳automake bison flex texinfo help2man libtool libtool-bin make
```

- Arch:

```
sudo pacman -Sy --needed python-pip
```

创建工作目录，并进入该目录：

```
mkdir -p ~/esp
cd ~/esp
```

下载并编译 crosstool-NG：

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

注解： 在设置支持 64 位 `time_t` 的工具链时，您需要将 `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` 文件中第 33 和 43 行的可选参数 `--enable-newlib-long-time_t` 删除。

编译工具链：

```
./ct-ng xtensa-esp32s3-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32s3-elf
```

编译得到的工具链会被保存至 `~/esp/crosstool-NG/builds/xtensa-esp32s3-elf`。

添加工具链到 PATH 环境变量 需要将自定义工具链复制到一个二进制目录中，并将其添加到 PATH 中。例如，您可以将编译好的工具链复制到 `~/esp/xtensa-esp32s3-elf/` 目录中。

为了正常使用工具链，您需要更新 `~/.profile` 文件中 PATH 环境变量。此外，您还可以在 `~/.profile` 文件中增加以下代码。这样，所有终端窗口均可以使用 `xtensa-esp32s3-elf`：

```
export PATH="$HOME/esp/xtensa-esp32s3-elf/bin:$PATH"
```

注解：如果您已将 `/bin/bash` 设置为登录 shell，且同时存在 `.bash_profile` 和 `.profile` 两个文件，则请更新 `.bash_profile`。在 CentOS 环境下，`alias` 需要添加到 `.bashrc` 文件中。

退出并重新登录以使 `.profile` 的更改生效。运行以下命令来检查 PATH 设置是否正确：

```
printenv PATH
```

此时您需要检查输出结果的开头中是否包含类似如下的工具链路径：

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32s3-elf/bin:/home/user-name/bin:/home/user-name/.
↳local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
↳games:/usr/local/games:/snap/bin
```

注意这里的 `/home/user-name` 应该替换成您安装的主路径。

后续步骤 请前往 [第二步：获取 ESP-IDF](#) 章节继续设置开发环境。

从零开始设置 macOS 环境下的工具链

软件包管理器 从零开始设置工具链，您需要安装 [MacPorts](#) 或 [Homebrew](#) 软件包管理器。或者，您也可以直接下载[预编译的工具链](#)。

MacPorts 需要完整的 XCode 软件，而 Homebrew 只需要安装 XCode 命令行工具即可。

请参考[工具链自定义设置](#) 章节，查看可能需从头开始设置工具链的情况。

安装准备

- 安装 pip:

```
sudo easy_install pip
```

- 安装 pyserial:

```
pip install --user pyserial
```

- 安装 CMake 和 Ninja 编译工具：
 - 若有 Homebrew，您可以运行：

```
brew install cmake ninja dfu-util
```

- 若有 MacPorts，您可以运行：

```
sudo port install cmake ninja dfu-util
```

从源代码编译工具链 安装依赖项：

- 对于 MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf_
↳ automake make
```

- 对于 Homebrew:

```
brew install gnu-sed gawk binutils gperf tools gettext wget help2man libtool_
↳ autoconf automake make
```

创建一个文件系统镜像 (区分大小写) :

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_
↳ HFS+"
```

挂载:

```
hdiutil mount ~/esp/crosstool.dmg
```

创建指向您工作目录的符号链接:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

前往新创建的目录:

```
cd ~/esp/ctng-volume
```

下载并编译 crosstool-NG:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

编译工具链:

```
./ct-ng xtensa-esp32s3-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32s3-elf
```

编译得到的工具链会被保存到 ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32s3-elf。使用工具链前, 请将 ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32s3-elf/bin 添加至 PATH 环境变量。

后续步骤 请前往 [第二步: 获取 ESP-IDF](#) 章节继续设置开发环境。

Chapter 2

API 参考

2.1 蓝牙 API

2.1.1 Controller & VHCI

Overview

Instructions

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller_vhci_ble_adv](#).

API Reference

Header File

- `components/bt/include/esp32/include/esp_bt.h`

Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`

Set BLE TX power Connection Tx power should only be set after connection created.

Return ESP_OK - success, other - failed

Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level`: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`

Get BLE TX power Connection Tx power should only be get after connection created.

Return ≥ 0 - Power level, < 0 - Invalid

Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.

Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

Return `ESP_OK` - success, other - failed

Parameters

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

esp_err_t **esp_bredr_tx_power_get** (*esp_power_level_t* *`min_power_level`, *esp_power_level_t* *`max_power_level`)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Return `ESP_OK` - success, other - failed

Parameters

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

esp_err_t **esp_bredr_sco_datapath_set** (*esp_sco_data_path_t* `data_path`)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

Return `ESP_OK` - success, other - failed

Parameters

- `data_path`: SCO data path

esp_err_t **esp_bt_controller_init** (*esp_bt_controller_config_t* *`cfg`)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return `ESP_OK` - success, other - failed

Parameters

- `cfg`: Initial configuration of BT controller. Different from previous version, there' s a mode and some connection configuration in “`cfg`” to configure controller work mode and allocate the resource which is needed.

esp_err_t **esp_bt_controller_deinit** (void)

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

Return `ESP_OK` - success, other - failed

esp_err_t **esp_bt_controller_enable** (*esp_bt_mode_t* `mode`)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

Return `ESP_OK` - success, other - failed

Parameters

- `mode`: : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “`cfg`” of `esp_bt_controller_init()`.

esp_err_t **esp_bt_controller_disable** (void)

Disable BT controller.

Return `ESP_OK` - success, other - failed

esp_bt_controller_status_t **esp_bt_controller_get_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

bool **esp_vhci_host_check_send_available** (void)

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.

Return true for ready to send, false means cannot send packet

void **esp_vhci_host_send_packet** (uint8_t *data, uint16_t len)
 esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters

- data: the packet point
- len: the packet length

esp_err_t **esp_vhci_host_register_callback** (const *esp_vhci_host_callback_t* *callback)
 esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Return ESP_OK - success, ESP_FAIL - failed

Parameters

- callback: *esp_vhci_host_callback* type variable

esp_err_t **esp_bt_controller_mem_release** (*esp_bt_mode_t* mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return ESP_OK - success, other - failed

Parameters

- mode: : the mode want to release memory

esp_err_t **esp_bt_mem_release** (*esp_bt_mode_t* mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

Note In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

Return ESP_OK - success, other - failed

Parameters

- mode: : the mode whose memory is to be released

esp_err_t **esp_bt_sleep_enable** (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request” .

Return

- ESP_OK : success
- other : failed

esp_err_t **esp_bt_sleep_disable** (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

Return

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_scan_duplicate_list_flush** (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

Note This function name is incorrectly spelled, it will be fixed in release 5.x version.

Return

- ESP_OK : success
- other : failed

void **esp_wifi_bt_power_domain_on** (void)

bt Wi-Fi power domain power on

void **esp_wifi_bt_power_domain_off** (void)

bt Wi-Fi power domain power off

Structures

struct esp_bt_controller_config_t

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t controller_task_stack_size

Bluetooth controller task stack size

uint8_t controller_task_prio

Bluetooth controller task priority

uint8_t hci_uart_no

If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode

scan duplicate mode

uint8_t scan_duplicate_type

scan duplicate type

uint16_t normal_adv_size

Normal adv size for scan duplicate

uint16_t mesh_adv_size

Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size

Controller minimum memory value

uint32_t controller_debug_flag

Controller debug log flag

uint8_t mode

Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn

BLE maximum connection numbers

uint8_t bt_max_acl_conn

BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath

SCO data path, i.e. HCI or PCM module

bool auto_latency

BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt

BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn

BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca

BLE low power crystal accuracy index

uint8_t pcm_role

PCM role (master & slave)

uint8_t pcm_polar

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**
Using high level interrupt or not

uint32_t **magic**
Magic number

struct esp_vhci_host_callback
esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (***notify_host_send_available**) (void)
callback used to notify that the host can send packet to controller

int (***notify_host_recv**) (uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT ()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
Bluetooth mode for controller enable/disable.

Values:

ESP_BT_MODE_IDLE = 0x00
Bluetooth is not running

ESP_BT_MODE_BLE = 0x01
Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
Run dual mode

enum [anonymous]
BLE sleep clock accuracy(SCA), values for ble_sca field in *esp_bt_controller_config_t*, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

ESP_BLE_SCA_500PPM = 0
BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
BLE SCA at 75ppm

ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

ESP_BT_CONTROLLER_STATUS_IDLE = 0

ESP_BT_CONTROLLER_STATUS_INITED

ESP_BT_CONTROLLER_STATUS_ENABLED

ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection' s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0

ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
For connection handle 1

ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
For connection handle 2

ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
For connection handle 3

ESP_BLE_PWR_TYPE_CONN_HDL4 = 4
For connection handle 4

ESP_BLE_PWR_TYPE_CONN_HDL5 = 5
For connection handle 5

ESP_BLE_PWR_TYPE_CONN_HDL6 = 6
For connection handle 6

ESP_BLE_PWR_TYPE_CONN_HDL7 = 7
For connection handle 7

ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
For connection handle 8

ESP_BLE_PWR_TYPE_ADV = 9
For advertising

ESP_BLE_PWR_TYPE_SCAN = 10
For scan

ESP_BLE_PWR_TYPE_DEFAULT = 11
For default, if not set other, it will use default value

ESP_BLE_PWR_TYPE_NUM = 12
TYPE numbers

enum esp_power_level_t

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

Values:

ESP_PWR_LVL_N12 = 0
Corresponding to -12dbm

ESP_PWR_LVL_N9 = 1
Corresponding to -9dbm

ESP_PWR_LVL_N6 = 2
Corresponding to -6dbm

ESP_PWR_LVL_N3 = 3
Corresponding to -3dbm

ESP_PWR_LVL_N0 = 4
Corresponding to 0dbm

ESP_PWR_LVL_P3 = 5
Corresponding to +3dbm

ESP_PWR_LVL_P6 = 6
Corresponding to +6dbm

ESP_PWR_LVL_P9 = 7
Corresponding to +9dbm

ESP_PWR_LVL_N14 = [ESP_PWR_LVL_N12](#)
Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = [ESP_PWR_LVL_N9](#)
Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = [ESP_PWR_LVL_N6](#)
Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = [ESP_PWR_LVL_N3](#)
Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = [ESP_PWR_LVL_N0](#)
Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = [ESP_PWR_LVL_P3](#)
Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = [ESP_PWR_LVL_P6](#)
Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = [ESP_PWR_LVL_P9](#)
Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t

Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
data over HCI transport

ESP_SCO_DATA_PATH_PCM = 1
data over PCM interface

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_bt_main.h`

Functions

esp_bluedroid_status_t **esp_bluedroid_get_status** (void)

Get bluetooth stack status.

Return Bluetooth stack status

esp_err_t **esp_bluedroid_enable** (void)

Enable bluetooth, must after esp_bluedroid_init().

Return

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_disable** (void)

Disable bluetooth, must prior to esp_bluedroid_deinit().

Return

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

Return

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

Return

- ESP_OK : Succeed
- Other : Failed

Enumerations

enum esp_bluedroid_status_t

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

ESP_BLUEDROID_STATUS_UNINITIALIZED = 0

Bluetooth not initialized

ESP_BLUEDROID_STATUS_INITIALIZED

Bluetooth initialized but not enabled

ESP_BLUEDROID_STATUS_ENABLED

Bluetooth initialized and enabled

BT DEVICE APIs

Overview Bluetooth device reference APIs.

Functions

const uint8_t ***esp_bt_dev_get_address** (void)

Get bluetooth device address. Must use after “esp_bluedroid_enable” .

Return bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t **esp_bt_dev_set_device_name** (**const** char **name*)

Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

Parameters

- [in] name: : device name to be set

2.1.3 BT LE**GAP API****Overview** [Instructions](#)

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
 - [bluetooth/bluedroid/ble/gatt_security_client](#)
 - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.

Functions

esp_err_t **esp_ble_gap_register_callback** (*esp_gap_ble_cb_t* *callback*)

This function is called to occur gap event, such as scan result.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] callback: callback function

esp_err_t **esp_ble_gap_config_adv_data** (*esp_ble_adv_data_t* **adv_data*)

This function is called to override the BTA default ADV parameters.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `adv_data`: Pointer to User defined ADV data structure. This memory space can not be freed until callback of `config_adv_data` is received.

esp_err_t **esp_ble_gap_set_scan_params** (*esp_ble_scan_params_t* **scan_params*)

This function is called to set scan parameters.

Return

- `ESP_OK` : success
- other : failed

Parameters

- [in] `scan_params`: Pointer to User defined `scan_params` data structure. This memory space can not be freed until callback of `set_scan_params`

esp_err_t **esp_ble_gap_start_scanning** (*uint32_t* *duration*)

This procedure keep the device scanning the peer device which advertising on the air.

Return

- `ESP_OK` : success
- other : failed

Parameters

- [in] `duration`: Keeping the scanning time, the unit is second.

esp_err_t **esp_ble_gap_stop_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

Return

- `ESP_OK` : success
- other : failed

esp_err_t **esp_ble_gap_start_advertising** (*esp_ble_adv_params_t* **adv_params*)

This function is called to start advertising.

Return

- `ESP_OK` : success
- other : failed

Parameters

- [in] `adv_params`: pointer to User defined `adv_params` data structure.

esp_err_t **esp_ble_gap_stop_advertising** (void)

This function is called to stop advertising.

Return

- `ESP_OK` : success
- other : failed

esp_err_t **esp_ble_gap_update_conn_params** (*esp_ble_conn_update_params_t* **params*)

Update connection parameters, can only be used when connection is up.

Return

- `ESP_OK` : success
- other : failed

Parameters

- [in] `params`: - connection update parameters

esp_err_t **esp_ble_gap_set_pkt_data_len** (*esp_bd_addr_t* *remote_device*, *uint16_t* *tx_data_length*)

This function is to set maximum LE data packet size.

Return

- `ESP_OK` : success
- other : failed

esp_err_t **esp_ble_gap_set_rand_addr** (*esp_bd_addr_t* *rand_addr*)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] rand_addr: the random address which should be setting

esp_err_t **esp_ble_gap_clear_rand_addr** (void)

This function clears the random address for the application.

Return

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_privacy** (bool *privacy_enable*)

Enable/disable privacy on the local device.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] privacy_enable: - enable/disable privacy on remote device.

esp_err_t **esp_ble_gap_config_local_icon** (uint16_t *icon*)

set local gap appearance icon

Return

- ESP_OK : success
- other : failed

Parameters

- [in] icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml>

esp_err_t **esp_ble_gap_update_whitelist** (bool *add_remove*, *esp_bd_addr_t* *remote_bda*, *esp_ble_wl_addr_type_t* *wl_addr_type*)

Add or remove device from white list.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] remote_bda: the remote device address add/remove from the white list.
- [in] wl_addr_type: whitelist address type

esp_err_t **esp_ble_gap_clear_whitelist** (void)

Clear all white list.

Return

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_whitelist_size** (uint16_t **length*)

Get the whitelist size in the controller.

Return

- ESP_OK : success
- other : failed

Parameters

- [out] length: the white list length.

esp_err_t **esp_ble_gap_set_prefer_conn_params** (*esp_bd_addr_t* *bd_addr*, *uint16_t* *min_conn_int*, *uint16_t* *max_conn_int*, *uint16_t* *slave_latency*, *uint16_t* *supervision_tout*)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] *bd_addr*: BD address of the peripheral
- [in] *min_conn_int*: minimum preferred connection interval
- [in] *max_conn_int*: maximum preferred connection interval
- [in] *slave_latency*: preferred slave latency
- [in] *supervision_tout*: preferred supervision timeout

esp_err_t **esp_ble_gap_set_device_name** (const char **name*)

Set device name to the local device.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] *name*: - device name.

esp_err_t **esp_ble_gap_get_local_used_addr** (*esp_bd_addr_t* *local_used_addr*, *uint8_t* **addr_type*)

This function is called to get local used address and address type. *uint8_t* **esp_bt_dev_get_address*(void) get the public address.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *local_used_addr*: - current local used ble address (six bytes)
- [in] *addr_type*: - ble address type

uint8_t ***esp_ble_resolve_adv_data** (*uint8_t* **adv_data*, *uint8_t* *type*, *uint8_t* **length*)

This function is called to get ADV data for a specific type.

Return pointer of ADV data

Parameters

- [in] *adv_data*: - pointer of ADV data which to be resolved
- [in] *type*: - finding ADV data type
- [out] *length*: - return the length of ADV data not including type

esp_err_t **esp_ble_gap_config_adv_data_raw** (*uint8_t* **raw_data*, *uint32_t* *raw_data_len*)

This function is called to set raw advertising data. User need to fill ADV data by self.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] *raw_data*: : raw advertising data
- [in] *raw_data_len*: : raw advertising data length , less than 31 bytes

esp_err_t **esp_ble_gap_config_scan_rsp_data_raw** (*uint8_t* **raw_data*, *uint32_t* *raw_data_len*)

This function is called to set raw scan response data. User need to fill scan response data by self.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] raw_data: : raw scan response data
- [in] raw_data_len: : raw scan response data length , less than 31 bytes

esp_err_t **esp_ble_gap_read_rssi** (*esp_bd_addr_t* remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] remote_addr: : The remote connection device address.

esp_err_t **esp_ble_gap_add_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to add a device info into the duplicate scan exceptional list.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- [in] device_info: the device information.

esp_err_t **esp_ble_gap_remove_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to remove a device info from the duplicate scan exceptional list.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- [in] device_info: the device information.

esp_err_t **esp_ble_gap_clean_duplicate_scan_exceptional_list** (*esp_duplicate_scan_exceptional_list_type_t* list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

esp_err_t **esp_ble_gap_set_security_param** (*esp_ble_sm_param_t* param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’ .

To accept only secure connection mode, it is necessary do as following:

1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

Return - `ESP_OK` : success
 • other : failed

Parameters

- [in] `param_type`: : the type of the param which to be set
- [in] `value`: : the param value
- [in] `len`: : the length of the param value

esp_err_t **esp_ble_gap_security_rsp** (*esp_bd_addr_t* `bd_addr`, bool `accept`)

Grant security request access.

Return - `ESP_OK` : success
 • other : failed

Parameters

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : accept the security request or not

esp_err_t **esp_ble_set_encryption** (*esp_bd_addr_t* `bd_addr`, *esp_ble_sec_act_t* `sec_act`)

Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - `ESP_OK` : success
 • other : failed

Parameters

- [in] `bd_addr`: : the address of the peer device need to encryption
- [in] `sec_act`: : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

esp_err_t **esp_ble_passkey_reply** (*esp_bd_addr_t* `bd_addr`, bool `accept`, uint32_t `passkey`)

Reply the key value to the peer device in the legacy connection stage.

Return - `ESP_OK` : success
 • other : failed

Parameters

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : passkey entry successful or declined.
- [in] `passkey`: : passkey value, must be a 6 digit number, can be lead by 0.

esp_err_t **esp_ble_confirm_reply** (*esp_bd_addr_t* `bd_addr`, bool `accept`)

Reply the confirm value to the peer device in the secure connection stage.

Return - `ESP_OK` : success
 • other : failed

Parameters

- [in] `bd_addr`: : BD address of the peer device
- [in] `accept`: : numbers to compare are the same or different.

esp_err_t **esp_ble_remove_bond_device** (*esp_bd_addr_t* `bd_addr`)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - `ESP_OK` : success
 • other : failed

Parameters

- [in] `bd_addr`: : BD address of the peer device

int **esp_ble_get_bond_device_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - `>= 0` : bonded devices number.
 • `ESP_FAIL` : failed

esp_err_t **esp_ble_get_bond_device_list** (int *dev_num, *esp_ble_bond_dev_t* *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return - ESP_OK : success

- other : failed

Parameters

- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- [out] dev_list: an array(buffer) of *esp_ble_bond_dev_t* type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t **esp_ble_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t *TK, uint8_t len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return - ESP_OK : success

- other : failed

Parameters

- [in] bd_addr: BD address of the peer device.
- [in] TK: TK value, the TK value shall be a 128-bit random number
- [in] len: length of tk, should always be 128-bit

esp_err_t **esp_ble_gap_disconnect** (*esp_bd_addr_t* remote_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Return - ESP_OK : success

- other : failed

Parameters

- [in] remote_device: : BD address of the peer device

esp_err_t **esp_ble_get_current_conn_params** (*esp_bd_addr_t* bd_addr, *esp_gap_conn_params_t* *conn_params)

This function is called to read the connection parameters information of the device.

Return - ESP_OK : success

- other : failed

Parameters

- [in] bd_addr: BD address of the peer device.
- [out] conn_params: the connection parameters information

esp_err_t **esp_gap_ble_set_channels** (*esp_gap_ble_channels_t* channels)

BLE set channels.

Return - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Parameters

- [in] channels: : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

esp_err_t **esp_gap_ble_set_authorization** (*esp_bd_addr_t* bd_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

Return - ESP_OK : success

- other : failed

Parameters

- [in] bd_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.

esp_err_t **esp_ble_gap_read_phy** (*esp_bd_addr_t* *bd_addr*)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *bd_addr*: : BD address of the peer device

esp_err_t **esp_ble_gap_set_prefered_default_phy** (*esp_ble_gap_phy_mask_t* *tx_phy_mask*,
esp_ble_gap_phy_mask_t *rx_phy_mask*)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *tx_phy_mask*: : indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] *rx_phy_mask*: : indicates the receiver PHYs that the Host prefers the Controller to use

esp_err_t **esp_ble_gap_set_prefered_phy** (*esp_bd_addr_t* *bd_addr*, *esp_ble_gap_all_phys_t* *all_phys_mask*,
esp_ble_gap_phy_mask_t *tx_phy_mask*, *esp_ble_gap_phy_mask_t* *rx_phy_mask*,
esp_ble_gap_prefer_phy_options_t *phy_options*)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *bd_addr*: : remote address
- [in] *all_phys_mask*: : a bit field that allows the Host to specify
- [in] *tx_phy_mask*: : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] *rx_phy_mask*: : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- [in] *phy_options*: : a bit field that allows the Host to specify options for PHYs

esp_err_t **esp_ble_gap_ext_adv_set_rand_addr** (*uint8_t* *instance*, *esp_bd_addr_t* *rand_addr*)

This function is used by the Host to set the random device address specified by the Random_Address parameter.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *instance*: : Used to identify an advertising set
- [in] *rand_addr*: : Random Device Address

esp_err_t **esp_ble_gap_ext_adv_set_params** (*uint8_t* *instance*, *const* *esp_ble_gap_ext_adv_params_t* **params*)

This function is used by the Host to set the advertising parameters.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *instance*: : identifies the advertising set whose parameters are being configured.
- [in] *params*: : advertising parameters

esp_err_t **esp_ble_gap_config_ext_adv_data_raw** (*uint8_t* *instance*, *uint16_t* *length*, *const* *uint8_t* **data*)

This function is used to set the data used in advertising PDUs that have a data field.

Return - ESP_OK : success

- other : failed

Parameters

- [in] instance: : identifies the advertising set whose data are being configured
- [in] length: : data length
- [in] data: : data information

esp_err_t **esp_ble_gap_config_ext_scan_rsp_data_raw**(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

Return - ESP_OK : success

- other : failed

Parameters

- [in] instance: : identifies the advertising set whose response data are being configured.
- [in] length: : response data length
- [in] scan_rsp_data: : response data information

esp_err_t **esp_ble_gap_ext_adv_start**(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

Return - ESP_OK : success

- other : failed

Parameters

- [in] num_adv: : Number of advertising sets to enable or disable
- [in] ext_adv: : adv parameters

esp_err_t **esp_ble_gap_ext_adv_stop**(uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

Return - ESP_OK : success

- other : failed

Parameters

- [in] num_adv: : Number of advertising sets to enable or disable
- [in] ext_adv_inst: : ext adv instance

esp_err_t **esp_ble_gap_ext_adv_set_remove**(uint8_t instance)

This function is used to remove an advertising set from the Controller.

Return - ESP_OK : success

- other : failed

Parameters

- [in] instance: : Used to identify an advertising set

esp_err_t **esp_ble_gap_ext_adv_set_clear**(void)

This function is used to remove all existing advertising sets from the Controller.

Return - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_params**(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)

This function is used by the Host to set the parameters for periodic advertising.

Return - ESP_OK : success

- other : failed

Parameters

- [in] instance: : identifies the advertising set whose periodic advertising parameters are being configured.
- [in] params: : periodic adv parameters

esp_err_t **esp_ble_gap_config_periodic_adv_data_raw** (uint8_t *instance*, uint16_t *length*,
const uint8_t **data*)

This function is used to set the data used in periodic advertising PDUs.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *instance*: : identifies the advertising set whose periodic advertising parameters are being configured.
- [in] *length*: : the length of periodic data
- [in] *data*: : periodic data information

esp_err_t **esp_ble_gap_periodic_adv_start** (uint8_t *instance*)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *instance*: : Used to identify an advertising set

esp_err_t **esp_ble_gap_periodic_adv_stop** (uint8_t *instance*)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *instance*: : Used to identify an advertising set

esp_err_t **esp_ble_gap_set_ext_scan_params** (const *esp_ble_ext_scan_params_t* **params*)

This function is used to set the extended scan parameters to be used on the advertising channels.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *params*: : scan parameters

esp_err_t **esp_ble_gap_start_ext_scan** (uint32_t *duration*, uint16_t *period*)

This function is used to enable scanning.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *duration*: : Scan duration
- [in] *period*: : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

esp_err_t **esp_ble_gap_stop_ext_scan** (void)

This function is used to disable scanning.

Return - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_create_sync** (const *esp_ble_gap_periodic_adv_sync_params_t* **params*)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *params*: : sync parameters

esp_err_t **esp_ble_gap_periodic_adv_sync_cancel** (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Return - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_terminate** (uint16_t *sync_handle*)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *sync_handle*: : identify the periodic advertiser

esp_err_t **esp_ble_gap_periodic_adv_add_dev_to_list** (*esp_ble_addr_type_t* *addr_type*,
esp_bd_addr_t *addr*, uint8_t *sid*)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *addr_type*: : address type
- [in] *addr*: : Device Address
- [in] *sid*: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

esp_err_t **esp_ble_gap_periodic_adv_remove_dev_from_list** (*esp_ble_addr_type_t*
addr_type, *esp_bd_addr_t*
addr, uint8_t *sid*)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *addr_type*: : address type
- [in] *addr*: : Device Address
- [in] *sid*: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

esp_err_t **esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

Return - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_prefer_ext_connect_params_set** (*esp_bd_addr_t* *addr*,
esp_ble_gap_phy_mask_t
phy_mask, **const**
esp_ble_gap_conn_params_t
phy_1m_conn_params*, **const
esp_ble_gap_conn_params_t
phy_2m_conn_params*, **const
esp_ble_gap_conn_params_t
**phy_coded_conn_params*)

This function is used to set aux connection parameters.

Return - ESP_OK : success

- other : failed

Parameters

- [in] *addr*: : device address
- [in] *phy_mask*: : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- [in] *phy_1m_conn_params*: : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- [in] *phy_2m_conn_params*: : Connection parameters for the LE 2M PHY are provided.
- [in] *phy_coded_conn_params*: : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

struct ble_set_perf_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT.
```

Public Members*esp_bt_status_t* **status**

Indicate perf phy set status

struct ble_set_rand_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.

Public Members*esp_bt_status_t* **status**

Indicate set static rand address operation success status

struct ble_update_conn_params_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.

Public Members*esp_bt_status_t* **status**

Indicate update connection parameters success status

esp_bd_addr_t **bda**

Bluetooth device address

uint16_t **min_int**

Min connection interval

uint16_t **max_int**

Max connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **conn_int**

Current connection interval

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct ble_update_duplicate_exceptional_list_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.

Public Members*esp_bt_status_t* **status**

Indicate update duplicate scan exceptional list operation success status

uint8_t **subcode**

Define in esp_bt_duplicate_exceptional_subcode_type_t

uint16_t **length**

The length of device_info

esp_duplicate_info_t **device_info**

device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

struct ble_update_whitelist_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the add or remove whitelist operation success status

esp_ble_wl_operation_t **wl_operation**

The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

struct esp_ble_adv_params_t

Advertising parameters.

Public Members

uint16_t **adv_int_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t **adv_int_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

esp_ble_adv_type_t **adv_type**

Advertising type

esp_ble_addr_type_t **own_addr_type**

Owner bluetooth device address type

esp_bd_addr_t **peer_addr**

Peer device bluetooth device address

esp_ble_addr_type_t **peer_addr_type**

Peer device bluetooth device address type, only support public address type and random address type

esp_ble_adv_channel_t **channel_map**

Advertising channel map

esp_ble_adv_filter_t **adv_filter_policy**

Advertising filter policy

struct esp_ble_adv_data_t

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

Public Members

bool **set_scan_rsp**

Set this advertising data as scan response or not

bool **include_name**

Advertising data include device name or not

bool **include_txpower**

Advertising data include TX power

int **min_interval**

Advertising data show slave preferred connection min interval. The connection interval in the following manner: $\text{connIntervalmin} = \text{Conn_Interval_Min} * 1.25 \text{ ms}$ Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval

Advertising data show slave preferred connection max interval. The connection interval in the following manner: $\text{connIntervalmax} = \text{Conn_Interval_Max} * 1.25 \text{ ms}$ Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min . Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance

External appearance of device

uint16_t manufacturer_len

Manufacturer data length

uint8_t *p_manufacturer_data

Manufacturer data point

uint16_t service_data_len

Service data length

uint8_t *p_service_data

Service data point

uint16_t service_uuid_len

Service uuid length

uint8_t *p_service_uuid

Service uuid array point

uint8_t flag

Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t

Ble scan parameters.

Public Members***esp_ble_scan_type_t* scan_type**

Scan type

***esp_ble_addr_type_t* own_addr_type**

Owner address type

***esp_ble_scan_filter_t* scan_filter_policy**

Scan filter policy

uint16_t scan_interval

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) $\text{Time} = N * 0.625 \text{ msec}$ Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window

Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) $\text{Time} = N * 0.625 \text{ msec}$ Time Range: 2.5 msec to 10240 msec

***esp_ble_scan_duplicate_t* scan_duplicate**

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t

connection parameters information

Public Members

`uint16_t interval`
connection interval

`uint16_t latency`
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
Connection update parameters.

Public Members

`esp_bd_addr_t bda`
Bluetooth device address

`uint16_t min_int`
Min connection interval

`uint16_t max_int`
Max connection interval

`uint16_t latency`
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
BLE pkt data length keys.

Public Members

`uint16_t rx_len`
pkt rx data length value

`uint16_t tx_len`
pkt tx data length value

struct esp_ble_penc_keys_t
BLE encryption keys.

Public Members

`esp_bt_octet16_t ltk`
The long term key

`esp_bt_octet8_t rand`
The random number

`uint16_t ediv`
The ediv value

`uint8_t sec_level`
The security level of the security link

`uint8_t key_size`
The key size(7~16) of the security link

struct esp_ble_pcsrkeys_t
BLE CSRK keys.

Public Members

uint32_t **counter**
The counter

esp_bt_octet16_t **csrkey**
The csrkey

uint8_t **sec_level**
The security level

struct esp_ble_pidkeys_t
BLE pid keys.

Public Members

esp_bt_octet16_t **irk**
The irk value

esp_ble_addr_type_t **addr_type**
The address type

esp_bd_addr_t **static_addr**
The static address

struct esp_ble_lenckeys_t
BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t **ltk**
The long term key

uint16_t **div**
The div value

uint8_t **key_size**
The key size of the security link

uint8_t **sec_level**
The security level of the security link

struct esp_ble_lcsrkeys_t
BLE SRK keys.

Public Members

uint32_t **counter**
The counter value

uint16_t **div**
The div value

uint8_t **sec_level**
The security level of the security link

esp_bt_octet16_t **csrkey**
The csrkey value

struct esp_ble_sec_key_notif_t
Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t **bd_addr**
peer address

uint32_t **passkey**
the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
Structure of the security request.

Public Members

esp_bd_addr_t **bd_addr**
peer address

struct esp_ble_bond_key_info_t
struct type of the bond key information value

Public Members

esp_ble_key_mask_t **key_mask**
the key mask to indicate witch key is present

esp_ble_penc_keys_t **penc_key**
received peer encryption key

esp_ble_pcsrkeys_t **pcsrk_key**
received peer device SRK

esp_ble_pid_keys_t **pid_key**
peer device ID key

struct esp_ble_bond_dev_t
struct type of the bond device value

Public Members

esp_bd_addr_t **bd_addr**
peer address

esp_ble_bond_key_info_t **bond_key**
the bond key information

struct esp_ble_key_t
union type of the security key value

Public Members

esp_bd_addr_t **bd_addr**
peer address

esp_ble_key_type_t **key_type**
key type of the security link

esp_ble_key_value_t **p_key_value**
the pointer to the key value

struct esp_ble_local_id_keys_t
structure type of the ble local id keys value

Public Members

esp_bt_octet16_t **ir**
the 16 bits of the ir value

esp_bt_octet16_t **irk**
the 16 bits of the ir key value

esp_bt_octet16_t **dhk**
the 16 bits of the dh key value

struct esp_ble_auth_cmpl_t
Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t **bd_addr**
BD address peer device.

bool **key_present**
Valid link key value in key element

esp_link_key **key**
Link key associated with peer device.

uint8_t **key_type**
The type of Link Key

bool **success**
TRUE of authentication succeeded, FALSE if failed.

uint8_t **fail_reason**
The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t **addr_type**
Peer device address type

esp_bt_dev_type_t **dev_type**
Device type

esp_ble_auth_req_t **auth_mode**
authentication mode

struct esp_ble_gap_ext_adv_params_t
ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t **type**
ext adv type

uint32_t **interval_min**
ext adv minimum interval

uint32_t **interval_max**
ext adv maximum interval

esp_ble_adv_channel_t **channel_map**
ext adv channel map

esp_ble_addr_type_t **own_addr_type**
ext adv own addresss type

esp_ble_addr_type_t **peer_addr_type**
ext adv peer address type

esp_bd_addr_t **peer_addr**
ext adv peer address

esp_ble_adv_filter_t **filter_policy**
ext adv filter policy

int8_t **tx_power**
ext adv tx power

esp_ble_gap_pri_phy_t **primary_phy**
ext adv primary phy

uint8_t **max_skip**
ext adv maximum skip

esp_ble_gap_phy_t **secondary_phy**
ext adv secondary phy

uint8_t **sid**
ext adv sid

bool **scan_req_notif**
ext adv sacn request event notify

struct esp_ble_ext_scan_cfg_t
ext scan config

Public Members

esp_ble_scan_type_t **scan_type**
ext scan type

uint16_t **scan_interval**
ext scan interval

uint16_t **scan_window**
ext scan window

struct esp_ble_ext_scan_params_t
ext scan parameters

Public Members

esp_ble_addr_type_t **own_addr_type**
ext scan own addresss type

esp_ble_scan_filter_t **filter_policy**
ext scan filter policy

esp_ble_scan_duplicate_t **scan_duplicate**
ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t **cfg_mask**
ext scan config mask

esp_ble_ext_scan_cfg_t **uncoded_cfg**
ext scan uncoded config parameters

esp_ble_ext_scan_cfg_t **coded_cfg**
ext scan coded config parameters

struct esp_ble_gap_conn_params_t
create extend connection parameters

Public Members

uint16_t **scan_interval**
init scan interval

uint16_t **scan_window**
init scan window

uint16_t **interval_min**
minimum interval

uint16_t **interval_max**
maximum interval

uint16_t **latency**
ext scan type

uint16_t **supervision_timeout**
connection supervision timeout

uint16_t **min_ce_len**
minimum ce length

uint16_t **max_ce_len**
maximum ce length

struct esp_ble_gap_ext_adv_t
extend adv enable parameters

Public Members

uint8_t **instance**
advertising handle

int **duration**
advertising duration

int **max_events**
maximum number of extended advertising events

struct esp_ble_gap_periodic_adv_params_t
periodic adv parameters

Public Members

uint16_t **interval_min**
periodic advertising minimum interval

uint16_t **interval_max**
periodic advertising maximum interval

uint8_t **properties**
periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
periodic adv sync parameters

Public Members

esp_ble_gap_sync_t **filter_policy**
periodic advertising sync filter policy

uint8_t **sid**
periodic advertising sid

esp_ble_addr_type_t **addr_type**
periodic advertising address type

esp_bd_addr_t **addr**
periodic advertising address

uint16_t **skip**
the maximum number of periodic advertising events that can be skipped

uint16_t **sync_timeout**
synchronization timeout

struct esp_ble_gap_ext_adv_reprot_t
extend adv report parameters

Public Members

esp_ble_gap_adv_type_t **event_type**
extend advertising type

uint8_t **addr_type**
extend advertising address type

esp_bd_addr_t **addr**
extend advertising address

esp_ble_gap_pri_phy_t **primary_phy**
extend advertising primary phy

esp_ble_gap_phy_t **secondly_phy**
extend advertising secondary phy

uint8_t **sid**
extend advertising sid

uint8_t **tx_power**
extend advertising tx power

int8_t **rssi**
extend advertising rssi

uint16_t **per_adv_interval**
periodic advertising interval

uint8_t **dir_addr_type**
direct address type

esp_bd_addr_t **dir_addr**
direct address

esp_ble_gap_ext_adv_data_status_t **data_status**
data type

uint8_t **adv_data_len**
extend advertising data length

uint8_t **adv_data**[251]
extend advertising data

struct esp_ble_gap_periodic_adv_report_t
periodic adv report parameters

Public Members

uint16_t **sync_handle**
periodic advertising train handle

uint8_t **tx_power**
periodic advertising tx power

int8_t **rssi**
periodic advertising rssi

esp_ble_gap_ext_adv_data_status_t **data_status**
periodic advertising data type

uint8_t **data_length**
periodic advertising data length

uint8_t **data**[251]
periodic advertising data

struct esp_ble_gap_periodic_adv_sync_estab_t
periodic adv sync establish parameters

Public Members

uint8_t **status**
periodic advertising sync status

uint16_t **sync_handle**
periodic advertising train handle

uint8_t **sid**
periodic advertising sid

esp_ble_addr_type_t **addr_type**
periodic advertising address type

esp_bd_addr_t **adv_addr**
periodic advertising address

esp_ble_gap_phy_t **adv_phy**
periodic advertising adv phy type

uint16_t **period_adv_interval**
periodic advertising interval

uint8_t **adv_clk_accuracy**
periodic advertising clock accuracy

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC
BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

typedef uint8_t esp_ble_gap_adv_type_t
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t
    *param)
    GAP callback function type.

```

Parameters

- `event`: : Event type
- `param`: : Point to callback parameter, currently is union type

Enumerations

enum esp_gap_ble_cb_event_t

GAP BLE callback event type.

Values:

ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0

When advertising data set complete, the event comes

ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT

When scan response data set complete, the event comes

ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT

When scan parameters set complete, the event comes

ESP_GAP_BLE_SCAN_RESULT_EVT

When one scan result ready, the event comes each time

ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT

When raw advertising data set complete, the event comes

ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT

When raw advertising data set complete, the event comes

ESP_GAP_BLE_ADV_START_COMPLETE_EVT

When start advertising complete, the event comes

ESP_GAP_BLE_SCAN_START_COMPLETE_EVT

When start scan complete, the event comes

ESP_GAP_BLE_AUTH_CMPL_EVT = 8

ESP_GAP_BLE_KEY_EVT

ESP_GAP_BLE_SEC_REQ_EVT

ESP_GAP_BLE_PASSKEY_NOTIF_EVT

ESP_GAP_BLE_PASSKEY_REQ_EVT

ESP_GAP_BLE_OOB_REQ_EVT

ESP_GAP_BLE_LOCAL_IR_EVT

ESP_GAP_BLE_LOCAL_ER_EVT

ESP_GAP_BLE_NC_REQ_EVT

ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT

When stop adv complete, the event comes

ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT

When stop scan complete, the event comes

ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19

When set the static rand address complete, the event comes

ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT

When update connection parameters complete, the event comes

ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT

When set pkt length complete, the event comes

ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT

When Enable/disable privacy on the local device complete, the event comes

ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
When remove the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
When clear the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When get the bond device list complete, the event comes

ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT = 29
When setting BLE channels complete, the event comes

ESP_GAP_BLE_READ_PHY_COMPLETE_EVT

ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT

ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT

```

enum esp_ble_adv_type_t
Advertising mode.

Values:

```
ADV_TYPE_IND = 0x00
ADV_TYPE_DIRECT_IND_HIGH = 0x01
ADV_TYPE_SCAN_IND = 0x02
ADV_TYPE_NONCONN_IND = 0x03
ADV_TYPE_DIRECT_IND_LOW = 0x04
```

enum esp_ble_adv_channel_t
Advertising channel mask.

Values:

```
ADV_CHNL_37 = 0x01
ADV_CHNL_38 = 0x02
ADV_CHNL_39 = 0x04
ADV_CHNL_ALL = 0x07
```

enum esp_ble_adv_filter_t

Values:

```
ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
    Allow both scan and connection requests from anyone.
ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
    Allow both scan req from White List devices only and connection req from anyone.
ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
    Allow both scan req from anyone and connection req from White List devices only.
ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
    Allow scan and connection requests from White List devices only.
```

enum esp_ble_sec_act_t

Values:

```
ESP_BLE_SEC_ENCRYPT = 1
ESP_BLE_SEC_ENCRYPT_NO_MITM
ESP_BLE_SEC_ENCRYPT_MITM
```

enum esp_ble_sm_param_t

Values:

```
ESP_BLE_SM_PASSKEY = 0
ESP_BLE_SM_AUTHEN_REQ_MODE
ESP_BLE_SM_IOCAP_MODE
```

```

ESP_BLE_SM_SET_INIT_KEY
ESP_BLE_SM_SET_RSP_KEY
ESP_BLE_SM_MAX_KEY_SIZE
ESP_BLE_SM_MIN_KEY_SIZE
ESP_BLE_SM_SET_STATIC_PASSKEY
ESP_BLE_SM_CLEAR_STATIC_PASSKEY
ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH
ESP_BLE_SM_OOB_SUPPORT
ESP_BLE_APP_ENC_KEY_SIZE
ESP_BLE_SM_MAX_PARAM

```

```
enum esp_ble_scan_type_t
```

Ble scan type.

Values:

```
BLE_SCAN_TYPE_PASSIVE = 0x0
```

Passive scan

```
BLE_SCAN_TYPE_ACTIVE = 0x1
```

Active scan

```
enum esp_ble_scan_filter_t
```

Ble scan filter type.

Values:

```
BLE_SCAN_FILTER_ALLOW_ALL = 0x0
```

Accept all :

1. advertisement packets except directed advertising packets not addressed to this device (default).

```
BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
```

Accept only :

1. advertisement packets from devices where the advertiser' s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

```
BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
```

Accept all :

1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

```
BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3
```

Accept all :

1. advertisement packets from devices where the advertiser' s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

```
enum esp_ble_scan_duplicate_t
```

Ble scan duplicate type.

Values:

```
BLE_SCAN_DUPLICATE_DISABLE = 0x0
```

the Link Layer should generate advertising reports to the host for each packet received

```
BLE_SCAN_DUPLICATE_ENABLE = 0x1
```

the Link Layer should filter out duplicate advertising reports to the Host

BLE_SCAN_DUPLICATE_MAX = 0x2
0x02–0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

ESP_GAP_SEARCH_INQ_RES_EVT = 0
Inquiry result for a peer device.

ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
Inquiry complete.

ESP_GAP_SEARCH_DISC_RES_EVT = 2
Discovery result for a peer device.

ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
Discovery result for BLE GATT based service on a peer device.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
Discovery complete.

ESP_GAP_SEARCH_DI_DISC_CMPL_EVT = 5
Discovery complete.

ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
Search cancelled

ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

ESP_BLE_EVT_CONN_ADV = 0x00
Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
Non connectable undirected advertising (ADV_NONCONN_IND)

ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_opration_t

Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist

ESP_BLE_WHITELIST_ADD = 0X01
add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t

Values:

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN

Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t

Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0

BLE advertising address , device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID

BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enum esp_duplicate_scan_exceptional_list_type_t

Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)

duplicate scan exceptional addr list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)

duplicate scan exceptional mesh link ID list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)

duplicate scan exceptional mesh beacon type list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST = BLE_BIT(3)

duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)

duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF

duplicate scan exceptional all list

GATT DEFINES

Overview [Instructions](#)

Application Example [Instructions](#)

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h](#)

Unions

union esp_gatt_rsp_t

#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t **attr_value**
Gatt attribute structure

uint16_t **handle**
Gatt attribute handle

Structures

struct esp_gatt_id_t
Gatt id, include uuid and instance id.

Public Members

esp_bt_uuid_t **uuid**
UUID

uint8_t **inst_id**
Instance id

struct esp_gatt_srvc_id_t
Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

esp_gatt_id_t **id**
Gatt id, include uuid and instance

bool **is_primary**
This service is primary or not

struct esp_attr_desc_t
Attribute description (used to create database)

Public Members

uint16_t **uuid_length**
UUID length

uint8_t ***uuid_p**
UUID value

uint16_t **perm**
Attribute permission

uint16_t **max_length**
Maximum length of the element

uint16_t **length**
Current length of the element

uint8_t ***value**
Element value array

struct esp_attr_control_t
attribute auto response flag

Public Members**uint8_t auto_rsp**

if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t

attribute type added to the gatt server database

Public Members**esp_attr_control_t attr_control**

The attribute control type

esp_attr_desc_t att_desc

The attribute type

struct esp_attr_value_t

set the attribute value type

Public Members**uint16_t attr_max_len**

attribute max value length

uint16_t attr_len

attribute current value length

uint8_t *attr_value

the pointer to attribute value

struct esp_gatts_incl_svc_desc_t

Gatt include service entry element.

Public Members**uint16_t start_hdl**

Gatt start handle value of included service

uint16_t end_hdl

Gatt end handle value of included service

uint16_t uuid

Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t

Gatt include 128 bit service entry element.

Public Members**uint16_t start_hdl**

Gatt start handle value of included 128 bit service

uint16_t end_hdl

Gatt end handle value of included 128 bit service

struct esp_gatt_value_t

Gatt attribute value.

Public Members

`uint8_t value[ESP_GATT_MAX_ATTR_LEN]`
Gatt attribute value

`uint16_t handle`
Gatt attribute handle

`uint16_t offset`
Gatt attribute value offset

`uint16_t len`
Gatt attribute value length

`uint8_t auth_req`
Gatt authentication request

struct esp_gatt_conn_params_t
Connection parameters information.

Public Members

`uint16_t interval`
connection interval

`uint16_t latency`
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
read multiple attribute

Public Members

`uint8_t num_attr`
The number of the attribute

`uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]`
The handles list

struct esp_gattc_db_elem_t
data base attribute element

Public Members

esp_gatt_db_attr_type_t **type**
The attribute type

`uint16_t attribute_handle`
The attribute handle, it' s valid for all of the type

`uint16_t start_handle`
The service start handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

`uint16_t end_handle`
The service end handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

***esp_gatt_char_prop_t* properties**

The characteristic properties, it's valid only when the type = ESP_GATT_DB_CHARACTERISTIC

***esp_bt_uuid_t* uuid**

The attribute uuid, it's valid for all of the type

struct esp_gattc_service_elem_t
service element

Public Members**bool is_primary**

The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle

The start handle of the service

uint16_t end_handle

The end handle of the service

***esp_bt_uuid_t* uuid**

The uuid of the service

struct esp_gattc_char_elem_t
characteristic element

Public Members**uint16_t char_handle**

The characteristic handle

***esp_gatt_char_prop_t* properties**

The characteristic properties

***esp_bt_uuid_t* uuid**

The characteristic uuid

struct esp_gattc_descr_elem_t
descriptor element

Public Members**uint16_t handle**

The characteristic descriptor handle

***esp_bt_uuid_t* uuid**

The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
include service element

Public Members**uint16_t handle**

The include service current attribute handle

uint16_t incl_srvc_s_handle

The start handle of the service which has been included

uint16_t incl_srvc_e_handle

The end handle of the service which has been included

esp_bt_uuid_t uuid

The include service uuid

GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE

If callback report `gattc_if/gatts_if` as this macro, means this event is not correspond to any app

Type Definitions

typedef uint16_t **esp_gatt_perm_t**

typedef uint8_t **esp_gatt_char_prop_t**

typedef uint8_t **esp_gatt_if_t**

Gatt interface type, different application on GATT client use different `gatt_if`

Enumerations

enum **esp_gatt_prep_write_type**

Attribute write data type from the client.

Values:

ESP_GATT_PREP_WRITE_CANCEL = 0x00

Prepare write cancel

ESP_GATT_PREP_WRITE_EXEC = 0x01

Prepare write execute

enum **esp_gatt_status_t**

GATT success code and error codes.

Values:

ESP_GATT_OK = 0x0

ESP_GATT_INVALID_HANDLE = 0x01

ESP_GATT_READ_NOT_PERMIT = 0x02

ESP_GATT_WRITE_NOT_PERMIT = 0x03

```

```

enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.

```

Values:

```

ESP_GATT_CONN_UNKNOWN = 0
    Gatt connection unknown

ESP_GATT_CONN_L2C_FAILURE = 1
    General L2cap failure

```

ESP_GATT_CONN_TIMEOUT = 0x08
Connection timeout

ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
Connection terminate by peer user

ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
Connection terminated by local host

ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
Connection fail to establish

ESP_GATT_CONN_LMP_TIMEOUT = 0x22
Connection fail for LMP response tout

ESP_GATT_CONN_CONN_CANCEL = 0x0100
L2CAP connection cancelled

ESP_GATT_CONN_NONE = 0x0101
No connection to cancel

enum esp_gatt_auth_req_t
Gatt authentication request type.

Values:

ESP_GATT_AUTH_REQ_NONE = 0

ESP_GATT_AUTH_REQ_NO_MITM = 1

ESP_GATT_AUTH_REQ_MITM = 2

ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3

ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0

ESP_GATT_SERVICE_FROM_NVS_FLASH = 1

ESP_GATT_SERVICE_FROM_UNKNOWN = 2

enum esp_gatt_write_type_t

Gatt write type.

Values:

ESP_GATT_WRITE_TYPE_NO_RSP = 1
Gatt write attribute need no response

ESP_GATT_WRITE_TYPE_RSP
Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t

the type of attribute element

Values:

ESP_GATT_DB_PRIMARY_SERVICE
Gattc primary service attribute type in the cache

ESP_GATT_DB_SECONDARY_SERVICE
Gattc secondary service attribute type in the cache

ESP_GATT_DB_CHARACTERISTIC
Gattc characteristic attribute type in the cache

ESP_GATT_DB_DESCRIPTOR
Gattc characteristic descriptor attribute type in the cache

ESP_GATT_DB_INCLUDED_SERVICE

Gattc include service attribute type in the cache

ESP_GATT_DB_ALL

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API**Overview** [Instructions](#)

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
 - [bluetooth/bluedroid/ble/gatt_server_service_table](#)
 - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
 - [bluetooth/bluedroid/ble/gatt_server](#)
 - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
 - [bluetooth/bluedroid/ble/ble_spp_server](#)

API Reference**Header File**

- [components/bt/host/bluedroid/api/include/api/esp_gatts_api.h](#)

Functions

esp_err_t **esp_ble_gatts_register_callback** (*esp_gatts_cb_t* callback)

This function is called to register application callbacks with BTA GATTS module.

Return

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_register** (uint16_t app_id)

This function is called to register application identifier.

Return

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_unregister** (*esp_gatt_if_t* gatts_if)

unregister with GATT Server.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] gatts_if: GATT server access interface

esp_err_t **esp_ble_gatts_create_service** (*esp_gatt_if_t* gatts_if, *esp_gatt_srvc_id_t* *service_id, uint16_t num_handle)

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to

report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] gatts_if: GATT server access interface
- [in] service_id: service ID.
- [in] num_handle: number of handle requested for this service.

```
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db,
                                       esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t
                                       srvc_inst_id)
```

Create a service attribute tab.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] gatts_attr_db: the pointer to the service attr tab
- [in] gatts_if: GATT server access interface
- [in] max_nb_attr: the number of attribute to be added to the service database.
- [in] srvc_inst_id: the instance id of the service

```
esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t in-
                                             cluded_service_handle)
```

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char'. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] service_handle: service handle to which this included service is to be added.
- [in] included_service_handle: the service ID to be included.

```
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid,
                                  esp_gatt_perm_t perm, esp_gatt_char_prop_t property,
                                  esp_attr_value_t *char_val, esp_attr_control_t *control)
```

This function is called to add a characteristic into a service.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: : Characteristic UUID.
- [in] perm: : Characteristic value declaration attribute permission.
- [in] property: : Characteristic Properties
- [in] char_val: : Characteristic value
- [in] control: : attribute response control byte

```
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid,
                                         esp_gatt_perm_t perm, esp_attr_value_t
                                         *char_descr_val, esp_attr_control_t *control)
```

This function is called to add characteristic descriptor. When it's done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `service_handle`: service handle to which this characteristic descriptor is to be added.
- [in] `perm`: descriptor access permission.
- [in] `descr_uuid`: descriptor UUID.
- [in] `char_descr_val`: : Characteristic descriptor value
- [in] `control`: : attribute response control byte

esp_err_t **esp_ble_gatts_delete_service** (uint16_t *service_handle*)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `service_handle`: service_handle to be deleted.

esp_err_t **esp_ble_gatts_start_service** (uint16_t *service_handle*)

This function is called to start a service.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `service_handle`: the service handle to be started.

esp_err_t **esp_ble_gatts_stop_service** (uint16_t *service_handle*)

This function is called to stop a service.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `service_handle`: - service to be topped.

esp_err_t **esp_ble_gatts_send_indicate** (*esp_gatt_if_t* *gatts_if*, uint16_t *conn_id*, uint16_t *attr_handle*, uint16_t *value_len*, uint8_t **value*, bool *need_confirm*)

Send indicate or notify to GATT client. Set param `need_confirm` as false will send notification, otherwise indication.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: - connection id to indicate.
- [in] `attr_handle`: - attribute handle to indicate.
- [in] `value_len`: - indicate value length.
- [in] `value`: value to indicate.
- [in] `need_confirm`: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

esp_err_t **esp_ble_gatts_send_response** (*esp_gatt_if_t* *gatts_if*, uint16_t *conn_id*, uint32_t *trans_id*, *esp_gatt_status_t* *status*, *esp_gatt_rsp_t* **rsp*)

This function is called to send a response to a request.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: - connection identifier.

- [in] trans_id: - transfer id
- [in] status: - response status
- [in] rsp: - response data.

esp_err_t **esp_ble_gatts_set_attr_value** (uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

esp_gatt_status_t **esp_ble_gatts_get_attr_value** (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

Return

- ESP_GATT_OK : success
- other : failed

Parameters

- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

esp_err_t **esp_ble_gatts_open** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

esp_err_t **esp_ble_gatts_close** (*esp_gatt_if_t* gatts_if, uint16_t conn_id)

Close a connection a remote device.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

esp_err_t **esp_ble_gatts_send_service_change_indication** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda)

Send service change indication.

Return

- ESP_OK : success
- other : failed

Parameters

- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Unions

union esp_ble_gatts_cb_param_t

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

```

The write operation need to do response

bool **is_prep**

This write operation is prepare write

uint16_t **len**

The write attribute value length

uint8_t ***value**

The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL

Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC

Prepare write flag to indicate execute prepare write

Type Definitions

```
typedef void (*esp_gatts_cb_t) (esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,  
esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

Parameters

- *event*: : Event type
- *gatts_if*: : GATT server access interface, normally different *gatts_if* correspond to different profile
- *param*: : Point to callback parameter, currently is union type

Enumerations

enum esp_gatts_cb_event_t

GATT Server callback function events.

*Values:***ESP_GATTS_REG_EVT = 0**

When register application id, the event comes

ESP_GATTS_READ_EVT = 1

When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2

When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3

When gatt client request execute write, the event comes

ESP_GATTS_MTU_EVT = 4

When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5

When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6

When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7

When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8

When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9

When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10

When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11

When delete service complete, the event comes

ESP_GATTS_START_EVT = 12

When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13

When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14

When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15

When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16

When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17

When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18

When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19

When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20

When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21

When gatt send response complete, the event comes

ESP_GATTS_CREAT_ATTR_TAB_EVT = 22

When gatt create table complete, the event comes

ESP_GATTS_SET_ATTR_VAL_EVT = 23

When gatt set attr value complete, the event comes

ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24

When gatt send service change indication complete, the event comes

GATT CLIENT API

Overview [Instructions](#)

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
 - [bluetooth/bluedroid/ble/gatt_client](#)
 - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
 - [bluetooth/bluedroid/ble/gattc_multi_connect](#)
 - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.

Functions

esp_err_t **esp_ble_gattc_register_callback** (*esp_gattc_cb_t* callback)

This function is called to register application callbacks with GATTC module.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] callback: : pointer to the application callback function.

esp_err_t **esp_ble_gattc_app_register** (uint16_t app_id)

This function is called to register application callbacks with GATTC module.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] app_id: : Application Identify (UUID), for different application

esp_err_t **esp_ble_gattc_app_unregister** (*esp_gatt_if_t* gattc_if)

This function is called to unregister an application from GATTC module.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.

`esp_err_t esp_ble_gattc_open` (`esp_gatt_if_t gattc_if`, `esp_bd_addr_t remote_bda`,
`esp_ble_addr_type_t remote_addr_type`, `bool is_direct`)

Open a direct connection or add a background auto connection.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `remote_bda`: remote device bluetooth device address.
- [in] `remote_addr_type`: remote device bluetooth device the address type.
- [in] `is_direct`: direct connection or background auto connection (by now, background auto connection is not supported).

`esp_err_t esp_ble_gattc_aux_open` (`esp_gatt_if_t gattc_if`, `esp_bd_addr_t remote_bda`,
`esp_ble_addr_type_t remote_addr_type`, `bool is_direct`)

`esp_err_t esp_ble_gattc_close` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`)

Close the virtual connection to the GATT server. `gattc` may have multiple virtual GATT server connections when multiple `app_id` registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use `esp_ble_gap_disconnect`(`esp_bd_addr_t remote_device`).

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID to be closed.

`esp_err_t esp_ble_gattc_send_mtu_req` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use `esp_ble_gatt_set_local_mtu`() to configure the local MTU size.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.

`esp_err_t esp_ble_gattc_search_service` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`, `esp_bt_uuid_t *filter_uuid`)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `filter_uuid`: a UUID of the service application is interested in. If Null, discover for all services.

`esp_gatt_status_t esp_ble_gattc_get_service` (`esp_gatt_if_t gattc_if`, `uint16_t conn_id`,
`esp_bt_uuid_t *svc_uuid`, `esp_gattc_service_elem_t *result`, `uint16_t *count`, `uint16_t offset`)

Find all the service with the given service uuid in the `gattc` cache, if the `svc_uuid` is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the `esp_ble_gattc_cache_refresh`, then call `esp_ble_gattc_get_service` again.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `svc_uuid`: the pointer to the service uuid.
- [out] `result`: The pointer to the service which has been found in the gattc cache.
- [inout] `count`: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- [in] `offset`: Offset of the service position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t end_handle,
esp_gattc_char_elem_t *result, uint16_t *count,
uint16_t offset)
```

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle.
- [in] `end_handle`: the attribute end handle
- [out] `result`: The pointer to the characteristic in the service.
- [inout] `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] `offset`: Offset of the characteristic position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
char_handle, esp_gattc_descr_elem_t *result,
uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `char_handle`: the given characteristic handle
- [out] `result`: The pointer to the descriptor in the characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] `offset`: Offset of the descriptor position to get.

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t
end_handle, esp_bt_uuid_t char_uuid,
esp_gattc_char_elem_t *result, uint16_t
*count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `char_uuid`: the characteristic uuid
- [out] `result`: The pointer to the characteristic in the service.
- [inout] `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t
conn_id, uint16_t start_handle,
uint16_t end_handle, esp_bt_uuid_t
char_uuid, esp_bt_uuid_t descr_uuid,
esp_gattc_descr_elem_t *result, uint16_t
*count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Return

- `ESP_OK`: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `char_uuid`: the characteristic uuid.
- [in] `descr_uuid`: the descriptor uuid.
- [out] `result`: The pointer to the descriptor in the given characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t
conn_id, uint16_t char_handle,
esp_bt_uuid_t descr_uuid,
esp_gattc_descr_elem_t *result,
uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Return

- `ESP_OK`: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `char_handle`: the characteristic handle.
- [in] `descr_uuid`: the descriptor uuid.
- [out] `result`: The pointer to the descriptor in the given characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t
end_handle, esp_bt_uuid_t *incl_uuid,
esp_gattc_incl_svc_elem_t *result,
uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

Return

- `ESP_OK`: success

- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `incl_uuid`: the include service uuid
- [out] `result`: The pointer to the include service in the given service.
- [inout] `count`: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                             esp_gatt_db_attr_type_t type, uint16_t
                                             start_handle, uint16_t end_handle, uint16_t
                                             char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `type`: the attribute type.
- [in] `start_handle`: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] `end_handle`: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] `char_handle`: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] `count`: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
                                       start_handle, uint16_t end_handle, esp_gattc_db_elem_t
                                       *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `conn_id`: connection ID which identify the server.
- [in] `db`: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] `count`: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                  esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic handle.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.

- [in] handle: : characteritic handle to read.
- [in] auth_req: : authenticate request type

esp_err_t **esp_ble_gattc_read_by_type** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* *uuid, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service' s characteristics of the given characteristic UUID.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.
- [in] start_handle: : the attribute start handle.
- [in] end_handle: : the attribute end handle
- [in] uuid: : The UUID of attribute which will be read.
- [in] auth_req: : authenticate request type

esp_err_t **esp_ble_gattc_read_multiple** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gattc_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple characteristic or characteristic descriptors.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.
- [in] read_multi: : pointer to the read multiple parameter.
- [in] auth_req: : authenticate request type

esp_err_t **esp_ble_gattc_read_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a characteristics descriptor.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.
- [in] handle: : descriptor handle to read.
- [in] auth_req: : authenticate request type

esp_err_t **esp_ble_gattc_write_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic value.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.
- [in] handle: : characteristic handle to write.
- [in] value_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] write_type: : the type of attribute write operation.
- [in] auth_req: : authentication request.

```
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                         uint16_t handle, uint16_t value_len, uint8_t
                                         *value, esp_gatt_write_type_t write_type,
                                         esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID
- [in] handle: : descriptor handle to write.
- [in] value_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] write_type: : the type of attribute write operation.
- [in] auth_req: : authentication request.

```
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                       uint16_t offset, uint16_t value_len, uint8_t *value,
                                       esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.
- [in] handle: : characteristic handle to prepare write.
- [in] offset: : offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] auth_req: : authentication request.

```
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                  uint16_t handle, uint16_t offset,
                                                  uint16_t value_len, uint8_t *value,
                                                  esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.
- [in] handle: : characteristic descriptor handle to prepare write.
- [in] offset: : offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: : the value to be written.
- [in] auth_req: : authentication request.

```
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: : connection ID.

- [in] `is_execute`: : execute or cancel.

esp_err_t **esp_ble_gattc_register_for_notify** (*esp_gatt_if_t* `gattc_if`, *esp_bd_addr_t* `server_bda`, *uint16_t* `handle`)

This function is called to register for notification of a service.

Return

- ESP_OK: registration succeeds
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

esp_err_t **esp_ble_gattc_unregister_for_notify** (*esp_gatt_if_t* `gattc_if`, *esp_bd_addr_t* `server_bda`, *uint16_t* `handle`)

This function is called to de-register for notification of a service.

Return

- ESP_OK: unregister succeeds
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

esp_err_t **esp_ble_gattc_cache_refresh** (*esp_bd_addr_t* `remote_bda`)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `remote_bda`: remote device BD address.

esp_err_t **esp_ble_gattc_cache_assoc** (*esp_gatt_if_t* `gattc_if`, *esp_bd_addr_t* `src_addr`, *esp_bd_addr_t* `assoc_addr`, *bool* `is_assoc`)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to use the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `src_addr`: the source address which provide the attribute table.
- [in] `assoc_addr`: the associated device address which went to share the attribute table with the source address.
- [in] `is_assoc`: true add the associated device address, false remove the associated device address.

esp_err_t **esp_ble_gattc_cache_get_addr_list** (*esp_gatt_if_t* `gattc_if`)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] `gattc_if`: Gatt client access interface.

`esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)`

Clean the service cache of this device in the gattc stack,.

Return

- `ESP_OK`: success
- other: failed

Parameters

- [in] `remote_bda`: remote device BD address.

Unions

`union esp_ble_gattc_cb_param_t`

`#include <esp_gattc_api.h>` Gatt client callback parameters union.

esp_gatt_status_t **status**

Operation status

uint16_t **app_id**

Application id which input in register API

struct gattc_reg_for_notify_evt_param

#include <esp_gattc_api.h> ESP_GATTC_REG_FOR_NOTIFY_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **handle**

The characteristic or descriptor handle

struct gattc_search_cmpl_evt_param

#include <esp_gattc_api.h> ESP_GATTC_SEARCH_CMPL_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **conn_id**

Connection id

esp_service_source_t **searched_service_source**

The source of the service information

struct gattc_search_res_evt_param

#include <esp_gattc_api.h> ESP_GATTC_SEARCH_RES_EVT.

Public Members

`uint16_t conn_id`
Connection id

`uint16_t start_handle`
Service start handle

`uint16_t end_handle`
Service end handle

`esp_gatt_id_t srvc_id`
Service id, include service uuid and other information

bool `is_primary`
True if this is the primary service

struct gattc_set_assoc_addr_cmp_evt_param
#include <esp_gattc_api.h> ESP_GATTC_SET_ASSOC_EVT.

Public Members

`esp_gatt_status_t status`
Operation status

struct gattc_srvc_chg_evt_param
#include <esp_gattc_api.h> ESP_GATTC_SRVC_CHG_EVT.

Public Members

`esp_bd_addr_t remote_bda`
Remote bluetooth device address

struct gattc_unreg_for_notify_evt_param
#include <esp_gattc_api.h> ESP_GATTC_UNREG_FOR_NOTIFY_EVT.

Public Members

`esp_gatt_status_t status`
Operation status

`uint16_t handle`
The characteristic or descriptor handle

struct gattc_write_evt_param
#include <esp_gattc_api.h> ESP_GATTC_WRITE_CHAR_EVT, ESP_GATTC_PREP_WRITE_EVT, ESP_GATTC_WRITE_DESCR_EVT.

Public Members

`esp_gatt_status_t status`
Operation status

`uint16_t conn_id`
Connection id

`uint16_t handle`
The Characteristic or descriptor handle

`uint16_t offset`

The prepare write offset, this value is valid only when prepare write

Type Definitions

```
typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
                                esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

Parameters

- `event`: : Event type
- `gattc_if`: : GATT client access interface, normally different `gattc_if` correspond to different profile
- `param`: : Point to callback parameter, currently is union type

Enumerations

```
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

Values:

```
ESP_GATTC_REG_EVT = 0
```

When GATT client is registered, the event comes

```
ESP_GATTC_UNREG_EVT = 1
```

When GATT client is unregistered, the event comes

```
ESP_GATTC_OPEN_EVT = 2
```

When GATT virtual connection is set up, the event comes

```
ESP_GATTC_READ_CHAR_EVT = 3
```

When GATT characteristic is read, the event comes

```
ESP_GATTC_WRITE_CHAR_EVT = 4
```

When GATT characteristic write operation completes, the event comes

```
ESP_GATTC_CLOSE_EVT = 5
```

When GATT virtual connection is closed, the event comes

```
ESP_GATTC_SEARCH_CMPL_EVT = 6
```

When GATT service discovery is completed, the event comes

```
ESP_GATTC_SEARCH_RES_EVT = 7
```

When GATT service discovery result is got, the event comes

```
ESP_GATTC_READ_DESCR_EVT = 8
```

When GATT characteristic descriptor read completes, the event comes

```
ESP_GATTC_WRITE_DESCR_EVT = 9
```

When GATT characteristic descriptor write completes, the event comes

```
ESP_GATTC_NOTIFY_EVT = 10
```

When GATT notification or indication arrives, the event comes

```
ESP_GATTC_PREP_WRITE_EVT = 11
```

When GATT prepare-write operation completes, the event comes

```
ESP_GATTC_EXEC_EVT = 12
```

When write execution completes, the event comes

```
ESP_GATTC_ACL_EVT = 13
```

When ACL connection is up, the event comes

```
ESP_GATTC_CANCEL_OPEN_EVT = 14
```

When GATT client ongoing connection is cancelled, the event comes

- ESP_GATTC_SRVC_CHG_EVT = 15**
When “service changed” occurs, the event comes
- ESP_GATTC_ENC_CMPL_CB_EVT = 17**
When encryption procedure completes, the event comes
- ESP_GATTC_CFG_MTU_EVT = 18**
When configuration of MTU completes, the event comes
- ESP_GATTC_ADV_DATA_EVT = 19**
When advertising of data, the event comes
- ESP_GATTC_MULT_ADV_ENB_EVT = 20**
When multi-advertising is enabled, the event comes
- ESP_GATTC_MULT_ADV_UPD_EVT = 21**
When multi-advertising parameters are updated, the event comes
- ESP_GATTC_MULT_ADV_DATA_EVT = 22**
When multi-advertising data arrives, the event comes
- ESP_GATTC_MULT_ADV_DIS_EVT = 23**
When multi-advertising is disabled, the event comes
- ESP_GATTC_CONGEST_EVT = 24**
When GATT connection congestion comes, the event comes
- ESP_GATTC_BTH_SCAN_ENB_EVT = 25**
When batch scan is enabled, the event comes
- ESP_GATTC_BTH_SCAN_CFG_EVT = 26**
When batch scan storage is configured, the event comes
- ESP_GATTC_BTH_SCAN_RD_EVT = 27**
When Batch scan read event is reported, the event comes
- ESP_GATTC_BTH_SCAN_THR_EVT = 28**
When Batch scan threshold is set, the event comes
- ESP_GATTC_BTH_SCAN_PARAM_EVT = 29**
When Batch scan parameters are set, the event comes
- ESP_GATTC_BTH_SCAN_DIS_EVT = 30**
When Batch scan is disabled, the event comes
- ESP_GATTC_SCAN_FLT_CFG_EVT = 31**
When Scan filter configuration completes, the event comes
- ESP_GATTC_SCAN_FLT_PARAM_EVT = 32**
When Scan filter parameters are set, the event comes
- ESP_GATTC_SCAN_FLT_STATUS_EVT = 33**
When Scan filter status is reported, the event comes
- ESP_GATTC_ADV_VSC_EVT = 34**
When advertising vendor spec content event is reported, the event comes
- ESP_GATTC_REG_FOR_NOTIFY_EVT = 38**
When register for notification of a service completes, the event comes
- ESP_GATTC_UNREG_FOR_NOTIFY_EVT = 39**
When unregister for notification of a service completes, the event comes
- ESP_GATTC_CONNECT_EVT = 40**
When the ble physical connection is set up, the event comes
- ESP_GATTC_DISCONNECT_EVT = 41**
When the ble physical connection disconnected, the event comes

ESP_GATTC_READ_MULTIPLE_EVT = 42

When the ble characteristic or descriptor multiple complete, the event comes

ESP_GATTC_QUEUE_FULL_EVT = 43

When the gattc command queue full, the event comes

ESP_GATTC_SET_ASSOC_EVT = 44

When the ble gattc set the associated address complete, the event comes

ESP_GATTC_GET_ADDR_LIST_EVT = 45

When the ble get gattc address list in cache finish, the event comes

ESP_GATTC_DIS_SRVC_CMPL_EVT = 46

When the ble discover service complete, the event comes

BLUFI API

Overview BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

API Reference

Header File

- [components/bt/common/api/include/api/esp_blufi_api.h](#)

Functions

esp_err_t **esp_blufi_register_callbacks** (*esp_blufi_callbacks_t* *callbacks)

This function is called to receive blufi callback event.

Return ESP_OK - success, other - failed

Parameters

- [in] *callbacks*: callback functions

esp_err_t **esp_blufi_profile_init** (void)

This function is called to initialize blufi_profile.

Return ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_deinit** (void)

This function is called to de-initialize blufi_profile.

Return ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_conn_report** (*wifi_mode_t* opmode, *esp_blufi_sta_conn_state_t* sta_conn_state, *uint8_t* softap_conn_num, *esp_blufi_extra_info_t* *extra_info)

This function is called to send wifi connection report.

Return ESP_OK - success, other - failed

Parameters

- *opmode*: : wifi opmode
- *sta_conn_state*: : station is already in connection or not

- `softap_conn_num`: : softap connection number
- `extra_info`: : extra information, such as `sta_ssid`, `softap_ssid` and etc.

`esp_err_t esp_blufi_send_wifi_list` (`uint16_t apCount`, `esp_blufi_ap_record_t *list`)

This function is called to send wifi list.

Return ESP_OK - success, other - failed

Parameters

- `apCount`: : wifi list count
- `list`: : wifi list

`uint16_t esp_blufi_get_version` (void)

Get BLUFI profile version.

Return Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_send_error_info` (`esp_blufi_error_state_t state`)

This function is called to send blufi error information.

Return ESP_OK - success, other - failed

Parameters

- `state`: : error state

`esp_err_t esp_blufi_send_custom_data` (`uint8_t *data`, `uint32_t data_len`)

This function is called to custom data.

Return ESP_OK - success, other - failed

Parameters

- `data`: : custom data value
- `data_len`: : the length of custom data

Unions

`union esp_blufi_cb_param_t`

`#include <esp_blufi_api.h>` BLUFI callback parameters union.

Public Members

`struct esp_blufi_cb_param_t::blufi_init_finish_evt_param` **init_finish**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

`struct esp_blufi_cb_param_t::blufi_deinit_finish_evt_param` **deinit_finish**

Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

`struct esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param` **wifi_mode**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

`struct esp_blufi_cb_param_t::blufi_connect_evt_param` **connect**

Blufi callback param of ESP_BLUFI_EVENT_CONNECT

`struct esp_blufi_cb_param_t::blufi_disconnect_evt_param` **disconnect**

Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

`struct esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param` **sta_bssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

`struct esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param` **sta_ssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID

`struct esp_blufi_cb_param_t::blufi_recv_sta_passwd_evt_param` **sta_passwd**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD

`struct esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param` **softap_ssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID

```

struct esp_blufi_cb_param_t::blufi_rcv_softap_passwd_evt_param softap_passwd
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct esp_blufi_cb_param_t::blufi_rcv_softap_max_conn_num_evt_param softap_max_conn_num
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct esp_blufi_cb_param_t::blufi_rcv_softap_auth_mode_evt_param softap_auth_mode
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

struct esp_blufi_cb_param_t::blufi_rcv_softap_channel_evt_param softap_channel
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL

struct esp_blufi_cb_param_t::blufi_rcv_username_evt_param username
    Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct esp_blufi_cb_param_t::blufi_rcv_ca_evt_param ca
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT

struct esp_blufi_cb_param_t::blufi_rcv_client_cert_evt_param client_cert
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT

struct esp_blufi_cb_param_t::blufi_rcv_server_cert_evt_param server_cert
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT

struct esp_blufi_cb_param_t::blufi_rcv_client_pkey_evt_param client_pkey
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_rcv_server_pkey_evt_param server_pkey
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error
    Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR

struct esp_blufi_cb_param_t::blufi_rcv_custom_data_evt_param custom_data
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

struct blufi_connect_evt_param
    #include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.

```

Public Members

```

Structures

struct esp_blufi_extra_info_t
BLUFI extra information structure.

Public Members

uint8_t sta_bssid[6]
BSSID of station interface

bool sta_bssid_set
is BSSID of station interface set

uint8_t *sta_ssid
SSID of station interface

int sta_ssid_len
length of SSID of station interface

uint8_t *sta_passwd
password of station interface

int sta_passwd_len
length of password of station interface

uint8_t *softap_ssid
SSID of softap interface

int softap_ssid_len
length of SSID of softap interface

uint8_t *softap_passwd
password of station interface

int softap_passwd_len
length of password of station interface

uint8_t softap_authmode
authentication mode of softap interface

bool softap_authmode_set
is authentication mode of softap interface set

uint8_t softap_max_conn_num
max connection number of softap interface

bool softap_max_conn_num_set
is max connection number of softap interface set

uint8_t softap_channel
channel of softap interface

bool softap_channel_set
is channel of softap interface set

struct esp_blufi_ap_record_t
Description of an WiFi AP.

Public Members

uint8_t **ssid**[33]
SSID of AP

int8_t **rssi**
signal strength of AP

struct esp_blufi_callbacks_t
BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t **event_cb**
BLUFI event callback

esp_blufi_negotiate_data_handler_t **negotiate_data_handler**
BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t **encrypt_func**
BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t **decrypt_func**
BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t **checksum_func**
BLUFI check sum function (FCS)

Macros

ESP_BD_ADDR_LEN
Bluetooth address length.

Type Definitions

typedef uint8_t **esp_bd_addr_t**[ESP_BD_ADDR_LEN]
Bluetooth device address.

typedef void (***esp_blufi_event_cb_t**) (*esp_blufi_cb_event_t* event, *esp_blufi_cb_param_t* *param)
BLUFI event callback function type.

Parameters

- event: : Event type
- param: : Point to callback parameter, currently is union type

typedef void (***esp_blufi_negotiate_data_handler_t**) (uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Parameters

- data: : data from phone
- len: : length of data from phone
- output_data: : data want to send to phone
- output_len: : length of data want to send to phone
- need_free: : output reporting if memory needs to be freed or not *

typedef int (***esp_blufi_encrypt_func_t**) (uint8_t iv8, uint8_t *crypt_data, int crypt_len)
BLUFI encrypt the data after negotiate a share key.

Return Nonnegative number is encrypted length, if error, return negative number;

Parameters

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: : plain text and encrypted data, the encrypt function must support autochthonous encrypt
- `crypt_len`: : length of plain text

```
typedef int (*esp_blufi_decrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int crypt_len)
BLUFI decrypt the data after negotiate a share key.
```

Return Nonnegative number is decrypted length, if error, return negative number;

Parameters

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: : encrypted data and plain text, the encrypt function must support autochthonous decrypt
- `crypt_len`: : length of encrypted text

```
typedef uint16_t (*esp_blufi_checksum_func_t) (uint8_t iv8, uint8_t *data, int len)
BLUFI checksum.
```

Parameters

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `data`: : data need to checksum
- `len`: : length of data

Enumerations

```
enum esp_blufi_cb_event_t
```

Values:

```
ESP_BLUFI_EVENT_INIT_FINISH = 0
ESP_BLUFI_EVENT_DEINIT_FINISH
ESP_BLUFI_EVENT_SET_WIFI_OPMODE

ESP_BLUFI_READ_PARAM_ERROR
ESP_BLUFI_MAKE_PUBLIC_ERROR
ESP_BLUFI_DATA_FORMAT_ERROR
```

2.1.4 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Blueroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all

the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

图 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Return

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_init` (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration

nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

Return

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note This function should be called after the NimBLE host is deinitialized.

Return

- ESP_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

Note This function should not be executed in the context of Bluetooth host task.

Note This function should be called after the NimBLE host is deinitialized.

```

int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with
↳error: %d", ret);
    }
}
}

```

If `nimble_port_freertos_init()` is used during initialization, then `nimble_port_freertos_deinit()` should be called in the host task after `nimble_port_run()`.

Return

- ESP_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

2.1.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [ESP-BLE-MESH 快速入门](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH 架构](#).

Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH 示例](#) and [ESP-BLE-MESH 演示视频](#).

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- [components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h](#)

Unions

```
union esp_ble_mesh_prov_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.
```

Public Members

```
uint16_t lpn_addr
    Low Power Node unicast address
```

```
struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
```

Public Types

```
enum [anonymous]
    This enum value is the reason of friendship termination on the friend node side
```

Values:

```
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
    Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established
```

```
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
    Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received
```

```
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
    Receive Friend Request from existing Low Power Node
```

```
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
    Receive Friend Clear from other friend node
```

```
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
    Friend feature disabled or corresponding NetKey is deleted
```

Public Members

```
uint16_t lpn_addr
    Low Power Node unicast address
```

```
esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason
    This enum value is the reason of friendship termination on the friend node side Friendship terminated reason
```

```
struct ble_mesh_heartbeat_msg_rcv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
```

Public Members

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

struct ble_mesh_input_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_EVT.

Public Members

esp_ble_mesh_input_action_t **action**
Action of Input OOB Authentication

uint8_t size
Size of Input OOB Authentication

struct ble_mesh_input_number_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT.

Public Members

int err_code
Indicate the result of inputting number

struct ble_mesh_input_string_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT.

Public Members

int err_code
Indicate the result of inputting string

struct ble_mesh_link_close_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT.

Public Members

esp_ble_mesh_prov_bearer_t **bearer**
Type of the bearer used when device link is closed

struct ble_mesh_link_open_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT.

Public Members

esp_ble_mesh_prov_bearer_t **bearer**
Type of the bearer used when device link is open

struct ble_mesh_lpn_disable_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_LPN_DISABLE_COMP_EVT.

Public Members

int **err_code**
Indicate the result of disabling LPN functionality

struct ble_mesh_lpn_enable_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_LPN_ENABLE_COMP_EVT.

Public Members

int **err_code**
Indicate the result of enabling LPN functionality

struct ble_mesh_lpn_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t **friend_addr**
Friend Node unicast address

struct ble_mesh_lpn_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT.

Public Members

uint16_t **friend_addr**
Friend Node unicast address

struct ble_mesh_lpn_poll_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_LPN_POLL_COMP_EVT.

Public Members

int **err_code**
Indicate the result of sending Friend Poll

struct ble_mesh_model_sub_group_addr_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT.

Public Members

int **err_code**
Indicate the result of local model subscribing group address

uint16_t **element_addr**
Element address

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

uint16_t **group_addr**
Group Address

```
struct ble_mesh_model_unsub_group_addr_comp_param  
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT.
```

Public Members

```
int err_code  
    Indicate the result of local model unsubscribing group address  
  
uint16_t element_addr  
    Element address  
  
uint16_t company_id  
    Company ID  
  
uint16_t model_id  
    Model ID  
  
uint16_t group_addr  
    Group Address
```

```
struct ble_mesh_node_add_local_app_key_comp_param

```

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
    Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

```

```

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
    Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param model_publish_comp
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_rcv_publish_msg_param client_rcv_publish_msg
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param client_send_timeout
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param model_publish_update
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param server_model_update
    Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

```

Public Members

```

uint32_t opcode
    Opcode of the previously sent message

esp_ble_mesh_model_t *model
    Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the previous message

```

```

struct ble_mesh_mod_rcv_publish_msg_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

```

Public Members

```

uint32_t opcode
    Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the message

```

```

uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message

```

```

struct ble_mesh_model_operation_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

```

Public Members

```

uint32_t opcode
    Opcode of the received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

```

esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the received message

uint16_t length
Length of the received message

uint8_t *msg
Value of the received message

struct ble_mesh_model_publish_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
Indicate the result of publishing a message

esp_ble_mesh_model_t *model
Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
Indicate the result of sending a message

uint32_t opcode
Opcode of the message

esp_ble_mesh_model_t *model
Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t *ctx
Context of the message

struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int err_code
Indicate the result of updating server model state

esp_ble_mesh_model_t *model
Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t type
Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t

BLE Mesh deinit parameters

Public Members

bool **erase_flash**

Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

Public Members

uint16_t **element_addr**

Element Address, assigned during provisioning.

const uint16_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **sig_model_count**

SIG Model count

const uint8_t **vnd_model_count**

Vendor Model count

esp_ble_mesh_model_t ***sig_models**

SIG Models

esp_ble_mesh_model_t ***vnd_models**

Vendor Models

struct esp_ble_mesh_model_pub_t

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t **publish_addr**

Publish Address.

uint16_t **app_idx** : 12

Publish AppKey Index.

uint16_t **cred** : 1

Friendship Credentials Flag.

uint16_t **send_rel** : 1

Force reliable sending (segment acks)

uint8_t **ttl**

Publish Time to Live.

uint8_t **retransmit**

Retransmit Count & Interval Steps.

uint8_t **period**

Publish Period.

uint8_t period_div : 4
Divisor for the Period.

uint8_t fast_period : 1
Use FastPeriodDivisor

uint8_t count : 3
Retransmissions left.

uint32_t period_start
Start of the current period.

struct net_buf_simple *msg
Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

`ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

***esp_ble_mesh_cb_t* update**
Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
Publish Period Timer. Initialized by the stack.

uint8_t dev_role
Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

Public Members

const uint32_t opcode
Message opcode

const size_t min_len
Message minimum length

***esp_ble_mesh_cb_t* param_cb**
Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

Public Members

***esp_ble_mesh_cb_t* init_cb**
Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`

Public Members

const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.

uint16_t recv_dst
Destination address of a received message. Not used for sending.

int8_t recv_rssi
RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7
Received TTL value. Not used for sending.

uint8_t send_rel : 1
Force sending reliably by using segment acknowledgement

`uint8_t send_ttl`
TTL, or `ESP_BLE_MESH_TTL_DEFAULT` for default TTL.

`uint32_t recv_op`
Opcode of a received message. Not used for sending message.

`esp_ble_mesh_model_t *model`
Model corresponding to the message, no need to be initialized before sending message

`bool srv_send`
Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
Provisioning properties & capabilities. This structure is associated with struct `bt_mesh_prov` in `mesh_access.h`

struct esp_ble_mesh_comp_t
Node Composition data context. This structure is associated with struct `bt_mesh_comp` in `mesh_access.h`

Public Members

`uint16_t cid`
16-bit SIG-assigned company identifier

`uint16_t pid`
16-bit vendor-assigned product identifier

`uint16_t vid`
16-bit vendor-assigned product version identifier

`size_t element_count`
Element count

`esp_ble_mesh_elem_t *elements`
A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
Information of the device which is going to be added for provisioning.

Public Members

`esp_ble_mesh_bd_addr_t addr`
Device address

`esp_ble_mesh_addr_type_t addr_type`
Device address type

`uint8_t uuid[16]`
Device UUID

`uint16_t oob_info`
Device OOB Info `ADD_DEV_START_PROV_NOW_FLAG` shall not be set if the bearer has both `PB-ADV` and `PB-GATT` enabled

`esp_ble_mesh_prov_bearer_t bearer`
Provisioning Bearer

struct esp_ble_mesh_device_delete_t
Information of the device which is going to be deleted.

Public Members

`esp_ble_mesh_bd_addr_t addr`
Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint8_t **flag**

BIT0: device address; BIT1: device UUID

struct esp_ble_mesh_prov_data_info_t

Information of the provisioner which is going to be updated.

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **flags**

Flags

uint32_t **iv_index**

IV Index

uint8_t **flag**

BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t

Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t **addr**

Node device address

esp_ble_mesh_addr_type_t **addr_type**

Node device address type

uint8_t **dev_uuid**[16]

Device UUID

uint16_t **oob_info**

Node OOB information

uint16_t **unicast_addr**

Node unicast address

uint8_t **element_num**

Node element number

uint16_t **net_idx**

Node NetKey Index

uint8_t **flags**

Node key refresh flag and iv update flag

uint32_t **iv_index**

Node IV Index

uint8_t **dev_key**[16]

Node device key

char **name**[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]

Node name

uint16_t **comp_length**

Length of Composition Data

uint8_t *comp_data
Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
Minimum unicast address used for fast provisioning

uint16_t unicast_max
Maximum unicast address used for fast provisioning

uint16_t net_idx
Netkey index used for fast provisioning

uint8_t flags
Flags used for fast provisioning

uint32_t iv_index
IV Index used for fast provisioning

uint8_t offset
Offset of the UUID to be compared

uint8_t match_len
Length of the UUID to be compared

uint8_t match_val[16]
Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
Heartbeat source address (unicast address)

uint16_t hb_dst
Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the client model. Initialized by the stack.

int **op_pair_size**

Size of the op_pair

const *esp_ble_mesh_client_op_pair_t* ***op_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32_t **publish_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void ***internal_data**

Pointer to the internal data of client model

uint8_t **msg_role**

Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t

Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t **opcode**

Message opcode

esp_ble_mesh_model_t ***model**

Pointer to the client model structure

esp_ble_mesh_msg_ctx_t **ctx**

The context used to send message

int32_t **msg_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t **msg_role**

Role of the device - Node/Provisioner

struct esp_ble_mesh_state_transition_t

Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, *ESP_BLE_MESH_SERVER_FLAG_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp_ble_mesh_state_transition_t* sets “set_auto_rsp” to *ESP_BLE_MESH_SERVER_RSP_BY_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool **just_started**

Indicate if the state transition has just started

uint8_t **trans_time**

State transition time

uint8_t remain_time
Remaining time of state transition

uint8_t delay
Delay before starting state transition

uint32_t quo_tt
Duration of each divided transition step

uint32_t counter
Number of steps which the transition duration is divided

uint32_t total_duration
State transition total duration

int64_t start_timestamp
Time when the state transition is started

struct k_delayed_work timer
Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
Parameters of the server model received last same set message.

Public Members

uint8_t tid
Transaction number of the last message

uint16_t src
Source address of the last message

uint16_t dst
Destination address of the last message

int64_t timestamp
Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp : 1
BLE Mesh Server Response Option.

1. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;Response control for Client Get messages

uint8_t set_auto_rsp : 1
Response control for Client Set messages

uint8_t status_auto_rsp : 1
Response control for Server Status messages

Macros**ESP_BLE_MESH_SDU_MAX_LEN**

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT

Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG

The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN

The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN

The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE

Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX

Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN**ESP_BLE_MESH_OCTET8_LEN****ESP_BLE_MESH_CID_NVAL**

Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT

Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX**ESP_BLE_MESH_ADDR_UNASSIGNED****ESP_BLE_MESH_ADDR_ALL_NODES****ESP_BLE_MESH_ADDR_PROXIES****ESP_BLE_MESH_ADDR_FRIENDS****ESP_BLE_MESH_ADDR_RELAYS****ESP_BLE_MESH_KEY_UNUSED****ESP_BLE_MESH_KEY_DEV****ESP_BLE_MESH_KEY_PRIMARY****ESP_BLE_MESH_KEY_ANY**

Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY

Relay state value

ESP_BLE_MESH_RELAY_DISABLED**ESP_BLE_MESH_RELAY_ENABLED****ESP_BLE_MESH_RELAY_NOT_SUPPORTED**

Beacon state value

ESP_BLE_MESH_BEACON_DISABLED**ESP_BLE_MESH_BEACON_ENABLED**

GATT Proxy state value

ESP_BLE_MESH_GATT_PROXY_DISABLED**ESP_BLE_MESH_GATT_PROXY_ENABLED**

ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED

Friend state value

ESP_BLE_MESH_FRIEND_DISABLED**ESP_BLE_MESH_FRIEND_ENABLED****ESP_BLE_MESH_FRIEND_NOT_SUPPORTED**

Node identity state value

ESP_BLE_MESH_NODE_IDENTITY_STOPPED**ESP_BLE_MESH_NODE_IDENTITY_RUNNING****ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED**

Supported features

ESP_BLE_MESH_FEATURE_RELAY**ESP_BLE_MESH_FEATURE_PROXY****ESP_BLE_MESH_FEATURE_FRIEND****ESP_BLE_MESH_FEATURE_LOW_POWER****ESP_BLE_MESH_FEATURE_ALL_SUPPORTED****ESP_BLE_MESH_ADDR_IS_UNICAST** (addr)**ESP_BLE_MESH_ADDR_IS_GROUP** (addr)**ESP_BLE_MESH_ADDR_IS_VIRTUAL** (addr)**ESP_BLE_MESH_ADDR_IS_RFU** (addr)**ESP_BLE_MESH_INVALID_NODE_INDEX****ESP_BLE_MESH_TRANSMIT** (count, int_ms)

Encode transmission count & interval steps.

Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters

- **count**: Number of retransmissions (first transmission is excluded).
- **int_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)

Decode transmit count from a transmit value.

Return Transmission count (actual transmissions equal to N + 1).

Parameters

- **transmit**: Encoded transmit count & interval value.

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)

Decode transmit interval from a transmit value.

Return Transmission interval in milliseconds.

Parameters

- **transmit**: Encoded transmit count & interval value.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)

Encode Publish Retransmit count & interval steps.

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters

- **count**: Number of retransmissions (first transmission is excluded).
- **int_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)

Decode Publish Retransmit count from a given value.

Return Retransmission count (actual transmissions equal to $N + 1$).

Parameters

- `transmit`: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Return Transmission interval in milliseconds.

Parameters

- `transmit`: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN

Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters

- `_loc`: Location Descriptor.
- `_mods`: Array of SIG models.
- `_vnd_mods`: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)**BT_OCTET32_LEN****BD_ADDR_LEN****ESP_BLE_MESH_ADDR_TYPE_PUBLIC****ESP_BLE_MESH_ADDR_TYPE_RANDOM****ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC****ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM****ESP_BLE_MESH_MODEL_PUB_DEFINE** (_name, _msg_len, _role)

Define a model publication context.

Parameters

- `_name`: Variable name given to the context.
- `_msg_len`: Length of the publication message.
- `_role`: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)

Define a model operation context.

Parameters

- _opcode: Message opcode.
- _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG**DEL_DEV_UUID_FLAG****PROV_DATA_NET_IDX_FLAG****PROV_DATA_FLAGS_FLAG****PROV_DATA_IV_INDEX_FLAG****ESP_BLE_MESH_HEARTBEAT_FILTER_ACCEPTLIST****ESP_BLE_MESH_HEARTBEAT_FILTER_REJECTLIST**

Provisioner heartbeat filter operation

ESP_BLE_MESH_HEARTBEAT_FILTER_ADD**ESP_BLE_MESH_HEARTBEAT_FILTER_REMOVE****ESP_BLE_MESH_MODEL_ID_CONFIG_SRV**

BLE Mesh models related Model ID and Opcode definitions.

< Foundation Models

ESP_BLE_MESH_MODEL_ID_CONFIG_CLI**ESP_BLE_MESH_MODEL_ID_HEALTH_SRV****ESP_BLE_MESH_MODEL_ID_HEALTH_CLI**

Models from the Mesh Model Specification

Type Definitions

typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]
 Define the BLE Mesh octet 8 bytes size
typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]
 Invalid Company ID
typedef uint32_t esp_ble_mesh_cb_t
typedef uint8_t UINT8
typedef uint16_t UINT16
typedef uint32_t UINT32
typedef uint64_t UINT64
typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]
typedef uint8_t BD_ADDR[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_addr_type_t
 BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
typedef uint8_t esp_ble_mesh_dev_add_flag_t
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
 esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.
typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
 esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t

esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model' s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t

esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model' s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Provisioner establish a BLE Mesh link event
- ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**
Provisioner close a BLE Mesh link event
- ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**
Provisioner provisioning done event
- ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
- ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event
- ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event
- ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
- ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event
- ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT	Provisioner set unicast address of primary element completion event
ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT	Provisioner read unprovisioned device OOB public key completion event
ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT	Provisioner input number completion event
ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT	Provisioner input string completion event
ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT	Provisioner set node name completion event
ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT	Provisioner add local app key completion event
ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT	Provisioner update local app key completion event
ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT	Provisioner bind local model with local app key completion event
ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT	Provisioner add local network key completion event
ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT	Provisioner update local network key completion event
ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT	Provisioner store node composition data completion event
ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT	Provisioner delete node with uuid completion event
ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT	Provisioner delete node with unicast address completion event
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT	Provisioner start to receive heartbeat message completion event
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT	Provisioner set the heartbeat filter type completion event
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT	Provisioner set the heartbeat filter information completion event
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT	Provisioner receive heartbeat message event
ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT	Provisioner directly erase settings completion event
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT	Provisioner open settings with index completion event
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT	Provisioner open settings with user id completion event
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT	Provisioner close settings with index completion event
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT	Provisioner close settings with user id completion event
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT	Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT	Provisioner delete settings with user id completion event
ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT	Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event
ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT	Set fast provisioning action completion event
ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT	Receive Heartbeat message event
ESP_BLE_MESH_LPN_ENABLE_COMP_EVT	Enable Low Power Node completion event
ESP_BLE_MESH_LPN_DISABLE_COMP_EVT	Disable Low Power Node completion event
ESP_BLE_MESH_LPN_POLL_COMP_EVT	Low Power Node send Friend Poll completion event
ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT	Low Power Node establishes friendship event
ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT	Low Power Node terminates friendship event
ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT	Friend Node establishes friendship event
ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT	Friend Node terminates friendship event
ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT	Proxy Client receives Network ID advertising packet event
ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT	Proxy Client establishes connection successfully event
ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT	Proxy Client terminates connection successfully event
ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT	Proxy Client receives Proxy Filter Status event
ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT	Proxy Client connect completion event
ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT	Proxy Client disconnect completion event
ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT	Proxy Client set filter type completion event
ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT	Proxy Client add filter address completion event
ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT	Proxy Client remove filter address completion event
ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT	Proxy Server establishes connection successfully event
ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT	Proxy Server terminates connection successfully event
ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT	Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START

ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t

This enum value is the type of server model states

Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE

ESP_BLE_MESH_GENERIC_LEVEL_STATE

ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE

ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE

ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE

ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE

ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE

ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE

ESP_BLE_MESH_LIGHT_HSL_STATE

ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE

ESP_BLE_MESH_LIGHT_HSL_HUE_STATE

ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE

ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE

ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE

ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

ESP_BLE_MESH_MODEL_OPERATION_EVT

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT

User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

User-defined models publish messages completion event

ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

ESP-BLE-MESH Stack Initialization

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h](#)

Functions

esp_err_t **esp_ble_mesh_init** (*esp_ble_mesh_prov_t* *prov, *esp_ble_mesh_comp_t* *comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

esp_err_t **esp_ble_mesh_deinit** (*esp_ble_mesh_deinit_param_t* *param)

De-initialize BLE Mesh module.

Note This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] param: Pointer to the structure of BLE Mesh deinit parameters.

Reading of Local Data Information

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h](#)

Functions

`int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)`

Get the model publish period, the unit is ms.

Return Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

Parameters

- [in] `model`: Model instance pointer.

`uint16_t esp_ble_mesh_get_primary_element_address (void)`

Get the address of the primary element.

Return Address of the primary element on success, or `ESP_BLE_MESH_ADDR_UNASSIGNED` on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)`

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Return Pointer to the group address within the Subscription List of the model on success, or `NULL` on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to `0x0000` in order to unsubscribe the model from the group.

Parameters

- [in] `model`: Pointer to the model.
- [in] `group_addr`: Group address.

`esp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)`

Find the BLE Mesh element pointer via the element address.

Return Pointer to the element on success, or `NULL` on failure.

Parameters

- [in] `element_addr`: Element address.

`uint8_t esp_ble_mesh_get_element_count (void)`

Get the number of elements that have been registered.

Return Number of elements.

`esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)`

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Return Pointer to the Vendor Model on success, or `NULL` on failure which means the Vendor Model is not found.

Parameters

- [in] `element`: Element to which the model belongs.
- [in] `company_id`: A 16-bit company identifier assigned by the Bluetooth SIG.
- [in] `model_id`: A 16-bit vendor-assigned model identifier.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)`

Find the SIG model with the given element and Model id.

Return Pointer to the SIG Model on success, or `NULL` on failure which means the SIG Model is not found.

Parameters

- [in] `element`: Element to which the model belongs.
- [in] `model_id`: SIG model identifier.

`const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)`

Get the Composition data which has been registered.

Return Pointer to the Composition data on success, or `NULL` on failure which means the Composition data is not initialized.

esp_err_t **esp_ble_mesh_model_subscribe_group_addr** (uint16_t *element_addr*, uint16_t *company_id*, uint16_t *model_id*, uint16_t *group_addr*)

A local model of node or Provisioner subscribes a group address.

Note This function shall not be invoked before node is provisioned or Provisioner is enabled.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *element_addr*: Unicast address of the element to which the model belongs.
- [in] *company_id*: A 16-bit company identifier.
- [in] *model_id*: A 16-bit model identifier.
- [in] *group_addr*: The group address to be subscribed.

esp_err_t **esp_ble_mesh_model_unsubscribe_group_addr** (uint16_t *element_addr*, uint16_t *company_id*, uint16_t *model_id*, uint16_t *group_addr*)

A local model of node or Provisioner unsubscribes a group address.

Note This function shall not be invoked before node is provisioned or Provisioner is enabled.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *element_addr*: Unicast address of the element to which the model belongs.
- [in] *company_id*: A 16-bit company identifier.
- [in] *model_id*: A 16-bit model identifier.
- [in] *group_addr*: The subscribed group address.

const uint8_t* **esp_ble_mesh_node_get_local_net_key** (uint16_t *net_idx*)

This function is called by Node to get the local NetKey.

Return NetKey on success, or NULL on failure.

Parameters

- [in] *net_idx*: NetKey index.

const uint8_t* **esp_ble_mesh_node_get_local_app_key** (uint16_t *app_idx*)

This function is called by Node to get the local AppKey.

Return AppKey on success, or NULL on failure.

Parameters

- [in] *app_idx*: AppKey index.

esp_err_t **esp_ble_mesh_node_add_local_net_key** (**const** uint8_t *net_key*[16], uint16_t *net_idx*)

This function is called by Node to add a local NetKey.

Note This function can only be called after the device is provisioned.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *net_key*: NetKey to be added.
- [in] *net_idx*: NetKey Index.

esp_err_t **esp_ble_mesh_node_add_local_app_key** (**const** uint8_t *app_key*[16], uint16_t *net_idx*, uint16_t *app_idx*)

This function is called by Node to add a local AppKey.

Note The *net_idx* must be an existing one. This function can only be called after the device is provisioned.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *app_key*: AppKey to be added.
- [in] *net_idx*: NetKey Index.
- [in] *app_idx*: AppKey Index.

esp_err_t **esp_ble_mesh_node_bind_app_key_to_local_model** (uint16_t *element_addr*, uint16_t *company_id*, uint16_t *model_id*, uint16_t *app_idx*)

This function is called by Node to bind AppKey to model locally.

Note If going to bind `app_key` with local vendor model, the `company_id` shall be set to `0xFFFF`. This function can only be called after the device is provisioned.

Return `ESP_OK` on success or error code otherwise.

Parameters

- [in] `element_addr`: Node local element address
- [in] `company_id`: Node local company id
- [in] `model_id`: Node local model id
- [in] `app_idx`: Node local appkey index

Low Power Operation (Updating)

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h](#)

Functions

esp_err_t **esp_ble_mesh_lpn_enable** (void)

Enable BLE Mesh device LPN functionality.

Note This API enables LPN functionality. Once called, the proper Friend Request will be sent.

Return `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_disable** (bool *force*)

Disable BLE Mesh device LPN functionality.

Return `ESP_OK` on success or error code otherwise.

Parameters

- [in] `force`: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

esp_err_t **esp_ble_mesh_lpn_poll** (void)

LPN tries to poll messages from the Friend Node.

Note The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the `PollTimeout` timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

Return `ESP_OK` on success or error code otherwise.

Send/Publish Messages, add Local AppKey, etc.

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_custom_model_callback** (*esp_ble_mesh_model_cb_t* *callback*)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;

- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

Note The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_model_msg_opcode_init` (uint8_t *data, uint32_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

Note This API is only used to set the opcode of the message.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `data`: Pointer to the message data.
- [in] `opcode`: The message opcode.

`esp_err_t esp_ble_mesh_client_model_init` (`esp_ble_mesh_model_t` *model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `model`: BLE Mesh Client model to which the message belongs.

`esp_err_t esp_ble_mesh_client_model_deinit` (`esp_ble_mesh_model_t` *model)

De-initialize the user-defined client model.

Note This function shall be invoked before `esp_ble_mesh_deinit()` is called.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `model`: Pointer of the Client model.

`esp_err_t esp_ble_mesh_server_model_send_msg` (`esp_ble_mesh_model_t` *model, `esp_ble_mesh_msg_ctx_t` *ctx, uint32_t opcode, uint16_t length, uint8_t *data)

Send server model messages (such as server model status messages).

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `model`: BLE Mesh Server Model to which the message belongs.
- [in] `ctx`: Message context, includes keys, TTL, etc.
- [in] `opcode`: Message opcode.
- [in] `length`: Message length (exclude the message opcode).
- [in] `data`: Parameters of Access Payload (exclude the message opcode) to be sent.

`esp_err_t esp_ble_mesh_client_model_send_msg` (`esp_ble_mesh_model_t` *model, `esp_ble_mesh_msg_ctx_t` *ctx, uint32_t opcode, uint16_t length, uint8_t *data, int32_t msg_timeout, bool need_rsp, `esp_ble_mesh_dev_role_t` device_role)

Send client model message (such as model get, set, etc).

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `model`: BLE Mesh Client Model to which the message belongs.

- [in] ctx: Message context, includes keys, TTL, etc.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] msg_timeout: Time to get response to the message (in milliseconds).
- [in] need_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] device_role: Role of the device (Node/Provisioner) that sends the message.

esp_err_t **esp_ble_mesh_model_publish** (*esp_ble_mesh_model_t* *model, uint32_t opcode, uint16_t length, uint8_t *data, *esp_ble_mesh_dev_role_t* device_role)

Send a model publication message.

Note Before calling this function, the user needs to ensure that the model publication message (*esp_ble_mesh_model_pub_t:msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] model: Mesh (client) Model publishing the message.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] device_role: Role of the device (node/provisioner) publishing the message of the type *esp_ble_mesh_dev_role_t*.

esp_err_t **esp_ble_mesh_server_model_update_state** (*esp_ble_mesh_model_t* *model, *esp_ble_mesh_server_state_type_t* type, *esp_ble_mesh_server_state_value_t* *value)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note Currently this API is used to update bound state value, not for all server model states.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] model: Server model which is going to update the state.
- [in] type: Server model state type.
- [in] value: Server model state value.

esp_err_t **esp_ble_mesh_node_local_reset** (void)

Reset the provisioning procedure of the local BLE Mesh node.

Note All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function *esp_ble_mesh_node_prov_enable()* needs to be called to start a new provisioning procedure.

Return ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_node_name** (uint16_t index, const char *name)

This function is called to set the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] index: Index of the node in the node queue.
- [in] name: Name (end by '\0') to be set for the node.

const char ***esp_ble_mesh_provisioner_get_node_name** (uint16_t index)

This function is called to get the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Return Node name on success, or NULL on failure.

Parameters

- [in] index: Index of the node in the node queue.

`uint16_t esp_ble_mesh_provisioner_get_node_index (const char *name)`

This function is called to get the node (provisioned device) index.

Return Node index on success, or an invalid value (0xFFFF) on failure.

Parameters

- [in] name: Name of the node (end by ‘\0’).

`esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)`

This function is called to store the Composition Data of the node.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] unicast_addr: Element address of the node
- [in] data: Pointer of Composition Data
- [in] length: Length of Composition Data

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])`

This function is called to get the provisioned node information with the node device uuid.

Return Pointer of the node info struct or NULL on failure.

Parameters

- [in] uuid: Device UUID of the node

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)`

This function is called to get the provisioned node information with the node unicast address.

Return Pointer of the node info struct or NULL on failure.

Parameters

- [in] unicast_addr: Unicast address of the node

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name (const char *name)`

This function is called to get the provisioned node information with the node name.

Return Pointer of the node info struct or NULL on failure.

Parameters

- [in] name: Name of the node (end by ‘\0’).

`uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)`

This function is called by Provisioner to get provisioned node count.

Return Number of the provisioned nodes.

`const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry (void)`

This function is called by Provisioner to get the entry of the node table.

Note After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `(esp_ble_mesh_node_t **node)` is NULL. For example: ““ `const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { ... } }` ““

Return Pointer to the start of the node table.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])`

This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uuid: Device UUID of the node

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_addr** (uint16_t *unicast_addr*)

This function is called to delete the provisioned node information with the node unicast address.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *unicast_addr*: Unicast address of the node

esp_err_t **esp_ble_mesh_provisioner_add_local_app_key** (const uint8_t *app_key*[16],
uint16_t *net_idx*, uint16_t
app_idx)

This function is called to add a local AppKey for Provisioner.

Note *app_key*: If set to NULL, *app_key* will be generated internally. *net_idx*: Should be an existing one.
app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new *app_idx* will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *app_key*: The app key to be set for the local BLE Mesh stack.
- [in] *net_idx*: The network key index.
- [in] *app_idx*: The app key index.

esp_err_t **esp_ble_mesh_provisioner_update_local_app_key** (const uint8_t *app_key*[16],
uint16_t *net_idx*, uint16_t
app_idx)

This function is used to update a local AppKey for Provisioner.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *app_key*: Value of the AppKey.
- [in] *net_idx*: Corresponding NetKey Index.
- [in] *app_idx*: The AppKey Index

const uint8_t ***esp_ble_mesh_provisioner_get_local_app_key** (uint16_t *net_idx*, uint16_t
app_idx)

This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters

- [in] *net_idx*: Network key index.
- [in] *app_idx*: Application key index.

esp_err_t **esp_ble_mesh_provisioner_bind_app_key_to_local_model** (uint16_t *el-
ement_addr*,
uint16_t *app_idx*,
uint16_t
model_id,
uint16_t *com-
pany_id*)

This function is called by Provisioner to bind own model with proper app key.

Note *company_id*: If going to bind *app_key* with local vendor model, *company_id* should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *element_addr*: Provisioner local element address
- [in] *app_idx*: Provisioner local appkey index
- [in] *model_id*: Provisioner local model id
- [in] *company_id*: Provisioner local company id

esp_err_t **esp_ble_mesh_provisioner_add_local_net_key** (const uint8_t *net_key*[16],
uint16_t *net_idx*)

This function is called by Provisioner to add local network key.

Note *net_key*: If set to NULL, *net_key* will be generated internally. *net_idx*: If it is going to be generated internally, it should be set to 0xFFFF, and the new *net_idx* will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.
- [in] net_idx: The network key index.

esp_err_t **esp_ble_mesh_provisioner_update_local_net_key** (const uint8_t net_key[16],
uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] net_key: Value of the NetKey.
- [in] net_idx: The NetKey Index.

const uint8_t ***esp_ble_mesh_provisioner_get_local_net_key** (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Return Network key on success, or NULL on failure.

Parameters

- [in] net_idx: Network key index.

esp_err_t **esp_ble_mesh_provisioner_recv_heartbeat** (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] enable: Enable or disable receiving heartbeat messages.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_type** (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

Note 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] type: Heartbeat filter type (acceptlist or rejectlist).

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_info** (uint8_t op,
esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- The filter entry with the same SRC or DST will be removed.

Note 1. If the operation is “ADD” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] op: Add or REMOVE

- [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

esp_err_t **esp_ble_mesh_provisioner_direct_erase_settings** (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Return ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_index** (uint8_t *index*)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] index: Settings index.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_uid** (const char **uid*)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_index** (uint8_t *index*, bool *erase*)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

Return ESP_OK on success or error code otherwise.

Parameters

- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_uid** (const char **uid*, bool *erase*)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.
- [in] erase: Indicate if erasing mesh information.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t *index*)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *index*: Settings index.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_uid** (const char **uid*)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *uid*: Settings user id.

const char ***esp_ble_mesh_provisioner_get_settings_uid** (uint8_t *index*)

This function is called by Provisioner to get settings user id.

Return Setting user id on success or NULL on failure.

Parameters

- [in] *index*: Settings index.

uint8_t **esp_ble_mesh_provisioner_get_settings_index** (const char **uid*)

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters

- [in] *uid*: Settings user id.

uint8_t **esp_ble_mesh_provisioner_get_free_settings_count** (void)

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

const uint8_t ***esp_ble_mesh_get_fast_prov_app_key** (uint16_t *net_idx*, uint16_t *app_idx*)

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters

- [in] *net_idx*: Network key index.
- [in] *app_idx*: Application key index.

Type Definitions

```
typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t event,
                                         esp_ble_mesh_model_cb_param_t *param)
: event, event code of user-defined model events; param, parameters of user-defined model events
```

ESP-BLE-MESH Node/Provisioner Provisioning

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_prov_callback** (*esp_ble_mesh_prov_cb_t* *callback*)

Register BLE Mesh provisioning callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

bool **esp_ble_mesh_node_is_provisioned** (void)

Check if a device has been provisioned.

Return TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t **esp_ble_mesh_node_prov_enable** (*esp_ble_mesh_prov_bearer_t* bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

Note PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Return ESP_OK on success or error code otherwise.

Parameters

- `bearers`: Bit-wise OR of provisioning bearers.

esp_err_t **esp_ble_mesh_node_prov_disable** (*esp_ble_mesh_prov_bearer_t* bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

- `bearers`: Bit-wise OR of provisioning bearers.

esp_err_t **esp_ble_mesh_node_set_oob_pub_key** (uint8_t *pub_key_x*[32], uint8_t *pub_key_y*[32],
uint8_t *private_key*[32])

Unprovisioned device set own oob public key & private key pair.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `pub_key_x`: Unprovisioned device' s Public Key X
- [in] `pub_key_y`: Unprovisioned device' s Public Key Y
- [in] `private_key`: Unprovisioned device' s Private Key

esp_err_t **esp_ble_mesh_node_input_number** (uint32_t *number*)

Provide provisioning input OOB number.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `number`: Number input by device.

esp_err_t **esp_ble_mesh_node_input_string** (const char **string*)

Provide provisioning input OOB string.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `string`: String input by device.

esp_err_t **esp_ble_mesh_set_unprovisioned_device_name** (const char **name*)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

Note This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn' t apply to PB-ADV mode.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `name`: Unprovisioned device name

```
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t
                                                    pub_key_x[32], uint8_t
                                                    pub_key_y[32])
```

Provisioner inputs unprovisioned device's oob public key.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] link_idx: The provisioning link index
- [in] pub_key_x: Unprovisioned device's Public Key X
- [in] pub_key_y: Unprovisioned device's Public Key Y

```
esp_err_t esp_ble_mesh_provisioner_input_string (const char *string, uint8_t link_idx)
Provide provisioning input OOB string.
```

This is intended to be called after the *esp_ble_mesh_prov_t* prov_input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] string: String input by Provisioner.
- [in] link_idx: The provisioning link index.

```
esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)
Provide provisioning input OOB number.
```

This is intended to be called after the *esp_ble_mesh_prov_t* prov_input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] number: Number input by Provisioner.
- [in] link_idx: The provisioning link index.

```
esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)
Enable one or more provisioning bearers.
```

Note PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)
Disable one or more provisioning bearers.
```

Note PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] bearers: Bit-wise OR of provisioning bearers.

```
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev (esp_ble_mesh_unprov_dev_add_t
                                                    *add_dev,
                                                    esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov_dev queue.

Return ESP_OK on success or error code otherwise.

Note : 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.

- In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
3. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
 - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
 - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
 - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
 - Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters

- [in] `add_dev`: Pointer to a struct containing the device information
- [in] `flags`: Flags indicate several operations on the device information
 - Remove device information from queue after device has been provisioned (BIT0)
 - Start provisioning immediately after device is added to queue (BIT1)
 - Device can be removed if device queue is full (BIT2)

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
                                                       esp_ble_mesh_bd_addr_t
                                                       addr,
                                                       esp_ble_mesh_addr_type_t
                                                       addr_type,
                                                       esp_ble_mesh_prov_bearer_t
                                                       bearer, uint16_t oob_info,
                                                       uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Return Zero on success or (negative) error code otherwise.

Note : 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
3. Recommend to use only one of the functions “`esp_ble_mesh_provisioner_add_unprov_dev`” and “`esp_ble_mesh_provisioner_prov_device_with_addr`” by a Provisioner.

Parameters

- [in] `uuid`: Device UUID of the unprovisioned device
- [in] `addr`: Device address of the unprovisioned device
- [in] `addr_type`: Device address type of the unprovisioned device
- [in] `bearer`: Provisioning bearer going to be used by Provisioner
- [in] `oob_info`: OOB info of the unprovisioned device
- [in] `unicast_addr`: Unicast address going to be allocated for the unprovisioned device

```
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

Note If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] del_dev: Pointer to a struct containing the device information.

esp_err_t **esp_ble_mesh_provisioner_set_dev_uuid_match** (const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] match_val: Value to be compared with the part of the device UUID.
- [in] match_len: Length of the compared match value.
- [in] offset: Offset of the device UUID to be compared (based on zero).
- [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

esp_err_t **esp_ble_mesh_provisioner_set_prov_data_info** (*esp_ble_mesh_prov_data_info_t* *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

esp_err_t **esp_ble_mesh_provisioner_set_static_oob_value** (const uint8_t *value, uint8_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Return ESP_OK on success or error code otherwise.

Parameters

- [in] value: Pointer to the static oob value.
- [in] length: Length of the static oob value.

esp_err_t **esp_ble_mesh_provisioner_set_primary_elem_addr** (uint16_t addr)

This function is called by Provisioner to set own Primary element address.

Note This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct *esp_ble_mesh_prov_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] addr: Unicast address of the Primary element of Provisioner.

esp_err_t **esp_ble_mesh_set_fast_prov_info** (*esp_ble_mesh_fast_prov_info_t* *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `fast_prov_info`: Pointer to a struct containing unicast address range, `net_idx`, etc.

esp_err_t **esp_ble_mesh_set_fast_prov_action** (*esp_ble_mesh_fast_prov_action_t* *action*)

This function is called to start/suspend/exit fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `action`: fast provisioning action (i.e. enter, suspend, exit).

Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t          event,
                                       esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t      addr,
                                           const esp_ble_mesh_addr_type_t     addr_type,
                                           const uint8_t                    adv_type,      const
                                           uint8_t *dev_uuid,                uint16_t    oob_info,
                                           esp_ble_mesh_prov_bearer_t        bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Parameters

- [in] `addr`: Pointer to the unprovisioned device address.
- [in] `addr_type`: Unprovisioned device address type.
- [in] `adv_type`: Adv packet type(ADV_IND or ADV_NONCONN_IND).
- [in] `dev_uuid`: Unprovisioned device UUID pointer.
- [in] `oob_info`: OOB information of the unprovisioned device.
- [in] `bearer`: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server**Header File**

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h`

Functions

esp_err_t **esp_ble_mesh_proxy_identity_enable** (void)

Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_enable** (void)

Enable BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_connect** (*esp_ble_mesh_bd_addr_t* *addr*,
esp_ble_mesh_addr_type_t *addr_type*, *uint16_t*
net_idx)

Proxy Client creates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *addr*: Device address of the Proxy Server.
- [in] *addr_type*: Device address type(public or static random).
- [in] *net_idx*: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

esp_err_t **esp_ble_mesh_proxy_client_disconnect** (*uint8_t* *conn_handle*)

Proxy Client terminates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *conn_handle*: Proxy connection handle.

esp_err_t **esp_ble_mesh_proxy_client_set_filter_type** (*uint8_t* *conn_handle*,
uint16_t *net_idx*,
esp_ble_mesh_proxy_filter_type_t
filter_type)

Proxy Client sets the filter type of the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *conn_handle*: Proxy connection handle.
- [in] *net_idx*: Corresponding NetKey Index.
- [in] *filter_type*: whitelist or blacklist.

esp_err_t **esp_ble_mesh_proxy_client_add_filter_addr** (*uint8_t* *conn_handle*, *uint16_t*
net_idx, *uint16_t* **addr*, *uint16_t*
addr_num)

Proxy Client adds address to the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *conn_handle*: Proxy connection handle.
- [in] *net_idx*: Corresponding NetKey Index.
- [in] *addr*: Pointer to the filter address.
- [in] *addr_num*: Number of the filter address.

esp_err_t **esp_ble_mesh_proxy_client_remove_filter_addr** (*uint8_t* *conn_handle*, *uint16_t*
net_idx, *uint16_t* **addr*,
uint16_t *addr_num*)

Proxy Client removes address from the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *conn_handle*: Proxy connection handle.
- [in] *net_idx*: Corresponding NetKey Index.
- [in] *addr*: Pointer to the filter address.
- [in] *addr_num*: Number of the filter address.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*

- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

注解: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h`

Functions

`esp_err_t esp_ble_mesh_register_config_client_callback` (`esp_ble_mesh_cfg_client_cb_t callback`)

Register BLE Mesh Config Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_register_config_server_callback` (`esp_ble_mesh_cfg_server_cb_t callback`)

Register BLE Mesh Config Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_config_client_get_state` (`esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state`)

Get the value of Config Server Model states using the Config Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_config_client_set_state` (`esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state`)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions

```
union esp_ble_mesh_cfg_client_get_state_t
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
```

ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET ESP_BLE_MESH_MODEL_OP_FRIEND_GET
 ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
 the `get_state` parameter in the `esp_ble_mesh_config_client_get_state` function should not be set to NULL.

Parameters of Config Vendor Model App Get.

Public Members

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_get_t
Parameters of Config Key Refresh Phase Get.

Public Members

`uint16_t net_idx`
The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.

Public Members

`uint16_t lpn_addr`
The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.

Public Members

`uint8_t beacon`
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

`uint8_t ttl`
The default TTL state value

`struct esp_ble_mesh_cfg_friend_set_t`
Parameters of Config Friend Set.

Public Members

`uint8_t friend_state`
The friend state value

`struct esp_ble_mesh_cfg_gatt_proxy_set_t`
Parameters of Config GATT Proxy Set.

Public Members

`uint8_t gatt_proxy`
The GATT Proxy state value

`struct esp_ble_mesh_cfg_relay_set_t`
Parameters of Config Relay Set.

Public Members

`uint8_t relay`
The relay value

`uint8_t relay_retransmit`
The relay retransmit value

`struct esp_ble_mesh_cfg_net_key_add_t`
Parameters of Config NetKey Add.

Public Members

`uint16_t net_idx`
The network key index

`uint8_t net_key[16]`
The network key value

`struct esp_ble_mesh_cfg_app_key_add_t`
Parameters of Config AppKey Add.

Public Members

`uint16_t net_idx`
The network key index

`uint16_t app_idx`
The app key index

`uint8_t app_key[16]`
The app key value

`struct esp_ble_mesh_cfg_model_app_bind_t`
Parameters of Config Model App Bind.

Public Members**uint16_t element_addr**

The element address

uint16_t model_app_idx

Index of the app key to bind with the model

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t

Parameters of Config Model Publication Set.

Public Members**uint16_t element_addr**

The element address

uint16_t publish_addr

Value of the publish address

uint16_t publish_app_idx

Index of the application key

bool cred_flag

Value of the Friendship Credential Flag

uint8_t publish_ttl

Default TTL value for the publishing messages

uint8_t publish_period

Period for periodic status publishing

uint8_t publish_retransmit

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t

Parameters of Config Model Subscription Add.

Public Members**uint16_t element_addr**

The element address

uint16_t sub_addr

The address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t

Parameters of Config Model Subscription Delete.

Public Members**uint16_t element_addr**

The element address

uint16_t sub_addr

The address to be removed from the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t

Parameters of Config Model Subscription Overwrite.

Public Members**uint16_t element_addr**

The element address

uint16_t sub_addr

The address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t

Parameters of Config Model Subscription Virtual Address Add.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t

Parameters of Config Model Subscription Virtual Address Delete.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t

Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

`uint16_t element_addr`

The element address

`uint8_t label_uuid[16]`

The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t

Parameters of Config Model Publication Virtual Address Set.

Public Members

`uint16_t element_addr`

The element address

`uint8_t label_uuid[16]`

Value of the Label UUID publish address

`uint16_t publish_app_idx`

Index of the application key

`bool cred_flag`

Value of the Friendship Credential Flag

`uint8_t publish_ttl`

Default TTL value for the publishing messages

`uint8_t publish_period`

Period for periodic status publishing

`uint8_t publish_retransmit`

Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t

Parameters of Config Model Subscription Delete All.

Public Members

`uint16_t element_addr`

The element address

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_net_key_update_t`

Parameters of Config NetKey Update.

Public Members

`uint16_t net_idx`

The network key index

`uint8_t net_key[16]`

The network key value

`struct esp_ble_mesh_cfg_net_key_delete_t`

Parameters of Config NetKey Delete.

Public Members

`uint16_t net_idx`

The network key index

`struct esp_ble_mesh_cfg_app_key_update_t`

Parameters of Config AppKey Update.

Public Members

`uint16_t net_idx`

The network key index

`uint16_t app_idx`

The app key index

`uint8_t app_key[16]`

The app key value

`struct esp_ble_mesh_cfg_app_key_delete_t`

Parameters of Config AppKey Delete.

Public Members

`uint16_t net_idx`

The network key index

`uint16_t app_idx`

The app key index

`struct esp_ble_mesh_cfg_node_identity_set_t`

Parameters of Config Node Identity Set.

Public Members

`uint16_t net_idx`

The network key index

`uint8_t identity`

New Node Identity state

`struct esp_ble_mesh_cfg_model_app_unbind_t`

Parameters of Config Model App Unbind.

Public Members**uint16_t element_addr**

The element address

uint16_t model_app_idx

Index of the app key to bind with the model

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t

Parameters of Config Key Refresh Phase Set.

Public Members**uint16_t net_idx**

The network key index

uint8_t transition

New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_net_transmit_set_t

Parameters of Config Network Transmit Set.

Public Members**uint8_t net_transmit**

Network Transmit State

struct esp_ble_mesh_cfg_heartbeat_pub_set_t

Parameters of Config Model Heartbeat Publication Set.

Public Members**uint16_t dst**

Destination address for Heartbeat messages

uint8_t count

Number of Heartbeat messages to be sent

uint8_t period

Period for sending Heartbeat messages

uint8_t ttl

TTL to be used when sending Heartbeat messages

uint16_t feature

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx

NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t

Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t src
Source address for Heartbeat messages

uint16_t dst
Destination address for Heartbeat messages

uint8_t period
Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
Parameter of Config Beacon Status

Public Members

uint8_t beacon
Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
Parameters of Config Composition Data Status

Public Members

uint8_t page
Page number of the Composition Data

struct net_buf_simple *composition_data
Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
Parameters of Config AppKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
Parameters of Config Model App Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_friend_status_cb_t
Parameter of Config Friend Status

Public Members

uint8_t friend_state
Friend state value

struct esp_ble_mesh_cfg_hb_pub_status_cb_t
Parameters of Config Heartbeat Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t dst
Destination address for Heartbeat messages

uint8_t count
Number of Heartbeat messages remaining to be sent

uint8_t period
Period for sending Heartbeat messages

uint8_t ttl
TTL to be used when sending Heartbeat messages

uint16_t features
Features that trigger Heartbeat messages when changed

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t src
Source address for Heartbeat messages

uint16_t dst
Destination address for Heartbeat messages

uint8_t period
Remaining Period for processing Heartbeat messages

uint8_t count
Number of Heartbeat messages received

uint8_t min_hops
Minimum hops when receiving Heartbeat messages

uint8_t max_hops
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count : 3
Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step : 5
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct net_buf_simple *sub_addr

A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t

Parameter of Config NetKey List

Public Members

struct net_buf_simple *net_idx

A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t

Parameters of Config AppKey List

Public Members

uint8_t status

Status Code for the request message

uint16_t net_idx

NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct esp_ble_mesh_cfg_node_id_status_cb_t

Parameters of Config Node Identity Status

Public Members

uint8_t status

Status Code for the request message

uint16_t net_idx

Index of the NetKey

uint8_t identity

Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t

Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t company_id

Company ID

uint16_t model_id

Model ID

struct net_buf_simple *app_idx

All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t

Parameters of Config Key Refresh Phase Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t phase
Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

int32_t poll_timeout
The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
Configuration Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb
The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

Public Members

uint16_t element_addr
Element Address

uint16_t pub_addr
Publish Address

uint16_t app_idx
AppKey Index

bool cred_flag
Friendship Credential Flag

uint8_t pub_ttl
Publish TTL

uint8_t pub_period
Publish Period

uint8_t pub_retransmit
Publish Retransmit

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_add_t
Parameters of Config Model Subscription Add

Public Members

uint16_t **element_addr**
Element Address

uint16_t **sub_addr**
Subscription Address

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete

Public Members

uint16_t **element_addr**
Element Address

uint16_t **sub_addr**
Subscription Address

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
Parameters of Config NetKey Add

Public Members

uint16_t **net_idx**
NetKey Index

uint8_t **net_key**[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
Parameters of Config NetKey Update

Public Members

uint16_t **net_idx**
NetKey Index

uint8_t **net_key**[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t **net_idx**
NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add

Public Members

uint16_t **net_idx**
NetKey Index

uint16_t **app_idx**
AppKey Index

uint8_t **app_key**[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update

Public Members

uint16_t **net_idx**
NetKey Index

uint16_t **app_idx**
AppKey Index

uint8_t **app_key**[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t **net_idx**
NetKey Index

uint16_t **app_idx**
AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

uint16_t **element_addr**
Element Address

uint16_t **app_idx**
AppKey Index

uint16_t **company_id**
Company ID

`uint16_t model_id`
Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

`uint16_t element_addr`
Element Address

`uint16_t app_idx`
AppKey Index

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set

Public Members

`uint16_t net_idx`
NetKey Index

`uint8_t kr_phase`
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the server model structure

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received message

`esp_ble_mesh_cfg_server_cb_value_t value`
Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)
Define a new Config Server Model.

Note The Config Server Model can only be included by a Primary Element.

Return New Config Server Model instance.

Parameters

- `srv_data`: Pointer to a unique Config Server Model `user_data`.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)
Define a new Config Client Model.

Note The Config Client Model can only be included by a Primary Element.

Return New Config Client Model instance.

Parameters

- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

Type Definitions

```
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```

Configuration Server Model context

```
typedef void (*esp_ble_mesh_cfg_client_cb_t) (esp_ble_mesh_cfg_client_cb_event_t event,  
                                              esp_ble_mesh_cfg_client_cb_param_t  
                                              *param)
```

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_cfg_server_cb_t) (esp_ble_mesh_cfg_server_cb_event_t event,  
                                              esp_ble_mesh_cfg_server_cb_param_t  
                                              *param)
```

Configuration Server Model callback function type.

Parameters

- event: Event type
- param: Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_cfg_client_cb_event_t
```

This enum value is the event of Configuration Client Model

Values:

```
ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_CFG_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_cfg_server_cb_event_t
```

This enum value is the event of Configuration Server model

Values:

```
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
```

```
ESP_BLE_MESH_CFG_SERVER_EVT_MAX
```

Health Client/Server Models**Header File**

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h`

Functions

```
esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t  
                                                       callback)
```

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

```
esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t  
                                                       callback)
```

Register BLE Mesh Health Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

esp_err_t **esp_ble_mesh_health_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_get_state_t* *get_state)

This function is called to get the Health Server states using the Health Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_health_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_set_state_t* *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_health_server_fault_update** (*esp_ble_mesh_elem_t* *element)

This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `element`: The element to which the Health Server Model belongs.

Unions

union `esp_ble_mesh_health_client_get_state_t`
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t **fault_get**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union `esp_ble_mesh_health_client_set_state_t`
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the `set_state` parameter in the `esp_ble_mesh_health_client_set_state` function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t **attention_set**

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t **period_set**
 For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or
 ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t **fault_test**
 For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or
 ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t **fault_clear**
 For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or
 ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union esp_ble_mesh_health_client_common_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

esp_ble_mesh_health_current_status_cb_t **current_status**
 The health current status value

esp_ble_mesh_health_fault_status_cb_t **fault_status**
 The health fault status value

esp_ble_mesh_health_period_status_cb_t **period_status**
 The health period status value

esp_ble_mesh_health_attention_status_cb_t **attention_status**
 The health attention status value

union esp_ble_mesh_health_server_cb_param_t

 ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

Structures

struct esp_ble_mesh_health_srv_cb_t
 ESP BLE Mesh Health Server callback

Public Members

esp_ble_mesh_cb_t **fault_clear**
 Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t **fault_test**
 Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t **attention_on**
Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t **attention_off**
Health attention off callback. Initialized by the stack.

struct esp_ble_mesh_health_test_t
ESP BLE Mesh Health Server test Context

Public Members

uint8_t **id_count**
Number of Health self-test ID

const uint8_t ***test_ids**
Array of Health self-test IDs

uint16_t **company_id**
Company ID used to identify the Health Fault state

uint8_t **prev_test_id**
Current test ID of the health fault test

uint8_t **current_faults**[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
Array of current faults

uint8_t **registered_faults**[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
Array of registered faults

struct esp_ble_mesh_health_srv_t
ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t ***model**
Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t **health_cb**
Health callback struct

struct k_delayed_work **attention_timer**
Attention Timer state

bool **attention_timer_start**
Attention Timer start flag

esp_ble_mesh_health_test_t **health_test**
Health Server fault test

struct esp_ble_mesh_health_fault_get_t
Parameter of Health Fault Get

Public Members

uint16_t **company_id**
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
Parameter of Health Attention Set

Public Members

`uint8_t attention`
Value of the Attention Timer state

`struct esp_ble_mesh_health_period_set_t`
Parameter of Health Period Set

Public Members

`uint8_t fast_period_divisor`
Divider for the Publish Period

`struct esp_ble_mesh_health_fault_test_t`
Parameter of Health Fault Test

Public Members

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`uint8_t test_id`
ID of a specific test to be performed

`struct esp_ble_mesh_health_fault_clear_t`
Parameter of Health Fault Clear

Public Members

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct esp_ble_mesh_health_current_status_cb_t`
Parameters of Health Current Status

Public Members

`uint8_t test_id`
ID of a most recently performed test

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct net_buf_simple *fault_array`
FaultArray field contains a sequence of 1-octet fault values

`struct esp_ble_mesh_health_fault_status_cb_t`
Parameters of Health Fault Status

Public Members

`uint8_t test_id`
ID of a most recently performed test

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct net_buf_simple *fault_array`
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status

Public Members

uint8_t **fast_period_divisor**
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status

Public Members

uint8_t **attention**
Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
Health Client Model callback parameters

Public Members

int **error_code**
Appropriate error code

esp_ble_mesh_client_common_param_t ***params**
The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t **status_cb**
The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
Parameter of publishing Health Current Status completion event

Public Members

int **error_code**
The result of publishing Health Current Status

esp_ble_mesh_elem_t ***element**
Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Health Server Model

uint16_t **company_id**
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
Parameters of Health Fault Test event

Public Members

esp_ble_mesh_model_t *model
 Pointer to the Health Server Model

uint8_t test_id
 ID of a specific test to be performed

uint16_t company_id
 Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
 Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t *model
 Pointer to the Health Server Model

uint8_t time
 Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
 Parameter of Health Attention Off event

Public Members

esp_ble_mesh_model_t *model
 Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
 Define a new Health Server Model.

Note The Health Server Model can only be included by a Primary Element.

Return New Health Server Model instance.

Parameters

- *srv*: Pointer to the unique struct *esp_ble_mesh_health_srv_t*.
- *pub*: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
 Define a new Health Client Model.

Note This API needs to be called for each element on which the application needs to have a Health Client Model.

Return New Health Client Model instance.

Parameters

- *cli_data*: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
 A helper to define a health publication context

Parameters

- *_name*: Name given to the publication context variable.
- *_max*: Maximum number of faults the element can have.
- *_role*: Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST
 SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t) (esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Parameters

- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t) (esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters

- event: Event type
- param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:

ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT

ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT

ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT

ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT

ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t

This enum value is the event of Health Server Model

Values:

ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT

```

ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

```

Generic Client/Server Models

Header File

- [components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_generic_client_callback** (*esp_ble_mesh_generic_client_cb_t* callback)

Register BLE Mesh Generic Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

esp_err_t **esp_ble_mesh_generic_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_get_state_t* *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get_state: Pointer to generic get message value. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_generic_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_set_state_t* *set_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set_state: Pointer to generic set message value. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_register_generic_server_callback** (*esp_ble_mesh_generic_server_cb_t* callback)

Register BLE Mesh Generic Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

Unions

```

union esp_ble_mesh_generic_client_get_state_t

Parameter of Generic Power Default Set.

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t
Parameters of Generic Power Range Set.

Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property

struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_gen_admin_property_set_t
Parameters of Generic Admin Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

uint8_t **present_onoff**
Current value of Generic OnOff state

uint8_t **target_onoff**
Target value of Generic OnOff state (optional)

uint8_t **remain_time**
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
Parameters of Generic Level Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

int16_t **present_level**
Current value of Generic Level state

int16_t **target_level**
Target value of the Generic Level state (optional)

uint8_t **remain_time**
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
Parameter of Generic Default Transition Time Status.

Public Members

uint8_t **trans_time**
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t
Parameter of Generic OnPowerUp Status.

Public Members

uint8_t **onpowerup**
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
Parameters of Generic Power Level Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **present_power**
Current value of Generic Power Actual state

uint16_t **target_power**
Target value of Generic Power Actual state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t

Parameter of Generic Power Last Status.

Public Members

uint16_t power

The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t

Parameter of Generic Power Default Status.

Public Members

uint16_t power

The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t

Parameters of Generic Power Range Status.

Public Members

uint8_t status_code

Status Code for the request message

uint16_t range_min

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t

Parameters of Generic Battery Status.

Public Members

uint32_t battery_level : 8

Value of Generic Battery Level state

uint32_t time_to_discharge : 24

Value of Generic Battery Time to Discharge state

uint32_t time_to_charge : 24

Value of Generic Battery Time to Charge state

uint32_t flags : 8

Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t

Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude

Global Coordinates (Latitude)

int32_t global_longitude

Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
Parameters of Generic Location Local Status.

Public Members

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID identifying a Generic User Property

`uint8_t user_access`
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
Generic Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t ***params**
The client common parameters.

esp_ble_mesh_gen_client_status_cb_t **status_cb**
The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
Parameters of Generic OnOff state

Public Members

uint8_t onoff
The present value of the Generic OnOff state

uint8_t target_onoff
The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
Parameters of Generic Level state

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_level_state_t **state**

Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t

Parameter of Generic Default Transition Time state

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t

User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t **state**

Parameters of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_state_t

Parameter of Generic OnPowerUp state

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_srv_t

User data of Generic Power OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *state

Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_setup_srv_t

User data of Generic Power OnOff Setup Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *state

Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_state_t

Parameters of Generic Power Level state

Public Members

uint16_t power_actual

The present value of the Generic Power Actual state

uint16_t target_power_actual

The target value of the Generic Power Actual state

uint16_t power_last

The value of the Generic Power Last state

uint16_t power_default

The value of the Generic Power Default state

uint8_t status_code

The status code of setting Generic Power Range state

uint16_t power_range_min

The minimum value of the Generic Power Range state

uint16_t power_range_max

The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t

User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state

Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t last

Parameters of the last received set message

esp_ble_mesh_state_transition_t transition

Parameters of state transition

`int32_t tt_delta_level`
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_state_t
Parameters of Generic Battery state

Public Members

`uint32_t battery_level : 8`
The value of the Generic Battery Level state

`uint32_t time_to_discharge : 24`
The value of the Generic Battery Time to Discharge state

`uint32_t time_to_charge : 24`
The value of the Generic Battery Time to Charge state

`uint32_t battery_flags : 8`
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Battery Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_battery_state_t state`
Parameters of the Generic Battery state

struct esp_ble_mesh_gen_location_state_t
Parameters of Generic Location state

Public Members

`int32_t global_latitude`
The value of the Global Latitude field

`int32_t global_longitude`
The value of the Global Longitude field

`int16_t global_altitude`
The value of the Global Altitude field

int16_t local_north
The value of the Local North field

int16_t local_east
The value of the Local East field

int16_t local_altitude
The value of the Local Altitude field

uint8_t floor_number
The value of the Floor Number field

uint16_t uncertainty
The value of the Uncertainty field

struct esp_ble_mesh_gen_location_srv_t
User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**
Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**
Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
Parameters of Generic Property states

Public Members

uint16_t id
The value of User/Admin/Manufacturer Property ID

uint8_t user_access
The value of User Access field

uint8_t admin_access
The value of Admin Access field

uint8_t manu_access
The value of Manufacturer Access field

struct net_buf_simple ***val**
The value of User/Admin/Manufacturer Property

struct esp_ble_mesh_gen_user_prop_srv_t
User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic User Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic User Property state

struct esp_ble_mesh_gen_admin_prop_srv_t
User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Admin Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Manufacturer Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Manufacturer Property state

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

`uint8_t id_count`
Generic Client Property ID count

`uint16_t *property_ids`
Parameters of the Generic Client Property state

`struct esp_ble_mesh_state_change_gen_onoff_set_t`
Parameter of Generic OnOff Set state change event

Public Members

`uint8_t onoff`
The value of Generic OnOff state

`struct esp_ble_mesh_state_change_gen_level_set_t`
Parameter of Generic Level Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_delta_set_t`
Parameter of Generic Delta Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_move_set_t`
Parameter of Generic Move Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_def_trans_time_set_t`
Parameter of Generic Default Transition Time Set state change event

Public Members

`uint8_t trans_time`
The value of Generic Default Transition Time state

`struct esp_ble_mesh_state_change_gen_onpowerup_set_t`
Parameter of Generic OnPowerUp Set state change event

Public Members

`uint8_t onpowerup`
The value of Generic OnPowerUp state

`struct esp_ble_mesh_state_change_gen_power_level_set_t`
Parameter of Generic Power Level Set state change event

Public Members**uint16_t power**

The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t

Parameter of Generic Power Default Set state change event

Public Members**uint16_t power**

The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t

Parameters of Generic Power Range Set state change event

Public Members**uint16_t range_min**

The minimum value of Generic Power Range state

uint16_t range_max

The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t

Parameters of Generic Location Global Set state change event

Public Members**int32_t latitude**

The Global Latitude value of Generic Location state

int32_t longitude

The Global Longitude value of Generic Location state

int16_t altitude

The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t

Parameters of Generic Location Local Set state change event

Public Members**int16_t north**

The Local North value of Generic Location state

int16_t east

The Local East value of Generic Location state

int16_t altitude

The Local Altitude value of Generic Location state

uint8_t floor_number

The Floor Number value of Generic Location state

uint16_t uncertainty

The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t

Parameters of Generic User Property Set state change event

Public Members**uint16_t id**

The property id of Generic User Property state

struct net_buf_simple *value

The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t

Parameters of Generic Admin Property Set state change event

Public Members**uint16_t id**

The property id of Generic Admin Property state

uint8_t access

The property access of Generic Admin Property state

struct net_buf_simple *value

The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t

Parameters of Generic Manufacturer Property Set state change event

Public Members**uint16_t id**

The property id of Generic Manufacturer Property state

uint8_t access

The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_rcv_gen_user_property_get_t

Context of the received Generic User Property Get message

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct esp_ble_mesh_server_rcv_gen_admin_property_get_t

Context of the received Generic Admin Property Get message

Public Members**uint16_t property_id**

Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_rcv_gen_manufacturer_property_get_t

Context of the received Generic Manufacturer Property message

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_rcv_gen_client_properties_get_t

Context of the received Generic Client Properties Get message

Public Members**uint16_t property_id**

A starting Client Property ID present within an element

struct esp_ble_mesh_server_rcv_gen_onoff_set_t

Context of the received Generic OnOff Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t onoff

Target value of Generic OnOff state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_gen_level_set_t

Context of the received Generic Level Set message

Public Members**bool op_en**

Indicate if optional parameters are included

int16_t level

Target value of Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_gen_delta_set_t

Context of the received Generic Delta Set message

Public Members**bool op_en**

Indicate if optional parameters are included

int32_t delta_level

Delta change of Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_gen_move_set_t

Context of the received Generic Move Set message

Public Members

bool op_en

Indicate if optional parameters are included

int16_t delta_level

Delta Level step to calculate Move speed for Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_gen_def_trans_time_set_t

Context of the received Generic Default Transition Time Set message

Public Members

uint8_t trans_time

The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_rcv_gen_onpowerup_set_t

Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup

The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_rcv_gen_power_level_set_t

Context of the received Generic Power Level Set message

Public Members

bool op_en

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_gen_power_default_set_t

Context of the received Generic Power Default Set message

Public Members**uint16_t power**

The value of the Generic Power Default state

struct esp_ble_mesh_server_rcv_gen_power_range_set_t

Context of the received Generic Power Range Set message

Public Members**uint16_t range_min**

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_server_rcv_gen_loc_global_set_t

Context of the received Generic Location Global Set message

Public Members**int32_t global_latitude**

Global Coordinates (Latitude)

int32_t global_longitude

Global Coordinates (Longitude)

int16_t global_altitude

Global Altitude

struct esp_ble_mesh_server_rcv_gen_loc_local_set_t

Context of the received Generic Location Local Set message

Public Members**int16_t local_north**

Local Coordinates (North)

int16_t local_east

Local Coordinates (East)

int16_t local_altitude

Local Altitude

uint8_t floor_number

Floor Number

uint16_t uncertainty

Uncertainty

struct esp_ble_mesh_server_rcv_gen_user_property_set_t

Context of the received Generic User Property Set message

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct net_buf_simple *property_value

Raw value for the User Property

struct esp_ble_mesh_server_rcv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_server_rcv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)
Define a new Generic OnOff Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

Return New Generic OnOff Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data**: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)
Define a new Generic Level Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

Return New Generic Level Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data**: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

Return New Generic Default Transition Time Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

Return New Generic Power OnOff Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

Return New Generic Power Level Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)

Define a new Generic Battery Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Return New Generic Battery Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)

Define a new Generic Location Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Return New Generic Location Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)

Define a new Generic Property Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Return New Generic Location Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

Note 1. The Generic OnOff Server Model is a root model.

1. This model shall support model publication and model subscription.

Return New Generic OnOff Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (`srv_pub`, `srv_data`)

Define a new Generic Level Server Model.

Note 1. The Generic Level Server Model is a root model.

1. This model shall support model publication and model subscription.

Return New Generic Level Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (`srv_pub`, `srv_data`)

Define a new Generic Default Transition Time Server Model.

Note 1. The Generic Default Transition Time Server Model is a root model.

1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.

Return New Generic Power OnOff Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Setup Server Model.

Note 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.

Return New Generic Power OnOff Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (`srv_pub`, `srv_data`)

Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

Note 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)

Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.

1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)

Define a new Generic Location Server Model.

Note 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that knows its location (global or local).

Return New Generic Location Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

Note 1. The Generic Location Setup Server model extends the Generic Location Server model.

1. This model shall support model subscription.

Return New Generic Location Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note 1. The Generic User Property Server model is a root model.

1. This model shall support model publication and model subscription.

Return New Generic User Property Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

Note 1. The Generic Admin Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

Return New Generic Admin Property Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

Note 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
1. This model shall support model publication and model subscription.

Return New Generic Manufacturer Property Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note 1. The Generic Client Property Server model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Client Property Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t) (esp_ble_mesh_generic_client_cb_event_t
                                                event,
                                                esp_ble_mesh_generic_client_cb_param_t
                                                *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t) (esp_ble_mesh_generic_server_cb_event_t
                                                event,
                                                esp_ble_mesh_generic_server_cb_param_t
                                                *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

Values:

```
ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

Values:

```
ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE
```

enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property

Values:

```
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE
```

enum esp_ble_mesh_gen_manu_prop_access_t
This enum value is the access value of Generic Manufacturer Property

Values:

```
ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ
```

enum esp_ble_mesh_generic_server_cb_event_t
This enum value is the event of Generic Server Model

Values:

```
ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
```

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

```
ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
```

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

```
ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
```

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

```
ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX
```

Sensor Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

Functions

`esp_err_t esp_ble_mesh_register_sensor_client_callback` (*esp_ble_mesh_sensor_client_cb_t callback*)

Register BLE Mesh Sensor Client Model callback.

Return `ESP_OK` on success or error code otherwise.

Parameters

- [in] `callback`: Pointer to the callback function.

esp_err_t **esp_ble_mesh_sensor_client_get_state** (*esp_ble_mesh_client_common_param_t*
*params, *esp_ble_mesh_sensor_client_get_state_t*
*get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_sensor_message_opcode_t* in *esp_ble_mesh_defs.h*

Return ESP_OK on success or error code otherwise.

Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get_state: Pointer to sensor get message value. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_sensor_client_set_state** (*esp_ble_mesh_client_common_param_t*
*params, *esp_ble_mesh_sensor_client_set_state_t*
*set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_sensor_message_opcode_t* in *esp_ble_mesh_defs.h*

Return ESP_OK on success or error code otherwise.

Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set_state: Pointer to sensor set message value. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_register_sensor_server_callback** (*esp_ble_mesh_sensor_server_cb_t*
callback)

Register BLE Mesh Sensor Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

Structures

struct esp_ble_mesh_sensor_descriptor_get_t
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
Parameters of Sensor Descriptor Get

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID of a sensor (optional)

struct esp_ble_mesh_sensor_cadence_get_t
Parameter of Sensor Cadence Get

Public Members

uint16_t **property_id**
Property ID of a sensor

struct esp_ble_mesh_sensor_cadence_set_t
Parameters of Sensor Cadence Set

Public Members**uint16_t property_id**

Property ID for the sensor

uint8_t fast_cadence_period_divisor : 7

Divisor for the publish period

uint8_t status_trigger_type : 1

The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down

Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up

Delta up value that triggers a status message

uint8_t status_min_interval

Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low

Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high

Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t

Parameter of Sensor Settings Get

Public Members**uint16_t sensor_property_id**

Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t

Parameters of Sensor Setting Get

Public Members**uint16_t sensor_property_id**

Property ID of a sensor

uint16_t sensor_setting_property_id

Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t

Parameters of Sensor Setting Set

Public Members**uint16_t sensor_property_id**

Property ID identifying a sensor

uint16_t sensor_setting_property_id

Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw

Raw value for the setting

struct esp_ble_mesh_sensor_get_t

Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
Property for the sensor

struct net_buf_simple *sensor_cadence_value
Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
Parameters of Sensor Settings Status

Public Members

`uint16_t sensor_property_id`
Property ID identifying a sensor

`struct net_buf_simple *sensor_setting_property_ids`
A sequence of N sensor setting property IDs (optional)

`struct esp_ble_mesh_sensor_setting_status_cb_t`
Parameters of Sensor Setting Status

Public Members

`bool op_en`
Indicate id optional parameters are included

`uint16_t sensor_property_id`
Property ID identifying a sensor

`uint16_t sensor_setting_property_id`
Setting ID identifying a setting within a sensor

`uint8_t sensor_setting_access`
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`
Parameter of Sensor Status

Public Members

`struct net_buf_simple *marshalled_sensor_data`
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`
Parameters of Sensor Column Status

Public Members

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`
Parameters of Sensor Series Status

Public Members

`uint16_t property_id`
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`
Sensor Client Model callback parameters

Public Members**int error_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params

The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t status_cb

The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t

Parameters of Sensor Descriptor state

Public Members**uint32_t positive_tolerance : 12**

The value of Sensor Positive Tolerance field

uint32_t negative_tolerance : 12

The value of Sensor Negative Tolerance field

uint32_t sampling_function : 8

The value of Sensor Sampling Function field

uint8_t measure_period

The value of Sensor Measurement Period field

uint8_t update_interval

The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t

Parameters of Sensor Setting state

Public Members**uint16_t property_id**

The value of Sensor Setting Property ID field

uint8_t access

The value of Sensor Setting Access field

struct net_buf_simple *raw

The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t

Parameters of Sensor Cadence state

Public Members**uint8_t period_divisor : 7**

The value of Fast Cadence Period Divisor field

uint8_t trigger_type : 1

The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down

Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple ***trigger_delta_up**
The value of Status Trigger Delta Up field

uint8_t **min_interval**
The value of Status Min Interval field

struct net_buf_simple ***fast_cadence_low**
The value of Fast Cadence Low field

struct net_buf_simple ***fast_cadence_high**
The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t **format** : 1
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 –16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 –127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t **length** : 7
The value of the Sensor Data length

struct net_buf_simple ***raw_value**
The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members

struct net_buf_simple ***raw_value_x**
The value of Sensor Raw Value X field

struct net_buf_simple ***column_width**
The value of Sensor Column Width field

struct net_buf_simple ***raw_value_y**
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states

Public Members

uint16_t **sensor_property_id**
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t **descriptor**
Parameters of the Sensor Descriptor state

const uint8_t **setting_count**
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t ***settings**
Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t ***cadence**

The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t **sensor_data**

Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t **series_column**

Parameters of the Sensor Series Column state

struct esp_ble_mesh_sensor_srv_t

User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t

User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t

Parameters of Sensor Cadence Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint8_t **period_divisor** : 7

The value of Fast Cadence Period Divisor state

uint8_t **trigger_type** : 1

The value of Status Trigger Type state

struct net_buf_simple ***trigger_delta_down**

The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up state

uint8_t min_interval
The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_rcv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_server_rcv_sensor_cadence_get_t
Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
Property ID of a sensor

struct esp_ble_mesh_server_rcv_sensor_settings_get_t
Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
Property ID of a sensor

struct esp_ble_mesh_server_rcv_sensor_setting_get_t
Context of the received Sensor Setting Get message

Public Members

`uint16_t property_id`
Property ID of a sensor

`uint16_t setting_property_id`
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_rcv_sensor_get_t
Context of the received Sensor Get message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID for the sensor (optional)

struct esp_ble_mesh_server_rcv_sensor_column_get_t
Context of the received Sensor Column Get message

Public Members

`uint16_t property_id`
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_server_rcv_sensor_series_get_t
Context of the received Sensor Series Get message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property identifying a sensor

struct net_buf_simple *raw_value
Raw value containing X1 and X2 (optional)

struct esp_ble_mesh_server_rcv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

`uint16_t property_id`
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_rcv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

`uint16_t property_id`
Property ID identifying a sensor

`uint16_t setting_property_id`
Setting ID identifying a setting within a sensor

`struct net_buf_simple *setting_raw`
Raw value for the setting

`struct esp_ble_mesh_sensor_server_cb_param_t`
Sensor Server Model callback parameters

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Sensor Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_sensor_server_cb_value_t value`
Value of the received Sensor Messages

Macros

`ESP_BLE_MESH_MODEL_SENSOR_CLI` (`cli_pub`, `cli_data`)
Define a new Sensor Client Model.

Note This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return New Sensor Client Model instance.

Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_SENSOR_SRV` (`srv_pub`, `srv_data`)
Sensor Server Models related context.

Define a new Sensor Server Model.

Note 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Sensor Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

`ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV` (`srv_pub`, `srv_data`)
Define a new Sensor Setup Server Model.

Note 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

Return New Sensor Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

`ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID`
Invalid Sensor Property ID

`ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN`
Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN	Length of Sensor Descriptor state
ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE	Unspecified Sensor Positive Tolerance
ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE	Unspecified Sensor Negative Tolerance
ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD	Not applicable Sensor Measurement Period
ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL	Not applicable Sensor Update Interval
ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID	Invalid Sensor Setting Property ID
ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN	Length of Sensor Setting Property ID
ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN	Length of Sensor Setting Access
ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ	Sensor Setting Access - Read
ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE	Sensor Setting Access - Read & Write
ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN	Length of Sensor Divisor Trigger Type
ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN	Length of Sensor Status Min Interval
ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE	Maximum value of Sensor Period Divisor
ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX	Maximum value of Sensor Status Min Interval
ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR	Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references
ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16	Sensor Status Trigger Type - Format Type “uint16”
ESP_BLE_MESH_SENSOR_DATA_FORMAT_A	Sensor Data Format A
ESP_BLE_MESH_SENSOR_DATA_FORMAT_B	Sensor Data Format B
ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN	MPID length of Sensor Data Format A
ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN	MPID length of Sensor Data Format B
ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN	Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)	Get format of the sensor data.
--	--------------------------------

Note Multiple sensor data may be concatenated. Make sure the `_data` pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters

- `_data`: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (`_data`, `_fmt`)

Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the `_data` pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters

- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (`_data`, `_fmt`)

Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the `_data` pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters

- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (`_len`, `_id`)

Generate a MPID value for sensor data with Format A.

Note 1. The Format field is 0b0 and indicates that Format A is used.

1. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
2. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
3. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Return 2-octet MPID value for sensor data with Format A.

Parameters

- `_len`: Length of Sensor Raw value.
- `_id`: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (`_len`, `_id`)

Generate a MPID value for sensor data with Format B.

Note 1. The Format field is 0b1 and indicates Format B is used.

1. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
2. The Property ID is a 16-bit bit field representing a Property ID.
3. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
4. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Return 3-octet MPID value for sensor data with Format B.

Parameters

- `_len`: Length of Sensor Raw value.
- `_id`: Sensor Property ID.

Type Definitions

```
typedef void (*esp_ble_mesh_sensor_client_cb_t) (esp_ble_mesh_sensor_client_cb_event_t
                                                event, esp_ble_mesh_sensor_client_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t) (esp_ble_mesh_sensor_server_cb_event_t
                                                    event, esp_ble_mesh_sensor_server_cb_param_t
                                                    *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Parameters

- event: Event type
- param: Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

Values:

```
ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

Values:

```
ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
```

```
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
```

```
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
```

```
ESP_BLE_MESH_SAMPLE_FUNC_RMS
```

```
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
```

```
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
```

```
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
```

```
ESP_BLE_MESH_SAMPLE_FUNC_COUNT
```

```
enum esp_ble_mesh_sensor_server_cb_event_t
```

This enum value is the event of Sensor Server Model

Values:

```
ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
```

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

```
ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
```

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

```
ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
```

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

```
ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX
```

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback (*esp_ble_mesh_time_scene_client_cb_t callback*)

Register BLE Mesh Time Scene Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *callback*: Pointer to the callback function.

esp_err_t esp_ble_mesh_time_scene_client_get_state (*esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state*)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_time_scene_message_opcode_t* in *esp_ble_mesh_defs.h*

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *params*: Pointer to BLE Mesh common client parameters.
- [in] *get_state*: Pointer to time scene get message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_time_scene_client_set_state (*esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set_state*)

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_time_scene_message_opcode_t* in *esp_ble_mesh_defs.h*

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *params*: Pointer to BLE Mesh common client parameters.
- [in] *set_state*: Pointer to time scene set message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_register_time_scene_server_callback (*esp_ble_mesh_time_scene_server_cb_t callback*)

Register BLE Mesh Time and Scenes Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] *callback*: Pointer to the callback function.

Structures

struct esp_ble_mesh_time_set_t
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.
Parameters of Time Set

Public Members

uint8_t **tai_seconds**[5]
The current TAI time in seconds

uint8_t **sub_second**
The sub-second time in units of 1/256 second

uint8_t **uncertainty**
The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority** : 1
0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta** : 15
Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_set_t
Parameters of Time Zone Set

Public Members

uint8_t **time_zone_offset_new**
Upcoming local time zone offset

uint8_t **tai_zone_change**[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_set_t
Parameters of TAI-UTC Delta Set

Public Members

`uint16_t tai_utc_delta_new`: 15
Upcoming difference between TAI and UTC in seconds

`uint16_t padding`: 1
Always 0b0. Other values are Prohibited.

`uint8_t tai_delta_change`[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set

Public Members

`uint8_t time_role`
The Time Role for the element

struct esp_ble_mesh_scene_store_t
Parameter of Scene Store

Public Members

`uint16_t scene_number`
The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t scene_number`
The number of scenes to be recalled

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete

Public Members

`uint16_t scene_number`
The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get

Public Members**uint8_t index**

Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t

Parameters of Scheduler Action Set

Public Members**uint64_t index : 4**

Index of the Schedule Register entry to set

uint64_t year : 7

Scheduled year for the action

uint64_t month : 12

Scheduled month for the action

uint64_t day : 5

Scheduled day of the month for the action

uint64_t hour : 5

Scheduled hour for the action

uint64_t minute : 6

Scheduled minute for the action

uint64_t second : 6

Scheduled second for the action

uint64_t day_of_week : 7

Schedule days of the week for the action

uint64_t action : 4

Action to be performed at the scheduled time

uint64_t trans_time : 8

Transition time for this action

uint16_t scene_number

Transition time for this action

struct esp_ble_mesh_time_status_cb_t

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members**uint8_t tai_seconds[5]**

The current TAI time in seconds

uint8_t sub_second

The sub-second time in units of 1/256 second

uint8_t uncertainty

The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1

0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15

Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
Current local time zone offset

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint16_t padding_1 : 1
Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding_2 : 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
Parameter of Time Role Status

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
Parameters of Scene Status

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t status_code
Status code of the last operation

uint16_t current_scene
Scene Number of the current scene

uint16_t target_scene
Scene Number of the target scene (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status

Public Members

uint8_t status_code
Status code for the previous operation

uint16_t current_scene
Scene Number of the current scene

struct net_buf_simple *scenes
A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
Parameter of Scheduler Status

Public Members

uint16_t schedules
Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t index : 4
Enumerates (selects) a Schedule Register entry

uint64_t year : 7
Scheduled year for the action

uint64_t month : 12
Scheduled month for the action

uint64_t day : 5
Scheduled day of the month for the action

uint64_t hour : 5
Scheduled hour for the action

uint64_t minute : 6
Scheduled minute for the action

uint64_t second : 6
Scheduled second for the action

uint64_t day_of_week : 7
Schedule days of the week for the action

uint64_t action : 4
Action to be performed at the scheduled time

uint64_t trans_time : 8
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
Time Scene Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t ***params**
The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t **status_cb**
The scene status message callback values

struct esp_ble_mesh_time_state_t
Parameters of Time state

Public Members

uint8_t tai_seconds[5]
The value of the TAI Seconds state

uint8_t subsecond
The value of the Subsecond field

uint8_t uncertainty
The value of the Uncertainty field

uint8_t time_zone_offset_curr
The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
The value of the TAI of Zone Chaneg field

uint16_t time_authority : 1
The value of the Time Authority bit

uint16_t tai_utc_delta_curr : 15
The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new : 15
The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
Parameters of the Time state

uint8_t time_role
The value of the Time Role state

struct esp_ble_mesh_time_srv_t
User data of Time Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t

User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct esp_ble_mesh_scene_register_t

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t **scene_number**

The value of the Scene Number

uint8_t **scene_type**

The value of the Scene Type

struct net_buf_simple ***scene_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct esp_ble_mesh_scenes_state_t

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t scene_count

The Scenes state's scene count

esp_ble_mesh_scene_register_t ***scenes**

Parameters of the Scenes state

uint16_t current_scene

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code

The status code of the last scene operation

bool in_progress

Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t

User data of Scene Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct esp_ble_mesh_scene_setup_srv_t

User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

struct esp_ble_mesh_schedule_register_t

Parameters of Scheduler Register state

Public Members

bool **in_use**

Indicate if the registered schedule is in use

uint64_t **year** : 7

The value of Scheduled year for the action

uint64_t **month** : 12

The value of Scheduled month for the action

uint64_t **day** : 5

The value of Scheduled day of the month for the action

uint64_t **hour** : 5

The value of Scheduled hour for the action

uint64_t **minute** : 6

The value of Scheduled minute for the action

uint64_t **second** : 6

The value of Scheduled second for the action

uint64_t **day_of_week** : 7

The value of Schedule days of the week for the action

uint64_t **action** : 4

The value of Action to be performed at the scheduled time

uint64_t **trans_time** : 8

The value of Transition time for this action

uint16_t **scene_number**

The value of Scene Number to be used for some actions

struct esp_ble_mesh_scheduler_state_t

Parameters of Scheduler state

Public Members

const uint8_t **schedule_count**

Scheduler count

esp_ble_mesh_schedule_register_t ***schedules**

Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t

User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t

User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received Messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t

Parameters of Time Set state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority** : 1

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta_curr** : 15

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset_curr**

The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t

Parameters of Time Status state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority` : 1
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr` : 15
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

`uint8_t time_zone_offset_new`
Upcoming local time zone offset

`uint8_t tai_zone_change[5]`
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

`uint16_t tai_utc_delta_new` : 15
Upcoming difference between TAI and UTC in seconds

`uint8_t tai_delta_change[5]`
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
Parameter of Time Role Set state change event

Public Members

`uint8_t time_role`
The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
Parameter of Scene Store state change event

Public Members

`uint16_t scene_number`
The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
Parameter of Scene Recall state change event

Public Members

`uint16_t scene_number`
The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
Parameter of Scene Delete state change event

Public Members

`uint16_t scene_number`
The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
Parameter of Scheduler Action Set state change event

Public Members

`uint64_t index` : 4
Index of the Schedule Register entry to set

`uint64_t year` : 7
Scheduled year for the action

`uint64_t month` : 12
Scheduled month for the action

`uint64_t day` : 5
Scheduled day of the month for the action

`uint64_t hour` : 5
Scheduled hour for the action

`uint64_t minute` : 6
Scheduled minute for the action

`uint64_t second` : 6
Scheduled second for the action

`uint64_t day_of_week` : 7
Schedule days of the week for the action

`uint64_t action` : 4
Action to be performed at the scheduled time

`uint64_t trans_time` : 8
Transition time for this action

`uint16_t scene_number`
Scene number to be used for some actions

struct esp_ble_mesh_server_rcv_scheduler_act_get_t
Context of the received Scheduler Action Get message

Public Members

`uint8_t index`
Index of the Schedule Register entry to get

struct esp_ble_mesh_server_rcv_time_set_t
Context of the received Time Set message

Public Members

`uint8_t tai_seconds`[5]
The current TAI time in seconds

`uint8_t subsecond`
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_rcv_time_zone_set_t
Context of the received Time Zone Set message

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_rcv_tai_utc_delta_set_t
Context of the received TAI UTC Delta Set message

Public Members

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_rcv_time_role_set_t
Context of the received Time Role Set message

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_server_rcv_scene_store_t
Context of the received Scene Store message

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_server_rcv_scene_recall_t
Context of the received Scene Recall message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **scene_number**
The number of scenes to be recalled

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_scene_delete_t
Context of the received Scene Delete message

Public Members

uint16_t **scene_number**
The number of scenes to be deleted

struct esp_ble_mesh_server_rcv_scheduler_act_set_t
Context of the received Scheduler Action Set message

Public Members

uint64_t **index** : 4
Index of the Schedule Register entry to set

uint64_t **year** : 7
Scheduled year for the action

uint64_t **month** : 12
Scheduled month for the action

uint64_t **day** : 5
Scheduled day of the month for the action

uint64_t **hour** : 5
Scheduled hour for the action

uint64_t **minute** : 6
Scheduled minute for the action

uint64_t **second** : 6
Scheduled second for the action

uint64_t **day_of_week** : 7
Schedule days of the week for the action

uint64_t **action** : 4
Action to be performed at the scheduled time

uint64_t **trans_time** : 8
Transition time for this action

uint16_t **scene_number**
Scene number to be used for some actions

struct esp_ble_mesh_server_rcv_time_status_t
Context of the received Time Status message

Public Members

`uint8_t tai_seconds[5]`
The current TAI time in seconds

`uint8_t subsecond`
The sub-second time in units of 1/256 second

`uint8_t uncertainty`
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta : 15`
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
Time Scene Server Model callback parameters

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Time and Scenes Server Models

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received messages

`esp_ble_mesh_time_scene_server_cb_value_t value`
Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
Define a new Time Client Model.

Note This API needs to be called for each element on which the application needs to have a Time Client Model.

Return New Time Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
Define a new Scene Client Model.

Note This API needs to be called for each element on which the application needs to have a Scene Client Model.

Return New Scene Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
Define a new Scheduler Client Model.

Note This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Return New Scheduler Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

Note 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Time Server Model instance.

Parameters

- *srv_pub*: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- *srv_data*: Pointer to the unique struct *esp_ble_mesh_time_srv_t*.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)

Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

2. This model does not support subscribing nor publishing.

Return New Time Setup Server Model instance.

Parameters

- *srv_data*: Pointer to the unique struct *esp_ble_mesh_time_setup_srv_t*.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)

Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.

Return New Scene Server Model instance.

Parameters

- *srv_pub*: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- *srv_data*: Pointer to the unique struct *esp_ble_mesh_scene_srv_t*.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)

Define a new Scene Setup Server Model.

Note 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

Return New Scene Setup Server Model instance.

Parameters

- *srv_pub*: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- *srv_data*: Pointer to the unique struct *esp_ble_mesh_scene_setup_srv_t*.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)

Define a new Scheduler Server Model.

Note 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.
3. The model requires the Time Server model shall be present on the element.

Return New Scheduler Server Model instance.

Parameters

- *srv_pub*: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- *srv_data*: Pointer to the unique struct *esp_ble_mesh_scheduler_srv_t*.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)

Define a new Scheduler Setup Server Model.

Note 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

1. This model shall support model subscription.

2. The model may be present only on the Primary element of a node.

Return New Scheduler Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_scheduler_setup_srv_t*.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS

Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE

Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE

Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE

Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN

Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN

Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN

Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER

Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN

Length of the Scene Number

ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR

Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY

Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR

Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY

Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR

Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC EVERY_15_MIN

Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC EVERY_20_MIN

Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR

Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC ANY_OF_MIN

Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC EVERY_15_SEC

Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t) (esp_ble_mesh_time_scene_client_cb_event_t
                                                    event,
                                                    esp_ble_mesh_time_scene_client_cb_param_t
                                                    *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t) (esp_ble_mesh_time_scene_server_cb_event_t
                                                    event,
                                                    esp_ble_mesh_time_scene_server_cb_param_t
                                                    *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Parameters

- event: Event type

- param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_time_scene_client_cb_event_t

This enum value is the event of Time Scene Client Model

Values:

ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT

ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT

ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT

ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT

ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t

This enum value is the event of Time Scene Server Model

Values:

ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h`

Functions

esp_err_t esp_ble_mesh_register_light_client_callback (*esp_ble_mesh_light_client_cb_t* callback)

Register BLE Mesh Light Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] `callback`: pointer to the callback function.

esp_err_t esp_ble_mesh_light_client_get_state (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_get_state_t* *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

Return ESP_OK on success or error code otherwise.

Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get_state: Pointer of light get message value. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_light_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_set_state_t* *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] set_state: Pointer of light set message value. Shall not be set to NULL.

esp_err_t **esp_ble_mesh_register_lighting_server_callback** (*esp_ble_mesh_lighting_server_cb_t* callback)

Register BLE Mesh Lighting Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

Structures

struct esp_ble_mesh_light_lightness_set_t
Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.
Parameters of Light Lightness Set

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **lightness**
Target value of light lightness actual state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_linear_set_t
Parameters of Light Lightness Linear Set

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **lightness**
Target value of light lightness linear state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_default_set_t

Parameter of Light Lightness Default Set

Public Members

uint16_t lightness

The value of the Light Lightness Default state

struct esp_ble_mesh_light_lightness_range_set_t

Parameters of Light Lightness Range Set

Public Members

uint16_t range_min

Value of range min field of light lightness range state

uint16_t range_max

Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_set_t

Parameters of Light CTL Set

Public Members

bool op_en

Indicate if optional parameters are included

uint16_t ctl_lightness

Target value of light ctl lightness state

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_set_t

Parameters of Light CTL Temperature Set

Public Members

bool op_en

Indicate if optional parameters are included

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_set_t

Parameters of Light CTL Temperature Range Set

Public Members

`uint16_t range_min`

Value of temperature range min field of light ctl temperature range state

`uint16_t range_max`

Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_set_t

Parameters of Light CTL Default Set

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t temperature`

Value of light temperature default state

`int16_t delta_uv`

Value of light delta UV default state

struct esp_ble_mesh_light_hsl_set_t

Parameters of Light HSL Set

Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t hsl_lightness`

Target value of light hsl lightness state

`uint16_t hsl_hue`

Target value of light hsl hue state

`uint16_t hsl_saturation`

Target value of light hsl saturation state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_hue_set_t

Parameters of Light HSL Hue Set

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **hue**
Target value of light hsl hue state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
Parameters of Light HSL Saturation Set

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **saturation**
Target value of light hsl hue state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_default_set_t
Parameters of Light HSL Default Set

Public Members

uint16_t **lightness**
Value of light lightness default state

uint16_t **hue**
Value of light hue default state

uint16_t **saturation**
Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
Parameters of Light HSL Range Set

Public Members

uint16_t **hue_range_min**
Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The target value of the Light xyL Lightness state

uint16_t xyl_x
The target value of the Light xyL x state

uint16_t xyl_y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
Parameter of Light LC Property Get

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
Parameters of Light LC Property Set

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness actual state

uint16_t target_lightness
Target value of light lightness actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
Parameters of Light Lightness Linear Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness linear state

uint16_t target_lightness
Target value of light lightness linear state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
Target value of light ctl temperature state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t present_ctl_delta_uv
Current value of light ctl delta UV state

uint16_t target_ctl_temperature
Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
Target value of light ctl delta UV state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
Parameters of Light CTL Temperature Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status

Public Members

`uint16_t lightness`
Value of light lightness default state

`uint16_t temperature`
Value of light temperature default state

`int16_t delta_uv`
Value of light delta UV default state

`struct esp_ble_mesh_light_hsl_status_cb_t`
Parameters of Light HSL Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t hsl_lightness`
Current value of light hsl lightness state

`uint16_t hsl_hue`
Current value of light hsl hue state

`uint16_t hsl_saturation`
Current value of light hsl saturation state

`uint8_t remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_target_status_cb_t`
Parameters of Light HSL Target Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t hsl_lightness_target`
Target value of light hsl lightness state

`uint16_t hsl_hue_target`
Target value of light hsl hue state

`uint16_t hsl_saturation_target`
Target value of light hsl saturation state

`uint8_t remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_hue_status_cb_t`
Parameters of Light HSL Hue Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t present_hue`
Current value of light hsl hue state

uint16_t target_hue
Target value of light hsl hue state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_saturation
Current value of light hsl saturation state

uint16_t target_saturation
Target value of light hsl saturation state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t hue
Value of light hue default state

uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
Parameters of Light HSL Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
Parameters of Light xyL Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The present value of the Light xyL Lightness state

uint16_t xyl_x
The present value of the Light xyL x state

uint16_t xyl_y
The present value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xyL Target Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t target_xyl_lightness
The target value of the Light xyL Lightness state

uint16_t target_xyl_x
The target value of the Light xyL x state

uint16_t target_xyl_y
The target value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xyL Default Status

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

Public Members

uint8_t status_code
Status Code for the requesting message

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

`uint16_t xyl_x_range_max`

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t xyl_y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t xyl_y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t

Parameter of Light LC Mode Status

Public Members

`uint8_t mode`

The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t

Parameter of Light LC OM Status

Public Members

`uint8_t mode`

The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t

Parameters of Light LC Light OnOff Status

Public Members

`bool op_en`

Indicate whether optional parameters included

`uint8_t present_light_onoff`

The present value of the Light LC Light OnOff state

`uint8_t target_light_onoff`

The target value of the Light LC Light OnOff state (Optional)

`uint8_t remain_time`

Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t

Parameters of Light LC Property Status

Public Members

`uint16_t property_id`

Property ID identifying a Light LC Property

struct net_buf_simple *property_value

Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t

Lighting Client Model callback parameters

Public Members**int error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t *params

The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb

The light status message callback values

struct esp_ble_mesh_light_lightness_state_t

Parameters of Light Lightness state

Public Members**uint16_t lightness_linear**

The present value of Light Lightness Linear state

uint16_t target_lightness_linear

The target value of Light Lightness Linear state

uint16_t lightness_actual

The present value of Light Lightness Actual state

uint16_t target_lightness_actual

The target value of Light Lightness Actual state

uint16_t lightness_last

The value of Light Lightness Last state

uint16_t lightness_default

The value of Light Lightness Default state

uint8_t status_code

The status code of setting Light Lightness Range state

uint16_t lightness_range_min

The minimum value of Light Lightness Range state

uint16_t lightness_range_max

The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t

User data of Light Lightness Server Model

Public Members**esp_ble_mesh_model_t *model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state

Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last

Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition

Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition

Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

***esp_ble_mesh_model_t* *model**
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

***esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl**
Response control of the server model received messages

***esp_ble_mesh_light_lightness_state_t* *state**
Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
The present value of Light CTL Lightness state

uint16_t target_lightness
The target value of Light CTL Lightness state

uint16_t temperature
The present value of Light CTL Temperature state

uint16_t target_temperature
The target value of Light CTL Temperature state

int16_t delta_uv
The present value of Light CTL Delta UV state

int16_t target_delta_uv
The target value of Light CTL Delta UV state

uint8_t status_code
The statue code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t temperature_default
The value of Light CTL Temperature Default state

int16_t delta_uv_default
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t

User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t

User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct esp_ble_mesh_light_hsl_state_t
Parameters of Light HSL state

Public Members

uint16_t lightness
The present value of Light HSL Lightness state

uint16_t target_lightness
The target value of Light HSL Lightness state

uint16_t hue
The present value of Light HSL Hue state

uint16_t target_hue
The target value of Light HSL Hue state

uint16_t saturation
The present value of Light HSL Saturation state

uint16_t target_saturation
The target value of Light HSL Saturation state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t hue_default
The value of Light HSL Hue Default state

uint16_t saturation_default
The value of Light HSL Saturation Default state

uint8_t status_code
The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**
Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`int32_t tt_delta_saturation`
Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
User data of Light HSL Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

struct esp_ble_mesh_light_hsl_hue_srv_t
User data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

struct esp_ble_mesh_light_hsl_sat_srv_t
User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_saturation**

Delta change value of saturation state transition

struct esp_ble_mesh_light_xyl_state_t

Parameters of Light xyL state

Public Members

uint16_t **lightness**

The present value of Light xyL Lightness state

uint16_t **target_lightness**

The target value of Light xyL Lightness state

uint16_t **x**

The present value of Light xyL x state

uint16_t **target_x**

The target value of Light xyL x state

uint16_t **y**

The present value of Light xyL y state

uint16_t **target_y**

The target value of Light xyL y state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **x_default**

The value of Light xyL x Default state

uint16_t **y_default**

The value of Light xyL y Default state

uint8_t **status_code**

The status code of setting Light xyL x & y Range state

uint16_t **x_range_min**

The minimum value of Light xyL x Range state

uint16_t **x_range_max**

The maximum value of Light xyL x Range state

uint16_t **y_range_min**

The minimum value of Light xyL y Range state

uint16_t **y_range_max**

The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t

User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_x**

Delta change value of x state transition

int32_t **tt_delta_y**

Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t

User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

struct esp_ble_mesh_light_lc_state_t

Parameters of Light LC states

Public Members

uint32_t **mode** : 1

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t **occupancy_mode** : 1

The value of Light LC Occupancy Mode state

uint32_t **light_onoff** : 1

The present value of Light LC Light OnOff state

uint32_t **target_light_onoff** : 1

The target value of Light LC Light OnOff state

uint32_t **occupancy** : 1

The value of Light LC Occupancy state

uint32_t **ambient_luxlevel** : 24

The value of Light LC Ambient LuxLevel state

uint16_t **linear_output**

1. Light LC Linear Output = $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members**uint32_t time_occupancy_delay**

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on

A lightness state that determines the perceptible light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to Ob1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t

Parameters of Light LC state machine

Public Members**uint8_t fade_on**

The value of transition time of Light LC Time Fade On

uint8_t fade

The value of transition time of Light LC Time Fade

uint8_t fade_standby_auto

The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual

The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_light_lc_state_t state

The value of Light LC state machine state

struct k_delayed_work timer

Timer of Light LC state machine

struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t **state**
Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t **prop_state**
Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t **state_machine**
Parameters of Light LC state machine

struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**
Parameters of the Light controller

esp_ble_mesh_last_msg_info_t **last**
Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**
Parameters of state transition

struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**
Parameters of the Light controller

struct esp_ble_mesh_state_change_light_lightness_set_t
Parameter of Light Lightness Actual state change event

Public Members

uint16_t **lightness**
The value of Light Lightness Actual state

struct esp_ble_mesh_state_change_light_lightness_linear_set_t
Parameter of Light Lightness Linear state change event

Public Members**uint16_t lightness**

The value of Light Lightness Linear state

struct esp_ble_mesh_state_change_light_lightness_default_set_t

Parameter of Light Lightness Default state change event

Public Members**uint16_t lightness**

The value of Light Lightness Default state

struct esp_ble_mesh_state_change_light_lightness_range_set_t

Parameters of Light Lightness Range state change event

Public Members**uint16_t range_min**

The minimum value of Light Lightness Range state

uint16_t range_max

The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t

Parameters of Light CTL state change event

Public Members**uint16_t lightness**

The value of Light CTL Lightness state

uint16_t temperature

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_set_t

Parameters of Light CTL Temperature state change event

Public Members**uint16_t temperature**

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t

Parameters of Light CTL Temperature Range state change event

Public Members**uint16_t range_min**

The minimum value of Light CTL Temperature Range state

uint16_t range_max

The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness state

uint16_t hue
The value of Light HSL Hue state

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness Default state

uint16_t hue
The value of Light HSL Hue Default state

uint16_t saturation
The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event

Public Members

uint16_t hue_range_min
The minimum hue value of Light HSL Range state

uint16_t hue_range_max
The maximum hue value of Light HSL Range state

uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state

struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyL state change event

Public Members

uint16_t lightness
The value of Light xyL Lightness state

uint16_t x
The value of Light xyL x state

uint16_t y
The value of Light xyL y state

struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t x
The value of Light xyL x Default state

uint16_t y
The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members**uint8_t mode**

The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t

Parameter of Light LC Occupancy Mode state change event

Public Members**uint8_t mode**

The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t

Parameter of Light LC Light OnOff state change event

Public Members**uint8_t onoff**

The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t

Parameters of Light LC Property state change event

Public Members**uint16_t property_id**

The property id of Light LC Property state

struct net_buf_simple *property_value

The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t

Parameters of Sensor Status state change event

Public Members**uint16_t property_id**

The value of Sensor Property ID

uint8_t occupancy

The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay

The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel

The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state

Parameters of Sensor Status related state

struct esp_ble_mesh_server_rcv_light_lc_property_get_t

Context of the received Light LC Property Get message

Public Members

`uint16_t property_id`
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_rcv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t lightness`
Target value of light lightness actual state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_lightness_linear_set_t
Context of the received Light Lightness Linear Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t lightness`
Target value of light lightness linear state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_lightness_default_set_t
Context of the received Light Lightness Default Set message

Public Members

`uint16_t lightness`
The value of the Light Lightness Default state

struct esp_ble_mesh_server_rcv_light_lightness_range_set_t
Context of the received Light Lightness Range Set message

Public Members

`uint16_t range_min`
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_server_rcv_light_ctl_set_t
Context of the received Light CTL Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light ctl lightness state

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_ctl_temperature_set_t
Context of the received Light CTL Temperature Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_ctl_temperature_range_set_t
Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_server_rcv_light_ctl_default_set_t
Context of the received Light CTL Default Set message

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_server_rcv_light_hsl_set_t
Context of the received Light HSL Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light hsl lightness state

uint16_t hue
Target value of light hsl hue state

uint16_t saturation
Target value of light hsl saturation state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_hsl_hue_set_t
Context of the received Light HSL Hue Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hue
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_hsl_saturation_set_t
Context of the received Light HSL Saturation Set message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **saturation**
Target value of light hsl hue state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_hsl_default_set_t
Context of the received Light HSL Default Set message

Public Members

uint16_t **lightness**
Value of light lightness default state

uint16_t **hue**
Value of light hue default state

uint16_t **saturation**
Value of light saturation default state

struct esp_ble_mesh_server_rcv_light_hsl_range_set_t
Context of the received Light HSL Range Set message

Public Members

uint16_t **hue_range_min**
Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**
Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**
Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_rcv_light_xyl_set_t
Context of the received Light xyL Set message

Public Members

bool **op_en**
Indicate whether optional parameters included

uint16_t **lightness**
The target value of the Light xyL Lightness state

uint16_t **x**
The target value of the Light xyL x state

uint16_t y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_xyl_default_set_t
Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xyL x Default state

uint16_t y
The value of the Light xyL y Default state

struct esp_ble_mesh_server_rcv_light_xyl_range_set_t
Context of the received Light xyl Range Set message

Public Members

uint16_t x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_rcv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_server_rcv_light_lc_om_set_t
Context of the received Light OM Set message

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_rcv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_rcv_light_lc_property_set_t
Context of the received Light LC Property Set message

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_server_rcv_sensor_status_t
Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
Lighting Server Model callback parameters

Public Members

***esp_ble_mesh_model_t* *model**
Pointer to Lighting Server Models

***esp_ble_mesh_msg_ctx_t* ctx**
Context of the received messages

***esp_ble_mesh_lighting_server_cb_value_t* value**
Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
Define a new Light Lightness Client Model.

Note This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Return New Light Lightness Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data**: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)

Define a new Light CTL Client Model.

Note This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

Return New Light CTL Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)

Define a new Light HSL Client Model.

Note This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Return New Light HSL Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)

Define a new Light xyL Client Model.

Note This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Return New Light xyL Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)

Define a new Light LC Client Model.

Note This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Return New Light LC Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- cli_data: Pointer to the unique struct *esp_ble_mesh_client_t*.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

Note 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light Lightness Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- srv_data: Pointer to the unique struct *esp_ble_mesh_light_lightness_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

Note 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

Return New Light Lightness Setup Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- srv_data: Pointer to the unique struct *esp_ble_mesh_light_lightness_setup_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

Note 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Return New Light CTL Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

Note 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light CTL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

Note 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

Return New Light CTL Temperature Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)

Define a new Light HSL Server Model.

Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light HSL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_light_hsl_setup_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (`srv_pub`, `srv_data`)

Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

Return New Light HSL Hue Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_light_hsl_hue_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (`srv_pub`, `srv_data`)

Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

Return New Light HSL Saturation Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_light_hsl_sat_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (`srv_pub`, `srv_data`)

Define a new Light xyL Server Model.

Note 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light xyL Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_light_xyl_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (`srv_pub`, `srv_data`)

Define a new Light xyL Setup Server Model.

Note 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light xyL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_light_xyl_setup_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (`srv_pub`, `srv_data`)

Define a new Light LC Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- `srv_data`: Pointer to the unique struct *esp_ble_mesh_light_lc_srv_t*.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (`srv_pub`, `srv_data`)

Define a new Light LC Setup Server Model.

- Note**
1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
 1. This model shall support model publication and model subscription.
 2. This model may be used to configure setup parameters for the Light LC Server model.

Return New Light LC Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t) (esp_ble_mesh_light_client_cb_event_t
                                             event, esp_ble_mesh_light_client_cb_param_t
                                             *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t) (esp_ble_mesh_lighting_server_cb_event_t
                                                  event,
                                                  esp_ble_mesh_lighting_server_cb_param_t
                                                  *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
This enum value is the event of Lighting Client Model
```

Values:

```
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states
```

Values:

```
ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL
```

enum esp_ble_mesh_lighting_server_cb_event_t

This enum value is the event of Lighting Server Model

Values:

ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT

1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

蓝牙 API 的示例代码存放于 ESP-IDF [bluetooth/bluedroid](#) 示例目录下，请查看。

下面的示例给出了详细介绍：

- [GATT 客户端示例](#)
- [GATT 服务端服务表格示例](#)
- [GATT 服务端示例](#)
- [GATT 客户端安全性示例](#)
- [GATT 服务端安全性示例](#)
- [GATT 客户端多连接示例](#)

2.2 连网 API

2.2.1 Wi-Fi

Wi-Fi 库

概述 Wi-Fi 库支持配置及监控 ESP32-S3 Wi-Fi 连网功能。

支持配置：

- 基站模式（即 STA 模式或 Wi-Fi 客户端模式），此时 ESP32-S3 连接到接入点 (AP)。
- AP 模式（即 Soft-AP 模式或接入点模式），此时基站连接到 ESP32-S3。
- AP-STA 共存模式（ESP32-S3 既是接入点，同时又作为基站连接到另外一个接入点）。
- 上述模式的各种安全模式（WPA、WPA2 及 WEP 等）。
- 扫描接入点（包括主动扫描及被动扫描）。
- 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

应用示例 ESP-IDF 示例项目的 [wifi](#) 目录下包含以下应用程序：

- Wi-Fi 示例代码；
- 另外一个简单的应用程序 [esp-idf-template](#)，演示了如何将 ESP32-S3 模组连接到 AP。

API 参考

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t **esp_wifi_init** (const *wifi_init_config_t* *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into *wifi_init_config_t* in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of *wifi_init_config_t* should always be WIFI_INIT_CONFIG_MAGIC!

Return

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

Parameters

- config: pointer to WiFi initialized configuration structure; can point to a temporary variable.

esp_err_t **esp_wifi_deinit** (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_mode** (*wifi_mode_t* mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

Parameters

- mode: WiFi operating mode

esp_err_t **esp_wifi_get_mode** (*wifi_mode_t* *mode)

Get current operating mode of WiFi.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- [out] mode: store current WiFi mode

esp_err_t **esp_wifi_start** (void)

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

esp_err_t esp_wifi_stop (void)

Stop WiFi. If mode is WIFI_MODE_STA, it stop station and free station control block. If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block. If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_restore (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_connect (void)

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode

Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.

Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn't exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

esp_err_t esp_wifi_disconnect (void)

Disconnect the ESP32 WiFi station from the AP.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

esp_err_t esp_wifi_clear_fast_connect (void)

Currently this API is just an stub API.

Return

- ESP_OK: succeed
- others: fail

esp_err_t esp_wifi_deauth_sta (uint16_t aid)

deauthenticate all stations or associated id equals to aid

Return

- ESP_OK: succeed

- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters

- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

esp_err_t **esp_wifi_scan_start** (const *wifi_scan_config_t* *config, bool block)

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters

- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

esp_err_t **esp_wifi_scan_stop** (void)

Stop the scan in process.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t **esp_wifi_scan_get_ap_num** (uint16_t *number)

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- [out] number: store number of APIs found in last scan

esp_err_t **esp_wifi_scan_get_ap_records** (uint16_t *number, *wifi_ap_record_t* *ap_records)

Get AP list found in last scan.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

Parameters

- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- ap_records: *wifi_ap_record_t* array to hold the found APs

*esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)*

Get information of AP which the ESP32 station is associated with.

Attention When the obtained country information is empty, it means that the AP does not carry country information

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

Parameters

- ap_info: the *wifi_ap_record_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_11r in the *wifi_ap_record_t* struct. For example, phy_11b = 1 imply that ap support 802.11b mode

esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)

Set current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Return ESP_OK: succeed

Parameters

- type: power save type

*esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)*

Get current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Return ESP_OK: succeed

Parameters

- [out] type: store current power save type

esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_11AC)

Attention Currently we only support 802.11b or 802.11bg or 802.11bgn mode

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

Parameters

- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

*esp_err_t esp_wifi_get_protocol (wifi_interface_t ifx, uint8_t *protocol_bitmap)*

Get the current protocol bitmap of the specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

Parameters

- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx

esp_err_t esp_wifi_set_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t bw)

Set the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to configure an interface that is not enabled

Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

Parameters

- ifx: interface to be configured
- bw: bandwidth

*esp_err_t esp_wifi_get_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t *bw)*

Get the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to get a interface that is not enable

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

esp_err_t esp_wifi_set_channel (uint8_t primary, wifi_second_chan_t second)

Set primary/secondary channel of ESP32.

Attention 1. This API should be called after esp_wifi_start()

Attention 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

Attention 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

Attention 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
- second: for HT20, second is ignored, for HT40, second is the second channel

*esp_err_t esp_wifi_get_channel (uint8_t *primary, wifi_second_chan_t *second)*

Get the primary/secondary channel of ESP32.

Attention 1. API return false if try to get a interface that is not enable

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- primary: store current primary channel
- [out] second: store current second channel

*esp_err_t esp_wifi_set_country (const wifi_country_t *country)*

configure country info

Attention 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

Attention 2. The default country is CHINA {.cc=" CN" , .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

Attention 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=" USA" , .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=" JP" , .schan=1, .nchan=14} then the country info that will be used is {.cc=" JP" , .schan=1, .nchan=14}. If the station

disconnected from the AP the country info is set back to the country info of the station automatically, {`.cc=" US" , .schan=1, .nchan=11`} in the example.

Attention 4. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

Attention 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 6. The country configuration is stored into flash.

Attention 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters

- `country`: the configured country info

`esp_err_t esp_wifi_get_country (wifi_country_t *country)`

get the current country info

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters

- `country`: country info

`esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])`

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX” , but can not be “15:XX:XX:XX:XX:XX” .

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- others: refer to error codes in `esp_err.h`

Parameters

- `ifx`: interface
- `mac`: the MAC address

`esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])`

Get mac of specified interface.

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface

Parameters

- `ifx`: interface
- `[out] mac`: store mac of the interface `ifx`

`esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)`

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- cb: callback

esp_err_t **esp_wifi_set_promiscuous** (bool *en*)

Enable the promiscuous mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- en: false - disable, true - enable

esp_err_t **esp_wifi_get_promiscuous** (bool **en*)

Get the promiscuous mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- [out] *en*: store the current status of promiscuous mode

esp_err_t **esp_wifi_set_promiscuous_filter** (const *wifi_promiscuous_filter_t* **filter*)

Enable the promiscuous mode packet type filter.

Note The default filter is to filter all packets except WIFI_PKT_MISC

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- *filter*: the packet type filtered in promiscuous mode.

esp_err_t **esp_wifi_get_promiscuous_filter** (*wifi_promiscuous_filter_t* **filter*)

Get the promiscuous filter.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- [out] *filter*: store the current status of promiscuous filter

esp_err_t **esp_wifi_set_promiscuous_ctrl_filter** (const *wifi_promiscuous_filter_t* **filter*)

Enable subtype filter of the control packet in promiscuous mode.

Note The default filter is to filter none control packet.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- *filter*: the subtype of the control packet filtered in promiscuous mode.

esp_err_t **esp_wifi_get_promiscuous_ctrl_filter** (*wifi_promiscuous_filter_t* **filter*)

Get the subtype filter of the control packet in promiscuous mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- [out] *filter*: store the current status of subtype filter of the control packet in promiscuous mode

esp_err_t **esp_wifi_set_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail

Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

Parameters

- interface: interface
- conf: station or soft-AP configuration

esp_err_t **esp_wifi_get_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Get configuration of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters

- interface: interface
- [out] conf: station or soft-AP configuration

esp_err_t **esp_wifi_ap_get_sta_list** (*wifi_sta_list_t* *sta)

Get STAs associated with soft-AP.

Attention SSC only API

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters

- [out] sta: station list ap can get the connected sta' s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_1r in the *wifi_sta_info_t* struct. For example, phy_11b = 1 imply that sta support 802.11b mode

esp_err_t **esp_wifi_ap_get_sta_aid** (const uint8_t mac[6], uint16_t *aid)

Get AID of STA connected with soft-AP.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters

- mac: STA' s mac address
- [out] aid: Store the AID corresponding to STA mac

esp_err_t **esp_wifi_set_storage** (*wifi_storage_t* storage)

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- storage: : storage type

esp_err_t **esp_wifi_set_vendor_ie** (bool enable, *wifi_vendor_ie_type_t* type, *wifi_vendor_ie_id_t* idx, const void *vnd_ie)

Set 802.11 Vendor-Specific Information Element.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

Parameters

- enable: If true, specified IE is enabled. If false, specified IE is removed.
- type: Information Element type. Determines the frame type to associate with the IE.
- idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *wifi_vendor_ie_data_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

esp_err_t **esp_wifi_set_vendor_ie_cb** (*esp_vendor_ie_cb_t* cb, void *ctx)

Register Vendor-Specific Information Element monitoring callback.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- cb: Callback function
- ctx: Context argument, passed to callback function.

esp_err_t **esp_wifi_set_max_tx_power** (int8_t power)

Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.

Attention 2. The value set by this API will be mapped to the max_tx_power of the structure *wifi_country_t* variable.

Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

Parameters

- power: Maximum WiFi transmitting power.

esp_err_t **esp_wifi_get_max_tx_power** (int8_t *power)

Get maximum transmitting power after WiFi start.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- power: Maximum WiFi transmitting power, unit is 0.25dBm.

`esp_err_t esp_wifi_set_event_mask (uint32_t mask)`

Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRCVED.

Attention 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- mask: WiFi event mask.

`esp_err_t esp_wifi_get_event_mask (uint32_t *mask)`

Get mask of WiFi events.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- mask: WiFi event mask.

`esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Return

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

Parameters

- ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- buffer: raw ieee80211 buffer
- len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

`esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)`

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- `cb`: callback
- `ctx`: context argument, passed to callback function

esp_err_t **esp_wifi_set_csi_config** (const *wifi_csi_config_t* **config*)

Set CSI data configuration.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_START`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters

- `config`: configuration

esp_err_t **esp_wifi_set_csi** (bool *en*)

Enable or disable CSI.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_START`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters

- `en`: true - enable, false - disable

esp_err_t **esp_wifi_set_ant_gpio** (const *wifi_ant_gpio_config_t* **config*)

Set antenna GPIO configuration.

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

Parameters

- `config`: Antenna GPIO configuration.

esp_err_t **esp_wifi_get_ant_gpio** (*wifi_ant_gpio_config_t* **config*)

Get current antenna GPIO configuration.

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument, e.g. parameter is NULL

Parameters

- `config`: Antenna GPIO configuration.

esp_err_t **esp_wifi_set_ant** (const *wifi_ant_config_t* **config*)

Set antenna configuration.

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters

- `config`: Antenna configuration.

esp_err_t **esp_wifi_get_ant** (*wifi_ant_config_t* **config*)

Get current antenna configuration.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters

- config: Antenna configuration.

int64_t **esp_wifi_get_tsf_time** (*wifi_interface_t interface*)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

Attention Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Return 0 or the TSF time

Parameters

- interface: The interface whose tsf_time is to be retrieved.

esp_err_t **esp_wifi_set_inactive_time** (*wifi_interface_t ifx*, uint16_t sec)

Set the inactive time of the ESP32 STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

Attention 3. The inactive time configuration is not stored into flash

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters

- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

esp_err_t **esp_wifi_get_inactive_time** (*wifi_interface_t ifx*, uint16_t *sec)

Get inactive time of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

esp_err_t **esp_wifi_stats_dump** (uint32_t modules)

Dump WiFi statistics.

Return

- ESP_OK: succeed
- others: failed

Parameters

- modules: statistic modules to be dumped

esp_err_t **esp_wifi_set_rssi_threshold** (int32_t rssi)

Set RSSI threshold below which APP will get an event.

Attention This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- `rss_i`: threshold value in dbm between -100 to 0

`esp_err_t esp_wifi_ftm_initiate_session (wifi_ftm_initiator_cfg_t *cfg)`

Start an FTM Initiator session by sending FTM request. If successful, event `WIFI_EVENT_FTM_REPORT` is generated with the result of the FTM procedure.

Attention Use this API only in Station mode

Return

- `ESP_OK`: succeed
- others: failed

Parameters

- `cfg`: FTM Initiator session configuration

`esp_err_t esp_wifi_ftm_end_session (void)`

End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

Return

- `ESP_OK`: succeed
- others: failed

`esp_err_t esp_wifi_ftm_resp_set_offset (int16_t offset_cm)`

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

Attention Use this API only in AP mode before performing FTM as responder

Return

- `ESP_OK`: succeed
- others: failed

Parameters

- `offset_cm`: T1 Offset to be added in centimeters

`esp_err_t esp_wifi_config_11b_rate (wifi_interface_t ifx, bool disable)`

Enable or disable 11b rate of specified interface.

Attention 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

Attention 2. Only when really need to disable 11b rate call this API otherwise don't call this.

Return

- `ESP_OK`: succeed
- others: failed

Parameters

- `ifx`: Interface to be configured.
- `disable`: true means disable 11b rate while false means enable 11b rate.

`esp_err_t esp_wifi_config_espnow_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)`

Config ESPNOW rate of specified interface.

Attention 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

Return

- `ESP_OK`: succeed
- others: failed

Parameters

- `ifx`: Interface to be configured.
- `rate`: Phy rate to be configured.

`esp_err_t esp_wifi_set_connectionless_wake_interval (uint16_t interval)`

Set interval for station to wake up periodically at disconnected.

Attention 1. Only when `ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` is enabled, this configuration could work

Attention 2. This configuration only work for station mode and disconnected status

Attention 3. This configuration would influence nothing until some module configure `wake_window`

Attention 4. A sensible interval which is not too small is recommended (e.g. 100ms)

Parameters

- `interval`: how much microsecond would the chip wake up, from 1 to 65535.

`esp_err_t esp_wifi_set_country_code (const char *country, bool ieee80211d_enabled)`
configure country

Attention 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

Attention 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 4. The country configuration is stored into flash.

Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 6. Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.

Attention 8. The default country is “CN” and `ieee80211d_enabled` is TRUE.

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters

- `country`: the configured country ISO code
- `ieee80211d_enabled`: 802.11d is enabled or not

`esp_err_t esp_wifi_get_country_code (char *country)`
get the current country code

Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters

- `country`: country code

`esp_err_t esp_wifi_config_80211_tx_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)`
Config 80211 tx rate of specified interface.

Attention 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

Return

- `ESP_OK`: succeed
- others: failed

Parameters

- `ifx`: Interface to be configured.
- `rate`: Phy rate to be configured.

Structures

`struct wifi_init_config_t`

WiFi stack configuration parameters passed to `esp_wifi_init` call.

Public Members

`system_event_handler_t event_handler`

WiFi event handler

`wifi_osi_funcs_t *osi_funcs`
WiFi OS functions

`wpa_crypto_funcs_t wpa_crypto_funcs`
WiFi station crypto functions when connect

`int static_rx_buf_num`
WiFi static RX buffer number

`int dynamic_rx_buf_num`
WiFi dynamic RX buffer number

`int tx_buf_type`
WiFi TX buffer type

`int static_tx_buf_num`
WiFi static TX buffer number

`int dynamic_tx_buf_num`
WiFi dynamic TX buffer number

`int cache_tx_buf_num`
WiFi TX cache buffer number

`int csi_enable`
WiFi channel state information enable flag

`int ampdu_rx_enable`
WiFi AMPDU RX feature enable flag

`int ampdu_tx_enable`
WiFi AMPDU TX feature enable flag

`int amsdu_tx_enable`
WiFi AMSDU TX feature enable flag

`int nvs_enable`
WiFi NVS flash enable flag

`int nano_enable`
Nano option for printf/scan family enable flag

`int rx_ba_win`
WiFi Block Ack RX window size

`int wifi_task_core_id`
WiFi Task Core ID

`int beacon_max_len`
WiFi softAP maximum length of the beacon

`int mgmt_sbuf_num`
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

`uint64_t feature_caps`
Enables additional WiFi features and capabilities

`bool sta_disconnected_pm`
WiFi Power Management for station at disconnected status

`int magic`
WiFi init magic number, it should be the last field

Macros

`ESP_ERR_WIFI_NOT_INIT`
WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
WiFi interface error

ESP_ERR_WIFI_MODE
WiFi mode error

ESP_ERR_WIFI_STATE
WiFi internal state error

ESP_ERR_WIFI_CONN
WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
WiFi internal NVS module error

ESP_ERR_WIFI_MAC
MAC address is invalid

ESP_ERR_WIFI_SSID
SSID is invalid

ESP_ERR_WIFI_PASSWORD
Password is invalid

ESP_ERR_WIFI_TIMEOUT
Timeout error

ESP_ERR_WIFI_WAKE_FAIL
WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

WIFI_STATIC_TX_BUFFER_NUM

WIFI_CACHE_TX_BUFFER_NUM

WIFI_DYNAMIC_TX_BUFFER_NUM

WIFI_CSI_ENABLED

WIFI_AMPDU_RX_ENABLED

WIFI_AMPDU_TX_ENABLED

WIFI_AMSDU_TX_ENABLED

WIFI_NV_S_ENABLED
WIFI_NANO_FORMAT_ENABLED
WIFI_INIT_CONFIG_MAGIC
WIFI_DEFAULT_RX_BA_WIN
WIFI_TASK_CORE_ID
WIFI_SOFTAP_BEACON_MAX_LEN
WIFI_MGMT_SBUF_NUM
WIFI_STA_DISCONNECTED_PM_ENABLED
CONFIG_FEATURE_WPA3_SAE_BIT
CONFIG_FEATURE_CACHE_TX_BUF_BIT
CONFIG_FEATURE_FTM_INITIATOR_BIT
CONFIG_FEATURE_FTM_RESPONDER_BIT
WIFI_INIT_CONFIG_DEFAULT()

Type Definitions

typedef void (***wifi_promiscuous_cb_t**) (void *buf, *wifi_promiscuous_pkt_type_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters

- **buf**: Data received. Type of data in buffer (*wifi_promiscuous_pkt_t* or *wifi_pkt_rx_ctrl_t*) indicated by 'type' parameter.
- **type**: promiscuous packet type.

typedef void (***esp_vendor_ie_cb_t**) (void *ctx, *wifi_vendor_ie_type_t* type, **const** uint8_t sa[6], **const** *vendor_ie_data_t* *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Parameters

- **ctx**: Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.
- **type**: Information element type, based on frame type received.
- **sa**: Source 802.11 address.
- **vnd_ie**: Pointer to the vendor specific element data received.
- **rssi**: Received signal strength indication.

typedef void (***wifi_csi_cb_t**) (void *ctx, *wifi_csi_info_t* *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters

- **ctx**: context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.
- **data**: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- [components/esp_wifi/include/esp_wifi_types.h](#)

Unions

union **wifi_config_t**

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

Public Members

wifi_ap_config_t **ap**
configuration of AP

wifi_sta_config_t **sta**
configuration of STA

Structures

struct wifi_country_t
Structure describing WiFi country-based regional restrictions.

Public Members

char **cc**[3]
country code string

uint8_t **schan**
start channel

uint8_t **nchan**
total channel number

int8_t **max_tx_power**
This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

wifi_country_policy_t **policy**
country policy

struct wifi_active_scan_time_t
Range of active scan times per channel.

Public Members

uint32_t **min**
minimum active scan time per channel, units: millisecond

uint32_t **max**
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t
Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t **active**
active scan time per channel, units: millisecond.

uint32_t **passive**
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

`uint8_t *ssid`
SSID of AP

`uint8_t *bssid`
MAC address of AP

`uint8_t channel`
channel, scan the specific channel

bool `show_hidden`
enable to scan AP whose SSID is hidden

wifi_scan_type_t `scan_type`
scan type, active or passive

wifi_scan_time_t `scan_time`
scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.

Public Members

`uint8_t bssid[6]`
MAC address of AP

`uint8_t ssid[33]`
SSID of AP

`uint8_t primary`
channel of AP

wifi_second_chan_t `second`
secondary channel of AP

`int8_t rssi`
signal strength of AP

wifi_auth_mode_t `authmode`
authmode of AP

wifi_cipher_type_t `pairwise_cipher`
pairwise cipher of AP

wifi_cipher_type_t `group_cipher`
group cipher of AP

wifi_ant_t `ant`
antenna used to receive beacon from AP

`uint32_t phy_11b : 1`
bit: 0 flag to identify if 11b mode is enabled or not

`uint32_t phy_11g : 1`
bit: 1 flag to identify if 11g mode is enabled or not

`uint32_t phy_11n : 1`
bit: 2 flag to identify if 11n mode is enabled or not

`uint32_t phy_1r : 1`
bit: 3 flag to identify if low rate is enabled or not

`uint32_t wps : 1`
bit: 4 flag to identify if WPS is supported or not

uint32_t **ftm_responder** : 1
bit: 5 flag to identify if FTM is supported in responder mode

uint32_t **ftm_initiator** : 1
bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t **reserved** : 25
bit: 7..31 reserved

wifi_country_t **country**
country information of AP

struct wifi_scan_threshold_t
Structure describing parameters for a WiFi fast scan.

Public Members

int8_t **rssi**
The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t **authmode**
The weakest authmode to accept in the fast scan mode

struct wifi_pmf_config_t
Configuration structure for Protected Management Frame

Public Members

bool **capable**
Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct wifi_ap_config_t
Soft-AP configuration settings for the ESP32.

Public Members

uint8_t **ssid**[32]
SSID of ESP32 soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

uint8_t **password**[64]
Password of ESP32 soft-AP.

uint8_t **ssid_len**
Optional length of SSID field.

uint8_t **channel**
Channel of ESP32 soft-AP

wifi_auth_mode_t **authmode**
Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t **ssid_hidden**
Broadcast SSID or not, default 0, broadcast the SSID

uint8_t **max_connection**
Max number of stations allowed to connect in, default 4, max 10

uint16_t beacon_interval

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t pairwise_cipher

pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool ftm_responder

Enable FTM Responder mode

struct wifi_sta_config_t

STA configuration settings for the ESP32.

Public Members**uint8_t ssid[32]**

SSID of target AP.

uint8_t password[64]

Password of target AP.

wifi_scan_method_t scan_method

do all channel scan or fast scan

bool bssid_set

whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t bssid[6]

MAC address of target AP

uint8_t channel

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t listen_interval

Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method

sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold

When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled : 1

Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled : 1

Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled : 1

Whether MBO is enabled for the connection

uint32_t reserved : 29

Reserved for future feature set

struct wifi_sta_info_t

Description of STA associated with AP.

Public Members

uint8_t **mac**[6]

mac address

int8_t **rss**

current average rssi of sta connected

uint32_t **phy_11b** : 1

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g** : 1

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n** : 1

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr** : 1

bit: 3 flag to identify if low rate is enabled or not

uint32_t **is_mesh_child** : 1

bit: 4 flag to identify mesh child

uint32_t **reserved** : 27

bit: 5..31 reserved

struct wifi_sta_list_t

List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t **sta**[ESP_WIFI_MAX_CONN_NUM]

station list

int **num**

number of stations in the list (other entries are invalid)

struct vendor_ie_data_t

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t **element_id**

Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8_t **vendor_oui**[3]

Vendor identifier (OUI).

uint8_t **vendor_oui_type**

Vendor-specific OUI type.

uint8_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct wifi_pkt_rx_ctrl_t

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed **rss_i** : 8

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate** : 5

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **__pad0__** : 1

reserved

unsigned **sig_mode** : 2

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **__pad1__** : 16

reserved

unsigned **mcs** : 7

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb** : 1

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **__pad2__** : 16

reserved

unsigned **smoothing** : 1

reserved

unsigned **not_sounding** : 1

reserved

unsigned **__pad3__** : 1

reserved

unsigned **aggregation** : 1

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc** : 2

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec_coding** : 1

Flag is set for 11n packets which are LDPC

unsigned **sgi** : 1

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **__pad4__** : 8

reserved

unsigned **ampdu_cnt** : 8

ampdu cnt

unsigned **channel** : 4

primary channel on which this packet is received

unsigned **secondary_channel** : 4

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad5__** : 8

reserved

unsigned **timestamp** : 32
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad6__** : 32
reserved

signed **noise_floor** : 8
noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned **__pad7__** : 24
reserved

unsigned **__pad8__** : 32
reserved

unsigned **__pad9__** : 31
reserved

unsigned **ant** : 1
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **__pad10__** : 32
reserved

unsigned **__pad11__** : 32
reserved

unsigned **__pad12__** : 32
reserved

unsigned **sig_len** : 12
length of packet including Frame Check Sequence(FCS)

unsigned **__pad13__** : 12
reserved

unsigned **rx_state** : 8
state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t

Payload passed to 'buf' parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**
metadata header

uint8_t **payload**[0]
Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t

Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t **filter_mask**
OR of one or more filter values WIFI_PROMIS_FILTER_*

struct wifi_csi_config_t

Channel state information(CSI) configuration type.

Public Members

- bool **lltf_en**
enable to receive legacy long training field(lltf) data. Default enabled
- bool **htltf_en**
enable to receive HT long training field(htltf) data. Default enabled
- bool **stbc_htltf2_en**
enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled
- bool **ltf_merge_en**
enable to generate htltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled
- bool **channel_filter_en**
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled
- bool **manu_scale**
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false
- uint8_t **shift**
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

- wifi_pkt_rx_ctrl_t rx_ctrl*
received packet radio metadata header of the CSI data
- uint8_t **mac**[6]
source MAC address of the CSI data
- bool **first_word_invalid**
first four bytes of the CSI data is invalid or not
- int8_t ***buf**
buffer of CSI data
- uint16_t **len**
length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.

Public Members

- uint8_t **gpio_select** : 1
Whether this GPIO is connected to external antenna switch
- uint8_t **gpio_num** : 7
The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t **gpio_cfg**[4]

The configurations of GPIOs that connect to external antenna switch

struct **wifi_ant_config_t**

WiFi antenna configuration.

Public Members

wifi_ant_mode_t **rx_ant_mode**

WiFi antenna mode for receiving

wifi_ant_t **rx_ant_default**

Default antenna mode for receiving, it's ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t **tx_ant_mode**

WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t **enabled_ant0** : 4

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t **enabled_ant1** : 4

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct **wifi_action_tx_req_t**

Action Frame Tx Request.

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint8_t **dest_mac**[6]

Destination MAC address

bool **no_ack**

Indicates no ack required

wifi_action_rx_cb_t **rx_cb**

Rx Callback to receive any response

uint32_t **data_len**

Length of the appended Data

uint8_t **data**[0]

Appended Data payload

struct **wifi_ftm_initiator_cfg_t**

FTM Initiator configuration.

Public Members

uint8_t **resp_mac**[6]

MAC address of the FTM Responder

uint8_t **channel**

Primary channel of the FTM Responder

uint8_t **frm_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

`uint16_t burst_period`

Requested time period between consecutive FTM bursts in 100³ s of milliseconds (0 - No pref)

struct wifi_event_sta_scan_done_t

Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

`uint32_t status`

status of scanning APs: 0 —success, 1 - failure

`uint8_t number`

number of scan results

`uint8_t scan_id`

scan sequence number, used for block scan

struct wifi_event_sta_connected_t

Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

`uint8_t ssid[32]`

SSID of connected AP

`uint8_t ssid_len`

SSID length of connected AP

`uint8_t bssid[6]`

BSSID of connected AP

`uint8_t channel`

channel of connected AP

wifi_auth_mode_t `authmode`

authentication mode used by AP

struct wifi_event_sta_disconnected_t

Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

`uint8_t ssid[32]`

SSID of disconnected AP

`uint8_t ssid_len`

SSID length of disconnected AP

`uint8_t bssid[6]`

BSSID of disconnected AP

`uint8_t reason`

reason of disconnection

struct wifi_event_sta_authmode_change_t

Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t `old_mode`

the old auth mode of AP

wifi_auth_mode_t **new_mode**
the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t **pin_code**[8]
PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t **ap_cred_cnt**
Number of AP credentials received

uint8_t **ssid**[MAX_SSID_LEN]
SSID of AP

uint8_t **passphrase**[MAX_PASSPHRASE_LEN]
Passphrase for the AP

struct *wifi_event_sta_wps_er_success_t*::[anonymous] **ap_cred**[MAX_WPS_AP_CRED]
All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t **mac**[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t **aid**
the aid that ESP32 soft-AP gives to the station connected to

bool **is_mesh_child**
flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t **mac**[6]
MAC address of the station disconnects to ESP32 soft-AP

uint8_t **aid**
the aid that ESP32 soft-AP gave to the station disconnects to

bool **is_mesh_child**
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength

uint8_t mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for

Public Members

uint8_t dlog_token
Dialog Token of the FTM frame

int8_t rssi
RSSI of the FTM frame received

uint32_t rtt
Round Trip Time in pSec with a peer

uint64_t t1
Time of departure of FTM frame from FTM Responder in pSec

uint64_t t2
Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t t3
Time of departure of ACK from FTM Initiator in pSec

uint64_t t4
Time of arrival of ACK at FTM Responder in pSec

struct wifi_event_ftm_report_t
Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

uint8_t peer_mac[6]
MAC address of the FTM Peer

wifi_ftm_status_t status
Status of the FTM operation

uint32_t rtt_raw
Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est
Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t dist_est
Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t *ftm_report_data

Pointer to FTM Report with multiple entries, should be freed after use

uint8_t ftm_report_num_entries

Number of entries in the FTM Report data

struct wifi_event_action_tx_status_t

Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t ifx

WiFi interface to send request to

uint32_t context

Context to identify the request

uint8_t da[6]

Destination MAC address

uint8_t status

Status of the operation

struct wifi_event_roc_done_t

Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t context

Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL

WIFI_PROTOCOL_11B

WIFI_PROTOCOL_11G

WIFI_PROTOCOL_11N

WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM

max number of stations which can connect to ESP32 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL

filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT

filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL

filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA

filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
mask all WiFi events

WIFI_EVENT_MASK_NONE
mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN

MAX_PASSPHRASE_LEN

MAX_WPS_AP_CRED

WIFI_STATIS_BUFFER

WIFI_STATIS_RXTX

WIFI_STATIS_HW

WIFI_STATIS_DIAG

WIFI_STATIS_PS

WIFI_STATIS_ALL

Type Definitions

```
typedef int (*wifi_action_rx_cb_t) (uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

Parameters

- `hdr`: pointer to the IEEE 802.11 Header structure
- `payload`: pointer to the Payload following 802.11 Header
- `len`: length of the Payload
- `channel`: channel number the frame is received on

Enumerations

```
enum wifi_mode_t
```

Values:

```
WIFI_MODE_NULL = 0
```

null mode

```
WIFI_MODE_STA
```

WiFi station mode

```
WIFI_MODE_AP
```

WiFi soft-AP mode

```
WIFI_MODE_APSTA
```

WiFi station + soft-AP mode

```
WIFI_MODE_MAX
```

```
enum wifi_interface_t
```

Values:

```
WIFI_IF_STA = ESP_IF_WIFI_STA
```

```
WIFI_IF_AP = ESP_IF_WIFI_AP
```

```
enum wifi_country_policy_t
```

Values:

```
WIFI_COUNTRY_POLICY_AUTO
```

Country policy is auto, use the country info of AP to which the station is connected

```
WIFI_COUNTRY_POLICY_MANUAL
```

Country policy is manual, always use the configured country info

```
enum wifi_auth_mode_t
```

Values:

```
WIFI_AUTH_OPEN = 0
```

authenticate mode : open

```
WIFI_AUTH_WEP
```

authenticate mode : WEP

```
WIFI_AUTH_WPA_PSK
```

authenticate mode : WPA_PSK

```
WIFI_AUTH_WPA2_PSK
```

authenticate mode : WPA2_PSK

```
WIFI_AUTH_WPA_WPA2_PSK
```

authenticate mode : WPA_WPA2_PSK

```
WIFI_AUTH_WPA2_ENTERPRISE
```

authenticate mode : WPA2_ENTERPRISE

```
WIFI_AUTH_WPA3_PSK
```

authenticate mode : WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode : WPA2_WPA3_PSK

WIFI_AUTH_WAPI_PSK
authenticate mode : WAPI_PSK

WIFI_AUTH_MAX

enum wifi_err_reason_t

Values:

WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
WIFI_REASON_ROAMING = 207

enum wifi_second_chan_t*Values:***WIFI_SECOND_CHAN_NONE = 0**

the channel width is HT20

WIFI_SECOND_CHAN_ABOVE

the channel width is HT40 and the secondary channel is above the primary channel

WIFI_SECOND_CHAN_BELOW

the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t*Values:***WIFI_SCAN_TYPE_ACTIVE = 0**

active scan

WIFI_SCAN_TYPE_PASSIVE

passive scan

enum wifi_cipher_type_t*Values:***WIFI_CIPHER_TYPE_NONE = 0**

the cipher type is none

WIFI_CIPHER_TYPE_WEP40

the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104

the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP

the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP

the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP

the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128

the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_SMS4

the cipher type is SMS4

WIFI_CIPHER_TYPE_GCMP

the cipher type is GCMP

WIFI_CIPHER_TYPE_GCMP256

the cipher type is GCMP-256

WIFI_CIPHER_TYPE_AES_GMAC128

the cipher type is AES-GMAC-128

WIFI_CIPHER_TYPE_AES_GMAC256

the cipher type is AES-GMAC-256

WIFI_CIPHER_TYPE_UNKNOWN

the cipher type is unknown

enum wifi_ant_t

WiFi antenna.

*Values:***WIFI_ANT_ANT0**

WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t
Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in [wifi_sta_config_t](#)

enum wifi_bandwidth_t
Values:

WIFI_BW_HT20 = 1

WIFI_BW_HT40

enum wifi_storage_t
Values:

WIFI_STORAGE_FLASH
all configuration will store in both memory and flash

WIFI_STORAGE_RAM
all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

WIFI_VND_IE_TYPE_BEACON

WIFI_VND_IE_TYPE_PROBE_REQ

WIFI_VND_IE_TYPE_PROBE_RESP

WIFI_VND_IE_TYPE_ASSOC_REQ

WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

WIFI_VND_IE_ID_0

WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

WIFI_PKT_MGMT

Management frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

WIFI_PKT_CTRL

Control frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

WIFI_PKT_DATA

Data frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

WIFI_PKT_MISC

Other type, such as MIMO etc. ‘buf’ argument is *wifi_promiscuous_pkt_t* but the payload is zero length.

enum wifi_ant_mode_t

WiFi antenna mode.

Values:

WIFI_ANT_MODE_ANT0

Enable WiFi antenna 0 only

WIFI_ANT_MODE_ANT1

Enable WiFi antenna 1 only

WIFI_ANT_MODE_AUTO

Enable WiFi antenna 0 and 1, automatically select an antenna

WIFI_ANT_MODE_MAX

Invalid WiFi enabled antenna

enum wifi_phy_rate_t

WiFi PHY rate encodings.

Values:

WIFI_PHY_RATE_1M_L = 0x00

1 Mbps with long preamble

WIFI_PHY_RATE_2M_L = 0x01

2 Mbps with long preamble

WIFI_PHY_RATE_5M_L = 0x02

5.5 Mbps with long preamble

WIFI_PHY_RATE_11M_L = 0x03

11 Mbps with long preamble

WIFI_PHY_RATE_2M_S = 0x05

2 Mbps with short preamble

WIFI_PHY_RATE_5M_S = 0x06

5.5 Mbps with short preamble

WIFI_PHY_RATE_11M_S = 0x07
11 Mbps with short preamble

WIFI_PHY_RATE_48M = 0x08
48 Mbps

WIFI_PHY_RATE_24M = 0x09
24 Mbps

WIFI_PHY_RATE_12M = 0x0A
12 Mbps

WIFI_PHY_RATE_6M = 0x0B
6 Mbps

WIFI_PHY_RATE_54M = 0x0C
54 Mbps

WIFI_PHY_RATE_36M = 0x0D
36 Mbps

WIFI_PHY_RATE_18M = 0x0E
18 Mbps

WIFI_PHY_RATE_9M = 0x0F
9 Mbps

WIFI_PHY_RATE_MCS0_LGI = 0x10
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS1_LGI = 0x11
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_LGI = 0x12
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_LGI = 0x13
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_LGI = 0x14
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_LGI = 0x15
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_LGI = 0x16
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_LGI = 0x17
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS0_SGI = 0x18
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

WIFI_PHY_RATE_MCS1_SGI = 0x19
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_SGI = 0x1A
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_SGI = 0x1B
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_SGI = 0x1C
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_SGI = 0x1D
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_SGI = 0x1E
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_SGI = 0x1F
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

WIFI_PHY_RATE_LORA_250K = 0x29
250 Kbps

WIFI_PHY_RATE_LORA_500K = 0x2A
500 Kbps

WIFI_PHY_RATE_MAX

enum wifi_event_t

WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 WiFi ready

WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start

WIFI_EVENT_STA_STOP
ESP32 station stop

WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRCVD
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT

Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW

AP's RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS

Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE

Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT

ESP32 station beacon timeout

WIFI_EVENT_MAX

Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t

Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

*Values:***WPS_FAIL_REASON_NORMAL = 0**

ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D

ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX**enum wifi_ftm_status_t**

FTM operation status types.

*Values:***FTM_STATUS_SUCCESS = 0**

FTM exchange is successful

FTM_STATUS_UNSUPPORTED

Peer does not support FTM

FTM_STATUS_CONF_REJECTED

Peer rejected FTM configuration in FTM Request

FTM_STATUS_NO_RESPONSE

Peer did not respond to FTM Requests

FTM_STATUS_FAIL

Unknown error during FTM exchange

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-S3 devices, check [配网 API](#).

Application Example Connect ESP32-S3 to target AP using SmartConfig: [wifi/smart_config](#).

API Reference

Header File

- `components/esp_wifi/include/esp_smartconfig.h`

Functions

const char ***esp_smartconfig_get_version** (void)

Get the version of SmartConfig.

Return

- SmartConfig version const char.

esp_err_t **esp_smartconfig_start** (const *smartconfig_start_config_t* *config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.

Attention 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

Return

- ESP_OK: succeed
- others: fail

Parameters

- config: pointer to smartconfig start configure structure

esp_err_t **esp_smartconfig_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

Return

- ESP_OK: succeed
- others: fail

esp_err_t **esp_esptouch_set_timeout** (uint8_t time_s)

Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return

- ESP_OK: succeed
- others: fail

Parameters

- time_s: range 15s~255s, offset:45s.

esp_err_t **esp_smartconfig_set_type** (*smartconfig_type_t* type)

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

Return

- ESP_OK: succeed
- others: fail

Parameters

- type: Choose from the `smartconfig_type_t`.

esp_err_t **esp_smartconfig_fast_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API `esp_smartconfig_start`.

Attention 2. Fast mode have corresponding APP(phone).

Attention 3. Two mode is compatible.

Return

- ESP_OK: succeed
- others: fail

Parameters

- `enable`: false-disable(default); true-enable;

esp_err_t **esp_smartconfig_get_rvd_data** (uint8_t **rvd_data*, uint8_t *len*)

Get reserved data of ESPTouch v2.

Return

- `ESP_OK`: succeed
- others: fail

Parameters

- `rvd_data`: reserved data
- `len`: length of reserved data

Structures

struct smartconfig_event_got_ssid_pswd_t

Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid_set**

whether set MAC address of target AP or not.

uint8_t **bssid**[6]

MAC address of target AP.

smartconfig_type_t **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8_t **cellphone_ip**[4]

IP address of cellphone.

struct smartconfig_start_config_t

Configure structure for esp_smartconfig_start

Public Members

bool **enable_log**

Enable smartconfig logs.

bool **esp_touch_v2_enable_crypt**

Enable ESPTouch v2 crypt.

char ***esp_touch_v2_key**

ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations**enum smartconfig_type_t**

Values:

SC_TYPE_ESPTOUCH = 0
protocol: ESPTouch**SC_TYPE_AIRKISS**
protocol: AirKiss**SC_TYPE_ESPTOUCH_AIRKISS**
protocol: ESPTouch and AirKiss**SC_TYPE_ESPTOUCH_V2**
protocol: ESPTouch v2**enum smartconfig_event_t**

Smartconfig event declarations

Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs**SC_EVENT_FOUND_CHANNEL**
ESP32 station smartconfig has found the channel of the target AP**SC_EVENT_GOT_SSID_PSWD**
ESP32 station smartconfig got the SSID and password**SC_EVENT_SEND_ACK_DONE**
ESP32 station smartconfig has sent ACK to cellphone**ESP-NOW**

概述 ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用于保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

帧格式 ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为：

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示：

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。

- 长度：长度是组织标识符、类型、版本和正文的总长度。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

安全

ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始

- PMK 可使用 AES-128 算法加密 LMK。请调用 `esp_now_set_pmk()` 设置 PMK。如果未设置 PMK，将使用默认 PMK。
- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密，最多拥有 6 个不同的 LMK。如果未设置配对设备的 LMK，则动作帧不进行加密。

目前，不支持加密组播供应商特定的动作帧。

初始化和反初始化 调用 `esp_now_init()` 初始化 ESP-NOW，调用 `esp_now_deinit()` 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 `esp_now_deinit()` 时，配对设备的所有信息都将被删除。

添加配对设备 在将数据发送到其他设备之前，请先调用 `esp_now_add_peer()` 将其添加到配对设备列表中。配对设备的最大数量是 20。如果启用了加密，则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 ~ 14。如果信道设置为 0，数据将在当前信道上发送。否则，必须使用本地设备所在的通道。

发送 ESP-NOW 数据 调用 `esp_now_send()` 发送 ESP-NOW 数据，调用 `esp_now_register_send_cb` 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则，它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，则调用 `esp_now_send()` 一次性发送不大于 250 字节的数据。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此，建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发布到队列，并交给优先级较低的任务处理。

接收 ESP-NOW 数据 调用 `esp_now_register_rcv_cb` 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发布到队列，并交给优先级较低的任务处理。

API 参考

Header File

- `components/esp_wifi/include/esp_now.h`

Functions***esp_err_t* esp_now_init** (void)

Initialize ESPNOW function.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error

***esp_err_t* esp_now_deinit** (void)

De-initialize ESPNOW function.

Return

- ESP_OK : succeed

***esp_err_t* esp_now_get_version** (uint32_t **version*)

Get the version of ESPNOW.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

Parameters

- *version*: ESPNOW version

***esp_err_t* esp_now_register_recv_cb** (*esp_now_recv_cb_t* *cb*)

Register callback function of receiving ESPNOW data.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters

- *cb*: callback function of receiving ESPNOW data

***esp_err_t* esp_now_unregister_recv_cb** (void)

Unregister callback function of receiving ESPNOW data.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

***esp_err_t* esp_now_register_send_cb** (*esp_now_send_cb_t* *cb*)

Register callback function of sending ESPNOW data.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters

- *cb*: callback function of sending ESPNOW data

***esp_err_t* esp_now_unregister_send_cb** (void)

Unregister callback function of sending ESPNOW data.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

***esp_err_t* esp_now_send** (const uint8_t **peer_addr*, const uint8_t **data*, size_t *len*)

Send ESPNOW data.

Attention 1. If *peer_addr* is not NULL, send data to the peer whose MAC address matches *peer_addr***Attention** 2. If *peer_addr* is NULL, send data to all of the peers that are added to the peer list**Attention** 3. The maximum length of *data* must be less than ESP_NOW_MAX_DATA_LEN**Attention** 4. The buffer pointed to by *data* argument does not need to be valid after *esp_now_send* returns**Return**

- ESP_OK : succeed

- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

Parameters

- `peer_addr`: peer MAC address
- `data`: data to send
- `len`: length of data

`esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)`

Add a peer to peer list.

Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

Parameters

- `peer`: peer information

`esp_err_t esp_now_del_peer (const uint8_t *peer_addr)`

Delete a peer from peer list.

Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

Parameters

- `peer_addr`: peer MAC address

`esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)`

Modify a peer.

Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

Parameters

- `peer`: peer information

`esp_err_t esp_now_get_peer (const uint8_t *peer_addr, esp_now_peer_info_t *peer)`

Get a peer whose MAC address matches `peer_addr` from peer list.

Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

Parameters

- `peer_addr`: peer MAC address
- `peer`: peer information

`esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)`

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters

- *from_head*: fetch from head of list or not
- *peer*: peer information

bool **esp_now_is_peer_exist** (const uint8_t **peer_addr*)

Peer exists or not.

Return

- true : peer exists
- false : peer not exists

Parameters

- *peer_addr*: peer MAC address

esp_err_t **esp_now_get_peer_num** (*esp_now_peer_num_t* **num*)

Get the number of peers.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

Parameters

- *num*: number of peers

esp_err_t **esp_now_set_pmk** (const uint8_t **pmk*)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

Parameters

- *pmk*: primary master key

esp_err_t **esp_now_set_wake_window** (uint16_t *window*)

Set *esp_now* wake window for *sta_disconnected* power management.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

Attention 2. This configuration only work for station mode and disconnected status

Attention 3. If more than one module has configured its *wake_window*, chip would choose the largest one to stay waked

Attention 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time

Attention 5. If never configured *wake_window*, the chip would keep waked at disconnected once it uses *esp_now*

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Parameters

- *window*: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

Structures

struct **esp_now_peer_info**

ESPNOW peer information parameters.

Public Members

`uint8_t peer_addr[ESP_NOW_ETH_ALEN]`

ESPNow peer MAC address that is also the MAC address of station or softap

`uint8_t lmk[ESP_NOW_KEY_LEN]`

ESPNow peer local master key that is used to encrypt data

`uint8_t channel`

Wi-Fi channel that peer uses to send/receive ESPNow data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

`wifi_interface_t ifidx`

Wi-Fi interface that peer uses to send/receive ESPNow data

`bool encrypt`

ESPNow data that this peer sends/receives is encrypted or not

`void *priv`

ESPNow peer private data

`struct esp_now_peer_num`

Number of ESPNow peers which exist currently.

Public Members

`int total_num`

Total number of ESPNow peers, maximum value is `ESP_NOW_MAX_TOTAL_PEER_NUM`

`int encrypt_num`

Number of encrypted ESPNow peers, maximum value is `ESP_NOW_MAX_ENCRYPT_PEER_NUM`

Macros

`ESP_ERR_ESPNOW_BASE`

ESPNow error number base.

`ESP_ERR_ESPNOW_NOT_INIT`

ESPNow is not initialized.

`ESP_ERR_ESPNOW_ARG`

Invalid argument

`ESP_ERR_ESPNOW_NO_MEM`

Out of memory

`ESP_ERR_ESPNOW_FULL`

ESPNow peer list is full

`ESP_ERR_ESPNOW_NOT_FOUND`

ESPNow peer is not found

`ESP_ERR_ESPNOW_INTERNAL`

Internal error

`ESP_ERR_ESPNOW_EXIST`

ESPNow peer has existed

`ESP_ERR_ESPNOW_IF`

Interface error

`ESP_NOW_ETH_ALEN`

Length of ESPNow peer MAC address

`ESP_NOW_KEY_LEN`

Length of ESPNow peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM

Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM

Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN

Maximum length of ESPNOW data which is sent very time

Type Definitions**typedef struct *esp_now_peer_info* esp_now_peer_info_t**

ESPNOW peer information parameters.

typedef struct *esp_now_peer_num* esp_now_peer_num_t

Number of ESPNOW peers which exist currently.

typedef void (*esp_now_rcv_cb_t) (const uint8_t *mac_addr, const uint8_t *data, int data_len)

Callback function of receiving ESPNOW data.

Parameters

- *mac_addr*: peer MAC address
- *data*: received data
- *data_len*: length of received data

typedef void (*esp_now_send_cb_t) (const uint8_t *mac_addr, *esp_now_send_status_t* status)

Callback function of sending ESPNOW data.

Parameters

- *mac_addr*: peer MAC address
- *status*: status of sending ESPNOW data (succeed or fail)

Enumerations**enum esp_now_send_status_t**

Status of sending ESPNOW data .

*Values:***ESP_NOW_SEND_SUCCESS = 0**

Send ESPNOW data successfully

ESP_NOW_SEND_FAIL

Send ESPNOW data fail

ESP-WIFI-MESH 编程指南

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. [ESP-WIFI-MESH 编程模型](#)
2. [编写 ESP-WIFI-MESH 应用程序](#)
3. [自组网](#)
4. [应用实例](#)
5. [API 参考](#)

有关 ESP-WIFI-MESH 协议的文档，请见[ESP-WIFI-MESH API 指南](#)。有关 ESP-WIFI-MESH 开发框架的更多内容，请见[ESP-WIFI-MESH 开发框架](#)。**ESP-WIFI-MESH 编程模型****软件栈** ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

图 2: ESP-WIFI-MESH 软件栈

系统事件 应用程序可通过 **ESP-WIFI-MESH 事件** 与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 **Wi-Fi 事件任务** 与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

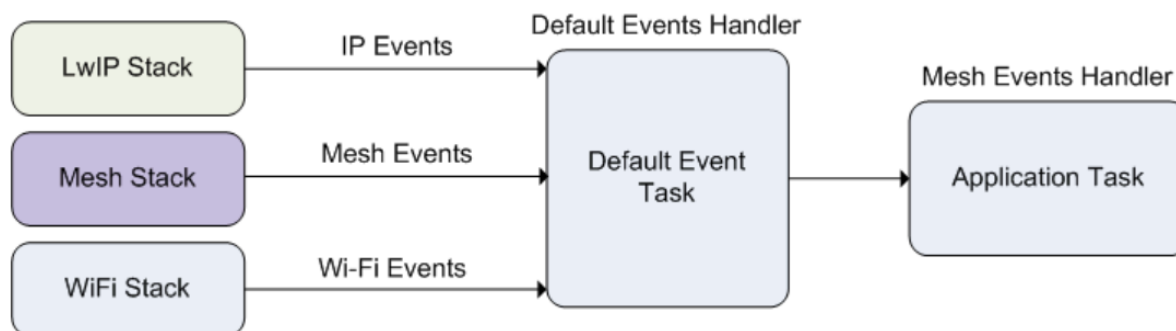

图 3: ESP-WIFI-MESH 系统事件交付

`mesh_event_id_t` 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过 `esp_event_handler_register()` 将 **Mesh 事件处理程序** 注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

Mesh 事件的典型应用场景包括：使用 `MESH_EVENT_PARENT_CONNECTED` 和 `MESH_EVENT_CHILD_CONNECTED` 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用 `IP_EVENT_STA_GOT_IP` 和 `IP_EVENT_STA_LOST_IP` 事件来指示根节点何时可以向外部 IP 网络传输数据。

警告： 在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为。因此，用户不应该在 `esp_mesh_start()` 和 `esp_mesh_stop()` 之间调用 Wi-Fi API。

LwIP & ESP-WIFI-MESH 应用程序无需通过 LwIP 层便可直接访问 ESP-WIFI-MESH 软件栈，LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

每个节点都需要通过调用 `tcpip_adapter_init()` 初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序应该在 LwIP 初始化完成后停止以下服务：

- SoftAP 接口上的 DHCP 服务器服务。

- Station 接口上的 DHCP 客户端服务。

下方代码片段展示如何为 ESP-WIFI-MESH 应用程序进行 LwIP 初始化。

```
/* tcpip 初始化 */
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下, 在 SoftAP 接口上停止 DHCP 服务器
 * 默认情况下, 在 Station 接口上停止 DHCP 客户端
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));
```

注解: ESP-WIFI-MESH 的根节点必须与路由器连接。因此, 当一个节点成为根节点时, **该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址**。这样做将允许其他节点开始向/从外部 IP 网络发送/接收数据包。但是, 如果使用静态 IP 设置, 则不需要执行此步骤。

编写 ESP-WIFI-MESH 应用程序 ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。

```
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下, 在 SoftAP 接口上停止 DHCP 服务器
 * 默认情况下, 在 Station 接口上停止 DHCP 客户端
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));

/* 事件初始化 */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/*Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* 注册 IP 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

在完成 LwIP 和 Wi-Fi 的初始化后, 需完成以下三个步骤以启动并运行 ESP-WIFI-MESH。

1. 初始化 Mesh
2. 配置 ESP-WIFI-MESH 网络
3. 启动 Mesh

初始化 Mesh 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```
/*Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/* 注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));
```

配置 ESP-WIFI-MESH 网络 ESP-WIFI-MESH 可通过 `esp_mesh_set_config()` 进行配置, 并使用 `mesh_cfg_t` 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数:

参数	描述
Channel (信道)	1 到 14 信道
Mesh ID	ESP-WIFI-MESH 网络的 ID, 见 <i>mesh_addr_t</i> 。
Router (路由器)	路由器配置, 见 <i>mesh_router_t</i> 。
Mesh AP	Mesh AP 配置, 见 <i>mesh_ap_cfg_t</i>
Crypto Functions (加密函数)	Mesh IE 的加密函数, 见 <i>mesh_crypto_funcs_t</i> 。

下方代码片段展示如何配置 ESP-WIFI-MESH。

```
/* 默认启用 MESH IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* Mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 信道 (需与路由器信道匹配) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
        strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
        strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

启动 Mesh 下方代码片段展示如何启动 ESP-WIFI-MESH。

```
/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());
```

启动 ESP-WIFI-MESH 后, 应用程序应检查 ESP-WIFI-MESH 事件, 以确定它是何时连接到网络的。连接后, 应用程序可使用 *esp_mesh_send()* 和 *esp_mesh_recv()* 在 ESP-WIFI-MESH 网络中发送、接收数据包。

自组网 自组网是 ESP-WIFI-MESH 的功能之一, 允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性, 可适应变化的动态网络拓扑结构和环境。启用自组网功能后, ESP-WIFI-MESH 网络中的节点能够自主完成以下操作:

- 选择或选举根节点 (见 [建立网络](#) 中的 [自动根节点选择](#))
- 选择首选的父节点 (见 [建立网络](#) 中的 [父节点选择](#))
- 网络断开时自动重新连接 (见 [管理网络](#) 中的 [中间父节点失败](#))

启用自组网功能后, ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此, 在启用自组网功能时, 应用层不得调用 Wi-Fi API, 否则会干扰 ESP-WIFI-MESH 的工作。

开关自组网 应用程序可以在运行时通过调用 *esp_mesh_set_self_organized()* 函数, 启用或禁用自组网功能。该函数具有以下两个参数:

- bool enable 指定启用或禁用自组网功能。
- bool select_parent 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态, 选择新的父节点具有不同的作用。在禁用自组网功能时, 此参数不使用。

禁用自组网 下方代码片段展示了如何禁用自组网功能。

```
//禁用自组网
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

启用自组网 ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

是否选择父节点	是否为根结点	作用
N	N	已连接到父节点的节点将保持连接。 之前扫描父节点的节点将停止扫描。调用 <code>esp_mesh_connect()</code> 重新启动。
	Y	已连接到路由器的根节点将保持连接。 从路由器断开的根节点需调用 <code>esp_mesh_connect()</code> 进行重连。
Y	N	没有父节点的节点将自动选择首选父节点并连接。 已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。
	Y	根结点在连接至父节点前必须放弃“根结点”的角色。因此，根节点将断开与路由器和所有子节点连接，选择首选父节点并进行连接。

下方代码片段展示了如何启用自组网功能。

```
//启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...

//启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

调用 Wi-Fi API 在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描邻近的接入点 (AP)。但在应用程序调用任何 Wi-Fi API 之前，必须先禁用自组网。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。

应用程序不应在 `esp_mesh_set_self_organized()` 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用 `esp_wifi_scan_start()`。

```
//禁用自组网
esp_mesh_set_self_organized(0, 0);

//停止任何正在进行的扫描
esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();

//进程扫描结果
...

//如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

...

//如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

...

```

(下页继续)

```
//如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0); //不选择新的父节点
esp_mesh_connect(); //手动重新连接到路由器
```

应用实例 ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目：

内部通信示例 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。

手动连网示例 展示了如何在禁用自组网功能的情况下使用 ESP-WIFI-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

API 参考

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

esp_err_t **esp_mesh_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

Return

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

Return

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

Attention This API shall be called after mesh initialization and configuration.

Return

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

esp_err_t **esp_mesh_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.

- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

Return

- ESP_OK
- ESP_FAIL

```
esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)
```

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

Attention This API is not reentrant.

Return

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

Parameters

- [in] to: the address of the final destination of the packet
 - If the packet is to the root, set this parameter to NULL.
 - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- [in] data: pointer to a sending mesh packet
 - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
 - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
 - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- [in] flag: bitmap for data sent
 - Speed up the route search
 - * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
 - * If the packet is to an internal device, MESH_DATA_P2P should be set.
 - * If the packet is to the root (“to” parameter isn’ t NULL) or to external IP network, MESH_DATA_TODS should be set.
 - * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
 - Specify whether this API is block or non-block, block by default
 - * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
 - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’ t read out in time by esp_mesh_rcv_toDS(). Generally, we suggest esp_mesh_rcv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading

esp_mesh_recv_toDS() which avoids unnecessary memory copy.

- [in] opt: options
 - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
 - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- [in] opt_count: option count
 - Currently, this API only takes one option, so opt_count is only supported to be 1.

esp_err_t esp_mesh_send_block_time (uint32_t time_ms)

Set blocking time of esp_mesh_send()

Attention This API shall be called before mesh is started.

Return

- ESP_OK

Parameters

- [in] time_ms: blocking time of esp_mesh_send(), unit:ms

esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

Parameters

- [out] from: the address of the original source of the packet
- [out] data: pointer to the received mesh packet
 - Field proto is the data protocol in use. Should follow it to parse the received data.
 - Field tos is the transmission tos (type of service) in use.
- [in] timeout_ms: wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- [out] flag: bitmap for data received
 - MESH_DATA_FROMDS represents data from external IP network
 - MESH_DATA_TODS represents data directed upward within the mesh network

Parameters

- [out] opt: options desired to receive
 - MESH_OPT_RECV_DS_ADDR attaches the DS address
- [in] opt_count: option count desired to receive
 - Currently, this API only takes one option, so opt_count is only supported to be 1.

esp_err_t esp_mesh_recv_toDS (mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large,

and `esp_mesh_rcv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be `MESH_DATA_TODS`.

Attention This API is only called by the root.

Return

- `ESP_OK`
- `ESP_ERR_MESH_ARGUMENT`
- `ESP_ERR_MESH_NOT_START`
- `ESP_ERR_MESH_TIMEOUT`
- `ESP_ERR_MESH_DISCARD`
- `ESP_ERR_MESH_RECV_RELEASE`

Parameters

- [out] `from`: the address of the original source of the packet
- [out] `to`: the address contains remote IP address and port (IPv4:PORT)
- [out] `data`: pointer to the received packet
 - Contain the protocol and applications should follow it to parse the data.
- [in] `timeout_ms`: wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- [out] `flag`: bitmap for data received
 - `MESH_DATA_TODS` represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters

- [out] `opt`: options desired to receive
- [in] `opt_count`: option count desired to receive

esp_err_t `esp_mesh_set_config(const mesh_cfg_t *config)`

Set mesh stack configuration.

- Use `MESH_INIT_CONFIG_DEFAULT()` to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. `max_connection` of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

Return

- `ESP_OK`
- `ESP_ERR_MESH_ARGUMENT`
- `ESP_ERR_MESH_NOT_ALLOWED`

Parameters

- [in] `config`: pointer to mesh stack configuration

esp_err_t `esp_mesh_get_config(mesh_cfg_t *config)`

Get mesh stack configuration.

Return

- `ESP_OK`
- `ESP_ERR_MESH_ARGUMENT`

Parameters

- [out] config: pointer to mesh stack configuration

esp_err_t **esp_mesh_set_router** (const *mesh_router_t* *router)

Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] router: pointer to router configuration

esp_err_t **esp_mesh_get_router** (*mesh_router_t* *router)

Get router configuration.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- [out] router: pointer to router configuration

esp_err_t **esp_mesh_set_id** (const *mesh_addr_t* *id)

Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

Parameters

- [in] id: pointer to mesh network ID

esp_err_t **esp_mesh_get_id** (*mesh_addr_t* *id)

Get mesh network ID.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- [out] id: pointer to mesh network ID

esp_err_t **esp_mesh_set_type** (*mesh_type_t* type)

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Return

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] type: device type

mesh_type_t **esp_mesh_get_type** (void)

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return mesh type

esp_err_t **esp_mesh_set_max_layer** (int *max_layer*)

Set network max layer value.

- for tree topology, the max is 25.

- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] `max_layer`: max layer value

int `esp_mesh_get_max_layer` (void)

Get max layer value.

Return max layer value

esp_err_t `esp_mesh_set_ap_password` (const uint8_t *pwd, int len)

Set mesh softAP password.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] `pwd`: pointer to the password
- [in] `len`: password length

esp_err_t `esp_mesh_set_ap_authmode` (*wifi_auth_mode_t* authmode)

Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] `authmode`: authentication mode

wifi_auth_mode_t `esp_mesh_get_ap_authmode` (void)

Get mesh softAP authentication mode.

Return authentication mode

esp_err_t `esp_mesh_set_ap_connections` (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] `connections`: the number of max connections

int `esp_mesh_get_ap_connections` (void)

Get mesh max connection configuration.

Return the number of mesh max connections

int `esp_mesh_get_non_mesh_connections` (void)

Get non-mesh max connection configuration.

Return the number of non-mesh max connections

int **esp_mesh_get_layer** (void)

Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return layer value

esp_err_t **esp_mesh_get_parent_bssid** (*mesh_addr_t* *bssid)

Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [out] bssid: pointer to parent BSSID

bool **esp_mesh_is_root** (void)

Return whether the device is the root node of the network.

Return true/false

esp_err_t **esp_mesh_set_self_organized** (bool *enable*, bool *select_parent*)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

Attention This API is used to dynamically modify whether to enable the self organizing.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *enable*: enable or disable self-organized networking
- [in] *select_parent*: Only valid when self-organized networking is enabled.
 - if *select_parent* is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

bool **esp_mesh_get_self_organized** (void)

Return whether enable self-organized networking or not.

Return true/false

esp_err_t **esp_mesh_waive_root** (const *mesh_vote_t* **vote*, int *reason*)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return

- ESP_OK

- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

Parameters

- [in] vote: vote configuration
 - If this parameter is set NULL, the vote will perform the default 15 times.
 - Field percentage threshold is 0.9 by default.
 - Field is_rc_specified shall be false.
 - Field attempts shall be at least 15 times.
- [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t **esp_mesh_set_vote_percentage** (float *percentage*)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] percentage: vote percentage threshold

float **esp_mesh_get_vote_percentage** (void)

Get vote percentage threshold for approval of being a root.

Return percentage threshold

esp_err_t **esp_mesh_set_ap_assoc_expire** (int *seconds*)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] seconds: the expired time

int **esp_mesh_get_ap_assoc_expire** (void)

Get mesh softAP associate expired time.

Return seconds

int **esp_mesh_get_total_node_num** (void)

Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Return total number of devices (including the root)

int **esp_mesh_get_routing_table_size** (void)

Get the number of devices in this device's sub-network (including self)

Return the number of devices over this device's sub-network (including self)

esp_err_t **esp_mesh_get_routing_table** (*mesh_addr_t* **mac*, int *len*, int **size*)

Get routing table of this device's sub-network (including itself)

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- [out] mac: pointer to routing table
- [in] len: routing table size(in bytes)

- [out] size: pointer to the number of devices in routing table (including itself)

esp_err_t **esp_mesh_post_toDS_state** (bool *reachable*)

Post the toDS state to the mesh stack.

Attention This API is only for the root.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *reachable*: this state represents whether the root is able to access external IP network

esp_err_t **esp_mesh_get_tx_pending** (*mesh_tx_pending_t* **pending*)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [out] *pending*: pointer to the TX pending

esp_err_t **esp_mesh_get_rx_pending** (*mesh_rx_pending_t* **pending*)

Return the number of packets available in the queue waiting to be received by applications.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [out] *pending*: pointer to the RX pending

int **esp_mesh_available_txupQ_num** (const *mesh_addr_t* **addr*, uint32_t **xseqno_in*)

Return the number of packets could be accepted from the specified address.

Return the number of upQ for a certain address

Parameters

- [in] *addr*: self address or an associate children address
- [out] *xseqno_in*: sequence number of the last received packet from the specified address

esp_err_t **esp_mesh_set_xon_qsize** (int *qsize*)

Set the number of queue.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *qsize*: default:32 (min:16)

int **esp_mesh_get_xon_qsize** (void)

Get queue size.

Return the number of queue

esp_err_t **esp_mesh_allow_root_conflicts** (bool *allowed*)

Set whether allow more than one root existing in one network.

Return

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

Parameters

- [in] *allowed*: allow or not

bool **esp_mesh_is_root_conflicts_allowed** (void)

Check whether allow more than one root to exist in one network.

Return true/false

esp_err_t **esp_mesh_set_group_id** (*const mesh_addr_t* **addr*, *int num*)

Set group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- [in] *addr*: pointer to new group ID addresses
- [in] *num*: the number of group ID addresses

esp_err_t **esp_mesh_delete_group_id** (*const mesh_addr_t* **addr*, *int num*)

Delete group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- [in] *addr*: pointer to deleted group ID address
- [in] *num*: the number of group ID addresses

int **esp_mesh_get_group_num** (*void*)

Get the number of group ID addresses.

Return the number of group ID addresses

esp_err_t **esp_mesh_get_group_list** (*mesh_addr_t* **addr*, *int num*)

Get group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- [out] *addr*: pointer to group ID addresses
- [in] *num*: the number of group ID addresses

bool **esp_mesh_is_my_group** (*const mesh_addr_t* **addr*)

Check whether the specified group address is my group.

Return true/false

esp_err_t **esp_mesh_set_capacity_num** (*int num*)

Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

Parameters

- [in] *num*: mesh network capacity

int **esp_mesh_get_capacity_num** (*void*)

Get mesh network capacity.

Return mesh network capacity

esp_err_t **esp_mesh_set_ie_crypto_funcs** (*const mesh_crypto_funcs_t* **crypto_funcs*)

Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

Return

- ESP_OK

Parameters

- [in] *crypto_funcs*: crypto functions for mesh IE

- If `crypto_funcs` is set to `NULL`, mesh IE is no longer encrypted.

esp_err_t **esp_mesh_set_ie_crypto_key** (`const char *key`, `int len`)

Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

Return

- `ESP_OK`
- `ESP_MESH_ERR_ARGUMENT`

Parameters

- [`in`] `key`: ASCII crypto key
- [`in`] `len`: length in bytes, range:8~64

esp_err_t **esp_mesh_get_ie_crypto_key** (`char *key`, `int len`)

Get mesh IE crypto key.

Return

- `ESP_OK`
- `ESP_MESH_ERR_ARGUMENT`

Parameters

- [`out`] `key`: ASCII crypto key
- [`in`] `len`: length in bytes, range:8~64

esp_err_t **esp_mesh_set_root_healing_delay** (`int delay_ms`)

Set delay time before starting root healing.

Return

- `ESP_OK`

Parameters

- [`in`] `delay_ms`: delay time in milliseconds

`int` **esp_mesh_get_root_healing_delay** (`void`)

Get delay time before network starts root healing.

Return delay time in milliseconds

esp_err_t **esp_mesh_fix_root** (`bool enable`)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

Return

- `ESP_OK`

Parameters

- [`in`] `enable`: enable or not

`bool` **esp_mesh_is_root_fixed** (`void`)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

esp_err_t **esp_mesh_set_parent** (`const wifi_config_t *parent`, `const mesh_addr_t *parent_mesh_id`, `mesh_type_t my_type`, `int my_layer`)

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return

- `ESP_OK`
- `ESP_ERR_ARGUMENT`
- `ESP_ERR_MESH_NOT_CONFIG`

Parameters

- [in] `parent`: parent configuration, the SSID and the channel of the parent are mandatory.
 - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- [in] `parent_mesh_id`: parent mesh ID,
 - If this value is not set, the original mesh ID is used.
- [in] `my_type`: mesh type
 - MESH_STA is not supported.
 - If the parent set for the device is the same as the router in the network configuration, then `my_type` shall set MESH_ROOT and `my_layer` shall set MESH_ROOT_LAYER.
- [in] `my_layer`: mesh layer
 - `my_layer` of the device may change after joining the network.
 - If `my_type` is set MESH_NODE, `my_layer` shall be greater than MESH_ROOT_LAYER.
 - If `my_type` is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

esp_err_t **esp_mesh_scan_get_ap_ie_len** (int *len)

Get mesh networking IE length of one AP.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters

- [out] `len`: mesh networking IE length

esp_err_t **esp_mesh_scan_get_ap_record** (*wifi_ap_record_t* *ap_record, void *buffer)

Get AP record.

Attention Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual_networking” example.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters

- [out] `ap_record`: pointer to one AP record
- [out] `buffer`: pointer to the mesh networking IE of this AP

esp_err_t **esp_mesh_flush_upstream_packets** (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Return

- ESP_OK

esp_err_t **esp_mesh_get_subnet_nodes_num** (const *mesh_addr_t* *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

Return

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] `child_mac`: an associated child address of this device
- [out] `nodes_num`: pointer to the number of nodes in the subnet of a specific child

esp_err_t **esp_mesh_get_subnet_nodes_list** (const *mesh_addr_t* *child_mac, *mesh_addr_t* *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

Return

- ESP_OK

- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] `child_mac`: an associated child address of this device
- [out] `nodes`: pointer to nodes in the subnet of a specific child
- [in] `nodes_num`: the number of nodes in the subnet of a specific child

esp_err_t **esp_mesh_disconnect** (void)

Disconnect from current parent.

Return

- ESP_OK

esp_err_t **esp_mesh_connect** (void)

Connect to current parent.

Return

- ESP_OK

esp_err_t **esp_mesh_flush_scan_result** (void)

Flush scan result.

Return

- ESP_OK

esp_err_t **esp_mesh_switch_channel** (`const uint8_t *new_bssid`, `int csa_newchan`, `int csa_count`)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

Attention This API is only called by the root.

Return

- ESP_OK

Parameters

- [in] `new_bssid`: the new router BSSID if the router changes
- [in] `csa_newchan`: the new channel number to which the whole network is moving
- [in] `csa_count`: channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

esp_err_t **esp_mesh_get_router_bssid** (`uint8_t *router_bssid`)

Get the router BSSID.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

Parameters

- [out] `router_bssid`: pointer to the router BSSID

`int64_t` **esp_mesh_get_tsf_time** (void)

Get the TSF time.

Return the TSF time

esp_err_t **esp_mesh_set_topology** (*esp_mesh_topology_t* `topo`)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] topo: MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t **esp_mesh_get_topology** (void)

Get mesh topology.

Return MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t **esp_mesh_enable_ps** (void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_disable_ps** (void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool **esp_mesh_is_ps_enabled** (void)

Check whether the mesh Power Save function is enabled.

Return true/false

bool **esp_mesh_is_device_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Return true/false

esp_err_t **esp_mesh_set_active_duty_cycle** (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] dev_duty: device duty cycle
- [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

esp_err_t **esp_mesh_get_active_duty_cycle** (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

Return

- ESP_OK

Parameters

- [out] `dev_duty`: device duty cycle
- [out] `dev_duty_type`: device PS duty cycle type

esp_err_t **esp_mesh_set_network_duty_cycle** (int *nwk_duty*, int *duration_mins*, int *applied_rule*)

Set the network duty cycle, duration and rule.

- The range of `nwk_duty` values is 1 to 100. The default value is 10.
- `nwk_duty` is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the `nwk_duty` is known as a NWK-DUTY-MASTER.
- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins` = (-1) represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to (-1).
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins`(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to (-1); (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

Return

- `ESP_OK`
- `ESP_FAIL`

Parameters

- [in] `nwk_duty`: network duty cycle
- [in] `duration_mins`: duration (unit: minutes)
- [in] `applied_rule`: only support `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

esp_err_t **esp_mesh_get_network_duty_cycle** (int **nwk_duty*, int **duration_mins*, int **dev_duty_type*, int **applied_rule*)

Get the network duty cycle, duration, type and rule.

Return

- `ESP_OK`

Parameters

- [out] `nwk_duty`: current network duty cycle
- [out] `duration_mins`: the duration of current `nwk_duty`
- [out] `dev_duty_type`: if it includes `MESH_PS_DEVICE_DUTY_MASTER`, this device is the current NWK-DUTY-MASTER.
- [out] `applied_rule`: `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

int **esp_mesh_get_running_active_duty_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the running active duty cycle is `dev_duty` specified by the users.

- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Return the running active duty cycle

esp_err_t **esp_mesh_ps_duty_signaling**(int *fwd_times*)

Duty signaling.

Return

- ESP_OK

Parameters

- [in] *fwd_times*: the times of forwarding duty signaling packets

Unions

union mesh_addr_t

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t **addr**[6]

mac address

mip_t **mip**

mip address

union mesh_event_info_t

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t **channel_switch**

channel switch

mesh_event_child_connected_t **child_connected**

child connected

mesh_event_child_disconnected_t **child_disconnected**

child disconnected

mesh_event_routing_table_change_t **routing_table**

routing table change

mesh_event_connected_t **connected**

parent connected

mesh_event_disconnected_t **disconnected**

parent disconnected

mesh_event_no_parent_found_t **no_parent**

no parent found

mesh_event_layer_change_t **layer_change**

layer change

mesh_event_toDS_state_t **toDS_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t **vote_started**
vote started

mesh_event_root_address_t **root_addr**
root address

mesh_event_root_switch_req_t **switch_req**
root switch request

mesh_event_root_conflict_t **root_conflict**
other powerful root

mesh_event_root_fixed_t **root_fixed**
fixed root

mesh_event_scan_done_t **scan_done**
scan done

mesh_event_network_state_t **network_state**
network state, such as whether current mesh network has a root.

mesh_event_find_network_t **find_network**
network found that can join

mesh_event_router_switch_t **router_switch**
new router information

mesh_event_ps_duty_t **ps_duty**
PS duty information

union mesh_rc_config_t
#include <esp_mesh.h> Vote address configuration.

Public Members

int **attempts**
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t **rc_addr**
a new root address specified by users for API `esp_mesh_waive_root()`

Structures

struct mip_t
IP address and port.

Public Members

ip4_addr_t **ip4**
IP address

uint16_t **port**
port

struct mesh_event_channel_switch_t
Channel switch information.

Public Members

uint8_t **channel**
new channel

struct mesh_event_connected_t
Parent connected information.

Public Members

wifi_event_sta_connected_t **connected**

parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t **self_layer**

layer

uint8_t **duty**

parent duty

struct mesh_event_no_parent_found_t

No parent found information.

Public Members

int **scan_times**

scan times being through

struct mesh_event_layer_change_t

Layer change information.

Public Members

uint16_t **new_layer**

new layer

struct mesh_event_vote_started_t

vote started information

Public Members

int **reason**

vote reason, vote could be initiated by children or by the root itself

int **attempts**

max vote attempts before stopped

mesh_addr_t **rc_addr**

root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t

find a mesh network that this device can join

Public Members

uint8_t **channel**

channel number of the new found network

uint8_t **router_bssid[6]**

router BSSID

struct mesh_event_root_switch_req_t

Root switch request information.

Public Members**int reason**root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`**mesh_addr_t rc_addr**

the address of root switch requester

struct mesh_event_root_conflict_t

Other powerful root address.

Public Members**int8_t rssi**

rssi with router

uint16_t capacity

the number of devices in current network

uint8_t addr[6]

other powerful root address

struct mesh_event_routing_table_change_t

Routing table change.

Public Members**uint16_t rt_size_new**

the new value

uint16_t rt_size_change

the changed value

struct mesh_event_root_fixed_t

Root fixed.

Public Members**bool is_fixed**

status

struct mesh_event_scan_done_t

Scan done event information.

Public Members**uint8_t number**

the number of APs scanned

struct mesh_event_network_state_t

Network state information.

Public Members**bool is_rootless**

whether current mesh network has a root

struct mesh_event_ps_duty_t

PS duty information.

Public Members

`uint8_t duty`
parent or child duty

`mesh_event_child_connected_t child_connected`
child info

struct mesh_opt_t
Mesh option.

Public Members

`uint8_t type`
option type

`uint16_t len`
option length

`uint8_t *val`
option value

struct mesh_data_t
Mesh data for `esp_mesh_send()` and `esp_mesh_rcv()`

Public Members

`uint8_t *data`
data

`uint16_t size`
data size

`mesh_proto_t proto`
data protocol

`mesh_tos_t tos`
data type of service

struct mesh_router_t
Router configuration.

Public Members

`uint8_t ssid[32]`
SSID

`uint8_t ssid_len`
length of SSID

`uint8_t bssid[6]`
BSSID, if this value is specified, users should also specify “`allow_router_switch`” .

`uint8_t password[64]`
password

bool `allow_router_switch`

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (`mesh_attempts_t`) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct mesh_ap_cfg_t
Mesh softAP configuration.

Public Members

uint8_t **password**[64]
mesh softAP password

uint8_t **max_connection**
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connectionmax mesh connections

uint8_t **nonmesh_max_connection**
max non-mesh connections

struct mesh_cfg_t
Mesh initialization configuration.

Public Members

uint8_t **channel**
channel, the mesh network on

bool **allow_channel_switch**
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t **mesh_id**
mesh network identification

mesh_router_t **router**
router configuration

mesh_ap_cfg_t **mesh_ap**
mesh softAP configuration

const mesh_crypto_funcs_t ***crypto_funcs**
crypto functions

struct mesh_vote_t
Vote.

Public Members

float **percentage**
vote percentage threshold for approval of being a root

bool **is_rc_specified**
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t **config**
vote address configuration

struct mesh_tx_pending_t
The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int **to_parent**
to parent queue

int **to_parent_p2p**
to parent (P2P) queue

int **to_child**
to child queue

int **to_child_p2p**
to child (P2P) queue

int **mgmt**
management queue

int **broadcast**
broadcast and multicast queue

struct mesh_rx_pending_t

The number of packets available in the queue waiting to be received by applications.

Public Members

int **toDS**
to external DS

int **toSelf**
to self

Macros

MESH_ROOT_LAYER
root layer value

MESH_MTU
max transmit unit(in bytes)

MESH_MPS
max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
Mesh error code definition.
Wi-Fi isn't started

ESP_ERR_MESH_NOT_INIT
mesh isn't initialized

ESP_ERR_MESH_NOT_CONFIG
mesh isn't configured

ESP_ERR_MESH_NOT_START
mesh isn't started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory

ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED

disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL

queue fail

ESP_ERR_MESH_QUEUE_FULL

queue full

ESP_ERR_MESH_NO_PARENT_FOUND

no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND

no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL

no option found

ESP_ERR_MESH_OPTION_UNKNOWN

unknown option

ESP_ERR_MESH_XON_NO_WINDOW

no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE

low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE

discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD

discard the packet

ESP_ERR_MESH_VOTING

vote in progress

ESP_ERR_MESH_XMIT

XMIT

ESP_ERR_MESH_QUEUE_READ

error in reading queue

ESP_ERR_MESH_PS

mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE

release esp_mesh_rcv_toDS

MESH_DATA_ENC

Flags bitmap for esp_mesh_send() and esp_mesh_rcv()

data encrypted (Unimplemented)

MESH_DATA_P2P

point-to-point delivery over the mesh network

MESH_DATA_FROMDS

receive from external IP network

MESH_DATA_TODS

identify this packet is target to external IP network

MESH_DATA_NONBLOCK

esp_mesh_send() non-block

MESH_DATA_DROP

in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP

identify this packet is target to a group address

MESH_OPT_SEND_GROUP

Option definitions for `esp_mesh_send()` and `esp_mesh_recv()`

data transmission by group; used with `esp_mesh_send()` and shall have payload

MESH_OPT_RECV_DS_ADDR

return a remote IP address; used with `esp_mesh_send()` and `esp_mesh_recv()`

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS

Flag of mesh networking IE.

vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE

no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND

root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED

fixed root

MESH_PS_DEVICE_DUTY_REQUEST

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND

requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Mesh PS (Power Save) duty cycle applied rule.

MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**MESH_INIT_CONFIG_DEFAULT ()****Type Definitions**

```
typedef mesh_addr_t mesh_event_root_address_t
```

Root address.

```
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
```

Parent disconnected information.

```
typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
```

Child connected information.

```
typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
```

Child disconnected information.

```
typedef wifi_event_sta_connected_t mesh_event_router_switch_t
```

New router information.

Enumerations

```
enum mesh_event_id_t
```

Enumerated list of mesh event id.

Values:

```
MESH_EVENT_STARTED
```

mesh is started

```
MESH_EVENT_STOPPED
```

mesh is stopped

- MESH_EVENT_CHANNEL_SWITCH**
channel switch
- MESH_EVENT_CHILD_CONNECTED**
a child is connected on softAP interface
- MESH_EVENT_CHILD_DISCONNECTED**
a child is disconnected on softAP interface
- MESH_EVENT_ROUTING_TABLE_ADD**
routing table is changed by adding newly joined children
- MESH_EVENT_ROUTING_TABLE_REMOVE**
routing table is changed by removing leave children
- MESH_EVENT_PARENT_CONNECTED**
parent is connected on station interface
- MESH_EVENT_PARENT_DISCONNECTED**
parent is disconnected on station interface
- MESH_EVENT_NO_PARENT_FOUND**
no parent found
- MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network
- MESH_EVENT_TODS_STATE**
state represents whether the root is able to access external IP network
- MESH_EVENT_VOTE_STARTED**
the process of voting a new root is started either by children or by the root
- MESH_EVENT_VOTE_STOPPED**
the process of voting a new root is stopped
- MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.
- MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate
- MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root
- MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.
- MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.
- MESH_EVENT_SCAN_DONE**
if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.
- MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.
- MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.
- MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

MESH_EVENT_ROUTER_SWITCH

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

MESH_EVENT_PS_PARENT_DUTY

parent duty

MESH_EVENT_PS_CHILD_DUTY

child duty

MESH_EVENT_PS_DEVICE_DUTY

device duty

MESH_EVENT_MAX**enum mesh_type_t**

Device type.

Values:

MESH_IDLE

hasn't joined the mesh network yet

MESH_ROOT

the only sink of the mesh network. Has the ability to access external IP network

MESH_NODE

intermediate device. Has the ability to forward packets over the mesh network

MESH_LEAF

has no forwarding ability

MESH_STA

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum mesh_proto_t

Protocol of transmitted application data.

Values:

MESH_PROTO_BIN

binary

MESH_PROTO_HTTP

HTTP protocol

MESH_PROTO_JSON

JSON format

MESH_PROTO_MQTT

MQTT protocol

MESH_PROTO_AP

IP network mesh communication of node's AP interface

MESH_PROTO_STA

IP network mesh communication of node's STA interface

enum mesh_tos_t

For reliable transmission, mesh stack provides three type of services.

Values:

MESH_TOS_P2P

provide P2P (point-to-point) retransmission on mesh stack by default

MESH_TOS_E2E

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

MESH_TOS_DEF

no retransmission on mesh stack

enum mesh_vote_reason_t

Vote reason.

*Values:***MESH_VOTE_REASON_ROOT_INITIATED = 1**

vote is initiated by the root

MESH_VOTE_REASON_CHILD_INITIATED

vote is initiated by children

enum mesh_disconnect_reason_t

Mesh disconnect reason code.

*Values:***MESH_REASON_CYCLIC = 100**

cyclic is detected

MESH_REASON_PARENT_IDLE

parent is idle

MESH_REASON_LEAF

the connected device is changed to a leaf

MESH_REASON_DIFF_ID

in different mesh ID

MESH_REASON_ROOTS

root conflict is detected

MESH_REASON_PARENT_STOPPED

parent has stopped the mesh

MESH_REASON_SCAN_FAIL

scan fail

MESH_REASON_IE_UNKNOWN

unknown IE

MESH_REASON_WAIVE_ROOT

waive root

MESH_REASON_PARENT_WORSE

parent with very poor RSSI

MESH_REASON_EMPTY_PASSWORD

use an empty password to connect to an encrypted parent

MESH_REASON_PARENT_UNENCRYPTED

connect to an unencrypted parent/router

enum esp_mesh_topology_t

Mesh topology.

*Values:***MESH_TOPO_TREE**

tree topology

MESH_TOPO_CHAIN

chain topology

enum mesh_event_toDS_state_t

The reachability of the root to a DS (distribute system)

*Values:***MESH_TODS_UNREACHABLE**

the root isn't able to access external IP network

MESH_TODS_REACHABLE

the root is able to access external IP network

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-S3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

Application Example Example on how to provision ESP32-S3 using a supported smartphone: [wifi/wifi_easy_connect/dpp-enrollee](#).

API Reference**Header File**

- [components/wpa_supplicant/esp_supplicant/include/esp_dpp.h](#)

Functions

esp_err_t **esp_supp_dpp_init** (*esp_supp_dpp_event_cb_t* evt_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP_OK: Success
- ESP_FAIL: Failure

Parameters

- evt_cb: Callback function to receive DPP related events

void **esp_supp_dpp_deinit** (void)

De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

esp_err_t **esp_supp_dpp_bootstrap_gen** (const char *chan_list, *esp_supp_dpp_bootstrap_t* type, const char *key, const char *info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Return

- ESP_OK: Success
- ESP_FAIL: Failure

Parameters

- `chan_list`: List of channels device will be available on for listening
- `type`: Bootstrap method type, only QR Code method is supported for now.
- `key`: (Optional) Private Key used to generate a Bootstrapping Public Key
- `info`: (Optional) Ancilliary Device Information like Serial Number

esp_err_t **esp_supp_dpp_start_listen** (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel from Channel List for a pre-defined wait time.

Return

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void **esp_supp_dpp_stop_listen** (void)

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

Macros

ESP_ERR_DPP_FAILURE

Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE

DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR

Encountered invalid DPP Attribute

Type Definitions

typedef enum *dpp_bootstrap_type* esp_supp_dpp_bootstrap_t

Types of Bootstrap Methods for DPP.

typedef void (*esp_supp_dpp_event_cb_t) (*esp_supp_dpp_event_t* evt, void *data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

Parameters

- `evt`: DPP event ID
- `data`: Event data payload

Enumerations

enum dpp_bootstrap_type

Types of Bootstrap Methods for DPP.

Values:

DPP_BOOTSTRAP_QR_CODE

QR Code Method

DPP_BOOTSTRAP_PKEY

Proof of Knowledge Method

DPP_BOOTSTRAP_NFC_URI

NFC URI record Method

enum esp_supp_dpp_event_t

Types of Callback Events received from DPP Supplicant.

Values:

ESP_SUPP_DPP_URI_READY

URI is ready through Bootstrapping

ESP_SUPP_DPP_CFG_RECVD

Config received via DPP Authentication

ESP_SUPP_DPP_FAIL

DPP Authentication failure

Header File

- [components/esp_eth/include/esp_eth.h](#)

Functions

`esp_err_t esp_eth_driver_install (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)`

Install Ethernet driver.

Return

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there's no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

Parameters

- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

`esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)`

Uninstall Ethernet driver.

Note It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

Return

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver

`esp_err_t esp_eth_start (esp_eth_handle_t hdl)`

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

Note This API will start driver state machine and internal software timer (for checking link status).

Return

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver

`esp_err_t esp_eth_stop (esp_eth_handle_t hdl)`

Stop Ethernet driver.

Note This function does the oppsite operation of esp_eth_start.

Return

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver

`esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input) esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv)`
 Update Ethernet data input path (i.e. specify where to pass the input buffer)

Note After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Return

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

Parameters

- [in] `hdl`: handle of Ethernet driver
- [in] `stack_input`: function pointer, which does the actual process on incoming packets
- [in] `priv`: private resource, which gets passed to `stack_input` callback without any modification

esp_err_t **esp_eth_transmit** (*esp_eth_handle_t* *hdl*, void **buf*, size_t *length*)

General Transmit.

Return

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters

- [in] `hdl`: handle of Ethernet driver
- [in] `buf`: buffer of the packet to transfer
- [in] `length`: length of the buffer to transfer

esp_err_t **esp_eth_receive** (*esp_eth_handle_t* *hdl*, uint8_t **buf*, uint32_t **length*)

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Note This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn't support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

Return

- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

Parameters

- [in] `hdl`: handle of Ethernet driver
- [out] `buf`: buffer to preserve the received packet
- [out] `length`: length of the received packet

esp_err_t **esp_eth_ioctl** (*esp_eth_handle_t* *hdl*, *esp_eth_io_cmd_t* *cmd*, void **data*)

Misc IO function of Ethernet driver.

The following IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- `ETH_CMD_G_SPEED` gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.
- `ETH_CMD_S_PROMISCUOUS` sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_FLOW_CTRL` sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver
- [in] cmd: IO control command
- [inout] data: address of data for set command or address where to store the data when used with get command

esp_err_t **esp_eth_increase_reference** (*esp_eth_handle_t* hdl)

Increase Ethernet driver reference.

Note Ethernet driver handle can be obtained by os timer, netif, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

- [in] hdl: handle of Ethernet driver

esp_err_t **esp_eth_decrease_reference** (*esp_eth_handle_t* hdl)

Decrease Ethernet driver reference.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

- [in] hdl: handle of Ethernet driver

Structures

struct esp_eth_config_t

Configuration of Ethernet driver.

Public Members

esp_eth_mac_t ***mac**

Ethernet MAC object.

esp_eth_phy_t ***phy**

Ethernet PHY object.

uint32_t **check_link_period_ms**

Period time of checking Ethernet link status.

esp_err_t (***stack_input**) (*esp_eth_handle_t* eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user's stack.

Return

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters

- [in] eth_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

esp_err_t (***on_lowlevel_init_done**) (*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel initialization is finished.

Return

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters

- [in] eth_handle: handle of Ethernet driver

esp_err_t (***on_lowlevel_deinit_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

Return

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters

- [in] eth_handle: handle of Ethernet driver

esp_err_t (***read_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

Parameters

- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

esp_err_t (***write_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters

- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

Macros

ETH_DEFAULT_CONFIG (emac, ephy)

Default configuration for Ethernet driver.

Type Definitions

typedef void ***esp_eth_handle_t**

Handle of Ethernet driver.

API 参考-通用接口

Header File

- `components/esp_eth/include/esp_eth_com.h`

Functions

`esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)`

Detect PHY address.

Return

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Parameters

- [in] `eth`: mediator of Ethernet driver
- [out] `detected_addr`: a valid address after detection

Structures

`struct esp_eth_mediator_s`

Ethernet mediator.

Public Members

`esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`

Read PHY register.

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

Parameters

- [in] `eth`: mediator of Ethernet driver
- [in] `phy_addr`: PHY Chip address (0~31)
- [in] `phy_reg`: PHY register index code
- [out] `reg_value`: PHY register value

`esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)`

Write PHY register.

Return

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

Parameters

- [in] `eth`: mediator of Ethernet driver
- [in] `phy_addr`: PHY Chip address (0~31)
- [in] `phy_reg`: PHY register index code
- [in] `reg_value`: PHY register value

`esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)`

Deliver packet to upper stack.

Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

Parameters

- [in] `eth`: mediator of Ethernet driver
- [in] `buffer`: packet buffer
- [in] `length`: length of the packet

`esp_err_t (*on_state_changed) (esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)`
 Callback on Ethernet state changed.

Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Parameters

- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

Macros**ETH_MAX_PAYLOAD_LEN**

Maximum Ethernet payload size.

ETH_MIN_PAYLOAD_LEN

Minimum Ethernet payload size.

ETH_HEADER_LEN

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

ETH_VLAN_TAG_LEN

Optional 802.1q VLAN Tag length.

ETH_JUMBO_FRAME_PAYLOAD_LEN

Jumbo frame payload size.

ETH_MAX_PACKET_SIZE

Maximum frame size (1522 Bytes)

ETH_MIN_PACKET_SIZE

Minimum frame size (64 Bytes)

Type Definitions

`typedef struct esp_eth_mediator_s esp_eth_mediator_t`
 Ethernet mediator.

Enumerations**enum esp_eth_state_t**

Ethernet driver state.

Values:

ETH_STATE_LLINIT

Lowlevel init done

ETH_STATE_DEINIT

Deinit done

ETH_STATE_LINK

Link status changed

ETH_STATE_SPEED

Speed updated

ETH_STATE_DUPLEX

Duplex updated

ETH_STATE_PAUSE

Pause ability updated

enum esp_eth_io_cmd_t

Command list for ioctl API.

Values:

ETH_CMD_G_MAC_ADDR
Get MAC address

ETH_CMD_S_MAC_ADDR
Set MAC address

ETH_CMD_G_PHY_ADDR
Get PHY address

ETH_CMD_S_PHY_ADDR
Set PHY address

ETH_CMD_G_SPEED
Get Speed

ETH_CMD_S_PROMISCUOUS
Set promiscuous mode

ETH_CMD_S_FLOW_CTRL
Set flow control

ETH_CMD_G_DUPLEX_MODE
Get Duplex mode

ETH_CMD_S_PHY_LOOPBACK
Set PHY loopback

enum eth_event_t
Ethernet event declarations.

Values:

ETHERNET_EVENT_START
Ethernet driver start

ETHERNET_EVENT_STOP
Ethernet driver stop

ETHERNET_EVENT_CONNECTED
Ethernet got a valid link

ETHERNET_EVENT_DISCONNECTED
Ethernet lost a valid link

    Ethernet MAC.
```

Public Members

```
esp_err_t (*set_mediator) (esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
    Set mediator for Ethernet MAC.
```

Return

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

Parameters

- [in] mac: Ethernet MAC instance
- [in] eth: Ethernet mediator

```
esp_err_t (*init) (esp_eth_mac_t *mac)
    Initialize Ethernet MAC.
```

Return

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance

```
esp_err_t (*deinit) (esp_eth_mac_t *mac)
    Deinitialize Ethernet MAC.
```

Return

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

Parameters

- [in] mac: Ethernet MAC instance

```
esp_err_t (*start) (esp_eth_mac_t *mac)
    Start Ethernet MAC.
```

Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance

```
esp_err_t (*stop) (esp_eth_mac_t *mac)
    Stop Ethernet MAC.
```

Return

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

Parameters

- [in] mac: Ethernet MAC instance

```
esp_err_t (*transmit) (esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
    Transmit packet from Ethernet MAC.
```

Return

- ESP_OK: transmit packet successfully

- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] buf: packet buffer to transmit
- [in] length: length of packet

esp_err_t (***receive**) (*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t *length)

Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [out] buf: packet buffer which will preserve the received frame
- [out] length: length of the received packet

esp_err_t (***read_phy_reg**) (*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

esp_err_t (***write_phy_reg**) (*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

esp_err_t (***set_addr**) (*esp_eth_mac_t* *mac, uint8_t *addr)

Set MAC address.

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument

- ESP_FAIL: set MAC address failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

esp_err_t (***get_addr**) (*esp_eth_mac_t* *mac, uint8_t *addr)

Get MAC address.

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

esp_err_t (***set_speed**) (*esp_eth_mac_t* *mac, eth_speed_t speed)

Set speed of MAC.

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

esp_err_t (***set_duplex**) (*esp_eth_mac_t* *mac, eth_duplex_t duplex)

Set duplex mode of MAC.

Return

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

esp_err_t (***set_link**) (*esp_eth_mac_t* *mac, eth_link_t link)

Set link status of MAC.

Return

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] link: Link status

esp_err_t (***set_promiscuous**) (*esp_eth_mac_t* *mac, bool enable)

Set promiscuous of MAC.

Return

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

Parameters

- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

esp_err_t (***enable_flow_ctrl**) (*esp_eth_mac_t* *mac, bool enable)

Enable flow control on MAC layer or not.

Return

- ESP_OK: set flow control successfully

- **ESP_FAIL**: set flow control failed because some error occurred

Parameters

- [in] **mac**: Ethernet MAC instance
- [in] **enable**: set true to enable flow control; set false to disable flow control

esp_err_t (**set_peer_pause_ability**) (*esp_eth_mac_t* *mac, uint32_t ability)

Set the PAUSE ability of peer node.

Return

- **ESP_OK**: set peer pause ability successfully
- **ESP_FAIL**: set peer pause ability failed because some error occurred

Parameters

- [in] **mac**: Ethernet MAC instance
- [in] **ability**: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

esp_err_t (**del**) (*esp_eth_mac_t* *mac)

Free memory of Ethernet MAC.

Return

- **ESP_OK**: free Ethernet MAC instance successfully
- **ESP_FAIL**: free Ethernet MAC instance failed because some error occurred

Parameters

- [in] **mac**: Ethernet MAC instance

struct eth_mac_config_t

Configuration of Ethernet MAC object.

Public Members

uint32_t **sw_reset_timeout_ms**

Software reset timeout value (Unit: ms)

uint32_t **rx_task_stack_size**

Stack size of the receive task

uint32_t **rx_task_prio**

Priority of the receive task

int **smi_mdc_gpio_num**

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int **smi_mdio_gpio_num**

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

uint32_t **flags**

Flags that specify extra capability for mac driver

eth_data_interface_t **interface**

EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t **clock_config**

EMAC Interface clock configuration

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE

MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE

Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG ()

Default configuration for Ethernet MAC object.

Type Definitions

```
typedef struct esp_eth_mac_s esp_eth_mac_t
```

Ethernet MAC.

Enumerations

```
enum emac_rmii_clock_mode_t
```

RMII Clock Mode Options.

Values:

EMAC_CLK_DEFAULT

Default values configured using Kconfig are going to be used when “Default” selected.

EMAC_CLK_EXT_IN

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

Note MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

EMAC_CLK_OUT

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

```
enum emac_rmii_clock_gpio_t
```

RMII Clock GPIO number Options.

Values:

EMAC_CLK_IN_GPIO = 0

MAC will get RMII clock from outside at this GPIO.

Note ESP32 only supports GPIO0 to input the RMII clock.

EMAC_APPL_CLK_OUT_GPIO = 0

Output RMII Clock from internal APLL Clock available at GPIO0.

Note GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

EMAC_CLK_OUT_GPIO = 16

Output RMII Clock from internal APLL Clock available at GPIO16.

EMAC_CLK_OUT_180_GPIO = 17

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

API 参考-PHY 接口

Header File

- [components/esp_eth/include/esp_eth_phy.h](#)

Functions

```
esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)
```

Create a PHY instance of IP101.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

esp_eth_phy_t ***esp_eth_phy_new_rt18201** (const *eth_phy_config_t* *config)
Create a PHY instance of RTL8201.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

esp_eth_phy_t ***esp_eth_phy_new_lan87xx** (const *eth_phy_config_t* *config)
Create a PHY instance of LAN87xx.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

static *esp_eth_phy_t* ***esp_eth_phy_new_lan8720** (const *eth_phy_config_t* *config)
Create a PHY instance of LAN8720.

Note For ESP-IDF backwards compatibility reasons. In all other cases, use *esp_eth_phy_new_lan87xx* instead.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

esp_eth_phy_t ***esp_eth_phy_new_dp83848** (const *eth_phy_config_t* *config)
Create a PHY instance of DP83848.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

esp_eth_phy_t ***esp_eth_phy_new_ksz8041** (const *eth_phy_config_t* *config)
Create a PHY instance of KSZ8041.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

esp_eth_phy_t ***esp_eth_phy_new_ksz8081** (const *eth_phy_config_t* *config)
Create a PHY instance of KSZ8081.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

Structures

struct esp_eth_phy_s
Ethernet PHY.

Public Members

esp_err_t (***set_mediator**) (*esp_eth_phy_t* *phy, *esp_eth_mediator_t* *mediator)
Set mediator for PHY.

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

Parameters

- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

esp_err_t (***reset**) (*esp_eth_phy_t* *phy)
Software Reset Ethernet PHY.

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

esp_err_t (***reset_hw**) (*esp_eth_phy_t* *phy)
Hardware Reset Ethernet PHY.

Note Hardware reset is mostly done by pull down and up PHY's nRST pin

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

esp_err_t (***init**) (*esp_eth_phy_t* *phy)
Initialize Ethernet PHY.

Return

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

esp_err_t (***deinit**) (*esp_eth_phy_t* *phy)
Deinitialize Ethernet PHY.

Return

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

esp_err_t (***negotiate**) (*esp_eth_phy_t* *phy)
Start auto negotiation.

Return

- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

esp_err_t (***get_link**) (*esp_eth_phy_t* *phy)
Get Ethernet PHY link status.

Return

- ESP_OK: get Ethernet PHY link status successfully

- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

esp_err_t (***pwrcnt1**) (*esp_eth_phy_t* *phy, bool enable)

Power control of Ethernet PHY.

Return

- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

esp_err_t (***set_addr**) (*esp_eth_phy_t* *phy, uint32_t addr)

Set PHY chip address.

Return

- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

esp_err_t (***get_addr**) (*esp_eth_phy_t* *phy, uint32_t *addr)

Get PHY chip address.

Return

- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters

- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

esp_err_t (***advertise_pause_ability**) (*esp_eth_phy_t* *phy, uint32_t ability)

Advertise pause function supported by MAC layer.

Return

- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

Parameters

- [in] phy: Ethernet PHY instance
- [out] addr: Pause ability

esp_err_t (***loopback**) (*esp_eth_phy_t* *phy, bool enable)

Return

- ESP_OK: configures PHY instance loopback function successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance
- [in] enable: enables or disables PHY loopback

esp_err_t (***del**) (*esp_eth_phy_t* *phy)

Free memory of Ethernet PHY instance.

Return

- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

struct eth_phy_config_t

Ethernet PHY configuration.

Public Members

`int32_t phy_addr`
PHY address, set -1 to enable PHY address detection at initialization stage

`uint32_t reset_timeout_ms`
Reset timeout value (Unit: ms)

`uint32_t autonego_timeout_ms`
Auto-negotiation timeout value (Unit: ms)

`int reset_gpio_num`
Reset GPIO number, -1 means no hardware reset

Macros

`ESP_ETH_PHY_ADDR_AUTO`

`ETH_PHY_DEFAULT_CONFIG()`
Default configuration for Ethernet PHY object.

Type Definitions

`typedef struct esp_eth_phy_s esp_eth_phy_t`
Ethernet PHY.

API 参考-esp_netif 相关使用

Header File

- [components/esp_eth/include/esp_eth_netif_glue.h](#)

Functions

`esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)`
Create a netif glue for Ethernet driver.

Note netif glue is used to attach io driver to TCP/IP netif

Return glue object, which inherits `esp_netif_driver_base_t`

Parameters

- `eth_hdl`: Ethernet driver handle

`esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)`
Delete netif glue of Ethernet driver.

Return `-ESP_OK`: delete netif glue successfully

Parameters

- `eth_netif_glue`: netif glue

`esp_err_t esp_eth_set_default_handlers(void *esp_netif)`
Register default IP layer handlers for Ethernet.

Note : Ethernet handle might not yet properly initialized when setting up these default handlers

Warning : This function is deprecated and is kept here only for compatibility reasons. Registration of default IP layer handlers for Ethernet is now handled automatically. Do not call this function if you want to use multiple Ethernet instances at a time.

Return

- `ESP_ERR_INVALID_ARG`: invalid parameter (`esp_netif` is NULL)
- `ESP_OK`: set default IP layer handlers successfully
- others: other failure occurred during register `esp_event` handler

Parameters

- `[in] esp_netif`: esp network interface handle created for Ethernet driver

esp_err_t **esp_eth_clear_default_handlers** (void **esp_netif*)

Unregister default IP layer handlers for Ethernet.

Warning : This function is deprecated and is kept here only for compatibility reasons. Unregistration of default IP layer handlers for Ethernet is now handled automatically if not registered by calling `esp_eth_set_default_handlers`.

Return

- ESP_ERR_INVALID_ARG: invalid parameter (*esp_netif* is NULL)
- ESP_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister `esp_event` handler

Parameters

- [in] *esp_netif*: esp network interface handle created for Ethernet driver

Type Definitions

```
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

本部分的以太网 API 示例代码存放在 ESP-IDF 示例项目的 `ethernet` 目录下。

2.2.3 Thread

Thread

Introduction `Thread` is a IP-based mesh networking protocol. It's based on the 802.15.4 physical and MAC layer.

Application Examples The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`.
- The Thread border router `openthread/ot_br`.
- The Thread radio co-processor `openthread/ot_rcp`.

API Reference For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- `components/openthread/include/esp_openthread.h`

Functions

esp_err_t **esp_openthread_init** (const *esp_openthread_platform_config_t* **init_config*)

Initializes the full OpenThread stack.

Note The OpenThread instance will also be initialized in this function.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

Parameters

- [in] *init_config*: The initialization configuration.

esp_err_t **esp_openthread_launch_mainloop** (void)

Launches the OpenThread main loop.

Note This function will not return unless error happens when running the OpenThread stack.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

esp_err_t **esp_openthread_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

otInstance ***esp_openthread_get_instance** (void)

This function acquires the underlying OpenThread instance.

Note This function can be called on other tasks without lock.

Return The OpenThread instance pointer

Header File

- components/openthread/include/esp_openthread_types.h

Structures

struct esp_openthread_mainloop_context_t

This structure represents a context for a select() based mainloop.

Public Members

fd_set **read_fds**

The read file descriptors

fd_set **write_fds**

The write file descriptors

fd_set **error_fds**

The error file descriptors

int **max_fd**

The max file descriptor

struct timeval timeout

The timeout

struct esp_openthread_uart_config_t

The uart port config for OpenThread.

Public Members

uart_port_t **port**

UART port number

uart_config_t **uart_config**

UART configuration, see *uart_config_t* docs

int **rx_pin**

UART RX pin

int **tx_pin**

UART TX pin

struct esp_openthread_radio_config_t

The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t **radio_mode**

The radio mode

esp_openthread_uart_config_t **radio_uart_config**

The uart configuration to RCP

struct esp_openthread_host_connection_config_t

The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t **host_connection_mode**

The host connection mode

esp_openthread_uart_config_t **host_uart_config**

The uart configuration to host

struct esp_openthread_port_config_t

The OpenThread port specific configuration.

Public Members

const char *storage_partition_name

The partition for storing OpenThread dataset

uint8_t netif_queue_size

The packet queue size for the network interface

uint8_t task_queue_size

The task queue size

struct esp_openthread_platform_config_t

The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t **radio_config**

The radio configuration

esp_openthread_host_connection_config_t **host_config**

The host connection configuration

esp_openthread_port_config_t **port_config**

The port configuration

Enumerations

enum esp_openthread_event_t

OpenThread event declarations.

Values:

OPENTHREAD_EVENT_START

OpenThread stack start

OPENTHREAD_EVENT_STOP

OpenThread stack stop

OPENTHREAD_EVENT_IF_UP

OpenThread network interface up

OPENTHREAD_EVENT_IF_DOWN

OpenThread network interface down

OPENTHREAD_EVENT_GOT_IP6

OpenThread stack added IPv6 address

OPENTHREAD_EVENT_LOST_IP6

OpenThread stack removed IPv6 address

OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN

OpenThread stack joined IPv6 multicast group

OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE

OpenThread stack left IPv6 multicast group

enum esp_openthread_radio_mode_t

The radio mode of OpenThread.

*Values:***RADIO_MODE_NATIVE = 0x0**

Use the native 15.4 radio

RADIO_MODE_UART_RCP = 0x1

UART connection to a 15.4 capable radio co-processor (RCP)

RADIO_MODE_SPI_RCP = 0x2

SPI connection to a 15.4 capable radio co-processor (RCP)

enum esp_openthread_host_connection_mode_t

How OpenThread connects to the host.

*Values:***HOST_CONNECTION_MODE_NONE = 0x0**

Disable host connection

HOST_CONNECTION_MODE_CLI_UART = 0x1

CLI UART connection to the host

HOST_CONNECTION_MODE_RCP_UART = 0x2

RCP UART connection to the host

Header File

- [components/openthread/include/esp_openthread_lock.h](#)

Functions*esp_err_t* **esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void **esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp_openthread_lock_acquire** (TickType_t *block_ticks*)

This functions acquires the OpenThread API lock.

Note Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

Return

- True on lock acquired
- False on failing to acquire the lock with the timeout.

Parameters

- [in] `block_ticks`: The maximum number of RTOS ticks to wait for the lock.

void **esp_openthread_lock_release** (void)
This function releases the OpenThread API lock.

Header File

- [components/openthread/include/esp_openthread_netif_glue.h](#)

Functions

void ***esp_openthread_netif_glue_init** (const *esp_openthread_platform_config_t* *config)
This function initializes the OpenThread network interface glue.

Return

- glue pointer on success
- NULL on failure

Parameters

- [in] `config`: The platform configuration.

void **esp_openthread_netif_glue_deinit** (void)
This function deinitializes the OpenThread network interface glue.

esp_netif_t ***esp_openthread_get_netif** (void)
This function acquires the OpenThread netif.

Return The OpenThread netif or NULL if not initialized.

Header File

- [components/openthread/include/esp_openthread_border_router.h](#)

Functions

esp_err_t **esp_openthread_border_router_init** (*esp_netif_t* *backbone_netif)
Initializes the border router features of OpenThread.

Note Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

Return

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FIAL` on other failures

Parameters

- [in] `backbone_netif`: The backbone network interface (WiFi or ethernet)

esp_err_t **esp_openthread_border_router_deinit** (void)
Deinitializes the border router features of OpenThread.

Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FIAL` on other failures

esp_netif_t ***esp_openthread_get_backbone_netif** (void)
Gets the backbone interface of OpenThread border router.

Return The backbone interface or NULL if border router not initialized.

本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 `openthread` 目录下。

2.2.4 IP 网络层协议

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

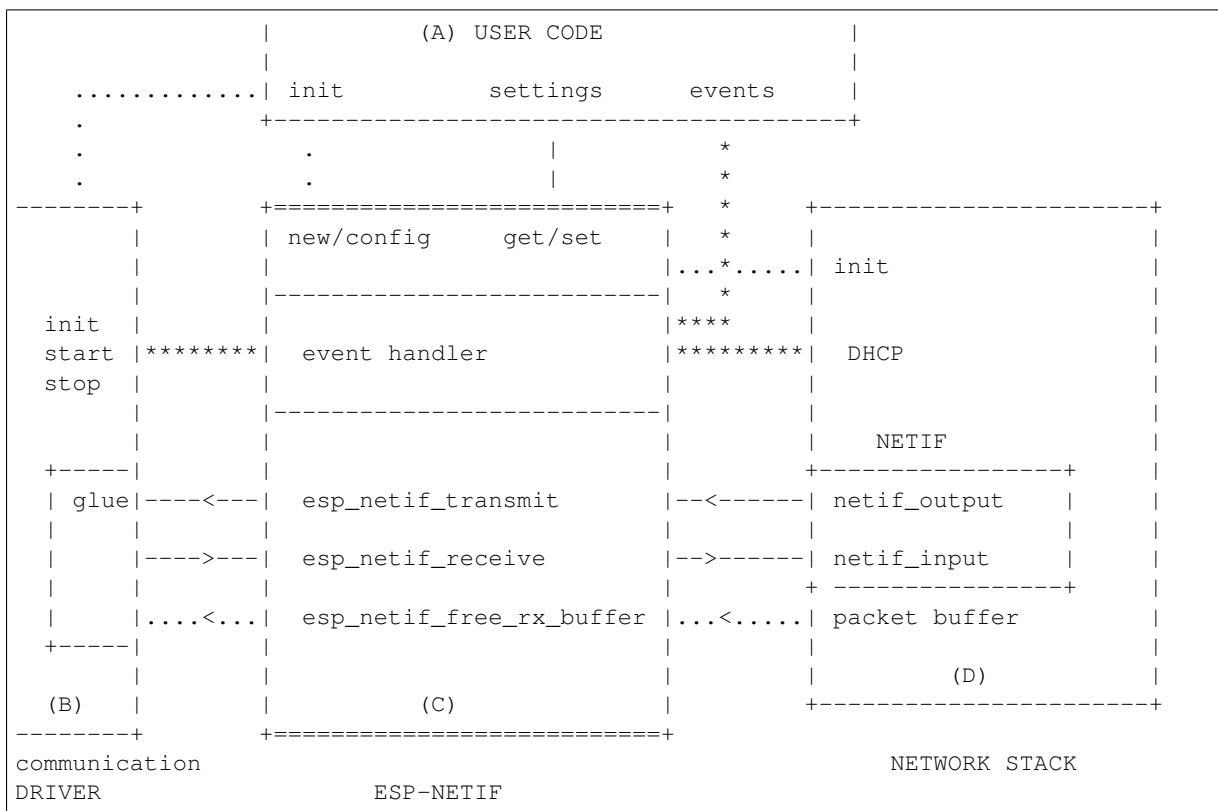

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the [TCP/IP 适配器迁移指南](#) section in case existing applications to be ported to use the esp-netif API instead.

ESP-NETIF architecture

Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back
- ***** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
 - ESP-NETIF specific options (flags, behaviour, name)
 - Network stack options (netif init and input functions, not publicly available)
 - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
 - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
 - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
 - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
 - Calls `esp_netif_receive()` to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
 - Used for network interface lifecycle management
 - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
 - Set interface up or down
 - DHCP server and client API
 - DNS API
- 6) Driver conversion utilities

D) Network stack Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

ESP-NETIF programmer' s manual Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- WiFi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

WiFi default initialization The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- [esp_netif_create_default_wifi_ap\(\)](#)
- [esp_netif_create_default_wifi_sta\(\)](#)

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using [esp_netif_destroy_default_wifi\(\)](#).
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using [esp_netif_destroy\(\)](#).
- When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

- [components/esp_netif/include/esp_netif.h](#)

Functions

esp_err_t **esp_netif_init** (void)

Initialize the underlying TCP/IP stack.

Return

- ESP_OK on success
- ESP_FAIL if initializing failed

Note This function should be called exactly once from application code, when the application starts up.

esp_err_t **esp_netif_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

Return

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t` ***esp_netif_new** (const `esp_netif_config_t` **esp_netif_config*)

Creates an instance of new esp-netif object based on provided config.

Return

- pointer to esp-netif object on success
- NULL otherwise

Parameters

- [in] `esp_netif_config`: pointer esp-netif configuration

void **esp_netif_destroy** (`esp_netif_t` **esp_netif*)

Destroys the esp_netif object.

Parameters

- [in] `esp_netif`: pointer to the object to be deleted

esp_err_t **esp_netif_set_driver_config** (*esp_netif_t* **esp_netif*, **const** *esp_netif_driver_ifconfig_t* **driver_config*)

Configures driver related options of *esp_netif* object.

Return

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

Parameters

- [inout] *esp_netif*: pointer to the object to be configured
- [in] *driver_config*: pointer esp-netif io driver related configuration

esp_err_t **esp_netif_attach** (*esp_netif_t* **esp_netif*, *esp_netif_io_driver_handle_t* *driver_handle*)

Attaches *esp_netif* instance to the io driver handle.

Calling this function enables connecting specific *esp_netif* object with already initialized io driver to update *esp_netif* object with driver specific configuration (i.e. calls *post_attach* callback, which typically sets io driver callbacks to *esp_netif* instance and starts the driver)

Return

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver's *post_attach* callback failed

Parameters

- [inout] *esp_netif*: pointer to *esp_netif* object to be attached
- [in] *driver_handle*: pointer to the driver handle

esp_err_t **esp_netif_receive** (*esp_netif_t* **esp_netif*, void **buffer*, *size_t* *len*, void **eb*)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

Return

- ESP_OK

Parameters

- [in] *esp_netif*: Handle to esp-netif instance
- [in] *buffer*: Received data
- [in] *len*: Length of the data frame
- [in] *eb*: Pointer to internal buffer (used in Wi-Fi driver)

void **esp_netif_action_start** (void **esp_netif*, *esp_event_base_t* *base*, *int32_t* *event_id*, void **data*)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

Note This API can be directly used as event handler

Parameters

- [in] *esp_netif*: Handle to esp-netif instance
- *base*:
- *event_id*:
- *data*:

void **esp_netif_action_stop** (void **esp_netif*, *esp_event_base_t* *base*, *int32_t* *event_id*, void **data*)

Default building block for network interface action upon IO driver stop event.

Note This API can be directly used as event handler

Parameters

- [in] *esp_netif*: Handle to esp-netif instance
- *base*:
- *event_id*:
- *data*:

void **esp_netif_action_connected** (void **esp_netif*, *esp_event_base_t* *base*, *int32_t* *event_id*, void **data*)

Default building block for network interface action upon IO driver connected event.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp_netif_action_disconnected**(void **esp_netif*, *esp_event_base_t* *base*, int32_t *event_id*, void **data*)

Default building block for network interface action upon IO driver disconnected event.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp_netif_action_got_ip**(void **esp_netif*, *esp_event_base_t* *base*, int32_t *event_id*, void **data*)

Default building block for network interface action upon network got IP event.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp_netif_action_join_ip6_multicast_group**(void **esp_netif*, *esp_event_base_t* *base*, int32_t *event_id*, void **data*)

Default building block for network interface action upon IPv6 multicast group join.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp_netif_action_leave_ip6_multicast_group**(void **esp_netif*, *esp_event_base_t* *base*, int32_t *event_id*, void **data*)

Default building block for network interface action upon IPv6 multicast group leave.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp_netif_action_add_ip6_address**(void **esp_netif*, *esp_event_base_t* *base*, int32_t *event_id*, void **data*)

Default building block for network interface action upon IPv6 address added by the underlying stack.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp_netif_action_remove_ip6_address**(void **esp_netif*, *esp_event_base_t* *base*, int32_t *event_id*, void **data*)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note This API can be directly used as event handler

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

esp_err_t **esp_netif_set_mac** (`esp_netif_t *esp_netif`, `uint8_t mac[]`)

Set the mac address for the interface instance.

Return

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `mac`: Desired mac address for the related network interface

esp_err_t **esp_netif_get_mac** (`esp_netif_t *esp_netif`, `uint8_t mac[]`)

Get the mac address for the interface instance.

Return

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `mac`: Resultant mac address for the related network interface

esp_err_t **esp_netif_set_hostname** (`esp_netif_t *esp_netif`, `const char *hostname`)

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

Return

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `hostname`: New hostname for the interface. Maximum length 32 bytes.

esp_err_t **esp_netif_get_hostname** (`esp_netif_t *esp_netif`, `const char **hostname`)

Get interface hostname.

Return

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `hostname`: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

bool **esp_netif_is_netif_up** (`esp_netif_t *esp_netif`)

Test if supplied interface is up or down.

Return

- `true` - Interface is up
- `false` - Interface is down

Parameters

- [in] `esp_netif`: Handle to esp-netif instance

esp_err_t **esp_netif_get_ip_info** (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

esp_err_t **esp_netif_get_old_ip_info** (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

esp_err_t **esp_netif_set_ip_info** (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

Note DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

Note Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: IP information to set on the specified interface

esp_err_t **esp_netif_set_old_ip_info** (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: Store the old IP information for the specified interface

int **esp_netif_get_netif_impl_index** (`esp_netif_t *esp_netif`)

Get net interface index from network stack implementation.

Note This index could be used in `setsockopt()` to bind socket with multicast interface

Return implementation specific index of interface represented with supplied `esp_netif`

Parameters

- [in] `esp_netif`: Handle to esp-netif instance

esp_err_t **esp_netif_get_netif_impl_name** (`esp_netif_t *esp_netif`, `char *name`)

Get net interface name from network stack implementation.

Note This name could be used in `setsockopt()` to bind socket with appropriate interface

Return

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `name`: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

esp_err_t **esp_netif_dhcps_option** (`esp_netif_t *esp_netif`, `esp_netif_dhcp_option_mode_t opt_op`, `esp_netif_dhcp_option_id_t opt_id`, `void *opt_val`, `uint32_t opt_len`)

Set or Get DHCP server option.

Return

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `opt_op`: `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

esp_err_t **esp_netif_dhcpc_option** (`esp_netif_t *esp_netif`, `esp_netif_dhcp_option_mode_t opt_op`, `esp_netif_dhcp_option_id_t opt_id`, `void *opt_val`, `uint32_t opt_len`)

Set or Get DHCP client option.

Return

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `opt_op`: `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

esp_err_t **esp_netif_dhcpc_start** (`esp_netif_t *esp_netif`)

Start DHCP client (only if enabled in interface object)

Note The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

Parameters

- [in] `esp_netif`: Handle to esp-netif instance

esp_err_t **esp_netif_dhcpc_stop** (`esp_netif_t *esp_netif`)

Stop DHCP client (only if enabled in interface object)

Note Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters

- [in] `esp_netif`: Handle to esp-netif instance

esp_err_t **esp_netif_dhcpc_get_status** (`esp_netif_t *esp_netif`, `esp_netif_dhcp_status_t *status`)

Get DHCP client status.

Return

- ESP_OK

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `status`: If successful, the status of DHCP client will be returned in this argument.

esp_err_t **esp_netif_dhcps_get_status** (`esp_netif_t *esp_netif`, `esp_netif_dhcp_status_t *status`)

Get DHCP Server status.

Return

- ESP_OK

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `status`: If successful, the status of the DHCP server will be returned in this argument.

esp_err_t **esp_netif_dhcps_start** (`esp_netif_t *esp_netif`)

Start DHCP server (only if enabled in interface object)

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters

- [in] `esp_netif`: Handle to esp-netif instance

esp_err_t **esp_netif_dhcps_stop** (`esp_netif_t *esp_netif`)

Stop DHCP server (only if enabled in interface object)

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters

- [in] `esp_netif`: Handle to esp-netif instance

esp_err_t **esp_netif_set_dns_info** (`esp_netif_t *esp_netif`, `esp_netif_dns_type_t type`, `esp_netif_dns_info_t *dns`)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
- This function can override it by setting server type `ESP_NETIF_DNS_MAIN`.
- Other DNS Server types are not supported for the Wi-Fi AP interface.

Return

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

Parameters

- `[in] esp_netif`: Handle to esp-netif instance
- `[in] type`: Type of DNS Server to set: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- `[in] dns`: DNS Server address to set

```
esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type,
                                  esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Return

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

Parameters

- `[in] esp_netif`: Handle to esp-netif instance
- `[in] type`: Type of DNS Server to get: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- `[out] dns`: DNS Server result is written here on success

```
esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a `SYSTEM_EVENT_GOT_IP6` event will be sent.

Return

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

Parameters

- `[in] esp_netif`: Handle to esp-netif instance

```
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Return

- `ESP_OK`
- `ESP_FAIL` If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

Parameters

- `[in] esp_netif`: Handle to esp-netif instance

- [out] `if_ip6`: IPv6 information will be returned in this argument if successful.

esp_err_t **esp_netif_get_ip6_global** (*esp_netif_t* **esp_netif*, *esp_ip6_addr_t* **if_ip6*)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Return

- `ESP_OK`
- `ESP_FAIL` If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `if_ip6`: IPv6 information will be returned in this argument if successful.

int **esp_netif_get_all_ip6** (*esp_netif_t* **esp_netif*, *esp_ip6_addr_t* *if_ip6*[])

Get all IPv6 addresses of the specified interface.

Return number of returned IPv6 addresses

Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `if_ip6`: Array of IPv6 addresses will be copied to the argument

void **esp_netif_set_ip4_addr** (*esp_ip4_addr_t* **addr*, *uint8_t* *a*, *uint8_t* *b*, *uint8_t* *c*, *uint8_t* *d*)

Sets IPv4 address to the specified octets.

Parameters

- [out] `addr`: IP address to be set
- `a`: the first octet (127 for IP 127.0.0.1)
- `b`:
- `c`:
- `d`:

char ***esp_ip4addr_ntoa** (**const** *esp_ip4_addr_t* **addr*, char **buf*, int *buflen*)

Converts numeric IP address into decimal dotted ASCII representation.

Return either pointer to `buf` which now holds the ASCII representation of `addr` or `NULL` if `buf` was too small

Parameters

- `addr`: ip address in network order to convert
- `buf`: target buffer where the string is stored
- `buflen`: length of `buf`

uint32_t **esp_ip4addr_aton** (**const** char **addr*)

Ascii internet address interpretation routine The value returned is in network order.

Return ip address in network order

Parameters

- `addr`: IP address in ascii representation (e.g. "127.0.0.1")

esp_err_t **esp_netif_str_to_ip4** (**const** char **src*, *esp_ip4_addr_t* **dst*)

Converts Ascii internet IPv4 address into `esp_ip4_addr_t`.

Return

- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

Parameters

- [in] `src`: IPv4 address in ascii representation (e.g. "127.0.0.1")
- [out] `dst`: Address of the target `esp_ip4_addr_t` structure to receive converted address

esp_err_t **esp_netif_str_to_ip6** (**const** char **src*, *esp_ip6_addr_t* **dst*)

Converts Ascii internet IPv6 address into `esp_ip4_addr_t` Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1")

Return

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters

- [in] src: IPv6 address in ascii representation (e.g. "2001:0db8:85a3:0000:0000:0000:0002:0001")
- [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address

esp_netif_iedriver_handle **esp_netif_get_io_driver** (esp_netif_t *esp_netif)

Gets media driver handle for this esp-netif instance.

Return opaque pointer of related IO driver

Parameters

- [in] esp_netif: Handle to esp-netif instance

esp_netif_t ***esp_netif_get_handle_from_ifkey** (const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

Return Handle to esp-netif instance

Parameters

- if_key: Textual description of network interface

esp_netif_flags_t **esp_netif_get_flags** (esp_netif_t *esp_netif)

Returns configured flags for this interface.

Return Configuration flags

Parameters

- [in] esp_netif: Handle to esp-netif instance

const char ***esp_netif_get_ifkey** (esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

Return Textual description of related interface

Parameters

- [in] esp_netif: Handle to esp-netif instance

const char ***esp_netif_get_desc** (esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

Return Enumerated type of this interface, such as station, AP, ethernet

Parameters

- [in] esp_netif: Handle to esp-netif instance

int **esp_netif_get_route_prio** (esp_netif_t *esp_netif)

Returns configured routing priority number.

Return Integer representing the instance's route-prio, or -1 if invalid paramters

Parameters

- [in] esp_netif: Handle to esp-netif instance

int32_t **esp_netif_get_event_id** (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)

Returns configured event for this esp-netif instance and supplied event type.

Return specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

Parameters

- [in] esp_netif: Handle to esp-netif instance
- event_type: (either get or lost IP)

esp_netif_t ***esp_netif_next** (esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return First netif from the list if supplied parameter is NULL, next one otherwise

Parameters

- [in] esp_netif: Handle to esp-netif instance

`size_t esp_netif_get_nr_of_ifs` (void)
Returns number of registered `esp_netif` objects.

Return Number of `esp_netifs`

void `esp_netif_netstack_buf_ref` (void **netstack_buf*)
increase the reference counter of net stack buffer

Parameters

- [in] `netstack_buf`: the net stack buffer

void `esp_netif_netstack_buf_free` (void **netstack_buf*)
free the netstack buffer

Parameters

- [in] `netstack_buf`: the net stack buffer

Macros

`_ESP_NETIF_SUPPRESS_LEGACY_WARNING_`

WiFi default API reference

Header File

- [components/esp_wifi/include/esp_wifi_default.h](#)

Functions

esp_err_t `esp_netif_attach_wifi_station` (`esp_netif_t` **esp_netif*)
Attaches wifi station interface to supplied `netif`.

Return

- `ESP_OK` on success
- `ESP_FAIL` if attach failed

Parameters

- `esp_netif`: instance to attach the wifi station to

esp_err_t `esp_netif_attach_wifi_ap` (`esp_netif_t` **esp_netif*)
Attaches wifi soft AP interface to supplied `netif`.

Return

- `ESP_OK` on success
- `ESP_FAIL` if attach failed

Parameters

- `esp_netif`: instance to attach the wifi AP to

esp_err_t `esp_wifi_set_default_wifi_sta_handlers` (void)
Sets default wifi event handlers for STA interface.

Return

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

esp_err_t `esp_wifi_set_default_wifi_ap_handlers` (void)
Sets default wifi event handlers for AP interface.

Return

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

esp_err_t `esp_wifi_clear_default_wifi_driver_and_handlers` (void **esp_netif*)
Clears default wifi event handlers for supplied network interface.

Return

- `ESP_OK` on success, error returned from `esp_event_handler_register` if failed

Parameters

- `esp_netif`: instance of corresponding if object

`esp_netif_t *esp_netif_create_default_wifi_ap` (void)
Creates default WIFI AP. In case of any init error this API aborts.

Note The API creates `esp_netif` object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

Return pointer to esp-netif instance

`esp_netif_t *esp_netif_create_default_wifi_sta` (void)
Creates default WIFI STA. In case of any init error this API aborts.

Note The API creates `esp_netif` object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

Return pointer to esp-netif instance

void `esp_netif_destroy_default_wifi` (void **esp_netif*)
Destroys default WIFI netif created with `esp_netif_create_default_wifi_...` API.

Note This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if `esp_netif` is NULL)

Parameters

- [in] `esp_netif`: object to detach from WiFi and destroy

`esp_netif_t *esp_netif_create_wifi` (*wifi_interface_t* *wifi_if*, `esp_netif_inherent_config_t` **esp_netif_config*)

Creates `esp_netif` WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

Return pointer to esp-netif instance

Parameters

- [in] `wifi_if`: type of wifi interface
- [in] `esp_netif_config`: inherent esp-netif configuration pointer

`esp_err_t esp_netif_create_default_wifi_mesh_netifs` (`esp_netif_t` **p_netif_sta*, `esp_netif_t` ***p_netif_ap*)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Return ESP_OK on success

Parameters

- [out] `p_netif_sta`: pointer where the resultant STA interface is saved (if non NULL)
- [out] `p_netif_ap`: pointer where the resultant AP interface is saved (if non NULL)

TCP/IP 适配器迁移指南

TCP/IP 适配器是在 IDF V4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` 移出至其后继者 *ESP-NETIF* 的过程。

更新网络连接代码

网络软件栈初始化 只需将 `tcpip_adapter_init()` 替换为 `esp_netif_init()`。请注意, *ESP-NETIF* 初始化 API 可返回标准错误代码, 还可以使用 `esp_netif_deinit()` 进行去初始化。

此外, 还需将 `#include "tcpip_adapter.h"` 替换为 `#include "esp_netif.h"`。

创建网络接口 TCP/IP 适配器静态定义了三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

网络接口的设计应严格参考 *ESP-NETIF*，以使其能够连接到 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`；或 `esp_netif_create_default_wifi_ap()`。请参阅这三个接口的初始化代码示例：

- Wi-Fi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- Wi-Fi AP: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- 以太网: [ethernet/basic/main/ethernet_example_main.c](#)

更换其他 `tcpip_adapter` API 所有 `tcpip_adapter` 函数都有对应的 `esp-netif`。具体请见 `esp_netif` 的内容：

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

默认事件处理程序 事件处理程序已经从 `tcpip_adapter` 移动到相应的驱动程序代码。从应用程序的角度来看，这不会带来任何影响，所有事件仍以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 `esp-netif` 结构体的形式接收 IP 地址（不是 LwIP 结构，但兼容二进制格式）。这是打印地址的首选方式：

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

而不是

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

由于 `ip4addr_ntoa()` 为 LwIP API，因此 `esp-netif` 还提供了替代函数 `esp_ip4addr_ntoa()`，但整体而言仍推荐上述方法。

IP 地址 推荐使用 `esp-netif` 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。
* [esp-netif IP address definitions](#)

下一步 为了移植应用程序使其可以使用 *ESP-NETIF* 还需完成的步骤包括：在组件配置中禁用 `tcpip_adapter` 兼容层。方法为：`ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface`，并检查工程是否编译成功。TCP/IP 适配器涉及大量依赖项，这一步可能有助于将应用程序与使用特定 TCP/IP 软件栈的 API 分离开来。

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with `esp-netif` connection capabilities. By convention the I/O driver has to register itself as an `esp-netif` driver and thus holds a dependency on `esp-netif` component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with `esp-netif`:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_io_driver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_io_driver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as_
↳esp-netif driver */
    driver_impl_t driver_impl;             /*!< handle of driver_
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

Default handlers I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

Header File

- [components/esp_netif/include/esp_netif_net_stack.h](#)

Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)`

Returns esp-netif handle.

Return handle to related esp-netif instance

Parameters

- [in] dev: opaque ptr to network interface of specific TCP/IP stack

`void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)`

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Return handle to related network stack netif handle

Parameters

- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame

`esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame
- [in] netstack_buf: net stack buffer

`void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)`

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 [protocols/sockets](#) 目录下。

2.2.5 应用层协议

应用层网络协议（IP 网络层协议之上）的相关文档存放在[应用层协议](#)。

2.3 外设 API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32-S3 integrates 2 SAR ([Successive Approximation Register](#)) ADCs, supporting a total of 20 measurement channels (analog enabled pins).

These channels are supported:

ADC1:

- 10 channels: GPIO1 - GPIO10

ADC2:

- 10 channels: GPIO11 - GPIO20

ADC Attenuation

Vref is the reference voltage used internally by ESP32-S3 ADCs for measuring the input voltage. The ESP32-S3 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

Attenuation	Measurable input voltage range
ADC_ATTEN_DB_0	0 mV ~ 950 mV
ADC_ATTEN_DB_2_5	0 mV ~ 1250 mV
ADC_ATTEN_DB_6	0 mV ~ 1750 mV
ADC_ATTEN_DB_11	0 mV ~ 3100 mV

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32-S3 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, see ADC Attenuation .
Dmax	Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 8191 under Continuous Read mode.

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via

the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See [ADC Calibration](#).

ADC Limitations

注解:

- Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.
-

Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

注解: ADC readings from a pin not connected to any signal are random.

ADC Single Read mode The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in [peripherals/adc/single_read](#) directory of ESP-IDF examples.

This API provides convenient way to configure ADC1 for reading from *ULP*. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

注解: See [ADC Limitations](#) for the limitation of using ADC single read mode.

Minimizing Noise

The ESP32-S3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

ADC Calibration

ESP32-S3 ADC Calibration contains 2 steps: Hardware Calibration and Software Calibration.

Hardware Calibration Based on series of comparisons with the reference voltage, ESP32-S3 ADC determines each bit of the output digital result. Per design the ESP32-S3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. To minimize this difference, hardware calibration is introduced.

Hardware calibration contains 2 steps:

1. Set an auto-calibration parameter of bandgap voltage reference. In this way, the difference mentioned above can be minimized.
2. Correct the offset of the ADC Vin-Dout characteristics. ADC characteristics is generally a function: $f(x) = A * x + B$, where B is the offset.

An uncalibrated ADC characteristics is as follows:

The offset in the uncalibrated characteristics is significant. Step 2 is to correct the offset to 0.

After hardware calibration, the ADC characteristics would be like:

Hardware calibration is done internally by the ADC driver. The consequent results are raw data. A transformation is needed to get the final result, see [ADC Conversion](#).

Software Calibration To convert ADC raw data to calibrated digital data, following steps should be followed:

1. Check the eFuse to know if the software calibration is supported via `esp_adc_cal_check_efuse()`.
2. Calculate the ADC calibration characteristics via `esp_adc_cal_characterize()`. The ADC software calibration characteristics are per ADC module and per attenuation. For example, characteristics of ADC1 channel 0 under 11 dB attenuation are the same as characteristics of ADC1 channel 2 under 11 dB attenuation. But characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC2 channel 0 under 11 dB attenuation. Also characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC1 channel 0 under 6 dB attenuation.
3. Get the actual voltage value via `esp_adc_cal_raw_to_voltage()`.

After software calibration, the ADC characteristics would be like:

The results provided by the ADC calibration APIs indicate the actual voltage values. ADC software calibration example can be found in [peripherals/adc/single_read](#) directory of ESP-IDF examples.

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0.
2. `ADC1_GPIOn_CHANNEL` is the ADC1 channel number of GPIO n.

API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

ADC driver

Header File

- [components/driver/include/driver/adc.h](#)

Functions

void `adc_power_on` (void)

Enable ADC power.

void `adc_power_off` (void)

Power off SAR ADC.

void `adc_power_acquire` (void)

Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.

void `adc_power_release` (void)

Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

esp_err_t `adc1_pad_get_io_num` (*adc1_channel_t* channel, *gpio_num_t* **gpio_num*)

Get the GPIO number of a specific ADC1 channel.

Return

- `ESP_OK` if success
- `ESP_ERR_INVALID_ARG` if channel not valid

Parameters

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

esp_err_t `adc1_config_channel_atten` (*adc1_channel_t* channel, *adc_atten_t* atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

Note For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

Note This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

`esp_err_t adc1_config_width(adc_bits_width_t width_bit)`

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `width_bit`: Bit capture width for ADC1

`int adc1_get_raw(adc1_channel_t channel)`

Take an ADC1 reading from a single channel.

Note ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Note Call `adc1_config_width()` before the first time this function is called.

Note For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

Return

- -1: Parameter error
- Other: ADC1 channel reading.

Parameters

- channel: ADC1 channel to read

esp_err_t **adc_set_data_inv** (*adc_unit_t* *adc_unit*, bool *inv_en*)
Set ADC data invert.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *adc_unit*: ADC unit index
- *inv_en*: whether enable data invert

esp_err_t **adc_set_clk_div** (uint8_t *clk_div*)
Set ADC source clock.

Return

- ESP_OK success

Parameters

- *clk_div*: ADC clock divider, ADC clock is divided from APB clock

esp_err_t **adc_set_data_width** (*adc_unit_t* *adc_unit*, *adc_bits_width_t* *width_bit*)
Configure ADC capture width.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *adc_unit*: ADC unit index
- *width_bit*: Bit capture width for ADC unit.

void **adc1_ulp_enable** (void)
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw()` function.

Note that `adc1_config_channel_atten`, `adc1_config_width()` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

esp_err_t **adc2_pad_get_io_num** (*adc2_channel_t* *channel*, *gpio_num_t* **gpio_num*)
Get the GPIO number of a specific ADC2 channel.

Return

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters

- *channel*: Channel to get the GPIO number
- *gpio_num*: output buffer to hold the GPIO number

esp_err_t **adc2_config_channel_atten** (*adc2_channel_t* *channel*, *adc_atten_t* *atten*)
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
	0	100 ~ 950
	2.5	100 ~ 1250

(下页继续)

ESP32	6	150 ~ 1750
	11	150 ~ 2450
	0	0 ~ 750
ESP32-S2	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

Note This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

Note For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

esp_err_t `adc2_get_raw`(*adc2_channel_t* `channel`, *adc_bits_width_t* `width_bit`, int *`raw_out`)

Take an ADC2 reading on a single channel.

Note ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Note ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

Note ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

Return

- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

Parameters

- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

esp_err_t `adc_vref_to_gpio`(*adc_unit_t* `adc_unit`, *gpio_num_t* `gpio`)

Output ADC1 or ADC2’s reference voltage to `adc2_channe_t`’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

Note ESP32 only supports output of ADC2’s internal reference voltage.

Return

- ESP_OK: `v_ref` successfully routed to selected GPIO

- ESP_ERR_INVALID_ARG: Unsupported GPIO

Parameters

- [in] `adc_unit`: ADC unit index
- [in] `gpio`: GPIO number (Only ADC2's channels IO are supported)

esp_err_t `adc2_vref_to_gpio` (*gpio_num_t* `gpio`)

Output ADC2 reference voltage to `adc2_channel_t`'s IO.

This function routes the internal reference voltage of ADCn to one of ADC2's channels. This reference voltage can then be manually measured for calibration purposes.

Return

- ESP_OK: `v_ref` successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

Parameters

- [in] `gpio`: GPIO number (ADC2's channels are supported)

esp_err_t `adc_digi_initialize` (`const` *adc_digi_init_config_t* `*init_config`)

Initialize the Digital ADC.

Return

- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

Parameters

- `init_config`: Pointer to Digital ADC initialization config. Refer to `adc_digi_init_config_t`.

esp_err_t `adc_digi_read_bytes` (`uint8_t` `*buf`, `uint32_t` `length_max`, `uint32_t` `*out_length`, `uint32_t` `timeout_ms`)

Read bytes from Digital ADC through DMA.

Return

- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

Parameters

- [out] `buf`: Buffer to read from ADC.
- [in] `length_max`: Expected length of data read from the ADC.
- [out] `out_length`: Real length of data read from the ADC via this API.
- [in] `timeout_ms`: Time to wait for data via this API, in millisecond.

esp_err_t `adc_digi_start` (`void`)

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

Return

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t `adc_digi_stop` (`void`)

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

Return

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t `adc_digi_deinitialize` (`void`)

Deinitialize the Digital ADC.

Return

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_digi_controller_configure** (const *adc_digi_configuration_t* *config)

Setting the digital controller.

Return

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

Parameters

- config: Pointer to digital controller paramter. Refer to *adc_digi_config_t*.

Structures

struct adc_digi_init_config_s

ADC DMA driver configuration.

Public Members

uint32_t **max_store_buf_size**

Max length of the converted data that driver can store before they are processed.

uint32_t **conv_num_each_intr**

Bytes of data that can be converted in 1 interrupt.

uint32_t **adc1_chan_mask**

Channel list of ADC1 to be initialized.

uint32_t **adc2_chan_mask**

Channel list of ADC2 to be initialized.

struct adc_digi_configuration_t

ADC digital controller settings.

Public Members

bool **conv_limit_en**

To limit ADC conversion times. Conversion stops after finishing *conv_limit_num* times conversion.

uint32_t **conv_limit_num**

Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t **pattern_num**

Number of ADC channels that will be used.

adc_digi_pattern_config_t ***adc_pattern**

List of configs for each ADC channel that will be used.

uint32_t **sample_freq_hz**

The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz $F_s = F_d / \text{interval} / 2$ F_s : sampling frequency; F_d : digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

adc_digi_convert_mode_t **conv_mode**

ADC DMA conversion mode, see *adc_digi_convert_mode_t*.

adc_digi_output_format_t **format**

ADC DMA conversion output format, see *adc_digi_output_format_t*.

Macros

ADC_ATTEN_0db

ADC rtc controller attenuation option.

Note This definitions are only for being back-compatible

ADC_ATTEN_2_5db

ADC_ATTEN_6db

ADC_ATTEN_11db

ADC_WIDTH_BIT_DEFAULT

The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by `SOC_ADC_MAX_BITWIDTH` defined in `soc_caps.h`.

ADC_WIDTH_9Bit

ADC_WIDTH_10Bit

ADC_WIDTH_11Bit

ADC_WIDTH_12Bit

ADC_MAX_DELAY

Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.

Type Definitions

```
typedef struct adc_digi_init_config_s adc_digi_init_config_t  
ADC DMA driver configuration.
```

Enumerations

```
enum adc1_channel_t
```

Values:

ADC1_CHANNEL_0 = 0
ADC1 channel 0 is GPIO1

ADC1_CHANNEL_1
ADC1 channel 1 is GPIO2

ADC1_CHANNEL_2
ADC1 channel 2 is GPIO3

ADC1_CHANNEL_3
ADC1 channel 3 is GPIO4

ADC1_CHANNEL_4
ADC1 channel 4 is GPIO5

ADC1_CHANNEL_5
ADC1 channel 5 is GPIO6

ADC1_CHANNEL_6
ADC1 channel 6 is GPIO7

ADC1_CHANNEL_7
ADC1 channel 7 is GPIO8

ADC1_CHANNEL_8
ADC1 channel 8 is GPIO9

ADC1_CHANNEL_9
ADC1 channel 9 is GPIO10

ADC1_CHANNEL_MAX

```
enum adc2_channel_t
```

Values:

ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)

ADC2_CHANNEL_1

ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)

ADC2_CHANNEL_2

ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)

ADC2_CHANNEL_3

ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)

ADC2_CHANNEL_4

ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)

ADC2_CHANNEL_5

ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)

ADC2_CHANNEL_6

ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)

ADC2_CHANNEL_7

ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

ADC2_CHANNEL_8

ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

ADC2_CHANNEL_9

ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

ADC2_CHANNEL_MAX**enum adc_i2s_encode_t**

ADC digital controller encode option.

*Values:***ADC_ENCODE_12BIT**

ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data

ADC_ENCODE_11BIT

ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

ADC_ENCODE_MAX**Header File**

- [components/hal/include/hal/adc_types.h](#)

Structures**struct adc_digi_pattern_config_t**

ADC digital controller pattern configuration.

Public Members**uint8_t atten**

Attenuation of this ADC channel.

uint8_t channel

ADC channel.

uint8_t unit

ADC unit.

uint8_t bit_width

ADC output bit width.

struct adc_digi_output_data_t

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t **data** : 13

ADC real output data info. Resolution: 13 bit.

uint32_t **channel** : 4

ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t **unit** : 1

ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t **reserved17_31** : 14

Reserved17.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit. ADC_DIGI_FORMAT_11BIT

uint32_t **val**

Raw data value

struct **adc_arbiter_t**

ADC arbiter work mode and priority setting.

Note ESP32-S2: Only ADC2 support arbiter.

Public Members

adc_arbiter_mode_t **mode**

Refer to *adc_arbiter_mode_t*. Note: only support ADC2.

uint8_t **rtc_pri**

RTC controller priority. Range: 0 ~ 2.

uint8_t **dig_pri**

Digital controller priority. Range: 0 ~ 2.

uint8_t **pwdet_pri**

Wi-Fi controller priority. Range: 0 ~ 2.

struct **adc_digi_filter_t**

ADC digital controller (DMA mode) filter configuration.

Note For ESP32-S2, The filter object of the ADC is fixed.

Note For ESP32-S2, The filter object is always all enabled channels.

Public Members

adc_unit_t **adc_unit**

Set adc unit number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t **channel**

Set adc channel number for filter. For ESP32-S2, it' s always ADC_CHANNEL_MAX

adc_digi_filter_mode_t **mode**

Set adc filter mode for filter. See *adc_digi_filter_mode_t*.

struct **adc_digi_monitor_t**

ADC digital controller (DMA mode) monitor configuration.

Note For ESP32-S2, The monitor object of the ADC is fixed.

Note For ESP32-S2, The monitor object is always all enabled channels.

Public Members**`adc_unit_t` `adc_unit`**

Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

`adc_channel_t` `channel`

Set adc channel number for monitor. For ESP32-S2, it's always `ADC_CHANNEL_MAX`

`adc_digi_monitor_mode_t` `mode`

Set adc monitor mode. See `adc_digi_monitor_mode_t`.

`uint32_t` `threshold`

Set monitor threshold of adc digital controller.

Macros**`ADC_ARBITER_CONFIG_DEFAULT()`**

ADC arbiter default configuration.

Note ESP32S2: Only ADC2 supports (needs) an arbiter.

Enumerations**`enum` `adc_unit_t`**

ADC unit enumeration.

Note For ADC digital controller (DMA mode), ESP32 doesn't support `ADC_UNIT_2`, `ADC_UNIT_BOTH`, `ADC_UNIT_ALTER`.

Values:

`ADC_UNIT_1` = 1
SAR ADC 1.

`ADC_UNIT_2` = 2
SAR ADC 2.

`ADC_UNIT_BOTH` = 3
SAR ADC 1 and 2.

`ADC_UNIT_ALTER` = 7
SAR ADC 1 and 2 alternative mode.

`ADC_UNIT_MAX`**`enum` `adc_channel_t`**

ADC channels handle. See `adc1_channel_t`, `adc2_channel_t`.

Note For ESP32 ADC1, don't use `ADC_CHANNEL_8`, `ADC_CHANNEL_9`. See `adc1_channel_t`.

Values:

`ADC_CHANNEL_0` = 0
ADC channel

`ADC_CHANNEL_1`
ADC channel

`ADC_CHANNEL_2`
ADC channel

`ADC_CHANNEL_3`
ADC channel

`ADC_CHANNEL_4`
ADC channel

ADC_CHANNEL_5
ADC channel

ADC_CHANNEL_6
ADC channel

ADC_CHANNEL_7
ADC channel

ADC_CHANNEL_8
ADC channel

ADC_CHANNEL_9
ADC channel

ADC_CHANNEL_MAX

enum adc_atten_t

ADC attenuation parameter. Different parameters determine the range of the ADC. See `adc1_config_channel_atten`.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.

ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

ADC_ATTEN_MAX

enum adc_bits_width_t

ADC resolution setting option.

Note Only used in single read mode

Values:

ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t

ADC digital controller (DMA mode) work mode.

Values:

ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.

ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.

ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.

ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t

ADC digital controller (DMA mode) output data format option.

Values:

ADC_DIGI_FORMAT_12BIT

ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (*adc_digi_output_data_t*). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT

ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (*adc_digi_output_data_t*). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX**ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See *adc_digi_output_data_t.type1*

ADC_DIGI_OUTPUT_FORMAT_TYPE2

See *adc_digi_output_data_t.type2*

enum adc_arbiter_mode_t

ADC arbiter work mode option.

Note ESP32-S2: Only ADC2 support arbiter.

Values:

ADC_ARB_MODE_SHIELD

Force shield arbiter, Select the highest priority controller to work.

ADC_ARB_MODE_FIX

Fixed priority switch controller mode.

ADC_ARB_MODE_LOOP

Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch to the next controller after the measurement is completed.

enum adc_digi_filter_idx_t

ADC digital controller (DMA mode) filter index options.

Note For ESP32-S2, The filter object of the ADC is fixed.

Values:

ADC_DIGI_FILTER_IDX0 = 0

The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

ADC_DIGI_FILTER_IDX1

The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

ADC_DIGI_FILTER_IDX_MAX**enum adc_digi_filter_mode_t**

ADC digital controller (DMA mode) filter type options. Expression: $\text{filter_data} = (k-1)/k * \text{last_data} + \text{new_data} / k$.

Values:

ADC_DIGI_FILTER_IIR_2 = 0

The filter mode is first-order IIR filter. The coefficient is 2.

ADC_DIGI_FILTER_IIR_4

The filter mode is first-order IIR filter. The coefficient is 4.

ADC_DIGI_FILTER_IIR_8

The filter mode is first-order IIR filter. The coefficient is 8.

ADC_DIGI_FILTER_IIR_16

The filter mode is first-order IIR filter. The coefficient is 16.

ADC_DIGI_FILTER_IIR_64

The filter mode is first-order IIR filter. The coefficient is 64.

ADC_DIGI_FILTER_IIR_MAX**enum adc_digi_monitor_idx_t**

ADC digital controller (DMA mode) monitor index options.

Note For ESP32-S2, The monitor object of the ADC is fixed.

Values:

ADC_DIGI_MONITOR_IDX0 = 0

The monitor index 0. For ESP32-S2, It can only be used to monitor all enabled channels of ADC1 unit at the same time.

ADC_DIGI_MONITOR_IDX1

The monitor index 1. For ESP32-S2, It can only be used to monitor all enabled channels of ADC2 unit at the same time.

ADC_DIGI_MONITOR_IDX_MAX**enum adc_digi_monitor_mode_t**

Set monitor mode of adc digital controller. MONITOR_HIGH: If ADC_OUT > threshold, Generates monitor interrupt. MONITOR_LOW: If ADC_OUT < threshold, Generates monitor interrupt.

Values:

ADC_DIGI_MONITOR_HIGH = 0

If ADC_OUT > threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_LOW

If ADC_OUT < threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_MAX**enum adc_i2s_source_t**

ESP32 ADC DMA source selection.

Values:

ADC_I2S_DATA_SRC_IO_SIG = 0

I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1

I2S data from ADC

ADC_I2S_DATA_SRC_MAX**ADC Calibration****Header File**

- [components/esp_adc_cal/include/esp_adc_cal.h](#)

Functions

esp_err_t **esp_adc_cal_check_efuse** (*esp_adc_cal_value_t* value_type)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Note in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

Return

- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

Parameters

- value_type: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

esp_adc_cal_value_t **esp_adc_cal_characterize** (*adc_unit_t* adc_num, *adc_atten_t* atten, *adc_bits_width_t* bit_width, *uint32_t* default_vref, *esp_adc_cal_characteristics_t* *chars)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of $y = \text{coeff_a} * x + \text{coeff_b}$. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

Note For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

Return

- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

Parameters

- [in] adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- [in] atten: Attenuation to characterize
- [in] bit_width: Bit width configuration of ADC
- [in] default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- [out] chars: Pointer to empty structure used to store ADC characteristics

uint32_t **esp_adc_cal_raw_to_voltage** (*uint32_t* adc_reading, *const esp_adc_cal_characteristics_t* *chars)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC's characteristics.

Note Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return Voltage in mV

Parameters

- [in] adc_reading: ADC reading
- [in] chars: Pointer to initialized structure containing ADC characteristics

esp_err_t **esp_adc_cal_get_voltage** (*adc_channel_t* channel, *const esp_adc_cal_characteristics_t* *chars, *uint32_t* *voltage)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

Note The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return

- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Parameters

- [in] channel: ADC Channel to read

- [in] `chars`: Pointer to initialized ADC characteristics structure
- [out] `voltage`: Pointer to store converted voltage

Structures

struct esp_adc_cal_characteristics_t

Structure storing characteristics of an ADC.

Note Call `esp_adc_cal_characterize()` to initialize the structure

Public Members

`adc_unit_t` **adc_num**

ADC number

`adc_atten_t` **atten**

ADC attenuation

`adc_bits_width_t` **bit_width**

ADC bit width

`uint32_t` **coeff_a**

Gradient of ADC-Voltage curve

`uint32_t` **coeff_b**

Offset of ADC-Voltage curve

`uint32_t` **vref**

Vref used by lookup table

const `uint32_t*` **low_curve**

Pointer to low Vref curve of lookup table (NULL if unused)

const `uint32_t*` **high_curve**

Pointer to high Vref curve of lookup table (NULL if unused)

`uint8_t` **version**

ADC Calibration

Enumerations

enum esp_adc_cal_value_t

Type of calibration value used in characterization.

Values:

ESP_ADC_CAL_VAL_EFUSE_VREF = 0

Characterization based on reference voltage stored in eFuse

ESP_ADC_CAL_VAL_EFUSE_TP = 1

Characterization based on Two Point values stored in eFuse

ESP_ADC_CAL_VAL_DEFAULT_VREF = 2

Characterization based on default reference voltage

ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3

Characterization based on Two Point values and fitting curve coefficients stored in eFuse

2.3.2 通用定时器

简介

ESP32-S3 芯片提供两组硬件定时器，每组包含两个通用硬件定时器。

所有通用定时器均基于 16 位预分频器和 54 位可自动重新加载向上/向下计数器。

功能概述

下文介绍了配置和操作定时器的常规步骤：

- **定时器初始化** - 启动定时器前应设置的参数，以及每个设置提供的具体功能。
- **定时器控制** - 如何读取定时器的值，如何暂停/启动定时器以及如何改变定时器的操作方式。
- **警报** - 如何设置和使用警报。
- **处理中断事务** - 如何使用中断提供的回调函数。

定时器初始化 两个 ESP32-S3 定时器组中，每组都有两个定时器，两组共有四个定时器供使用。ESP32-S3 定时器组的类型为 `timer_group_t`，每组中的个体定时器类型为 `timer_idx_t`。

首先调用 `timer_init()` 函数，并将 `timer_config_t` 结构体传递给此函数，用于定义定时器的工作方式，实现定时器初始化。特别注意以下定时器参数可设置为：

- **时钟源**: 选择时钟源，与时钟分频器一起决定了定时器的分辨率。
- **分频器**: 设置定时器中计数器计数的速度，`divider` 的设置将用作输入时钟源的除数。默认的时钟源是 `APB_CLK` (一般是 80 MHz)。更多有关 `APB_CLK` 时钟频率信息，请查看 *ESP32-S3 技术参考手册* > 复位和时钟 [PDF] 章节。
- **模式**: 设置计数器是递增还是递减。可通过从 `timer_count_dir_t` 中选取一个值，后使用 `counter_dir` 来选择模式。
- **计数器使能**: 如果计数器已使能，则在调用 `timer_init()` 后计数器将立即开始递增/递减。您可通过从 `timer_start_t` 中选取一个值，后使用 `counter_en` 改变此行为。
- **报警使能**: 可使用 `alarm_en` 设置。
- **自动重载**: 设置计数器是否应该在定时器警报上使用 `auto_reload` 自动重载首个计数值，还是继续递增或递减。

要获取定时器设置的当前值，请使用函数 `timer_get_config()`。

定时器控制 定时器使能后便开始计数。要使能定时器，可首先设置 `counter_en` 为 `true`，然后调用函数 `timer_init()`，或者直接调用函数 `timer_start()`。您可通过调用函数 `timer_set_counter_value()` 来指定定时器的首个计数值。要检查定时器的当前值，调用函数 `timer_get_counter_value()` 或 `timer_get_counter_time_sec()`。

可通过调用函数 `timer_pause()` 随时暂停定时器。要再次启动它，调用函数 `timer_start()`。

要重新配置定时器，可调用函数 `timer_init()`，该函数详细介绍见 [定时器初始化](#)。

除此之外，还可通过使用专有函数更改个别设置来重新配置定时器：

设置	专有函数	描述
分频器	<code>timer_set_divider()</code>	更改计数频率。为避免发生不可预测情况，更改分频器时应暂停定时器。如果定时器正在运行，则使用 <code>timer_set_divider()</code> 将其暂停并更改设置，然后重启定时器。
模式	<code>timer_set_counter_mode()</code>	设置计数器应递增还是递减
自动重载	<code>timer_set_auto_reload()</code>	设置是否应在定时器警报上重载首个计数值

警报 要设置警报，先调用函数 `timer_set_alarm_value()`，然后使用 `timer_set_alarm()` 使能警报。当调用函数 `timer_init()` 时，也可以在定时器初始化阶段使能警报。

警报已使能且定时器达到警报值后，根据配置，可能会出现以下两种行为：

- 如果先前已配置，此时将触发中断。有关如何配置中断，请参见 [处理中断事务](#)。
- 如 `auto_reload` 已使能，定时器的计数器将重新加载，从先前配置好的值开始再次计数。应使用函数 `timer_set_counter_value()` 预先设置该值。

注解：

- 如果已设置警报值且定时器已超过该值，则将立即触发警报。
- 一旦触发后，警报将自动关闭，需要重新使能以再次触发。

要检查某特定的警报值，调用函数 `timer_get_alarm_value()`。

处理中断事务 调用 `timer_isr_callback_add()` 函数可以给某个定时器注册一个中断回调函数，顾名思义，该函数会在中断上下文中被执行，因此用户不能在回调函数中调用任何会阻塞 CPU 的 API。相较于从头编写中断处理程序，使用中断回调函数的好处是，用户无需检测和处理中断的状态位，这些操作会由驱动中默认的中断处理程序替我们完成。

有关如何使用中断回调函数，请参考如下应用示例。

应用示例

54 位通用硬件定时器示例：[peripherals/timer_group](#)。

API 参考

Header File

- [components/driver/include/driver/timer.h](#)

Functions

`esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

Read the counter value of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

- `timer_val`: Pointer to accept timer counter value.

`esp_err_t timer_get_counter_time_sec` (*timer_group_t* group_num, *timer_idx_t* timer_num, double *time)

Read the counter value of hardware timer, in unit of a given scale.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- time: Pointer, type of double*, to accept timer counter value, in seconds.

`esp_err_t timer_set_counter_value` (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t load_val)

Set counter value to hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- load_val: Counter value to write to the hardware timer.

`esp_err_t timer_start` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Start the counter of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

`esp_err_t timer_pause` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Pause the counter of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

`esp_err_t timer_set_counter_mode` (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_count_dir_t* counter_dir)

Set counting mode for hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- counter_dir: Counting direction of timer, count-up or count-down

`esp_err_t timer_set_auto_reload` (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_autoreload_t* reload)

Enable or disable counter reload function when alarm event occurs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `reload`: Counter reload mode.

esp_err_t **timer_set_divider** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint32_t divider)

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `divider`: Timer clock divider value. The divider's range is from 2 to 65536.

esp_err_t **timer_set_alarm_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t alarm_value)

Set timer alarm value.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: A 64-bit value to set the alarm value.

esp_err_t **timer_get_alarm_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t *alarm_value)

Get timer alarm value.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: Pointer of A 64-bit value to accept the alarm value.

esp_err_t **timer_set_alarm** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_alarm_t* alarm_en)

Enable or disable generation of timer alarm events.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_en`: To enable or disable timer alarm function.

esp_err_t **timer_isr_callback_add** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_isr_t* isr_handler, void *arg, int intr_alloc_flags)

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do `YIELD` at the end of the ISR.

Note This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call `timer_isr_register(...)` to register ISR.

Parameters

- `group_num`: Timer group number
- `timer_num`: Timer index of timer group

- `isr_handler`: Interrupt handler function, it is a callback function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_isr_callback_remove(timer_group_t group_num, timer_idx_t timer_num)`

Remove ISR handle callback for the corresponding timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number
- `timer_num`: Timer index of timer group

`esp_err_t timer_isr_register(timer_group_t group_num, timer_idx_t timer_num, void (*fn)) void * , void *arg, int intr_alloc_flags, timer_isr_handle_t *handle` Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

Note If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call `timer_spinlock_take(..)` before your handling, and call `timer_spinlock_give(...)` after your handling.

Parameters

- `group_num`: Timer group number
- `timer_num`: Timer index of timer group
- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_init(timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)`

Initializes and configure the timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer to timer initialization parameters.

`esp_err_t timer_deinit(timer_group_t group_num, timer_idx_t timer_num)`

Deinitializes the timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

`esp_err_t timer_get_config(timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)`

Get timer configure value.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer of struct to accept timer parameters.

`esp_err_t timer_group_intr_enable(timer_group_t group_num, timer_intr_t intr_mask)`

Enable timer group interrupt, by enable mask.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt enable mask.
 - `TIMER_INTR_T0`: t0 interrupt
 - `TIMER_INTR_T1`: t1 interrupt
 - `TIMER_INTR_WDT`: watchdog interrupt

`esp_err_t timer_group_intr_disable(timer_group_t group_num, timer_intr_t intr_mask)`

Disable timer group interrupt, by disable mask.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt disable mask.
 - `TIMER_INTR_T0`: t0 interrupt
 - `TIMER_INTR_T1`: t1 interrupt
 - `TIMER_INTR_WDT`: watchdog interrupt

`esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)`

Enable timer interrupt.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

`esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)`

Disable timer interrupt.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

`void timer_group_intr_clr_in_isr(timer_group_t group_num, timer_idx_t timer_num)`

Clear timer interrupt status, just used in ISR.

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_clr_intr_status_in_isr` (*timer_group_t* `group_num`, *timer_idx_t* `timer_num`)

Clear timer interrupt status, just used in ISR.

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_enable_alarm_in_isr` (*timer_group_t* `group_num`, *timer_idx_t* `timer_num`)

Enable alarm interrupt, just used in ISR.

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

uint64_t `timer_group_get_counter_value_in_isr` (*timer_group_t* `group_num`, *timer_idx_t* `timer_num`)

Get the current counter value, just used in ISR.

Return

- Counter value

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_set_alarm_value_in_isr` (*timer_group_t* `group_num`, *timer_idx_t* `timer_num`,
uint64_t `alarm_val`)

Set the alarm threshold for the timer, just used in ISR.

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.
- `alarm_val`: Alarm threshold.

void `timer_group_set_counter_enable_in_isr` (*timer_group_t* `group_num`, *timer_idx_t* `timer_num`,
timer_start_t `counter_en`)

Enable/disable a counter, just used in ISR.

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.
- `counter_en`: Enable/disable.

timer_intr_t `timer_group_intr_get_in_isr` (*timer_group_t* `group_num`)

Get the masked interrupt status, just used in ISR.

Return

- Interrupt status

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

uint32_t `timer_group_get_intr_status_in_isr` (*timer_group_t* `group_num`)

Get interrupt status, just used in ISR.

Return

- Interrupt status

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

void `timer_group_clr_intr_sta_in_isr` (*timer_group_t* `group_num`, *timer_intr_t* `intr_mask`)

Clear the masked interrupt status, just used in ISR.

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

- `intr_mask`: Masked interrupt.

`bool timer_group_get_auto_reload_in_isr` (*timer_group_t* *group_num*, *timer_idx_t* *timer_num*)

Get auto reload enable status, just used in ISR.

Return

- True Auto reload enabled
- False Auto reload disabled

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index

esp_err_t `timer_spinlock_take` (*timer_group_t* *group_num*)

Take timer spinlock to enter critical protect.

Note Deprecated, the recommended way is to use ISR callbacks instead, see `timer_group_example_main`

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

esp_err_t `timer_spinlock_give` (*timer_group_t* *group_num*)

Give timer spinlock to exit critical protect.

Note Deprecated, the recommended way is to use ISR callbacks instead, see `timer_group_example_main`

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

Macros

`TIMER_BASE_CLK`

Frequency of the clock on the input of the timer groups

Type Definitions

`typedef bool (*timer_isr_t)` (void *)

Interrupt handle callback function. User need to retrun a bool value in callback.

Return

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

Note If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

`typedef intr_handle_t timer_isr_handle_t`

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

Header File

- `components/hal/include/hal/timer_types.h`

Structures

`struct timer_config_t`

Data structure with timer' s configuration settings.

Public Members

timer_alarm_t **alarm_en**

Timer alarm enable

timer_start_t **counter_en**

Counter enable

timer_intr_mode_t **intr_type**

Interrupt mode

timer_count_dir_t **counter_dir**

Counter direction

timer_autoreload_t **auto_reload**

Timer auto-reload

uint32_t **divider**

Counter clock divider. The divider's range is from 2 to 65536.

timer_src_clk_t **clk_src**

Use XTAL as source clock.

Enumerations

enum timer_group_t

Selects a Timer-Group out of 2 available groups.

Values:

TIMER_GROUP_0 = 0

Hw timer group 0

TIMER_GROUP_1 = 1

Hw timer group 1

TIMER_GROUP_MAX

enum timer_idx_t

Select a hardware timer from timer groups.

Values:

TIMER_0 = 0

Select timer0 of GROUPx

TIMER_1 = 1

Select timer1 of GROUPx

TIMER_MAX

enum timer_count_dir_t

Decides the direction of counter.

Values:

TIMER_COUNT_DOWN = 0

Descending Count from cnt.hightcnt.low

TIMER_COUNT_UP = 1

Ascending Count from Zero

TIMER_COUNT_MAX

enum timer_start_t

Decides whether timer is on or paused.

Values:

TIMER_PAUSE = 0
Pause timer counter

TIMER_START = 1
Start timer counter

enum timer_intr_t
Interrupt types of the timer.

Values:

TIMER_INTR_T0 = BIT(0)
interrupt of timer 0

TIMER_INTR_T1 = BIT(1)
interrupt of timer 1

TIMER_INTR_WDT = BIT(2)
interrupt of watchdog

TIMER_INTR_NONE = 0

enum timer_alarm_t
Decides whether to enable alarm mode.

Values:

TIMER_ALARM_DIS = 0
Disable timer alarm

TIMER_ALARM_EN = 1
Enable timer alarm

TIMER_ALARM_MAX

enum timer_intr_mode_t
Select interrupt type if running in alarm mode.

Values:

TIMER_INTR_LEVEL = 0
Interrupt mode: level mode

TIMER_INTR_MAX

enum timer_autoreload_t
Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

TIMER_AUTORELOAD_DIS = 0
Disable auto-reload: hardware will not load counter value after an alarm event

TIMER_AUTORELOAD_EN = 1
Enable auto-reload: hardware will load counter value after an alarm event

TIMER_AUTORELOAD_MAX

enum timer_src_clk_t
Select timer source clock.

Values:

TIMER_SRC_CLK_APB = 0
Select APB as the source clock

TIMER_SRC_CLK_XTAL = 1
Select XTAL as the source clock

2.3.3 GPIO & RTC GPIO

Overview

The ESP32-S3 chip features 45 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF]. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	RTC GPIO	Comment
GPIO0		RTC_GPIO0	Strapping pin
GPIO1	ADC1_CH0	RTC_GPIO1	
GPIO2	ADC1_CH1	RTC_GPIO2	
GPIO3	ADC1_CH2	RTC_GPIO3	Strapping pin
GPIO4	ADC1_CH3	RTC_GPIO4	
GPIO5	ADC1_CH4	RTC_GPIO5	
GPIO6	ADC1_CH5	RTC_GPIO6	
GPIO7	ADC1_CH6	RTC_GPIO7	
GPIO8	ADC1_CH7	RTC_GPIO8	
GPIO9	ADC1_CH8	RTC_GPIO9	
GPIO10	ADC1_CH9	RTC_GPIO10	
GPIO11	ADC2_CH0	RTC_GPIO11	
GPIO12	ADC2_CH1	RTC_GPIO12	
GPIO13	ADC2_CH2	RTC_GPIO13	
GPIO14	ADC2_CH3	RTC_GPIO14	
GPIO15	ADC2_CH4	RTC_GPIO15	
GPIO16	ADC2_CH5	RTC_GPIO16	
GPIO17	ADC2_CH6	RTC_GPIO17	
GPIO18	ADC2_CH7	RTC_GPIO18	
GPIO19	ADC2_CH8	RTC_GPIO19	USB-JTAG
GPIO20	ADC2_CH9	RTC_GPIO20	USB-JTAG

表 1 - 续上页

GPIO	Analog Function	RTC GPIO	Comment
GPIO47			
GPIO48			

注解:

- Strapping pin: GPIO0, GPIO3, GPIO45 and GPIO46 are strapping pins.
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses. When using Octal Flash or Octal PSRAM or both, GPIO33~37 are connected to SPIIO4 ~ SPIIO7 and SPIDQS. Therefore on ESP32-S3R8 / ESP32-S3R8V board GPIO33~37 are also not recommended for other uses.
- USB-JTAG: GPIO 19 and 20 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: [peripherals/gpio/generic_gpio](#).

API Reference - Normal GPIO**Header File**

- [components/driver/include/driver/gpio.h](#)

Functions

`esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)`

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- pGPIOConfig: Pointer to GPIO configure struct

`esp_err_t gpio_reset_pin(gpio_num_t gpio_num)`

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Return Always return ESP_OK.

Parameters

- gpio_num: GPIO number.

`esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

GPIO set interrupt trigger type.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `gpio_num`: GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `intr_type`: Interrupt type, select from `gpio_int_type_t`

esp_err_t **gpio_intr_enable** (*gpio_num_t* *gpio_num*)

Enable GPIO module interrupt signal.

Note Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `gpio_num`: GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

esp_err_t **gpio_intr_disable** (*gpio_num_t* *gpio_num*)

Disable GPIO module interrupt signal.

Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `gpio_num`: GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

esp_err_t **gpio_set_level** (*gpio_num_t* *gpio_num*, *uint32_t* *level*)

GPIO set output level.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO number error

Parameters

- `gpio_num`: GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level`: Output level. 0: low ; 1: high

int **gpio_get_level** (*gpio_num_t* *gpio_num*)

GPIO get input level.

Warning If the pad is not configured for input (or input and output) the returned value is always 0.

Return

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

Parameters

- `gpio_num`: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

esp_err_t **gpio_set_direction** (*gpio_num_t* *gpio_num*, *gpio_mode_t* *mode*)

GPIO set direction.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error

Parameters

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode`: GPIO direction

esp_err_t **gpio_set_pull_mode** (*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Parameters

- gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- pull: GPIO pull up/down mode.

esp_err_t **gpio_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO wake-up function.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number.
- intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

esp_err_t **gpio_wakeup_disable** (*gpio_num_t* gpio_num)

Disable GPIO wake-up function.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

esp_err_t **gpio_isr_register** (void (*fn)) void *

, void *arg, int intr_alloc_flags, *gpio_isr_handle_t* *handle Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

Parameters

- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return

- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

esp_err_t **gpio_pullup_en** (*gpio_num_t* gpio_num)

Enable pull-up on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

esp_err_t **gpio_pullup_dis** (*gpio_num_t* *gpio_num*)

Disable pull-up on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *gpio_num*: GPIO number

esp_err_t **gpio_pulldown_en** (*gpio_num_t* *gpio_num*)

Enable pull-down on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *gpio_num*: GPIO number

esp_err_t **gpio_pulldown_dis** (*gpio_num_t* *gpio_num*)

Disable pull-down on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *gpio_num*: GPIO number

esp_err_t **gpio_install_isr_service** (int *intr_alloc_flags*)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

Parameters

- *intr_alloc_flags*: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.

void **gpio_uninstall_isr_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

esp_err_t **gpio_isr_handler_add** (*gpio_num_t* *gpio_num*, *gpio_isr_t* *isr_handler*, void **args*)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *gpio_num*: GPIO number

- `isr_handler`: ISR handler function for the corresponding GPIO number.
- `args`: parameter for ISR handler.

esp_err_t `gpio_isr_handler_remove` (*gpio_num_t* `gpio_num`)

Remove ISR handler for the corresponding GPIO pin.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `gpio_num`: GPIO number

esp_err_t `gpio_set_drive_capability` (*gpio_num_t* `gpio_num`, *gpio_drive_cap_t* `strength`)

Set GPIO pad drive capability.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad

esp_err_t `gpio_get_drive_capability` (*gpio_num_t* `gpio_num`, *gpio_drive_cap_t* *`strength`)

Get GPIO pad drive capability.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Pointer to accept drive capability of the pad

esp_err_t `gpio_hold_en` (*gpio_num_t* `gpio_num`)

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Return

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

Parameters

- `gpio_num`: GPIO number, only support output-capable GPIOs

esp_err_t `gpio_hold_dis` (*gpio_num_t* `gpio_num`)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

Return

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

Parameters

- `gpio_num`: GPIO number, only support output-capable GPIOs

void **gpio_deep_sleep_hold_en** (void)

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void **gpio_deep_sleep_hold_dis** (void)

Disable all digital gpio pad hold function during Deep-sleep.

void **gpio_iomux_in** (uint32_t *gpio_num*, uint32_t *signal_idx*)

Set pad input to a peripheral signal through the IOMUX.

Parameters

- `gpio_num`: GPIO number of the pad.
- `signal_idx`: Peripheral signal id to input. One of the `*_IN_IDX` signals in `soc/gpio_sig_map.h`.

void **gpio_iomux_out** (uint8_t *gpio_num*, int *func*, bool *oen_inv*)

Set peripheral output to an GPIO pad through the IOMUX.

Parameters

- `gpio_num`: `gpio_num` GPIO number of the pad.
- `func`: The function number of the peripheral pin to output pin. One of the `FUNC_X_*` of specified pin (X) in `soc/io_mux_reg.h`.
- `oen_inv`: True if the output enable needs to be inverted, otherwise False.

esp_err_t **gpio_force_hold_all** (void)

Force hold digital and rtc gpio pad.

Note GPIO force hold, whether the chip in sleep mode or wakeup mode.

esp_err_t **gpio_force_unhold_all** (void)

Force unhold digital and rtc gpio pad.

Note GPIO force unhold, whether the chip in sleep mode or wakeup mode.

esp_err_t **gpio_sleep_sel_en** (*gpio_num_t* *gpio_num*)

Enable SLP_SEL to change GPIO status automantically in lightsleep.

Return

- ESP_OK Success

Parameters

- `gpio_num`: GPIO number of the pad.

esp_err_t **gpio_sleep_sel_dis** (*gpio_num_t* *gpio_num*)

Disable SLP_SEL to change GPIO status automantically in lightsleep.

Return

- ESP_OK Success

Parameters

- `gpio_num`: GPIO number of the pad.

esp_err_t **gpio_sleep_set_direction** (*gpio_num_t* *gpio_num*, *gpio_mode_t* *mode*)

GPIO set direction at sleep.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

Parameters

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode`: GPIO direction

esp_err_t `gpio_sleep_set_pull_mode` (*gpio_num_t* `gpio_num`, *gpio_pull_mode_t* `pull`)

Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` : Parameter error

Parameters

- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull`: GPIO pull up/down mode.

Macros

`GPIO_PIN_COUNT`

`GPIO_IS_VALID_GPIO` (`gpio_num`)

Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO` (`gpio_num`)

Check whether it can be a valid GPIO number of output mode.

Type Definitions

`typedef intr_handle_t` `gpio_isr_handle_t`

Header File

API Reference - RTC GPIO

Header File

- [components/driver/include/driver/rtc_io.h](#)

Functions

static bool `rtc_gpio_is_valid_gpio` (*gpio_num_t* gpio_num)
Determine if the specified GPIO is a valid RTC GPIO.

Return true if GPIO is valid for RTC GPIO use. false otherwise.

Parameters

- gpio_num: GPIO number

static int `rtc_io_number_get` (*gpio_num_t* gpio_num)
Get RTC IO index number by gpio number.

Return >=0: Index of rtcio. -1 : The gpio is not rtcio.

Parameters

- gpio_num: GPIO number

esp_err_t `rtc_gpio_init` (*gpio_num_t* gpio_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t `rtc_gpio_deinit` (*gpio_num_t* gpio_num)

Init a GPIO as digital GPIO.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

uint32_t `rtc_gpio_get_level` (*gpio_num_t* gpio_num)

Get the RTC IO input level.

Return

- 1 High level
- 0 Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t `rtc_gpio_set_level` (*gpio_num_t* gpio_num, *uint32_t* level)

Set the RTC IO output level.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- level: output level

esp_err_t `rtc_gpio_set_direction` (*gpio_num_t* gpio_num, *rtc_gpio_mode_t* mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

esp_err_t rtc_gpio_set_direction_in_sleep (*gpio_num_t* gpio_num, *rtc_gpio_mode_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

esp_err_t rtc_gpio_pullup_en (*gpio_num_t* gpio_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_en (*gpio_num_t* gpio_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pullup_dis (*gpio_num_t* gpio_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_dis (*gpio_num_t* gpio_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_set_drive_capability (*gpio_num_t* gpio_num, *gpio_drive_cap_t* strength)

Set RTC GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad

esp_err_t **rtc_gpio_get_drive_capability** (*gpio_num_t* `gpio_num`, *gpio_drive_cap_t* *`strength`)

Get RTC GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Pointer to accept drive capability of the pad

esp_err_t **rtc_gpio_hold_en** (*gpio_num_t* `gpio_num`)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

esp_err_t **rtc_gpio_hold_dis** (*gpio_num_t* `gpio_num`)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

esp_err_t **rtc_gpio_isolate** (*gpio_num_t* `gpio_num`)

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call `rtc_gpio_isolate(GPIO_NUM_12)` before entering deep sleep, to reduce deep sleep current.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

Parameters

- `gpio_num`: GPIO number (e.g. GPIO_NUM_12).

esp_err_t **rtc_gpio_force_hold_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

esp_err_t **rtc_gpio_force_hold_dis_all** (void)

Disable force hold signal for all RTC IOs.

esp_err_t **rtc_gpio_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable wakeup from sleep mode using specific GPIO.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

Parameters

- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

esp_err_t **rtc_gpio_wakeup_disable** (*gpio_num_t* gpio_num)

Disable wakeup from sleep mode using specific GPIO.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

Parameters

- gpio_num: GPIO number

Macros

RTC_GPIO_IS_VALID_GPIO (gpio_num)

Header File

- [components/hal/include/hal/rtc_io_types.h](#)

Enumerations

enum rtc_gpio_mode_t

RTCIO output/input mode type.

Values:

RTC_GPIO_MODE_INPUT_ONLY

Pad input

RTC_GPIO_MODE_OUTPUT_ONLY

Pad output

RTC_GPIO_MODE_INPUT_OUTPUT

Pad input + output

RTC_GPIO_MODE_DISABLED

Pad (output + input) disable

RTC_GPIO_MODE_OUTPUT_OD

Pad open-drain output

RTC_GPIO_MODE_INPUT_OUTPUT_OD

Pad input + open-drain output

2.3.4 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What' s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

注解: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It' s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it' s impossible to control GPIOA.

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
 - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
 - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

注解: `dedic_gpio_new_bundle()` doesn' t cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that input to bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that output from bundle	<code>dedic_gpio_bundle_read_in()</code>

注解: The functions above just wrap the customized instructions defined for ESP32-S3, for the details of those instructions, please refer to *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF].

Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `cpu_ll_write_dedic_gpio_mask`) or write assembly code with that mask
4. The fasted way of toggling IO is to use the dedicated “set/clear” instructions:

CPU Arch	Set bits of GPIO	Clear bits of GPIO	Remarks
Xtensa	<code>set_bit_gpio_out imm[7:0]</code>	<code>clr_bit_gpio_out imm[7:0]</code>	immediate value width depends on the number of dedicated GPIO channels
RISC-V	<code>csrrsi rd, csr, imm[4:0]</code>	<code>csrrci rd, csr, imm[4:0]</code>	can only control the lowest 4 GPIO channels

For details of supported dedicated GPIO instructions, please refer to *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF]. The supported dedicated CPU instructions are also wrapped inside `soc/cpu_ll.h` as helper inline functions.

注解: Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

Application Example

Matrix keyboard example based on dedicated GPIO: [peripherals/gpio/matrix_keyboard](#).

API Reference

Header File

- `components/driver/include/driver/dedic_gpio.h`

Functions

`esp_err_t dedic_gpio_get_out_mask(dedic_gpio_bundle_handle_t bundle, uint32_t *mask)`
Get allocated channel mask.

Return

- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

Note Each bundle should have at least one mask (in or/and out), based on bundle configuration.

Note With the returned mask, user can directly invoke LL function like “cpu_ll_write_dedic_gpio_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

Parameters

- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- [out] mask: Returned mask value for on specific direction (in or out)

esp_err_t **dedic_gpio_get_in_mask** (*dedic_gpio_bundle_handle_t* bundle, *uint32_t* *mask)

esp_err_t **dedic_gpio_new_bundle** (*const* *dedic_gpio_bundle_config_t* *config, *dedic_gpio_bundle_handle_t* *ret_bundle)

Create GPIO bundle and return the handle.

Return

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

Note One has to enable at least input or output mode in “config” parameter.

Parameters

- [in] config: Configuration of GPIO bundle
- [out] ret_bundle: Returned handle of the new created GPIO bundle

esp_err_t **dedic_gpio_del_bundle** (*dedic_gpio_bundle_handle_t* bundle)

Destory GPIO bundle.

Return

- ESP_OK: Destory GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destory GPIO bundle failed because of invalid argument
- ESP_FAIL: Destory GPIO bundle failed because of other error

Parameters

- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

void **dedic_gpio_bundle_write** (*dedic_gpio_bundle_handle_t* bundle, *uint32_t* mask, *uint32_t* value)

Write value to GPIO bundle.

Note The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

Note For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters

- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- [in] mask: Mask of the GPIOs to be written in the given bundle
- [in] value: Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_out** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that output from the given GPIO bundle.

Return Value that output from the GPIO bundle, low bit represents low member in the bundle

Note For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters

- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

uint32_t **dedic_gpio_bundle_read_in** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that input to the given GPIO bundle.

Return Value that input to the GPIO bundle, low bit represents low member in the bundle

Note For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters

- `[in] bundle`: Handle of GPIO bundle that returned from “`dedic_gpio_new_bundle`”

Structures

struct `dedic_gpio_bundle_config_t`

Type of Dedicated GPIO bundle configuration.

Public Members

const int `*gpio_array`

Array of GPIO numbers, `gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num`

size_t `array_size`

Number of GPIOs in `gpio_array`

unsigned int `in_en` : 1

Enable input

unsigned int `in_invert` : 1

Invert input signal

unsigned int `out_en` : 1

Enable output

unsigned int `out_invert` : 1

Invert output signal

struct `dedic_gpio_bundle_config_t::[anonymous] flags`

Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct `dedic_gpio_bundle_t *dedic_gpio_bundle_handle_t`

Type of Dedicated GPIO bundle.

2.3.5 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

HMAC on the ESP32-S3

On the ESP32-S3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-S3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

eFuse Keys for HMAC Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.

HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose `HMAC_DOWN_ALL` (5) or `HMAC_DOWN_JTAG` (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.

4. Burn the “soft JTAG disable” bit by `esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG)`. This will permanently disable JTAG unless the correct key value is provided by software.

JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP(8)` means that this key can only be used for HMAC generation for software usage:

```
#include "esp32s3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
                                     ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
                                     key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

API Reference

Header File

- `components/esp_hw_support/include/soc/esp32s3/esp_hmac.h`

Functions

`esp_err_t esp_hmac_calculate` (`hmac_key_id_t key_id`, `const void *message`, `size_t message_len`, `uint8_t *hmac`)

Calculate the HMAC of a given message.

Calculate the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation (fixed on ESP32S3).

Note Uses the HMAC peripheral in “upstream” mode.

Return

- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if `message` or `hmac` is a nullptr or if `key_id` out of range
- ESP_FAIL, if the `hmac` calculation failed

Parameters

- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- `message`: the message for which to calculate the HMAC
- `message_len`: message length
- [out] `hmac`: the `hmac` result; the buffer behind the provided pointer must be 32 bytes long

esp_err_t `esp_hmac_jtag_enable` (*hmac_key_id_t* `key_id`, **const** *uint8_t* *`token`)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

Return

- ESP_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP_FAIL, if the `hmac` calculation failed or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

Parameters

- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- `token`: Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

esp_err_t `esp_hmac_jtag_disable` (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling `esp_hmac_jtag_enable()` API.

Return

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

enum `hmac_key_id_t`

The possible efuse keys for the HMAC peripheral

Values:

`HMAC_KEY0` = 0

`HMAC_KEY1`

`HMAC_KEY2`

`HMAC_KEY3`

`HMAC_KEY4`

`HMAC_KEY5`

`HMAC_KEY_MAX`

2.3.6 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

注解: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-S3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the python script [configure_ds.py](#). More details about the *configure_ds.py* script can be found at [mqtt example README](#).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. *Non Volatile Storage* can be used to store the encrypted private key parameters in flash. The script [configure_ds.py](#) creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-S3. The application then needs to read the DS data from NVS, which can be done with the function *esp_read_ds_data_from_nvs* in file [ssl_mutual_auth/main/app_main.c](#)

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the *esp_tls* context (as *ds_data*), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example [ssl_ds](#) shows how to use the DS peripheral for mutual authentication. The example uses *mqtt_client* (Implemented through *ESP-MQTT*) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with *ESP-TLS*. See [example README](#) for more details.

API Reference

Header File

- [components/esp_hw_support/include/soc/esp32s3/esp_ds.h](#)

Functions

esp_err_t **esp_ds_sign** (**const** void *message, **const** *esp_ds_data_t* *data, *hmac_key_id_t* key_id, void *signature)

Sign the message.

This function is a wrapper around *esp_ds_finish_sign()* and *esp_ds_start_sign()*, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

Note This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

Return

- ESP_OK if successful, the signature was written to the parameter *signature*.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or *data->rsa_length* is too long or 0
- ESP_ERR_HW_CRYPTODS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTODS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTODS_INVALID_DIGEST if the message digest didn't match; the signature is invalid.
- ESP_ERR_HW_CRYPTODS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

Parameters

- *message*: the message to be signed; its length is determined by *data->rsa_length*
- *data*: the encrypted signing key data (AES encrypted RSA key + IV)

- `key_id`: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- `signature`: the destination of the signature, should be $(data->rsa_length + 1) * 4$ bytes long

`esp_err_t esp_ds_start_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, esp_ds_context_t **esp_ds_ctx)`

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process.

Note This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

Return

- `ESP_OK` if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component

Parameters

- `message`: the message to be signed; its length is determined by `data->rsa_length`
- `data`: the encrypted signing key data (AES encrypted RSA key + IV)
- `key_id`: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- `esp_ds_ctx`: the context object which is needed for finishing the signing process later

bool `esp_ds_is_busy`(void)

Return true if the DS peripheral is busy, otherwise false.

Note Only valid if `esp_ds_start_sign()` was called before.

`esp_err_t esp_ds_finish_sign(void *signature, esp_ds_context_t *esp_ds_ctx)`

Finish the signing process.

Return

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

Parameters

- `signature`: the destination of the signature, should be $(data->rsa_length + 1) * 4$ bytes long
- `esp_ds_ctx`: the context object retrieved by `esp_ds_start_sign()`

`esp_err_t esp_ds_encrypt_params(esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)`

Encrypt the private key parameters.

Return

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `p_data->rsa_length` is too long

Parameters

- `data`: Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it's filled by DMA. Both is asserted at run time.
- `iv`: Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- `p_data`: Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.

- `key`: Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

Structures

struct esp_digital_signature_data

Encrypted private key data. Recommended to store in flash in this format.

Note This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

esp_digital_signature_length_t **rsa_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 4096).

This value must match the length field encrypted and stored in `'c'`, or invalid results will be returned. (The DS peripheral will always use the value in `'c'`, not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

Note In IDF, the enum type `length` is the same as of type `unsigned`, so they can be used interchangeably. See the ROM code for the original declaration of `struct ets_ds_data_t`.

`uint8_t iv[ESP_DS_IV_LEN]`
IV value used to encrypt `'c'`

`uint8_t c[ESP_DS_C_LEN]`
Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct esp_ds_p_data_t

Plaintext parameters used by Digital Signature.

Not used for signing with DS peripheral, but can be encrypted in-device by calling `esp_ds_encrypt_params()`

Note This documentation is mostly taken from the ROM code.

Public Members

`uint32_t Y[(4096) / 32]`
RSA exponent.

`uint32_t M[(4096) / 32]`
RSA modulus.

`uint32_t Rb[(4096) / 32]`
RSA r inverse operand.

`uint32_t M_prime`
RSA M prime operand.

esp_digital_signature_length_t **length**
RSA length.

Macros

ESP32S3_ERR_HW_CRYPTO_DS_HMAC_FAIL

HMAC peripheral problem

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_KEY

given HMAC key isn't correct, HMAC peripheral problem

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_DIGEST

message digest check failed, result is invalid

ESP32S3_ERR_HW_CRYPTODS_INVALID_PADDING

padding check failed, but result is produced anyway and can be read

ESP_DS_IV_LEN**ESP_DS_C_LEN****Type Definitions****typedef struct esp_ds_context esp_ds_context_t****typedef struct esp_digital_signature_data esp_ds_data_t**

Encrypted private key data. Recommended to store in flash in this format.

Note This struct has to match to one from the ROM code! This documentation is mostly taken from there.**Enumerations****enum esp_digital_signature_length_t***Values:***ESP_DS_RSA_1024** = (1024 / 32) - 1**ESP_DS_RSA_2048** = (2048 / 32) - 1**ESP_DS_RSA_3072** = (3072 / 32) - 1**ESP_DS_RSA_4096** = (4096 / 32) - 1**2.3.7 I2C 驱动程序****概述**

I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线 (SDA) 和串行时钟线 (SCL) 线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32-S3 有两个 I2C 控制器（也称为端口），负责处理在 I2C 两根总线上的通信。每个控制器都可以设置为主机或从机。例如，可以同时让一个控制器用作主机，另一个用作从机。

驱动程序的功能

I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. **配置驱动程序** - 设置初始化参数（如主机模式或从机模式，SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. **安装驱动程序** - 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机
3. 根据是为主机还是从机配置驱动程序，选择合适的项目
 - a) **主机模式下通信** - 发起通信（主机模式）
 - b) **从机模式下通信** - 响应主机消息（从机模式）
4. **中断处理** - 配置 I2C 中断服务
5. **用户自定义配置** - 调整默认的 I2C 通信参数（如时序、位序等）
6. **错误处理** - 如何识别和处理驱动程序配置和通信错误
7. **删除驱动程序** - 在通信结束时释放 I2C 驱动程序所使用的资源

配置驱动程序 建立 I2C 通信第一步是配置驱动程序，这需要设置 `i2c_config_t` 结构中的几个参数：

- 设置 I2C 工作模式 - 从 `i2c_mode_t` 中选择主机模式或从机模式
- 设置 通信管脚
 - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
 - 是否启用 ESP32-S3 的内部上拉电阻
- (仅限主机模式) 设置 I2C 时钟速度
- (仅限从机模式) 设置以下内容：
 - 是否启用 **10 位寻址模式**
 - 定义 **从机地址**

然后，初始化给定 I2C 端口的配置，请使用端口号和 `i2c_config_t` 作为函数调用参数来调用 `i2c_param_config()` 函数。

配置示例 (主机):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,   // select frequency specific to your_
↪project
    // .clk_flags = 0,                          /*!< Optional, you can use I2C_SCLK_SRC_FLAG_*_
↪flags to choose i2c source clock here. */
};
```

配置示例 (从机):

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,           // select GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,       // address of your project
};
```

在此阶段，`i2c_param_config()` 还将其他 I2C 配置参数设置为 I2C 总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考[用户自定义配置](#)。

源时钟配置 增加了 **时钟源分配器**，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如 `i2c_config_t::clk_flags` 中的要求）。

当 `i2c_config_t::clk_flags` 为 0 时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如 APB 之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将 `i2c_config_t::clk_flags` 设置为 0。有关时钟特性，请参见下表。

注解： 如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位 (`clk_flags`) 在时钟的功能中均为 0。

表 2: ESP32-S3 时钟源特性

时钟名称	时钟频率	SCL 的最大频率	时钟功能
XTAL 时钟	40 MHz	2 MHz	/
RTC 时钟	20 MHz	1 MHz	<code>I2C_SCLK_SRC_FLAG_AWARE_DFS</code> , <code>I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</code>

对 `i2c_config_t::clk_flags` 的解释如下:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: 当 APB 时钟改变时, 时钟的波特率不会改变。
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: 支持轻度睡眠模式, APB 时钟则不支持。
3. ESP32-S3 可能不支持某些标志, 请在使用前阅读技术参考手册。

注解: 在主机模式下, SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。

安装驱动程序 配置好 I2C 驱动程序后, 使用以下参数调用函数 `i2c_driver_install()` 安装驱动程序:

- 端口号, 从 `i2c_port_t` 中二选一
- 主机或从机模式, 从 `i2c_mode_t` 中选择
- (仅限从机模式) 分配用于在从机模式下发送和接收数据的缓存区大小。I2C 是一个以主机为中心的总线, 数据只能根据主机的请求从从机传输到主机。因此, 从机通常有一个发送缓存区, 供从应用程序写入数据使用。数据保留在发送缓存区中, 由主机自行读取。
- 用于分配中断的标志 (请参考 `esp_hw_support/include/esp_intr_alloc.h` 中 `ESP_INTR_FLAG_*` 值)

主机模式下通信 安装 I2C 驱动程序后, ESP32-S3 即可与其他 I2C 设备通信。

ESP32-S3 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信, 并发送命令让从机响应, 如进行测量并将结果发给主机。

为优化通信流程, 驱动程序提供一个名为“命令链接”的容器, 该容器应填充一系列命令, 然后传递给 I2C 控制器执行。

主机写入数据 下面的示例展示如何为 I2C 主机构建命令链接, 从而向从机发送 n 个字节。

下面介绍如何为“主机写入数据”设置命令链接及其内部内容:

1. 使用 `i2c_cmd_link_create()` 创建一个命令链接。
然后, 将一系列待发送给从机的数据填充命令链接:
 - a) **启动位** - `i2c_master_start()`
 - b) **从机地址** - `i2c_master_write_byte()`。提供单字节地址作为调用此函数的实参。
 - c) **数据** - 一个或多个字节的数据作为 `i2c_master_write()` 的实参。
 - d) **停止位** - `i2c_master_stop()`
函数 `i2c_master_write_byte()` 和 `i2c_master_write()` 都有额外的实参, 规定主机是否应确认其有无接受到 ACK 位。
2. 通过调用 `i2c_master_cmd_begin()` 来触发 I2C 控制器执行命令链接。一旦开始执行, 就不能再修改命令链接。
3. 命令发送后, 通过调用 `i2c_cmd_link_delete()` 释放命令链接使用的资源。

图 4: I2C command link - master write example

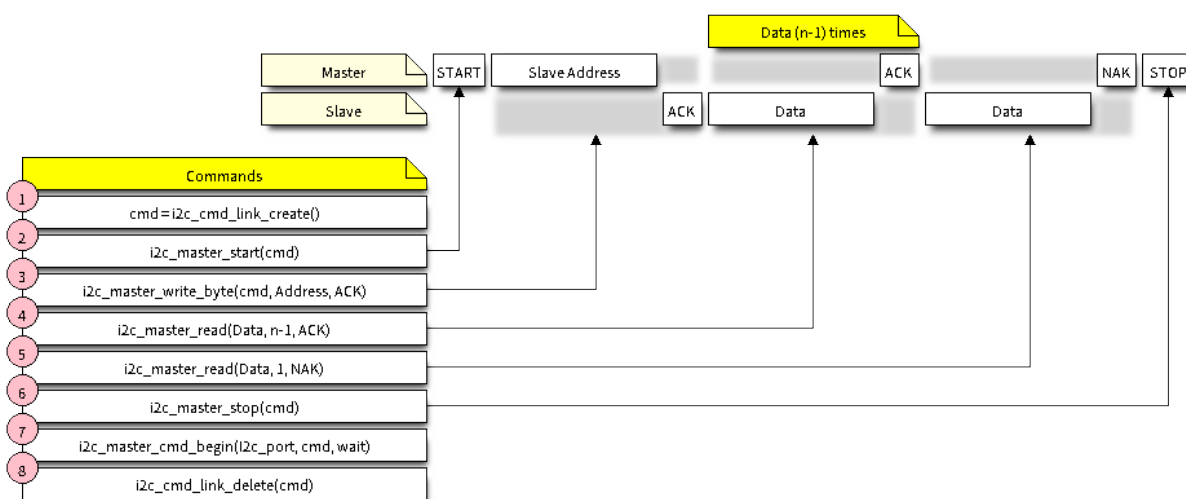

图 5: I2C command link - master read example

主机读取数据 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取 n 个字节。

在读取数据时，在上图的步骤 4 中，不是用 `i2c_master_write...`，而是用 `i2c_master_read_byte()` 和/或 `i2c_master_read()` 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

指示写入或读取数据 发送从机地址后（请参考上图中第 3 步），主机可以写入或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址 (`ESP_SLAVE_ADDR << 1`) | `I2C_MASTER_WRITE`，如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

同理，指示从从机读取数据的命令链接如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

从机模式下通信 安装 I2C 驱动程序后，ESP32-S3 即可与其他 I2C 设备通信。

API 为从机提供以下功能：

- `i2c_slave_read_buffer()`
当主机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数 `i2c_slave_read_buffer()`。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。
- `i2c_slave_write_buffer()`
发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数 `i2c_slave_write_buffer()` 有一个参数，用于指定发送缓存区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。

在 `peripherals/i2c` 中可找到介绍如何使用这些功能的代码示例。

中断处理 安装驱动程序时，默认情况下会安装中断处理程序。但是，您可以通过调用函数 `i2c_isr_register()` 来注册自己的而不是默认的中断处理程序。在运行自己的中断处理程序时，可以参考 *ESP32-S3 技术参考手册 > I2C 控制器 (I2C) > 中断 [PDF]*，以获取有关 I2C 控制器触发的中断描述。

调用函数 `i2c_isr_free()` 删除中断处理程序。

用户自定义配置 如本节末尾所述配置驱动程序，函数 `i2c_param_config()` 在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 I2C 总线协议规范规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。APB 的频率在 `I2C_APB_CLK_FREQ` 中指定。

表 3: 其他可配置的 I2C 通信参数

要更改的参数	函数
SCL 脉冲周期的高电平和低电平	<code>i2c_set_period()</code>
在产生 启动信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_start_timing()</code>
在产生 停止信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_stop_timing()</code>
从机采样以及主机切换时，SCL 和 SDA 信号之间的时序关系	<code>i2c_set_data_timing()</code>
I2C 超时	<code>i2c_set_timeout()</code>
优先发送/接收最高有效位 (LSB) 或最低有效位 (MSB)，可在 <code>i2c_trans_mode_t</code> 定义的模式中选择	<code>i2c_set_data_mode()</code>

上述每个函数都有一个 `_get_` 对应项来检查当前设置的值。例如，调用 `i2c_get_timeout()` 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值，请参考文件 `driver/i2c.c` 并查找带有后缀 `_DEFAULT` 的定义。

通过函数 `i2c_set_pin()` 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值，请使用函数 `i2c_param_config()`。

注解：ESP32-S3 的内部上拉电阻范围为几万欧姆，因此在大多数情况下，它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 [I2C 总线协议规范](#) 规定范围内的上拉电阻。

错误处理 大多数 I2C 驱动程序的函数在成功完成时会返回 `ESP_OK`，或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息，其中包含错误说明，例如检查输入配置的正确性。有关详细信息，请参考文件 `driver/i2c.c` 并用后缀 `_ERR_STR` 查找定义。

使用专用中断来捕获通信故障。例如，如果从机将数据发送回主机耗费太长时间，会触发 `I2C_TIME_OUT_INT` 中断。详细信息请参考 [中断处理](#)。

如果出现通信失败，可以分别为发送和接收缓存区调用 `i2c_reset_tx_fifo()` 和 `i2c_reset_rx_fifo()` 来重置内部硬件缓存区。

删除驱动程序 当使用 `i2c_driver_install()` 建立 I2C 通信，一段时间后不再需要 I2C 通信时，可以通过调用 `i2c_driver_delete()` 来移除驱动程序以释放分配的资源。

由于函数 `i2c_driver_delete()` 无法保证线程安全性，请在调用该函数移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

应用示例

I2C 主机和从机示例：[peripherals/i2c](#)。

API 参考

Header File

- `components/driver/include/driver/i2c.h`

Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

Install an I2C driver.

Note In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

Parameters

- `i2c_num`: I2C port number
- `mode`: I2C mode (either master or slave)
- `slv_rx_buf_len`: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.

- `slv_tx_buf_len`: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

esp_err_t **i2c_driver_delete** (*i2c_port_t* *i2c_num*)

Delete I2C driver.

Note This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port to delete

esp_err_t **i2c_param_config** (*i2c_port_t* *i2c_num*, **const** *i2c_config_t* **i2c_conf*)

Configure an I2C bus with the given configuration.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port to configure
- `i2c_conf`: Pointer to the I2C configuration

esp_err_t **i2c_reset_tx_fifo** (*i2c_port_t* *i2c_num*)

reset I2C tx hardware fifo

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number

esp_err_t **i2c_reset_rx_fifo** (*i2c_port_t* *i2c_num*)

reset I2C rx fifo

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number

esp_err_t **i2c_isr_register** (*i2c_port_t* *i2c_num*, void (**fn*)) void *
, void **arg*, int *intr_alloc_flags*, *intr_handle_t* **handle*) Register an I2C ISR handler.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number to attach handler to
- `fn`: ISR handler function
- `arg`: Parameter for the ISR handler
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: Handle return from `esp_intr_alloc`.

esp_err_t **i2c_isr_free** (*intr_handle_t* *handle*)

Delete and free I2C ISR handle.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- handle: Handle of isr to delete.

`esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)`

Configure GPIO pins for I2C SCK and SDA signals.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- sda_io_num: GPIO number for I2C SDA signal
- scl_io_num: GPIO number for I2C SCL signal
- sda_pullup_en: Enable the internal pullup for SDA pin
- scl_pullup_en: Enable the internal pullup for SCL pin
- mode: I2C mode

`esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)`

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters

- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device's 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)`

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters

- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device's 7-bit address
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)`

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the

write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave hasn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

Parameters

- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device's 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

i2c_cmd_handle_t `i2c_cmd_link_create_static` (`uint8_t *buffer`, `uint32_t size`)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

Note It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

Return Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

Parameters

- `buffer`: Buffer to use for commands allocations
- `size`: Size in bytes of the buffer

i2c_cmd_handle_t `i2c_cmd_link_create` (`void`)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

Return Handle to the I2C command link

`void` `i2c_cmd_link_delete_static` (*i2c_cmd_handle_t* `cmd_handle`)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

Parameters

- `cmd_handle`: I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

`void` `i2c_cmd_link_delete` (*i2c_cmd_handle_t* `cmd_handle`)

Free the I2C commands list.

Parameters

- `cmd_handle`: I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

esp_err_t `i2c_master_start` (*i2c_cmd_handle_t* `cmd_handle`)

Queue a "START signal" to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters

- `cmd_handle`: I2C commands list

`esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)`

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters

- `cmd_handle`: I2C commands list
- `data`: Byte to send on the port
- `ack_en`: Enable ACK signal

`esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)`

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters

- `cmd_handle`: I2C commands list
- `data`: Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- `data_len`: Length, in bytes, of the data buffer
- `ack_en`: Enable ACK signal

`esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)`

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters

- `cmd_handle`: I2C commands list
- `data`: Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- `ack`: ACK signal

`esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)`

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters

- `cmd_handle`: I2C commands list
- `data`: Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- `data_len`: Size, in bytes, of the data buffer
- `ack`: ACK signal

esp_err_t **i2c_master_stop** (*i2c_cmd_handle_t* `cmd_handle`)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters

- `cmd_handle`: I2C commands list

esp_err_t **i2c_master_cmd_begin** (*i2c_port_t* `i2c_num`, *i2c_cmd_handle_t* `cmd_handle`, *TickType_t* `ticks_to_wait`)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave hasn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

Parameters

- `i2c_num`: I2C port number
- `cmd_handle`: I2C commands list
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

`int` **i2c_slave_write_buffer** (*i2c_port_t* `i2c_num`, `const uint8_t *data`, `int size`, *TickType_t* `ticks_to_wait`)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

Note This function shall only be called in I2C slave mode.

Return

- `ESP_FAIL` (-1) Parameter error
- Other (≥ 0) The number of data bytes pushed to the I2C slave buffer.

Parameters

- `i2c_num`: I2C port number
- `data`: Bytes to write into internal buffer
- `size`: Size, in bytes, of data buffer
- `ticks_to_wait`: Maximum ticks to wait.

`int` **i2c_slave_read_buffer** (*i2c_port_t* `i2c_num`, `uint8_t *data`, `size_t max_size`, *TickType_t* `ticks_to_wait`)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note This function shall only be called in I2C slave mode.

Return

- `ESP_FAIL` (-1) Parameter error
- Others (≥ 0) The number of data bytes read from I2C slave buffer.

Parameters

- `i2c_num`: I2C port number
- `data`: Buffer to fill with ringbuffer's bytes

- `max_size`: Maximum bytes to read
- `ticks_to_wait`: Maximum waiting ticks

`esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)`

Set I2C master clock period.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number
- `high_period`: Clock cycle number during SCL is high level, `high_period` is a 14 bit value
- `low_period`: Clock cycle number during SCL is low level, `low_period` is a 14 bit value

`esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)`

Get I2C master clock period.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number
- `high_period`: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- `low_period`: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

`esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)`

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow down the SCL clock.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number to filter
- `cyc_num`: the APB cycles need to be filtered ($0 \leq \text{cyc_num} \leq 7$). When the period of a pulse is less than `cyc_num * APB_cycle`, the I2C controller will ignore this pulse.

`esp_err_t i2c_filter_disable(i2c_port_t i2c_num)`

Disable filter on I2C bus.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master start signal timing

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number
- `setup_time`: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- `hold_time`: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

`esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master start signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2c_num*: I2C port number
- *setup_time*: pointer to get setup time
- *hold_time*: pointer to get hold time

esp_err_t **i2c_set_stop_timing** (*i2c_port_t* *i2c_num*, int *setup_time*, int *hold_time*)

set I2C master stop signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2c_num*: I2C port number
- *setup_time*: clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- *hold_time*: clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

esp_err_t **i2c_get_stop_timing** (*i2c_port_t* *i2c_num*, int **setup_time*, int **hold_time*)

get I2C master stop signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2c_num*: I2C port number
- *setup_time*: pointer to get setup time.
- *hold_time*: pointer to get hold time.

esp_err_t **i2c_set_data_timing** (*i2c_port_t* *i2c_num*, int *sample_time*, int *hold_time*)

set I2C data signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2c_num*: I2C port number
- *sample_time*: clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- *hold_time*: clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

esp_err_t **i2c_get_data_timing** (*i2c_port_t* *i2c_num*, int **sample_time*, int **hold_time*)

get I2C data signal timing

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2c_num*: I2C port number
- *sample_time*: pointer to get sample time
- *hold_time*: pointer to get hold time

esp_err_t **i2c_set_timeout** (*i2c_port_t* *i2c_num*, int *timeout*)

set I2C timeout value

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2c_num*: I2C port number

- `timeout`: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

`esp_err_t i2c_get_timeout (i2c_port_t i2c_num, int *timeout)`
get I2C timeout value

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number
- `timeout`: pointer to get timeout value

`esp_err_t i2c_set_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)`
set I2C data transfer mode

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number
- `tx_trans_mode`: I2C sending data mode
- `rx_trans_mode`: I2C receiving data mode

`esp_err_t i2c_get_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)`
get I2C data transfer mode

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `i2c_num`: I2C port number
- `tx_trans_mode`: pointer to get I2C sending data mode
- `rx_trans_mode`: pointer to get I2C receiving data mode

Structures

`struct i2c_config_t`
I2C initialization parameters.

Public Members

`i2c_mode_t mode`
I2C mode

int `sda_io_num`
GPIO number for I2C sda signal

int `scl_io_num`
GPIO number for I2C scl signal

bool `sda_pullup_en`
Internal GPIO pull mode for I2C sda signal

bool `scl_pullup_en`
Internal GPIO pull mode for I2C scl signal

uint32_t `clk_speed`
I2C clock frequency for master mode, (no higher than 1MHz for now)

`struct i2c_config_t::[anonymous]::[anonymous] master`
I2C master config

```

uint8_t addr_10bit_en
    I2C 10bit address mode enable for slave mode

uint16_t slave_addr
    I2C address for slave mode

uint32_t maximum_speed
    I2C expected clock speed from SCL.

struct i2c_config_t::[anonymous]::[anonymous] slave
    I2C slave config

uint32_t clk_flags
    Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

```

Macros

```

I2C_APB_CLK_FREQ
    I2C source clock is APB clock, 80MHz

I2C_NUM_MAX
    I2C port max

I2C_NUM_0
    I2C port 0

I2C_NUM_1
    I2C port 1

I2C_SCLK_SRC_FLAG_FOR_NOMAL
    Any one clock source that is available for the specified frequency may be choosen

I2C_SCLK_SRC_FLAG_AWARE_DFS
    For REF tick clock, it won' t change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
    For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE
    Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)
    The following macro is used to determine the recommended size of the buffer to pass to
    i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, de-
    scribing the number of transactions intended to be performed on the I2C port. For example, if one wants
    to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands
    required are the following:
    

- write device register
- read register content

    Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

```

Type Definitions

```

typedef void *i2c_cmd_handle_t
    I2C command handle

```

Header File

- [components/hal/include/hal/i2c_types.h](#)

Macros

```

I2C_CLK_FREQ_MAX
    Use the highest speed that is available for the clock source picked by clk_flags.

```

Type Definitions

```
typedef int i2c_port_t
    I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
```

Enumerations

```
enum i2c_mode_t
```

Values:

```
I2C_MODE_SLAVE = 0
```

I2C slave mode

```
I2C_MODE_MASTER
```

I2C master mode

```
I2C_MODE_MAX
```

```
enum i2c_rw_t

```
enum i2c_ack_type_t
```

Values:

```
I2C_MASTER_ACK = 0x0
```

I2C ack for each byte read

```
I2C_MASTER_NACK = 0x1
```

I2C nack for each byte read

```
I2C_MASTER_LAST_NACK = 0x2
```

I2C nack for the last byte

```
I2C_MASTER_ACK_MAX
```

```
enum i2c_sclk_t
```

I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.

Values:

```
I2C_SCLK_DEFAULT = 0
```

I2C source clock not selected

I2C_SCLK_XTAL

I2C source clock from XTAL, 40M

I2C_SCLK_RTC

I2C source clock from 8M RTC, 8M

I2C_SCLK_MAX

2.3.8 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-S3 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

Functional Overview

Installing the Driver Install the I2S driver by calling the function `:cpp:func'i2s_driver_install'` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `:cpp:func'i2s_driver_install'` returns `ESP_OK`, it means I2S has started.

Configuration example:

```
static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .bits_per_chan = I2S_BITS_PER_SAMPLE_16BIT
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

Setting Communication Pins Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `cpp:func'i2s_set_pin'` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

注解: MCK only takes effect in `I2S_MODE_MASTER` mode.

```
static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

Running I2S Communication To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read,
↪100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func'i2s_driver_install'` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

Deleting the Driver If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

Application Example

A code example for the I2S driver can be found in the directory [peripherals/i2s](#).

In addition, there is a short configuration examples for the I2S driver.

I2S configuration Example for general usage.

```
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
```

(下页继续)

```

        .mode = I2S_MODE_MASTER | I2S_MODE_TX,
        .sample_rate = 44100,
        .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
        .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
        .communication_format = I2S_COMM_FORMAT_STAND_I2S
        .tx_desc_auto_clear = false,
        .dma_buf_count = 8,
        .dma_buf_len = 64
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

I2S on ESP32-S3 support TDM mode, up to 16 channels are available in TDM mode. If you want to use TDM mode, set field `channel_format` of `i2s_config_t` to `I2S_CHANNEL_FMT_MULTIPLE`. Then enable the channels by setting `chan_mask` using masks in `i2s_channel_t`, the number of active channels and total channels will be calculate automatically. Also you can set a particular total channel number for it, but it shouldn't be smaller than the largest channel you use.

If active channels are discrete, the inactive channels within total channels will be filled by a constant automatically. But if `skip_msk` is enabled, these inactive channels will be skipped.

```

#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_MULTIPLE,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .chan_mask = I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH2
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,

```

```

        .data_out_num = 18,
        .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_port_t i2s_num, 22050, bits_cfg, I2S_TDM_ACTIVE_CH0 | I2S_TDM_
↪ACTIVE_CH1); // set clock
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

API Reference

Header File

- [components/driver/include/driver/i2s.h](#)

Functions

esp_err_t **i2s_set_pin** (*i2s_port_t* i2s_num, **const** *i2s_pin_config_t* *pin)

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

Note The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

Parameters

- i2s_num: I2S port number
- pin: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

Note if *pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call i2s_set_dac_mode instead.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

esp_err_t **i2s_set_pdm_rx_down_sample** (*i2s_port_t* i2s_num, *i2s_pdm_dsr_t* downsample)

Set PDM mode down-sample rate In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be (fpcm * 64) or (fpcm * 128) accordingly.

Note After calling this function, it would call i2s_set_clk inside to update the clock frequency. Please call this function after I2S driver has been initialized.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

- ESP_ERR_NO_MEM Out of memory

Parameters

- `i2s_num`: I2S port number
- `downsample`: i2s RX down sample rate for PDM mode.

`esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)`

Set TX PDM mode up-sample rate.

Note If you have set PDM mode while calling ‘`i2s_driver_install`’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters

- `i2s_num`: I2S port number
- `upsample_cfg`: Set I2S PDM up-sample rate configuration

`esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)`

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

Parameters

- `i2s_num`: I2S port number
- `i2s_config`: I2S configurations - see `i2s_config_t` struct
- `queue_size`: I2S event queue size/depth.
- `i2s_queue`: I2S event queue handle, if set NULL, driver will not use an event queue.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

`esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)`

Uninstall I2S driver.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)

Parameters

- `i2s_num`: I2S port number

`esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)`

Write data to I2S DMA transmit buffer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `i2s_num`: I2S port number
- `src`: Source address to write from
- `size`: Size of data in bytes
- `[out] bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
- `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data

is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.)
Pass portMAX_DELAY for no timeout.

esp_err_t **i2s_write_expand** (*i2s_port_t* *i2s_num*, const void **src*, size_t *size*, size_t *src_bits*, size_t *aim_bits*, size_t **bytes_written*, TickType_t *ticks_to_wait*)

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see *i2s_config_t*).

Parameters

- *i2s_num*: I2S port number
- *src*: Source address to write from
- *size*: Size of data in bytes
- *src_bits*: Source audio bit
- *aim_bits*: Bit wanted, no more than 32, and must be greater than *src_bits*
- [out] *bytes_written*: Number of bytes written, if timeout, the result will be less than the size passed in.
- *ticks_to_wait*: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_read** (*i2s_port_t* *i2s_num*, void **dest*, size_t *size*, size_t **bytes_read*, TickType_t *ticks_to_wait*)

Read data from I2S DMA receive buffer.

Note If the built-in ADC mode is enabled, we should call *i2s_adc_enable* and *i2s_adc_disable* around the whole reading process, to prevent the data getting corrupted.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2s_num*: I2S port number
- *dest*: Destination address to read into
- *size*: Size of data in bytes
- [out] *bytes_read*: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- *ticks_to_wait*: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

esp_err_t **i2s_set_sample_rates** (*i2s_port_t* *i2s_num*, uint32_t *rate*)

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and *i2s_config_t* configuration parameters (number of channels, *bits_per_sample*).

$\text{bit_clock} = \text{rate} * (\text{number of channels}) * \text{bits_per_sample}$

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters

- *i2s_num*: I2S port number
- *rate*: I2S sample rate (ex: 8000, 44100...)

esp_err_t **i2s_stop**(*i2s_port_t* *i2s_num*)

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2s_num*: I2S port number

esp_err_t **i2s_start**(*i2s_port_t* *i2s_num*)

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2s_num*: I2S port number

esp_err_t **i2s_zero_dma_buffer**(*i2s_port_t* *i2s_num*)

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2s_num*: I2S port number

esp_err_t **i2s_pcm_config**(*i2s_port_t* *i2s_num*, **const** *i2s_pcm_cfg_t* **pcm_cfg*)

Configure I2S a/u-law decompress or compress.

Note This function should be called after i2s driver installed Only take effective when the i2s 'communication_format' is set to 'I2S_COMM_FORMAT_STAND_PCM_SHORT' or 'I2S_COMM_FORMAT_STAND_PCM_LONG'

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *i2s_num*: I2S port number
- *pcm_cfg*: including mode selection and a/u-law decompress or compress configuration paramater

esp_err_t **i2s_set_clk**(*i2s_port_t* *i2s_num*, *uint32_t* *rate*, *uint32_t* *bits_cfg*, *i2s_channel_t* *ch*)

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

1. stop i2s;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters

- *i2s_num*: I2S port number
- *rate*: I2S sample rate (ex: 8000, 44100...)

- `bits_cfg`: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘`i2s_bits_per_sample_t`’) the high 16 bits is for total bits in one channel (see ‘`i2s_bits_per_chan_t`’) high 16bits =0 means same as the bits per sample.
- `ch`: I2S channel, (`I2S_CHANNEL_MONO`, `I2S_CHANNEL_STEREO` or specific channel in TDM mode)

float `i2s_get_clk` (`i2s_port_t` `i2s_num`)
get clock set on particular port number.

Return

- actual clock set by i2s driver

Parameters

- `i2s_num`: I2S port number

Structures

struct `i2s_pcm_cfg_t`
I2S PCM configuration.

Public Members

`i2s_pcm_compress_t` `pcm_type`

I2S PCM a/u-law decompress or compress type

struct `i2s_pdm_tx_upsample_cfg_t`
I2S PDM up-sample rate configuration.

Note TX PDM can only be set to the following two upsampling rate configurations: 1: $fp = 960$, $fs = \text{sample_rate} / 100$, in this case, $Fpdm = 128 * 48000$ 2: $fp = 960$, $fs = 480$, in this case, $Fpdm = 128 * Fpcm = 128 * \text{sample_rate}$ If the pdm receiver do not care the pdm serial clock, it's recommended set $Fpdm = 128 * 48000$. Otherwise, the second configuration should be applied.

Public Members

int `sample_rate`
I2S PDM sample rate

int `fp`
I2S PDM TX upsampling paramater. Normally it should be set to 960

int `fs`
I2S PDM TX upsampling paramater. When it is set to 480, the pdm clock frequency $Fpdm = 128 * \text{sample_rate}$, when it is set to $\text{sample_rate} / 100$, $Fpdm$ will be fixed to $128 * 48000$

struct `i2s_pin_config_t`
I2S pin number for `i2s_set_pin`.

Public Members

int `mck_io_num`
MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int `bck_io_num`
BCK in out pin

int `ws_io_num`
WS in out pin

int `data_out_num`
DATA out pin

int **data_in_num**
DATA in pin

struct **i2s_driver_config_t**
I2S driver configuration parameters.

Public Members

i2s_mode_t **mode**
I2S work mode

uint32_t **sample_rate**
I2S sample rate

i2s_bits_per_sample_t **bits_per_sample**
I2S sample bits in one channel

i2s_channel_fmt_t **channel_format**
I2S channel format.

i2s_comm_format_t **communication_format**
I2S communication format

int **intr_alloc_flags**
Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

int **dma_buf_count**
The total number of DMA buffers to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, 'dma_desc_num' can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to 'i2s_read' and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

int **dma_buf_len**
Number of frames in a DMA buffer. A frame means the data of all channels in a WS cycle. The $real_dma_buf_size = dma_buf_len * chan_num * bits_per_chan / 8$. For example, if two channels in stereo mode (i.e., 'channel_format' is set to 'I2S_CHANNEL_FMT_RIGHT_LEFT') are active, and each channel transfers 32 bits (i.e., 'bits_per_sample' is set to 'I2S_BITS_PER_CHAN_32BIT'), then the total number of bytes of a frame is 'channel_format' * 'bits_per_sample' = $2 * 32 / 8 = 8$ bytes. We assume that the current 'dma_buf_len' is 100, then the real length of the DMA buffer is $8 * 100 = 800$ bytes. Note that the length of an internal real DMA buffer shouldn't be greater than 4092.

bool **use_apll**
I2S using APLL as main I2S clock, enable it to get accurate clock

bool **tx_desc_auto_clear**
I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int **fixed_mclk**
I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won't take effect

i2s_mclk_multiple_t **mclk_multiple**
The multiple of I2S master clock(MCLK) to sample rate

i2s_bits_per_chan_t **bits_per_chan**
I2S total bits in one channel, only take effect when larger than 'bits_per_sample', default '0' means equal to 'bits_per_sample'

***i2s_channel_t* chan_mask**

I2S active channel bit mask, set value in `i2s_channel_t` to enable specific channel, the bit map of active channel can not exceed $(0x1 \ll \text{total_chan})$.

uint32_t total_chan

I2S Total number of channels. If it is smaller than the biggest active channel number, it will be set to this number automatically.

bool left_align

Set to enable left alignment

bool big_edin

Set to enable big edin

bool bit_order_msb

Set to enable msb order

bool skip_msk

Set to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

struct i2s_event_t

Event structure used in I2S event queue.

Public Members***i2s_event_type_t* type**

I2S event type

size_t size

I2S data size for I2S_DATA event

Macros**I2S_PIN_NO_CHANGE**

Use in *i2s_pin_config_t* for pins which should not be changed

I2S_PDM_DEFAULT_UPSAMPLE_CONFIG (rate)

Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

```
typedef i2s_driver_config_t i2s_config_t
```

```
typedef intr_handle_t i2s_isr_handle_t
```

Enumerations**enum i2s_port_t**

I2S port number, the max port number is $(\text{I2S_NUM_MAX} - 1)$.

Values:

I2S_NUM_0 = 0

I2S port 0

I2S_NUM_1 = 1

I2S port 1

I2S_NUM_MAX

I2S port max

enum i2s_event_type_t

I2S event queue types.

Values:

I2S_EVENT_DMA_ERROR

I2S_EVENT_TX_DONE
I2S DMA finish sent 1 buffer

I2S_EVENT_RX_DONE
I2S DMA finish received 1 buffer

I2S_EVENT_TX_O_OVF
I2S DMA sent queue overflow

I2S_EVENT_RX_O_OVF
I2S DMA receive queue overflow

I2S_EVENT_MAX
I2S event max index

Header File

- [components/hal/include/hal/i2s_types.h](#)

Enumerations

enum i2s_bits_per_sample_t

I2S bit width per sample.

Values:

I2S_BITS_PER_SAMPLE_8BIT = 8
data bit-width: 8

I2S_BITS_PER_SAMPLE_16BIT = 16
data bit-width: 16

I2S_BITS_PER_SAMPLE_24BIT = 24
data bit-width: 24

I2S_BITS_PER_SAMPLE_32BIT = 32
data bit-width: 32

enum i2s_bits_per_chan_t

I2S bit width per chan.

Values:

I2S_BITS_PER_CHAN_DEFAULT = (0)
channel bit-width equals to data bit-width

I2S_BITS_PER_CHAN_8BIT = (8)
channel bit-width: 8

I2S_BITS_PER_CHAN_16BIT = (16)
channel bit-width: 16

I2S_BITS_PER_CHAN_24BIT = (24)
channel bit-width: 24

I2S_BITS_PER_CHAN_32BIT = (32)
channel bit-width: 32

enum i2s_channel_t

I2S channel.

Values:

I2S_CHANNEL_MONO = 1

I2S channel (mono), one channel activated. In this mode, you only need to send one channel data but the fifo will copy same data for the other unactivated channels automatically, then both channels will transmit same data.

I2S_CHANNEL_STEREO = 2
I2S channel (stereo), two (or more) channels activated. In this mode, these channels will transmit different data.

I2S_TDM_ACTIVE_CH0 = (0x1 << 16)
I2S channel 0 activated

I2S_TDM_ACTIVE_CH1 = (0x1 << 17)
I2S channel 1 activated

I2S_TDM_ACTIVE_CH2 = (0x1 << 18)
I2S channel 2 activated

I2S_TDM_ACTIVE_CH3 = (0x1 << 19)
I2S channel 3 activated

I2S_TDM_ACTIVE_CH4 = (0x1 << 20)
I2S channel 4 activated

I2S_TDM_ACTIVE_CH5 = (0x1 << 21)
I2S channel 5 activated

I2S_TDM_ACTIVE_CH6 = (0x1 << 22)
I2S channel 6 activated

I2S_TDM_ACTIVE_CH7 = (0x1 << 23)
I2S channel 7 activated

I2S_TDM_ACTIVE_CH8 = (0x1 << 24)
I2S channel 8 activated

I2S_TDM_ACTIVE_CH9 = (0x1 << 25)
I2S channel 9 activated

I2S_TDM_ACTIVE_CH10 = (0x1 << 26)
I2S channel 10 activated

I2S_TDM_ACTIVE_CH11 = (0x1 << 27)
I2S channel 11 activated

I2S_TDM_ACTIVE_CH12 = (0x1 << 28)
I2S channel 12 activated

I2S_TDM_ACTIVE_CH13 = (0x1 << 29)
I2S channel 13 activated

I2S_TDM_ACTIVE_CH14 = (0x1 << 30)
I2S channel 14 activated

I2S_TDM_ACTIVE_CH15 = (0x1 << 31)
I2S channel 15 activated

enum i2s_comm_format_t

I2S communication standard format.

Values:

I2S_COMM_FORMAT_STAND_I2S = 0X01
I2S communication I2S Philips standard, data launch at second BCK

I2S_COMM_FORMAT_STAND_MSB = 0X02
I2S communication MSB alignment standard, data launch at first BCK

I2S_COMM_FORMAT_STAND_PCM_SHORT = 0x04
PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_STAND_PCM_LONG = 0x0C
PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

I2S_COMM_FORMAT_STAND_MAX

standard max

I2S_COMM_FORMAT_I2S = 0x01

I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01

I2S format MSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02

I2S format LSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04

I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04

PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_LONG = 0x08

PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t

I2S channel format type.

Values:

I2S_CHANNEL_FMT_RIGHT_LEFT

Separated left and right channel

I2S_CHANNEL_FMT_ALL_RIGHT

Load right channel data in both two channels

I2S_CHANNEL_FMT_ALL_LEFT

Load left channel data in both two channels

I2S_CHANNEL_FMT_ONLY_RIGHT

Only load data in right channel (mono mode)

I2S_CHANNEL_FMT_ONLY_LEFT

Only load data in left channel (mono mode)

I2S_CHANNEL_FMT_MULTIPLE

More than two channels are used

enum i2s_mode_t

I2S Mode.

Values:

I2S_MODE_MASTER = (0x1 << 0)

Master mode

I2S_MODE_SLAVE = (0x1 << 1)

Slave mode

I2S_MODE_TX = (0x1 << 2)

TX mode

I2S_MODE_RX = (0x1 << 3)

RX mode

I2S_MODE_PDM = (0x1 << 6)

I2S PDM mode

enum i2s_clock_src_t

I2S source clock.

*Values:***I2S_CLK_D2CLK = 0**

Clock from PLL_D2_CLK(160M)

enum i2s_mclk_multiple_t

The multiple of mclk to sample rate.

*Values:***I2S_MCLK_MULTIPLE_DEFAULT = 0**Default value. $mclk = sample_rate * 256$ **I2S_MCLK_MULTIPLE_128 = 128** $mclk = sample_rate * 128$ **I2S_MCLK_MULTIPLE_256 = 256** $mclk = sample_rate * 256$ **I2S_MCLK_MULTIPLE_384 = 384** $mclk = sample_rate * 384$ **enum i2s_pcm_compress_t**

A/U-law decompress or compress configuration.

*Values:***I2S_PCM_DISABLE = 0**

Disable A/U law decompress or compress

I2S_PCM_A_DECOMPRESS

A-law decompress

I2S_PCM_A_COMPRESS

A-law compress

I2S_PCM_U_DECOMPRESS

U-law decompress

I2S_PCM_U_COMPRESS

U-law compress

enum i2s_pdm_dsr_t

I2S PDM RX downsample mode.

*Values:***I2S_PDM_DSR_8S = 0**

downsampling number is 8 for PDM RX mode

I2S_PDM_DSR_16S

downsampling number is 16 for PDM RX mode

I2S_PDM_DSR_MAX**enum i2s_pdm_sig_scale_t***Values:***I2S_PDM_SIG_SCALING_DIV_2 = 0**

I2S TX PDM sigmadelta signal scaling: /2

I2S_PDM_SIG_SCALING_MUL_1 = 1

I2S TX PDM sigmadelta signal scaling: x1

I2S_PDM_SIG_SCALING_MUL_2 = 2

I2S TX PDM sigmadelta signal scaling: x2

```
I2S_PDM_SIG_SCALING_MUL_4 = 3
I2S TX PDM sigmadelta signal scaling: x4
```

2.3.9 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: [peripherals/lcd](#):

- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- LVGL porting and animation UI - [peripherals/lcd/lvgl](#)

API Reference

Header File

- [components/hal/include/hal/lcd_types.h](#)

Enumerations

```
enum lcd_clock_source_t
```

LCD clock source.

Note User should select the clock source based on the real requirement:

LCD clock source	Features	Power Management
LCD_CLK_SRC_PLL160M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_APLL	Configurable resolution	ESP_PM_NO_LIGHT_SLEEP lock
LCD_CLK_SRC_XTAL	Medium resolution	No PM lock

Values:

```
LCD_CLK_SRC_PLL160M
```

Select PLL160M as the source clock

```
LCD_CLK_SRC_APLL
```

Select APLL as the source clock

```
LCD_CLK_SRC_XTAL
```

Select XTAL as the source clock

Header File

- [components/esp_lcd/include/esp_lcd_types.h](#)

Type Definitions

```
typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
```

Type of LCD panel IO handle

```
typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
```

Type of LCD panel handle

Enumerations

```
enum esp_lcd_color_space_t
```

LCD color space type definition.

Values:

```
ESP_LCD_COLOR_SPACE_RGB
```

Color space: RGB

```
ESP_LCD_COLOR_SPACE_BGR
```

Color space: BGR

```
ESP_LCD_COLOR_SPACE_MONOCHROME
```

Color space: monochrome

Header File

- [components/esp_lcd/include/esp_lcd_panel_io.h](#)

Functions

```
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

Note Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- `[in]` `io`: LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- `[in]` `lcd_cmd`: The specific LCD command
- `[in]` `param`: Buffer that holds the command specific parameters, set to `NULL` if no parameter is needed for the command
- `[in]` `param_size`: Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

```
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
```

Transmit LCD RGB data.

Note This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of `color` buffer should be done in the callback `on_color_trans_done()`.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- [in] `io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- [in] `lcd_cmd`: The specific LCD command
- [in] `color`: Buffer that holds the RGB color data
- [in] `color_size`: Size of `color` in memory, in bytes

`esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)`
Destory LCD panel IO handle (deinitialize panel and free all corresponding resource)

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- [in] `io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

`esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`

Create LCD panel IO handle, for SPI interface.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

Parameters

- [in] `bus`: SPI bus handle
- [in] `io_config`: IO configuration, for SPI interface
- [out] `ret_io`: Returned IO handle

`esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`

Create LCD panel IO handle, for I2C interface.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

Parameters

- [in] `bus`: I2C bus handle
- [in] `io_config`: IO configuration, for I2C interface
- [out] `ret_io`: Returned IO handle

`esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t *ret_bus)`

Create Intel 8080 bus handle.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_NOT_FOUND` if no free bus is available
- `ESP_OK` on success

Parameters

- [in] `bus_config`: Bus configuration
- [out] `ret_bus`: Returned bus handle

`esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)`
Destory Intel 8080 bus handle.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if there still be some device attached to the bus

- ESP_OK on success

Parameters

- [in] bus: Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

```
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const
esp_lcd_panel_io_i80_config_t *io_config,
esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can't be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] bus: Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- [in] io_config: IO configuration, for i80 interface
- [out] ret_io: Returned panel IO handle

Structures

```
struct esp_lcd_panel_io_event_data_t
```

Type of LCD panel IO event data.

```
struct esp_lcd_panel_io_spi_config_t
```

Panel IO configuration structure, for SPI interface.

Public Members

```
int cs_gpio_num
```

GPIO used for CS line

```
int dc_gpio_num
```

GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

```
int spi_mode
```

Traditional SPI mode (0~3)

```
unsigned int pclk_hz
```

Frequency of pixel clock

```
size_t trans_queue_depth
```

Size of internal transaction queue

```
esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
```

Callback invoked when color data transfer has finished

```
void *user_ctx
```

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

```
int lcd_cmd_bits
```

Bit-width of LCD command

```
int lcd_param_bits
```

Bit-width of LCD parameter

```
unsigned int dc_as_cmd_phase : 1
```

D/C line value is encoded into SPI transaction command phase

```
unsigned int dc_low_on_data : 1
```

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal_mode** : 1
transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

struct esp_lcd_panel_io_i2c_config_t

Public Members

uint32_t **dev_addr**
I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**
Callback invoked when color data transfer has finished

void ***user_ctx**
User private data, passed directly to on_color_trans_done's user_ctx

size_t **control_phase_bytes**
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**
Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**
Bit-width of LCD command

int **lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_low_on_data** : 1
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

struct esp_lcd_i80_bus_config_t
LCD Intel 8080 bus configuration structure.

Public Members

int **dc_gpio_num**
GPIO used for D/C line

int **wr_gpio_num**
GPIO used for WR line

lcd_clock_source_t **clk_src**
Clock source for the I80 LCD peripheral

int **data_gpio_nums**[(16)]
GPIOs used for data lines

size_t **bus_width**
Number of data lines, 8 or 16

size_t **max_transfer_bytes**
Maximum transfer size, this determines the length of internal DMA link

struct esp_lcd_panel_io_i80_config_t
Panel IO configuration structure, for intel 8080 interface.

Public Members

int **cs_gpio_num**
GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int **pclk_hz**
Frequency of pixel clock

size_t **trans_queue_depth**
Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**
Callback invoked when color data was transferred done

void ***user_ctx**
User private data, passed directly to *on_color_trans_done*'s *user_ctx*

int **lcd_cmd_bits**
Bit-width of LCD command

int **lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_idle_level** : 1
Level of DC line in IDLE phase

unsigned int **dc_cmd_level** : 1
Level of DC line in CMD phase

unsigned int **dc_dummy_level** : 1
Level of DC line in DUMMY phase

unsigned int **dc_data_level** : 1
Level of DC line in DATA phase

struct *esp_lcd_panel_io_i80_config_t*::**[anonymous] dc_levels**
Each i80 device might have its own D/C control logic

unsigned int **cs_active_high** : 1
If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse_color_bits** : 1
Reverse the data bits, D[N:0] -> D[0:N]

unsigned int **swap_color_bytes** : 1
Swap adjacent two color bytes

unsigned int **pclk_active_neg** : 1
The display will write data lines when there's a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk_idle_low** : 1
The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

Type Definitions

typedef void ***esp_lcd_spi_bus_handle_t**
Type of LCD SPI bus handle

typedef void ***esp_lcd_i2c_bus_handle_t**
Type of LCD I2C bus handle

typedef struct *esp_lcd_i80_bus_t* ***esp_lcd_i80_bus_handle_t**
Type of LCD intel 8080 bus handle

typedef bool (***esp_lcd_panel_io_color_trans_done_cb_t**) (*esp_lcd_panel_io_handle_t*
panel_io,
esp_lcd_panel_io_event_data_t
**edata*, void **user_ctx*)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return Whether a high priority task has been waken up by this function

Parameters

- [in] *panel_io*: LCD panel IO handle, which is created by factory API like *esp_lcd_new_panel_io_spi()*
- [in] *edata*: Panel IO event data, fed by driver
- [in] *user_ctx*: User data, passed from *esp_lcd_panel_io_xxx_config_t*

Header File

- components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

esp_err_t **esp_lcd_panel_reset** (*esp_lcd_panel_handle_t* panel)

Reset LCD panel.

Note Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

Return

- ESP_OK on success

Parameters

- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

esp_err_t **esp_lcd_panel_init** (*esp_lcd_panel_handle_t* panel)

Initialize LCD panel.

Note Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

Return

- ESP_OK on success

Parameters

- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

esp_err_t **esp_lcd_panel_del** (*esp_lcd_panel_handle_t* panel)

Deinitialize the LCD panel.

Return

- ESP_OK on success

Parameters

- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

esp_err_t **esp_lcd_panel_draw_bitmap** (*esp_lcd_panel_handle_t* panel, int x_start, int y_start, int x_end, int y_end, **const** void *color_data)

Draw bitmap on LCD panel.

Return

- ESP_OK on success

Parameters

- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] x_start: Start index on x-axis (x_start included)
- [in] y_start: Start index on y-axis (y_start included)
- [in] x_end: End index on x-axis (x_end not included)
- [in] y_end: End index on y-axis (y_end not included)
- [in] color_data: RGB color data that will be dumped to the specific window range

esp_err_t **esp_lcd_panel_mirror** (*esp_lcd_panel_handle_t* panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

Note Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

Return

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Parameters

- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] mirror_x: Whether the panel will be mirrored about the x axis
- [in] mirror_y: Whether the panel will be mirrored about the y axis

esp_err_t esp_lcd_panel_swap_xy (*esp_lcd_panel_handle_t panel*, bool *swap_axes*)

Swap/Exchange x and y axis.

Note Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

Return

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Parameters

- [in] *panel*: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] *swap_axes*: Whether to swap the x and y axis

esp_err_t esp_lcd_panel_set_gap (*esp_lcd_panel_handle_t panel*, int *x_gap*, int *y_gap*)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

Note Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Return

- ESP_OK on success

Parameters

- [in] *panel*: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] *x_gap*: Extra gap on x axis, in pixels
- [in] *y_gap*: Extra gap on y axis, in pixels

esp_err_t esp_lcd_panel_invert_color (*esp_lcd_panel_handle_t panel*, bool *invert_color_data*)

Invert the color (bit-wise invert the color data line)

Return

- ESP_OK on success

Parameters

- [in] *panel*: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] *invert_color_data*: Whether to invert the color data

esp_err_t esp_lcd_panel_disp_off (*esp_lcd_panel_handle_t panel*, bool *off*)

Turn off the display.

Return

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Parameters

- [in] *panel*: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] *off*: Whether to turn off the screen

Header File

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

Functions

esp_err_t esp_lcd_new_rgb_panel (const *esp_lcd_rgb_panel_config_t* **rgb_panel_config*,
esp_lcd_panel_handle_t **ret_panel*)

Create RGB LCD panel.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free RGB panel is available
- ESP_OK on success

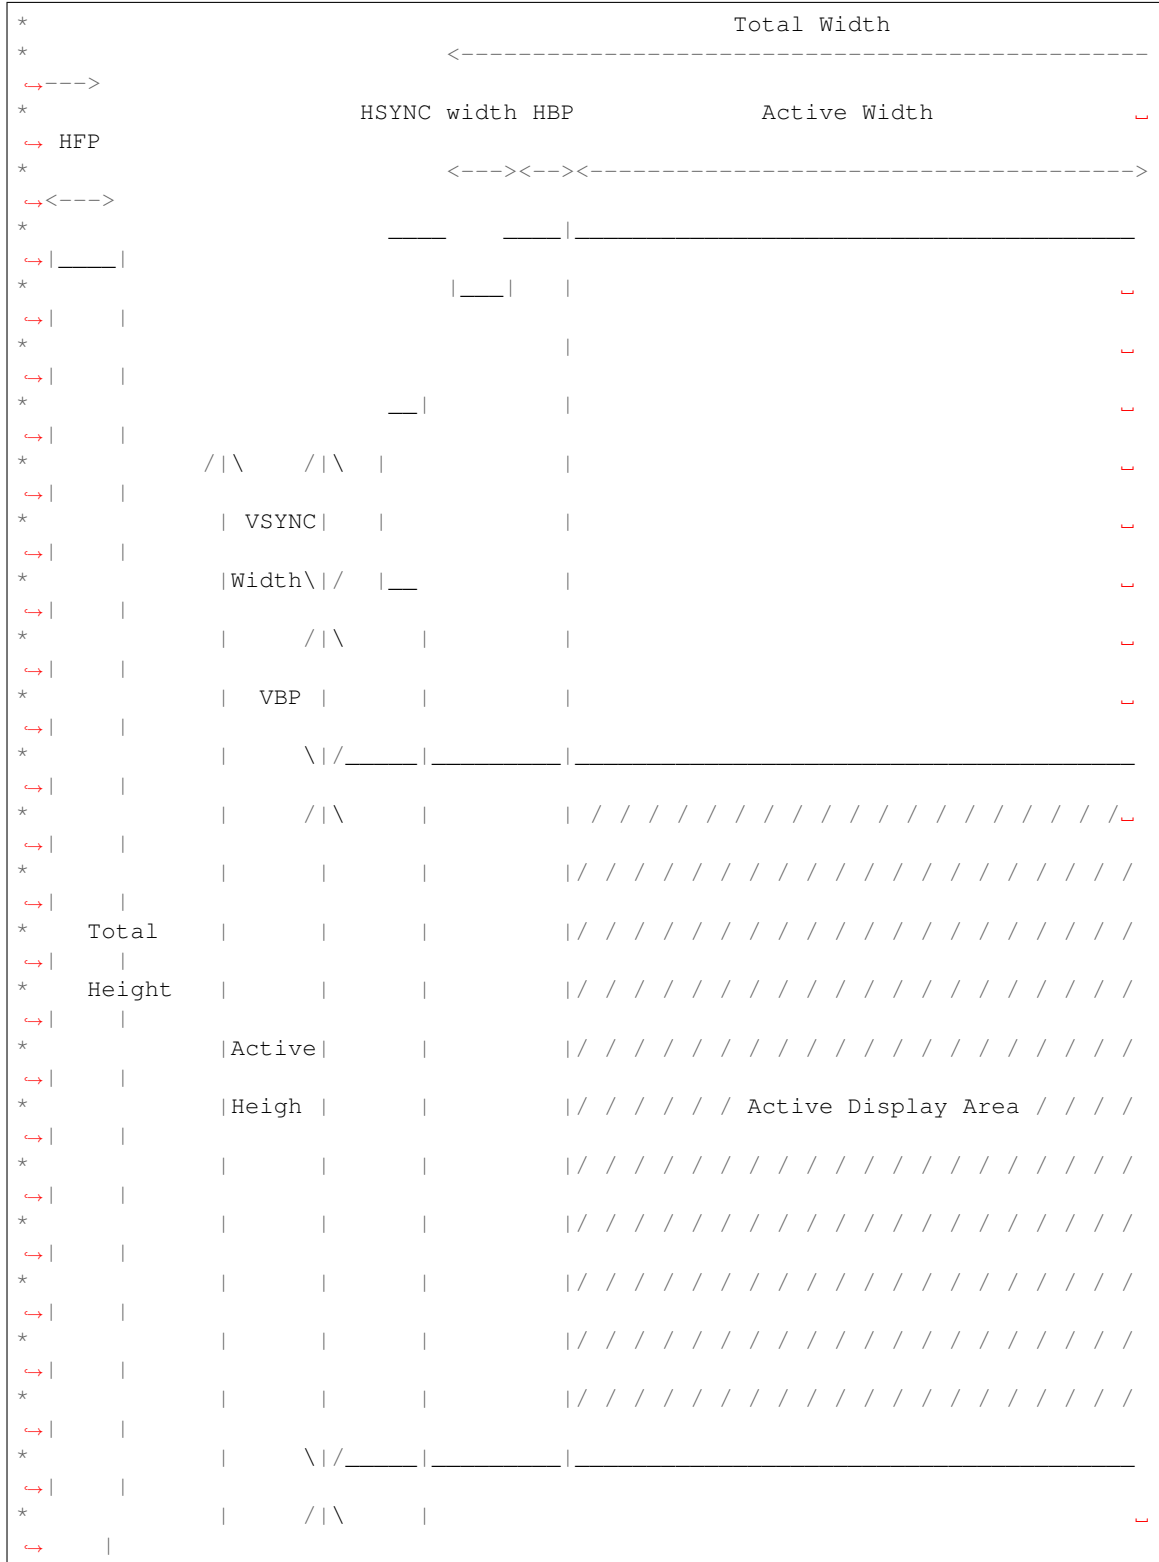

Parameters

- rgb_panel_config: RGB panel configuration
- ret_panel: Returned LCD panel handle

Structures

struct esp_lcd_rgb_timing_t

LCD RGB timing structure.

(下页继续)

Public Members

unsigned int **pclk_hz**

Frequency of pixel clock

unsigned int **h_res**

Horizontal resolution, i.e. the number of pixels in a line

unsigned int **v_res**

Vertical resolution, i.e. the number of lines in the frame

unsigned int **hsync_pulse_width**

Horizontal sync width, unit: PCLK period

unsigned int **hsync_back_porch**

Horizontal back porch, number of PCLK between hsync and start of line active data

unsigned int **hsync_front_porch**

Horizontal front porch, number of PCLK between the end of active data and the next hsync

unsigned int **vsync_pulse_width**

Vertical sync width, unit: number of lines

unsigned int **vsync_back_porch**

Vertical back porch, number of invalid lines between vsync and start of frame

unsigned int **vsync_front_porch**

Vertical front porch, number of invalid lines between then end of frame and the next vsync

unsigned int **hsync_idle_low** : 1

The hsync signal is low in IDLE state

unsigned int **vsync_idle_low** : 1

The vsync signal is low in IDLE state

unsigned int **de_idle_high** : 1

The de signal is high in IDLE state

unsigned int **pclk_active_neg** : 1

Whether the display data is clocked out at the falling edge of PCLK

unsigned int **pclk_idle_high** : 1

The PCLK stays at high level in IDLE phase

struct esp_lcd_rgb_panel_event_data_t

Type of RGB LCD panel event data.

struct esp_lcd_rgb_panel_config_t

LCD RGB panel configuration structure.

Public Members

lcd_clock_source_t **clk_src**

Clock source for the RGB LCD peripheral

esp_lcd_rgb_timing_t **timings**

RGB timing parameters

size_t data_width
 Number of data lines

size_t sram_trans_align
 Alignment for framebuffer that allocated in SRAM

size_t psram_trans_align
 Alignment for framebuffer that allocated in PSRAM

int hsync_gpio_num
 GPIO used for HSYNC signal

int vsync_gpio_num
 GPIO used for VSYNC signal

int de_gpio_num
 GPIO used for DE signal, set to -1 if it's not used

int pclk_gpio_num
 GPIO used for PCLK signal

int data_gpio_nums[(16)]
 GPIOs used for data lines

int disp_gpio_num
 GPIO used for display control signal, set to -1 if it's not used

esp_lcd_rgb_panel_frame_trans_done_cb_t on_frame_trans_done
 Callback invoked when one frame buffer has transferred done

void *user_ctx
 User data which would be passed to `on_frame_trans_done`'s `user_ctx`

unsigned int disp_active_low : 1
 If this flag is enabled, a low level of display control signal can turn the screen on; vice versa

unsigned int relax_on_idle : 1
 If this flag is enabled, the host won't refresh the LCD if nothing changed in host's frame buffer (this is useful for LCD with built-in GRAM)

unsigned int fb_in_psram : 1
 If this flag is enabled, the frame buffer will be allocated from PSRAM preferentially

Type Definitions

```

typedef bool (*esp_lcd_rgb_panel_frame_trans_done_cb_t) (esp_lcd_panel_handle_t
                                                         panel,
                                                         esp_lcd_rgb_panel_event_data_t
                                                         *edata, void *user_ctx)
  
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return Whether a high priority task has been waken up by this function

Parameters

- [in] `panel`: LCD panel handle, returned from `esp_lcd_new_rgb_panel`
- [in] `edata`: Panel event data, fed by driver
- [in] `user_ctx`: User data, passed from `esp_lcd_rgb_panel_config_t`

Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

Functions

```
esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const
                                     esp_lcd_panel_dev_config_t *panel_dev_config,
                                     esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const
                                       esp_lcd_panel_dev_config_t *panel_dev_config,
                                       esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const
                                       esp_lcd_panel_dev_config_t *panel_dev_config,
                                       esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

Structures

```
struct esp_lcd_panel_dev_config_t
```

Configuration structure for panel device.

Public Members

```
int reset_gpio_num
```

GPIO used to reset the LCD panel, set to -1 if it's not used

```
esp_lcd_color_space_t color_space
```

Set the color space used by the LCD panel

```
unsigned int bits_per_pixel
```

Color depth, in bpp

```
unsigned int reset_active_high: 1
```

Setting this if the panel reset is high level active

2.3.10 LED PWM 控制器

概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 8 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

功能概览

设置 LEDC 通道分三步完成。注意，与 ESP32 不同，ESP32-S3 仅支持设置通道为低速模式。

1. **定时器配置** 指定 PWM 信号的频率和占空比分辨率。
2. **通道配置** 绑定定时器和输出 PWM 信号的 GPIO。
3. **改变 PWM 信号** 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

另一个可选步骤是可以在渐变终端设置一个中断。

图 6: LED PWM 控制器 API 的关键配置

定时器配置 要设置定时器，可调用函数 `ledc_timer_config()`，并将包括如下配置参数的数据结构 `ledc_timer_config_t` 传递给该函数：

- 速度模式（值必须为 `LEDC_LOW_SPEED_MODE`）
- 定时器索引 `ledc_timer_t`
- PWM 信号频率
- PWM 占空比分辨率

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见 [频率和占空比分辨率支持范围](#) 一节。

通道配置 定时器设置好后，请配置所需的通道（`ledc_channel_t` 之一）。配置通道需调用函数 `ledc_channel_config()`。

通道的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体 `ledc_channel_config_t`。

此时，通道会按照 `ledc_channel_config_t` 的配置开始运作，并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中，可以随时通过调用函数 `ledc_stop()` 将其暂停。

改变 PWM 信号 通道开始运行、生成具有恒定占空比和频率的 PWM 信号之后，有几种方式可以改变该信号。驱动 LED 时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM 信号的频率也可更改，详见 [改变 PWM 频率](#) 一节。

使用软件改变 PWM 占空比 调用函数 `ledc_set_duty()` 可以设置新的占空比。之后，调用函数 `ledc_update_duty()` 使新配置生效。要查看当前设置的占空比，可使用 `_get_` 函数 `ledc_get_duty()`。

另外一种设置占空比和其他通道参数的方式是调用 [通道配置](#) 一节提到的函数 `ledc_channel_config()`。

传递给函数的占空比数值范围取决于选定的 `duty_resolution`，应为 0 至 $(2^{**} \text{duty_resolution}) - 1$ 。例如，如选定的占空比分辨率为 10，则占空比的数值范围为 0 至 1023。此时分辨率为 ~0.1%。

使用硬件改变 PWM 占空比 LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数 `ledc_fade_func_install()` 使能渐变，之后用下列可用渐变函数之一配置：

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

最后用 `ledc_fade_start()` 开启渐变。

如不需要渐变和渐变中断，可用函数 `ledc_fade_func_uninstall()` 关闭。

改变 PWM 频率 LED PWM 控制器 API 有多种方式即时改变 PWM 频率：

- 通过调用函数 `ledc_set_freq()` 设置频率。可用函数 `ledc_get_freq()` 查看当前频率。
- 通过调用函数 `ledc_bind_channel_timer()` 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数 `ledc_channel_config()` 改变通道的定时器。

控制 PWM 的更多方式 有一些较底层的定时器特定函数可用于更改 PWM 设置：

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数 `ledc_channel_config()` 在后台运行，在定时器配置后启动。

使用中断 配置 LED PWM 控制器通道时，可在 `ledc_channel_config_t` 中选取参数 `ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数 `ledc_isr_register()`。

频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比可为 0 至 100% 之间的任意值，分辨率为 ~0.012% ($2^{**} 13 = 8192$ LED 亮度的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器计

时的时钟信号，LED PWM 控制器为通道提供时钟（具体可参考[定时器配置](#)和[ESP32-S3 技术参考手册 > LED PWM 计时器 \(LEDC\) \[PDF\]](#)）。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz、占空比分辨率设置为 3 位时，串行端口监视器上会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用 `ledc_timer_bit_t` 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

应用实例

使用 LEDC 改变占空比和渐变控制的实例请参照 [peripherals/ledc/ledc_fade](#)。

使用 LEDC 基本实例请参照 [peripherals/ledc/ledc_basic](#)。

API 参考

Header File

- `components/driver/include/driver/ledc.h`

Functions

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `ledc_conf`: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

Parameters

- `timer_conf`: Pointer of LEDC timer configure struct

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

LEDC update channel parameters.

Note Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

Note `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

esp_err_t `ledc_set_pin` (int *gpio_num*, *ledc_mode_t* *speed_mode*, *ledc_channel_t* *ledc_channel*)

Set LEDC output gpio.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `gpio_num`: The LEDC output gpio
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `ledc_channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

esp_err_t `ledc_stop` (*ledc_mode_t* *speed_mode*, *ledc_channel_t* *channel*, *uint32_t* *idle_level*)

LEDC stop. Disable LEDC output, and set idle level.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `idle_level`: Set output idle level after LEDC stops.

esp_err_t `ledc_set_freq` (*ledc_mode_t* *speed_mode*, *ledc_timer_t* *timer_num*, *uint32_t* *freq_hz*)

LEDC set channel frequency (Hz)

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num`: LEDC timer index (0-3), select from `ledc_timer_t`
- `freq_hz`: Set the LEDC frequency

uint32_t `ledc_get_freq` (*ledc_mode_t* *speed_mode*, *ledc_timer_t* *timer_num*)

LEDC get channel frequency (Hz)

Return

- 0 error
- Others Current LEDC frequency

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num`: LEDC timer index (0-3), select from `ledc_timer_t`

esp_err_t **ledc_set_duty_with_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- hpoint: Set the LEDC hpoint value(max: 0xffff)

int **ledc_get_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

Return

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

esp_err_t **ledc_set_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]

uint32_t **ledc_get_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn't take effect until the next cycle.

Return

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

esp_err_t **ledc_set_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* duty, *ledc_duty_direction_t* fade_direction, *uint32_t* step_num, *uint32_t* duty_cycle_num, *uint32_t* duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- fade_direction: Set the direction of the gradient
- step_num: Set the number of the gradient
- duty_cycle_num: Set how many LEDC tick each time the gradient lasts
- duty_scale: Set gradient change amplitude

esp_err_t **ledc_isr_register** (void (*fn)) void *
, void *arg, int intr_alloc_flags, *ledc_isr_handle_t* *handle Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- fn: Interrupt handler function.
- arg: User-supplied argument passed to the handler function.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

esp_err_t **ledc_timer_set** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel, *uint32_t* clock_divider, *uint32_t* duty_resolution, *ledc_clk_src_t* clk_src)

Configure LEDC settings.

Return

- (-1) Parameter error
- Other Current LEDC duty

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: Timer index (0-3), there are 4 timers in LEDC module
- clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
- duty_resolution: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
- clk_src: Select LEDC source clock.

esp_err_t **ledc_timer_rst** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Reset LEDC timer.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

esp_err_t **ledc_timer_pause** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

esp_err_t **ledc_timer_resume** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

esp_err_t **ledc_bind_channel_timer** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

esp_err_t **ledc_set_fade_with_step** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* target_duty, *uint32_t* scale, *uint32_t* cycle_num)

Set LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

Note ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle_num: increase or decrease the duty every cycle_num cycles

esp_err_t **ledc_set_fade_with_time** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* target_duty, *int* max_fade_time_ms)

Set LEDC fade function, with a limited time.

Note Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- `channel`: LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [$0, (2^{**}duty_resolution) - 1$]
- `max_fade_time_ms`: The maximum time of the fading (ms).

esp_err_t `ledc_fade_func_install` (int *intr_alloc_flags*)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function already installed.

Parameters

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`OR`ed) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

void `ledc_fade_func_uninstall` (void)

Uninstall LEDC fade function.

esp_err_t `ledc_fade_start` (*ledc_mode_t* *speed_mode*, *ledc_channel_t* *channel*, *ledc_fade_mode_t* *fade_mode*)

Start LEDC fading.

Note Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel number
- `fade_mode`: Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

esp_err_t `ledc_set_duty_and_update` (*ledc_mode_t* *speed_mode*, *ledc_channel_t* *channel*, *uint32_t* *duty*, *uint32_t* *hpoint*)

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

- `duty`: Set the LEDC duty, the range of duty setting is $[0, (2^{**}duty_resolution) - 1]$
- `hpoint`: Set the LEDC hpoint value(max: 0xffff)

esp_err_t **ledc_set_fade_time_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* target_duty, *uint32_t* max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

Note Call `ledc_fade_func_install()` once, before calling this function.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- `target_duty`: Target duty of fading $[0, (2^{**}duty_resolution) - 1]$
- `max_fade_time_ms`: The maximum time of the fading (ms).
- `fade_mode`: choose blocking or non-blocking mode

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* target_duty, *uint32_t* scale, *uint32_t* cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

Note Call `ledc_fade_func_install()` once before calling this function.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- `target_duty`: Target duty of fading $[0, (2^{**}duty_resolution) - 1]$
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles
- `fade_mode`: choose blocking or non-blocking mode

esp_err_t **ledc_cb_register** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

Note The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- `cbs`: Group of LEDC callback functions

- `user_arg`: user registered data for the callback function

Structures

struct ledc_cb_param_t
LEDC callback parameter.

Public Members

ledc_cb_event_t **event**
Event name

uint32_t **speed_mode**
Speed mode of the LEDC channel group

uint32_t **channel**
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t **duty**
LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]

struct ledc_cbs_t
Group of supported LEDC callbacks.

Note The callbacks are all running under ISR environment

Public Members

ledc_cb_t **fade_cb**
LEDC fade_end callback function

Macros

LEDC_APB_CLK_HZ

LEDC_REF_CLK_HZ

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef intr_handle_t ledc_isr_handle_t

typedef bool (*ledc_cb_t) (const *ledc_cb_param_t* *param, void *user_arg)
Type of LEDC event callback.

Parameters

- `param`: LEDC callback parameter
- `user_arg`: User registered data

Enumerations

enum ledc_cb_event_t
LEDC callback event type.

Values:

LEDC_FADE_END_EVT
LEDC fade end event

Header File

- `components/hal/include/hal/ledc_types.h`

Structures**struct ledc_channel_config_t**

Configuration parameters of LEDC channel for ledc_channel_config function.

Public Members**int gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t speed_mode

LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_channel_t channel

LEDC channel (0 - 7)

ledc_intr_type_t intr_type

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t timer_sel

Select the timer source of channel (0 - 3)

uint32_t duty

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int hpoint

LEDC channel hpoint value, the max value is 0xffff

unsigned int output_invert : 1

Enable (1) or disable (0) gpio output invert

struct ledc_channel_config_t::[anonymous] flags

LEDC flags

struct ledc_timer_config_t

Configuration parameters of LEDC Timer timer for ledc_timer_config function.

Public Members**ledc_mode_t speed_mode**

LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_timer_bit_t duty_resolution

LEDC channel duty resolution

ledc_timer_bit_t bit_num

Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

ledc_timer_t timer_num

The timer source of channel (0 - 3)

uint32_t freq_hz

LEDC timer frequency (Hz)

ledc_clk_cfg_t clk_cfg

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK

Enumerations**enum ledc_mode_t**

Values:

LEDC_LOW_SPEED_MODE

LEDC low speed speed_mode

LEDC_SPEED_MODE_MAX

LEDC speed limit

enum ledc_intr_type_t

Values:

LEDC_INTR_DISABLE = 0

Disable LEDC interrupt

LEDC_INTR_FADE_END

Enable LEDC interrupt

LEDC_INTR_MAX

enum ledc_duty_direction_t

Values:

LEDC_DUTY_DIR_DECREASE = 0

LEDC duty decrease direction

LEDC_DUTY_DIR_INCREASE = 1

LEDC duty increase direction

LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t

Values:

LEDC_SLOW_CLK_RTC8M = 0

LEDC low speed timer clock source is 8MHz RTC clock

LEDC_SLOW_CLK_APB

LEDC low speed timer clock source is 80MHz APB clock

LEDC_SLOW_CLK_XTAL

LEDC low speed timer clock source XTAL clock

enum ledc_clk_cfg_t

Values:

LEDC_AUTO_CLK = 0

The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

LEDC_USE_REF_TICK

LEDC timer select REF_TICK clock as source clock

LEDC_USE_APB_CLK

LEDC timer select APB clock as source clock

LEDC_USE_RTC8M_CLK

LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

LEDC_USE_XTAL_CLK

LEDC timer select XTAL clock as source clock

enum ledc_clk_src_t

Values:

LEDC_REF_TICK = LEDC_USE_REF_TICK

LEDC timer clock divided from reference tick (1Mhz)

LEDC_APB_CLK = LEDC_USE_APB_CLK

LEDC timer clock divided from APB clock (80Mhz)

enum ledc_timer_t*Values:***LEDC_TIMER_0** = 0
LEDC timer 0**LEDC_TIMER_1**
LEDC timer 1**LEDC_TIMER_2**
LEDC timer 2**LEDC_TIMER_3**
LEDC timer 3**LEDC_TIMER_MAX****enum ledc_channel_t***Values:***LEDC_CHANNEL_0** = 0
LEDC channel 0**LEDC_CHANNEL_1**
LEDC channel 1**LEDC_CHANNEL_2**
LEDC channel 2**LEDC_CHANNEL_3**
LEDC channel 3**LEDC_CHANNEL_4**
LEDC channel 4**LEDC_CHANNEL_5**
LEDC channel 5**LEDC_CHANNEL_6**
LEDC channel 6**LEDC_CHANNEL_7**
LEDC channel 7**LEDC_CHANNEL_MAX****enum ledc_timer_bit_t***Values:***LEDC_TIMER_1_BIT** = 1
LEDC PWM duty resolution of 1 bits**LEDC_TIMER_2_BIT**
LEDC PWM duty resolution of 2 bits**LEDC_TIMER_3_BIT**
LEDC PWM duty resolution of 3 bits**LEDC_TIMER_4_BIT**
LEDC PWM duty resolution of 4 bits**LEDC_TIMER_5_BIT**
LEDC PWM duty resolution of 5 bits**LEDC_TIMER_6_BIT**
LEDC PWM duty resolution of 6 bits**LEDC_TIMER_7_BIT**
LEDC PWM duty resolution of 7 bits

LEDC_TIMER_8_BIT
LEDC PWM duty resolution of 8 bits

LEDC_TIMER_9_BIT
LEDC PWM duty resolution of 9 bits

LEDC_TIMER_10_BIT
LEDC PWM duty resolution of 10 bits

LEDC_TIMER_11_BIT
LEDC PWM duty resolution of 11 bits

LEDC_TIMER_12_BIT
LEDC PWM duty resolution of 12 bits

LEDC_TIMER_13_BIT
LEDC PWM duty resolution of 13 bits

LEDC_TIMER_14_BIT
LEDC PWM duty resolution of 14 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t

Values:

LEDC_FADE_NO_WAIT = 0
LEDC fade function will return immediately

LEDC_FADE_WAIT_DONE
LEDC fade function will block until fading to the target duty

LEDC_FADE_MAX

2.3.11 Motor Control Pulse Width Modulator (MCPWM)

ESP32-S3 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

图 7: MCPWM Overview

Further in documentation the outputs of a single unit are labeled $PWMxA$ / $PWMxB$.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each

unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

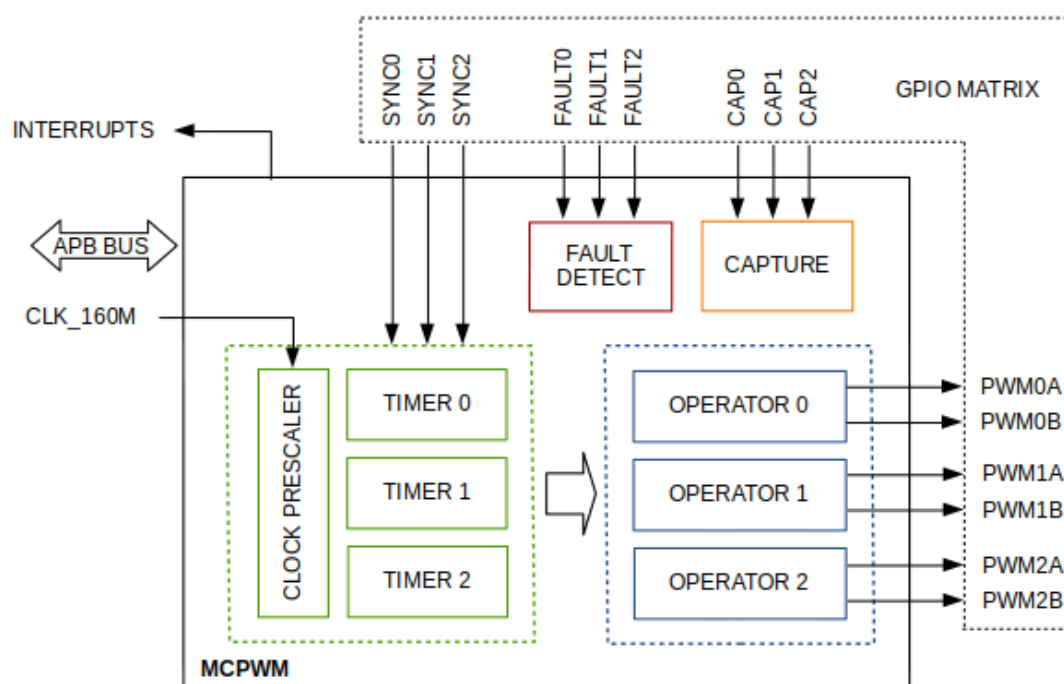

图 8: MCPWM Block Diagram

Description of this API starts with configuration of MCPWM's **Timer** and **Generator** submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a **Fault Handler**, signal **Capture** and **Carrier**.

Contents

- *Configure* a basic functionality of the outputs
- *Operate* the outputs to drive a motor
- *Adjust* how the motor is driven
- *Synchronize* sync timers to work together
- *Capture* external signals to provide additional control over the outputs
- Use *Fault Handler* to detect and manage faults
- Add a higher frequency *Carrier*, if output signals are passed through an isolation transformer
- Extra configuration of *Resolution*.

Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM's resources. An example circuit is shown below. It includes a **H-Bridge** to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

图 9: Example of Brushed DC Motor Control with MCPWM

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32-S3 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit's outputs. The outputs are organized into three pairs. Within a pair they are labeled "A" and "B" and each driven by a submodule called an "Generator". To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM's duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of options from `mcpwm_duty_type_t`.

注解: Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the *block diagram* of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

注解: Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see *ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM)* [PDF].

Synchronize

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers' synchronization outputs or GPIO signals via the GPIO matrix. Timer' s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%~99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section *Configure*.

It's normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

Software sync event which triggered on one timer can be propagated to other timers on ESP32-S3, which can be used as a tricky way to get all three timers synced without any extra requirement.

```
// configure timer0 as trigger source
mcpwm_set_timer_sync_output(MCPWM_UNIT_0, MCPWM_TIMER_0, MCPWM_SWSYNC_SOURCE_
↳SYNCIN);
mcpwm_sync_config_t sync_conf = {
    .sync_sig = MCPWM_SELECT_TIMER0_SYNC,
    .timer_val = 0,
    .count_direction = MCPWM_TIMER_DIRECTION_UP,
};
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_0, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_1, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_2, &sync_conf);
// then send soft sync event to timer0
mcpwm_timer_trigger_soft_sync(MCPWM_UNIT_0, MCPWM_TIMER_0);
```

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal's edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section *Configure*.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer's value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler's internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

图 10: Example of Brushless DC Motor Control with MCPWM

Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
 - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
 - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see *ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule* [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

Resolution

The default resolution for MCPWM group and MCPWM timer are configured to **10MHz** and **1MHz** in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won't update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

Application Example

MCPWM example are located under: `peripherals/mcpwm`:

- Control of BLDC (brushless DC) motor with hall sensor feedback - `peripherals/mcpwm/mcpwm_blcd_hall_control`
- Brushed DC motor control - `peripherals/mcpwm/mcpwm_brushed_dc_control`
- Servo motor control - `peripherals/mcpwm/mcpwm_servo_control`
- HC-SR04 sensor with capture - `peripherals/mcpwm/mcpwm_capture_hc_sr04`

Functions

`esp_err_t mcpwm_gpio_init (mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)`

This function initializes each gpio signal for MCPWM.

Note This function initializes one gpio at a time.**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `io_signal`: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) 'X' is timer_num(0-2)
- `gpio_num`: set this to configure gpio for MCPWM, if you want to use gpio16, `gpio_num = 16`

`esp_err_t mcpwm_set_pin (mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)`

Initialize MCPWM gpio structure.

Note This function initialize a group of MCPWM GPIOs at a time.**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `mcpwm_pin`: MCPWM pin structure

`esp_err_t mcpwm_init (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)`

Initialize MCPWM parameters.

Note The default resolution configured for MCPWM group and timer are $160\text{M} / 16 = 10\text{M}$ and $10\text{M} / 10 = 1\text{M}$. The default resolution can be changed by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`, before calling this function.**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- `mcpwm_conf`: configure structure `mcpwm_config_t`

`esp_err_t mcpwm_group_set_resolution (mcpwm_unit_t mcpwm_num, unsigned long int resolution)`

Set resolution of the MCPWM group.

Note This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back.**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `resolution`: set expected frequency resolution

esp_err_t **mcpwm_timer_set_resolution** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, unsigned long int resolution)

Set resolution of each timer.

Note This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- resolution: set expected frequency resolution

esp_err_t **mcpwm_set_frequency** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, uint32_t frequency)

Set frequency(in Hz) of MCPWM timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

esp_err_t **mcpwm_set_duty** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen, float duty)

Set duty cycle of each operator(MCPWMXA/MCPWMB)

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMB), 'X' is operator number selected
- duty: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

esp_err_t **mcpwm_set_duty_in_us** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen, uint32_t duty_in_us)

Set duty cycle of each operator(MCPWMXA/MCPWMB) in us.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected
- duty_in_us: set duty value in microseconds of each operator

esp_err_t **mcpwm_set_duty_type** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen, *mcpwm_duty_type_t* duty_type)

Set duty either active high or active low(out of phase/inverted)

Note Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)

- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected
- `duty_type`: set active low or active high duty type

`uint32_t mcpwm_get_frequency (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Get frequency of timer.

Return

- frequency of timer

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`float mcpwm_get_duty (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)`

Get duty cycle of each operator.

Return

- duty cycle in % of each operator(56.7 means duty is 56.7%)

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected

`uint32_t mcpwm_get_duty_in_us (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)`

Get duty cycle of each operator in us.

Return

- duty cycle in us of each operator

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMB), 'x' is operator number selected

`esp_err_t mcpwm_set_signal_high (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)`

Use this function to set MCPWM signal high.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMB), 'x' is timer number selected

`esp_err_t mcpwm_set_signal_low (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)`

Use this function to set MCPWM signal low.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMB), 'x' is timer number selected

`esp_err_t mcpwm_start (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Start MCPWM signal on timer 'x' .

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Start MCPWM signal on timer 'x' .

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)`

Initialize carrier configuration.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure `mcpwm_carrier_config_t`

`esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Enable MCPWM carrier submodule, for respective timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Disable MCPWM carrier submodule, for respective timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)`

Set period of carrier.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_period`: set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns (carrier_period <= 15)

`esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)`

Set duty_cycle of carrier.

Return

- `ESP_OK` Success

- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_duty`: set `duty_cycle` of carrier , carrier duty cycle = `carrier_duty`*12.5% (`chop_duty` <= 7)

`esp_err_t mcpwm_carrier_oneshot_mode_enable` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `uint8_t` `pulse_width`)

Enable and set width of first pulse in carrier oneshot mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `pulse_width`: set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width + 1) (pulse_width <= 15)

`esp_err_t mcpwm_carrier_oneshot_mode_disable` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`)

Disable oneshot mode, width of first pulse = carrier period.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_output_invert` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `mcpwm_carrier_out_ivt_t` `carrier_ivt_mode`)

Enable or disable carrier output inversion.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_ivt_mode`: enable or disable carrier output inversion

`esp_err_t mcpwm_deadtime_enable` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`, `mcpwm_deadtime_type_t` `dt_mode`, `uint32_t` `red`, `uint32_t` `fed`)

Enable and initialize deadtime for each MCPWM timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `dt_mode`: set deadtime mode
- `red`: set rising edge delay = `red`*100ns
- `fed`: set rising edge delay = `fed`*100ns

`esp_err_t mcpwm_deadtime_disable` (`mcpwm_unit_t` `mcpwm_num`, `mcpwm_timer_t` `timer_num`)

Disable deadtime on MCPWM timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_fault_init` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_fault_input_level_t* `input_level`, *mcpwm_fault_signal_t* `fault_sig`)

Initialize fault submodule, currently low level triggering is not supported.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `input_level`: set fault signal level, which will cause fault to occur
- `fault_sig`: set the fault pin, which needs to be enabled

`esp_err_t mcpwm_fault_set_oneshot_mode` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`, *mcpwm_fault_signal_t* `fault_sig`, *mcpwm_output_action_t* `action_on_pwmxa`, *mcpwm_output_action_t* `action_on_pwmxb`)

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

Note currently low level triggering is not supported

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_set_cyc_mode` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`, *mcpwm_fault_signal_t* `fault_sig`, *mcpwm_output_action_t* `action_on_pwmxa`, *mcpwm_output_action_t* `action_on_pwmxb`)

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

Note currently low level triggering is not supported

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for cyc mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_deinit` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_fault_signal_t* `fault_sig`)

Disable fault signal.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)

- `fault_sig`: fault pin, which needs to be disabled

`esp_err_t mcpwm_capture_enable` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_capture_signal_t* `cap_sig`, *mcpwm_capture_on_edge_t* `cap_edge`, *uint32_t* `num_of_pulse`)

Initialize capture submodule.

Note Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by `mcpwm_isr_register`, and in there, query the capture data.

Note The capture timer uses APB_CLK (typically 80MHz) as the count source.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_edge`: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- `cap_sig`: capture pin, which needs to be enabled
- `num_of_pulse`: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

`esp_err_t mcpwm_capture_disable` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_capture_signal_t* `cap_sig`)

Disable capture signal.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin, which needs to be disabled

`esp_err_t mcpwm_capture_enable_channel` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_capture_channel_id_t* `cap_channel`, **const** *mcpwm_capture_config_t* `*cap_conf`)

Enable capture channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be enabled
- `cap_conf`: capture channel configuration

`esp_err_t mcpwm_capture_disable_channel` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_capture_channel_id_t* `cap_channel`)

Disable capture channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be disabled

uint32_t `mcpwm_capture_signal_get_value` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_capture_signal_t* `cap_sig`)

Get capture value.

Return Captured value

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel on which value is to be measured

uint32_t `mcpwm_capture_signal_get_edge` (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_capture_signal_t* `cap_sig`)

Get edge of capture signal.

Return Capture signal edge: 1 - positive edge, 2 - negative edge

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel of whose edge is to be determined

esp_err_t **mcpwm_sync_enable** (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`, *mcpwm_sync_signal_t* `sync_sig`, *uint32_t* `phase_val`)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Note Count direction is undefined within this API

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization input signal
- `phase_val`: phase value in 1/1000 (for 86.7%, `phase_val` = 867) which timer moves to on sync signal

esp_err_t **mcpwm_sync_configure** (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`, **const** *mcpwm_sync_config_t* `*sync_conf`)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_conf`: sync configuration on this timer

esp_err_t **mcpwm_sync_disable** (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`)

Disable sync submodule on given timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t **mcpwm_set_timer_sync_output** (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`, *mcpwm_timer_sync_trigger_t* `trigger`)

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `trigger`: set the trigger that will cause the timer to generate a software sync signal. Specifically, `MCPWM_SWSYNC_SOURCE_DISABLED` will disable the timer from generating sync signal.

esp_err_t **mcpwm_timer_trigger_soft_sync** (*mcpwm_unit_t* `mcpwm_num`, *mcpwm_timer_t* `timer_num`)

Trigger a software sync event and sends it to a specific timer.

Note This software sync event will have the same effect as hw one, except that:

- On esp32s3 the soft sync event can be routed to its output if `MCPWM_SWSYNC_SOURCE_SYNCIN` is selected via `mcpwm_set_timer_sync_output()`

- On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_sync_invert_gpio_synchro` (`mcpwm_unit_t mcpwm_num`, `mcpwm_sync_signal_t sync_sig`, `bool invert`)

Set external GPIO sync input inverter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `sync_sig`: set sync signal of MCPWM, only supports GPIO sync signal
- `invert`: whether GPIO sync source input is inverted (to get negative edge trigger)

`esp_err_t mcpwm_isr_register` (`mcpwm_unit_t mcpwm_num`, `void (*fn)`) `void *`, `void *arg`, `int intr_alloc_flags`, `intr_handle_t *handle` Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `fn`: interrupt handler function.
- `arg`: user-supplied argument passed to the handler function.
- `intr_alloc_flags`: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. see `esp_intr_alloc.h` for more info.
- `handle`: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Structures

`struct mcpwm_pin_config_t`
pin number for MCPWM

Public Members

`int mcpwm0a_out_num`
MCPWM0A out pin

`int mcpwm0b_out_num`
MCPWM0A out pin

`int mcpwm1a_out_num`
MCPWM0A out pin

`int mcpwm1b_out_num`
MCPWM0A out pin

CAP0 in pin

int **mcpwm_cap1_in_num**
CAP1 in pin

int **mcpwm_cap2_in_num**
CAP2 in pin

struct cap_event_data_t
event data that will be passed into ISR callback

Public Members

mcpwm_capture_on_edge_t **cap_edge**
Which signal edge is detected

uint32_t **cap_value**
Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)

struct mcpwm_config_t
MCPWM config structure.

Public Members

uint32_t **frequency**
Set frequency of MCPWM in Hz

float **cmpr_a**
Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty_a = 62.3

float **cmpr_b**
Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty_b = 48.0

mcpwm_duty_type_t **duty_mode**
Set type of duty cycle

mcpwm_counter_type_t **counter_mode**
Set type of MCPWM counter

struct mcpwm_carrier_config_t
MCPWM carrier configuration structure.

Public Members

uint8_t **carrier_period**
Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16

`uint8_t carrier_duty`

Set carrier duty cycle, `carrier_duty` should be less than 8 (increment every 12.5%)

`uint8_t pulse_width_in_os`

Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less than 16

`mcpwm_carrier_os_t carrier_os_mode`

Enable or disable carrier oneshot mode

`mcpwm_carrier_out_ivt_t carrier_ivt_mode`

Invert output of carrier

`struct mcpwm_capture_config_t`

MCPWM config capture structure.

Public Members

`mcpwm_capture_on_edge_t cap_edge`

Set capture edge

`uint32_t cap_prescale`

Prescale of capture signal, ranging from 1 to 256

`cap_isr_cb_t capture_cb`

User defined capture event callback, running under interrupt context

`void *user_data`

User defined ISR callback function args

`struct mcpwm_sync_config_t`

MCPWM config sync structure.

Public Members

`mcpwm_sync_signal_t sync_sig`

Set sync input signal that will cause timer to sync

`uint32_t timer_val`

Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak

`mcpwm_timer_direction_t count_direction`

Counting direction to be set after sync

Macros

`MCPWM_OPR_A`

`MCPWM_OPR_B`

`MCPWM_OPR_MAX`

Type Definitions

typedef *mcpwm_generator_t* **mcpwm_operator_t**

typedef *mcpwm_output_action_t* **mcpwm_action_on_pwmxa_t**

typedef *mcpwm_output_action_t* **mcpwm_action_on_pwmxb_t**

typedef *mcpwm_capture_signal_t* **mcpwm_capture_channel_id_t**

MCPWM capture channel ID alias.

typedef bool (***cap_isr_cb_t**) (*mcpwm_unit_t* mcpwm, *mcpwm_capture_channel_id_t* cap_channel, **const** *cap_event_data_t* *edata, void *user_data)

Type of capture event callback.

Note Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR(usually has ‘_ISR’ postfix)

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Parameters

- mcpwm: MCPWM unit(0-1)
- cap_channel: capture channel ID
- edata: Capture event data, contains capture edge and capture value, fed by the driver
- user_data: User registered data, passed from *mcpwm_capture_config_t*

Enumerations

enum **mcpwm_io_signals_t**

IO signals for the MCPWM.

- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0

PWM0A output pin

MCPWM0B

PWM0B output pin

MCPWM1A

PWM1A output pin

MCPWM1B

PWM1B output pin

MCPWM2A

PWM2A output pin

MCPWM2B

PWM2B output pin

MCPWM_SYNC_0

SYNC0 input pin

MCPWM_SYNC_1

SYNC1 input pin

MCPWM_SYNC_2
SYNC2 input pin

MCPWM_FAULT_0
FAULT0 input pin

MCPWM_FAULT_1
FAULT1 input pin

MCPWM_FAULT_2
FAULT2 input pin

MCPWM_CAP_0 = 84
CAP0 input pin

MCPWM_CAP_1
CAP1 input pin

MCPWM_CAP_2
CAP2 input pin

enum mcpwm_unit_t
Select MCPWM unit.

Values:

MCPWM_UNIT_0
MCPWM unit0 selected

MCPWM_UNIT_1
MCPWM unit1 selected

MCPWM_UNIT_MAX
Max number of MCPWM units

enum mcpwm_timer_t
Select MCPWM timer.

Values:

MCPWM_TIMER_0
Select MCPWM timer0

MCPWM_TIMER_1
Select MCPWM timer1

MCPWM_TIMER_2
Select MCPWM timer2

MCPWM_TIMER_MAX
Max number of timers in a unit

enum mcpwm_generator_t
Select MCPWM operator.

Values:

MCPWM_GEN_A
Select MCPWMXA, where 'X' is operator number

MCPWM_GEN_B
Select MCPWMXB, where 'X' is operator number

MCPWM_GEN_MAX
Num of generators to each operator of MCPWM

enum mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

Values:

MCPWM_ONESHOT_MODE_DIS

Enable oneshot mode

MCPWM_ONESHOT_MODE_EN

Disable oneshot mode

enum mcpwm_carrier_out_ivt_t

MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:

MCPWM_CARRIER_OUT_IVT_DIS

Enable carrier output inversion

MCPWM_CARRIER_OUT_IVT_EN

Disable carrier output inversion

enum mcpwm_fault_signal_t

MCPWM select fault signal input.

Values:

MCPWM_SELECT_F0

Select F0 as input

MCPWM_SELECT_F1

Select F1 as input

MCPWM_SELECT_F2

Select F2 as input

enum mcpwm_sync_signal_t

MCPWM select sync signal input.

Values:

MCPWM_SELECT_NO_INPUT

No sync input selected

MCPWM_SELECT_TIMER0_SYNC

Select software sync signal from timer0 as input

MCPWM_SELECT_TIMER1_SYNC

Select software sync signal from timer1 as input

MCPWM_SELECT_TIMER2_SYNC

Select software sync signal from timer2 as input

MCPWM_SELECT_GPIO_SYNC0

Select GPIO SYNC0 as input

MCPWM_SELECT_GPIO_SYNC1

Select GPIO SYNC1 as input

MCPWM_SELECT_GPIO_SYNC2

Select GPIO SYNC2 as input

enum mcpwm_timer_sync_trigger_t

MCPWM timer sync event trigger.

Values:

MCPWM_SWSYNC_SOURCE_SYNCIN

the input sync signal will be routed to its sync output path

MCPWM_SWSYNC_SOURCE_TEZ

sync signal generated when timer counts to zero

MCPWM_SWSYNC_SOURCE_TEP

sync signal generated when timer counts to peak

MCPWM_SWSYNC_SOURCE_DISABLED

timer does not generate sync signals

enum mcpwm_fault_input_level_t

MCPWM select triggering level of fault signal.

Values:

MCPWM_LOW_LEVEL_TGR

Fault condition occurs when fault input signal goes from high to low

MCPWM_HIGH_LEVEL_TGR

Fault condition occurs when fault input signal goes low to high

enum mcpwm_capture_on_edge_t

MCPWM select capture starts from which edge.

Values:

MCPWM_NEG_EDGE = BIT(0)

Capture the negative edge

MCPWM_POS_EDGE = BIT(1)

Capture the positive edge

MCPWM_BOTH_EDGE = BIT(1) | BIT(0)

Capture both edges

enum mcpwm_intr_t

Interrupt masks for MCPWM capture.

Values:

MCPWM_LL_INTR_CAP0 = BIT(27)

Capture 0 happened.

MCPWM_LL_INTR_CAP1 = BIT(28)

Capture 1 happened.

MCPWM_LL_INTR_CAP2 = BIT(29)

Capture 2 happened.

enum mcpwm_counter_type_t

Select type of MCPWM counter.

Values:

MCPWM_FREEZE_COUNTER

Counter freeze

MCPWM_UP_COUNTER

For asymmetric MCPWM

MCPWM_DOWN_COUNTER

For asymmetric MCPWM

MCPWM_UP_DOWN_COUNTER

For symmetric MCPWM, frequency is half of MCPWM frequency set

MCPWM_COUNTER_MAX

Maximum counter mode

enum mcpwm_duty_type_t

Select type of MCPWM duty cycle mode.

Values:

MCPWM_DUTY_MODE_0 = 0

Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

MCPWM_DUTY_MODE_1

Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

MCPWM_HAL_GENERATOR_MODE_FORCE_LOW**MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH****MCPWM_DUTY_MODE_MAX**

Num of duty cycle modes

enum mcpwm_deadtime_type_t

MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

Values:

MCPWM_DEADTIME_BYPASS = 0

Bypass the deadtime

MCPWM_BYPASS_RED

MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_BYPASS_FED

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

MCPWM_ACTIVE_HIGH_MODE

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_LOW_MODE

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_LOW_COMPLIMENT_MODE

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXA

MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXB

MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

MCPWM_DEADTIME_TYPE_MAX

Maximum number of supported dead time modes

enum mcpwm_output_action_t

MCPWM select action to be taken on the output when event happens.

Values:

MCPWM_ACTION_NO_CHANGE = 0

No change in the output

MCPWM_ACTION_FORCE_LOW

Make output low

MCPWM_ACTION_FORCE_HIGH

Make output high

MCPWM_ACTION_TOGGLE

Make output toggle

enum mcpwm_capture_signal_t

MCPWM select capture signal input.

*Values:***MCPWM_SELECT_CAP0**

Select CAP0 as input

MCPWM_SELECT_CAP1

Select CAP1 as input

MCPWM_SELECT_CAP2

Select CAP2 as input

2.3.12 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- *Configuration* - describes counter's configuration parameters and how to setup the counter.
- *Operating the Counter* - provides information on control functions to pause, measure and clear the counter.
- *Filtering Pulses* - describes options to filtering pulses and the counter control signals.
- *Using Interrupts* - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit's channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter's operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

注解: For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a *filer*.

Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`. and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

Application Example

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`.
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`.

API Reference

Header File

- `components/driver/include/driver/pcnt.h`

Functions

esp_err_t **pcnt_unit_config** (*const pcnt_config_t* **pcnt_config*)

Configure Pulse Counter unit.

Note This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *pcnt_config*: Pointer of Pulse Counter unit configure parameter

esp_err_t **pcnt_get_counter_value** (*pcnt_unit_t* *pcnt_unit*, *int16_t* **count*)

Get pulse counter value.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *pcnt_unit*: Pulse Counter unit number
- *count*: Pointer to accept counter value

esp_err_t **pcnt_counter_pause** (*pcnt_unit_t* *pcnt_unit*)

Pause PCNT counter of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *pcnt_unit*: PCNT unit number

esp_err_t **pcnt_counter_resume** (*pcnt_unit_t* *pcnt_unit*)

Resume counting for PCNT counter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *pcnt_unit*: PCNT unit number, select from *pcnt_unit_t*

esp_err_t **pcnt_counter_clear** (*pcnt_unit_t* *pcnt_unit*)

Clear and reset PCNT counter value to zero.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *pcnt_unit*: PCNT unit number, select from *pcnt_unit_t*

esp_err_t **pcnt_intr_enable** (*pcnt_unit_t* *pcnt_unit*)

Enable PCNT interrupt for PCNT unit.

Note Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with *pcnt_event_enable()* and *pcnt_event_disable()*

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `pcnt_unit`: PCNT unit number

esp_err_t **pcnt_intr_disable** (*pcnt_unit_t* *pcnt_unit*)

Disable PCNT interrupt for PCNT unit.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `pcnt_unit`: PCNT unit number

esp_err_t **pcnt_event_enable** (*pcnt_unit_t* *unit*, *pcnt_evt_type_t* *evt_type*)

Enable PCNT event of PCNT unit.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

esp_err_t **pcnt_event_disable** (*pcnt_unit_t* *unit*, *pcnt_evt_type_t* *evt_type*)

Disable PCNT event of PCNT unit.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

esp_err_t **pcnt_set_event_value** (*pcnt_unit_t* *unit*, *pcnt_evt_type_t* *evt_type*, *int16_t* *value*)

Set PCNT event value of PCNT unit.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Counter value for PCNT event

esp_err_t **pcnt_get_event_value** (*pcnt_unit_t* *unit*, *pcnt_evt_type_t* *evt_type*, *int16_t* **value*)

Get PCNT event value of PCNT unit.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` `pcnt` driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Pointer to accept counter value for PCNT event

esp_err_t **pcnt_get_event_status** (*pcnt_unit_t* *unit*, *uint32_t* **status*)

Get PCNT event status of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *unit*: PCNT unit number
- *status*: Pointer to accept event status word

esp_err_t **pcnt_isr_unregister** (*pcnt_isr_handle_t* *handle*)

Unregister PCNT interrupt handler (registered by `pcnt_isr_register`), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by `pcnt_isr_service_install`, please call `pcnt_isr_service_uninstall` instead.

Return

- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- *handle*: handle to unregister the ISR service.

esp_err_t **pcnt_isr_register** (void (**fn*)) void *

, void **arg*, int *intr_alloc_flags*, *pcnt_isr_handle_t* **handle* Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

Return

- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- *fn*: Interrupt handler function.
- *arg*: Parameter for handler function
- *intr_alloc_flags*: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- *handle*: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `pcnt_isr_unregister` to unregister this ISR service if needed, but only if the handle is not NULL.

esp_err_t **pcnt_set_pin** (*pcnt_unit_t* *unit*, *pcnt_channel_t* *channel*, int *pulse_io*, int *ctrl_io*)

Configure PCNT pulse signal input pin and control input pin.

Note Set the signal input to PCNT_PIN_NOT_USED if unused.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *unit*: PCNT unit number
- *channel*: PCNT channel number
- *pulse_io*: Pulse signal input GPIO
- *ctrl_io*: Control signal input GPIO

esp_err_t **pcnt_filter_enable** (*pcnt_unit_t* *unit*)

Enable PCNT input filter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- *unit*: PCNT unit number

esp_err_t **pcnt_filter_disable** (*pcnt_unit_t* unit)

Disable PCNT input filter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number

esp_err_t **pcnt_set_filter_value** (*pcnt_unit_t* unit, uint16_t filter_val)

Set PCNT filter value.

Note filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

esp_err_t **pcnt_get_filter_value** (*pcnt_unit_t* unit, uint16_t *filter_val)

Get PCNT filter value.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- filter_val: Pointer to accept PCNT filter value.

esp_err_t **pcnt_set_mode** (*pcnt_unit_t* unit, *pcnt_channel_t* channel, *pcnt_count_mode_t* pos_mode, *pcnt_count_mode_t* neg_mode, *pcnt_ctrl_mode_t* hctrl_mode, *pcnt_ctrl_mode_t* lctrl_mode)

Set PCNT counter mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- channel: PCNT channel number
- pos_mode: Counter mode when detecting positive edge
- neg_mode: Counter mode when detecting negative edge
- hctrl_mode: Counter mode when control signal is high level
- lctrl_mode: Counter mode when control signal is low level

esp_err_t **pcnt_isr_handler_add** (*pcnt_unit_t* unit, void (*isr_handler)) void *, void *args

Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver's ISR handler service.

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `unit`: PCNT unit number
- `isr_handler`: Interrupt handler function.
- `args`: Parameter for handler function

esp_err_t **pcnt_isr_service_install** (int *intr_alloc_flags*)

Install PCNT ISR service.

Note We can manage different interrupt service for each unit. This function will use the default ISR handle service, Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

Parameters

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

void **pcnt_isr_service_uninstall** (void)

Uninstall PCNT ISR service, freeing related resources.

esp_err_t **pcnt_isr_handler_remove** (*pcnt_unit_t* *unit*)

Delete ISR handler for specified unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `unit`: PCNT unit number

Structures

struct **pcnt_config_t**

Pulse Counter configuration for a single channel.

Public Members

int **pulse_gpio_num**

Pulse input GPIO number, if you want to use GPIO16, enter `pulse_gpio_num = 16`, a negative value will be ignored

int **ctrl_gpio_num**

Control signal input GPIO number, a negative value will be ignored

pcnt_ctrl_mode_t **lctrl_mode**

PCNT low control mode

pcnt_ctrl_mode_t **hctrl_mode**

PCNT high control mode

pcnt_count_mode_t **pos_mode**

PCNT positive edge count mode

pcnt_count_mode_t **neg_mode**

PCNT negative edge count mode

`int16_t counter_h_lim`
Maximum counter value

`int16_t counter_l_lim`
Minimum counter value

`pcnt_unit_t unit`
PCNT unit number

`pcnt_channel_t channel`
the PCNT channel

Macros

PCNT_PIN_NOT_USED

When selected for a pin, this pin will not be used

PCNT_MODE_KEEP

Control mode: won't change counter mode

PCNT_MODE_REVERSE

Control mode: invert counter mode(increase -> decrease, decrease -> increase)

PCNT_MODE_DISABLE

Control mode: Inhibit counter(counter value will not change in this condition)

PCNT_MODE_MAX

PCNT_COUNT_DIS

Counter mode: Inhibit counter(counter value will not change in this condition)

PCNT_COUNT_INC

Counter mode: Increase counter value

PCNT_COUNT_DEC

Counter mode: Decrease counter value

PCNT_COUNT_MAX

Type Definitions

`typedef intr_handle_t pcnt_isr_handle_t`

`typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t`

Selection of available modes that determine the counter's action depending on the state of the control signal's input GPIO.

Note Configuration covers two actions, one for high, and one for low level on the control input

`typedef pcnt_channel_edge_action_t pcnt_count_mode_t`

Selection of available modes that determine the counter's action on the edge of the pulse signal's input GPIO.

Note Configuration covers two actions, one for positive, and one for negative edge on the pulse input

Enumerations

`enum pcnt_port_t`

PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

Values:

PCNT_PORT_0
PCNT port 0

PCNT_PORT_MAX
PCNT port max

`enum pcnt_unit_t`

Selection of all available PCNT units.

Values:

PCNT_UNIT_0
PCNT unit 0

PCNT_UNIT_1
PCNT unit 1

PCNT_UNIT_2
PCNT unit 2

PCNT_UNIT_3
PCNT unit 3

PCNT_UNIT_MAX

enum pcnt_channel_t
Selection of channels available for a single PCNT unit.

Values:

PCNT_CHANNEL_0
PCNT channel 0

PCNT_CHANNEL_1
PCNT channel 1

PCNT_CHANNEL_MAX

enum pcnt_evt_type_t
Selection of counter's events that may trigger an interrupt.

Values:

PCNT_EVT_THRES_1 = 1 << 2
PCNT watch point event: threshold1 value event

PCNT_EVT_THRES_0 = 1 << 3
PCNT watch point event: threshold0 value event

PCNT_EVT_L_LIM = 1 << 4
PCNT watch point event: Minimum counter value

PCNT_EVT_H_LIM = 1 << 5
PCNT watch point event: Maximum counter value

PCNT_EVT_ZERO = 1 << 6
PCNT watch point event: counter value zero event

PCNT_EVT_MAX

Header File

- [components/hal/include/hal/pcnt_types.h](#)

Enumerations

enum pcnt_channel_level_action_t
PCNT channel action on control level.

Values:

PCNT_CHANNEL_LEVEL_ACTION_KEEP
Keep current count mode

PCNT_CHANNEL_LEVEL_ACTION_INVERSE
Invert current count mode (increase -> decrease, decrease -> increase)

PCNT_CHANNEL_LEVEL_ACTION_HOLD
Hold current count value

enum pcnt_channel_edge_action_t

PCNT channel action on signal edge.

*Values:***PCNT_CHANNEL_EDGE_ACTION_HOLD**

Hold current count value

PCNT_CHANNEL_EDGE_ACTION_INCREASE

Increase count value

PCNT_CHANNEL_EDGE_ACTION_DECREASE

Decrease count value

enum pcnt_unit_count_sign_t

PCNT unit counter value's sign.

*Values:***PCNT_UNIT_COUNT_SIGN_ZERO_POS**

positive value to zero

PCNT_UNIT_COUNT_SIGN_ZERO_NEG

negative value to zero

PCNT_UNIT_COUNT_SIGN_NEG

counter value negative

PCNT_UNIT_COUNT_SIGN_POS

counter value positive

2.3.13 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT's transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

图 11: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. *Configure Driver*
2. *Transmit Data or Receive Data*
3. *Change Operation Parameters*
4. *Use Interrupts*

图 12: RMT Receiver Overview

The RMT has eight channels numbered from zero to seven. The first half (i.e. Channel 0 ~ 3) channels can only be configured for transmitting, and the other half (i.e. Channel 4 ~ 7) channels can only be configured for receiving. They are referred to using indexes defined in structure `rmt_channel_t`.

Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio_num**.
- How many **memory blocks** will be used by the channel, set with **mem_block_num**.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
 - When **RMT_CHANNEL_FLAGS_AWARE_DFS** is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See [power_management](#) for more information.
 - When **RMT_CHANNEL_FLAGS_INVERT_SIG** is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when **RMT_CHANNEL_FLAGS_AWARE_DFS** is set in **flags**, RMT source clock is changed to REF_TICK or XTAL.

注解: The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in [Transmit Mode](#) or [Receive Mode](#):

Transmit Mode When configuring channel in transmit mode, set **tx_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop_en**

- Enable the RMT carrier signal - **carrier_en**
- Frequency of the carrier in Hz - **carrier_freq_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier_duty_percent**
- Level of the RMT output, when the carrier is applied - **carrier_level**
- Enable the RMT output if idle - **idle_output_en**
- Set the signal level on the RMT output if idle - **idle_level**
- Specify maximum number of transmissions in a loop - **loop_count**

Receive Mode In receive mode, set **rx_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter_en**
- A threshold of the filter, set in the number of ticks - **filter_ticks_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle_threshold**. The receiver will ignore pulses longer than this setting.
- Enable the RMT carrier demodulation - **carrier_rm**
- Frequency of the carrier in Hz - **carrier_freq_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier_duty_percent**
- Level of the RMT input, where the carrier is modulated to - **carrier_level**

Finalize Configuration Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0 , then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in [Use Interrupts](#).

Now, depending on how the channel is configured, we are ready to either [Transmit Data](#) or [Receive Data](#). This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

For a simple example how to define a block of items see [peripherals/rmt/morse_code](#).

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 384 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The

图 13: Structure of RMT items (L - signal level)

size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what's inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`
- Enable or disable loop count feature to automatically transmit items for N iterations, then trigger an ISR callback - `rmt_set_tx_loop_count()`

- Enable automatically stopping when the number of iterations matches the set loop count. Note this is not reliable for target that doesn't support `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP`. - `rmt_enable_tx_loop_autostop()`

Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

注解: When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32s3/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the event_name is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

警告: It's not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification when transaction is done, go ahead with `rmt_register_tx_end_callback()`.

Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

- Using RMT to send morse code: [peripherals/rmt/morse_code](#).
- Using RMT to drive RGB LED strip: [peripherals/rmt/led_strip](#).
- NEC remote control TX and RX example: [peripherals/rmt/ir_protocols](#).
- Musical buzzer example: [peripherals/rmt/musical_buzzer](#).

API Reference

Header File

- `components/driver/include/driver/rmt.h`

Functions

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`

Set RMT clock divider, channel clock is divided from source clock.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `div_cnt`: RMT counter clock divider

`esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t *div_cnt)`

Get RMT clock divider, channel clock is divided from source clock.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `div_cnt`: pointer to accept RMT counter divider

`esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)`

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thresh` channel clock cycles, the receive process is finished.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `thresh`: RMT RX idle threshold

`esp_err_t rmt_get_rx_idle_thresh(rmt_channel_t channel, uint16_t *thresh)`

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thresh` channel clock cycles, the receive process is finished.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `thresh`: pointer to accept RMT RX idle threshold value

`esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)`

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel `n`. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel `n` is `start_addr_CHn` to `end_addr_CHn`, which are defined by: Memory block start address is `RMT_CHANNEL_MEM(n)` (in `soc/rmt_reg.h`), that is, `start_addr_chn = RMT base address + 0x800 + 64 * 4 * n`, and `end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4`

Note If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

esp_err_t **rmt_get_mem_block_num** (*rmt_channel_t* channel, uint8_t *rmt_mem_num)

Get RMT memory block number.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rmt_mem_num: Pointer to accept RMT RX memory block number

esp_err_t **rmt_set_tx_carrier** (*rmt_channel_t* channel, bool carrier_en, uint16_t high_level, uint16_t low_level, *rmt_carrier_level_t* carrier_level)

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- carrier_en: Whether to enable output carrier.
- high_level: High level duration of carrier
- low_level: Low level duration of carrier.
- carrier_level: Configure the way carrier wave is modulated for channel.
 - 1' b1:transmit on low output level
 - 1' b0:transmit on high output level

esp_err_t **rmt_set_mem_pd** (*rmt_channel_t* channel, bool pd_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- pd_en: RMT memory low power enable.

esp_err_t **rmt_get_mem_pd** (*rmt_channel_t* channel, bool *pd_en)

Get RMT memory low power mode.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- pd_en: Pointer to accept RMT memory low power mode.

esp_err_t **rmt_tx_start** (*rmt_channel_t* channel, bool tx_idx_rst)

Set RMT start sending data from memory.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `tx_idx_rst`: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

esp_err_t **rmt_tx_stop** (*rmt_channel_t* channel)

Set RMT stop sending.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel

esp_err_t **rmt_rx_start** (*rmt_channel_t* channel, bool rx_idx_rst)

Set RMT start receiving data.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `rx_idx_rst`: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

esp_err_t **rmt_rx_stop** (*rmt_channel_t* channel)

Set RMT stop receiving data.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel

esp_err_t **rmt_tx_memory_reset** (*rmt_channel_t* channel)

Reset RMT TX memory.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel

esp_err_t **rmt_rx_memory_reset** (*rmt_channel_t* channel)

Reset RMT RX memory.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel

esp_err_t **rmt_set_memory_owner** (*rmt_channel_t* channel, *rmt_mem_owner_t* owner)

Set RMT memory owner.

Note Setting memroy is only valid for RX channel.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel

- `owner`: To set when the transmitter or receiver can process the memory of channel.

`esp_err_t rmt_get_memory_owner(rmt_channel_t channel, rmt_mem_owner_t *owner)`

Get RMT memory owner.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `owner`: Pointer to get memory owner.

`esp_err_t rmt_set_tx_loop_mode(rmt_channel_t channel, bool loop_en)`

Set RMT tx loop mode.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `loop_en`: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

`esp_err_t rmt_get_tx_loop_mode(rmt_channel_t channel, bool *loop_en)`

Get RMT tx loop mode.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `loop_en`: Pointer to accept RMT transmitter loop sending mode.

`esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)`

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `rx_filter_en`: To enable RMT receiver filter.
- `thresh`: Threshold of pulse width for receiver.

`esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)`

Set RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `base_clk`: To choose source clock for RMT module.

`esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)`

Get RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `src_clk`: Pointer to accept source clock for RMT module.

esp_err_t **rmt_set_idle_level** (*rmt_channel_t* channel, bool *idle_out_en*, *rmt_idle_level_t* level)

Set RMT idle output level for transmitter.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `idle_out_en`: To enable idle level output.
- `level`: To set the output signal's level for channel in idle state.

esp_err_t **rmt_get_idle_level** (*rmt_channel_t* channel, bool **idle_out_en*, *rmt_idle_level_t* **level*)

Get RMT idle output level for transmitter.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `idle_out_en`: Pointer to accept value of enable idle.
- `level`: Pointer to accept value of output signal's level in idle state for specified channel.

esp_err_t **rmt_get_status** (*rmt_channel_t* channel, uint32_t **status*)

Get RMT status.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `status`: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in `rmt_reg.h` for more details of each field.

esp_err_t **rmt_set_rx_intr_en** (*rmt_channel_t* channel, bool *en*)

Set RMT RX interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `en`: enable or disable RX interrupt.

esp_err_t **rmt_set_err_intr_en** (*rmt_channel_t* channel, bool *en*)

Set RMT RX error interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `en`: enable or disable RX err interrupt.

esp_err_t **rmt_set_tx_intr_en**(*rmt_channel_t* channel, bool en)

Set RMT TX interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable TX interrupt.

esp_err_t **rmt_set_tx_thr_intr_en**(*rmt_channel_t* channel, bool en, uint16_t evt_thresh)

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable TX event interrupt.
- evt_thresh: RMT event interrupt threshold value

esp_err_t **rmt_set_gpio**(*rmt_channel_t* channel, *rmt_mode_t* mode, *gpio_num_t* gpio_num, bool invert_signal)

Configure the GPIO used by RMT channel.

Return

- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

Parameters

- channel: RMT channel
- mode: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- gpio_num: GPIO number, which is connected with certain RMT signal
- invert_signal: Invert RMT signal physically by GPIO matrix

esp_err_t **rmt_config**(const *rmt_config_t* *rmt_param)

Configure RMT parameters.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- rmt_param: RMT parameter struct

esp_err_t **rmt_isr_register**(void (*fn)) void *

, void *arg, int intr_alloc_flags, *rmt_isr_handle_t* *handle Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

Note If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

Parameters

- fn: Interrupt handler function.
- arg: Parameter for the handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

esp_err_t **rmt_isr_deregister** (*rmt_isr_handle_t* handle)

Deregister previously registered RMT interrupt handler.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

Parameters

- handle: Handle obtained from rmt_isr_register

esp_err_t **rmt_fill_tx_items** (*rmt_channel_t* channel, **const** *rmt_item32_t* *item, *uint16_t* item_num, *uint16_t* mem_offset)

Fill memory data of channel with given RMT items.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- item: Pointer of items.
- item_num: RMT sending items number.
- mem_offset: Index offset of memory.

esp_err_t **rmt_driver_install** (*rmt_channel_t* channel, *size_t* rx_buf_size, *int* intr_alloc_flags)

Initialize RMT driver.

Return

- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

esp_err_t **rmt_driver_uninstall** (*rmt_channel_t* channel)

Uninstall RMT driver.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel

esp_err_t **rmt_get_channel_status** (*rmt_channel_status_result_t* *channel_status)

Get the current status of eight channels.

Note Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

Parameters

- [out] channel_status: store the current status of each channel

esp_err_t **rmt_get_counter_clock** (*rmt_channel_t* channel, *uint32_t* *clock_hz)

Get speed of channel's internal counter clock.

Return

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

Parameters

- channel: RMT channel
- [out] clock_hz: counter clock speed, in hz

esp_err_t **rmt_write_items** (*rmt_channel_t* channel, const *rmt_item32_t* *rmt_item, int item_num, bool wait_tx_done)

RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

Note This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rmt_item: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
- item_num: RMT data item number.
- wait_tx_done:
 - If set 1, it will block the task and wait for sending done.
 - If set 0, it will not wait and return immediately.

esp_err_t **rmt_wait_tx_done** (*rmt_channel_t* channel, TickType_t wait_time)

Wait RMT TX finished.

Return

- ESP_OK RMT Tx done successfully
- ESP_ERR_TIMEOUT Exceeded the 'wait_time' given
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters

- channel: RMT channel
- wait_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

esp_err_t **rmt_get_ringbuf_handle** (*rmt_channel_t* channel, RingbufHandle_t *buf_handle)

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

esp_err_t **rmt_translator_init** (*rmt_channel_t* channel, sample_to_rmt_t fn)

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Return

- ESP_FAIL Init fail.
- ESP_OK Init success.

Parameters

- channel: RMT channel .
- fn: Point to the data conversion function.

esp_err_t **rmt_translator_set_context** (*rmt_channel_t* channel, void *context)

Set user context for the translator of specific channel.

Return

- ESP_FAIL Set context fail
- ESP_OK Set context success

Parameters

- `channel`: RMT channel number
- `context`: User context

esp_err_t **rmt_translator_get_context** (`const` `size_t` *`item_num`, `void` **`context`)

Get the user context set by 'rmt_translator_set_context'.

Note This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter 'item_num' you got in that callback function.

Return

- ESP_FAIL Get context fail
- ESP_OK Get context success

Parameters

- `item_num`: Address of the memory which contains the number of translated items (It's from driver's internal memory)
- `context`: Returned User context

esp_err_t **rmt_write_sample** (`rmt_channel_t` `channel`, `const` `uint8_t` *`src`, `size_t` `src_size`, `bool` `wait_tx_done`)

Translate `uint8_t` type of data into rmt format and send it out. Requires `rmt_translator_init` to init the translator first.

Return

- ESP_FAIL Send fail
- ESP_OK Send success

Parameters

- `channel`: RMT channel.
- `src`: Pointer to the raw data.
- `src_size`: The size of the raw data.
- `wait_tx_done`: Set true to wait all data send done.

rmt_tx_end_callback_t **rmt_register_tx_end_callback** (`rmt_tx_end_fn_t` `function`, `void` *`arg`)

Registers a callback that will be called when transmission ends.

Called by `rmt_driver_isr_default` in interrupt context.

Note Requires `rmt_driver_install` to install the default ISR handler.

Return the previous callback settings (members will be set to NULL if there was none)

Parameters

- `function`: Function to be called from the default interrupt handler or NULL.
- `arg`: Argument which will be provided to the callback when it is called.

esp_err_t **rmt_set_rx_thr_intr_en** (`rmt_channel_t` `channel`, `bool` `en`, `uint16_t` `evt_thresh`)

Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `en`: enable or disable RX event interrupt.
- `evt_thresh`: RMT event interrupt threshold value

esp_err_t **rmt_add_channel_to_group** (`rmt_channel_t` `channel`)

Add channel into a synchronous group (channels in the same group can start transaction simultaneously)

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel

`esp_err_t rmt_remove_channel_from_group(rmt_channel_t channel)`

Remove channel out of a group.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel

`esp_err_t rmt_set_tx_loop_count(rmt_channel_t channel, uint32_t count)`

Set loop count threshold value for RMT TX channel.

When tx loop count reaches this value, an ISR callback will notify user

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `count`: loop count, 1 ~ 1023

`esp_err_t rmt_enable_tx_loop_autostop(rmt_channel_t channel, bool en)`

Enable or disable the feature that when loop count reaches the threshold, RMT will stop transmitting.

- When the loop auto-stop feature is enabled will halt RMT transmission after the loop count reaches a certain threshold
- When disabled, the RMT transmission continue indefinitely until halted by the users

Note The auto-stop feature is implemented in hardware on particular targets (i.e. those with `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP` defined). Otherwise, the auto-stop feature is implemented in software via the interrupt.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel
- `en`: enable bit

`esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)`

Reset RMT TX/RX memory index.

Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Parameters

- `channel`: RMT channel

`void rmt_set_intr_enable_mask(uint32_t mask)`

Set mask value to RMT interrupt enable register.

Parameters

- `mask`: Bit mask to set to the register

`void rmt_clr_intr_enable_mask(uint32_t mask)`

Clear mask value to RMT interrupt enable register.

Parameters

- `mask`: Bit mask to clear the register

`esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)`

Set RMT pin.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `mode`: TX or RX mode for RMT
- `gpio_num`: GPIO number to transmit or receive the signal.

Structures

struct rmt_tx_config_t

Data struct of RMT TX configure parameters.

Public Members

uint32_t **carrier_freq_hz**

RMT carrier frequency

rmt_carrier_level_t **carrier_level**

Level of the RMT output, when the carrier is applied

rmt_idle_level_t **idle_level**

RMT idle level

uint8_t **carrier_duty_percent**

RMT carrier duty (%)

uint32_t **loop_count**

Maximum loop count

bool **carrier_en**

RMT carrier enable

bool **loop_en**

Enable sending RMT items in a loop

bool **idle_output_en**

RMT idle level output enable

struct rmt_rx_config_t

Data struct of RMT RX configure parameters.

Public Members

uint16_t **idle_threshold**

RMT RX idle threshold

uint8_t **filter_ticks_thresh**

RMT filter tick number

bool **filter_en**

RMT receiver filter enable

bool **rm_carrier**

RMT receiver remove carrier enable

uint32_t **carrier_freq_hz**

RMT carrier frequency

uint8_t **carrier_duty_percent**

RMT carrier duty (%)

rmt_carrier_level_t **carrier_level**

The level to remove the carrier

struct rmt_config_t

Data struct of RMT configure parameters.

Public Members*rmt_mode_t* **rmt_mode**

RMT mode: transmitter or receiver

rmt_channel_t **channel**

RMT channel

gpio_num_t **gpio_num**

RMT GPIO number

uint8_t **clk_div**

RMT channel counter divider

uint8_t **mem_block_num**

RMT memory block number

uint32_t **flags**

RMT channel extra configurations, OR' d with RMT_CHANNEL_FLAGS_[*]

rmt_tx_config_t **tx_config**

RMT TX parameter

rmt_rx_config_t **rx_config**

RMT RX parameter

struct rmt_tx_end_callback_t

Structure encapsulating a RMT TX end callback.

Public Members*rmt_tx_end_fn_t* **function**

Function which is called on RMT TX end

void ***arg**

Optional argument passed to function

Macros**RMT_CHANNEL_FLAGS_AWARE_DFS**

Channel can work during APB clock scaling

RMT_CHANNEL_FLAGS_INVERT_SIG

Invert RMT signal

RMT_MEM_ITEM_NUM

Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)

Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)

Default configuration for RX channel.

Type Definitions

typedef *intr_handle_t* **rmt_isr_handle_t**

RMT interrupt handle.

typedef void (***rmt_tx_end_fn_t**) (*rmt_channel_t* channel, void *arg)

Type of RMT Tx End callback function.

```
typedef void (*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t  
                                wanted_num, size_t *translated_size, size_t *item_num)
```

User callback function to convert uint8_t type data to rmt format(rmt_item32_t).

This function may be called from an ISR, so, the code should be short and efficient.

Note In fact, item_num should be a multiple of translated_size, e.g. : When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be $item_num = translated_size * 8$.

Parameters

- **src**: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- [out] **dest**: Pointer to the buffer storing the rmt format data.
- **src_size**: The raw data size.
- **wanted_num**: The number of rmt format data that wanted to get.
- [out] **translated_size**: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- [out] **item_num**: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. it should return 0 if no data was converted.

Header File

- [components/hal/include/hal/rmt_types.h](#)

Structures

```
struct rmt_channel_status_result_t
```

Data struct of RMT channel status.

Public Members

```
rmt_channel_status_t status[RMT_CHANNEL_MAX]
```

Store the current status of each channel

Enumerations

```
enum rmt_channel_t
```

RMT channel ID.

Values:

```
RMT_CHANNEL_0  
RMT channel number 0
```

```
RMT_CHANNEL_1  
RMT channel number 1
```

```
RMT_CHANNEL_2  
RMT channel number 2

```

RMT_CHANNEL_MAX

Number of RMT channels

enum rmt_mem_owner_t

RMT Internal Memory Owner.

*Values:***RMT_MEM_OWNER_TX**

RMT RX mode, RMT transmitter owns the memory block

RMT_MEM_OWNER_RX

RMT RX mode, RMT receiver owns the memory block

RMT_MEM_OWNER_MAX**enum rmt_source_clk_t**

Clock Source of RMT Channel.

*Values:***RMT_BASECLK_APB = 1**

RMT source clock is APB CLK, 80Mhz by default

RMT_BASECLK_XTAL = 3

RMT source clock is XTAL clock, 40Mhz by default

RMT_BASECLK_MAX**enum rmt_data_mode_t**

RMT Data Mode.

Note We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

*Values:***RMT_DATA_MODE_FIFO****RMT_DATA_MODE_MEM****RMT_DATA_MODE_MAX****enum rmt_mode_t**

RMT Channel Working Mode (TX or RX)

*Values:***RMT_MODE_TX**

RMT TX mode

RMT_MODE_RX

RMT RX mode

RMT_MODE_MAX**enum rmt_idle_level_t**

RMT Idle Level.

*Values:***RMT_IDLE_LEVEL_LOW**

RMT TX idle level: low Level

RMT_IDLE_LEVEL_HIGH

RMT TX idle level: high Level

RMT_IDLE_LEVEL_MAX**enum rmt_carrier_level_t**

RMT Carrier Level.

Values:

RMT_CARRIER_LEVEL_LOW

RMT carrier wave is modulated for low Level output

RMT_CARRIER_LEVEL_HIGH

RMT carrier wave is modulated for high Level output

RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t

RMT Channel Status.

Values:

RMT_CHANNEL_UNINIT

RMT channel uninitialized

RMT_CHANNEL_IDLE

RMT channel status idle

RMT_CHANNEL_BUSY

RMT channel status busy

2.3.14 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-S3 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs) ESP32-S3 SDMMC host controller allows using any of GPIOs for any of SD interface signals. However, it is recommended to avoid using strapping GPIOs, GPIOs with internal weak pull-downs and GPIOs commonly used for other purposes to prevent conflicts:

- GPIO0 (strapping pin)
- GPIO45, GPIO46 (strapping pins, internal weak pulldown)
- GPIO26 - GPIO32 (commonly used for SPI Flash and PSRAM)
- GPIO33 - GPIO37 (when using chips and modules with Octal SPI Flash or Octal PSRAM)
- GPIO43, GPIO44 (GPIOs used for UART0 by default)
- GPIO19, GPIO20 (GPIOs used for USB by default)

Systems in Packages (SIP)

Modules

Development Boards

- ESP32-S3-DevKitC-1
 - *No Pull-ups*
- ESP32-S3-USB-OTG
 - The board may be used in 1-line and 4-line SD mode or SPI mode.
 - Required pull-ups are provided on GPIOs 33-38.
- ESP32-S3-EYE
 - The board is limited to 1-line SD mode.
 - Required pull-ups are provided on GPIOs 38-40.

Solutions

No Pull-ups If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Related Information

2.3.15 SDMMC Host Driver

Overview

ESP32-S3's SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

Both slots (`SDMMC_HOST_SLOT_0`, `SDMMC_HOST_SLOT_1`) support 1-, 4- and 8-line SD interface. The slots are connected to ESP32-S3 GPIOs using GPIO matrix. This means that any GPIO may be used for each of the SD card signals.

Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`

- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

Configuring GPIOs

ESP32-S3 SDMMC Host can be configured to use arbitrary GPIOs for each of the signals. Configuration is performed by setting members of `sdmmc_slot_config_t` structure. For example, to use GPIOs 1-6 for CLK, CMD, D0 - D3 signals, respectively:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.clk = GPIO_NUM_1;
slot.cmd = GPIO_NUM_2;
slot.d0 = GPIO_NUM_3;
slot.d1 = GPIO_NUM_4;
slot.d2 = GPIO_NUM_5;
slot.d3 = GPIO_NUM_6;
```

It is also possible to configure Card Detect and Write Protect pins. Similar to other signals, set `cd` and `wp` members of the same structure:

```
slot.cd = GPIO_NUM_7;
slot.wp = GPIO_NUM_8;
```

`SDMMC_SLOT_CONFIG_DEFAULT` sets both to `GPIO_NUM_NC`, meaning that by default the signals are not used.

Once `sdmmc_slot_config_t` structure is initialized this way, you can use it when calling `sdmmc_host_init_slot()` or one of the higher level functions, such as `esp_vfs_fat_sdmmc_mount()`.

DDR Mode for eMMC chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping `SDMMC_FREQ_HIGHSPEED` frequency, clear `SDMMC_HOST_FLAG_DDR` bit in `flags` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

See *SD/SDIO/MMC Driver* for the higher level driver which implements the protocol layer.

See *SD SPI Host Driver* for a similar driver which uses the SPI controller and is limited to SD protocol's SPI mode.

See *SD Pull-up Requirements* for pullup support and compatibilities of modules and development kits.

API Reference**Header File**

- `components/driver/include/driver/sdmmc_host.h`

Functions

esp_err_t **sdmmc_host_init** (void)

Initialize SDMMC host peripheral.

Note This function is not thread safe

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
- ESP_ERR_NO_MEM if memory can not be allocated

esp_err_t **sdmmc_host_init_slot** (int *slot*, const *sdmmc_slot_config_t* **slot_config*)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

Note This function is not thread safe

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using `sdmmc_host_init`

Parameters

- *slot*: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- *slot_config*: additional configuration for the slot

esp_err_t **sdmmc_host_set_bus_width** (int *slot*, size_t *width*)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

Note This function is not thread safe

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

Parameters

- *slot*: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- *width*: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

size_t **sdmmc_host_get_slot_width** (int *slot*)

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

Return configured bus width of the specified slot.

Parameters

- *slot*: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

esp_err_t **sdmmc_host_set_card_clk** (int slot, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note This function is not thread safe

Return

- ESP_OK on success
- other error codes may be returned in the future

Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- freq_khz: card clock frequency, in kHz

esp_err_t **sdmmc_host_set_bus_ddr_mode** (int slot, bool ddr_enabled)

Enable or disable DDR mode of SD interface.

Return

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- ddr_enabled: enable or disable DDR mode

esp_err_t **sdmmc_host_do_transaction** (int slot, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

Attention Data buffer passed in cmdinfo->data must be in DMA capable memory

Return

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- cmdinfo: pointer to structure describing command and data to transfer

esp_err_t **sdmmc_host_io_int_enable** (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

Return returns ESP_OK, other errors possible in the future

Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

esp_err_t **sdmmc_host_io_int_wait** (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

Return

- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks: number of RTOS ticks to wait for the interrupt

esp_err_t **sdmmc_host_deinit** (void)

Disable SDMMC host and release allocated resources.

Note This function is not thread safe

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

esp_err_t **sdmmc_host_pullup_en** (int slot, int width)

Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in *sdmmc_slot_config_t::flags* instead.

Note You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

Return

- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

Parameters

- slot: Slot to use, normally set it to 1.
- width: Bit width of your configuration, 1 or 4.

SDMMC_HOST_DEFAULT ()

Default *sdmmc_host_t* structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

SDMMC_SLOT_FLAG_INTERNAL_PULLUP

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

SDMMC_SLOT_NO_CD

indicates that card detect line is not used

SDMMC_SLOT_NO_WP

indicates that write protect line is not used

SDMMC_SLOT_WIDTH_DEFAULT

use the maximum possible width for the slot

SDMMC_SLOT_CONFIG_DEFAULT ()

Macro defining default configuration of SDMMC host slot

2.3.16 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi_dev_handle_t* *spi_handle* returned when attaching the device to an SPI bus by calling *sdspi_host_init_device*. The bus should be already initialized before (by *spi_bus_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro *SDSPI_DEVICE_CONFIG_DEFAULT* to initialize a structure *sdmmc_slot_config_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi_host_init_device* to initialize the SD SPI device and attach to its bus.

Then use *SDSPI_HOST_DEFAULT* macro to initialize a *sdmmc_host_t* structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI

device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [the SD/SDIO/MMC Driver](#).

注解: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

API Reference

Header File

- `components/driver/include/driver/sdspi_host.h`

Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

Note This function is not thread safe

Return

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` *`dev_config`, `sdspi_dev_handle_t` *`out_handle`)

Attach and initialize an SD SPI device on the specific SPI bus.

Note This function is not thread safe

Note Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

Note The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `sdspi_host_init_device` has invalid arguments
- `ESP_ERR_NO_MEM` if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

Parameters

- `dev_config`: pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

`esp_err_t sdspi_host_remove_device` (`sdspi_dev_handle_t` `handle`)

Remove an SD SPI device.

Return Always `ESP_OK`

Parameters

- `handle`: Handle of the SD SPI device

esp_err_t **sdspi_host_do_transaction** (*sdspi_dev_handle_t* handle, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

Return

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

Parameters

- handle: Handle of the sdspi device
- cmdinfo: pointer to structure describing command and data to transfer

esp_err_t **sdspi_host_set_card_clk** (*sdspi_dev_handle_t* host, *uint32_t* freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note This function is not thread safe

Return

- ESP_OK on success
- other error codes may be returned in the future

Parameters

- host: Handle of the sdspi device
- freq_khz: card clock frequency, in kHz

esp_err_t **sdspi_host_deinit** (void)

Release resources allocated using `sdspi_host_init`.

Note This function is not thread safe

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdspi_host_init` function has not been called

esp_err_t **sdspi_host_io_int_enable** (*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

Return

- ESP_OK on success

Parameters

- handle: Handle of the sdspi device

esp_err_t **sdspi_host_io_int_wait** (*sdspi_dev_handle_t* handle, *TickType_t* timeout_ticks)

Wait for SDIO interrupt until timeout.

Return

- ESP_OK on success

Parameters

- handle: Handle of the sdspi device
- timeout_ticks: Ticks to wait before timeout.

esp_err_t **sdspi_host_init_slot** (int slot, const *sdspi_slot_config_t* *slot_config)

Initialize SD SPI driver for the specific SPI controller.

Note This function is not thread safe

Note The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

Parameters

- slot: SPI controller to use (SPI2_HOST or SPI3_HOST)
- slot_config: pointer to slot configuration structure

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_init_slot` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

SDSPI_DEVICE_CONFIG_DEFAULT()

Macro defining default configuration of SD SPI device.

SDSPI_SLOT_CONFIG_DEFAULT()

Macro defining default configuration of SPI host

Type Definitions

```
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

2.3.17 Sigma-delta Modulation

Introduction

ESP32-S3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the 'duty' input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of `sigmadelta_set_duty()`.

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

图 14: Sallen-Key Low Pass Filter

API Reference

Header File

- components/driver/include/driver/sigmadelata.h

Functions

`esp_err_t sigmadelta_config(const sigmadelta_config_t *config)`

Configure Sigma-delta channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- config: Pointer of Sigma-delta channel configuration struct

`esp_err_t sigmadelta_set_duty(sigmadelata_channel_t channel, int8_t duty)`

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be $V_{dc} = V_{DDIO} / 256 * duty + V_{DDIO}/2$, where VDDIO is the power supply voltage.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- channel: Sigma-delta channel number
- duty: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

`esp_err_t sigmadelta_set_prescale(sigmadelata_channel_t channel, uint8_t prescale)`

Set Sigma-delta channel's clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency

of the sigma-delta channel is `APP_CLK / pre_scale`.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` sigmadelta driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `channel`: Sigma-delta channel number
- `prescale`: The divider of source clock, ranges from 0 to 255

`esp_err_t sigmadelta_set_pin (sigmadelta_channel_t channel, gpio_num_t gpio_num)`

Set Sigma-delta signal output pin.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` sigmadelta driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `channel`: Sigma-delta channel number
- `gpio_num`: GPIO number of output pin.

Header File

- `components/hal/include/hal/sigmadelta_types.h`

Structures

`struct sigmadelta_config_t`

Sigma-delta configure struct.

Public Members

`sigmadelta_channel_t channel`

Sigma-delta channel number

`int8_t sigmadelta_duty`

Sigma-delta duty, duty ranges from -128 to 127.

`uint8_t sigmadelta_prescale`

Sigma-delta prescale, prescale ranges from 0 to 255.

`uint8_t sigmadelta_gpio`

Sigma-delta output io number, refer to `gpio.h` for more details.

Enumerations

`enum sigmadelta_port_t`

SIGMADELTA port number, the max port number is `(SIGMADELTA_NUM_MAX - 1)`.

Values:

`enum sigmadelta_channel_t`

Sigma-delta channel list.

Values:

2.3.18 SPI Master Driver

SPI Master driver is a program that controls ESP32-S3's SPI peripherals while they function as masters.

Overview of ESP32-S3' s SPI peripherals

ESP32-S3 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-S3' s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 and SPI3 are general purpose SPI controllers. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. SPI2 has 6 CS lines. SPI3 has 3 CS lines. Each CS line can be used to drive one SPI slave.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
De-vice	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device' s individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
As- ser- tion	The action of activating a line.
De- asser- tion	The action of returning the line back to inactive (back to idle) status.
Trans- ac- tion	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments

- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

警告: The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-S3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

SPI Features

SPI Master

SPI Bus Lock To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it' s meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Com-mand	In this phase, a command (0-16 bit) is written to the bus by the Host.
Ad-dress	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Dummy	This phase is configurable and is used to meet the timing requirements.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

Interrupt Transactions Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

Transaction Line Mode Supported line modes for ESP32-S3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOMMON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOMMON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO SPI_TRANS_MULTILINE_ADDR	
Octal Output	1	1	8	SPI_TRANS_MODE_OCT	SPICOMMON_BUSFLAG_OCTAL
OPI	8	8	8	SPI_TRANS_MODE_OCT SPI_TRANS_MULTILINE_ADDR SPI_TRANS_MULTILINE_CMD	

Command and Address Phases During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of `base` as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see [Transaction Line Mode](#).

Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in [Transaction Line Mode](#).

注解: Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
 - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
 - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 26 μ s.
- Interrupt Transaction via CPU: 24 μ s.
- Polling Transaction via DMA: 11 μ s.
- Polling Transaction via CPU: 9 μ s.

SPI Clock Frequency Transferring each byte takes eight times the clock period $8/f_{spi}$.

Cache Miss The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/F_{spi}[MHz]$ [us] for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/F_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM 安全中断处理程序](#).

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- `components/hal/include/hal/spi_types.h`

Structures

struct spi_line_mode_t

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

`uint8_t cmd_lines`

The line width of command phase, e.g. 2-line-cmd-phase.

`uint8_t addr_lines`

The line width of address phase, e.g. 1-line-addr-phase.

`uint8_t data_lines`

The line width of data phase, e.g. 4-line-data-phase.

Enumerations

enum spi_host_device_t

Enum with the three SPI peripherals that are software-accessible in it.

Values:

`SPI1_HOST = 0`
SPI1.

SPI2_HOST = 1
SPI2.

SPI3_HOST = 2
SPI3.

enum spi_event_t
SPI Events.

Values:

SPI_EV_BUF_TX = BIT(0)
The buffer has sent data to master.

SPI_EV_BUF_RX = BIT(1)
The buffer has received data from master.

SPI_EV_SEND_DMA_READY = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

SPI_EV_SEND = BIT(3)
Master has received certain number of the data, the number is determined by Master.

SPI_EV_RECV_DMA_READY = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

SPI_EV_RECV = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.

SPI_EV_CMDA = BIT(7)
Received CMDA from master.

SPI_EV_TRANS = BIT(8)
A transaction has done.

Header File

- [components/driver/include/driver/spi_common.h](#)

Functions

esp_err_t **spi_bus_initialize** (*spi_host_device_t* host_id, **const** *spi_bus_config_t* *bus_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus.

Warning SPI0/1 is not supported

Warning If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

- **ESP_ERR_INVALID_ARG** if configuration is invalid
- **ESP_ERR_INVALID_STATE** if host already is in use
- **ESP_ERR_NOT_FOUND** if there is no available DMA channel
- **ESP_ERR_NO_MEM** if out of memory
- **ESP_OK** on success

Parameters

- **host_id**: SPI peripheral that controls this bus
- **bus_config**: Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **dma_chan**: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting **SPI_DMA_DISABLED** limits the size of transactions.

- Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
- Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

`esp_err_t spi_bus_free (spi_host_device_t host_id)`

Free a SPI bus.

Warning In order for this to succeed, all devices have to be removed first.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

Parameters

- `host_id`: SPI peripheral to free

Structures

struct spi_bus_config_t

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the `IO_MUX` or are `-1`. In that case, the `IO_MUX` is used, allowing for >40 MHz speeds.

Note Be advised that the slave driver does not use the `quadwp/quadhd` lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int `mosi_io_num`

GPIO pin for Master Out Slave In (=spi_d) signal, or `-1` if not used.

int `data0_io_num`

GPIO pin for spi data0 signal in quad/octal mode, or `-1` if not used.

int `miso_io_num`

GPIO pin for Master In Slave Out (=spi_q) signal, or `-1` if not used.

int `data1_io_num`

GPIO pin for spi data1 signal in quad/octal mode, or `-1` if not used.

int `sclk_io_num`

GPIO pin for SPI Clock signal, or `-1` if not used.

int `quadwp_io_num`

GPIO pin for WP (Write Protect) signal, or `-1` if not used.

int `data2_io_num`

GPIO pin for spi data2 signal in quad/octal mode, or `-1` if not used.

int `quadhd_io_num`

GPIO pin for HD (Hold) signal, or `-1` if not used.

int `data3_io_num`

GPIO pin for spi data3 signal in quad/octal mode, or `-1` if not used.

int `data4_io_num`

GPIO pin for spi data4 signal in octal mode, or `-1` if not used.

int `data5_io_num`

GPIO pin for spi data5 signal in octal mode, or `-1` if not used.

int `data6_io_num`

GPIO pin for spi data6 signal in octal mode, or `-1` if not used.

int `data7_io_num`

GPIO pin for spi data7 signal in octal mode, or `-1` if not used.

int max_transfer_sz

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32_t flags

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

int intr_flags

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros**SPI_MAX_DMA_LEN****SPI_SWAP_DATA_TX** (DATA, LEN)

Transform unsigned integer of length ≤ 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

Parameters

- DATA: Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)

Transform received data of length ≤ 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters

- DATA: Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS**Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

Enumerations

```
enum spi_common_dma_t
```

SPI DMA channels.

Values:

```
SPI_DMA_DISABLED = 0
```

Do not enable DMA for SPI.

```
SPI_DMA_CH_AUTO = 3
```

Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master**Header File**

- `components/driver/include/driver/spi_master.h`

Functions

```
esp_err_t spi_bus_add_device (spi_host_device_t host_id, const spi_device_interface_config_t
                             *dev_config, spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_FOUND` if host doesn't have any free CS slots
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

Parameters

- `host_id`: SPI peripheral to allocate device on
- `dev_config`: SPI interface protocol config for the device
- `handle`: Pointer to variable to hold the device handle

```
esp_err_t spi_bus_remove_device (spi_device_handle_t handle)
```

Remove a device from the SPI bus.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if device already is freed
- `ESP_OK` on success

Parameters

- `handle`: Device handle to free

esp_err_t **spi_device_queue_trans** (*spi_device_handle_t* `handle`, *spi_transaction_t* *`trans_desc`, TickType_t `ticks_to_wait`)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

esp_err_t **spi_device_get_trans_result** (*spi_device_handle_t* `handle`, *spi_transaction_t* **`trans_desc`, TickType_t `ticks_to_wait`)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

esp_err_t **spi_device_transmit** (*spi_device_handle_t* `handle`, *spi_transaction_t* *`trans_desc`)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

esp_err_t **spi_device_polling_start** (*spi_device_handle_t* `handle`, *spi_transaction_t* *`trans_desc`, TickType_t `ticks_to_wait`)

Immediately start a polling transaction.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there's a room in the queue; currently only `portMAX_DELAY` is supported.

`esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)`

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

`esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)`

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

`esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)`

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

Note The function will wait until all the existing transactions have been sent.

Return

- `ESP_ERR_INVALID_ARG`: `wait` is not set to `portMAX_DELAY`.
- `ESP_OK`: Success.

Parameters

- `device`: The device to occupy the bus.
- `wait`: Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

`void spi_device_release_bus(spi_device_handle_t dev)`

Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters

- `dev`: The device to release the bus.

int **spi_cal_clock** (int *fapb*, int *hz*, int *duty_cycle*, uint32_t **reg_o*)

Calculate the working frequency that is most close to desired frequency, and also the register value.

Parameters

- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock
- `reg_o`: Output of value to be set in clock register, or NULL if not needed.

Return Actual working frequency that most fit.

int **spi_get_actual_clock** (int *fapb*, int *hz*, int *duty_cycle*)

Calculate the working frequency that is most close to desired frequency.

Return Actual working frequency that most fit.

Parameters

- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock

void **spi_get_timing** (bool *gpio_is_used*, int *input_delay_ns*, int *eff_clk*, int **dummy_o*, int **cycles_remain_o*)

Calculate the timing settings of specified frequency and settings.

Note If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters

- `gpio_is_used`: True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.
- `eff_clk`: Effective clock frequency (in Hz) from `spi_cal_clock`.
- `dummy_o`: Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o`: Address of cycles remaining (after dummy bits are used) output.
 - -1 If too many cycles remaining, suggest to compensate half a clock.
 - 0 If no remaining cycles or dummy bits are not used.
 - positive value: cycles suggest to compensate.

int **spi_get_freq_limit** (bool *gpio_is_used*, int *input_delay_ns*)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Return Frequency limit of current configurations.

Parameters

- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

Structures

struct spi_device_interface_config_t

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t **command_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

uint8_t **address_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8_t dummy_bits

Amount of dummy bits to insert between address and data phase.

uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t duty_cycle_pos

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

int input_delay_ns

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggested to have the right value.

int spics_io_num

CS GPIO pin for this device, or -1 if not used.

uint32_t flags

Bitwise OR of `SPI_DEVICE_*` flags.

int queue_size

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

transaction_cb_t pre_cb

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

transaction_cb_t post_cb

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct spi_transaction_t

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members**uint32_t flags**

Bitwise OR of `SPI_TRANS_*` flags.

uint16_t cmd

Command data, of which the length is set in the `command_bits` of `spi_device_interface_config_t`.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

`uint64_t addr`

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

`size_t length`

Total data length, in bits.

`size_t rxlength`

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

`void *user`

User-defined variable. Can be used to store eg transaction ID.

`const void *tx_buffer`

Pointer to transmit buffer, or NULL for no MOSI phase.

`uint8_t tx_data[4]`

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

`void *rx_buffer`

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

`uint8_t rx_data[4]`

If `SPI_TRANS_USE_RXDATA` is set, data is received directly to this variable.

struct spi_transaction_ext_t

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.

Public Members

struct spi_transaction_t base

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

`uint8_t command_bits`

The command length in this transaction, in bits.

`uint8_t address_bits`

The address length in this transaction, in bits.

`uint8_t dummy_bits`

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).
8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK**SPI_TRANS_MODE_DIO**

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATAReceive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.**SPI_TRANS_USE_TXDATA**

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD

Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_VARIABLE_ADDR

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_VARIABLE_DUMMY

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

```
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t) (spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.3.19 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-S3's SPI peripherals while they function as slaves.

Overview of ESP32-S3's SPI peripherals

ESP32-S3 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• MOSI	Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.
• SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
• Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

注解: A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

Speed and Timing Considerations

Transaction Interval The ESP32-S3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi_slave](#).

SCLK Frequency Requirements The SPI slaves are designed to operate at up to 40 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

Application Example

The code example for Device/Host communication can be found in the [peripherals/spi_slave](#) directory of ESP-IDF examples.

API Reference

Header File

- [components/driver/include/driver/spi_slave.h](#)

Functions

```
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,
                             const spi_slave_interface_config_t *slave_config,
                             spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

Warning SPI0/1 is not supported

Warning If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- *host*: SPI peripheral to use as a SPI slave interface
- *bus_config*: Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- *slave_config*: Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- *dma_chan*: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting SPI_DMA_DISABLED limits the size of transactions.
 - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
 - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

Parameters

- `host`: SPI peripheral to free

```
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t
                               **trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- `host`: SPI peripheral that is acting as a slave
- `trans_desc`: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait`: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

```
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t
                                     **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- `host`: SPI peripheral to that is acting as a slave
- `[out] trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

```
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, Tick-
                             Type_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Parameters

- `host`: SPI peripheral to that is acting as a slave
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Structures

struct spi_slave_interface_config_t

This is a configuration for a SPI host acting as a slave device.

Public Members**int spics_io_num**

CS GPIO pin for this device.

uint32_t flags

Bitwise OR of SPI_SLAVE_* flags.

int queue_size

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

***slave_transaction_cb_t* post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

***slave_transaction_cb_t* post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t

This structure describes one SPI transaction

Public Members**size_t length**

Total data length, in bits.

size_t trans_len

Transaction data length, in bits.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void *user

User-defined variable. Can be used to store eg transaction ID.

Macros**SPI_SLAVE_TXBIT_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

Type Definitions

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

2.3.20 触摸传感器**概述**

触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成，保护覆盖层位于最上层，绝缘基板上设有电极及走线。用户触摸覆盖层将产生电容变化，根据电容变化判断此次触摸是否为有效触摸行为。

ESP32-S3 最多可支持 14 个电容式触摸传感器通道/GPIO。

触摸传感器可以以矩阵或滑条等方式组合使用，从而覆盖更大触感区域及更多触感点。触摸传感由软件或专用硬件计时器发起，由有限状态机 (FSM) 硬件控制。

如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32-S3 技术参考手册》(PDF) 中“片上传感器与模拟信号处理”章节。

请参考 [触摸传感器应用方案简介](#)，查看触摸传感器设计详情和固件开发指南。

功能介绍

下面将 API 分解成几个函数组进行介绍，帮助用户快速了解以下功能：

- 初始化触摸传感器驱动程序
- 配置触摸传感器 GPIO 管脚
- 触摸状态测量
- 调整测量参数（优化测量）
- 滤波采样
- 触摸监测方式
- 设置中断信号监测触碰动作
- 中断触发，唤醒睡眠模式

请前往 [API 参考](#) 章节，查看某一函数的具体描述。[应用示例](#) 章节则介绍了此 API 的具体实现。

初始化触摸传感器驱动程序 使用触摸传感器之前，需要先调用 `touch_pad_init()` 函数初始化触摸传感器驱动程序。此函数设置了 [API 参考](#) 项下的 *Macros* 中列出的几项 `.._DEFAULT` 驱动程序参数，同时删除之前设置过的触摸传感器信息（如有），并禁用中断。

如果不再需要该驱动程序，可以调用 `touch_pad_deinit()` 释放已初始化的驱动程序。

配置触摸传感器 GPIO 管脚 调用 `touch_pad_config()` 使能某一 GPIO 的触感功能。

使用 `touch_pad_set_fsm_mode()` 选择触摸传感器测量（由 FSM 操作）是由硬件定时器自动启动，还是由软件自动启动。如果选择软件模式，请使用 `touch_pad_sw_start()` 启动 FSM。

触摸状态测量 借助以下函数从传感器读取原始数据：

- `touch_pad_read_raw_data()`

该函数也可以用于检查触碰和释放触摸传感器时传感器读数变化范围，然后根据这些信息设定触摸传感器的触摸阈值。

请参考应用示例 [peripherals/touch_sensor/touch_sensor_v2/touch_pad_read](#)，查看如何使用读取触摸传感器数据。

优化测量 触摸传感器设有数个可配置参数，以适应触摸传感器设计特点。例如，如果需要感知较细微的电容变化，则可以缩小触摸传感器充放电的参考电压范围。用户可以使用 `touch_pad_set_voltage()` 函数设置电压参考低值和参考高值。

优化测量除了可以识别细微的电容变化之外，还可以降低应用程序功耗，但可能会增加测量噪声干扰。如果得到的动态读数范围结果比较理想，则可以调用 `touch_pad_set_meas_time()` 函数来减少测量时间，从而进一步降低功耗。

可用的测量参数及相应的 ‘set’ 函数总结如下：

- 触摸传感器充放电参数：
 - 电压门限： `touch_pad_set_voltage()`
 - 速率（斜率） `touch_pad_set_cnt_mode()`
- 测量时间： `touch_pad_set_meas_time()`

电压门限（参考低值/参考高值）、速率（斜率）与测量时间的关系如下图所示：

图 15: 触摸传感器 - 测量参数之间的关系

上图中的 *Output* 代表触摸传感器读值，即一个测量周期内测得的脉冲计数值。

所有函数均成对出现，用于设定某一特定参数，并获取当前参数值。例如：`touch_pad_set_voltage()` 和 `touch_pad_get_voltage()`。

滤波采样 如果测量中存在噪声，可以使用提供的 API 函数对采样进行滤波。ESP32-S3 的触摸功能提供了两套 API 可实现此功能。

一个是内部触摸通道，它没有连接到任何外部 GPIO。该降噪板的测量值可用于过滤所有通道上的干扰，如来自电源和外部 EMI 的噪声。降噪参数由 `touch_pad_denoise_set_config()` 设置并由 `touch_pad_denoise_enable()` 启动。

另一是可配置的硬件实现 IIR-滤波器（无限脉冲响应滤波器），该滤波器可通过调用 `touch_pad_filter_set_config()` 函数进行配置，调用 `touch_pad_filter_enable()` 函数启用。

触摸监测 触摸监测基于用户配置的阈值和 FSM 执行的原始测量，并由 ESP32 硬件实现。用户可以调用 `touch_pad_get_status()` 查看被触碰的触摸传感器，或调用 `touch_pad_clear_status()` 清除触摸状态信息。

用户也可以将硬件触摸监测连接至中断，详细介绍见下一章节。

如果测量中存在噪声，且电容变化幅度较小，硬件触摸监测结果可能就不太理想。如需解决这一问题，不建议使用硬件监测或中断信号，建议用户在自己的应用程序中进行采样滤波，并执行触摸监测。请参考 [peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt](#)，查看以上两种触摸监测的实现方式。

中断触发 在对触摸监测启用中断之前，请先设置一个触摸监测阈值。然后使用 [触摸状态测量](#) 中所述的函数读取并显示触摸和释放触摸传感器时测得的结果。如果测量中存在噪声且相对电容变化较小，请使用滤波器。用户也可以根据应用程序和环境条件，测试温度和电源电压变化对测量值的影响。

确定监测阈值后就可以在初始化时调用 `touch_pad_config()` 设置此阈值，或在运行时调用 `touch_pad_set_thresh()` 设置此阈值。

最后用户可以使用以下函数配置和管理中断调用：

- `touch_pad_isr_register() / touch_pad_isr_deregister()`
- `touch_pad_intr_enable() / touch_pad_intr_disable()`

中断配置完成后，用户可以调用 `touch_pad_get_status()` 查看中断信号来自哪个触摸传感器，也可以调用 `touch_pad_clear_status()` 清除触摸传感器状态信息。

应用示例

- 触摸传感器读值示例：[peripherals/touch_sensor/touch_sensor_v2/touch_pad_read](#)
- 触摸传感器中断示例：[peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt](#)

API 参考

Header File

- `components/driver/esp32s3/include/driver/touch_sensor.h`

Functions

`esp_err_t touch_pad_fsm_start (void)`

Set touch sensor FSM start.

Note Start FSM after the touch sensor FSM mode is set.

Note Call this function will reset benchmark of all touch channels.

Return

- ESP_OK on success

`esp_err_t touch_pad_fsm_stop (void)`

Stop touch sensor FSM.

Return

- ESP_OK on success

`esp_err_t touch_pad_sw_start (void)`

Trigger a touch sensor measurement, only support in SW mode of FSM.

Return

- ESP_OK on success

`esp_err_t touch_pad_set_meas_time (uint16_t sleep_cycle, uint16_t meas_times)`

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

Note The greater the duty cycle of the measurement time, the more system power is consumed.

Return

- ESP_OK on success

Parameters

- `sleep_cycle`: The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency)`. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.
- `meas_times`: The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

`esp_err_t touch_pad_get_meas_time` (uint16_t **sleep_cycle*, uint16_t **meas_times*)

Get touch sensor times of charge and discharge and sleep time.

Return

- ESP_OK on success

Parameters

- `sleep_cycle`: Pointer to accept sleep cycle number
- `meas_times`: Pointer to accept measurement times count.

`esp_err_t touch_pad_set_idle_channel_connect` (*touch_pad_conn_type_t* type)

Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ`(high resistance) setting increases the sensitivity of touch channels. The `CONN_GND`(grounding) setting increases the stability of touch channels.

Return

- ESP_OK on success

Parameters

- type: Select idle channel connect to high resistance state or ground.

`esp_err_t touch_pad_get_idle_channel_connect` (*touch_pad_conn_type_t* *type)

Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ`(high resistance) setting increases the sensitivity of touch channels. The `CONN_GND`(grounding) setting increases the stability of touch channels.

Return

- ESP_OK on success

Parameters

- type: Pointer to connection type.

`esp_err_t touch_pad_set_thresh` (*touch_pad_t* touch_num, uint32_t threshold)

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

Note If set “TOUCH_PAD_THRESHOLD_MAX” , the touch is never be triggered.

Return

- ESP_OK on success

Parameters

- touch_num: touch pad index
- threshold: threshold of touch sensor. Should be less than the max change value of touch.

`esp_err_t touch_pad_get_thresh` (*touch_pad_t* touch_num, uint32_t *threshold)

Get touch sensor trigger threshold.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters

- touch_num: touch pad index
- threshold: pointer to accept threshold

`esp_err_t touch_pad_set_channel_mask` (uint16_t enable_mask)

Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically

scanned. This function will set the scan bits according to the given bitmask.

Note If set this mask, the FSM timer should be stop firstly.

Note The touch sensor that in scan map, should be deinit GPIO function firstly by `touch_pad_io_init`.

Return

- ESP_OK on success

Parameters

- `enable_mask`: bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

esp_err_t `touch_pad_get_channel_mask` (`uint16_t *enable_mask`)

Get the touch sensor scan group bit mask.

Return

- ESP_OK on success

Parameters

- `enable_mask`: Pointer to bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

esp_err_t `touch_pad_clear_channel_mask` (`uint16_t enable_mask`)

Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

Note If clear all mask, the FSM timer should be stop firstly.

Return

- ESP_OK on success

Parameters

- `enable_mask`: bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

esp_err_t `touch_pad_config` (`touch_pad_t touch_num`)

Configure parameter for each touch channel.

Note Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

Parameters

- `touch_num`: touch pad index

esp_err_t `touch_pad_reset` (`void`)

Reset the FSM of touch module.

Note Call this function after `touch_pad_fsm_stop`.

Return

- ESP_OK Success

touch_pad_t `touch_pad_get_current_meas_channel` (`void`)

Get the current measure channel.

Note Should be called when touch sensor measurement is in cyclic scan mode.

Return

- touch channel number

`uint32_t` `touch_pad_read_intr_status_mask` (`void`)

Get the touch sensor interrupt status mask.

Return

- touch interrupt bit

esp_err_t `touch_pad_intr_enable` (`touch_pad_intr_mask_t int_mask`)

Enable touch sensor interrupt by bitmask.

Note This API can be called in ISR handler.

Return

- ESP_OK on success

Parameters

- `int_mask`: Pad mask to enable interrupts

`esp_err_t touch_pad_intr_disable(touch_pad_intr_mask_t int_mask)`

Disable touch sensor interrupt by bitmask.

Note This API can be called in ISR handler.

Return

- `ESP_OK` on success

Parameters

- `int_mask`: Pad mask to disable interrupts

`esp_err_t touch_pad_intr_clear(touch_pad_intr_mask_t int_mask)`

Clear touch sensor interrupt by bitmask.

Return

- `ESP_OK` on success

Parameters

- `int_mask`: Pad mask to clear interrupts

`esp_err_t touch_pad_isr_register(intr_handler_t fn, void *arg, touch_pad_intr_mask_t intr_mask)`

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Arguments error
- `ESP_ERR_NO_MEM` No memory

Parameters

- `fn`: Pointer to ISR handler
- `arg`: Parameter for ISR
- `intr_mask`: Enable touch sensor interrupt handler by bitmask.

`esp_err_t touch_pad_timeout_set(bool enable, uint32_t threshold)`

Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

Note The threshold compared with touch readings.

Note In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

Return

- `ESP_OK` Success

Parameters

- `enable`: true(default): Enable the timeout check; false: Disable the timeout check.
- `threshold`: For all channels, the maximum value that will not be exceeded during normal operation.

`esp_err_t touch_pad_timeout_resume(void)`

Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

Note Call this API after finishes the exception handling by user.

Return

- `ESP_OK` Success

`esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint32_t *raw_data)`

get raw data of touch sensor.

Note After the initialization is complete, the “raw_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.

Return

- `ESP_OK` Success
- `ESP_FAIL` Touch channel 0 haven't this parameter.

Parameters

- `touch_num`: touch pad index

- `raw_data`: pointer to accept touch sensor value

`esp_err_t touch_pad_read_benchmark` (`touch_pad_t touch_num`, `uint32_t *benchmark`)
get benchmark of touch sensor.

Note After initialization, the benchmark value is the maximum during the first measurement period.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Touch channel 0 haven't this parameter.

Parameters

- `touch_num`: touch pad index
- `benchmark`: pointer to accept touch sensor benchmark value

`esp_err_t touch_pad_filter_read_smooth` (`touch_pad_t touch_num`, `uint32_t *smooth`)
Get smoothed data that obtained by filtering the raw data.

Parameters

- `touch_num`: touch pad index
- `smooth`: pointer to smoothed data

`esp_err_t touch_pad_reset_benchmark` (`touch_pad_t touch_num`)
Force reset benchmark to raw data of touch sensor.

Return

- `ESP_OK` Success

Parameters

- `touch_num`: touch pad index
 - `TOUCH_PAD_MAX` Reset baseline of all channels

`esp_err_t touch_pad_filter_set_config` (`const touch_filter_config_t *filter_info`)
set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Return

- `ESP_OK` Success

Parameters

- `filter_info`: select filter type and threshold of detection algorithm

`esp_err_t touch_pad_filter_get_config` (`touch_filter_config_t *filter_info`)
get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Return

- `ESP_OK` Success

Parameters

- `filter_info`: select filter type and threshold of detection algorithm

`esp_err_t touch_pad_filter_enable` (void)
enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Return

- `ESP_OK` Success

`esp_err_t touch_pad_filter_disable` (void)
disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Return

- `ESP_OK` Success

`esp_err_t touch_pad_denoise_set_config` (`const touch_pad_denoise_t *denoise`)
set parameter of denoise pad (`TOUCH_PAD_NUM0`). `T0` is an internal channel that does not have a corresponding external GPIO. `T0` will work simultaneously with the measured channel `Tn`. Finally, the actual measured value of `Tn` is the value after subtracting lower bits of `T0`. The noise reduction function filters out

interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

Return

- ESP_OK Success

Parameters

- *denoise*: parameter of denoise

esp_err_t **touch_pad_denoise_get_config** (*touch_pad_denoise_t* **denoise*)
get parameter of denoise pad (TOUCH_PAD_NUM0).

Return

- ESP_OK Success

Parameters

- *denoise*: Pointer to parameter of denoise

esp_err_t **touch_pad_denoise_enable** (void)

enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

Return

- ESP_OK Success

esp_err_t **touch_pad_denoise_disable** (void)
disable denoise function.

Return

- ESP_OK Success

esp_err_t **touch_pad_denoise_read_data** (uint32_t **data*)
Get denoise measure value (TOUCH_PAD_NUM0).

Return

- ESP_OK Success

Parameters

- *data*: Pointer to receive denoise value

esp_err_t **touch_pad_waterproof_set_config** (const *touch_pad_waterproof_t* **waterproof*)
set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH_PAD_NUM14) and a guard channel. Guard pad is used to detect the large area of water covering the touch panel. Shield pad is used to shield the influence of water droplets covering the touch panel. It is generally designed as a grid and is placed around the touch buttons.

Return

- ESP_OK Success

Parameters

- *waterproof*: parameter of waterproof

esp_err_t **touch_pad_waterproof_get_config** (*touch_pad_waterproof_t* **waterproof*)
get parameter of waterproof function.

Return

- ESP_OK Success

Parameters

- *waterproof*: parameter of waterproof

esp_err_t **touch_pad_waterproof_enable** (void)

Enable parameter of waterproof function. Should be called after function `touch_pad_waterproof_set_config`.

Return

- ESP_OK Success

esp_err_t **touch_pad_waterproof_disable** (void)

Disable parameter of waterproof function.

Return

- ESP_OK Success

esp_err_t **touch_pad_proximity_enable** (*touch_pad_t* *touch_num*, bool *enabled*)

Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

Note Supports up to three touch channels configured as proximity sensors.

Return

- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.
- ESP_ERR_NOT_SUPPORTED: Don't support configured.

Parameters

- *touch_num*: touch pad index
- *enabled*: true: enable the proximity function; false: disable the proximity function

esp_err_t **touch_pad_proximity_set_count** (*touch_pad_t* *touch_num*, uint32_t *count*)

Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

Note All proximity channels use the same *count* value. So please pass the parameter TOUCH_PAD_MAX.

Return

- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.

Parameters

- *touch_num*: Touch pad index. In this version, pass the parameter TOUCH_PAD_MAX.
- *count*: The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

esp_err_t **touch_pad_proximity_get_count** (*touch_pad_t* *touch_num*, uint32_t **count*)

Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

Note All proximity channels use the same *count* value. So please pass the parameter TOUCH_PAD_MAX.

Return

- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.

Parameters

- *touch_num*: Touch pad index. In this version, pass the parameter TOUCH_PAD_MAX.
- *count*: The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

esp_err_t **touch_pad_proximity_get_data** (*touch_pad_t* *touch_num*, uint32_t **measure_out*)

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch num is not proximity

Parameters

- *touch_num*: touch pad index
- *measure_out*: If the accumulation process does not end, the *measure_out* is the process value.

esp_err_t **touch_pad_sleep_channel_get_info** (*touch_pad_sleep_channel_t* **slp_config*)

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses *touch_pad_sleep_channel_read_data* instead of *touch_pad_read_raw_data* to obtain the sleep channel reading.

Return

- ESP_OK Success

Parameters

- `slp_config`: touch sleep pad config.

esp_err_t **touch_pad_sleep_channel_enable** (*touch_pad_t* *pad_num*, bool *enable*)

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

Note ESP32S2 only support one sleep channel.

Note After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

Return

- ESP_OK Success

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `enable`: true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

esp_err_t **touch_pad_sleep_channel_enable_proximity** (*touch_pad_t* *pad_num*, bool *enable*)

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note ESP32S2 only support one sleep channel.

Return

- ESP_OK Success

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `enable`: true: enable proximity for sleep channel; false: disable proximity for sleep channel;

esp_err_t **touch_pad_sleep_set_threshold** (*touch_pad_t* *pad_num*, *uint32_t* *touch_thres*)

Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

Note In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

Return

- ESP_OK Success

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `touch_thres`: touch sleep pad threshold

esp_err_t **touch_pad_sleep_get_threshold** (*touch_pad_t* *pad_num*, *uint32_t* **touch_thres*)

Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

Note In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

Return

- ESP_OK Success

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `touch_thres`: touch sleep pad threshold

esp_err_t **touch_pad_sleep_channel_read_benchmark** (*touch_pad_t* *pad_num*, *uint32_t* **benchmark*)

Read benchmark of touch sensor sleep channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.

- `benchmark`: pointer to accept touch sensor benchmark value

`esp_err_t touch_pad_sleep_channel_read_smooth(touch_pad_t pad_num, uint32_t *smooth_data)`

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` parameter is NULL

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `smooth_data`: pointer to accept touch sensor smoothed data

`esp_err_t touch_pad_sleep_channel_read_data(touch_pad_t pad_num, uint32_t *raw_data)`

Read raw data of touch sensor sleep channel.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` parameter is NULL

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `raw_data`: pointer to accept touch sensor raw data

`esp_err_t touch_pad_sleep_channel_reset_benchmark(void)`

Reset benchmark of touch sensor sleep channel.

Return

- `ESP_OK` Success

`esp_err_t touch_pad_sleep_channel_read_proximity_cnt(touch_pad_t pad_num, uint32_t *proximity_cnt)`

Read proximity count of touch sensor sleep channel.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` parameter is NULL

Parameters

- `pad_num`: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `proximity_cnt`: pointer to accept touch sensor proximity count value

`esp_err_t touch_pad_sleep_channel_set_work_time(uint16_t sleep_cycle, uint16_t meas_times)`

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

Return

- `ESP_OK` Success

Parameters

- `sleep_cycle`: The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency)`. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.
- `meas_times`: The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

Header File

- `components/driver/include/driver/touch_sensor_common.h`

Functions***esp_err_t* touch_pad_init** (void)

Initialize touch module.

Note If default parameter don't match the usage scenario, it can be changed after this function.**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM Touch pad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

***esp_err_t* touch_pad_deinit** (void)

Un-install touch pad driver.

Note After this function is called, other touch functions are prohibited from being called.**Return**

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

***esp_err_t* touch_pad_io_init** (*touch_pad_t* touch_num)

Initialize touch pad GPIO.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters

- touch_num: touch pad index

***esp_err_t* touch_pad_set_voltage** (*touch_high_volt_t* refh, *touch_low_volt_t* refl, *touch_volt_atten_t* atten)

Set touch sensor high voltage threshold of change. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters

- refh: the value of DREFH
- refl: the value of DREFL
- atten: the attenuation on DREFH

***esp_err_t* touch_pad_get_voltage** (*touch_high_volt_t* *refh, *touch_low_volt_t* *refl, *touch_volt_atten_t* *atten)

Get touch sensor reference voltage,.

Return

- ESP_OK on success

Parameters

- refh: pointer to accept DREFH value
- refl: pointer to accept DREFL value
- atten: pointer to accept the attenuation on DREFH

***esp_err_t* touch_pad_set_cnt_mode** (*touch_pad_t* touch_num, *touch_cnt_slope_t* slope, *touch_tie_opt_t* opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

Note The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters

- touch_num: touch pad index
- slope: touch pad charge/discharge speed

- opt: the initial voltage

esp_err_t **touch_pad_get_cnt_mode** (*touch_pad_t* touch_num, *touch_cnt_slope_t* *slope, *touch_tie_opt_t* *opt)

Get touch sensor charge/discharge speed for each pad.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters

- touch_num: touch pad index
- slope: pointer to accept touch pad charge/discharge slope
- opt: pointer to accept the initial voltage

esp_err_t **touch_pad_isr_deregister** (void (*fn)) void *arg
Deregister the handler previously registered using touch_pad_isr_handler_register.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn't registered

Parameters

- fn: handler function to call (as passed to touch_pad_isr_handler_register)
- arg: argument of the handler (as passed to touch_pad_isr_handler_register)

esp_err_t **touch_pad_get_wakeup_status** (*touch_pad_t* *pad_num)

Get the touch pad which caused wakeup from deep sleep.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters

- pad_num: pointer to touch pad which caused wakeup

esp_err_t **touch_pad_set_fsm_mode** (*touch_fsm_mode_t* mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters

- mode: FSM mode

esp_err_t **touch_pad_get_fsm_mode** (*touch_fsm_mode_t* *mode)

Get touch sensor FSM mode.

Return

- ESP_OK on success

Parameters

- mode: pointer to accept FSM mode

esp_err_t **touch_pad_clear_status** (void)

To clear the touch sensor channel active status.

Note The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

Return

- ESP_OK on success

uint32_t **touch_pad_get_status** (void)

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

Return

- The touch sensor status. e.g. Touch1 trigger status is status_mask & (BIT1).

bool `touch_pad_meas_is_done` (void)
Check touch sensor measurement status.

Return

- True measurement is under way
- False measurement done

GPIO 宏查找表 用户可以使用宏定义某一触摸传感器通道的 GPIO，或定义某一 GPIO 的通道。例如：

1. `TOUCH_PAD_NUM5_GPIO_NUM` 定义了通道 5 的 GPIO（即 GPIO 12）；
2. `TOUCH_PAD_GPIO4_CHANNEL` 定义了 GPIO 4 的通道（即通道 0）。

Structures**struct touch_pad_denoise**

Touch sensor denoise configuration

Public Members*touch_pad_denoise_grade_t* **grade**

Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

touch_pad_denoise_cap_t **cap_level**

Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use `touch_pad_denoise_read_data` to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct touch_pad_waterproof

Touch sensor waterproof configuration

Public Members*touch_pad_t* **guard_ring_pad**

Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

touch_pad_shield_driver_t **shield_driver**

Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel(Touch0).

struct touch_filter_config

Touch sensor filter configuration

Public Members*touch_filter_mode_t* **mode**

Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

uint32_t **debounce_cnt**

Set debounce count, such as n . If the measured values continue to exceed the threshold for $n+1$ times, the touch sensor state changes. Range: 0 ~ 7

uint32_t **noise_thr**

Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient * touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;

uint32_t **jitter_step**

Set jitter filter step size. Range: 0 ~ 15

touch_smooth_mode_t **smh_lvl**

Level of filter applied on the original data against large noise interference.

struct touch_pad_sleep_channel_t

Touch sensor channel sleep configuration

Public Members

touch_pad_t **touch_num**

Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode. If clear the sleep channel, point this pad to TOUCH_PAD_NUM0

bool **en_proximity**

enable proximity function for sleep pad

Macros

enum touch_tie_opt_t
Touch sensor initial charge level

Values:

TOUCH_PAD_TIE_OPT_LOW = 0
Initial level of charging voltage, low level

TOUCH_PAD_TIE_OPT_HIGH = 1
Initial level of charging voltage, high level

TOUCH_PAD_TIE_OPT_MAX

enum touch_fsm_mode_t
Touch sensor FSM mode

Values:

TOUCH_FSM_MODE_TIMER = 0
To start touch FSM by timer

TOUCH_FSM_MODE_SW
To start touch FSM by software trigger

TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t

Values:

TOUCH_TRIGGER_BELOW = 0
Touch interrupt will happen if counter value is less than threshold.

TOUCH_TRIGGER_ABOVE = 1
Touch interrupt will happen if counter value is larger than threshold.

TOUCH_TRIGGER_MAX

enum touch_trigger_src_t

Values:

TOUCH_TRIGGER_SOURCE_BOTH = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

enum touch_pad_intr_mask_t

Values:

TOUCH_PAD_INTR_MASK_DONE = BIT(0)
Measurement done for one of the enabled channels.

TOUCH_PAD_INTR_MASK_ACTIVE = BIT(1)
Active for one of the enabled channels.

TOUCH_PAD_INTR_MASK_INACTIVE = BIT(2)
Inactive for one of the enabled channels.

TOUCH_PAD_INTR_MASK_SCAN_DONE = BIT(3)

Measurement done for all the enabled channels.

TOUCH_PAD_INTR_MASK_TIMEOUT = BIT(4)

Timeout for one of the enabled channels.

TOUCH_PAD_INTR_MASK_PROXI_MEAS_DONE = BIT(5)

For proximity sensor, when the number of measurements reaches the set count of measurements, an interrupt will be generated.

enum touch_pad_denoise_grade_t

Values:

TOUCH_PAD_DENOISE_BIT12 = 0

Denoise range is 12bit

TOUCH_PAD_DENOISE_BIT10 = 1

Denoise range is 10bit

TOUCH_PAD_DENOISE_BIT8 = 2

Denoise range is 8bit

TOUCH_PAD_DENOISE_BIT4 = 3

Denoise range is 4bit

TOUCH_PAD_DENOISE_MAX

enum touch_pad_denoise_cap_t

Values:

TOUCH_PAD_DENOISE_CAP_L0 = 0

Denoise channel internal reference capacitance is 5pf

TOUCH_PAD_DENOISE_CAP_L1 = 1

Denoise channel internal reference capacitance is 6.4pf

TOUCH_PAD_DENOISE_CAP_L2 = 2

Denoise channel internal reference capacitance is 7.8pf

TOUCH_PAD_DENOISE_CAP_L3 = 3

Denoise channel internal reference capacitance is 9.2pf

TOUCH_PAD_DENOISE_CAP_L4 = 4

Denoise channel internal reference capacitance is 10.6pf

TOUCH_PAD_DENOISE_CAP_L5 = 5

Denoise channel internal reference capacitance is 12.0pf

TOUCH_PAD_DENOISE_CAP_L6 = 6

Denoise channel internal reference capacitance is 13.4pf

TOUCH_PAD_DENOISE_CAP_L7 = 7

Denoise channel internal reference capacitance is 14.8pf

TOUCH_PAD_DENOISE_CAP_MAX = 8

enum touch_pad_shield_driver_t

Touch sensor shield channel drive capability level

Values:

TOUCH_PAD_SHIELD_DRV_L0 = 0

The max equivalent capacitance in shield channel is 40pf

TOUCH_PAD_SHIELD_DRV_L1

The max equivalent capacitance in shield channel is 80pf

TOUCH_PAD_SHIELD_DRV_L2

The max equivalent capacitance in shield channel is 120pf

TOUCH_PAD_SHIELD_DRV_L3

The max equivalent capacitance in shield channel is 160pf

TOUCH_PAD_SHIELD_DRV_L4

The max equivalent capacitance in shield channel is 200pf

TOUCH_PAD_SHIELD_DRV_L5

The max equivalent capacitance in shield channel is 240pf

TOUCH_PAD_SHIELD_DRV_L6

The max equivalent capacitance in shield channel is 280pf

TOUCH_PAD_SHIELD_DRV_L7

The max equivalent capacitance in shield channel is 320pf

TOUCH_PAD_SHIELD_DRV_MAX**enum touch_pad_conn_type_t**

Touch channel idle state configuration

Values:

TOUCH_PAD_CONN_HIGHZ = 0

Idle status of touch channel is high resistance state

TOUCH_PAD_CONN_GND = 1

Idle status of touch channel is ground connection

TOUCH_PAD_CONN_MAX**enum touch_filter_mode_t**

Touch channel IIR filter coefficient configuration.

Note On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection IIR_16.

Values:

TOUCH_PAD_FILTER_IIR_4 = 0

The filter mode is first-order IIR filter. The coefficient is 4.

TOUCH_PAD_FILTER_IIR_8

The filter mode is first-order IIR filter. The coefficient is 8.

TOUCH_PAD_FILTER_IIR_16

The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

TOUCH_PAD_FILTER_IIR_32

The filter mode is first-order IIR filter. The coefficient is 32.

TOUCH_PAD_FILTER_IIR_64

The filter mode is first-order IIR filter. The coefficient is 64.

TOUCH_PAD_FILTER_IIR_128

The filter mode is first-order IIR filter. The coefficient is 128.

TOUCH_PAD_FILTER_IIR_256

The filter mode is first-order IIR filter. The coefficient is 256.

TOUCH_PAD_FILTER_JITTER

The filter mode is jitter filter

TOUCH_PAD_FILTER_MAX**enum touch_smooth_mode_t**

Level of filter applied on the original data against large noise interference.

Note On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_2`.

Values:

`TOUCH_PAD_SMOOTH_OFF = 0`

No filtering of raw data.

`TOUCH_PAD_SMOOTH_IIR_2 = 1`

Filter the raw data. The coefficient is 2 (Typical value).

`TOUCH_PAD_SMOOTH_IIR_4 = 2`

Filter the raw data. The coefficient is 4.

`TOUCH_PAD_SMOOTH_IIR_8 = 3`

Filter the raw data. The coefficient is 8.

`TOUCH_PAD_SMOOTH_MAX`

2.3.21 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S3's peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

警告: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. *TWAI Protocol Summary*
2. *Signals Lines and Transceiver*
3. *Driver Configuration*
4. *Driver Operation*
5. *Examples*

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

Error Active: A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

Error Passive: A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

Bus-Off: A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-S3’s GPIO pads.

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

CLKOUT: The CLKOUT signal line is **optional** and outputs a prescaled version of the controller’s source clock (APB Clock).

注解: An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

图 16: Signal lines of the TWAI controller

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

表 4: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

注解: The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

注解: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the [CONFIG_TWAI_ISR_IN_IRAM](#) option is enabled (see [Placing ISR into IRAM](#)).

注解: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32-S3, the `brp` can be **any even number from 2 to 128**.

图 17: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

注解: Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`
- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`
- `TWAI_TIMING_CONFIG_10KBITS()`
- `TWAI_TIMING_CONFIG_5KBITS()`
- `TWAI_TIMING_CONFIG_1KBITS()`

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 18: Bit layout of single filter mode (Right side MSBit)

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram

illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 19: Bit layout of dual filter mode (Right side MSBit)

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

注解: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

图 20: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter \geq 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

Driver States Uninstalled: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
<code>TWAI_MSG_FLAG_EXTD</code>	Message is in Extended Frame Format (29bit ID)
<code>TWAI_MSG_FLAG_RTR</code>	Message is a Remote Frame (Remote Transmission Request)
<code>TWAI_MSG_FLAG_SS</code>	Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.
<code>TWAI_MSG_FLAG_SELF</code>	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
<code>TWAI_MSG_FLAG_DLC_NON</code>	Message's Data length code is larger than 8. This will break compliance with TWAI
<code>TWAI_MSG_FLAG_NONE</code>	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```

#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}

```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Message Transmission The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```

#include "driver/twai.h"

...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

Message Reception The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

```

(下页继续)

```
//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples **Network Example:** The TWAI Network example demonstrates communication between two ESP32-S3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai_network](#).

Alert and Recovery Example: This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai_alert_and_recovery](#).

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai_self_test](#).

API Reference

- [components/hal/include/hal/twai_types.h](#)

Structures

struct twai_message_t

Structure to store a TWAI message.

Note The flags member is deprecated

Public Members

uint32_t **extd** : 1

Extended Frame Format (29bit ID)

uint32_t **rtr** : 1

Message is a Remote Frame

`uint32_t ss` : 1
Transmit as a Single Shot Transmission. Unused for received.

`uint32_t self` : 1
Transmit as a Self Reception Request. Unused for received.

`uint32_t dlc_non_comp` : 1
Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

`uint32_t reserved` : 27
Reserved bits

`uint32_t flags`
Deprecated: Alternate way to set bits using message flags

`uint32_t identifier`
11 or 29 bit identifier

`uint8_t data_length_code`
Data length code

`uint8_t data[TWAI_FRAME_MAX_DLC]`
Data bytes (not relevant in RTR frame)

struct twai_timing_config_t
Structure for bit timing configuration of the TWAI driver.

Note Macro initializers are available for this structure

Public Members

`uint32_t brp`
Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

`uint8_t tseg_1`
Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`
Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool `triple_sampling`
Enables triple sampling when the TWAI controller samples a bit

struct twai_filter_config_t
Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note Macro initializers are available for this structure

Public Members

`uint32_t acceptance_code`
32-bit acceptance code

`uint32_t acceptance_mask`
32-bit acceptance mask

bool `single_filter`
Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK

Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC

Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES

EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES

SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH

Error counter threshold for error passive

Enumerations

enum twai_mode_t

TWAI Controller operating modes.

Values:

TWAI_MODE_NORMAL

Normal operating mode where TWAI controller can send/receive/acknowledge messages

TWAI_MODE_NO_ACK

Transmission does not require acknowledgment. Use this mode for self testing

TWAI_MODE_LISTEN_ONLY

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

Functions

```
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const
                             twai_timing_config_t *t_config, const twai_filter_config_t
                             *f_config)
```

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)

Note To reinstall the TWAI driver, call `twai_driver_uninstall()` first

Return

- `ESP_OK`: Successfully installed TWAI driver
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_NO_MEM`: Insufficient memory
- `ESP_ERR_INVALID_STATE`: Driver is already installed

Parameters

- [in] `g_config`: General configuration structure
- [in] `t_config`: Timing configuration structure
- [in] `f_config`: Filter configuration structure

esp_err_t twai_driver_uninstall (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

Warning The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Return

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Return

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_stop (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

Warning A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Return

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t twai_transmit (const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

Note This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Return

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

Parameters

- [in] message: Message to transmit
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

esp_err_t twai_receive (*twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

Warning The flags field of the received message should be checked to determine if the received message contains any data bytes.

Return

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters

- [out] message: Received message
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on RX queue

esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

Note Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Return

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters

- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks_to_wait: Number of FreeRTOS ticks to block for alert

esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Return

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters

- [in] alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
- [out] current_alerts: Bit field of currently raised alerts. Set to NULL if unused

esp_err_t twai_initiate_recovery (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Return

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t twai_get_status_info (twai_status_info_t *status_info)

Get current status information of the TWAI driver.

Return

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid

- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

Parameters

- `[out] status_info`: Status information

esp_err_t **twai_clear_transmit_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

Note The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

Return

- `ESP_OK`: Transmit queue cleared
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_receive_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

Note The receive queue is automatically cleared when `twai_start()` is called.

Return

- `ESP_OK`: Transmit queue cleared
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

Structures

struct twai_general_config_t

Structure for general configuration of the TWAI driver.

Note Macro initializers are available for this structure

Public Members

twai_mode_t **mode**

Mode of TWAI controller

gpio_num_t **tx_io**

Transmit GPIO number

gpio_num_t **rx_io**

Receive GPIO number

gpio_num_t **clkout_io**

CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t **bus_off_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t **tx_queue_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t **rx_queue_len**

Number of messages RX queue can hold

uint32_t **alerts_enabled**

Bit field of alerts to enable (see documentation)

uint32_t **clkout_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr_flags**

Interrupt flags to set the priority of the driver's ISR. Note that to use the `ESP_INTR_FLAG_IRAM`, the `CONFIG_TWAI_ISR_IN_IRAM` option should be enabled first.

struct twai_status_info_t

Structure to store status information of TWAI driver.

Public Members

`twai_state_t state`

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`

Number of messages queued for transmission or awaiting transmission completion

`uint32_t msgs_to_rx`

Number of messages in RX queue waiting to be read

`uint32_t tx_error_counter`

Current value of Transmit Error Counter

`uint32_t rx_error_counter`

Current value of Receive Error Counter

`uint32_t tx_failed_count`

Number of messages that failed transmissions

`uint32_t rx_missed_count`

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

`uint32_t rx_overrun_count`

Number of messages that were lost due to a RX FIFO overrun

`uint32_t arb_lost_count`

Number of instances arbitration was lost

`uint32_t bus_error_count`

Number of instances a bus error has occurred

Macros

`TWAI_IO_UNUSED`

Marks GPIO as unused in TWAI configuration

Enumerations

`enum twai_state_t`

TWAI driver states.

Values:

`TWAI_STATE_STOPPED`

Stopped state. The TWAI controller will not participate in any TWAI bus activities

`TWAI_STATE_RUNNING`

Running state. The TWAI controller can transmit and receive messages

`TWAI_STATE_BUS_OFF`

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

`TWAI_STATE_RECOVERING`

Recovering state. The TWAI controller is undergoing bus recovery

2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-S3 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32-S3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32-S3's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

Setting Communication Parameters UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

Multiple Steps Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

表 5: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Setting Communication Pins After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

Driver Installation Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Running UART Communication Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

Transmitting After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

Receiving Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-S3 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
 - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
 - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
 - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
 - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
 - Disable the interrupt using `uart_disable_pattern_det_intr()`

Macros The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

Overview of RS485 specific communication options

注解: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-S3 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]*. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S3’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the

user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-S3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the \sim RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

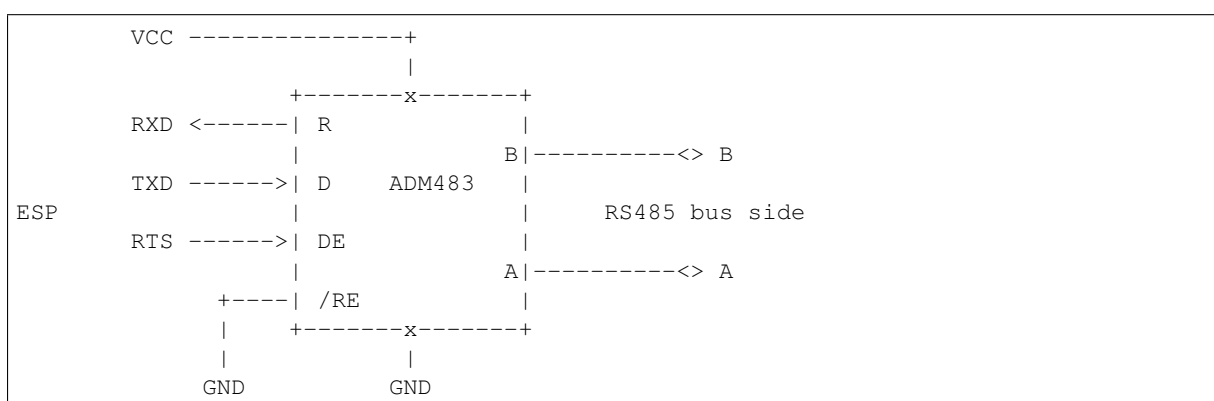

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32-S3's RS485 interface connection.

注解:

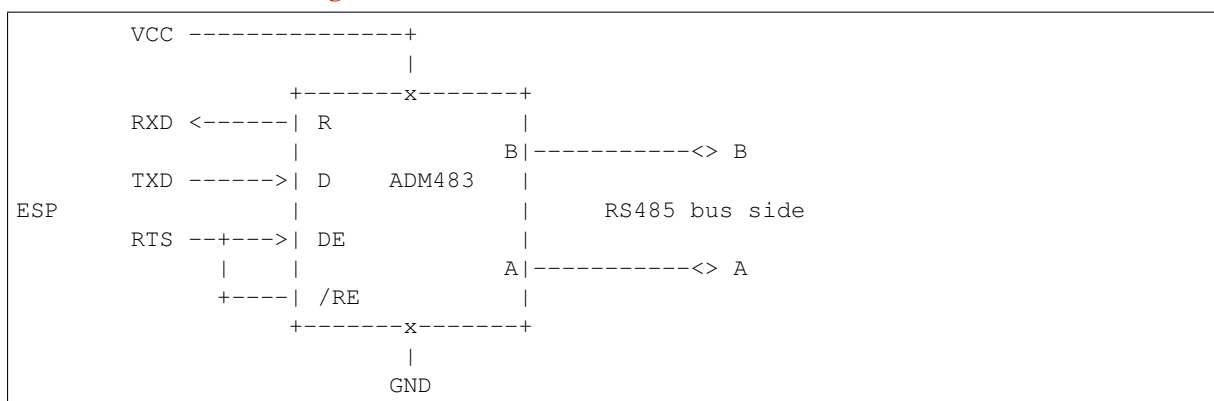

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485_TX_RX_EN` is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
peripherals/uart/uart_echo	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
peripherals/uart/uart_events	Reporting various communication events, using pattern detection interrupts.
peripherals/uart/uart_async_rxtxtasks	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
peripherals/uart/uart_select	Using synchronous I/O multiplexing for UART file descriptors.
peripherals/uart/uart_echo_rs485	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to peripherals/uart/uart_echo but allows communication through an RS485 interface chip connected to ESP32-S3 pins.
peripherals/uart/nmea0183_parser	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

API Reference

Header File

- `components/driver/include/driver/uart.h`

Functions

esp_err_t **uart_driver_install** (*uart_port_t* *uart_num*, int *rx_buffer_size*, int *tx_buffer_size*, int *queue_size*, *QueueHandle_t* **uart_queue*, int *intr_alloc_flags*)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

Note *Rx_buffer_size* should be greater than UART_FIFO_LEN. *Tx_buffer_size* should be either zero or greater than UART_FIFO_LEN.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- *uart_num*: UART port number, the max port number is (UART_NUM_MAX -1).
- *rx_buffer_size*: UART RX ring buffer size.
- *tx_buffer_size*: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- *queue_size*: UART event queue size/depth.
- *uart_queue*: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- *intr_alloc_flags*: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver's ISR handler is not located in IRAM)

esp_err_t **uart_driver_delete** (*uart_port_t* *uart_num*)

Uninstall UART driver.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- *uart_num*: UART port number, the max port number is (UART_NUM_MAX -1).

bool **uart_is_driver_installed** (*uart_port_t* *uart_num*)

Checks whether the driver is installed or not.

Return

- true driver is installed
- false driver is not installed

Parameters

- *uart_num*: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t **uart_set_word_length** (*uart_port_t* *uart_num*, *uart_word_length_t* *data_bit*)

Set UART data bits.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- *uart_num*: UART port number, the max port number is (UART_NUM_MAX -1).
- *data_bit*: UART data bits

esp_err_t **uart_get_word_length** (*uart_port_t* *uart_num*, *uart_word_length_t* **data_bit*)

Get the UART data bit configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (**data_bit*)

Parameters

- *uart_num*: UART port number, the max port number is (UART_NUM_MAX -1).
- *data_bit*: Pointer to accept value of UART data bits.

esp_err_t **uart_set_stop_bits** (*uart_port_t* *uart_num*, *uart_stop_bits_t* *stop_bits*)

Set UART stop bits.

Return

- ESP_OK Success
- ESP_FAIL Fail

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits`: UART stop bits

esp_err_t **uart_get_stop_bits** (*uart_port_t* `uart_num`, *uart_stop_bits_t* `*stop_bits`)

Get the UART stop bit configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (`*stop_bit`)

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits`: Pointer to accept value of UART stop bits.

esp_err_t **uart_set_parity** (*uart_port_t* `uart_num`, *uart_parity_t* `parity_mode`)

Set UART parity mode.

Return

- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode`: the enum of uart parity configuration

esp_err_t **uart_get_parity** (*uart_port_t* `uart_num`, *uart_parity_t* `*parity_mode`)

Get the UART parity mode configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (`*parity_mode`)

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode`: Pointer to accept value of UART parity mode.

esp_err_t **uart_set_baudrate** (*uart_port_t* `uart_num`, *uint32_t* `baudrate`)

Set UART baud rate.

Return

- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate`: UART baud rate.

esp_err_t **uart_get_baudrate** (*uart_port_t* `uart_num`, *uint32_t* `*baudrate`)

Get the UART baud rate configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (`*baudrate`)

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate`: Pointer to accept value of UART baud rate

esp_err_t **uart_set_line_inverse** (*uart_port_t* `uart_num`, *uint32_t* `inverse_mask`)

Set UART line inverse mode.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `inverse_mask`: Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

esp_err_t `uart_set_hw_flow_ctrl` (*uart_port_t* `uart_num`, *uart_hw_flowcontrol_t* `flow_ctrl`, *uint8_t* `rx_thresh`)

Set hardware flow control.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the `rx_thresh` value be set.

esp_err_t `uart_set_sw_flow_ctrl` (*uart_port_t* `uart_num`, *bool* `enable`, *uint8_t* `rx_thresh_xon`, *uint8_t* `rx_thresh_xoff`)

Set software flow control.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

esp_err_t `uart_get_hw_flow_ctrl` (*uart_port_t* `uart_num`, *uart_hw_flowcontrol_t* *`flow_ctrl`)

Get the UART hardware flow control configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*`flow_ctrl`)

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl`: Option for different flow control mode.

esp_err_t `uart_clear_intr_status` (*uart_port_t* `uart_num`, *uint32_t* `clr_mask`)

Clear UART interrupt status.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `clr_mask`: Bit mask of the interrupt status to be cleared.

esp_err_t `uart_enable_intr_mask` (*uart_port_t* `uart_num`, *uint32_t* `enable_mask`)

Set UART interrupt enable.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `enable_mask`: Bit mask of the enable bits.

esp_err_t `uart_disable_intr_mask` (*uart_port_t* `uart_num`, *uint32_t* `disable_mask`)

Clear UART interrupt enable bits.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `disable_mask`: Bit mask of the disable bits.

esp_err_t **uart_enable_rx_intr** (*uart_port_t* *uart_num*)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t **uart_disable_rx_intr** (*uart_port_t* *uart_num*)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t **uart_disable_tx_intr** (*uart_port_t* *uart_num*)

Disable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number

esp_err_t **uart_enable_tx_intr** (*uart_port_t* *uart_num*, int *enable*, int *thresh*)

Enable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `enable`: 1: enable; 0: disable
- `thresh`: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

esp_err_t **uart_isr_register** (*uart_port_t* *uart_num*, void (**fn*)) void *

, void **arg*, int *intr_alloc_flags*, *uart_isr_handle_t* **handle*) Register UART interrupt handler (ISR).

Note UART ISR handler will be attached to the same CPU core that this function is running on.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `fn`: Interrupt handler function.
- `arg`: parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

esp_err_t **uart_isr_free** (*uart_port_t* *uart_num*)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t **uart_set_pin**(*uart_port_t* `uart_num`, int `tx_io_num`, int `rx_io_num`, int `rts_io_num`, int `cts_io_num`)

Assign signals of a UART peripheral to GPIO pins.

Note If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0' s default TX pin and GPIO3 is UART0' s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `tx_io_num`: UART TX pin GPIO number.
- `rx_io_num`: UART RX pin GPIO number.
- `rts_io_num`: UART RTS pin GPIO number.
- `cts_io_num`: UART CTS pin GPIO number.

esp_err_t **uart_set_rts**(*uart_port_t* `uart_num`, int `level`)

Manually set the UART RTS pin level.

Note UART must be configured with hardware flow control disabled.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `level`: 1: RTS output low (active); 0: RTS output high (block)

esp_err_t **uart_set_dtr**(*uart_port_t* `uart_num`, int `level`)

Manually set the UART DTR pin level.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `level`: 1: DTR output low; 0: DTR output high

esp_err_t **uart_set_tx_idle_num**(*uart_port_t* `uart_num`, uint16_t `idle_num`)

Set UART idle interval after tx FIFO is empty.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `idle_num`: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

esp_err_t **uart_param_config**(*uart_port_t* `uart_num`, const *uart_config_t* *`uart_config`)

Set UART configuration parameters.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `uart_config`: UART parameter settings

`esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)`

Configure UART interrupts.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `intr_conf`: UART interrupt settings

`esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)`

Wait until UART TX FIFO is empty.

Return

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `ticks_to_wait`: Timeout, count in RTOS ticks

`int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)`

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note This function should only be used when UART TX buffer is not enabled.

Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `buffer`: data buffer address
- `len`: data length to send

`int uart_write_bytes(uart_port_t uart_num, const void *src, size_t size)`

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `src`: data buffer address
- `size`: data length to send

`int uart_write_bytes_with_break(uart_port_t uart_num, const void *src, size_t size, int brk_len)`

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `src`: data buffer address
- `size`: data length to send
- `brk_len`: break signal duration(unit: the time it takes to send one bit at current baudrate)

`int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)`
UART read bytes from UART buffer.

Return

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `buf`: pointer to the buffer.
- `length`: data length
- `ticks_to_wait`: sTimeout, count in RTOS ticks

`esp_err_t uart_flush (uart_port_t uart_num)`

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

`esp_err_t uart_flush_input (uart_port_t uart_num)`

Clear input buffer, discard all the data is in the ring-buffer.

Note In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

`esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)`

UART get RX ring buffer cached data length.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `size`: Pointer of `size_t` to accept cached data length

`esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)`

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

`esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)`

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

Return

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

Parameters

- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as `at_cmd` char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last `at_cmd` char
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first `at_cmd` char.

`int uart_pattern_pop_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

`int uart_pattern_get_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

`esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Return

- `ESP_ERR_NO_MEM` No enough memory

- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length`: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

esp_err_t **uart_set_mode** (*uart_port_t* `uart_num`, *uart_mode_t* `mode`)

UART set communication mode.

Note This function must be executed after `uart_driver_install()`, when the driver object is initialized.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode`: UART UART mode to set

esp_err_t **uart_set_rx_full_threshold** (*uart_port_t* `uart_num`, *int* `threshold`)

Set uart threshold value for RX fifo full.

Note If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value above which RX fifo full interrupt is generated

esp_err_t **uart_set_tx_empty_threshold** (*uart_port_t* `uart_num`, *int* `threshold`)

Set uart threshold values for TX fifo empty.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value below which TX fifo empty interrupt is generated

esp_err_t **uart_set_rx_timeout** (*uart_port_t* `uart_num`, *const* *uint8_t* `tout_thresh`)

UART set threshold timeout for TOUT feature.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `tout_thresh`: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tout_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

esp_err_t **uart_get_collision_flag** (*uart_port_t* `uart_num`, *bool* **collision_flag*)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by `collision_flag`. `*collision_flag = true`, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `uart_num`: Uart number to configure the max port number is (UART_NUM_MAX -1).
- `collision_flag`: Pointer to variable of type bool to return collision flag.

esp_err_t **uart_set_wakeup_threshold** (*uart_port_t* `uart_num`, int `wakeup_threshold`)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting `use_ref_tick` field in *uart_config_t* to true.

Note in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

Parameters

- `uart_num`: UART number, the max port number is (UART_NUM_MAX -1).
- `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* `uart_num`, int *`out_wakeup_threshold`)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `out_wakeup_threshold` is NULL

Parameters

- `uart_num`: UART number, the max port number is (UART_NUM_MAX -1).
- [`out`] `out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* `uart_num`)

Wait until UART tx memory empty and the last char send ok (polling mode).

- **Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters

- `uart_num`: UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* `uart_num`, bool `loop_back_en`)

Configure TX signal loop back to RX module, just for the test usage.

- **Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error

– ESP_FAIL Driver not installed

Parameters

- `uart_num`: UART number
- `loop_back_en`: Set true to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (*uart_port_t* `uart_num`, bool `always_rx_timeout_en`)
Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- `uart_num`: UART number
- `always_rx_timeout_en`: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct `uart_intr_config_t`

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

uint32_t `intr_enable_mask`

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8_t `rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

uint8_t `txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

uint8_t `rxfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.

Public Members

uart_event_type_t `type`

UART event type

size_t `size`

UART data size for `UART_DATA` event

bool `timeout_flag`

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_NUM_0

UART port 0

UART_NUM_1

UART port 1

UART_NUM_2

UART port 2

UART_NUM_MAX

UART port max

UART_PIN_NO_CHANGE**UART_FIFO_LEN**

Length of the UART HW FIFO.

UART_BITRATE_MAX

Maximum configurable bitrate.

Type Definitions

```
typedef intr_handle_t uart_isr_handle_t
```

Enumerations

```
enum uart_event_type_t
```

UART event types used in the ring buffer.

*Values:***UART_DATA**

UART data event

UART_BREAK

UART break event

UART_BUFFER_FULL

UART RX buffer full event

UART_FIFO_OVF

UART FIFO overflow event

UART_FRAME_ERR

UART RX frame error event

UART_PARITY_ERR

UART RX parity event

UART_DATA_BREAK

UART TX data and break event

UART_PATTERN_DET

UART pattern detected

UART_EVENT_MAX

UART event max index

Header File

- [components/hal/include/hal/uart_types.h](#)

Structures

```
struct uart_at_cmd_t
```

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

```
uint8_t cmd_char
```

UART AT cmd char

uint8_t char_num
AT cmd char repeat number

uint32_t gap_tout
gap time(in baud-rate) between AT cmd char

uint32_t pre_idle
the idle time(in baud-rate) between the non AT char and first AT char

uint32_t post_idle
the idle time(in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members

uint8_t xon_char
Xon flow control char

uint8_t xoff_char
Xoff flow control char

uint8_t xon_thrd
If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd
If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members

int baud_rate
UART baud rate

uart_word_length_t **data_bits**
UART byte size

uart_parity_t **parity**
UART parity mode

uart_stop_bits_t **stop_bits**
UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**
UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
UART HW RTS threshold

uart_sclk_t **source_clk**
UART source clock selection

bool use_ref_tick
Deprecated method to select ref tick clock source, set source_clk field instead

Type Definitions

UART source clock.

*Values:***UART_SCLK_APB** = 0x0
UART source clock from APB**UART_SCLK_RTC** = 0x1
UART source clock from RTC**UART_SCLK_XTAL** = 0x2
UART source clock from XTAL

GPIO Lookup Macros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of

finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

注解: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is `UART_NUM_0`). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

- `components/soc/esp32s3/include/soc/uart_channel.h`

Macros

```

2.3.23 USB Device Driver

Overview

The driver allows users to use ESP32-S3 chips to develop USB devices on top the TinyUSB stack. TinyUSB is integrating with ESP-IDF to provide USB features of the framework. Using this driver the chip works as a composite device supporting to represent several USB devices simultaneously. Currently, only the communications device class (CDC) type of the device with the ACM (Abstract Control Model) subclass is supported.

Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output through USB Serial Device

Hardware USB Connection

- Any board with the ESP32-S3 chip with USB connectors or with exposed USB 's D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g. with do-it-yourself cable from any USB connection cable).

On ESP32-S3, connect GPIO 20 and 19 to D+/D- respectively:

Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Encapsulated driver' s task servicing the TinyUSB

Configuration

Via Menuconfig options you can specify:

- Several of descriptor' s parameters (see: Descriptors Configuration bellow)
- USB Serial low-level Configuration

- The verbosity of the TinyUSB's log
- Disable the TinyUSB main task (for the custom implementation)

Descriptors Configuration The driver's descriptors are provided by the `tinyusb_config_t` structure's `descriptor` and `string_descriptor` members. Therefore, users should initialize `tinyusb_config_t` to their desired descriptor before calling `tinyusb_driver_install()` to install driver.

However, the driver also provides a default descriptor. The driver can be installed with the default descriptor by setting the `descriptor` and `string_descriptor` members of `tinyusb_config_t` to `NULL` before calling `tinyusb_driver_install()`. The driver's default descriptor is specified using Menuconfig, where the following fields should be configured:

- PID
- VID
- bcdDevice
- Manufacturer
- Product name
- Name of CDC device if it is On
- Serial number

If you want to use own descriptors with extended modification, you can define them during the driver installation process

Install Driver

To initialize the driver, users should call `tinyusb_driver_install()`. The driver's configuration is specified in a `tinyusb_config_t` structure that is passed as an argument to `tinyusb_driver_install()`.

Note that the `tinyusb_config_t` structure can be zero initialized (e.g. `tinyusb_config_t tusb_cfg = { 0 }`) or partially (as shown below). For any member that is initialized to `0` or `NULL`, the driver will use its default configuration values for that member (see example below)

```
tinyusb_config_t partial_init = {
    .descriptor = NULL;           //Uses default descriptor specified in Menuconfig
    .string_descriptor = NULL;   //Uses default string specified in Menuconfig
    .external_phy = false;
}
```

USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device could be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).

```
tinyusb_config_cdcacm_t amc_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&amc_cfg);
```

To specify callbacks you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

USB Serial Console The driver allows to redirect all standard application strings (stdin/out/err) to the USB Serial Device and return them to UART using `esp_tusb_init_console()/esp_tusb_deinit_console()` functions.

Application Examples

The table below describes the code examples available in the directory [peripherals/usb/](#).

Code Example	Description
peripherals/usb/tusb_console	How to set up ESP32-S3 chip to get log output via Serial Device connection
peripherals/usb/tusb_sample_descriptor	How to set up ESP32-S3 chip to work as a Generic USB Device with a user-defined descriptor
peripherals/usb/tusb_serial_device	How to set up ESP32-S3 chip to work as a USB Serial Device

API Reference

Header File

- `components/tinyusb/additions/include/tinyusb.h`

Functions

`esp_err_t tusb_driver_install(const tinyusb_config_t *config)`

This is an all-in-one helper function, including:

1. USB device driver initialization
2. Descriptors preparation
3. TinyUSB stack initialization
4. Creates and start a task to handle usb events

Note Don't change Custom descriptor, but if it has to be done, Suggest to define as follows in order to match the Interface Association Descriptor (IAD): `bDeviceClass = TUSB_CLASS_MISC, bDeviceSubClass = MISC_SUBCLASS_COMMON,`

Parameters

- `config`: tinyusb stack specific configuration

Return Value

- `ESP_ERR_INVALID_ARG`: Install driver and tinyusb stack failed because of invalid argument
- `ESP_FAIL`: Install driver and tinyusb stack failed because of internal error
- `ESP_OK`: Install driver and tinyusb stack successfully

Structures

`struct tinyusb_config_t`

Configuration structure of the tinyUSB core.

Public Members

`tusb_desc_device_t *descriptor`

Pointer to a device descriptor

`const char **string_descriptor`

Pointer to an array of string descriptors

bool `external_phy`

Should USB use an external PHY

Header File

- components/tinyusb/additions/include/tinyusb_types.h

Macros

USB_ESPRESSIF_VID

USB_STRING_DESCRIPTOR_ARRAY_SIZE

Type Definitions

```
typedef const char *tusb_desc_strarray_device_t[USB_STRING_DESCRIPTOR_ARRAY_SIZE]
```

Enumerations

```
enum tinyusb_usbdev_t
```

Values:

```
TINYUSB_USBDEV_0
```

Header File

- components/tinyusb/additions/include/tusb_cdc_acm.h

Functions

```
esp_err_t tusb_cdc_acm_init (const tinyusb_config_cdcacm_t *cfg)
```

Initialize CDC ACM. Initialization will be finished with the tud_cdc_line_state_cb callback.

Return esp_err_t

Parameters

- *cfg*: - init configuration structure

```
esp_err_t tinyusb_cdcacm_register_callback (tinyusb_cdcacm_if_t if, cdcacm_event_type_t event_type, tusb_cdcacm_callback_t callback)
```

Register a callback invoking on CDC event. If the callback had been already registered, it will be overwritten.

Return esp_err_t - ESP_OK or ESP_ERR_INVALID_ARG

Parameters

- *if*: - number of a CDC object
- *event_type*: - type of registered event for a callback
- *callback*: - callback function

```
esp_err_t tinyusb_cdcacm_unregister_callback (tinyusb_cdcacm_if_t if, cdcacm_event_type_t event_type)
```

Unregister a callback invoking on CDC event.

Return esp_err_t - ESP_OK or ESP_ERR_INVALID_ARG

Parameters

- *if*: - number of a CDC object
- *event_type*: - type of registered event for a callback

```
size_t tinyusb_cdcacm_write_queue_char (tinyusb_cdcacm_if_t if, char ch)
```

Sent one character to a write buffer.

Return size_t - amount of queued bytes

Parameters

- *if*: - number of a CDC object
- *ch*: - character to send

```
size_t tinyusb_cdcacm_write_queue (tinyusb_cdcacm_if_t if, const uint8_t *in_buf, size_t in_size)
```

Write data to write buffer from a byte array.

Return size_t - amount of queued bytes

Parameters

- `itf`: - number of a CDC object
- `in_buf`: - a source array
- `in_size`: - size to write from `arr_src`

`esp_err_t tinyusb_cdcacm_write_flush(tinyusb_cdcacm_itf_t itf, uint32_t timeout_ticks)`

Send all data from a write buffer. Use `tinyusb_cdcacm_write_queue` to add data to the buffer.

WARNING! TinyUSB can block output Endpoint for several RX callbacks, after will do additional flush after the each transfer. That can leads to the situation when you requested a flush, but it will fail until out of the next callbacks ends. SO USING OF THE FLUSH WITH TIMEOUTS IN CALLBACKS IS NOT RECOMMENDED - YOU CAN GET A LOCK FOR THE TIMEOUT

Return `esp_err_t` - `ESP_OK` if (`timeout_ticks > 0`) and flush was successful, `ESP_ERR_TIMEOUT` if timeout occurred or flush was successful with (`timeout_ticks == 0`) `ESP_FAIL` if flush was unsuccessful

Parameters

- `itf`: - number of a CDC object
- `timeout_ticks`: - waiting until flush will be considered as failed

`esp_err_t tinyusb_cdcacm_read(tinyusb_cdcacm_itf_t itf, uint8_t *out_buf, size_t out_buf_sz, size_t *rx_data_size)`

Read a content to the array, and defines it's size to the `sz_store`.

Return `esp_err_t` `ESP_OK`, `ESP_FAIL` or `ESP_ERR_INVALID_STATE`

Parameters

- `itf`: - number of a CDC object
- `out_buf`: - to this array will be stored the object from a CDC buffer
- `out_buf_sz`: - size of buffer for results
- `rx_data_size`: - to this address will be stored the object's size

bool `tusb_cdc_acm_initialized(tinyusb_cdcacm_itf_t itf)`

Check if the ACM initialized.

Return true or false

Parameters

- `itf`: - number of a CDC object

Structures

struct `cdcacm_event_rx_wanted_char_data_t`

Data provided to the input of the `callback_rx_wanted_char` callback.

Public Members

char `wanted_char`

Wanted character

struct `cdcacm_event_line_state_changed_data_t`

Data provided to the input of the `callback_line_state_changed` callback.

Public Members

bool `dtr`

Data Terminal Ready (DTR) line state

bool `rts`

Request To Send (RTS) line state

struct `cdcacm_event_line_coding_changed_data_t`

Data provided to the input of the `line_coding_changed` callback.

Public Members

`cdc_line_coding_t const *p_line_coding`
New line coding value

struct cdcacm_event_t
Describes an event passing to the input of a callbacks.

Public Members

`cdcacm_event_type_t type`
Event type

`cdcacm_event_rx_wanted_char_data_t rx_wanted_char_data`
Data input of the `callback_rx_wanted_char` callback

`cdcacm_event_line_state_changed_data_t line_state_changed_data`
Data input of the `callback_line_state_changed` callback

`cdcacm_event_line_coding_changed_data_t line_coding_changed_data`
Data input of the `line_coding_changed` callback

struct tinyusb_config_cdcacm_t
Configuration structure for CDC-ACM.

Public Members

`tinyusb_usbdev_t usb_dev`
Usb device to set up

`tinyusb_cdcacm_itf_t cdc_port`
CDC port

`size_t rx_unread_buf_sz`
Amount of data that can be passed to the AMC at once

`tusb_cdcacm_callback_t callback_rx`
Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

`tusb_cdcacm_callback_t callback_rx_wanted_char`
Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

`tusb_cdcacm_callback_t callback_line_state_changed`
Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

`tusb_cdcacm_callback_t callback_line_coding_changed`
Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

Type Definitions

typedef void (*`tusb_cdcacm_callback_t`) (int itf, `cdcacm_event_t *event`)
CDC-ACM callback type.

Enumerations

enum tinyusb_cdcacm_itf_t
CDC ports available to setup.

Values:

`TINYUSB_CDC_ACM_0 = 0x0`

enum cdcacm_event_type_t

Types of CDC ACM events.

Values:

CDC_EVENT_RX

CDC_EVENT_RX_WANTED_CHAR

CDC_EVENT_LINE_STATE_CHANGED

CDC_EVENT_LINE_CODING_CHANGED

Header File

- [components/tinyusb/additions/include/tusb_console.h](#)

Functions

esp_err_t **esp_tusb_init_console** (int *cdc_intf*)

Redirect output to the USB serial.

Return *esp_err_t* - ESP_OK, ESP_FAIL or an error code

Parameters

- *cdc_intf*: - interface number of TinyUSB' s CDC

esp_err_t **esp_tusb_deinit_console** (int *cdc_intf*)

Switch log to the default output.

Return *esp_err_t*

Parameters

- *cdc_intf*: - interface number of TinyUSB' s CDC

Header File

- [components/tinyusb/additions/include/tusb_tasks.h](#)

Functions

esp_err_t **tusb_run_task** (void)

This helper function creates and starts a task which wraps `tud_task()`.

The wrapper function basically wraps `tud_task` and some log. Default parameters: stack size and priority as configured, argument = NULL, not pinned to any core. If you have more requirements for this task, you can create your own task which calls `tud_task` as the last step.

Return Value

- ESP_OK: run tinyusb main task successfully
- ESP_FAIL: run tinyusb main task failed of internal error
- ESP_ERR_INVALID_STATE: tinyusb main task has been created before

esp_err_t **tusb_stop_task** (void)

This helper function stops and destroys the task created by `tusb_run_task()`

Return Value

- ESP_OK: stop and destory tinyusb main task successfully
- ESP_ERR_INVALID_STATE: tinyusb main task hasn' t been created yet

Header File

- [components/tinyusb/additions/include/vfs_tinyusb.h](#)

Functions

`esp_err_t esp_vfs_tusb_cdc_register` (int *cdc_intf*, char **const** **path*)

Register TinyUSB CDC at VFS with path.

Return `esp_err_t` ESP_OK or ESP_FAIL

Parameters

- `cdc_intf`: - interface number of TinyUSB's CDC
- `path`: - path where the CDC will be registered, `/dev/tusb_cdc` will be used if left NULL.

`esp_err_t esp_vfs_tusb_cdc_unregister` (char **const** **path*)

Unregister TinyUSB CDC from VFS.

Return `esp_err_t` ESP_OK or ESP_FAIL

Parameters

- `path`: - path where the CDC will be unregistered if NULL will be used `/dev/tusb_cdc`

2.3.24 USB Host

警告: The USB Host Library API is a beta version thus is subject to change.

The document provides information regarding the USB Host Library. This document is split into the following sections:

Sections

- [USB Host](#)
 - [Overview](#)
 - [Architecture](#)
 - [Usage](#)
 - [Examples](#)
 - [API Reference](#)

Overview

The USB Host Library (hereinafter referred to as the Host Library) is the lowest public facing API layer of the ESP-IDF USB Host Stack. In most cases, applications that require USB Host functionality will not need to interface with the Host Library directly. Instead, most applications will use the API provided by a host class driver that is implemented on top of the Host Library.

However, users may want to use the Host Library directly for some of (but not limited to) the following reasons:

- The user needs to implement a custom host class driver such as a vendor specific class driver
- The user has a requirement for a lower level of abstraction due to resource/latency requirements

Features & Limitations The Host Library has the following features:

- Supports Full Speed (FS) and Low Speed (LS) Devices
- Supports all four transfer types (Control, Bulk, Interrupt, and Isochronous)
- Allows multiple class drivers to run simultaneously (i.e., multiple clients of the Host Library)
- A single device can be used by multiple clients simultaneously (e.g., composite devices)
- The Host Library itself (and the underlying Host Stack) does not internally instantiate any OS tasks. The number of tasks are entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is (the number of host class drivers running + 1).

Currently, the Host Library (and the underlying Host Stack) has the following limitations:

- Only supports a single device, but the Host Library's API is designed for multiple device support.
- Only supports Asynchronous transfers
- Transfer timeouts are not supported yet

Architecture

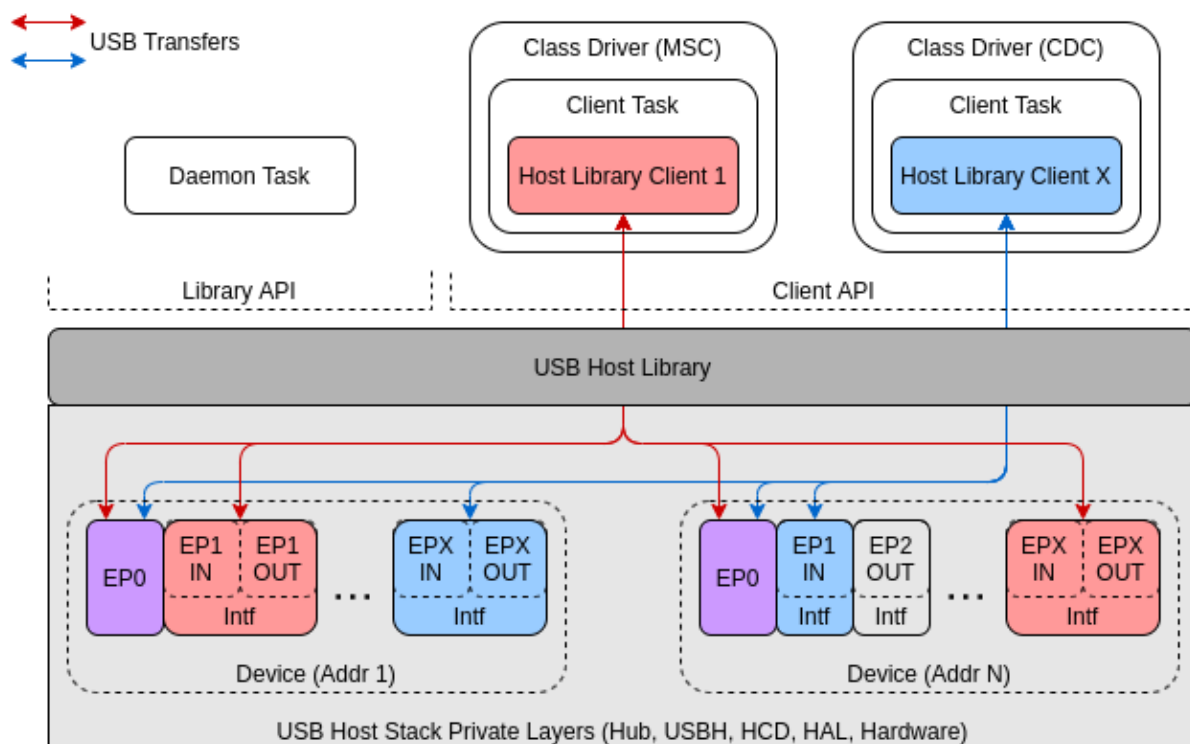

图 21: Diagram of the key entities involved in USB Host functionality

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

- The **Host Library**
- **Clients** of the Host Library
- **Devices**
- Host Library **Daemon Task**

Host Library The Host Library is the a lowest public facing layer of the USB Host Stack. Any other IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library's API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client (e.g., device enumeration). Usually, the library API is called by a Host Library Daemon Task.

Clients A client of the Host Library is a software component (such as a host class driver or user component) that uses the Host Library to communicate with a USB device. Generally each client has a one-to-one relation with a task, meaning that for a particular client, all of its Client API calls should be done from the context of the same task.

By organizing the software components that use the Host Library's into clients, the Host Library can delegate the handling of all client events (i.e., the events specific to that client) to the client's task. In other words, each client

task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.

Daemon Task Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events (i.e., events that are not specific to a client) that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients
- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task (usually the Host Library Daemon Task) to handle all of the library events.

Devices The Host Library hides the details of device handling (such as connection, memory allocation, and enumeration) from the clients. The clients are provided only with a list of already connected and enumerated devices to choose from. During enumeration, each device is configured to use configuration 1.

It is possible for a two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device's default endpoint (EPO), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device's address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints in the claimed interface. The client's task is responsible for handling its own processing and events.

Usage

The Host Library (and the underlying Host Stack) will not create any tasks. All tasks (i.e., the client tasks and the Daemon Task) will need to be created by the class drivers or the user. Instead, the Host Library provides two event handler functions that will handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be the largely centered around the invocation of these event handler functions.

Host Library & Daemon Task

Basic Usage The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the daemon task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
```

(下页继续)

```

usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
    ...
}
if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
    ...
}
...
}
...
}

```

注解: See the [peripherals/usb/host/usb_host_lib](#) example for a full implementation of the Daemon Task

图 22: Graph of Typical USB Host Library Lifecycle

Lifecycle The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves...

- two registered clients (Client 1 and Client 2)
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference the graph above, the typical lifecycle involves the following key stages.

1. **The Host Library is installed by calling `usb_host_install()`.**
 - Installation must be done before any other Host Library API is called.
 - Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) will depend on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.
2. **Once the Host Library is installed, the clients can be registered by calling `usb_host_client_register()`.**
 - This is typically called from the client task (where the client task waits for a signal from the Daemon Task).
 - This can be called elsewhere if necessary as long it is called after `usb_host_install()`.
3. **Device 1 connects and is then enumerated.**
 - Each registered client (in this case Client 1 and Client 2) are notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
 - Client 1 opens Device 1 and begins communication with it.
4. **Similarly Device 2 connects and is enumerated.**
 - Client 1 and 2 are notified of a new device (via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event).
 - Client 2 opens Device 2 and begins communication with it.

5. **Device 1 suddenly disconnects.**
 - Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
 - Client 2 is not notified as it has not opened Device 1.
6. **Client 1 completes its clean up and deregisters by calling `usb_host_client_deregister()`.**
 - This is typically called from the client task before the task exits.
 - This can be called elsewhere if necessary as long as Client 1 has already completed its clean up.
7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself.**
 - The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
 - Device 2 is still allocated (i.e., not freed) as it is still connected albeit not currently opened by any client.
8. **The Daemon Task decides to cleanup as there are no more clients.**
 - The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
 - If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
 - If `usb_host_device_free_all()` was unable to free all devices (e.g., because the device is still opened by a client), the function will return `ESP_ERR_NOT_FINISHED`.
 - The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.
9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

Clients & Class Driver

Basic Usage The Host Library API provides `usb_host_client_handle_events()` to handle a particular client's events. This function should be called repeatedly, typically from the client's task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling
- The function's primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` which delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` which indicates that a particular USB transfer previously submitted by the client has completed.

注解: Given that the callbacks are called from within `usb_host_client_handle_events()`, users should avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

        transfer->device_handle = class_driver_obj.dev_hdl;
        transfer->bEndpointAddress = 0x01;
        transfer->callback = transfer_cb;
        transfer->context = (void *)&class_driver_obj;
        usb_host_transfer_submit(transfer);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
        //Release the interface and close the device
        usb_host_interface_release(class_driver_obj.client_hdl, class_driver_
↪obj.dev_hdl, 1);
        usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.
↪dev_hdl);
        exit = true;
    }
    ... //Handle any other actions required by the class driver
}

//Cleanup class driver
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.client_hdl);
... //Delete the task and any other signal Daemon Task if required
}

```

注解: An actual host class driver will likely supported many more features, thus will have a much more complex state machine. A host class driver will likely also need to:

- Be able to open multiple devices
- Parse an opened device's descriptors to identify if the device is of the target class
- Communicate with multiple endpoints of an interface in a particular order
- Claim multiple interfaces of a device
- Handle various errors

Lifecycle The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources (e.g., allocating transfers using `usb_host_transfer_alloc()`).
3. For each new device that the class driver needs to communicate with:
 - a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
 - b. If the device is not already connected, wait for a `USB_HOST_CLIENT_EVENT_NEW_DEV` event from

- the client event callback.
- c. Open the device via `usb_host_device_open()`.
 - d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and `usb_host_get_active_config_descriptor()` respectively.
 - e. Claim the necessary interfaces of the device via `usb_host_interface_claim()`.
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
 5. Once an opened device is no longer needed by the class driver, or has disconnected (as indicated by a `USB_HOST_CLIENT_EVENT_DEV_GONE` event):
 - a. Stop any previously submitted transfers to the device's endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
 - b. Release all previously claimed interfaces via `usb_host_interface_release()`.
 - c. Close the device via `usb_host_device_close()`.
 6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
 7. Delete the client task. Signal the Daemon Task if necessary.

Examples

Host Library Examples The `peripherals/usb/host/usb_host_lib` demonstrates basic usage of the USB Host Library's API to implement a pseudo class driver.

Class Driver Examples The USB Host Stack provides a number examples that implement host class drivers using the Host Library's API.

CDC-ACM

- A host class driver for the Communication Device Class (Abstract Control Model) is currently implemented as an example component (found via `peripherals/usb/host/cdc/common/cdc_acm_host`).
- The `peripherals/usb/host/cdc/cdc_acm_host` example uses the CDC-ACM host driver component to communicate with CDC-ACM devices
- The `peripherals/usb/host/cdc/cdc_acm_bg96` example uses the CDC-ACM host driver component to communicate with non-compliant CDC-ACM devices (i.e., vendor-specific classes that support a subset of CDC-ACM features) such as the Quectel BG96 modem.

MSC

- A host class driver for the Mass Storage Class (Bulk-Only Transport) is current implemented as an example found via `peripherals/usb/host/msc`.

API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only `#include "usb/usb_host.h"` and all of USB Host Library headers will also be included.

- `usb/include/usb/usb_host.h` contains the functions and types of the USB Host Library
- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification (i.e., descriptors and standard requests).

Header File

- `components/usb/include/usb/usb_host.h`

Functions

esp_err_t **usb_host_install** (const *usb_host_config_t* **config*)

Install the USB Host Library.

- This function should only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

Note If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

Return *esp_err_t*

Parameters

- [in] *config*: USB Host Library configuration

esp_err_t **usb_host_uninstall** (void)

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag

Note If `skip_phy_setup` was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

Return *esp_err_t*

esp_err_t **usb_host_lib_handle_events** (TickType_t *timeout_ticks*, uint32_t **event_flags_ret*)

Handle USB Host Library events.

- This function handles all of the USB Host Library's processing and should be called repeatedly in a loop
- Check *event_flags_ret* to see if an flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

Note This function can block

Return *esp_err_t*

Parameters

- [in] *timeout_ticks*: Timeout in ticks to wait for an event to occur
- [out] *event_flags_ret*: Event flags that indicate what USB Host Library event occurred.

esp_err_t **usb_host_lib_unblock** (void)

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (`usb_host_lib_handle_events()`)

Return *esp_err_t*

esp_err_t **usb_host_lib_info** (*usb_host_lib_info_t* **info_ret*)

Get current information about the USB Host Library.

Return *esp_err_t*

Parameters

- [out] *info_ret*: USB Host Library Information

esp_err_t **usb_host_client_register** (const *usb_host_client_config_t* **client_config*,
usb_host_client_handle_t **client_hdl_ret*)

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function `usb_host_client_handle_events()` should be called repeatedly

Return *esp_err_t*

Parameters

- [in] *client_config*: Client configuration
- [out] *client_hdl_ret*: Client handle

esp_err_t **usb_host_client_deregister** (*usb_host_client_handle_t* client_hdl)

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library
- The client must have closed all previously opened devices before attempting to deregister

Return esp_err_t

Parameters

- [in] client_hdl: Client handle

esp_err_t **usb_host_client_handle_events** (*usb_host_client_handle_t* client_hdl, TickType_t timeout_ticks)

USB Host Library client processing function.

- This function handles all of a client's processing and should be called repeatedly in a loop
- For a particular client, this function should never be called by multiple threads simultaneously

Note This function can block

Return esp_err_t

Parameters

- [in] client_hdl: Client handle
- [in] timeout_ticks: Timeout in ticks to wait for an event to occur

esp_err_t **usb_host_client_unblock** (*usb_host_client_handle_t* client_hdl)

Unblock a client.

- This function simply unblocks a client if it is blocked on the usb_host_client_handle_events() function.
- This function is useful when need to unblock a client in order to deregister it.

Return esp_err_t

Parameters

- [in] client_hdl: Client handle

esp_err_t **usb_host_device_open** (*usb_host_client_handle_t* client_hdl, uint8_t dev_addr, *usb_device_handle_t* *dev_hdl_ret)

Open a device.

- This function allows a client to open a device
- A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

Return esp_err_t

Parameters

- [in] client_hdl: Client handle
- [in] dev_addr: Device's address
- [out] dev_hdl_ret: Device's handle

esp_err_t **usb_host_device_close** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl)

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before deregistering

Note This function can block

Return esp_err_t

Parameters

- [in] client_hdl: Client handle
- [in] dev_hdl: Device handle

esp_err_t **usb_host_device_free_all** (void)

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
- If a device is not opened by any clients, it will be freed immediately
- If a device is opened by at least one client, the device will be free when the last client closes that device.

- Wait for the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` flag to be set by `usb_host_lib_handle_events()` in order to know when all devices have been freed
- This function is useful when cleaning up devices before uninstalling the USB Host Library

Return

- `ESP_ERR_NOT_FINISHED`: There are one or more devices that still need to be freed. Wait for `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event
- `ESP_OK`: All devices already freed (i.e., there were no devices)
- Other: Error

esp_err_t **usb_host_device_addr_list_fill** (int *list_len*, uint8_t **dev_addr_list*, int **num_dev_ret*)

Fill a list of device address.

- This function fills an empty list with the address of connected devices
- The Device addresses can then used in `usb_host_device_open()`
- If there are more devices than the `list_len`, this function will only fill up to `list_len` number of devices.

Return `esp_err_t`

Parameters

- [in] `list_len`: Length of the empty list
- [inout] `dev_addr_list`: Empty list to be filled
- [out] `num_dev_ret`: Number of devices

esp_err_t **usb_host_device_info** (*usb_device_handle_t* *dev_hdl*, *usb_device_info_t* **dev_info*)

Get device' s information.

- This function gets some basic information of a device
- The device must be opened first before attempting to get its information

Note This function can block

Return `esp_err_t`

Parameters

- [in] `dev_hdl`: Device handle
- [out] `dev_info`: Device information

esp_err_t **usb_host_get_device_descriptor** (*usb_device_handle_t* *dev_hdl*, **const** *usb_device_desc_t* ***device_desc*)

Get device' s device descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device' s descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

Note No control transfer is sent. The device' s descriptor is cached on enumeration

Return `esp_err_t`

Parameters

- [in] `dev_hdl`: Device handle
- [out] `device_desc`: Device descriptor

esp_err_t **usb_host_get_active_config_descriptor** (*usb_device_handle_t* *dev_hdl*, **const** *usb_config_desc_t* ***config_desc*)

Get device' s active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device' s active configuration descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

Note This function can block

Note No control transfer is sent. A device' s active configuration descriptor is cached on enumeration

Return `esp_err_t`

Parameters

- [in] `dev_hdl`: Device handle
- [out] `config_desc`: Configuration descriptor

***esp_err_t* usb_host_interface_claim** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl, *uint8_t* bInterfaceNumber, *uint8_t* bAlternateSetting)

Function for a client to claim a device's interface.

- A client must claim a device's interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

Note This function can block

Return *esp_err_t*

Parameters

- [in] client_hdl: Client handle
- [in] dev_hdl: Device handle
- [in] bInterfaceNumber: Interface number
- [in] bAlternateSetting: Interface alternate setting number

***esp_err_t* usb_host_interface_release** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl, *uint8_t* bInterfaceNumber)

Function for a client to release a previously claimed interface.

- A client should release a device's interface after it no longer needs to communicate with the interface
- A client must release all of its interfaces of a device it has claimed before being able to close the device

Note This function can block

Return *esp_err_t*

Parameters

- [in] client_hdl: Client handle
- [in] dev_hdl: Device handle
- [in] bInterfaceNumber: Interface number

***esp_err_t* usb_host_endpoint_halt** (*usb_device_handle_t* dev_hdl, *uint8_t* bEndpointAddress)

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

Note This function can block

Return *esp_err_t*

Parameters

- dev_hdl: Device handle
- bEndpointAddress: Endpoint address

***esp_err_t* usb_host_endpoint_flush** (*usb_device_handle_t* dev_hdl, *uint8_t* bEndpointAddress)

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- Flushing an endpoint will cause any queued up transfers to be canceled

Note This function can block

Return *esp_err_t*

Parameters

- dev_hdl: Device handle
- bEndpointAddress: Endpoint address

***esp_err_t* usb_host_endpoint_clear** (*usb_device_handle_t* dev_hdl, *uint8_t* bEndpointAddress)

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

Note This function can block

Return `esp_err_t`

Parameters

- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

`esp_err_t` **usb_host_transfer_alloc** (`size_t data_buffer_size`, `int num_isoc_packets`, `usb_transfer_t **transfer`)

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

Return `esp_err_t`

Parameters

- `[in] data_buffer_size`: Size of the transfer's data buffer
- `[in] num_isoc_packets`: Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- `[out] transfer`: Transfer object

`esp_err_t` **usb_host_transfer_free** (`usb_transfer_t *transfer`)

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return `ESP_OK`

Return `esp_err_t`

Parameters

- `[in] transfer`: Transfer object

`esp_err_t` **usb_host_transfer_submit** (`usb_transfer_t *transfer`)

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

Return `esp_err_t`

Parameters

- `[in] transfer`: Initialized transfer object

`esp_err_t` **usb_host_transfer_submit_control** (`usb_host_client_handle_t client_hdl`, `usb_transfer_t *transfer`)

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer's data buffer should contain the control transfer setup packet
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

Return `esp_err_t`

Parameters

- `[in] client_hdl`: Client handle
- `[in] transfer`: Initialized transfer object

Structures

struct `usb_host_client_event_msg_t`

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

Note The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

Public Members

usb_host_client_event_t **event**

Type of event

uint8_t **address**

New device's address

usb_device_handle_t **dev_hdl**

The handle of the device that was gone

struct usb_host_lib_info_t

Current information about the USB Host Library obtained via `usb_host_lib_info()`

Public Members

int **num_devices**

Current number of connected (and enumerated) devices

int **num_clients**

Current number of registered clients

struct usb_host_config_t

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

Public Members

bool **skip_phy_setup**

If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling `usb_host_install()`. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY

int **intr_flags**

Interrupt flags for the underlying ISR used by the USB Host stack

struct usb_host_client_config_t

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

Public Members

bool **is_synchronous**

Whether the client is asynchronous or synchronous or not. Set to false for now.

int **max_num_event_msg**

Maximum number of event messages that can be stored (e.g., 3)

usb_host_client_event_cb_t **client_event_callback**

Client's event callback function

void ***callback_arg**
Event callback function argument

Macros

USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS
All clients have been deregistered from the USB Host Library

USB_HOST_LIB_EVENT_FLAGS_ALL_FREE
The USB Host Library has freed all devices

Type Definitions

typedef struct usb_host_client_handle_s ***usb_host_client_handle_t**
Handle to a USB Host Library asynchronous client.

An asynchronous client can be registered using `usb_host_client_register()`

Note Asynchronous API

typedef void (***usb_host_client_event_cb_t**) (**const** *usb_host_client_event_msg_t*
**event_msg*, void **arg*)

Client event callback.

- Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
- The client event callback is run from the context of the clients `usb_host_client_handle_events()` function

Enumerations

enum usb_host_client_event_t
The type event in a client event message.

Values:

USB_HOST_CLIENT_EVENT_NEW_DEV
A new device has been enumerated and added to the USB Host Library

USB_HOST_CLIENT_EVENT_DEV_GONE
A device opened by the client is now gone

Header File

- [components/usb/include/usb/usb_helpers.h](#)

Functions

const *usb_standard_desc_t* ***usb_parse_next_descriptor** (**const** *usb_standard_desc_t*
**cur_desc*, uint16_t *wTotalLength*, int
**offset*)

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

Return *usb_standard_desc_t** Next descriptor, NULL if end of configuration descriptor reached

Parameters

- [in] *cur_desc*: Current descriptor
- [in] *wTotalLength*: Total length of the configuration descriptor
- [inout] *offset*: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

```

const usb_standard_desc_t*usb_parse_next_descriptor_of_type (const
                                                                usb_standard_desc_t
                                                                *cur_desc,      uint16_t
                                                                wTotalLength,   uint8_t
                                                                bDescriptorType, int
                                                                *offset)

```

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the bDescriptorType value) within the configuration descriptor.

Return usb_standard_desc_t* Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

Parameters

- [in] cur_desc: Current descriptor
- [in] wTotalLength: Total length of the configuration descriptor
- [in] bDescriptorType: Type of the next descriptor to get
- [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

```

int usb_parse_interface_number_of_alternate (const  usb_config_desc_t  *config_desc,
                                                uint8_t bInterfaceNumber)

```

Get the number of alternate settings for a bInterfaceNumber.

Given a particular configuration descriptor, for a particular bInterfaceNumber, get the number of alternate settings available for that interface (i.e., the max possible value of bAlternateSetting for that bInterfaceNumber).

Return int The number of alternate settings that the interface has, -1 if bInterfaceNumber not found

Parameters

- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number

```

const usb_intf_desc_t*usb_parse_interface_descriptor (const  usb_config_desc_t
                                                       *config_desc,  uint8_t  bInter-
                                                       faceNumber, uint8_t bAlternateSet-
                                                       ting, int *offset)

```

Get a particular interface descriptor (using bInterfaceNumber and bAlternateSetting)

Given a full configuration descriptor, get a particular interface descriptor.

Note To get the number of alternate settings for a particular bInterfaceNumber, call usb_parse_interface_number_of_alternate()

Return const usb_intf_desc_t* Pointer to interface descriptor, NULL if not found.

Parameters

- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number
- [in] bAlternateSetting: Alternate setting number
- [out] offset: Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

```

const usb_ep_desc_t*usb_parse_endpoint_descriptor_by_index (const  usb_intf_desc_t
                                                            *intf_desc,  int  index,
                                                            uint16_t  wTotalLength,
                                                            int *offset)

```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

Note If bNumEndpoints is 0, it means the interface uses the default endpoint only

Return const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

Parameters

- [in] intf_desc: Pointer to the start of an interface descriptor
- [in] index: Endpoint index

- [in] wTotalLength: Total length of the containing configuration descriptor
- [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address (const
                                                             usb_config_desc_t
                                                             *config_desc, uint8_t
                                                             bInterfaceNumber,
                                                             uint8_t  bAlternate-
                                                             Setting,    uint8_t
                                                             bEndpointAddress, int
                                                             *offset)
```

Get an endpoint descriptor based on an endpoint's address.

Given a configuration descriptor, get an endpoint descriptor based on its bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

Return const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

Parameters

- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number
- [in] bAlternateSetting: Alternate setting number
- [in] bEndpointAddress: Endpoint address
- [out] offset: Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

```
void usb_print_device_descriptor (const usb_device_desc_t *devc_desc)
```

Print device descriptor.

Parameters

- devc_desc: Device descriptor

```
void usb_print_config_descriptor (const          usb_config_desc_t          *cfg_desc,
                                  print_class_descriptor_cb class_specific_cb)
```

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the class_specific_cb if it is provided

Parameters

- cfg_desc: Configuration descriptor
- class_specific_cb: Class specific descriptor callback. Can be NULL

```
void usb_print_string_descriptor (const usb_str_desc_t *str_desc)
```

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

Parameters

- str_desc: String descriptor

```
static int usb_round_up_to_mps (int num_bytes, int mps)
```

Round up to an integer multiple of endpoint's MPS.

This is a convenience function to round up a size/length to an endpoint's MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

- If MPS <= 0, this function will return 0
- If num_bytes <= 0, this function will return 0

Return int Round up integer multiple of MPS

Parameters

- [in] num_bytes: Number of bytes
- [in] mps: MPS

Type Definitions

typedef void (***print_class_descriptor_cb**) (const *usb_standard_desc_t* *)

Print class specific descriptor callback.

Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

Header File

- `components/usb/include/usb/usb_types_stack.h`

Structures

struct **usb_device_info_t**

Basic information of an enumerated device.

Public Members

usb_speed_t **speed**

Device' s speed

uint8_t **dev_addr**

Device' s address

uint8_t **bMaxPacketSize0**

The maximum packet size of the device' s default endpoint

uint8_t **bConfigurationValue**

Device' s current configuration number

const *usb_str_desc_t* ***str_desc_manufacturer**

Pointer to Manufacturer string descriptor (can be NULL)

const *usb_str_desc_t* ***str_desc_product**

Pointer to Product string descriptor (can be NULL)

const *usb_str_desc_t* ***str_desc_serial_num**

Pointer to Serial Number string descriptor (can be NULL)

struct **usb_isoc_packet_desc_t**

Isochronous packet descriptor.

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint' s specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

Public Members

int **num_bytes**

Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int **actual_num_bytes**

Actual number of bytes transmitted/received in the packet

usb_transfer_status_t **status**

Status of the packet

struct **usb_transfer_s**

Public Members**uint8_t *const data_buffer**

Pointer to data buffer

const size_t data_buffer_size

Size of the data buffer in bytes

int num_bytes

Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num_bytes should be an integer multiple of MPS.

int actual_num_bytes

Actual number of bytes transferred

uint32_t flags

Transfer flags

***usb_device_handle_t* device_handle**

Device handle

uint8_t bEndpointAddress

Endpoint Address

***usb_transfer_status_t* status**

Status of the transfer

uint32_t timeout_ms

Timeout (in milliseconds) of the packet (currently not supported yet)

***usb_transfer_cb_t* callback**

Transfer callback

void *context

Context variable for transfer to associate transfer with something

const int num_isoc_packets

Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

***usb_isoc_packet_desc_t* isoc_packet_desc[]**

Descriptors for each Isochronous packet

Macros**USB_TRANSFER_FLAG_ZERO_PACK**

Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer's length (i.e., transfer.num_bytes) is a multiple of the endpoint's MPS

Otherwise, this flag has no effect.

Users should check whether their target device's class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

Note See USB2.0 specification 5.7.3 and 5.8.3 for more details

Note IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host(For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

Type Definitions

typedef struct usb_device_handle_s ***usb_device_handle_t**

Handle of a USB Device connected to a USB Host.

typedef struct *usb_transfer_s* **usb_transfer_t**

USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- Bulk: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint's MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- Control: This structure represents a single control transfer. This first 8 bytes of the `data_buffer` must be filled with the setup packet (see *usb_setup_packet_t*). The `num_bytes` field should be the total size of the transfer (i.e., size of setup packet + `wLength`).
- Interrupt: Represents an interrupt transfer. If `num_bytes` exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint's specified interval.
- Isochronous: Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each `isoc_packet_desc`. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB's overall status and the status of each packet descriptor will be updated, and the `actual_num_bytes` reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.

Note For Bulk/Control/Interrupt IN transfers, the `num_bytes` must be a integer multiple of the endpoint's MPS

Note This structure should be allocated via `usb_host_transfer_alloc()`

Note Once the transfer has be submitted, users should not modify the structure until the transfer has completed

typedef void (***usb_transfer_cb_t**) (*usb_transfer_t* *transfer)

USB transfer completion callback.

Enumerations

enum **usb_speed_t**

USB Standard Speeds.

Values:

USB_SPEED_LOW = 0

USB Low Speed (1.5 Mbit/s)

USB_SPEED_FULL

USB Full Speed (12 Mbit/s)

enum **usb_transfer_type_t**

The type of USB transfer.

Note The enum values need to match the `bmAttributes` field of an EP descriptor

Values:

USB_TRANSFER_TYPE_CTRL = 0

USB_TRANSFER_TYPE_ISOCHRONOUS

USB_TRANSFER_TYPE_BULK

USB_TRANSFER_TYPE_INTR

enum usb_transfer_status_t

The status of a particular transfer.

Values:

USB_TRANSFER_STATUS_COMPLETED

The transfer was successful (but may be short)

USB_TRANSFER_STATUS_ERROR

The transfer failed because due to excessive errors (e.g. no response or CRC error)

USB_TRANSFER_STATUS_TIMED_OUT

The transfer failed due to a time out

USB_TRANSFER_STATUS_CANCELED

The transfer was canceled

USB_TRANSFER_STATUS_STALL

The transfer was stalled

USB_TRANSFER_STATUS_OVERFLOW

The transfer as more data was sent than was requested

USB_TRANSFER_STATUS_SKIPPED

ISOC packets only. The packet was skipped due to system latency or bus overload

USB_TRANSFER_STATUS_NO_DEVICE

The transfer failed because the target device is gone

Header File

- [components/usb/include/usb/usb_types_ch9.h](#)

Unions

union usb_setup_packet_t

#include <usb_types_ch9.h> Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

Public Members

uint8_t bmRequestType

Characteristics of request

uint8_t bRequest

Specific request

uint16_t wValue

Word-sized field that varies according to request

uint16_t wIndex

Word-sized field that varies according to request; typically used to pass an index or offset

uint16_t wLength

Number of bytes to transfer if there is a data stage

struct usb_setup_packet_t::[anonymous] [anonymous]

uint8_t val[USB_SETUP_PACKET_SIZE]

union usb_standard_desc_t

#include <usb_types_ch9.h> USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

Public Members**uint8_t bLength**

Size of the descriptor in bytes

uint8_t bDescriptorType

Descriptor Type

struct usb_standard_desc_t::[anonymous] USB_DESC_ATTR**uint8_t val[USB_STANDARD_DESC_SIZE]****union usb_device_desc_t**

#include <usb_types_ch9.h> Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details

Public Members**uint8_t bLength**

Size of the descriptor in bytes

uint8_t bDescriptorType

DEVICE Descriptor Type

uint16_t bcdUSB

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

uint8_t bDeviceClass

Class code (assigned by the USB-IF)

uint8_t bDeviceSubClass

Subclass code (assigned by the USB-IF)

uint8_t bDeviceProtocol

Protocol code (assigned by the USB-IF)

uint8_t bMaxPacketSize0

Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

uint16_t idVendor

Vendor ID (assigned by the USB-IF)

uint16_t idProduct

Product ID (assigned by the manufacturer)

uint16_t bcdDevice

Device release number in binary-coded decimal

uint8_t iManufacturer

Index of string descriptor describing manufacturer

uint8_t iProduct

Index of string descriptor describing product

uint8_t iSerialNumber

Index of string descriptor describing the device's serial number

uint8_t bNumConfigurations

Number of possible configurations

```
struct usb_device_desc_t::[anonymous] USB_DESC_ATTR
```

```
uint8_t val[USB_DEVICE_DESC_SIZE]
```

```
union usb_config_desc_t
```

```
#include <usb_types_ch9.h> Structure representing a short USB configuration descriptor.
```

See Table 9-10 of USB2.0 specification for more details

Note The full USB configuration includes all the interface and endpoint descriptors of that configuration.

Public Members

```
uint8_t bLength
```

Size of the descriptor in bytes

```
uint8_t bDescriptorType
```

CONFIGURATION Descriptor Type

```
uint16_t wTotalLength
```

Total length of data returned for this configuration

```
uint8_t bNumInterfaces
```

Number of interfaces supported by this configuration

```
uint8_t bConfigurationValue
```

Value to use as an argument to the SetConfiguration() request to select this configuration

```
uint8_t iConfiguration
```

Index of string descriptor describing this configuration

```
uint8_t bmAttributes
```

Configuration characteristics

```
uint8_t bMaxPower
```

Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.

```
struct usb_config_desc_t::[anonymous] USB_DESC_ATTR
```

```
uint8_t val[USB_CONFIG_DESC_SIZE]
```

```
union usb_iad_desc_t
```

```
#include <usb_types_ch9.h> Structure representing a USB interface association descriptor.
```

Public Members

```
uint8_t bLength
```

Size of the descriptor in bytes

```
uint8_t bDescriptorType
```

INTERFACE ASSOCIATION Descriptor Type

```
uint8_t bFirstInterface
```

Interface number of the first interface that is associated with this function

```
uint8_t bInterfaceCount
```

Number of contiguous interfaces that are associated with this function

```
uint8_t bFunctionClass
```

Class code (assigned by USB-IF)

```
uint8_t bFunctionSubClass
```

Subclass code (assigned by USB-IF)

```
uint8_t bFunctionProtocol
```

Protocol code (assigned by USB-IF)

uint8_t iFunction
Index of string descriptor describing this function

struct usb_iad_desc_t::[anonymous] USB_DESC_ATTR

uint8_t val[USB_IAD_DESC_SIZE]

union usb_intf_desc_t

#include <usb_types_ch9.h> Structure representing a USB interface descriptor.

See Table 9-12 of USB2.0 specification for more details

Public Members

uint8_t bLength
Size of the descriptor in bytes

uint8_t bDescriptorType
INTERFACE Descriptor Type

uint8_t bInterfaceNumber
Number of this interface.

uint8_t bAlternateSetting
Value used to select this alternate setting for the interface identified in the prior field

uint8_t bNumEndpoints
Number of endpoints used by this interface (excluding endpoint zero).

uint8_t bInterfaceClass
Class code (assigned by the USB-IF)

uint8_t bInterfaceSubClass
Subclass code (assigned by the USB-IF)

uint8_t bInterfaceProtocol
Protocol code (assigned by the USB)

uint8_t iInterface
Index of string descriptor describing this interface

struct usb_intf_desc_t::[anonymous] USB_DESC_ATTR

uint8_t val[USB_INTF_DESC_SIZE]

union usb_ep_desc_t

#include <usb_types_ch9.h> Structure representing a USB endpoint descriptor.

See Table 9-13 of USB2.0 specification for more details

Public Members

uint8_t bLength
Size of the descriptor in bytes

uint8_t bDescriptorType
ENDPOINT Descriptor Type

uint8_t bEndpointAddress
The address of the endpoint on the USB device described by this descriptor

uint8_t bmAttributes
This field describes the endpoint's attributes when it is configured using the bConfigurationValue.

uint16_t wMaxPacketSize
Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

uint8_t bInterval

Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

```
struct usb_ep_desc_t::[anonymous] USB_DESC_ATTR
```

```
uint8_t val[USB_EP_DESC_SIZE]
```

union usb_str_desc_t

#include <usb_types_ch9.h> Structure representing a USB string descriptor.

Public Members**uint8_t bLength**

Size of the descriptor in bytes

uint8_t bDescriptorType

STRING Descriptor Type

uint16_t wData[]

UTF-16LE encoded

```
struct usb_str_desc_t::[anonymous] USB_DESC_ATTR
```

```
uint8_t val[USB_STR_DESC_SIZE]
```

Macros

```
USB_DESC_ATTR
```

```
USB_B_DESCRIPTOR_TYPE_DEVICE
```

Descriptor types from USB2.0 specification table 9.5.

```
USB_B_DESCRIPTOR_TYPE_CONFIGURATION
```

```
USB_B_DESCRIPTOR_TYPE_STRING
```

```
USB_B_DESCRIPTOR_TYPE_INTERFACE
```

```
USB_B_DESCRIPTOR_TYPE_ENDPOINT
```

```
USB_B_DESCRIPTOR_TYPE_DEVICE_QUALIFIER
```

```
USB_B_DESCRIPTOR_TYPE_OTHER_SPEED_CONFIGURATION
```

```
USB_B_DESCRIPTOR_TYPE_INTERFACE_POWER
```

```
USB_B_DESCRIPTOR_TYPE_OTG
```

Descriptor types from USB 2.0 ECN.

```
USB_B_DESCRIPTOR_TYPE_DEBUG
```

```
USB_B_DESCRIPTOR_TYPE_INTERFACE_ASSOCIATION
```

```
USB_B_DESCRIPTOR_TYPE_SECURITY
```

Descriptor types from Wireless USB spec.

```
USB_B_DESCRIPTOR_TYPE_KEY
```

```
USB_B_DESCRIPTOR_TYPE_ENCRYPTION_TYPE
```

```
USB_B_DESCRIPTOR_TYPE_BOS
```

```
USB_B_DESCRIPTOR_TYPE_DEVICE_CAPABILITY
```

```
USB_B_DESCRIPTOR_TYPE_WIRELESS_ENDPOINT_COMP
```

```
USB_B_DESCRIPTOR_TYPE_WIRE_ADAPTER
```

```
USB_B_DESCRIPTOR_TYPE_RPIPE
```

USB_B_DESCRIPTOR_TYPE_CS_RADIO_CONTROL

USB_B_DESCRIPTOR_TYPE_PIPE_USAGE

Descriptor types from UAS specification.

USB_SETUP_PACKET_SIZE

Size of a USB control transfer setup packet in bytes.

USB_BM_REQUEST_TYPE_DIR_OUT

Bit masks belonging to the bmRequestType field of a setup packet.

USB_BM_REQUEST_TYPE_DIR_IN

USB_BM_REQUEST_TYPE_TYPE_STANDARD

USB_BM_REQUEST_TYPE_TYPE_CLASS

USB_BM_REQUEST_TYPE_TYPE_VENDOR

USB_BM_REQUEST_TYPE_TYPE_RESERVED

USB_BM_REQUEST_TYPE_TYPE_MASK

USB_BM_REQUEST_TYPE_RECIP_DEVICE

USB_BM_REQUEST_TYPE_RECIP_INTERFACE

USB_BM_REQUEST_TYPE_RECIP_ENDPOINT

USB_BM_REQUEST_TYPE_RECIP_OTHER

USB_BM_REQUEST_TYPE_RECIP_MASK

USB_B_REQUEST_GET_STATUS

Bit masks belonging to the bRequest field of a setup packet.

USB_B_REQUEST_CLEAR_FEATURE

USB_B_REQUEST_SET_FEATURE

USB_B_REQUEST_SET_ADDRESS

USB_B_REQUEST_GET_DESCRIPTOR

USB_B_REQUEST_SET_DESCRIPTOR

USB_B_REQUEST_GET_CONFIGURATION

USB_B_REQUEST_SET_CONFIGURATION

USB_B_REQUEST_GET_INTERFACE

USB_B_REQUEST_SET_INTERFACE

USB_B_REQUEST_SYNCH_FRAME

USB_W_VALUE_DT_DEVICE

Bit masks belonging to the wValue field of a setup packet.

USB_W_VALUE_DT_CONFIG

USB_W_VALUE_DT_STRING

USB_W_VALUE_DT_INTERFACE

USB_W_VALUE_DT_ENDPOINT

USB_W_VALUE_DT_DEVICE_QUALIFIER

USB_W_VALUE_DT_OTHER_SPEED_CONFIG

USB_W_VALUE_DT_INTERFACE_POWER

USB_SETUP_PACKET_INIT_SET_ADDR (setup_pkt_ptr, addr)

Initializer for a SET_ADDRESS request.

Sets the address of a connected device

USB_SETUP_PACKET_INIT_GET_DEVICE_DESC (setup_pkt_ptr)

Initializer for a request to get a device's device descriptor.

USB_SETUP_PACKET_INIT_GET_CONFIG (setup_pkt_ptr)

Initializer for a request to get a device's current configuration number.

USB_SETUP_PACKET_INIT_GET_CONFIG_DESC (setup_pkt_ptr, desc_index, desc_len)

Initializer for a request to get one of the device's current configuration descriptor.

- desc_index indicates the configuration's index number
- Number of bytes of the configuration descriptor to get

USB_SETUP_PACKET_INIT_SET_CONFIG (setup_pkt_ptr, config_num)

Initializer for a request to set a device's current configuration number.

USB_SETUP_PACKET_INIT_SET_INTERFACE (setup_pkt_ptr, intf_num, alt_setting_num)

Initializer for a request to set an interface's alternate setting.

USB_SETUP_PACKET_INIT_GET_STR_DESC (setup_pkt_ptr, string_index, lang_id, desc_len)

Initializer for a request to get a string descriptor.

USB_STANDARD_DESC_SIZE

Size of dummy USB standard descriptor.

USB_DEVICE_DESC_SIZE

Size of a USB device descriptor in bytes.

USB_CLASS_PER_INTERFACE

Possible base class values of the bDeviceClass field of a USB device descriptor.

USB_CLASS_AUDIO

USB_CLASS_COMM

USB_CLASS_HID

USB_CLASS_PHYSICAL

USB_CLASS_STILL_IMAGE

USB_CLASS_PRINTER

USB_CLASS_MASS_STORAGE

USB_CLASS_HUB

USB_CLASS_CDC_DATA

USB_CLASS_CSCID

USB_CLASS_CONTENT_SEC

USB_CLASS_VIDEO

USB_CLASS_WIRELESS_CONTROLLER

USB_CLASS_PERSONAL_HEALTHCARE

USB_CLASS_AUDIO_VIDEO

USB_CLASS_BILLBOARD

USB_CLASS_USB_TYPE_C_BRIDGE

USB_CLASS_MISC

USB_CLASS_APP_SPEC

USB_CLASS_VENDOR_SPEC

USB_SUBCLASS_VENDOR_SPEC

Vendor specific subclass code.

USB_CONFIG_DESC_SIZE

Size of a short USB configuration descriptor in bytes.

Note The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

USB_BM_ATTRIBUTES_ONE

Bit masks belonging to the bmAttributes field of a configuration descriptor.

USB_BM_ATTRIBUTES_SELFPOWER**USB_BM_ATTRIBUTES_WAKEUP****USB_BM_ATTRIBUTES_BATTERY****USB_IAD_DESC_SIZE**

Size of a USB interface association descriptor in bytes.

USB_INTF_DESC_SIZE

Size of a USB interface descriptor in bytes.

USB_EP_DESC_SIZE

Size of a USB endpoint descriptor in bytes.

USB_B_ENDPOINT_ADDRESS_EP_NUM_MASK

Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

USB_B_ENDPOINT_ADDRESS_EP_DIR_MASK**USB_BM_ATTRIBUTES_XFERTYPE_MASK**

Bit masks belonging to the bmAttributes field of an endpoint descriptor.

USB_BM_ATTRIBUTES_XFER_CONTROL**USB_BM_ATTRIBUTES_XFER_ISOC****USB_BM_ATTRIBUTES_XFER_BULK****USB_BM_ATTRIBUTES_XFER_INT****USB_BM_ATTRIBUTES_SYNCNCTYPE_MASK****USB_BM_ATTRIBUTES_SYNC_NONE****USB_BM_ATTRIBUTES_SYNC_ASYNC****USB_BM_ATTRIBUTES_SYNC_ADAPTIVE****USB_BM_ATTRIBUTES_SYNC_SYNC****USB_BM_ATTRIBUTES_USAGETYPE_MASK****USB_BM_ATTRIBUTES_USAGE_DATA****USB_BM_ATTRIBUTES_USAGE_FEEDBACK****USB_BM_ATTRIBUTES_USAGE_IMPLICIT_FB****USB_EP_DESC_GET_XFERTYPE** (desc_ptr)

Macro helpers to get information about an endpoint from its descriptor.

USB_EP_DESC_GET_EP_NUM (desc_ptr)**USB_EP_DESC_GET_EP_DIR** (desc_ptr)**USB_EP_DESC_GET_MPS** (desc_ptr)**USB_STR_DESC_SIZE**

Size of a short USB string descriptor in bytes.

Enumerations

enum usb_device_state_t

USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

Note The USB_DEVICE_STATE_NOT_ATTACHED is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

Values:

USB_DEVICE_STATE_NOT_ATTACHED

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

USB_DEVICE_STATE_ATTACHED

Device is attached to the USB, but is not powered.

USB_DEVICE_STATE_POWERED

Device is attached to the USB and powered, but has not been reset.

USB_DEVICE_STATE_DEFAULT

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

USB_DEVICE_STATE_ADDRESS

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

USB_DEVICE_STATE_CONFIGURED

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

USB_DEVICE_STATE_SUSPENDED

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device's function.

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 [peripherals](#) 目录下。

2.4 应用层协议

2.4.1 mDNS 服务

概述

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

绝大多数的操作系统默认都会安装 mDNS 服务，或者提供单独的安装包。Mac OS 默认会安装名为 Bonjour 的服务（该服务基于 mDNS），此外 Apple 还发布了适用于 Windows 系统的安装程序，可以在 [官方支持](#) 找到。在 Linux 上，mDNS 服务由 [avahi](#) 提供，通常也会被默认安装。

mDNS 属性

- `hostname`: 设备会去响应的主机名，如果没有设置，会根据设备的网络接口名定义 `hostname`。例如，`my-esp32s3` 会被解析为 `my-esp32s3.local`。
- `default_instance`: 默认实例名（即易记的设备名），例如 `Jhon's ESP32-S3 Thing`。如果没有设置，将会使用 `hostname`。

以下为 STA 接口启动 mDNS 服务并设置 `hostname` 和 `default_instance` 的示例方法：

```

void start_mdns_service()
{
    // 初始化 mDNS 服务
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    // 设置 hostname
    mdns_hostname_set("my-esp32s3");
    // 设置默认实例
    mdns_instance_name_set("Jhon's ESP32-S3 Thing");
}

```

mDNS 服务 mDNS 可以广播设备能够提供的网络服务的相关信息，每个服务会由以下属性构成。

- `instance_name`: 实例名 (即易记的服务名)，例如 Jhon's ESP32-S3 Web Server。如果没有定义，会使用 `default_instance`。
- `service_type`: (必需) 服务类型，以下划线为前缀，[这里](#) 列出了常见的类型。
- `proto`: (必需) 服务运行所依赖的协议，以下划线为前缀，例如 `_tcp` 或者 `_udp`。
- `port`: (必需) 服务运行所用的端口号。
- `txt`: 形如 `{var, val}` 的字符串数组，用于定义服务的属性。

添加一些服务和不同属性的示例方法:

```

void add_mdns_services()
{
    // 添加服务
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    // 注意: 必须先添加服务, 然后才能设置其属性
    // web 服务器使用自定义的实例名
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32-S3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32s3"},
        {"u", "user"},
        {"p", "password"}
    };
    // 设置服务的文本数据 (会释放并替换当前数据)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    // 修改服务端口号
    mdns_service_port_set("_myservice", "_udp", 4321);
}

```

mDNS 查询 mDNS 提供查询服务和解析主机 IP/IPv6 地址的方法。

服务查询的结果会作为 `mdns_result_t` 类型对象的链表返回。

解析主机 IP 地址的示例方法:

```

void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;

```

(下页继续)

```

addr.addr = 0;

esp_err_t err = mdns_query_a(host_name, 2000, &addr);
if(err){
    if(err == ESP_ERR_NOT_FOUND){
        printf("Host was not found!");
        return;
    }
    printf("Query Failed");
    return;
}

printf(IPSTR, IP2STR(&addr));
}

```

解析本地服务的示例方法:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
↪protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){

```

(下页继续)

```

    ESP_LOGE(TAG, "Query Failed");
    return;
}
if(!results){
    ESP_LOGW(TAG, "No results found!");
    return;
}

mdns_print_results(results);
mdns_query_results_free(results);
}

```

使用上述方法的示例:

```

void my_app_some_method(){
    // 搜索 esp32s3-mdns.local
    resolve_mdns_host("esp32s3-mdns");

    // 搜索 HTTP 服务器
    find_mdns_service("_http", "_tcp");
    // 或者搜索文件服务器
    find_mdns_service("_smb", "_tcp"); // Windows 系统的共享服务
    find_mdns_service("_afpovertcp", "_tcp"); // Apple AFP 文件共享服务
    find_mdns_service("_nfs", "_tcp"); // NFS 服务器
    find_mdns_service("_ftp", "_tcp"); // FTP 服务器
    // 或者网络打印机
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}

```

应用示例

有关 mDNS 服务器和查询器的应用示例请参考 [protocols/mdns](#)。

API 参考

Header File

- [components/mdns/include/mdns.h](#)

Functions

esp_err_t **mdns_init** (void)

Initialize mDNS on given interface.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mdns task

void **mdns_free** (void)

Stop and free mDNS server.

esp_err_t **mdns_hostname_set** (const char *hostname)

Set the hostname for mDNS server required if you want to advertise services.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

- ESP_ERR_NO_MEM memory error

Parameters

- `hostname`: Hostname to set

esp_err_t `mdns_delegate_hostname_add` (`const` char **hostname*, `const` *mdns_ip_addr_t* **address_list*)

Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters

- `hostname`: Hostname to add
- `address_list`: The IP address list of the host

esp_err_t `mdns_delegate_hostname_remove` (`const` char **hostname*)

Remove a delegated hostname All the services added to this host will also be removed.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters

- `hostname`: Hostname to remove

bool `mdns_hostname_exists` (`const` char **hostname*)

Query whether a hostname has been added.

Return

- true The hostname has been added.
- false The hostname has not been added.

Parameters

- `hostname`: Hostname to query

esp_err_t `mdns_instance_name_set` (`const` char **instance_name*)

Set the default instance name for mDNS server.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters

- `instance_name`: Instance name to set

esp_err_t `mdns_service_add` (`const` char **instance_name*, `const` char **service_type*, `const` char **proto*, `uint16_t` *port*, *mdns_txt_item_t* *txt*[], `size_t` *num_items*)

Add service to mDNS server.

Note The value length of txt items will be automatically decided by `strlen`

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters

- `instance_name`: instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- `service_type`: service type (`_http`, `_ftp`, etc)

- `proto`: service protocol (`_tcp`, `_udp`)
- `port`: service port
- `txt`: string array of TXT data (eg. `{{ "var" , " val" }},{ "other" , " 2" }}`)
- `num_items`: number of items in TXT data

esp_err_t `mdns_service_add_for_host` (`const char *instance_name`, `const char *service_type`,
`const char *proto`, `const char *hostname`, `uint16_t port`,
`mdns_txt_item_t txt[]`, `size_t num_items`)

Add service to mDNS server with a delegated hostname.

Note The value length of txt items will be automatically decided by `strlen`

Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error
- `ESP_FAIL` failed to add service

Parameters

- `instance_name`: instance name to set. If NULL, global instance name or hostname will be used
 Note that `MDNS_MULTIPLE_INSTANCE` config option needs to be enabled for adding multiple instances with the same instance type.
- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `port`: service port
- `txt`: string array of TXT data (eg. `{{ "var" , " val" }},{ "other" , " 2" }}`)
- `num_items`: number of items in TXT data

bool `mdns_service_exists` (`const char *service_type`, `const char *proto`, `const char *hostname`)
 Check whether a service has been added.

Return

- true Correspondding service has been added.
- false Service not found.

Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `hostname`: service hostname. If NULL, checks for the local hostname.

bool `mdns_service_exists_with_instance` (`const char *instance`, `const char *service_type`,
`const char *proto`, `const char *hostname`)

Check whether a service has been added.

Return

- true Correspondding service has been added.
- false Service not found.

Parameters

- `instance`: instance name
- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `hostname`: service hostname. If NULL, checks for the local hostname.

esp_err_t `mdns_service_remove` (`const char *service_type`, `const char *proto`)
 Remove service from mDNS server.

Return

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)

esp_err_t **mdns_service_remove_for_host** (**const** char **service_type*, **const** char **proto*,
const char **hostname*)

Remove service from mDNS server with hostname.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (_http, _ftp, etc)
- *proto*: service protocol (_tcp, _udp)
- *hostname*: service hostname. If NULL, local hostname will be used.

esp_err_t **mdns_service_instance_name_set** (**const** char **service_type*, **const** char **proto*,
const char **instance_name*)

Set instance name for service.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (_http, _ftp, etc)
- *proto*: service protocol (_tcp, _udp)
- *instance_name*: instance name to set

esp_err_t **mdns_service_instance_name_set_for_host** (**const** char **service_type*, **const**
char **proto*, **const** char **hostname*,
const char **instance_name*)

Set instance name for service with hostname.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (_http, _ftp, etc)
- *proto*: service protocol (_tcp, _udp)
- *hostname*: service hostname. If NULL, local hostname will be used.
- *instance_name*: instance name to set

esp_err_t **mdns_service_port_set** (**const** char **service_type*, **const** char **proto*, uint16_t *port*)

Set service port.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (_http, _ftp, etc)
- *proto*: service protocol (_tcp, _udp)
- *port*: service port

esp_err_t **mdns_service_port_set_for_host** (**const** char **service_type*, **const** char **proto*,
const char **hostname*, uint16_t *port*)

Set service port with hostname.

Return

- ESP_OK success

- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *hostname*: service hostname. If NULL, local hostname will be used.
- *port*: service port

esp_err_t `mdns_service_txt_set` (`const` char *service_type*, `const` char *proto*, *mdns_txt_item_t* *txt*[], `uint8_t` *num_items*)

Replace all TXT items for service.

Note The value length of *txt* items will be automatically decided by `strlen`

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *txt*: array of TXT data (eg. {{ "var" , " val" }, { "other" , " 2" }})
- *num_items*: number of items in TXT data

esp_err_t `mdns_service_txt_set_for_host` (`const` char *service_type*, `const` char *proto*, `const` char *hostname*, *mdns_txt_item_t* *txt*[], `uint8_t` *num_items*)

Replace all TXT items for service with hostname.

Note The value length of *txt* items will be automatically decided by `strlen`

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *hostname*: service hostname. If NULL, local hostname will be used.
- *txt*: array of TXT data (eg. {{ "var" , " val" }, { "other" , " 2" }})
- *num_items*: number of items in TXT data

esp_err_t `mdns_service_txt_item_set` (`const` char *service_type*, `const` char *proto*, `const` char *key*, `const` char *value*)

Set/Add TXT item for service TXT record.

Note The value length will be automatically decided by `strlen`

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *key*: the key that you want to add/update
- *value*: the new value of the key

```
esp_err_t mdns_service_txt_item_set_with_explicit_value_len(const char
                                                         *service_type, const
                                                         char *proto, const
                                                         char *key, const
                                                         char *value, uint8_t
                                                         value_len)
```

Set/Add TXT item for service TXT record.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *key*: the key that you want to add/update
- *value*: the new value of the key
- *value_len*: the length of the value

```
esp_err_t mdns_service_txt_item_set_for_host(const char *service_type, const char
                                                         *proto, const char *hostname, const char
                                                         *key, const char *value)
```

Set/Add TXT item for service TXT record with hostname.

Note The value length will be automatically decided by `strlen`

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- *service_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *hostname*: service hostname. If NULL, local hostname will be used.
- *key*: the key that you want to add/update
- *value*: the new value of the key

```
esp_err_t mdns_service_txt_item_set_for_host_with_explicit_value_len(const
                                                         char
                                                         *service_type,
                                                         const
                                                         char
                                                         *proto,
                                                         const
                                                         char
                                                         *hostname,
                                                         const
                                                         char
                                                         *key,
                                                         const
                                                         char
                                                         *value,
                                                         uint8_t
                                                         value_len)
```

Set/Add TXT item for service TXT record with hostname and txt value length.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found

- ESP_ERR_NO_MEM memory error

Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to add/update
- `value`: the new value of the key
- `value_len`: the length of the value

`esp_err_t mdns_service_txt_item_remove` (`const char *service_type`, `const char *proto`,
`const char *key`)

Remove TXT item for service TXT record.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `key`: the key that you want to remove

`esp_err_t mdns_service_txt_item_remove_for_host` (`const char *service_type`, `const char`
`*proto`, `const char *hostname`, `const`
`char *key`)

Remove TXT item for service TXT record with hostname.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to remove

`esp_err_t mdns_service_remove_all` (void)

Remove and free all services from mDNS server.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t mdns_query_async_delete` (`mdns_search_once_t *search`)

Deletes the finished query. Call this only after the search has ended!

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
- ESP_ERR_INVALID_ARG pointer to search object is NULL

Parameters

- `search`: pointer to search object

bool `mdns_query_async_get_results` (`mdns_search_once_t *search`, `uint32_t timeout`,
`mdns_result_t **results`)

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

Return True if search has finished before or at timeout False if search timeout is over

Parameters

- `search`: pointer to search object
- `timeout`: time in milliseconds to wait for answers
- `results`: pointer to the results of the query

`mdns_search_once_t *mdns_query_async_new` (`const` char *`name`, `const` char *`service_type`,
`const` char *`proto`, `uint16_t` `type`, `uint32_t` `timeout`,
`size_t` `max_results`, `mdns_query_notify_t` `notifier`)

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

Return `mdns_search_once_s` pointer to new search object if query initiated successfully. NULL otherwise.

Parameters

- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (`_http`, `_arduino`, `_ftp` etc.) (NULL for host queries)
- `proto`: service protocol (`_tcp`, `_udp`, etc.) (NULL for host queries)
- `type`: type of query (`MDNS_TYPE_*`)
- `timeout`: time in milliseconds during which mDNS query is active
- `max_results`: maximum results to be collected
- `notifier`: Notification function to be called when the result is ready, can be NULL

`esp_err_t mdns_query` (`const` char *`name`, `const` char *`service_type`, `const` char *`proto`, `uint16_t` `type`,
`uint32_t` `timeout`, `size_t` `max_results`, `mdns_result_t` **`results`)

Query mDNS for host or service All following query methods are derived from this one.

Return

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` timeout was not given

Parameters

- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (`_http`, `_arduino`, `_ftp` etc.) (NULL for host queries)
- `proto`: service protocol (`_tcp`, `_udp`, etc.) (NULL for host queries)
- `type`: type of query (`MDNS_TYPE_*`)
- `timeout`: time in milliseconds to wait for answers.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query results must be freed using `mdns_query_results_free` below

`void mdns_query_results_free` (`mdns_result_t` *`results`)

Free query results.

Parameters

- `results`: linked list of results to be freed

`esp_err_t mdns_query_ptr` (`const` char *`service_type`, `const` char *`proto`, `uint32_t` `timeout`, `size_t`
`max_results`, `mdns_result_t` **`results`)

Query mDNS for service.

Return

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

Parameters

- `service_type`: service type (`_http`, `_arduino`, `_ftp` etc.)
- `proto`: service protocol (`_tcp`, `_udp`, etc.)
- `timeout`: time in milliseconds to wait for answer.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query

`esp_err_t mdns_query_srv` (`const` char *`instance_name`, `const` char *`service_type`, `const` char
*`proto`, `uint32_t` `timeout`, `mdns_result_t` **`result`)

Query mDNS for SRV record.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters

- *instance_name*: service instance name
- *service_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *result*: pointer to the result of the query

`esp_err_t mdns_query_txt` (`const` char *instance_name*, `const` char *service_type*, `const` char *proto*, `uint32_t` *timeout*, `mdns_result_t` *result*)

Query mDNS for TXT record.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters

- *instance_name*: service instance name
- *service_type*: service type (`_http`, `_arduino`, `_ftp` etc.)
- *proto*: service protocol (`_tcp`, `_udp`, etc.)
- *timeout*: time in milliseconds to wait for answer.
- *result*: pointer to the result of the query

`esp_err_t mdns_query_a` (`const` char *host_name*, `uint32_t` *timeout*, `esp_ip4_addr_t` *addr*)

Query mDNS for A record.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters

- *host_name*: host name to look for
- *timeout*: time in milliseconds to wait for answer.
- *addr*: pointer to the resulting IP4 address

`esp_err_t mdns_query_aaaa` (`const` char *host_name*, `uint32_t` *timeout*, `esp_ip6_addr_t` *addr*)

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses `‘.local’` domain.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters

- *host_name*: host name to look for
- *timeout*: time in milliseconds to wait for answer. If 0, *max_results* needs to be defined
- *addr*: pointer to the resulting IP6 address

`esp_err_t mdns_handle_system_event` (`void` *ctx*, `system_event_t` *event*)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses `‘.local’` domain.

Parameters

- `ctx`: The system event context
- `event`: The system event

Structures

struct mdns_txt_item_t
mDNS basic text item structure Used in `mdns_service_add()`

Public Members

const char *key
item key name

const char *value
item value string

struct mdns_ip_addr_s
mDNS query linked list IP item

Public Members

`esp_ip_addr_t` **addr**
IP address

struct mdns_ip_addr_s *next
next IP, or NULL for the last IP in the list

struct mdns_result_s
mDNS query result structure

Public Members

struct mdns_result_s *next
next result, or NULL for the last result in the list

`mdns_if_t` **tcpip_if**
interface index

`uint32_t` **ttl**
time to live

`mdns_ip_protocol_t` **ip_protocol**
ip_protocol type of the interface (v4/v6)

`char *`**instance_name**
instance name

`char *`**service_type**
service type

`char *`**proto**
service protocol

`char *`**hostname**
hostname

`uint16_t` **port**
service port

`mdns_txt_item_t *`**txt**
txt record

`uint8_t *`**txt_value_len**
array of txt value len of each record

`size_t txt_count`
number of txt items

`mdns_ip_addr_t *addr`
linked list of IP addresses found

Macros

`MDNS_TYPE_A`
`MDNS_TYPE_PTR`
`MDNS_TYPE_TXT`
`MDNS_TYPE_AAAA`
`MDNS_TYPE_SRV`
`MDNS_TYPE_OPT`
`MDNS_TYPE_NSEC`
`MDNS_TYPE_ANY`

Type Definitions

`typedef struct mdns_search_once_s mdns_search_once_t`
Asynchronous query handle.

`typedef struct mdns_ip_addr_s mdns_ip_addr_t`
mDNS query linked list IP item

`typedef enum mdns_if_internal mdns_if_t`

`typedef struct mdns_result_s mdns_result_t`
mDNS query result structure

`typedef void (*mdns_query_notify_t) (mdns_search_once_t *search)`

Enumerations

`enum mdns_ip_protocol_t`
mDNS enum to specify the ip_protocol type

Values:

`MDNS_IP_PROTOCOL_V4`
`MDNS_IP_PROTOCOL_V6`
`MDNS_IP_PROTOCOL_MAX`

`enum mdns_if_internal`

Values:

`MDNS_IF_STA = 0`
`MDNS_IF_AP = 1`
`MDNS_IF_ETH = 2`
`MDNS_IF_MAX`

2.4.2 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection

among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](#).

Tree structure for ESP-TLS component

```

├─ esp_tls.c
├─ esp_tls.h
├─ esp_tls_mbedtls.c
├─ esp_tls_wolfssl.c
├─ private_include
│   └─ esp_tls_mbedtls.h
│   └─ esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
 - `cacert_buf` - pointer to the buffer which contains the CA cert.
 - `cacert_bytes` - size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.*

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

注解: *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

注解: *These values are subject to change with change in configuration options and version of respective libraries.*

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such

as how to calculate private key parameters can be found in *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in *Digital Signature*.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

注解: When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert_buf*) and the DS params (*ds_data*) are required and the client key (*clientkey_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

API Reference

Header File

- [components/esp-tls/esp_tls.h](#)

Functions

esp_tls_t ***esp_tls_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

Return *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

esp_tls_t ***esp_tls_conn_new** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp_tls_conn_new_sync* (and its asynchronous version *esp_tls_conn_new_async*)

Return pointer to *esp_tls_t*, or NULL if connection couldn't be opened.

Parameters

- [in] hostname: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as *esp_tls_cfg_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp_tls_cfg_t*. At a minimum, this structure should be zero-initialized.

int **esp_tls_conn_new_sync** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Return

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

Parameters

- [in] *hostname*: Hostname of the host.
- [in] *hostlen*: Length of hostname.
- [in] *port*: Port number of the host.
- [in] *cfg*: TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- [in] *tls*: Pointer to esp-tls as esp-tls handle.

```
esp_tls_t*esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)
```

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

Return pointer to `esp_tls_t`, or NULL if connection couldn’t be opened.

Parameters

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘`esp_tls_cfg_t`’. At a minimum, this structure should be zero-initialized.

```
int esp_tls_conn_new_async(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg,  
                           esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Return

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

Parameters

- [in] *hostname*: Hostname of the host.
- [in] *hostlen*: Length of hostname.
- [in] *port*: Port number of the host.
- [in] *cfg*: TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

```
int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

Return

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

Parameters

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as `esp_tls_cfg_t`.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

```
static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.

Return

- ≥ 0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- < 0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

Parameters

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer from which data will be written.
- [in] `datalen`: Length of data buffer.

static ssize_t esp_tls_conn_read (*esp_tls_t* *tls, void *data, size_t datalen)

Read from specified tls connection into the buffer 'data' .

Return

- > 0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- < 0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer to hold read data.
- [in] `datalen`: Length of data buffer.

void **esp_tls_conn_delete** (*esp_tls_t* *tls)

Compatible version of `esp_tls_conn_destroy()` to close the TLS/SSL connection.

Note This API will be removed in IDFv5.0

Parameters

- [in] `tls`: pointer to esp-tls as esp-tls handle.

int **esp_tls_conn_destroy** (*esp_tls_t* *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new()` or `esp_tls_conn_http_new()` APIs.

Return - 0 on success

- -1 if socket error or an invalid argument

Parameters

- [in] `tls`: pointer to esp-tls as esp-tls handle.

ssize_t **esp_tls_get_bytes_avail** (*esp_tls_t* *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

Return

- -1 in case of invalid arg
- bytes available in the application data record read buffer

Parameters

- [in] `tls`: pointer to esp-tls as esp-tls handle.

esp_err_t **esp_tls_get_conn_sockfd** (*esp_tls_t* *tls, int *sockfd)

Returns the connection socket file descriptor from *esp_tls* session.

Return - `ESP_OK` on success and value of sockfd will be updated with socket file descriptor for connection

- `ESP_ERR_INVALID_ARG` if (`tls == NULL || sockfd == NULL`)

Parameters

- [in] `tls`: handle to *esp_tls* context
- [out] `sockfd`: int pointer to sockfd value.

esp_err_t **esp_tls_init_global_ca_store**(void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

Return

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t **esp_tls_set_global_ca_store**(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

Return

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

Parameters

- [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- [in] cacert_pem_bytes: Length of the buffer.

void **esp_tls_free_global_ca_store**(void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t **esp_tls_get_and_clear_last_error**(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in *esp_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters

- [in] h: esp-tls error handle.
- [out] esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- [out] esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

esp_err_t **esp_tls_get_and_clear_error_type**(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)

Returns the last error captured in *esp_tls* of a specific type The error information is cleared internally upon return.

Return

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

Parameters

- [in] h: esp-tls error handle.
- [in] err_type: specific error type
- [out] error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

`mbedtls_x509_crt *esp_tls_get_global_ca_store` (void)

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

Note Modifying the pointer might cause a failure in verifying the certificates.

Return

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

`esp_err_t esp_tls_plain_tcp_connect` (const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Parameters

- [in] host: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.
- [in] cfg: ESP-TLS configuration as `esp_tls_cfg_t`.
- [out] error_handle: ESP-TLS error handle holding potential errors occurred during connection
- [out] sockfd: Socket descriptor if successfully connected on TCP layer

Structures

struct psk_key_hint

ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key

key in PSK authentication mode in binary format

const size_t key_size

length of the key

const char *hint

hint in PSK authentication mode in string format

struct tls_keep_alive_cfg

esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool keep_alive_enable

Enable keep-alive timeout

int keep_alive_idle

Keep-alive idle time (second)

int keep_alive_interval

Keep-alive interval time (second)

int keep_alive_count

Keep-alive packet retry send count

struct esp_tls_cfg

ESP-TLS configuration parameters.

Note Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char ****alpn_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2" , NULL };

- where 'h2' is the protocol name

const unsigned char ***cacert_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***cacert_pem_buf**

CA certificate buffer legacy name

unsigned int **cacert_bytes**

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert_pem_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char ***clientcert_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientcert_pem_buf**

Client certificate legacy name

unsigned int **clientcert_bytes**

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**

Size of client certificate legacy name

const unsigned char ***clientkey_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientkey_pem_buf**

Client key legacy name

unsigned int **clientkey_bytes**

Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**

Size of client key legacy name

const unsigned char ***clientkey_password**

Client key decryption password string

unsigned int **clientkey_password_len**

String length of the password pointed to by clientkey_password

bool **non_block**
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**
Enable this option to use secure element or atec608a chip (Integrated with ESP32-WROOM-32SE)

int **timeout_ms**
Network timeout in milliseconds

bool **use_global_ca_store**
Use a global ca_store for all the connections in which this bool is set.

const char ***common_name**
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t ***keep_alive_cfg**
Enable TCP keep-alive timeout for SSL connection

const *psk_hint_key_t* ***psk_hint_key**
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (***crt_bundle_attach**) (void *conf)
Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void ***ds_data**
Pointer for digital signature peripheral context

bool **is_plain_tcp**
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq ***if_name**
The name of interface for data to go through. Use the default interface without setting

struct **esp_tls**
ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context **ssl**
TLS/SSL context

mbedtls_entropy_context **entropy**
mbedtls entropy context structure

mbedtls_ctr_drbg_context **ctr_drbg**
mbedtls ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config **conf**
TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context **server_fd**
mbedtls wrapper type for sockets

mbedtls_x509_crt **cacert**
Container for the X.509 CA certificate

`mbedtls_x509_crt *cacert_ptr`
Pointer to the cacert being used.

`mbedtls_x509_crt clientcert`
Container for the X.509 client certificate

`mbedtls_pk_context clientkey`
Container for the private key of the client certificate

int `sockfd`
Underlying socket file descriptor.

`ssize_t (*read) (struct esp_tls *tls, char *data, size_t datalen)`
Callback function for reading data from TLS/SSL connection.

`ssize_t (*write) (struct esp_tls *tls, const char *data, size_t datalen)`
Callback function for writing data to TLS/SSL connection.

`esp_tls_conn_state_t conn_state`
ESP-TLS Connection state

fd_set `rset`
read file descriptors

fd_set `wset`
write file descriptors

bool `is_tls`
indicates connection type (TLS or NON-TLS)

`esp_tls_role_t role`
esp-tls role

- `ESP_TLS_CLIENT`
- `ESP_TLS_SERVER`

`esp_tls_error_handle_t error_handle`
handle to error descriptor

Type Definitions

`typedef enum esp_tls_conn_state esp_tls_conn_state_t`
ESP-TLS Connection State.

`typedef enum esp_tls_role esp_tls_role_t`

`typedef struct psk_key_hint psk_hint_key_t`
ESP-TLS preshared key and hint structure.

`typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t`
esp-tls client session ticket ctx

Keep alive parameters structure

`typedef struct esp_tls_cfg esp_tls_cfg_t`
ESP-TLS configuration parameters.

Note Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

```
typedef struct esp_tls esp_tls_t
    ESP-TLS Connection Handle.
```

Enumerations

```
enum esp_tls_conn_state
    ESP-TLS Connection State.
```

Values:

```
ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
ESP_TLS_DONE
```

```
enum esp_tls_role
```

Values:

```
ESP_TLS_CLIENT = 0
ESP_TLS_SERVER
```

2.4.3 OpenSSL-APIs

注解: The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in [openssl](#) directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

Chapter Introduction

- Chapter 1. SSL Context Method Create
- Chapter 2. SSL Context Function
- Chapter 3. SSL Function
- Chapter 4. SSL X509 Certification and Private Key Function

Chapter 1. SSL Context Method Create

```
1.1 const SSL_METHOD* SSLv3_client_method (void)
```

Arguments:

none

Return:

SSLV3.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();

    ...
}
```

1.2 const SSL_METHOD* TLSv1_client_method(void)**Arguments:**

```
none
```

Return:

```
TLSV1.0 version SSL context client method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();

    ...
}
```

1.3 const SSL_METHOD* TLSv1_1_client_method(void)**Arguments:**

```
none
```

Return:

```
TLSV1.1 version SSL context client method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();

    ...
}
```

1.4 const SSL_METHOD* TLSv1_2_client_method(void)**Arguments:**

```
none
```

Return:

```
TL SV1.2 version SSL context client method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

1.5 const SSL_METHOD* TLS_client_method (void)**Arguments:**

```
none
```

Return:

```
TL SV1.2 version SSL context client method point
```

Description:

```
create the default SSL context method, it's always to be TL SV1.2
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

1.6 const SSL_METHOD* SSLv3_server_method (void)**Arguments:**

```
none
```

Return:

```
SSLV3.0 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}
```

1.7 const SSL_METHOD* TLSv1_server_method (void)

Arguments:

```
none
```

Return:

```
TLSV1.0 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();

    ...
}
```

1.8 const SSL_METHOD* TLSv1_1_server_method (void)**Arguments:**

```
none
```

Return:

```
TLSV1.1 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();

    ...
}
```

1.9 const SSL_METHOD* TLSv1_2_server_method (void)**Arguments:**

```
none
```

Return:

```
TLSV1.2 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
```

(下页继续)

(续上页)

```
    ...  
}
```

1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:

```
none
```

Return:

```
TLSV1.2 version SSL context server method point
```

Description:

```
create the default SSL context method, it's always to be TLSV1.2
```

Example:

```
void example(void)  
{  
    const SSL_METHOD *method = TLSv1_2_server_method();  
    ...  
}
```

Chapter 2. SSL Context Function

2.1 SSL_CTX* SSL_CTX_new (const SSL_METHOD * method)

Arguments:

```
method - the SSL context method point
```

Return:

```
context point
```

Description:

```
create a SSL context
```

Example:

```
void example(void)  
{  
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());  
    ...  
}
```

2.2 void SSL_CTX_free (SSL_CTX * ctx)

Arguments:

```
ctx - the SSL context point
```

Return:

```
none
```

Description:

```
free a SSL context
```

Example:

```
void example(void)
{
    SSL_CTX *ctx;

    ... ..

    SSL_CTX_free(ctx);
}
```

2.3 int SSL_CTX_set_ssl_version(SSL_CTX * ctx, const SSL_METHOD * meth)**Arguments:**

```
ctx - SSL context point
meth - SSL method point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set the SSL context version
```

Example:

```
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;

    ... ..

    SSL_CTX_set_ssl_version(ctx, meth);
}
```

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method(SSL_CTX * ctx)**Arguments:**

```
ctx - SSL context point
```

Return:

```
SSL context method
```

Description:

```
get the SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;

    ... ..

    method = SSL_CTX_get_ssl_method(ctx);
}
```

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

Arguments:

```
ctx - SSL context point
```

Return:

```
SSL method
```

Description:

```
create a SSL
```

Example:

```
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;

    ... ..

    ssl = SSL_new(ctx);
}
```

3.2 void SSL_free (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
none
```

Description:

```
free SSL
```

Example:

```
void example(void)
{
    SSL *ssl;

    ... ..
}
```

(下页继续)

(续上页)

```
    SSL_free(ssl);  
}
```

3.3 int SSL_do_handshake (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : OK  
0 : failed, connect is close by remote  
-1 : a error catch
```

Description:

```
perform the SSL handshake
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_do_handshake(ssl);  
}
```

3.4 int SSL_connect (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : OK  
0 : failed, connect is close by remote  
-1 : a error catch
```

Description:

```
connect to the remote SSL server
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_connect(ssl);  
}
```

3.5 int SSL_accept (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : OK  
0 : failed, connect is close by remote  
-1 : a error catch
```

Description:

```
accept the remote connection
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_accept(ssl);  
}
```

3.6 int SSL_shutdown (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK  
0 : failed, connect is close by remote  
-1 : a error catch
```

Description:

```
shutdown the connection
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_shutdown(ssl);  
}
```

3.7 int SSL_clear (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
shutdown the connection
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)**Arguments:**

```
ssl    - point
buffer - data buffer point
len    - data length
```

Return:

```
> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch
```

Description:

```
read data from remote
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ..

    ret = SSL_read(ssl, buf, len);
}
```

3.9 int SSL_write (SSL * ssl, const void * buffer, int len)**Arguments:**

```
ssl    - SSL point
buffer - data buffer point
len    - data length
```

Return:

```
> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch
```

Description:

```
send the data to remote
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ..

    ret = SSL_write(ssl, buf, len);
}
```

3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL context
```

Description:

```
get SSL context of the SSL
```

Example:

```
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;

    ... ..

    ctx = SSL_get_SSL_CTX(ssl);
}
```

3.11 int SSL_get_shutdown (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
shutdown mode
```

Description:

```
get SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    int mode;
```

(下页继续)

(续上页)

```
... ..  
mode = SSL_get_SSL_CTX(ssl);  
}
```

3.12 void SSL_set_shutdown (SSL * ssl, int mode)

Arguments:

```
ssl - SSL point
```

Return:

```
shutdown mode
```

Description:

```
set SSL shutdown mode
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int mode = 0;  
  
    ... ..  
  
    SSL_set_shutdown(ssl, mode);  
}
```

3.13 const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL method
```

Description:

```
set SSL shutdown mode
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    const SSL_METHOD *method;  
  
    ... ..  
  
    method = SSL_get_ssl_method(ssl);  
}
```

3.14 int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)

Arguments:

```
ssl - SSL point  
meth - SSL method point
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
set the SSL method
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    const SSL_METHOD *method;  
  
    ... ..  
  
    ret = SSL_set_ssl_method(ssl, method);  
}
```

3.15 int SSL_pending (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
data bytes
```

Description:

```
get received data bytes
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_pending(ssl);  
}
```

3.16 int SSL_has_pending (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : Yes  
0 : No
```

Description:

```
check if data is received
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
>= 0 : socket id
< 0 : a error catch
```

Description:

```
get the socket of the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_get_fd(ssl);
}
```

3.18 int SSL_get_rfd (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
>= 0 : socket id
< 0 : a error catch
```

Description:

```
get the read only socket of the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
```

(下页继续)

(续上页)

```
... ..  
ret = SSL_get_rfd(ssl);  
}
```

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
>= 0 : socket id  
< 0 : a error catch
```

Description:

```
get the write only socket of the SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_wfd(ssl);  
}
```

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
set socket to SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    int socket;  
  
    ... ..  
  
    ret = SSL_set_fd(ssl, socket);  
}
```

3.21 int SSL_set_rfd (SSL * ssl, int fd)

Arguments:

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
set read only socket to SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    int socket;  
  
    ... ..  
  
    ret = SSL_set_rfd(ssl, socket);  
}
```

3.22 int SSL_set_wfd (SSL * ssl, int fd)

Arguments:

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
set write only socket to SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    int socket;  
  
    ... ..  
  
    ret = SSL_set_wfd(ssl, socket);  
}
```

3.23 int SSL_version (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL version
```

Description:

```
get SSL version
```

Example:

```
void example(void)
{
    int version;
    SSL *ssl;

    ... ..

    version = SSL_version(ssl);
}
```

3.24 const char* SSL_get_version (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL version string
```

Description:

```
get the SSL current version string
```

Example:

```
void example(void)
{
    char *version;
    SSL *ssl;

    ... ..

    version = SSL_get_version(ssl);
}
```

3.25 OSSL_HANDSHAKE_STATE SSL_get_state (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL state
```

Description:

```
get the SSL state
```

Example:

```
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;

    ... ..

    state = SSL_get_state(ssl);
}
```

3.26 const char* SSL_alert_desc_string (int value)

Arguments:

```
value - SSL description
```

Return:

```
alert value string
```

Description:

```
get alert description string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string(val);
}
```

3.27 const char* SSL_alert_desc_string_long (int value)

Arguments:

```
value - SSL description
```

Return:

```
alert value long string
```

Description:

```
get alert description long string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string_long(val);
}
```

3.28 const char* SSL_alert_type_string (int value)

Arguments:

```
value - SSL type description
```

Return:

```
alert type string
```

Description:

```
get alert type string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_type_string(val);
}
```

3.29 const char* SSL_alert_type_string_long (int value)**Arguments:**

```
value - SSL type description
```

Return:

```
alert type long string
```

Description:

```
get alert type long string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_type_string_long(val);
}
```

3.30 const char* SSL_rstate_string (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
state string
```

Description:

```
get the state string where SSL is reading
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_rstate_string(ssl);
}
```

3.31 const char* SSL_rstate_string_long (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
state long string
```

Description:

```
get the state long string where SSL is reading
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_rstate_string_long(ssl);
}
```

3.32 const char* SSL_state_string (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
state string
```

Description:

```
get the state string
```

Example:

```
void example(void)
{
    SSL *ssl;
    const char *str;

    ... ..
}
```

(下页继续)

(续上页)

```
    str = SSL_state_string(ssl);
}
```

3.33 char* SSL_state_string_long (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
state long string
```

Description:

```
get the state long string
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

3.34 int SSL_get_error (const SSL * ssl, int ret_code)

Arguments:

```
ssl      - SSL point
ret_code - SSL return code
```

Return:

```
SSL error number
```

Description:

```
get SSL error code
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;
    int err;

    ... ..

    err = SSL_get_error(ssl, ret);
}
```

3.35 int SSL_want (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
specific statement
```

Description:

```
get the SSL specific statement
```

Example:

```
void example(void)
{
    SSL *ssl;
    int state;

    ... ..

    state = SSL_want(ssl);
}
```

3.36 int SSL_want_nothing (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want nothing
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want(ssl);
}
```

3.37 int SSL_want_read (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want to read
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want_read(ssl);
}
```

3.38 int SSL_want_write (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want to write
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want_write(ssl);
}
```

Chapter 4. SSL X509 Certification and Private Key Function**4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)****Arguments:**

```
cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes
```

Return:

```
X509 certification object point
```

Description:

```
load a character certification context into system context. If '*cert' is
↳pointed to the
certification, then load certification into it. Or create a new X509
↳certification object
```

Example:

```
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ... ..

    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)**Arguments:**

```
ssl - SSL point
x   - CA certification point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
add CA client certification into the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;

    ... ..

    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX * ctx, X509 * x)**Arguments:**

```
ctx - SSL context point
x   - CA certification point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
add CA client certification into the SSL context
```

Example:

```
void example(void)
{
    int ret;
```

(下页继续)

(续上页)

```
SSL_CTX *ctx;
X509 *new;

... ..

ret = SSL_add_client_CA(ssl, new);
}
```

4.4 X509* SSL_get_certificate (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL certification point
```

Description:

```
get the SSL certification point
```

Example:

```
void example(void)
{
    SSL *ssl;
    X509 *cert;

    ... ..

    cert = SSL_get_certificate(ssl);
}
```

4.5 long SSL_get_verify_result (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
the result of verifying
```

Description:

```
get the verifying result of the SSL certification
```

Example:

```
void example(void)
{
    SSL *ssl;
    long ret;

    ... ..

    ret = SSL_get_verify_result(ssl);
}
```

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)

Arguments:

```
ctx - the SSL context point  
pkey - certification object point
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
load the certification into the SSL_CTX or SSL object
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL_CTX *ctx  
    X509 *new;  
  
    ... ..  
  
    ret = SSL_CTX_use_certificate(ctx, new);  
}
```

4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX * ctx, int len, const unsigned char * d)**Arguments:**

```
ctx - SSL context point  
len - certification length  
d - data point
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
load the ASN1 certification into SSL context
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL_CTX *ctx;  
    const unsigned char *buf;  
    int len;  
  
    ... ..  
  
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);  
}
```

4.8 int SSL_CTX_use_PrivateKey (SSL_CTX * ctx, EVP_PKEY * pkey)**Arguments:**

```
ctx - SSL context point  
pkey - private key object point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the private key into the context object
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;

    ... ..

    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}
```

4.9 int SSL_CTX_use_PrivateKey_ASN1 (int pk, SSL_CTX * ctx, const unsigned char * d, long len)**Arguments:**

```
ctx - SSL context point
d   - data point
len - private key length
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the ASN1 private key into SSL context
```

Example:

```
void example(void)
{
    int ret;
    int pk;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX * ctx, const unsigned char * d, long len)**Arguments:**

```
ctx - SSL context point
d   - data point
len - private key length
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the RSA ASN1 private key into SSL context
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)**Arguments:**

```
ssl - SSL point
len - data bytes
d   - data point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load certification into the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}
```

4.12 X509* SSL_get_peer_certificate (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
peer certification
```

Description:

```
get peer certification
```

Example:

```
void example(void)
{
    SSL *ssl;
    X509 *peer;

    ... ..

    peer = SSL_get_peer_certificate(ssl);
}
```

2.4.4 ESP HTTP Client

Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- `esp_http_client_init()`: To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the `esp_http_client_config_t` configurations. Which configuration values we do not define, the library will use default.
- `esp_http_client_perform()`: The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the `event_handle` (defined by `esp_http_client_config_t`). This function performs its job and blocks the current task until it's done
- `esp_http_client_cleanup()`: After completing our `esp_http_client`'s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

Application Example

```
esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.s", evt->data_len, (char*)evt->data);
            }

            break;
        case HTTP_EVENT_ON_FINISH:

```

(下页继续)

```

        ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example

```

esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);

```

HTTPS

The HTTP client supports SSL connections using **mbedtls**, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

注解: By providing information using HTTPS, the library will use the SSL transport type to connect to the server.

If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`

HTTPS example

```
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

Perform HTTP request as Stream reader Check the example function `http_perform_as_stream_reader` at [protocols/esp_http_client](#).

HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of `config` entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the `UNAUTHORIZED` header. Based on this information, it will know which authentication method to choose, and perform it on the second.

Config authentication example with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

Config authentication example with username, password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp_http_client](#).

API Reference

Header File

- [components/esp_http_client/include/esp_http_client.h](#)

Functions

esp_http_client_handle_t **esp_http_client_init** (**const** *esp_http_client_config_t* *config)

Start a HTTP session This function must be the first function to call, and it returns a *esp_http_client_handle_t* that you must use as input to other functions in the interface. This call MUST have a corresponding call to *esp_http_client_cleanup* when the operation is complete.

Return

- *esp_http_client_handle_t*
- NULL if any errors

Parameters

- [in] config: The configurations, see *http_client_config_t*

esp_err_t **esp_http_client_perform** (*esp_http_client_handle_t* client)

Invoke this function after *esp_http_client_init* and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same *esp_http_client_handle_t* as input as the *esp_http_client_init* call returned. *esp_http_client_perform* performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking *esp_http_client_perform()*, *is_async* member of *esp_http_client_config_t* must be set while making a call to *esp_http_client_init()* API. You can do any amount of calls to *esp_http_client_perform* while using the same *esp_http_client_handle_t*. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. *esp_http_client* will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use *esp_http_client_set_** between the invokes to set options for the following *esp_http_client_perform*.

Note You must never call this function simultaneously from two places using the same client handle.

Let the function return first before invoking it another time. If you want parallel transfers, you must use several *esp_http_client_handle_t*. This function include *esp_http_client_open* -> *esp_http_client_write* -> *esp_http_client_fetch_headers* -> *esp_http_client_read* (and option) *esp_http_client_close*.

Return

- ESP_OK on successful
- ESP_FAIL on error

Parameters

- `client`: The `esp_http_client` handle

esp_err_t `esp_http_client_set_url` (*esp_http_client_handle_t* `client`, **const** char *`url`)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Return

- `ESP_OK`
- `ESP_FAIL`

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `url`: The url

esp_err_t `esp_http_client_set_post_field` (*esp_http_client_handle_t* `client`, **const** char *`data`,
int `len`)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Return

- `ESP_OK`
- `ESP_FAIL`

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `data`: post data pointer
- [in] `len`: post length

int `esp_http_client_get_post_field` (*esp_http_client_handle_t* `client`, char **`data`)

Get current post field information.

Return Size of post data

Parameters

- [in] `client`: The client
- [out] `data`: Point to post data pointer

esp_err_t `esp_http_client_set_header` (*esp_http_client_handle_t* `client`, **const** char *`key`, **const**
char *`value`)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

Return

- `ESP_OK`
- `ESP_FAIL`

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `key`: The header key
- [in] `value`: The header value

esp_err_t `esp_http_client_get_header` (*esp_http_client_handle_t* `client`, **const** char *`key`, char
**`value`)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Return

- `ESP_OK`
- `ESP_FAIL`

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `key`: The header key
- [out] `value`: The header value

esp_err_t `esp_http_client_get_username` (*esp_http_client_handle_t* `client`, char **`value`)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] `client`: The `esp_http_client` handle
- [out] `value`: The username value

esp_err_t **esp_http_client_set_username** (*esp_http_client_handle_t* `client`, **const** `char` **username*)

Set http request username. The value of `username` parameter will be assigned to `username` buffer. If the `username` parameter is NULL then `username` buffer will be freed.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `username`: The username value

esp_err_t **esp_http_client_get_password** (*esp_http_client_handle_t* `client`, `char` ***value*)

Get http request password. The address of `password` buffer will be assigned to `value` parameter. This function must be called after `esp_http_client_init`.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] `client`: The `esp_http_client` handle
- [out] `value`: The password value

esp_err_t **esp_http_client_set_password** (*esp_http_client_handle_t* `client`, **const** `char` **password*)

Set http request password. The value of `password` parameter will be assigned to `password` buffer. If the `password` parameter is NULL then `password` buffer will be freed.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `password`: The password value

esp_err_t **esp_http_client_set_auth_type** (*esp_http_client_handle_t* `client`, *esp_http_client_auth_type_t* `auth_type`)

Set http request `auth_type`.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] `client`: The `esp_http_client` handle
- [in] `auth_type`: The `esp_http_client` auth type

`int` **esp_http_client_get_errno** (*esp_http_client_handle_t* `client`)

Get HTTP client session `errno`.

Return

- (-1) if invalid argument
- `errno`

Parameters

- [in] `client`: The `esp_http_client` handle

esp_err_t **esp_http_client_set_method** (*esp_http_client_handle_t* `client`, *esp_http_client_method_t* `method`)

Set http request method.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] *client*: The `esp_http_client` handle
- [in] *method*: The method

esp_err_t `esp_http_client_set_timeout_ms` (*esp_http_client_handle_t* *client*, int *timeout_ms*)

Set http request timeout.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- [in] *client*: The `esp_http_client` handle
- [in] *timeout_ms*: The timeout value

esp_err_t `esp_http_client_delete_header` (*esp_http_client_handle_t* *client*, const char **key*)

Delete http request header.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *client*: The `esp_http_client` handle
- [in] *key*: The key

esp_err_t `esp_http_client_open` (*esp_http_client_handle_t* *client*, int *write_len*)

This function will be open the connection, write all header strings and return.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *client*: The `esp_http_client` handle
- [in] *write_len*: HTTP Content length need to write to the server

int `esp_http_client_write` (*esp_http_client_handle_t* *client*, const char **buffer*, int *len*)

This function will write data to the HTTP connection previously opened by `esp_http_client_open()`

Return

- (-1) if any errors
- Length of data written

Parameters

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: This value must not be larger than the *write_len* parameter provided to `esp_http_client_open()`

int `esp_http_client_fetch_headers` (*esp_http_client_handle_t* *client*)

This function need to call after `esp_http_client_open`, it will read from http stream, process all receive headers.

Return

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked_response`)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

Parameters

- [in] *client*: The `esp_http_client` handle

bool `esp_http_client_is_chunked_response` (*esp_http_client_handle_t* *client*)

Check response data is chunked.

Return true or false

Parameters

- [in] `client`: The `esp_http_client` handle

int `esp_http_client_read` (*`esp_http_client_handle_t client`*, char **`buffer`*, int *`len`*)

Read data from http stream.

Return

- (-1) if any errors
- Length of data was read

Parameters

- [in] `client`: The `esp_http_client` handle
- `buffer`: The buffer
- [in] `len`: The length

int `esp_http_client_get_status_code` (*`esp_http_client_handle_t client`*)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

Return Status code

Parameters

- [in] `client`: The `esp_http_client` handle

int `esp_http_client_get_content_length` (*`esp_http_client_handle_t client`*)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

Return

- (-1) Chunked transfer
- Content-Length value as bytes

Parameters

- [in] `client`: The `esp_http_client` handle

`esp_err_t` `esp_http_client_close` (*`esp_http_client_handle_t client`*)

Close http connection, still kept all http request resources.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] `client`: The `esp_http_client` handle

`esp_err_t` `esp_http_client_cleanup` (*`esp_http_client_handle_t client`*)

This function must be the last function to call for a session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] `client`: The `esp_http_client` handle

`esp_http_client_transport_t` `esp_http_client_get_transport_type` (*`esp_http_client_handle_t client`*)

Get transport type.

Return

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

Parameters

- [in] `client`: The `esp_http_client` handle

`esp_err_t` `esp_http_client_set_redirection` (*`esp_http_client_handle_t client`*)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided

by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *client*: The `esp_http_client` handle

void `esp_http_client_add_auth` (*esp_http_client_handle_t client*)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters

- [in] *client*: The `esp_http_client` handle

bool `esp_http_client_is_complete_data_received` (*esp_http_client_handle_t client*)

Checks if entire data in the response has been read without any error.

Return

- true
- false

Parameters

- [in] *client*: The `esp_http_client` handle

int `esp_http_client_read_response` (*esp_http_client_handle_t client*, char **buffer*, int *len*)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

Return

- Length of data was read

Parameters

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: The buffer length

esp_err_t `esp_http_client_flush_response` (*esp_http_client_handle_t client*, int **len*)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

Return

- ESP_OK If successful, *len* will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

Parameters

- [in] *client*: The `esp_http_client` handle
- *len*: Length of data discarded

esp_err_t `esp_http_client_get_url` (*esp_http_client_handle_t client*, char **url*, const int *len*)

Get URL from client.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] *client*: The `esp_http_client` handle
- [inout] *url*: The buffer to store URL
- [in] *len*: The buffer length

esp_err_t `esp_http_client_get_chunk_length` (*esp_http_client_handle_t client*, int **len*)

Get Chunk-Length from client.

Return

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Parameters

- [in] *client*: The `esp_http_client` handle
- [out] *len*: Variable to store length

Structures

struct esp_http_client_event

HTTP Client events data.

Public Members

esp_http_client_event_id_t **event_id**

event_id, to know the cause of the event

esp_http_client_handle_t **client**

esp_http_client_handle_t context

void ***data**

data of the event

int **data_len**

data length of data

void ***user_data**

user_data context, from *esp_http_client_config_t* user_data

char ***header_key**

For HTTP_EVENT_ON_HEADER event_id, it' s store current http header key

char ***header_value**

For HTTP_EVENT_ON_HEADER event_id, it' s store current http header value

struct esp_http_client_config_t

HTTP configuration.

Public Members

const char ***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char ***username**

Using for Http authentication

const char ***password**

Using for Http authentication

esp_http_client_auth_type_t **auth_type**

Http authentication type, see esp_http_client_auth_type_t

const char ***path**

HTTP Path, if not set, default is /

const char ***query**

HTTP query

const char *cert_pem
SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
Client key decryption password string

size_t client_key_password_len
String length of the password pointed to by client_key_password

const char *user_agent
The User Agent string to send with HTTP requests

esp_http_client_method_t **method**
HTTP Method

int timeout_ms
Network timeout in milliseconds

bool disable_auto_redirect
Disable HTTP automatic redirects

int max_redirection_count
Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb **event_handler**
HTTP Event Handle

esp_http_client_transport_t **transport_type**
HTTP transport type, see *esp_http_client_transport_t*

int buffer_size
HTTP receive buffer size

int buffer_size_tx
HTTP transmit buffer size

void *user_data
HTTP user_data context

bool is_async
Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

esp_err_t (*crt_bundle_attach) (void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep_alive_enable**
Enable keep-alive timeout

int **keep_alive_idle**
Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**
Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**
Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE
Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN
Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
Read FIN from peer and the connection closed

Type Definitions

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb) (esp_http_client_event_t *evt)

Enumerations

enum esp_http_client_event_id_t
HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED

Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT

After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = *HTTP_EVENT_HEADERS_SENT*

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER

Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA

Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH

Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED

The connection has been disconnected

enum esp_http_client_transport_t

HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0

Unknown

HTTP_TRANSPORT_OVER_TCP

Transport over tcp

HTTP_TRANSPORT_OVER_SSL

Transport over ssl

enum esp_http_client_method_t

HTTP method.

Values:

HTTP_METHOD_GET = 0

HTTP GET Method

HTTP_METHOD_POST

HTTP POST Method

HTTP_METHOD_PUT

HTTP PUT Method

HTTP_METHOD_PATCH

HTTP PATCH Method

HTTP_METHOD_DELETE

HTTP DELETE Method

HTTP_METHOD_HEAD

HTTP HEAD Method

HTTP_METHOD_NOTIFY

HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE

HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE

HTTP UNSUBSCRIBE Method

HTTP_METHOD_OPTIONS

HTTP OPTIONS Method

HTTP_METHOD_COPY
HTTP COPY Method

HTTP_METHOD_MOVE
HTTP MOVE Method

HTTP_METHOD_LOCK
HTTP LOCK Method

HTTP_METHOD_UNLOCK
HTTP UNLOCK Method

HTTP_METHOD_PROPFIND
HTTP PROPFIND Method

HTTP_METHOD_PROPPATCH
HTTP PROPPATCH Method

HTTP_METHOD_MKCOL
HTTP MKCOL Method

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
HTTP Authentication type.

Values:

HTTP_AUTH_TYPE_NONE = 0
No authentication

HTTP_AUTH_TYPE_BASIC
HTTP Basic authentication

HTTP_AUTH_TYPE_DIGEST
HTTP Digest authentication

enum HttpStatus_Code
Enum for the HTTP status codes.

Values:

HttpStatus_Ok = 200

HttpStatus_MultipleChoices = 300

HttpStatus_MovedPermanently = 301

HttpStatus_Found = 302

HttpStatus_TemporaryRedirect = 307

HttpStatus_BadRequest = 400

HttpStatus_Unauthorized = 401

HttpStatus_Forbidden = 403

HttpStatus_NotFound = 404

HttpStatus_InternalError = 500

2.4.5 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32-S3

Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
 - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
 - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

TLS Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

注解: If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default not requiring verification.

PEM certificate for this example could be extracted from an `openssl s_client` command connecting to `websocket.org`. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `\ echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem``

This command will extract the second certificate in the chain and save it as a pem-file.

Subprotocol The subprotocol field in the config struct can be used to request a subprotocol

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

注解: The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

Events

- **WEBSOCKET_EVENT_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the websocket.org server can be found here: [protocols/websocket](#).

Sending Text Data The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

API Reference

Header File

- `components/esp_websocket_client/include/esp_websocket_client.h`

Functions

esp_websocket_client_handle_t **esp_websocket_client_init** (**const** *esp_websocket_client_config_t* **config*)

Start a WebSocket session This function must be the first function to call, and it returns a *esp_websocket_client_handle_t* that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to *esp_websocket_client_destroy* when the operation is complete.

Return

- *esp_websocket_client_handle_t*
- NULL if any errors

Parameters

- [in] *config*: The configuration

esp_err_t **esp_websocket_client_set_uri** (*esp_websocket_client_handle_t* *client*, **const** char **uri*)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

Return *esp_err_t*

Parameters

- [in] *client*: The client
- [in] *uri*: The uri

esp_err_t **esp_websocket_client_start** (*esp_websocket_client_handle_t* *client*)

Open the WebSocket connection.

Return *esp_err_t*

Parameters

- [in] *client*: The client

esp_err_t **esp_websocket_client_stop** (*esp_websocket_client_handle_t* *client*)

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using *esp_websocket_client_close*().

Notes:

- Cannot be called from the websocket event handler

Return *esp_err_t*

Parameters

- [in] *client*: The client

esp_err_t **esp_websocket_client_destroy** (*esp_websocket_client_handle_t* *client*)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the *esp_websocket_client_init* function and must be called with the same handle as input that a *esp_websocket_client_init* call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

Return *esp_err_t*

Parameters

- [in] *client*: The client

int **esp_websocket_client_send** (*esp_websocket_client_handle_t* *client*, **const** char **data*, int *len*, *TickType_t* *timeout*)

Generic write data to the WebSocket connection; defaults to binary send.

Return

- Number of data was sent
- (-1) if any errors

Parameters

- [in] *client*: The client
- [in] *data*: The data

- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

int **esp_websocket_client_send_bin** (*esp_websocket_client_handle_t* client, const char *data, int len, TickType_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

Return

- Number of data was sent
- (-1) if any errors

Parameters

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

int **esp_websocket_client_send_text** (*esp_websocket_client_handle_t* client, const char *data, int len, TickType_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

Return

- Number of data was sent
- (-1) if any errors

Parameters

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

esp_err_t **esp_websocket_client_close** (*esp_websocket_client_handle_t* client, TickType_t timeout)

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:

- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:

- Cannot be called from the websocket event handler

Return *esp_err_t*

Parameters

- [in] client: The client
- [in] timeout: Timeout in RTOS ticks for waiting

esp_err_t **esp_websocket_client_close_with_code** (*esp_websocket_client_handle_t* client, int code, const char *data, int len, TickType_t timeout)

Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for `esp_websocket_client_close()`

Notes:

- Cannot be called from the websocket event handler

Return *esp_err_t*

Parameters

- [in] client: The client
- [in] code: Close status code as defined in RFC6455 section-7.4
- [in] data: Additional data to closing message
- [in] len: The length of the additional data
- [in] timeout: Timeout in RTOS ticks for waiting

bool **esp_websocket_client_is_connected** (*esp_websocket_client_handle_t* client)
Check the WebSocket client connection state.

Return

- true
- false

Parameters

- [in] client: The client handle

esp_err_t **esp_websocket_register_events** (*esp_websocket_client_handle_t* client,
esp_websocket_event_id_t event, *esp_event_handler_t*
event_handler, void *event_handler_arg)

Register the WebSocket Events.

Return esp_err_t

Parameters

- client: The client handle
- event: The event id
- event_handler: The callback function
- event_handler_arg: User context

Structures

struct esp_websocket_event_data_t
WebSocket event data.

Public Members

const char *data_ptr
Data pointer

int **data_len**
Data length

uint8_t **op_code**
Received opcode

esp_websocket_client_handle_t **client**
esp_websocket_client_handle_t context

void ***user_context**
user_data context, from *esp_websocket_client_config_t* user_data

int **payload_len**
Total payload length, payloads exceeding buffer will be posted through multiple events

int **payload_offset**
Actual offset for the data associated with this event

struct esp_websocket_client_config_t
WebSocket client setup configuration.

Public Members

const char *uri
WebSocket URI, the information on the URI can be overrides the other fields below, if any

const char *host
Domain or IP as string

int **port**
Port to connect, default depend on esp_websocket_transport_t (80 or 443)

const char *username
Using for Http authentication - Not supported for now

const char *password
Using for Http authentication - Not supported for now

const char *path
HTTP Path, if not set, default is /

bool **disable_auto_reconnect**
Disable the automatic reconnect function when disconnected

void ***user_context**
HTTP user data context

int **task_prio**
Websocket task priority

int **task_stack**
Websocket task stack

int **buffer_size**
Websocket buffer size

const char *cert_pem
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t **cert_len**
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t **client_cert_len**
Length of the buffer pointed to by client_cert. May be 0 for null-terminated pem

const char *client_key
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t **client_key_len**
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_websocket_transport_t **transport**
Websocket transport type, see `esp_websocket_transport_t`

const char *subprotocol
Websocket subprotocol

const char *user_agent
Websocket user-agent

const char *headers
Websocket additional headers

int **pingpong_timeout_sec**
Period before connection is aborted due to no PONGs received

bool **disable_pingpong_discon**
Disable auto-disconnect due to no PONG received within pingpong_timeout_sec

bool **use_global_ca_store**
Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**
Skip any validation of server certificate CN field

bool **keep_alive_enable**
Enable keep-alive timeout

int **keep_alive_idle**
Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**
Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**
Keep-alive packet retry send count. Default is 3 counts

size_t **ping_interval_sec**
Websocket ping interval, defaults to 10 seconds if not set

struct ifreq ***if_name**
The name of interface for data to go through. Use the default interface without setting

Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

Enumerations

```
enum esp_websocket_event_id_t
```

Websocket Client events id.

Values:

WEBSOCKET_EVENT_ANY = -1

WEBSOCKET_EVENT_ERROR = 0

This event occurs when there are any errors during execution

WEBSOCKET_EVENT_CONNECTED

Once the Websocket has been connected to the server, no data exchange has been performed

WEBSOCKET_EVENT_DISCONNECTED

The connection has been disconnected

WEBSOCKET_EVENT_DATA

When receiving data from the server, possibly multiple portions of the packet

WEBSOCKET_EVENT_CLOSED

The connection has been closed cleanly

WEBSOCKET_EVENT_MAX

```
enum esp_websocket_transport_t
```

Websocket Client transport.

Values:

WEBSOCKET_TRANSPORT_UNKNOWN = 0x0

Transport unknown

WEBSOCKET_TRANSPORT_OVER_TCP

Transport over tcp

WEBSOCKET_TRANSPORT_OVER_SSL

Transport over ssl

2.4.6 HTTP 服务器

概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- `httpd_start()`：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 `httpd_start()` 传递 `httpd_config_t` 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。
- `httpd_stop()`：根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- `httpd_register_uri_handler()`：通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员：`uri` 名字，`method` 类型（比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等），`esp_err_t *handler (httpd_req_t *req)` 类型的函数指针，指向用户上下文数据的 `user_ctx` 指针。

应用示例

```

/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char[] resp = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST /uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓冲区
     * httpd_req_recv() 只接收 char* 数据，但也可以是任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，content_len 会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试
             * 简单起见，这里我们直接响应 HTTP 408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误，返回 ESP_FAIL 可以确保底层套接字被关闭 */
        return ESP_FAIL;
    }

    /* 发送简单的响应数据包 */
    const char[] resp = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

```

(下页继续)

```

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST /uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

    /* 启动 httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* 注册 URI 处理程序 */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* 如果服务器启动失败, 返回的句柄是 NULL */
    return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}

```

简单 HTTP 服务器示例 请查看位于 [protocols/http_server/simple](#) 的 HTTP 服务器示例, 该示例演示了如何处理任意内容长度的数据, 读取请求头和 URL 查询参数, 设置响应头。

HTTP 长连接

HTTP 服务器具有长连接的功能, 允许重复使用同一个连接 (会话) 进行多次传输, 同时保持会话的上下文数据。上下文数据可由处理程序动态分配, 在这种情况下需要提前指定好自定义的回调函数, 以便在连接/会话被关闭时释放这部分内存资源。

长连接示例

```

/* 自定义函数, 用来释放上下文数据 */
void free_ctx_func(void *ctx)

```

(下页继续)

```

{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 如果会话上下文还不存在则新建一个 */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func; /*!< 释放上下文数据的函数 */
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* 响应 */
    .....
    .....
    .....

    return ESP_OK;
}

```

详情请参考位于 [protocols/http_server/persistent_sockets](#) 的示例代码。

Functions

***esp_err_t* httpd_register_uri_handler** (*httpd_handle_t* handle, **const** *httpd_uri_t* *uri_handler)
Registers a URI handler.

Example usage:

```

esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,

```

(下页继续)

```

    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

```

Note URI handlers can be registered in real time as long as the server handle is valid.

Return

- ESP_OK : On successfully registering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered

esp_err_t **httpd_unregister_uri_handler** (*httpd_handle_t* handle, **const** char *uri, *httpd_method_t* method)

Unregister a URI handler.

Return

- ESP_OK : On successfully deregistering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

esp_err_t **httpd_unregister_uri** (*httpd_handle_t* handle, **const** char *uri)

Unregister all URI handlers with the specified uri string.

Return

- ESP_OK : On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : No handler registered with specified uri string

Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri: uri string specifying all handlers that need to be deregistered

esp_err_t **httpd_sess_set_recv_override** (*httpd_handle_t* hd, int sockfd, *httpd_recv_func_t* recv_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD

- [in] `recv_func`: The receive function to be set for this session

esp_err_t `httpd_sess_set_send_override` (*httpd_handle_t* `hd`, `int` `sockfd`, *httpd_send_func_t* `send_func`)

Override web server' s send function (by session FD)

This function overrides the web server' s send function. This same function is used to send out any response to any HTTP request.

Note This API is supposed to be called either from the context of

- an http session APIs where `sockfd` is a valid parameter
- a URI handler where `sockfd` is obtained using `httpd_req_to_sockfd()`

Return

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

Parameters

- [in] `hd`: HTTPD instance handle
- [in] `sockfd`: Session socket FD
- [in] `send_func`: The send function to be set for this session

esp_err_t `httpd_sess_set_pending_override` (*httpd_handle_t* `hd`, `int` `sockfd`, *httpd_pending_func_t* `pending_func`)

Override web server' s pending function (by session FD)

This function overrides the web server' s pending function. This function is used to test for pending bytes in a socket.

Note This API is supposed to be called either from the context of

- an http session APIs where `sockfd` is a valid parameter
- a URI handler where `sockfd` is obtained using `httpd_req_to_sockfd()`

Return

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

Parameters

- [in] `hd`: HTTPD instance handle
- [in] `sockfd`: Session socket FD
- [in] `pending_func`: The receive function to be set for this session

`int` `httpd_req_to_sockfd` (*httpd_req_t* *`r`)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

Note This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

Return

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

Parameters

- [in] `r`: The request whose socket descriptor should be found

`int` `httpd_req_recv` (*httpd_req_t* *`r`, `char` *`buf`, `size_t` `buf_len`)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

Return

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

Parameters

- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that the data will be read into
- [in] buf_len: Length of the buffer

size_t **httpd_req_get_hdr_value_len** (*httpd_req_t* *r, const char *field)

Search for a field in request headers and return the string length of it' s value.

Note

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once *httpd_resp_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

Parameters

- [in] r: The request being responded to
- [in] field: The header field to be searched in the request

esp_err_t **httpd_req_get_hdr_value_str** (*httpd_req_t* *r, const char *field, char *val, size_t *val_size*)

Get the value string of a field from the request headers.

Note

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once *httpd_resp_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use *httpd_req_get_hdr_value_len()* to know the right buffer length

Return

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters

- [in] r: The request being responded to
- [in] field: The field to be searched in the header
- [out] val: Pointer to the buffer into which the value will be copied if the field is found
- [in] val_size: Size of the user buffer "val"

size_t **httpd_req_get_url_query_len** (*httpd_req_t* *r)

Get Query string length from the request URL.

Note This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid

Return

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

Parameters

- [in] r: The request being responded to

esp_err_t **httpd_req_get_url_query_str** (*httpd_req_t* *r, char *buf, size_t buf_len)

Get Query string from the request URL.

Note

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Return

- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

Parameters

- [in] r: The request being responded to
- [out] buf: Pointer to the buffer into which the query string will be copied (if found)
- [in] buf_len: Length of output buffer

esp_err_t **httpd_query_key_value** (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1¶m2=val2.

Note

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters

- [in] qry: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val_size: Size of the user buffer “val”

esp_err_t **httpd_req_get_cookie_val** (*httpd_req_t* *req, const char *cookie_name, char *val, size_t val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Return

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

Parameters

- [in] req: Pointer to the HTTP request

- [in] `cookie_name`: The cookie name to be searched in the request
- [out] `val`: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- [inout] `val_size`: Pointer to size of the user buffer “`val`”. This variable will contain cookie length if `ESP_OK` is returned and required buffer length incase `ESP_ERR_HTTPD_RESULT_TRUNC` is returned.

bool `httpd_uri_match_wildcard`(const char *`uri_template`, const char *`uri_to_match`, size_t `match_upto`)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Return true if a match was found

Parameters

- [in] `uri_template`: URI template (pattern)
- [in] `uri_to_match`: URI to be matched
- [in] `match_upto`: how many characters of the URI buffer to test (there may be trailing query string etc.)

esp_err_t `httpd_resp_send`(*httpd_req_t* *`r`, const char *`buf`, ssize_t `buf_len`)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

Parameters

- [in] `r`: The request being responded to
- [in] `buf`: Buffer from where the content is to be fetched
- [in] `buf_len`: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

esp_err_t `httpd_resp_send_chunk`(*httpd_req_t* *`r`, const char *`buf`, ssize_t `buf_len`)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and

send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

Parameters

- `[in] r`: The request being responded to
- `[in] buf`: Pointer to a buffer that stores the data
- `[in] buf_len`: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

static *esp_err_t* httpd_resp_sendstr (*httpd_req_t* *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls `http_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

Parameters

- `[in] r`: The request being responded to
- `[in] str`: String to be sent as response body

static *esp_err_t* httpd_resp_sendstr_chunk (*httpd_req_t* *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

Parameters

- `[in] r`: The request being responded to
- `[in] str`: String to be sent as response body (NULL to finish response packet)

***esp_err_t* httpd_resp_set_status** (*httpd_req_t* *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the '200 OK' response is sent as the response.

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the status to this value. The status isn't sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

Return

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

Parameters

- `[in] r`: The request being responded to
- `[in] status`: The HTTP status code of this response

`esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)`

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the content type to this value. The type isn't sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

Return

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

Parameters

- `[in] r`: The request being responded to
- `[in] type`: The Content Type of the response

`esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)`

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- The header isn't sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

Return

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

Parameters

- `[in] r`: The request being responded to
- `[in] field`: The field name of the HTTP header
- `[in] value`: The value of this HTTP header

`esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

static esp_err_t httpd_resp_send_404 (*httpd_req_t* *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

- [in] r: The request being responded to

static esp_err_t httpd_resp_send_408 (*httpd_req_t* *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

- [in] r: The request being responded to

static esp_err_t httpd_resp_send_500 (*httpd_req_t* *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK : On successfully sending the response packet

- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

Parameters

- `[in]` `r`: The request being responded to

int `httpd_send` (`httpd_req_t` **r*, **const** char **buf*, `size_t` *buf_len*)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t`* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`

Return

- Bytes : Number of bytes that were sent successfully
- `HTTPD SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

Parameters

- `[in]` `r`: The request being responded to
- `[in]` `buf`: Buffer from where the fully constructed packet is to be read
- `[in]` `buf_len`: Length of the buffer

int `httpd_socket_send` (`httpd_handle_t` *hd*, int *sockfd*, **const** char **buf*, `size_t` *buf_len*, int *flags*)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

Note This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Return

- Bytes : The number of bytes sent successfully
- `HTTPD SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

Parameters

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor
- `[in]` `buf`: buffer with bytes to send
- `[in]` `buf_len`: data size
- `[in]` `flags`: flags for the send() function

int `httpd_socket_recv` (`httpd_handle_t` *hd*, int *sockfd*, char **buf*, `size_t` *buf_len*, int *flags*)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

Note This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD SOCK_ERR_INVALID` : Invalid arguments

- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

Parameters

- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

esp_err_t **httpd_register_err_handler** (*httpd_handle_t* handle, *httpd_err_code_t* error, *httpd_err_handler_func_t* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

Return

- ESP_OK : handler registered successfully
- ESP_ERR_INVALID_ARG : invalid error code or server handle

Parameters

- [in] handle: HTTP server handle
- [in] error: Error type
- [in] handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

esp_err_t **httpd_start** (*httpd_handle_t* *handle, **const** *httpd_config_t* *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

Return

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

Parameters

- [in] config: Configuration for new instance of the server
- [out] handle: Handle to newly created instance of the server. NULL on error

esp_err_t **httpd_stop** (*httpd_handle_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

Return

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

Parameters

- [in] handle: Handle to server returned by httpd_start

esp_err_t **httpd_queue_work** (*httpd_handle_t* handle, *httpd_work_fn_t* work, void *arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] work: Pointer to the function to be executed in the HTTPD' s context
- [in] arg: Pointer to the arguments that should be passed to this function

void ***httpd_sess_get_ctx** (*httpd_handle_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return

- void* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

void **httpd_sess_set_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session context by socket descriptor.

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free_fn: Function that should be called to free the context

void ***httpd_sess_get_transport_ctx** (*httpd_handle_t* handle, int sockfd)

Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

Return

- `void*` : Pointer to the transport context associated with this session
- `NULL` : Empty context / Invalid handle / Invalid socket fd

Parameters

- `[in] handle`: Handle to server returned by `httpd_start`
- `[in] sockfd`: The socket descriptor for which the context should be extracted.

void `httpd_sess_set_transport_ctx` (`httpd_handle_t handle`, int `sockfd`, void `*ctx`, `httpd_free_ctx_fn_t free_fn`)

Set session 'transport' context by socket descriptor.

See `httpd_sess_set_ctx()`

Parameters

- `[in] handle`: Handle to server returned by `httpd_start`
- `[in] sockfd`: The socket descriptor for which the context should be extracted.
- `[in] ctx`: Transport context object to assign to the session
- `[in] free_fn`: Function that should be called to free the transport context

void `*httpd_get_global_user_ctx` (`httpd_handle_t handle`)

Get HTTPD global user context (it was set in the server config struct)

Return global user context

Parameters

- `[in] handle`: Handle to server returned by `httpd_start`

void `*httpd_get_global_transport_ctx` (`httpd_handle_t handle`)

Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

Parameters

- `[in] handle`: Handle to server returned by `httpd_start`

`esp_err_t httpd_sess_trigger_close` (`httpd_handle_t handle`, int `sockfd`)

Trigger an httpd session close externally.

Note Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Return

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

Parameters

- `[in] handle`: Handle to server returned by `httpd_start`
- `[in] sockfd`: The socket descriptor of the session to be closed

`esp_err_t httpd_sess_update_lru_counter` (`httpd_handle_t handle`, int `sockfd`)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note Calling this API is only necessary if the LRU Purge Enable option is enabled.

Return

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

Parameters

- [in] `handle`: Handle to server returned by `httpd_start`
- [in] `sockfd`: The socket descriptor of the session for which LRU counter is to be updated

esp_err_t **httpd_get_client_list** (*httpd_handle_t* `handle`, *size_t* *`fds`, *int* *`client_fds`)

Returns list of current socket descriptors of active sessions.

Note Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

Return

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

Parameters

- [in] `handle`: Handle to server returned by `httpd_start`
- [inout] `fds`: In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- [out] `client_fds`: Array of client fds

Structures**struct httpd_config**

HTTP Server Configuration Structure.

Note Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**

Priority of FreeRTOS task which runs the server

size_t **stack_size**

The maximum stack size allowed for the server task

BaseType_t **core_id**

The core the HTTP server task will run on

uint16_t **server_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_open_sockets**

Max number of sockets/clients connected at any time

uint16_t **max_uri_handlers**

Maximum allowed uri handlers

uint16_t **max_resp_headers**

Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**

Number of backlog connections

bool **lru_purge_enable**

Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**

Timeout for `recv` function (in seconds)

uint16_t **send_wait_timeout**

Timeout for `send` function (in seconds)

void ***global_user_ctx**
Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[*httpd_free_ctx_fn_t*](#) **global_user_ctx_free_fn**
Free function for global user context

void ***global_transport_ctx**
Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[*httpd_free_ctx_fn_t*](#) **global_transport_ctx_free_fn**
Free function for global transport context

[*httpd_open_func_t*](#) **open_fn**
Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

[*httpd_close_func_t*](#) **close_fn**
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

[*httpd_uri_match_func_t*](#) **uri_match_fn**
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct httpd_req
HTTP Request Data Structure.

Public Members

[*httpd_handle_t*](#) **handle**
Handle to server instance

int **method**
The type of HTTP request, -1 if unsupported method

const char uri[HTTPD_MAX_URI_LEN + 1]
The URI of this request (1 byte extra for null termination)

size_t content_len
Length of the request body

void *aux
Internally used members

void *user_ctx
User context pointer passed during URI registration.

void *sess_ctx
Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

httpd_free_ctx_fn_t **free_ctx**
Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes
Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

struct httpd_uri
Structure for URI handler.

Public Members

const char *uri
The URI to handle

httpd_method_t **method**
Method supported by the URI

esp_err_t (***handler**) (*httpd_req_t* *r)
Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

void *user_ctx
Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD SOCK_ERR_FAIL

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octext-stream

HTTPD_DEFAULT_CONFIG ()

ESP_ERR_HTTPD_BASE

Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL

All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS

URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ

Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC

Result string truncated

ESP_ERR_HTTPD_RESP_HDR

Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND

Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM

Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK

Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct *httpd_req* httpd_req_t
HTTP Request Data Structure.

typedef struct *httpd_uri* httpd_uri_t
Structure for URI handler.

```
typedef int (*httpd_send_func_t) (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len,
                                int flags)
```

Prototype for HTTPDs low-level send function.

Note User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

Return

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

```
typedef int (*httpd_rcv_func_t) (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int
                                flags)
```

Prototype for HTTPDs low-level rcv function.

Note User specified rcv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_rcv()` function

Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

```
typedef int (*httpd_pending_func_t) (httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

Note User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

Return

- Bytes : The number of bytes waiting to be received
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `pending()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `pending()`

Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor

```
typedef esp_err_t (*httpd_err_handler_func_t) (httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note

- If implemented, the server will not automatically send out HTTP error response codes, therefore,

`httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.

- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

Return

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

Parameters

- `[in]` `req`: HTTP request for which the error needs to be handled
- `[in]` `error`: Error type

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

```
typedef enum http_method httpd_method_t
```

HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

```
typedef void (*httpd_free_ctx_fn_t) (void *ctx)
```

Prototype for freeing context data (if any)

Parameters

- `[in]` `ctx`: object to free

```
typedef esp_err_t (*httpd_open_func_t) (httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Return

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

Parameters

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor

```
typedef void (*httpd_close_func_t) (httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

Note It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Parameters

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor

```
typedef bool (*httpd_uri_match_func_t) (const char *reference_uri, const char *uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

Return true on match

Parameters

- `[in]` `reference_uri`: URI/template with respect to which the other URI is matched
- `[in]` `uri_to_match`: URI/template being matched to the reference URI/template
- `[in]` `match_upto`: For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

```
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

Note Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```
typedef void (*httpd_work_fn_t) (void *arg)
```

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

Parameters

- [in] `arg`: The arguments for this work function

Enumerations

```
enum httpd_err_code_t
```

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

```
HTTPD_500_INTERNAL_SERVER_ERROR = 0
```

```
HTTPD_501_METHOD_NOT_IMPLEMENTED
```

```
HTTPD_505_VERSION_NOT_SUPPORTED
```

```
HTTPD_400_BAD_REQUEST
```

```
HTTPD_401_UNAUTHORIZED
```

```
HTTPD_403_FORBIDDEN
```

```
HTTPD_404_NOT_FOUND
```

```
HTTPD_405_METHOD_NOT_ALLOWED
```

```
HTTPD_408_REQ_TIMEOUT
```

```
HTTPD_411_LENGTH_REQUIRED
```

```
HTTPD_414_URI_TOO_LONG
```

```
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
```

```
HTTPD_ERR_CODE_MAX
```

2.4.7 HTTPS server

Overview

This component is built on top of `esp_http_server`. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for `esp_http_server` applies also to a server you create this way.

Used APIs

The following API of `esp_http_server` should not be used with `esp_https_server`, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
 - `httpd_sess_set_send_override()`
 - `httpd_sess_set_rcv_override()`
 - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
 - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
 - `httpd_sess_set_transport_ctx()`
 - `httpd_get_global_transport_ctx()` - returns the shared SSL context
 - `httpd_config_t.global_transport_ctx`
 - `httpd_config_t.global_transport_ctx_free_fn`

- `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example [protocols/https_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- [components/esp_https_server/include/esp_https_server.h](#)

Functions

`esp_err_t httpd_ssl_start` (*httpd_handle_t* *handle, *httpd_ssl_config_t* *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Return success

Parameters

- [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] handle: - storage for the server handle, must be a valid pointer

void `httpd_ssl_stop` (*httpd_handle_t* handle)

Stop the server. Blocks until the server is shut down.

Parameters

- [in] handle:

Structures

`struct esp_https_server_user_cb_arg`

Callback data struct, contains the ESP-TLS connection handle.

`struct httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

Public Members

`httpd_config_t` `httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t *cacert_pem

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in https_server component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of client_verify_cert_pem var) 2)There should be another variable servercert which would hold servers own certificate (should inherit current role of cacert var)

size_t **cacert_len**

CA certificate byte length

const uint8_t *client_verify_cert_pem

Client verify authority certificate (CA used to sign clients, or client cert itself)

size_t **client_verify_cert_len**

Client verify authority cert len

const uint8_t *prvtkey_pem

Private key

size_t **prvtkey_len**

Private key byte length

httpd_ssl_transport_mode_t **transport_mode**

Transport Mode (default secure)

uint16_t **port_secure**

Port used when transport mode is secure (default 443)

uint16_t **port_insecure**

Port used when transport mode is insecure (default 80)

bool **session_tickets**

Enable tls session tickets

esp_https_server_user_cb ***user_cb**

User callback for esp_https_server

Macros

HTTPD_SSL_CONFIG_DEFAULT ()

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

typedef struct *esp_https_server_user_cb_arg* **esp_https_server_user_cb_arg_t**

Callback data struct, contains the ESP-TLS connection handle.

typedef void **esp_https_server_user_cb** (*esp_https_server_user_cb_arg_t* **user_cb*)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Parameters

- *user_cb*: Callback data struct

typedef struct *httpd_ssl_config* **httpd_ssl_config_t**

Enumerations

enum `httpd_ssl_transport_mode_t`

Values:

`HTTPD_SSL_TRANSPORT_SECURE`

`HTTPD_SSL_TRANSPORT_INSECURE`

2.4.8 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
    ↪seqno);
}
```

(下页继续)

```

}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↵
↵sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↵time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↵
↵received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↵ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↵
↵can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: [protocols/icmp_echo](#)

API Reference

Header File

- [components/lwip/include/apps/ping/ping_sock.h](#)

Functions

esp_err_t **esp_ping_new_session**(**const** *esp_ping_config_t* **config*, **const** *esp_ping_callbacks_t* **cbs*, *esp_ping_handle_t* **hdl_out*)

Create a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

Parameters

- *config*: ping configuration
- *cbs*: a bunch of callback functions invoked by internal ping task
- *hdl_out*: handle of ping session

esp_err_t **esp_ping_delete_session**(*esp_ping_handle_t* *hdl*)

Delete a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

Parameters

- *hdl*: handle of ping session

esp_err_t **esp_ping_start**(*esp_ping_handle_t* *hdl*)

Start the ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

Parameters

- *hdl*: handle of ping session

esp_err_t **esp_ping_stop**(*esp_ping_handle_t* *hdl*)

Stop the ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

Parameters

- *hdl*: handle of ping session

esp_err_t **esp_ping_get_profile**(*esp_ping_handle_t* *hdl*, *esp_ping_profile_t* *profile*, void **data*, uint32_t *size*)

Get runtime profile of ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP_OK: get profile successfully

Parameters

- *hdl*: handle of ping session

- `profile`: type of profile
- `data`: profile data
- `size`: profile data size

Structures

struct esp_ping_callbacks_t

Type of “ping” callback functions.

Public Members

void ***cb_args**

arguments for callback functions

void (***on_ping_success**) (*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (***on_ping_timeout**) (*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (***on_ping_end**) (*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t

Type of “ping” configuration.

Public Members

uint32_t **count**

A “ping” session contains count procedures

uint32_t **interval_ms**

Milliseconds between each ping procedure

uint32_t **timeout_ms**

Timeout value (in milliseconds) of each ping procedure

uint32_t **data_size**

Size of the data next to ICMP packet header

uint8_t **tos**

Type of Service, a field specified in the IP header

ip_addr_t **target_addr**

Target IP address, either IPv4 or IPv6

uint32_t **task_stack_size**

Stack size of internal ping task

uint32_t **task_prio**

Priority of internal ping task

uint32_t **interface**

Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG()

Default ping configuration.

ESP_PING_COUNT_INFINITE

Set ping count to zero will ping target infinitely

Type Definitions

typedef void ***esp_ping_handle_t**
Type of “ping” session handle.

Enumerations

enum esp_ping_profile_t
Profile of ping session.

Values:

ESP_PING_PROF_SEQNO
Sequence number of a ping procedure

ESP_PING_PROF_TTL
Time to live of a ping procedure

ESP_PING_PROF_REQUEST
Number of request packets sent out

ESP_PING_PROF_REPLY
Number of reply packets received

ESP_PING_PROF_IPADDR
IP address of replied target

ESP_PING_PROF_SIZE
Size of received packet

ESP_PING_PROF_TIMEGAP
Elapsed time between request and reply packet

ESP_PING_PROF_DURATION
Elapsed time of the whole ping session

2.4.9 ASIO port

Overview

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

Supported features ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio [protocols/asio](#):

- [protocols/asio/udp_echo_server](#)
- [protocols/asio/tcp_echo_server](#)
- [protocols/asio/asio_chat](#)
- [protocols/asio/ssl_client_server](#)

Please refer to the specific example README.md for details

2.4.10 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

Configuration

URI

- Curently support `mqtt`, `mqttps`, `ws`, `wss` schemes
- MQTT over TCP samples:
 - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
 - `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
 - `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
 - `mqttps://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
 - `mqttps://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over Websocket samples:
 - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
 - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↵client);
esp_mqtt_client_start(client);

```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};

```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see `esp-tls.h` for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_cert_len`: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in `esp-tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

Last Will and Testament MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects

- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from `menu-config`
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

Change settings in Project Configuration Menu The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

API Reference

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

Functions

esp_mqtt_client_handle_t **esp_mqtt_client_init** (**const** *esp_mqtt_client_config_t* **config*)

Creates mqtt client handle based on the configuration.

Return mqtt_client_handle if successfully created, NULL on error

Parameters

- *config*: mqtt configuration structure

esp_err_t **esp_mqtt_client_set_uri** (*esp_mqtt_client_handle_t* *client*, **const** char **uri*)

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

Return ESP_FAIL if URI parse error, ESP_OK on success

Parameters

- *client*: mqtt client handle
- *uri*:

esp_err_t **esp_mqtt_client_start** (*esp_mqtt_client_handle_t* *client*)

Starts mqtt client with already created client handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

Parameters

- *client*: mqtt client handle

esp_err_t **esp_mqtt_client_reconnect** (*esp_mqtt_client_handle_t* *client*)

This api is typically used to force reconnection upon a specific event.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

Parameters

- *client*: mqtt client handle

esp_err_t **esp_mqtt_client_disconnect** (*esp_mqtt_client_handle_t* *client*)

This api is typically used to force disconnection from the broker.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

Parameters

- *client*: mqtt client handle

esp_err_t **esp_mqtt_client_stop** (*esp_mqtt_client_handle_t* *client*)

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

Parameters

- *client*: mqtt client handle

int **esp_mqtt_client_subscribe** (*esp_mqtt_client_handle_t* *client*, **const** char **topic*, int *qos*)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Return message_id of the subscribe message on success -1 on failure

Parameters

- *client*: mqtt client handle
- *topic*:
- *qos*:

int **esp_mqtt_client_unsubscribe** (*esp_mqtt_client_handle_t* *client*, **const** char **topic*)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

Return `message_id` of the subscribe message on success -1 on failure

Parameters

- `client`: mqtt client handle
- `topic`:

int `esp_mqtt_client_publish` (*`esp_mqtt_client_handle_t` client*, const char **topic*, const char **data*, int *len*, int *qos*, int *retain*)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with `qos>1` (returning -1 for all the `qos=0` messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

Return `message_id` of the publish message (for QoS 0 `message_id` will always be zero) on success. -1 on failure.

Parameters

- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag

int `esp_mqtt_client_enqueue` (*`esp_mqtt_client_handle_t` client*, const char **topic*, const char **data*, int *len*, int *qos*, int *retain*, bool *store*)

Enqueue a message to the outbox, to be sent later. Typically used for messages with `qos>0`, but could be also used for `qos=0` messages if `store=true`.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the `mqtt-task` context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

Return `message_id` if queued successfully, -1 otherwise

Parameters

- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag
- `store`: if true, all messages are enqueued; otherwise only `qos1` and `qos 2` are enqueued

`esp_err_t` `esp_mqtt_client_destroy` (*`esp_mqtt_client_handle_t` client*)

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

Return `ESP_OK` `ESP_ERR_INVALID_ARG` on wrong initialization

Parameters

- `client`: mqtt client handle

`esp_err_t` `esp_mqtt_set_config` (*`esp_mqtt_client_handle_t` client*, const *`esp_mqtt_client_config_t`* **config*)

Set configuration structure, typically used when updating the config (i.e. on "before_connect" event).

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

Parameters

- `client`: mqtt client handle
- `config`: mqtt configuration structure

`esp_err_t esp_mqtt_client_register_event` (`esp_mqtt_client_handle_t client`,
`esp_mqtt_event_id_t event`, `esp_event_handler_t event_handler`, void *`event_handler_arg`)

Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization
ESP_OK on success

Parameters

- `client`: mqtt client handle
- `event`: event type
- `event_handler`: handler callback
- `event_handler_arg`: handlers context

int `esp_mqtt_client_get_outbox_size` (`esp_mqtt_client_handle_t client`)
Get outbox size.

Return outbox size 0 on wrong initialization

Parameters

- `client`: mqtt client handle

Structures

struct esp_mqtt_error_codes

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT |
`esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from
tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | `connect_return_code` | Internal
error reported from MQTT broker on connection |

Public Members

`esp_err_t esp_tls_last_esp_err`
last esp_err code reported from esp-tls component

int `esp_tls_stack_err`
tls specific error code reported from underlying tls stack

int `esp_tls_cert_verify_flags`
tls flags reported from underlying tls stack during certificate verification

`esp_mqtt_error_type_t error_type`
error type referring to the source of the error

`esp_mqtt_connect_return_code_t connect_return_code`
connection refused error code reported from MQTT broker on connection

int `esp_transport_sock_errno`
errno from the underlying socket

struct esp_mqtt_event_t
MQTT event configuration structure

Public Members*esp_mqtt_event_id_t* **event_id**

MQTT event type

esp_mqtt_client_handle_t **client**

MQTT client handle for this event

void ***user_context**

User context passed from MQTT client config

char ***data**

Data associated with this event

int **data_len**

Length of the data for this event

int **total_data_len**

Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**

Actual offset for the data associated with this event

char ***topic**

Topic associated with this event

int **topic_len**

Length of the topic for this event associated with this event

int **msg_id**

MQTT message id of message

int **session_present**

MQTT session_present flag for connection event

esp_mqtt_error_codes_t ***error_handle**

esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool **retain**

Retained flag of the message associated with this event

struct esp_mqtt_client_config_t

MQTT client configuration structure

Public Members*mqtt_event_callback_t* **event_handle**

handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t **event_loop_handle**

handle for MQTT event loop library

const char ***host**

MQTT server domain (ipv4 as string)

const char ***uri**

Complete MQTT broker URI

uint32_t **port**

MQTT server port

const char ***client_id**

default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char ***username**

MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true

int keepalive
mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context

int task_prio
MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

const char *cert_pem
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t **transport**
 overrides URI transport

int **refresh_connection_after_ms**
 Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
 Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool **use_global_ca_store**
 Use a global ca_store for all the connections in which this bool is set.

esp_err_t (***crt_bundle_attach**) (void *conf)
 Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int **reconnect_timeout_ms**
 Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
 NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
 Client key decryption password string

int **clientkey_password_len**
 String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t **protocol_ver**
 MQTT protocol version used for connection, defaults to value from menuconfig

int **out_buffer_size**
 size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

bool **skip_cert_common_name_check**
 Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool **use_secure_element**
 enable secure element for enabling SSL connection

void ***ds_data**
 carrier of handle for digital signature parameters

int **network_timeout_ms**
 Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool **disable_keepalive**
 Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

const char *path
 Path in the URI

int **message_retransmit_timeout**
 timeout for retransmit of failed packet

Macros

MQTT_ERROR_TYPE_ESP_TLS

`MQTT_ERROR_TYPE_TCP_TRANSPORT` error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from `MQTT_ERROR_TYPE_ESP_TLS` layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

```
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

```
| error_type | related member variables | note |
|-----|-----|-----|
| MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls |
| MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |
```

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

Enumerations

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

Values:

MQTT_EVENT_ANY = -1

MQTT_EVENT_ERROR = 0

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

MQTT_EVENT_CONNECTED

connected event, additional context: `session_present` flag

MQTT_EVENT_DISCONNECTED

disconnected event

MQTT_EVENT_SUBSCRIBED

subscribed event, additional context: `msg_id`

MQTT_EVENT_UNSUBSCRIBED

unsubscribed event

MQTT_EVENT_PUBLISHED

published event, additional context: `msg_id`

MQTT_EVENT_DATA

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- `retain` retain flag of the message Note: Multiple `MQTT_EVENT_DATA` could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT

The event occurs before connecting

MQTT_EVENT_DELETED

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enum esp_mqtt_connect_return_code_t

MQTT connection error codes propagated via ERROR event

Values:

MQTT_CONNECTION_ACCEPTED = 0

Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL

MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED

MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE

MQTT connection refused reason: Server unavailable

MQTT_CONNECTION_REFUSE_BAD_USERNAME

MQTT connection refused reason: Wrong user

MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED

MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t

MQTT connection error codes propagated via ERROR event

Values:

MQTT_ERROR_TYPE_NONE = 0

MQTT_ERROR_TYPE_TCP_TRANSPORT

MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t

Values:

MQTT_TRANSPORT_UNKNOWN = 0x0

MQTT_TRANSPORT_OVER_TCP

MQTT over TCP, using scheme: `mqtt`

MQTT_TRANSPORT_OVER_SSL

MQTT over SSL, using scheme: `mqttssl`

MQTT_TRANSPORT_OVER_WS

MQTT over Websocket, using scheme: `ws`

MQTT_TRANSPORT_OVER_WSS

MQTT over Websocket Secure, using scheme: `wss`

enum esp_mqtt_protocol_ver_t

MQTT protocol version used for connection

Values:

MQTT_PROTOCOL_UNDEFINED = 0

MQTT_PROTOCOL_V_3_1

MQTT_PROTOCOL_V_3_1_1

2.4.11 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- `Modbus RTU` —This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
- `Modbus ASCII` —This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (“:”) and trailing newline (CR/LF).
- `Modbus TCP/IP` or `Modbus TCP` —This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization’ s with protocol specifications for specifics.

Messaging Model And Data Mapping

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP). The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

注解: It is assumed that the number of slaves and their register maps are known by the Modbus master before the start of stack.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device’ s network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device’ s data to the four types of registers.

The following sections give an overview of how to use the ESP_Modbus component found under *components/freemodbus*. The sections cover initialization of a Modbus port, and the setup a master or slave device accordingly:

- [Modbus Port Initialization](#)
- [Modbus Slave API Overview](#)
- [Modbus Master API Overview](#)

Modbus Port Initialization The ESP_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`

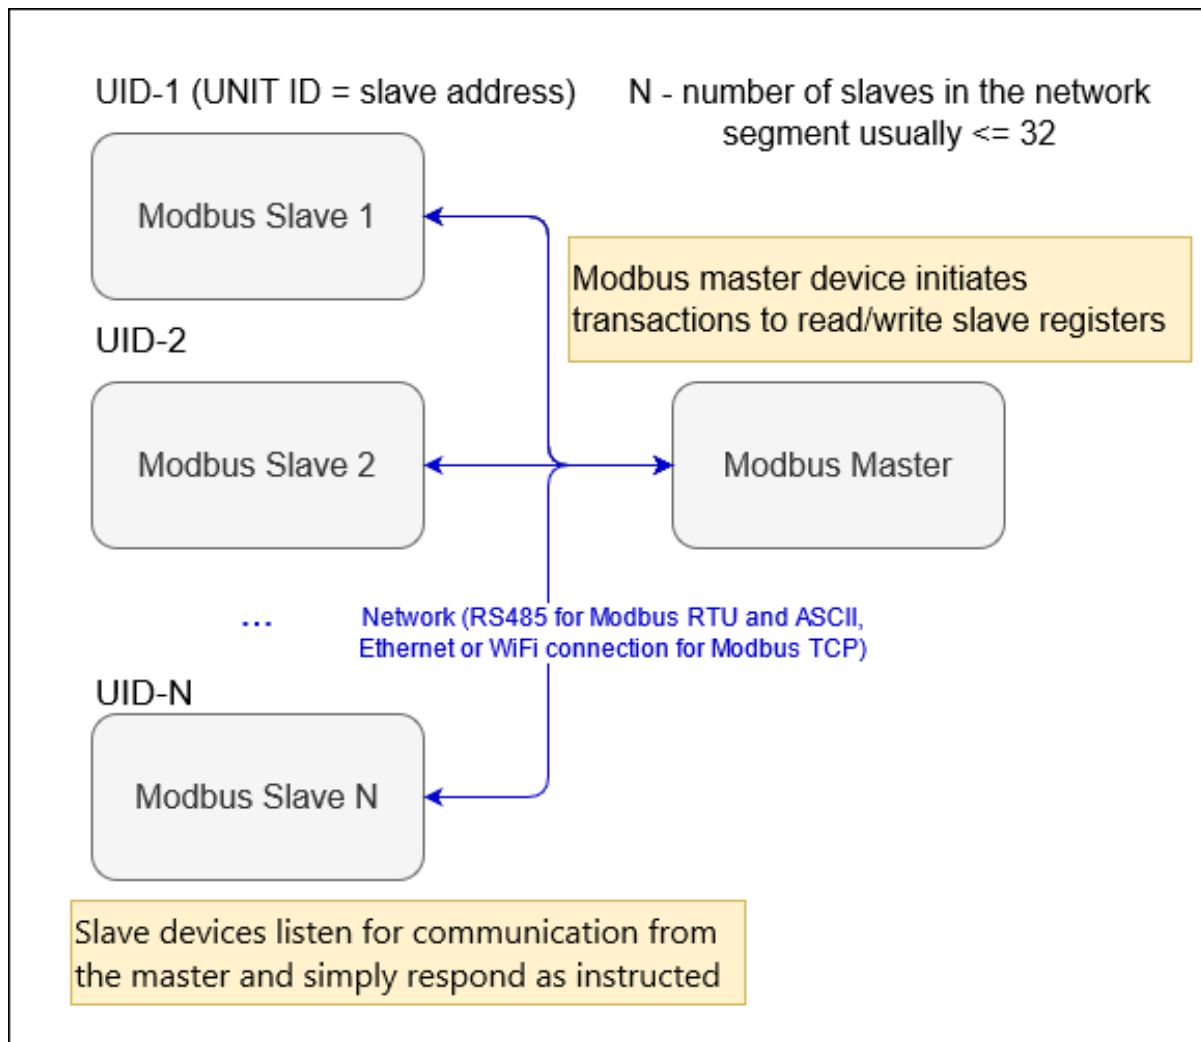

图 23: Modbus segment diagram

图 24: Modbus data mapping

- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER`, `MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER`, `MB_PORT_TCP_SLAVE` are reserved for internal usage.

```
void* master_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus master for serial port
esp_err_t err = mbc_master_init(MB_PORT_SERIAL_MASTER, &master_handler);
if (master_handler == NULL || err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

This example code to initialize slave port:

```
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
if (slave_handler == NULL || err != ESP_OK) {
    // Error handling is performed here
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

Modbus Master API Overview

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Modbus Port Initialization* - Initialization of Modbus controller interface for the selected port.
2. *Configuring Master Data Access* - Configure data descriptors to access slave parameters.
3. *Master Communication Options* - Allows to setup communication options for selected port.
4. *Master Communication* - Start stack and sending / receiving data.
5. *Modbus Master Teardown* - Destroy Modbus controller and its resources.

Configuring Master Data Access The architectural approach of ESP_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type `mb_parameter_descriptor_t` and represents the description of one physical characteristic:

表 6: Table 1 Modbus master Data Dictionary description

Field	Description	Detailed information
cid	Characteristic ID	The identifier of characteristic (must be unique).
param_name	Characteristic Name	String description of the characteristic.
param_units	Characteristic Units	Physical Units of the characteristic.
mb_slave_addr	Modbus Slave Address	The short address of the device with correspond parameter UID.
mb_param_reg_type	Modbus Register Type	Type of Modbus register area. MB_PARAM_INPUT , MB_PARAM_HOLDING , MB_PARAM_COIL , MB_PARAM_DISCRETE - represents Input , Holding, Coil and Discrete input register area accordingly;
mb_reg_start	Modbus Register Start	Relative register address of the characteristic in the register area.
mb_size	Modbus Register Size	Length of characteristic in registers.
param_inst_offset	Instance Offset	Offset to instance of the characteristic in bytes. It is used to calculate the absolute address to the characteristic in the storage structure. It is optional field and can be set to zero if the parameter is not used in the application.
param_data_type	Data Type	Specifies type of the characteristic. PARAM_TYPE_U8 , PARAM_TYPE_U16 , PARAM_TYPE_U32 - Unsigned integer 8/16/32 bit type; PARAM_TYPE_FLOAT - IEEE754 floating point format; PARAM_TYPE_ASCII - ASCII string or binary data;
param_data_size	Data Size	The storage size of the characteristic (bytes).
param_options	Parameter Options	Limits, options of characteristic used during processing of alarm in user application (optional)
access_type	Parameter access type	Can be used in user application to define the behavior of the characteristic during processing of data in user application; PAR_PERMS_READ_WRITE_TRIGGER , PAR_PERMS_READ , PAR_PERMS_READ_WRITE_TRIGGER ;

注解: The `cid` and `param_key` have to be unique. Please use the prefix to the parameter key if you have several similar parameters in your register map table.

表 7: Table 2 Example Register mapping table of Modbus slave

CID	Register	Range	Type	Units	Description
0	30004	MAX_UINT	U32	Not defined	Serial number of device (4 bytes) read-only
1	30002	MAX_UINT	U16	Not defined	Software version (4 bytes) read-only
2	40004	-20..40	FLOAT	DegC	Room temperature in DegC. Writing a temperature value to this register for single point calibration.

```
// Enumeration of modbus slave addresses accessed by master device
enum {
    MB_DEVICE_ADDR1 = 1,
    MB_DEVICE_ADDR2,
    MB_SLAVE_COUNT
}
```

(下页继续)

```

};

// Enumeration of all supported CIDs for device
enum {
    CID_SER_NUM1 = 0,
    CID_SW_VER1,
    CID_TEMP_DATA_1,
    CID_SER_NUM2,
    CID_SW_VER2,
    CID_TEMP_DATA_2
};

// Example Data Dictionary for Modbus parameters in 2 slaves in the segment
mb_parameter_descriptor_t device_parameters[] = {
    // CID, Name, Units, Modbus addr, register type, Modbus Reg Start Addr, Modbus_
    ↪Reg read length,
    // Instance offset (NA), Instance type, Instance length (bytes), Options (NA),_
    ↪Permissions
    { CID_SER_NUM1, STR("Serial_number_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_
    ↪INPUT, 0, 2,
        0, PARAM_TYPE_U32, 4, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_SW_VER1, STR("Software_version_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_
    ↪INPUT, 2, 1,
        0, PARAM_TYPE_U16, 2, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_TEMP_DATA_1, STR("Temperature_1"), STR("C"), MB_DEVICE_ADDR1, MB_PARAM_
    ↪HOLDING, 0, 2,
        0, PARAM_TYPE_FLOAT, 4, OPTS( 16, 30, 1 ), PAR_PERMS_READ_
    ↪WRITE_TRIGGER },
    { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_
    ↪INPUT, 0, 2,
        0, PARAM_TYPE_U32, 4, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_SW_VER2, STR("Software_version_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_
    ↪INPUT, 2, 1,
        0, PARAM_TYPE_U16, 2, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MB_DEVICE_ADDR2, MB_PARAM_
    ↪HOLDING, 0, 2,
        0, PARAM_TYPE_FLOAT, 4, OPTS( 20, 30, 1 ), PAR_PERMS_READ_
    ↪WRITE_TRIGGER },
};

// Calculate number of parameters in the table
uint16_t num_device_parameters = (sizeof(device_parameters) / sizeof(device_
    ↪parameters[0]));

```

During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as the parameter of the function below.

`mbc_master_set_descriptor()`: Initialization of master descriptor.

```

ESP_ERROR_CHECK(mbc_master_set_descriptor(&device_parameters[0], num_device_
    ↪parameters));

```

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initialization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included in descriptor table using its CID.

Master Communication Options Calling the setup function allows for specific communication options to be defined for port.

```
mbc_master_setup()
```

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```
mb_communication_info_t comm_info = {
    .port = MB_PORT_NUM,           // Serial port number
    .mode = MB_MODE_RTU,          // Modbus mode of communication (MB_MODE_RTU or MB_
    ↪MODE_ASCII)
    .baudrate = 9600,             // Modbus communication baud rate
    .parity = MB_PARITY_NONE     // parity option for serial port
};

ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

The order of IP address string corresponds to short slave address in the Data Dictionary.

```
#define MB_SLAVE_COUNT 2 // Number of slaves in the segment being accessed (as_
    ↪defined in Data Dictionary)

char* slave_ip_address_table[MB_SLAVE_COUNT] = {
    "192.168.1.2",           // Address corresponds to UID1 and set to predefined value_
    ↪by user
    "192.168.1.3",           // corresponds to UID2 in the segment
    NULL                     // end of table
};

mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,     // Modbus TCP port number (default_
    ↪= 502)
    .ip_addr_type = MB_IPV4,    // version of IP protocol
    .ip_mode = MB_MODE_TCP,     // Port communication mode
    .ip_addr = (void*)slave_ip_address_table, // assign table of IP addresses
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the_
    ↪corresponding network interface
};

ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

注解: Refer to [esp_netif component](#) for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to [protocols/modbus/tcp/mb_tcp_master](#) for more information.

注解: RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to [Running UART Communication](#) section of UART documentation.

Master Communication The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

```
mbc_master_start()
```

```
esp_err_t err = mbc_master_start();
if (err != ESP_OK) {
```

(下页继续)

```

ESP_LOGE(TAG, "mb controller start fail, err=%x.", err);
}

```

The list of functions below are used by the Modbus master stack from a user' s application:

mbc_master_send_request(): This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure *mb_param_request_t*) and then blocks until a response from corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

mbc_master_get_cid_info(): The function gets information about each characteristic supported in the data dictionary and returns the characteristic' s description in the form of the *mb_parameter_descriptor_t* structure. Each characteristic is accessed using its CID.

mbc_master_get_parameter(): The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for request is taken from parameter description table.

Example:

```

const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;
....

// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->
    ↪param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic #d %s (%s) value = (0x%08x) read successful.
        ↪",
                param_descriptor->cid,
                (char*)param_descriptor->param_key,
                (char*)param_descriptor->param_units,
                *(uint32_t*)temp_data);
    } else {
        ESP_LOGE(TAG, "Characteristic #d (%s) read fail, err = 0x%x (%s).",
                param_descriptor->cid,
                (char*)param_descriptor->param_key,
                (int)err,
                (char*)esp_err_to_name(err));
    }
} else {
    ESP_LOGE(TAG, "Could not get information for characteristic %d.", cid);
}
}

```

mbc_master_set_parameter()

The function writes characteristic' s value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

```

uint8_t type = 0; // Type of parameter
uint8_t temp_data[4] = {0}; // temporary buffer

esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_
    ↪t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.");
} else {
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s).", (int)err, (char*)esp_err_to_
    ↪name(err));
}
}

```

Modbus Master Teardown This function stops Modbus communication stack and destroys controller interface and free all used active objects.

`mbc_master_destroy()`

```
ESP_ERROR_CHECK(mbc_master_destroy());
```

Modbus Slave API Overview

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. *Modbus Port Initialization* - Initialization of Modbus controller interface for the selected port.
2. *Configuring Slave Data Access* - Configure data descriptors to access slave parameters.
3. *Slave Communication Options* - Allows to setup communication options for selected port.
4. *Slave Communication* - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. *Modbus Slave Teardown* - Destroy Modbus controller and its resources.

Configuring Slave Data Access The following functions must be called when the Modbus controller slave port is already initialized. Refer to *Modbus Port Initialization*.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using `mbc_slave_set_descriptor()` API call before the start of communication. The slave task can call the `mbc_slave_check_event()` function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

注解: One slave can define several area descriptors per each type of Modbus register area with different `start_offset`.

Register area is defined by using the `mb_register_area_descriptor_t` structure.

表 8: Table 3 Modbus register area descriptor

Field	Description
<code>start_offset</code>	Zero based register relative offset for defined register area. Example: register address = 40002 (4x register area - Function 3 - holding register), <code>start_offset = 2</code>
<code>type</code>	Type of the Modbus register area. Refer to <code>mb_param_type_t</code> for more information.
<code>address</code>	A pointer to the memory area which is used to store the register data for this area descriptor.
<code>size</code>	The size of the memory area in bytes which is used to store register data.

`mbc_slave_set_descriptor()`

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master.

```
#define MB_REG_INPUT_START_AREA0    (0)
#define MB_REG_HOLDING_START_AREA0 (0)
#define MB_REG_HOLD_CNT             (100)
#define MB_REG_INPUT_CNT            (100)

mb_register_area_descriptor_t reg_area; // Modbus register area descriptor
↪structure
unit16_t holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding
↪registers
unit16_t input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input
↪registers
```

(下页继续)

(续上页)

```

reg_area.type = MB_PARAM_HOLDING; // Set type of
↪register area
reg_area.start_offset = MB_REG_HOLDING_START_AREA0; // Offset of
↪register area in Modbus protocol
reg_area.address = (void*)&holding_reg_area[0]; // Set pointer to
↪storage instance
reg_area.size = sizeof(holding_reg_area) << 1; // Set the size of
↪register storage area in bytes
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

reg_area.type = MB_PARAM_INPUT;
reg_area.start_offset = MB_REG_INPUT_START_AREA0;
reg_area.address = (void*)&input_reg_area[0];
reg_area.size = sizeof(input_reg_area) << 1;
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

```

At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

```

portENTER_CRITICAL(&param_lock);
holding_reg_area[2] += 10;
portEXIT_CRITICAL(&param_lock);

```

Slave Communication Options The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

`mbc_slave_setup()`

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:

```

esp_netif_init();
...
mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT, // Modbus TCP port number (default
↪= 502)
    .ip_addr_type = MB_IPV4, // version of IP protocol
    .ip_mode = MB_MODE_TCP, // Port communication mode
    .ip_addr = NULL, // This field keeps the client IP
↪address to bind, NULL - bind to any client
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr - pointer to the
↪corresponding network interface
};

// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_setup((void*)&comm_info));

```

Example initialization of Modbus serial communication:

```

#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...

// Setup communication parameters and start stack
mb_communication_info_t comm_info = {

```

(下页继续)

(续上页)

```

        .mode = MB_MODE_RTU,                // Communication type
        .slave_addr = MB_SLAVE_ADDR,        // Short address of the slave
        .port = MB_SLAVE_PORT_NUM,         // UART physical port number
        .baudrate = MB_SLAVE_DEV_SPEED,    // Baud rate for communication
        .parity = MB_PARITY_NONE           // Parity option
    };

ESP_ERROR_CHECK(mbc_slave_setup((void*)&comm_info));

```

Slave Communication The function below is used to start Modbus controller interface and allows communication.

`mbc_slave_start()`

```
ESP_ERROR_CHECK(mbc_slave_start());
```

`mbc_slave_check_event()`

The blocking call to function waits for a event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event `mb_event_group_t` which describes the type of register access being done.

`mbc_slave_get_param_info()`

The function gets information about accessed parameters from the Modbus controller event queue. The KConfig `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE` key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The `mb_param_info_t` structure contains information about accessed parameter.

表 9: Table 4 Description of the register info structure:
`mb_param_info_t`

Field	Description
<code>time_stamp</code>	time stamp of the event when defined parameter is accessed
<code>mb_offset</code>	start Modbus register accessed by master
<code>type</code>	type of the Modbus register area being accessed (See the <code>mb_event_group_t</code> for more information)
<code>address</code>	memory address that corresponds to accessed register in defined area descriptor
<code>size</code>	number of registers being accessed by master

Example to get event when holding or input registers accessed in the slave:

```

#define MB_READ_MASK          (MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD)
#define MB_WRITE_MASK        (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK   (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10 / portTICK_RATE_MS)
....

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(&reg_info, MB_PAR_INFO_GET_TOUT));
const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG_WR | MB_EVENT_HOLDING_REG_RD)) {
    ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u
↪",
            rw_str,

```

(下页继续)

```
        (uint32_t) reg_info.time_stamp,
        (uint32_t) reg_info.mb_offset,
        (uint32_t) reg_info.type,
        (uint32_t) reg_info.address,
        (uint32_t) reg_info.size);
} else if (event & (MB_EVENT_INPUT_REG_RD)) {
    ESP_LOGI(TAG, "INPUT %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
             rw_str,
             (uint32_t) reg_info.time_stamp,
             (uint32_t) reg_info.mb_offset,
             (uint32_t) reg_info.type,
             (uint32_t) reg_info.address,
             (uint32_t) reg_info.size);
}
```

Modbus Slave Teardown This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

mbc_slave_destroy()

```
ESP_ERROR_CHECK(mbc_slave_destroy());
```

Possible Communication Issues And Solutions

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:

```
E (1692332) MB_CONTROLLER_MASTER: mbc_master_get_parameter(111): SERIAL master get_
->parameter failure error=(0x107) (ESP_ERR_TIMEOUT).
```

表 10: Table 5 Modbus error codes and troubleshooting

Error	Description	Possible solution
0x106	ESP_ERR_NOT_SUPPORTED - Invalid register request - slave returned an exception because the requested register is not supported.	Refer to slave register map. Check the master data dictionary for correctness.
0x107	ESP_ERR_TIMEOUT - Slave response timeout - Modbus slave did not send response during configured slave response timeout.	Measure and increase the maximum slave response timeout <i>idf.py menu-config</i> , option <code>CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND</code> . Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than <code>CONFIG_FMB_PORT_TASK_PRIO</code> it is recommended to place Modbus tasks on the other core using an option <code>CONFIG_FMB_PORT_TASK_AFFINITY</code> . Configure the Modbus task's priority <code>CONFIG_FMB_PORT_TASK_PRIO</code> to ensure that the task gets sufficient processing time to handle Modbus stack events.
0x108	ESP_ERR_INVALID_RESPONSE - Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect.	Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.
0x109	ESP_ERR_INVALID_STATE - Critical failure or FSM sequence failure or master FSM is busy processing previous request.	Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.

Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support ...” for appropriate communication mode and related configuration keys.

```

Enumerations

```
enum mb_port_type_t
    Types of actual Modbus implementation.
```

Values:

```
MB_PORT_SERIAL_MASTER = 0x00
    Modbus port type serial master.
```

```
MB_PORT_SERIAL_SLAVE
    Modbus port type serial slave.
```

```
MB_PORT_TCP_MASTER
    Modbus port type TCP master.
```

```
MB_PORT_TCP_SLAVE
    Modbus port type TCP slave.
```

```
MB_PORT_COUNT
    Modbus port count.
```

```
MB_PORT_INACTIVE = 0xFF
```

```
enum mb_event_group_t
    Event group for parameters notification.
```

Values:

```
MB_EVENT_NO_EVENTS = 0x00
```

```
MB_EVENT_HOLDING_REG_WR = BIT0
    Modbus Event Write Holding registers.
```

```
MB_EVENT_HOLDING_REG_RD = BIT1
    Modbus Event Read Holding registers.
```

```
MB_EVENT_INPUT_REG_RD = BIT3
    Modbus Event Read Input registers.
```

```
MB_EVENT_COILS_WR = BIT4
    Modbus Event Write Coils.
```

```
MB_EVENT_COILS_RD = BIT5
    Modbus Event Read Coils.
```

```
MB_EVENT_DISCRETE_RD = BIT6
    Modbus Event Read Discrete bits.
```

```
MB_EVENT_STACK_STARTED = BIT7
    Modbus Event Stack started
```

```
enum mb_param_type_t
    Type of Modbus parameter.
```

Values:

MB_PARAM_HOLDING = 0x00
Modbus Holding register.

MB_PARAM_INPUT
Modbus Input register.

MB_PARAM_COIL
Modbus Coils.

MB_PARAM_DISCRETE
Modbus Discrete bits.

MB_PARAM_COUNT

MB_PARAM_UNKNOWN = 0xFF

enum mb_mode_type_t
Modbus serial transmission modes (RTU/ASCII).

Values:

MB_MODE_RTU
RTU transmission mode.

MB_MODE_ASCII
ASCII transmission mode.

MB_MODE_TCP
TCP communication mode.

MB_MODE_UDP
UDP communication mode.

enum mb_tcp_addr_type_t
Modbus TCP type of address.

Values:

MB_IPV4 = 0
TCP IPV4 addressing

MB_IPV6 = 1
TCP IPV6 addressing

Header File

- [components/freemodbus/common/include/esp_modbus_master.h](#)

Functions

esp_err_t **mbc_master_init_tcp** (void ***handler*)
Initialize Modbus controller and stack for TCP port.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters

- [out] *handler*: handler(pointer) to master data structure

esp_err_t **mbc_master_init** (*mb_port_type_t* *port_type*, void ***handler*)
Initialize Modbus Master controller and stack for Serial port.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported

- ESP_ERR_INVALID_STATE Initialization failure

Parameters

- [out] handler: handler(pointer) to master data structure
- [in] port_type: type of stack

void **mbc_master_init_iface** (void *handler)

Initialize Modbus Master controller interface handle.

Parameters

- [in] handler: - pointer to master data structure

esp_err_t **mbc_master_destroy** (void)

Destroy Modbus controller and stack.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

esp_err_t **mbc_master_start** (void)

Start Modbus communication stack.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

esp_err_t **mbc_master_setup** (void *comm_info)

Set Modbus communication parameters for the controller.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters

- comm_info: Communication parameters structure.

esp_err_t **mbc_master_set_descriptor** (const *mb_parameter_descriptor_t* *descriptor, const uint16_t num_elements)

Assign parameter description table for Modbus controller interface.

Return

- *esp_err_t* ESP_OK - set descriptor successfully
- *esp_err_t* ESP_ERR_INVALID_ARG - invalid argument in function call

Parameters

- [in] descriptor: pointer to parameter description table
- num_elements: number of elements in the table

esp_err_t **mbc_master_send_request** (*mb_param_request_t* *request, void *data_ptr)

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

Return

- *esp_err_t* ESP_OK - request was successful
- *esp_err_t* ESP_ERR_INVALID_ARG - invalid argument of function
- *esp_err_t* ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- *esp_err_t* ESP_ERR_TIMEOUT - operation timeout or no response from slave
- *esp_err_t* ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- *esp_err_t* ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] request: pointer to request structure of type *mb_param_request_t*
- [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

esp_err_t **mbc_master_get_cid_info** (uint16_t cid, const *mb_parameter_descriptor_t* **param_info)

Get information about supported characteristic defined as cid. Uses parameter description table to get this

information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return

- esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
- esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters

- [in] cid: characteristic id
- param_info: pointer to pointer of characteristic data.

esp_err_t **mbc_master_get_parameter** (uint16_t cid, char *name, uint8_t *value, uint8_t *type)

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

Return

- esp_err_t ESP_OK - request was successful and value buffer contains representation of actual parameter data from slave
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter
- [out] type: parameter type associated with the name returned from parameter description table.

esp_err_t **mbc_master_set_parameter** (uint16_t cid, char *name, uint8_t *value, uint8_t *type)

Set characteristic's value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

Return

- esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave during processing of parameter
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup table.

Unions

union mb_parameter_opt_t

#include <esp_modbus_master.h> Modbus parameter options for description table.

Public Members

int opt1
Parameter option1

int opt2
Parameter option2

int opt3
Parameter option3

struct mb_parameter_opt_t::[anonymous] [anonymous]

int min
Parameter minimum value

int max
Parameter maximum value

int step
Step of parameter change tracking

struct mb_parameter_opt_t::[anonymous] [anonymous]

Structures

struct mb_parameter_descriptor_t

Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

Public Members

uint16_t cid
Characteristic cid

const char *param_key
The key (name) of the parameter

const char *param_units
The physical units of the parameter

uint8_t mb_slave_addr
Slave address of device in the Modbus segment

mb_param_type_t mb_param_type
Type of modbus parameter

uint16_t mb_reg_start
This is the Modbus register address. This is the 0 based value.

uint16_t mb_size
Size of mb parameter in registers

uint16_t param_offset
Parameter name (OFFSET in the parameter structure)

mb_descr_type_t param_type
Float, U8, U16, U32, ASCII, etc.

mb_descr_size_t param_size
Number of bytes in the parameter.

mb_parameter_opt_t param_opts
Parameter options used to check limits and etc.

mb_param_perms_t access
Access permissions based on mode

struct mb_param_request_t

Modbus register request type structure.

Public Members**uint8_t slave_addr**

Modbus slave address

uint8_t command

Modbus command to send

uint16_t reg_start

Modbus start register

uint16_t reg_size

Modbus number of registers

Macros**MB_MASTER_CHECK** (a, err_code, format, ...)**MB_MASTER_ASSERT** (con)**Enumerations****enum mb_descr_type_t**

Modbus descriptor table parameter type defines.

*Values:***PARAM_TYPE_U8** = 0x00

Unsigned 8

PARAM_TYPE_U16 = 0x01

Unsigned 16

PARAM_TYPE_U32 = 0x02

Unsigned 32

PARAM_TYPE_FLOAT = 0x03

Float type

PARAM_TYPE_ASCII = 0x04

ASCII type

enum mb_descr_size_t

Modbus descriptor table parameter size in bytes.

*Values:***PARAM_SIZE_U8** = 0x01

Unsigned 8

PARAM_SIZE_U16 = 0x02

Unsigned 16

PARAM_SIZE_U32 = 0x04

Unsigned 32

PARAM_SIZE_FLOAT = 0x04

Float size

PARAM_SIZE_ASCII = 0x08

ASCII size

PARAM_SIZE_ASCII24 = 0x18

ASCII24 size

PARAM_MAX_SIZE**enum mb_param_perms_t**

Permissions for the characteristics.

Values:

PAR_PERMS_READ = 1 « BIT0

the characteristic of the device are readable

PAR_PERMS_WRITE = 1 « BIT1

the characteristic of the device are writable

PAR_PERMS_TRIGGER = 1 « BIT2

the characteristic of the device are triggerable

PAR_PERMS_READ_WRITE = *PAR_PERMS_READ* | *PAR_PERMS_WRITE*

the characteristic of the device are readable & writable

PAR_PERMS_READ_TRIGGER = *PAR_PERMS_READ* | *PAR_PERMS_TRIGGER*

the characteristic of the device are readable & triggerable

PAR_PERMS_WRITE_TRIGGER = *PAR_PERMS_WRITE* | *PAR_PERMS_TRIGGER*

the characteristic of the device are writable & triggerable

PAR_PERMS_READ_WRITE_TRIGGER = *PAR_PERMS_READ_WRITE* | *PAR_PERMS_TRIGGER*

the characteristic of the device are readable & writable & triggerable

Header File

- [components/freemodbus/common/include/esp_modbus_slave.h](#)

Functions

esp_err_t **mbc_slave_init_tcp**(void ***handler*)

Initialize Modbus Slave controller and stack for TCP port.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters

- [out] *handler*: handler(pointer) to master data structure

esp_err_t **mbc_slave_init**(*mb_port_type_t* *port_type*, void ***handler*)

Initialize Modbus Slave controller and stack for Serial port.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters

- [out] *handler*: handler(pointer) to master data structure
- [in] *port_type*: the type of port

void **mbc_slave_init_iface**(void **handler*)

Initialize Modbus Slave controller interface handle.

Parameters

- [in] *handler*: - pointer to slave interface data structure

esp_err_t **mbc_slave_destroy**(void)

Destroy Modbus controller and stack.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

esp_err_t **mbc_slave_start** (void)

Start Modbus communication stack.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

esp_err_t **mbc_slave_setup** (void **comm_info*)

Set Modbus communication parameters for the controller.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters

- *comm_info*: Communication parameters structure.

mb_event_group_t **mbc_slave_check_event** (*mb_event_group_t* *group*)

Wait for specific event on parameter change.

Return

- *mb_event_group_t* event bits triggered

Parameters

- *group*: Group event bit mask to wait for change

esp_err_t **mbc_slave_get_param_info** (*mb_param_info_t* **reg_info*, *uint32_t* *timeout*)

Get parameter information.

Return

- ESP_OK Success
- ESP_ERR_TIMEOUT Can not get data from parameter queue or queue overflow

Parameters

- [out] *reg_info*: parameter info structure
- *timeout*: Timeout in milliseconds to read information from parameter queue

esp_err_t **mbc_slave_set_descriptor** (*mb_register_area_descriptor_t* *descr_data*)

Set Modbus area descriptor.

Return

- ESP_OK: The appropriate descriptor is set
- ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters

- *descr_data*: Modbus registers area descriptor structure

Structures

struct *mb_param_info_t*

Parameter access event information type.

Public Members

uint32_t **time_stamp**

Timestamp of Modbus Event (uS)

uint16_t **mb_offset**

Modbus register offset

mb_event_group_t **type**

Modbus event type

uint8_t ***address**

Modbus data storage address

size_t size

Modbus event register size (number of registers)

struct mb_register_area_descriptor_t

Parameter storage area descriptor.

Public Members

uint16_t start_offset

Modbus start address for area descriptor

mb_param_type_t type

Type of storage area descriptor

void *address

Instance address for storage area descriptor

size_t size

Instance size for area descriptor (bytes)

Macros

MB_SLAVE_CHECK (a, err_code, format, ...)

MB_SLAVE_ASSERT (con)

2.4.12 ESP Local Control

Overview

ESP Local Control (**esp_local_ctrl**) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp_local_ctrl** service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = &(protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx          = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
};
```

(下页继续)

```

    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTCOM_SEC1*: specifies that end to end encryption is used.
2. *PROTCOM_SEC0*: specifies that data will be exchanged as a plain text.
3. *PROTCOM_SEC_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom_handle* of type *protocomm_security_t* * in this context.

Creating a property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the *type* and *flags* fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
                                     ↪values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t_
                                     ↪*prop_values,
```

(下页继续)

```

                                void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↳props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                    prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp_local_ctrl](#)

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp_local_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp_local_ctrl** service:

1. *get_prop_count* : This should simply return the total number of properties supported by the service
2. *get_prop_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set_prop_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get_prop_count* and then *get_prop_values*, hence form an index to name mapping for all properties. Now when calling *set_prop_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp_local_ctrl** are listed below:

表 11: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl/version	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl/control	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

API Reference

Header File

- [components/esp_local_ctrl/include/esp_local_ctrl.h](#)

Functions

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_ble** (void)

Function for obtaining BLE transport mode.

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_httpd** (void)

Function for obtaining HTTPD transport mode.

esp_err_t **esp_local_ctrl_start** (const *esp_local_ctrl_config_t* *config)

Start local control service.

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] config: Pointer to configuration structure

esp_err_t **esp_local_ctrl_stop** (void)

Stop local control service.

esp_err_t **esp_local_ctrl_add_property** (const *esp_local_ctrl_prop_t* *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] prop: Property description structure

esp_err_t **esp_local_ctrl_remove_property** (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

Parameters

- [in] name: Name of the property to remove

const *esp_local_ctrl_prop_t* ***esp_local_ctrl_get_property** (const char *name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

Return

- Pointer to property
- NULL if not found

Parameters

- [in] name: Name of the property to find

esp_err_t **esp_local_ctrl_set_handler** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Note In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

Unions**union esp_local_ctrl_transport_config_t**

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members*esp_local_ctrl_transport_config_ble_t* *ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures**struct esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

char *name

Unique name of property

uint32_t type

Type of property. This may be set to application defined enums

size_t size

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32_t flags

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (*ctx_free_fn)(void *ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct esp_local_ctrl_prop_val

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data

Pointer to memory holding property value

size_t size

Size of property value

void (*free_fn)(void *data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct esp_local_ctrl_handlers

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (***get_prop_values**)(size_t props_count, **const** *esp_local_ctrl_prop_t* props[],
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

Note If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

Return Returning different error codes will convey the corresponding protocol level errors to the client

:

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

Parameters

- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the current values for which have been requested by the client
- [out] prop_values: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- [in] usr_ctx: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

esp_err_t (***set_prop_values**)(size_t props_count, **const** *esp_local_ctrl_prop_t* props[], **const**
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

Note If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

Return Returning different error codes will convey the corresponding protocol level errors to the client

:

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

Parameters

- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the values for which the client requests to change
- [in] prop_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument

- [in] `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

void ***usr_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (***usr_ctx_free_fn**) (void *usr_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct esp_local_ctrl_proto_sec_cfg

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

void ***custom_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

void ***pop**

Proof of possession to be used for local control. Could be NULL.

struct esp_local_ctrl_config

Configuration structure to pass to `esp_local_ctrl_start()`

Public Members

const esp_local_ctrl_transport_t *transport

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t **transport_config**

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t **proto_sec**

Security version and POP

esp_local_ctrl_handlers_t **handlers**

Register handlers for responding to get/set requests on properties

size_t **max_properties**

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp_local_ctrl_prop_val* esp_local_ctrl_prop_val_t
Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp_local_ctrl_handlers* esp_local_ctrl_handlers_t
Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm_ble_config* esp_local_ctrl_transport_config_ble_t
Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd_ssl_config* esp_local_ctrl_transport_config_httpd_t
Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`.

typedef enum *esp_local_ctrl_proto_sec* esp_local_ctrl_proto_sec_t
Security types for `esp_local_control`.

typedef struct *esp_local_ctrl_proto_sec_cfg* esp_local_ctrl_proto_sec_cfg_t
Protocom security configs

typedef struct *esp_local_ctrl_config* esp_local_ctrl_config_t
Configuration structure to pass to `esp_local_ctrl_start()`

Enumerations

enum esp_local_ctrl_proto_sec
Security types for `esp_local_control`.

Values:

PROTCOM_SEC0 = 0

PROTCOM_SEC1

PROTCOM_SEC_CUSTOM

2.4.13 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

Introduction In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
This phase determines the rest phases of the transactions. See *Supported Commands*.
- **Address:** 8-bit, master to slave, optional
For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional
This phase is the turn around time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to master.
- **Data:** variable length, the direction is also determined by the command.
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

Data IO Modes In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here' s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except from the QPI mode.

QPI Mode The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it' s not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit from the QPI mode, master can send EXQPI command.

Supported Commands

注解: The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

Segment Transaction Mode Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave

3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp_serial_slave_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

Initialization of ESP Serial Slave Link

ESP SDIO Slave The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:`Document of SDMMC driver </api-reference/storage/sdmmc>` structure).
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.

4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

ESP SPI Slave

注解: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn't been supported yet.

APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional) Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32-S3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

API Reference

Header File

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

esp_err_t **essl_init** (*essl_handle_t* handle, uint32_t wait_ms)

Initialize the slave.

Return

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_wait_for_ready** (*essl_handle_t* handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

Return

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_get_tx_buffer_num** (*essl_handle_t* handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

Return

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of a ESSL device.
- out_tx_num: Output of buffer num that host can send data to ESSL slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_get_rx_data_size** (*essl_handle_t* handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

Return

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of an ESSL device.
- out_rx_size: Output of data size to read from slave, in bytes
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_reset_cnt** (*essl_handle_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

Return

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

Parameters

- handle: Handle of an ESSL device.

esp_err_t **essl_send_packet** (*essl_handle_t* handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters

- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_get_packet** (*essl_handle_t* handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

Return

- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters

- handle: Handle of an ESSL device.
- [out] out_data: Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- [out] out_length: Output of length the data actually received from slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_write_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

Note sdio 28-31 are reserved, the lower API helps to skip.

Return

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of an ESSL device.
- addr: Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_read_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

Return

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of a `essl` device.

- `add`: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- `value_o`: Output value read from the register.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)`

wait for an interrupt of the slave

Return

- `ESP_OK`: If interrupt is triggered.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- `ESP_ERR_TIMEOUT`: No interrupts before timeout.

Parameters

- `handle`: Handle of an ESSL device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)`

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Return

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- `handle`: Handle of an ESSL device.
- `intr_mask`: Mask of interrupt bits to clear.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)`

Get interrupt bits of ESSL slave.

Return

- `ESP_OK`: Success
- `ESP_INVALID_ARG`: If both `intr_raw` and `intr_st` are NULL.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- `handle`: Handle of an ESSL device.
- `intr_raw`: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- `intr_st`: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)`

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Return

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- `handle`: Handle of an ESSL device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)`

Get interrupt enable bits of ESSL slave.

Return

- `ESP_OK` Success
- One of the error codes from SDMMC host controller

Parameters

- `handle`: Handle of an ESSL device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t **essl_send_slave_intr** (*essl_handle_t* *handle*, *uint32_t* *intr_mask*, *uint32_t* *wait_ms*)
Send interrupts to slave. Each bit of the interrupt will be triggered.

Return

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- `handle`: Handle of an ESSL device.
- `intr_mask`: Mask of interrupt bits to send to slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
    Handle of an ESSL device.
```

Header File

- [components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h](#)

Functions

esp_err_t **essl_sdio_init_dev** (*essl_handle_t* **out_handle*, **const** *essl_sdio_config_t* **config*)
Initialize the ESSL SDIO device and get its handle.

Return

- `ESP_OK`: on success
- `ESP_ERR_NO_MEM`: memory exhausted.

Parameters

- `out_handle`: Output of the handle.
- `config`: Configuration for the ESSL SDIO device.

esp_err_t **essl_sdio_deinit_dev** (*essl_handle_t* *handle*)
Deinitialize and free the space used by the ESSL SDIO device.

Return

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: wrong handle passed

Parameters

- `handle`: Handle of the ESSL SDIO device to deinit.

Structures

```
struct essl_sdio_config_t
    Configuration for the ESSL SDIO device.
```

Public Members

sdmmc_card_t ***card**
The initialized sdmmc card pointer of the slave.

int *recv_buffer_size*
The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- `components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h`

Functions

esp_err_t **essl_spi_init_dev** (*essl_handle_t* *out_handle, const *essl_spi_config_t* *init_config)

Initialize the ESSL SPI device function list and get its handle.

Return

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

Parameters

- [out] out_handle: Output of the handle
- init_config: Configuration for the ESSL SPI device

esp_err_t **essl_spi_deinit_dev** (*essl_handle_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

Return

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

Parameters

- handle: Handle of the ESSL SPI device

esp_err_t **essl_spi_read_reg** (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

Note The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- arg: Context of the component. (Member `arg` from `essl_handle_t`)
- addr: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- [out] out_value: Read buffer for the shared registers.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

esp_err_t **essl_spi_get_packet** (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

Return

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires `size` bytes of data but Slave did not load enough bytes.

Parameters

- arg: Context of the component. (Member `arg` from `essl_handle_t`)
- [out] out_data: Output data address
- size: The size of the output data.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

esp_err_t **essl_spi_write_reg** (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

Note The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

Note Feature of checking the actual written value (`out_value`) is not supported.

Return

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `addr`: Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- `value`: Buffer for data to send, should be align to 4.
- `[out] out_value`: Not supported, should be set to `NULL`.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t` **essl_spi_send_packet** (`void *arg`, `const void *data`, `size_t size`, `uint32_t wait_ms`)

Send a packet to Slave.

Return

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

Parameters

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `data`: Address of the data to send
- `size`: Size of the data to send.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

`void` **essl_spi_reset_cnt** (`void *arg`)

Reset the counter in Master context.

Note Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

Parameters

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)

`esp_err_t` **essl_spi_rdbuf** (`spi_device_handle_t spi`, `uint8_t *out_data`, `int addr`, `int len`, `uint32_t flags`)

Read the shared buffer from the slave in ISR way.

Note The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

Note `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Return

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

`esp_err_t` **essl_spi_rdbuf_polling** (`spi_device_handle_t spi`, `uint8_t *out_data`, `int addr`, `int len`, `uint32_t flags`)

Read the shared buffer from the slave in polling way.

Note `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Return

- ESP_OK: on success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t` **essl_spi_wrbuf** (*spi_device_handle_t* `spi`, **const** `uint8_t *data`, `int addr`, `int len`, `uint32_t flags`)

Write the shared buffer of the slave in ISR way.

Note `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Return

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer,
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t` **essl_spi_wrbuf_polling** (*spi_device_handle_t* `spi`, **const** `uint8_t *data`, `int addr`, `int len`, `uint32_t flags`)

Write the shared buffer of the slave in polling way.

Note `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Return

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer,
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t` **essl_spi_rddma** (*spi_device_handle_t* `spi`, `uint8_t *out_data`, `int len`, `int seg_len`, `uint32_t flags`)

Receive long buffer in segments from the slave through its DMA.

Note This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Return

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- `len`: Total length of data to receive.

- `seg_len`: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

esp_err_t **essl_spi_rddma_seg** (*spi_device_handle_t* spi, uint8_t *out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

Note To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

Return

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- `seg_len`: Length of this segment
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

esp_err_t **essl_spi_rddma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

Note This is required only when the slave is working in segment mode.

Return

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

esp_err_t **essl_spi_wrdma** (*spi_device_handle_t* spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

Note This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

Return

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `len`: Total length of data to send.
- `seg_len`: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

esp_err_t **essl_spi_wrdma_seg** (*spi_device_handle_t* spi, const uint8_t *data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

Note To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

Return

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `seg_len`: Length of this segment

- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

`esp_err_t` `essl_spi_wr dma_done` (`spi_device_handle_t` `spi`, `uint32_t` `flags`)

Send the `wr dma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note This is required only when the slave is working in segment mode.

Return

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

Parameters

- `spi`: SPI device handle representing the slave
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

Structures

`struct` `essl_spi_config_t`

Configuration of ESSL SPI device.

Public Members

`spi_device_handle_t` *`spi`

Pointer to SPI device handle.

`uint32_t` `tx_buf_size`

The pre-negotiated Master TX buffer size used by both the host and the slave.

`uint8_t` `tx_sync_reg`

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

`uint8_t` `rx_sync_reg`

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.4.14 ESP x509 Certificate Bundle

Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

注解: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-S3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 5 09:35:35 2021 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

注解: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from *cacrt_all.pem*.

Configuration

Most configuration is done through menuconfig. Make and CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {  
    .crt_bundle_attach = esp_cert_bundle_attach,  
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;  
mbedtls_ssl_config_init(&conf);  
  
esp_cert_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of [curl](#). Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, *cmn_cert_authorities.csv*, from [this list](#) provided by Mozilla.

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in [Updating the Certificate Bundle](#).

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https_x509_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https_mbedtls](#).

API Reference

Header File

- [components/mbedtls/esp_cert_bundle/include/esp_cert_bundle.h](#)

Functions

esp_err_t **esp_cert_bundle_attach**(void *conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

Return

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

Parameters

- [in] conf: The config struct for the SSL connection.

void **esp_cert_bundle_detach**(mbedtls_ssl_config *conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

Parameters

- [in] conf: The config struct for the SSL connection.

void **esp_cert_bundle_set**(const uint8_t *x509_bundle)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

Parameters

- [in] x509_bundle: A pointer to the certificate bundle.

此 API 部分的示例代码在 ESP-IDF 示例工程的 `protocols` 目录下提供。

2.4.15 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档位于[连网 API](#)。

2.5 配网 API

2.5.1 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to "System Settings" to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, "just-works" security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*securityI*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

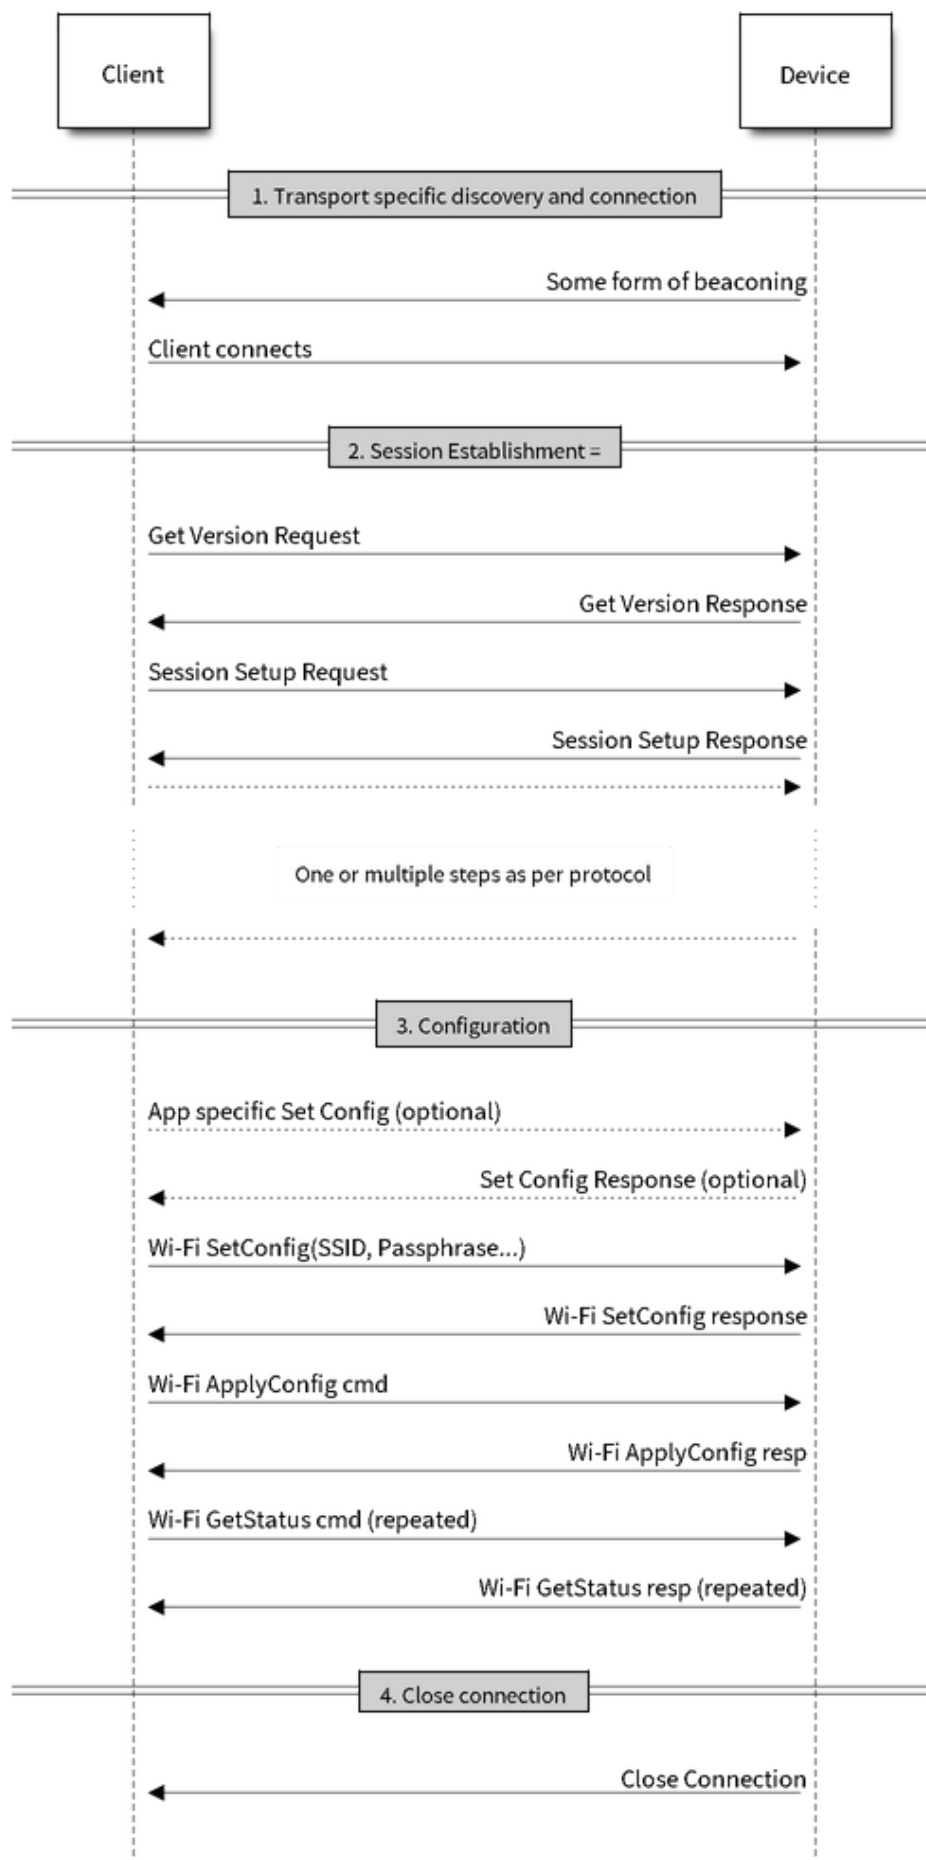

图 25: Typical Provisioning Process

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

图 26: Unified Provisioning Architecture

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

Sample Code

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage.

Application implementation can be found as an example under [provisioning](#).

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
 - [BLE Provisioning app on Play Store](#).
 - [SoftAP Provisioning app on Play Store](#).
 - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
 - [BLE Provisioning app on app store](#).
 - [SoftAP Provisioning app on app Store](#).
 - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

2.5.2 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning :

- **Communication security at application level -**
 - `protocomm_security0` (no security)
 - `protocomm_security1` (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with `protocomm_security1` only)

Protocomm internally uses `protobuf` (protocol buffers) for secure session establishment. Though users can implement their own security (even without using `protobuf`). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for `protocomm_security1`) by performing the two way handshake. See *Unified Provisioning* for more details about the secure handshake logic.

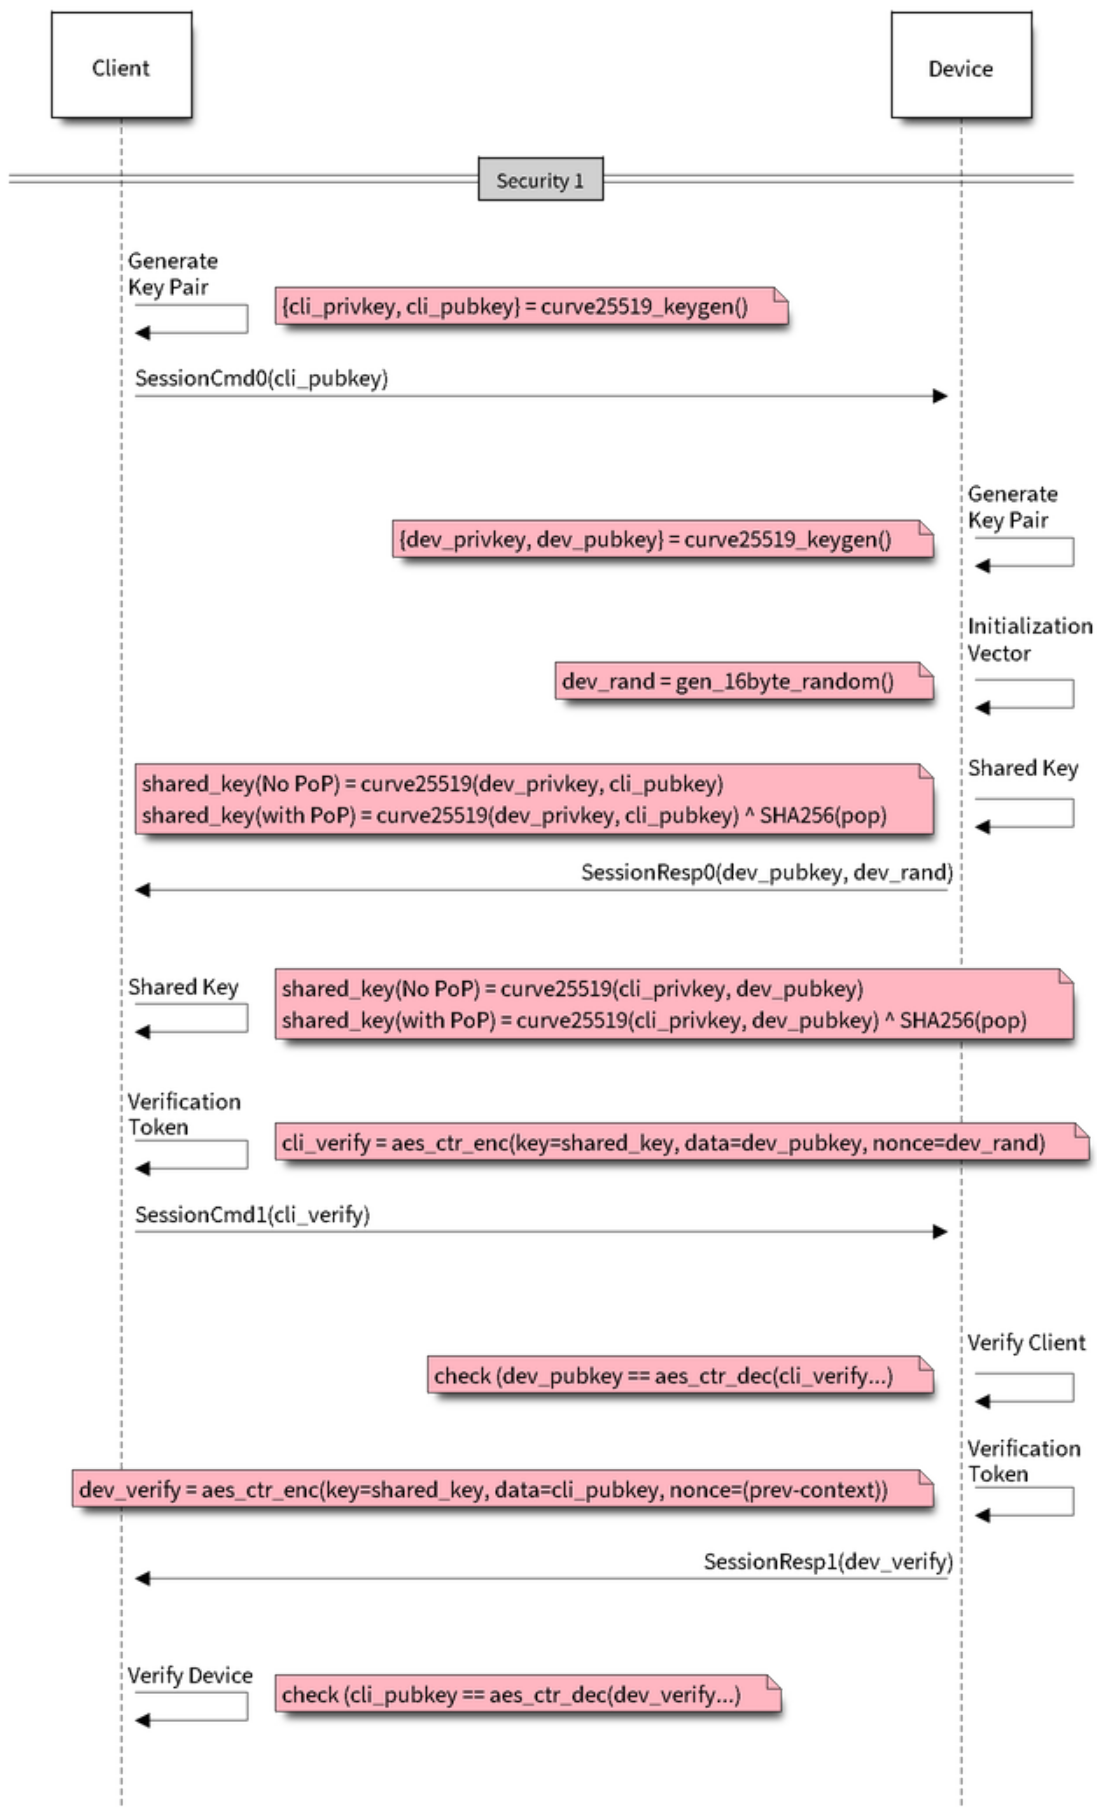

图 27: Security1

Transport Example (SoftAP + HTTP) with Security 1

For complete example see [provisioning/legacy/softap_prov](#)

```

/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
     * throughout the scope of protocomm endpoint. This need not be
     ↪static,
     * ie. could be dynamically allocated and freed at the time of
     ↪endpoint
     * removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for
     * request handlers, setting security creates an endpoint and
     ↪registers
     * the handler provided by protocomm_security1. One can similarly use
     * protocomm_security0. Only one type of security can be set for a
     * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
     ↪&pop_obj);

```

(下页继续)

(续上页)

```

    /* Private data passed to the endpoint must be valid throughout the
    ↪scope
    * of protocomm endpoint. This need not be static, ie. could be
    ↪dynamically
    * allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

    /* Add a new endpoint for the protocomm instance, identified by a
    ↪unique name
    * and register a handler function along with private data to be
    ↪passed at the
    * time of handler execution. Multiple endpoints can be added as long
    ↪as they
    * are identified by unique names */
    protocomm_add_endpoint(pc, "echo_req_endpoint",
                          echo_req_handler, (void *) &priv_data);

    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

```

Transport Example (BLE) with Security 0

For complete example see [provisioning/legacy/ble_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <-----
            * -----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
    ↪table[0]),

```

(下页继续)

```

        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can
    ↪be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
    ↪NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
    ↪NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

API Reference

Header File

- [components/protocomm/include/common/protocomm.h](#)

Functions

protocomm_t* **protocomm_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Return

- protocomm_t* : On success
- NULL : No memory for allocating new instance

void **protocomm_delete** (*protocomm_t* *pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

Parameters

- [in] pc: Pointer to the protocomm instance to be deleted

esp_err_t **protocomm_add_endpoint** (*protocomm_t* *pc, const char *ep_name, *protocomm_req_handler_t* h, void *priv_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

- This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

Return

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

Parameters

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string
- `[in] h`: Endpoint handler function
- `[in] priv_data`: Pointer to private data to be passed as a parameter to the handler function on call. Pass `NULL` if not needed.

esp_err_t **protocomm_remove_endpoint** (*protocomm_t* *pc, const char *ep_name)

Remove endpoint request handler for a `protocomm` instance.

This API will remove a registered endpoint handler identified by an endpoint name.

Note

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

Return

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

Parameters

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string

esp_err_t **protocomm_open_session** (*protocomm_t* *pc, uint32_t session_id)

Allocates internal resources for new transport session.

Note

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

Return

- `ESP_OK` : Request handled successfully
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

Parameters

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] session_id`: Unique ID for a communication session

esp_err_t **protocomm_close_session** (*protocomm_t* *pc, uint32_t session_id)

Frees internal resources used by a transport session.

Note

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

Return

- `ESP_OK` : Request handled successfully
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

Parameters

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] session_id`: Unique ID for a communication session

esp_err_t **protocomm_req_handle** (*protocomm_t* *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

Note

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

Return

- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] session_id: Unique ID for a communication session
- [in] inbuf: Input buffer contains input request data which is to be processed by the registered handler
- [in] inlen: Length of the input buffer
- [out] outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- [out] outlen: Buffer length of the allocated output buffer

```
esp_err_t protocomm_set_security(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

Return

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] sec: Pointer to endpoint security instance
- [in] pop: Pointer to proof of possession for authenticating a client

```
esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

```
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

Return

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] version: Version identifier(name) string

esp_err_t **protocomm_unset_version** (*protocomm_t* *pc, const char *ep_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t) (uint32_t session_id, const uint8_t *inbuf,
                                             ssize_t inlen, uint8_t **outbuf, ssize_t *outlen,
                                             void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

Note Structure of the protocomm object is kept private

Header File

- `components/protocomm/include/security/protocomm_security.h`

Structures

```
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

Public Members

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```
uint16_t len
```

Length (in bytes) of the proof of possession data

```
struct protocomm_security
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver

Unique version number of security implementation

esp_err_t (***init**) (*protocomm_security_handle_t* *handle)

Function for initializing/allocating security infrastructure

esp_err_t (***cleanup**) (*protocomm_security_handle_t* handle)

Function for deallocating security infrastructure

esp_err_t (***new_transport_session**) (*protocomm_security_handle_t* handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t (***close_transport_session**) (*protocomm_security_handle_t* handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t (***security_req_handler**) (*protocomm_security_handle_t* handle, const *protocomm_security_pop_t* *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (***encrypt**) (*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (***decrypt**) (*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct *protocomm_security_pop* protocomm_security_pop_t

Proof Of Possession for authenticating a secure session.

typedef void *protocomm_security_handle_t

typedef struct *protocomm_security* protocomm_security_t

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Header File

- [components/protocomm/include/security/protocomm_security0.h](#)

Header File

- [components/protocomm/include/security/protocomm_security1.h](#)

Header File

- [components/protocomm/include/transports/protocomm_httpd.h](#)

Functions

esp_err_t **protocomm_httpd_start** (*protocomm_t* *pc, const *protocomm_httpd_config_t* *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

Note This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

Return

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

Parameters

- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing HTTP server

esp_err_t **protocomm_httpd_stop**(*protocomm_t* *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

Return

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Parameters

- [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

Unions

union protocomm_httpd_config_data_t

#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

Public Members

void ***handle**

HTTP Server Handle, if ext_handle_provided is set to true

protocomm_http_server_config_t **config**

HTTP Server Configuration, if a server is not already active

Structures

struct protocomm_http_server_config_t

Config parameters for protocomm HTTP server.

Public Members

uint16_t **port**

Port on which the HTTP server will listen

size_t **stack_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task_priority**

Priority of server task

struct protocomm_httpd_config_t

Config parameters for protocomm HTTP server.

Public Members

bool **ext_handle_provided**

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOLM_HTTPD_DEFAULT_CONFIG()

Header File

- [components/protocomm/include/transport/protocomm_ble.h](#)

Functions

esp_err_t **protocomm_ble_start** (*protocomm_t* *pc, const *protocomm_ble_config_t* *config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Return

- ESP_OK : Success
- ESP_FAIL : Simple BLE start error
- ESP_ERR_NO_MEM : Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE : Error in ble config
- ESP_ERR_INVALID_ARG : Null arguments

Parameters

- [in] pc: Protocomm instance pointer obtained from `protocomm_new()`
- [in] config: Pointer to config structure for initializing BLE

esp_err_t **protocomm_ble_stop** (*protocomm_t* *pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

Note You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

Return

- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Parameters

- [in] pc: Same protocomm instance that was passed to `protocomm_ble_start()`

Structures

struct name_uuid

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char *name

Name of the handler, which is passed to protocomm layer

uint16_t uuid

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_config

Config parameters for protocomm BLE service.

Public Members

char **device_name**[**MAX_BLE_DEVNAME_LEN**]
BLE device name being broadcast at the time of provisioning

uint8_t **service_uuid**[**BLE_UUID128_VAL_LENGTH**]
128 bit UUID of the provisioning service

uint8_t ***manufacturer_data**
BLE device manufacturer data pointer in advertisement

ssize_t **manufacturer_data_len**
BLE device manufacturer data length in advertisement

ssize_t **nu_lookup_count**
Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t ***nu_lookup**
Pointer to the Name-UUID lookup table

Macros

MAX_BLE_DEVNAME_LEN

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH

MAX_BLE_MANUFACTURER_DATA_LEN

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

Type Definitions

typedef struct *name_uuid* **protocomm_ble_name_uuid_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm_ble_config* **protocomm_ble_config_t**

Config parameters for protocomm BLE service.

2.5.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure *Protocol Communication (protocomm)* sessions. The set of *wifi_prov_mgr_* APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

Initialization *wifi_prov_mgr_init()* is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other *wifi_prov_mgr_* APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to *wifi_prov_mgr_deinit()*.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
```

(下页继续)

```
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocol. Hence, we have three options :
 - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
 - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
 - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- *scheme_event_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
 - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app_event_handler* (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT` `s` that are emitted to the default event loop handler. See definition of ```wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
→*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                          "\n\tSSID      : %s\n\tPassword : %s",
                          (const char *) wifi_sta_cfg->ssid,
                          (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
```

(下页继续)

(续上页)

```

        wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↪reason_t *)event_data;
        ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                "\n\tPlease reset to factory and retry_
↪provisioning",
                (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                "Wi-Fi station authentication failed" : "Wi-Fi_
↪access-point not found");
        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

Check Provisioning State Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

Start Provisioning Service At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```

const char *service_name = "my_device";
const char *service_key = "password";

```

(下页继续)

(续上页)

```
wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↳name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

注解: If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

Waiting For Completion Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↳name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`s` and call `:cpp:func:`wifi_prov_mgr_deinit()`` when event ID is ``WIFI_PROV_END:`

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

User Side Implementation When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it

shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

表 12: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<code>http://<mdns-hostname>.local/prov-session</code>	Security endpoint used for session establishment
prov-scan	<code>http://wifi-prov.local/prov-scan</code>	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<code>http://<mdns-hostname>.local/prov-config</code>	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<code>http://<mdns-hostname>.local/proto-ver</code>	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the *proto-ver* endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] },` Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my_app* in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the *.proto* files found under `protocomm/proto`, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi_config* commands, serialized as Protobuf messages (the corresponding *.proto* files can be found under `wifi_provisioning/proto`) :

- *get_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set_config* - For setting the Wi-Fi connection credentials
- *apply_config* - For applying the credentials saved during *set_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi_config* commands described above. The *wifi_scan* endpoint supports the following protobuf commands :

- *scan_start* - For starting Wi-Fi scan with various options :
 - *blocking* (input) - If true, the command returns only when the scanning is finished
 - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
 - *group_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is

SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 4, will create 5 groups, with each group having 3 channels, except the last one which will have $14 \% 3 = 2$ channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- `period_ms` (input) - Scan parameter specifying how long to wait on each channel
- `scan_status` - Gives the status of scanning process :
 - `scan_finished` (output) - When scan has finished this returns true
 - `result_count` (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- `scan_result` - For fetching scan results. This can be called even if scan is still on going
 - `start_index` (input) - Starting index from where to fetch the entries from the results list
 - `count` (input) - Number of entries to fetch from the starting index
 - `entries` (output) - List of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information

Additional Endpoints In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

When / How To Stop Provisioning Service? The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and `WIFI_PROV_END` event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling

`wifi_prov_mgr_stop_provisioning()` inside the `protocomm` handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the `protocomm` handler reaches the client side application.

Application Examples

For complete example implementation see [provisioning/wifi_prov_mgr](#)

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
 - [BLE Provisioning app on Play Store](#).
 - [SoftAP Provisioning app on Play Store](#).
 - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
 - [BLE Provisioning app on app store](#).
 - [SoftAP Provisioning app on app Store](#).
 - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

API Reference

Header File

- [components/wifi_provisioning/include/wifi_provisioning/manager.h](#)

Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event `WIFI_PROV_INIT` is emitted right after initialization is complete

Return

- `ESP_OK` : Success
- `ESP_FAIL` : Fail

Parameters

- `[in] config`: Configuration structure

void `wifi_prov_mgr_deinit` (void)

Stop provisioning (if running) and release resource used by the manager.

Event `WIFI_PROV_DEINIT` is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting `WIFI_PROV_END`, and then performs the de-initialization

`esp_err_t wifi_prov_mgr_is_provisioned` (bool *provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by `esp_wifi` component

If one were to call `esp_wifi_set_config()` directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

Note Calling `wifi_prov_mgr_start_provisioning()` automatically resets the provision state, irrespective of what the state was prior to making the call.

Return

- `ESP_OK` : Retrieved provision state successfully
- `ESP_FAIL` : Wi-Fi not initialized
- `ESP_ERR_INVALID_ARG` : Null argument supplied
- `ESP_ERR_INVALID_STATE` : Manager not initialized

Parameters

- `[out] provisioned`: True if provisioned, else false

```
esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const char
                                           *pop, const char *service_name, const char
                                           *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- `wifi_prov_scheme_ble` : This starts `protocomm_ble`, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap` : This activates SoftAP mode of Wi-Fi and starts `protocomm_httpd`, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type `_esp_wifi_prov._tcp`)

Event `WIFI_PROV_START` is emitted right after provisioning starts without failure

Note This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

Return

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

Parameters

- `[in] security`: Specify which `protocomm` security scheme to use :
 - `WIFI_PROV_SECURITY_0` : For no security
 - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- `[in] pop`: Pointer to proof of possession string (NULL if not needed). This is relevant only for `protocomm security 1`, in which case it is used for authenticating secure session
- `[in] service_name`: Unique name of the service. This translates to:
 - Wi-Fi SSID when provisioning mode is softAP
 - Device name when provisioning mode is BLE
- `[in] service_key`: Key required by client to access the service (NULL if not needed). This translates to:
 - Wi-Fi password when provisioning mode is softAP
 - ignored when provisioning mode is BLE

```
void wifi_prov_mgr_stop_provisioning (void)
```

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some `protocomm` command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleaup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi_prov_mgr_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t **wifi_prov_mgr_disable_auto_stop** (uint32_t *cleanup_delay*)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

Note This must be called before executing `wifi_prov_mgr_start_provisioning()`

Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

Parameters

- [in] `cleanup_delay`: Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

esp_err_t **wifi_prov_mgr_set_app_info** (const char **label*, const char **version*, const char ***capabilities*, size_t *total_capabilities*)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov” , containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

Note This must be called before executing `wifi_prov_mgr_start_provisioning()`

Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

Parameters

- [in] `label`: String indicating the application name.
- [in] `version`: String indicating the application version. There is no constraint on format.
- [in] `capabilities`: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] `total_capabilities`: Size of capabilities array

esp_err_t **wifi_prov_mgr_endpoint_create** (const char **ep_name*)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

Note This API can only be called BEFORE provisioning is started

Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] `ep_name`: unique name of the endpoint

```
esp_err_t wifi_prov_mgr_endpoint_register (const char *ep_name, proto-comm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

Note This API can only be called AFTER provisioning has started

Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] `ep_name`: Name of the endpoint
- [in] `handler`: Endpoint handler function
- [in] `user_ctx`: User data

```
void wifi_prov_mgr_endpoint_unregister (const char *ep_name)
```

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters

- [in] `ep_name`: Name of the endpoint

```
esp_err_t wifi_prov_mgr_event_handler (void *ctx, system_event_t *event)
```

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

Note : This function is DEPRECATED, because events are now handled internally using the event loop library, `esp_event`. Calling this will do nothing and simply return ESP_OK.

Return

- ESP_OK : Event handled successfully

Parameters

- [in] `ctx`: Event context data
- [in] `event`: Event info

esp_err_t **wifi_prov_mgr_get_wifi_state** (*wifi_prov_sta_state_t* *state)

Get state of Wi-Fi Station during provisioning.

Return

- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

Parameters

- [out] state: Pointer to *wifi_prov_sta_state_t* variable to be filled

esp_err_t **wifi_prov_mgr_get_wifi_disconnect_reason** (*wifi_prov_sta_fail_reason_t* *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

Return

- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

Parameters

- [out] reason: Pointer to *wifi_prov_sta_fail_reason_t* variable to be filled

esp_err_t **wifi_prov_mgr_configure_sta** (*wifi_config_t* *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Return

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

Parameters

- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

esp_err_t **wifi_prov_mgr_reset_provisioning** (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Return

- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config

esp_err_t **wifi_prov_mgr_reset_sm_state_on_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

Return

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

Structures

struct **wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.

Public Members*wifi_prov_cb_func_t* **event_cb**

Callback function to be executed on provisioning events

void ***user_data**

User context data to pass as parameter to callback function

struct **wifi_prov_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

Note Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

Public Members*esp_err_t* (***prov_start**) (*protocomm_t* *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (***prov_stop**) (*protocomm_t* *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void **(*new_config)** (void)Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov_start()*void **(*delete_config)** (void *config)Function which is to be called by the manager to delete a configuration generated using *new_config()**esp_err_t* (***set_config_service**) (void *config, **const** char *service_name, **const** char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (***set_config_endpoint**) (void *config, **const** char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t **wifi_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- `WIFI_MODE_APSTA` for SoftAP transport
- `WIFI_MODE_STA` for BLE transport

struct **wifi_prov_mgr_config_t**

Structure for specifying the manager configuration.

Public Members*wifi_prov_scheme_t* **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t **scheme_event_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this

field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

wifi_prov_event_handler_t **app_event_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE

Event handler can be set to none if not used.

Type Definitions

```
typedef void (*wifi_prov_cb_func_t) (void *user_data, wifi_prov_cb_event_t event, void
                                     *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

Note Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Enumerations

```
enum wifi_prov_cb_event_t
```

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

WIFI_PROV_INIT

Emitted when the manager is initialized

WIFI_PROV_START

Indicates that provisioning has started

WIFI_PROV_CRED_RECV

Emitted when Wi-Fi AP credentials are received via protocomm endpoint `wifi_config`. The event data in this case is a pointer to the corresponding *wifi_sta_config_t* structure

WIFI_PROV_CRED_FAIL

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

WIFI_PROV_CRED_SUCCESS

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

WIFI_PROV_END

Signals that provisioning service has stopped

WIFI_PROV_DEINIT

Signals that manager has been de-initialized

enum wifi_prov_security

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Values:

WIFI_PROV_SECURITY_0 = 0

No security (plain-text communication)

WIFI_PROV_SECURITY_1

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h`

Functions

void **wifi_prov_scheme_ble_event_cb_free_bt**dm (void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_ble** (void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_bt** (void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

esp_err_t **wifi_prov_scheme_ble_set_service_uuid** (uint8_t *uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

Note The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

Parameters

- [in] `uuid128`: A custom 128 bit UUID

esp_err_t **wifi_prov_scheme_ble_set_mfg_data** (uint8_t *mfg_data, *ssize_t* mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

Note It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. $(mfg_data_len + 2) < 31 - (device_name_length + 2)$. If the `mfg_data` length exceeds this limit, the length will be truncated.

Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

Parameters

- [in] `mfg_data`: Custom manufacturer data

- [in] `mfg_data_len`: Manufacturer data length

Macros

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

Header File

- [components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h](#)

Functions

void `wifi_prov_scheme_softap_set_httpd_handle` (void **handle*)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note This API should be called before `wifi_prov_mgr_start_provisioning()`

Parameters

- [in] `handle`: Handle to HTTPD server instance

Header File

- [components/wifi_provisioning/include/wifi_provisioning/scheme_console.h](#)

Header File

- [components/wifi_provisioning/include/wifi_provisioning/wifi_config.h](#)

Functions

`esp_err_t wifi_prov_config_data_handler` (uint32_t *session_id*, const uint8_t **inbuf*, ssize_t *inlen*, uint8_t ***outbuf*, ssize_t **outlen*, void **priv_data*)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config_endpoint` handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

Structures

`struct wifi_prov_sta_conn_info_t`

WiFi STA connected status information.

Public Members

char `ip_addr`[IP4ADDR_STRLEN_MAX]

IP Address received by station

char `bssid`[6]

BSSID of the AP to which connection was established

char `ssid`[33]

SSID of the to which connection was established

uint8_t `channel`

Channel of the AP

`uint8_t auth_mode`

Authorization mode of the AP

struct wifi_prov_config_get_data_t

WiFi status data to be sent in response to `get_status` request from master.

Public Members

`wifi_prov_sta_state_t wifi_state`

WiFi state of the station

`wifi_prov_sta_fail_reason_t fail_reason`

Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

`wifi_prov_sta_conn_info_t conn_info`

Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct wifi_prov_config_set_data_t

WiFi config data received by slave during `set_config` request from master.

Public Members

char `ssid`[33]

SSID of the AP to which the slave is to be connected

char `password`[64]

Password of the AP

char `bssid`[6]

BSSID of the AP

uint8_t `channel`

Channel of the AP

struct wifi_prov_config_handlers

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Public Members

`esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)`

Handler function called when connection status of the slave (in WiFi station mode) is requested

`esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)`

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

`esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)`

Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

`wifi_prov_ctx_t *ctx`

Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx **wifi_prov_ctx_t**

Type of context data passed to each get/set/apply handler function set in *wifi_prov_config_handlers* structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi_prov_config_handlers* **wifi_prov_config_handlers_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as *priv_data* for protocomm request handler (refer to *wifi_prov_config_data_handler()*) when calling *protocomm_add_endpoint()*.

Enumerations

enum wifi_prov_sta_state_t

WiFi STA status for conveying back to the provisioning master.

Values:

WIFI_PROV_STA_CONNECTING

WIFI_PROV_STA_CONNECTED

WIFI_PROV_STA_DISCONNECTED

enum wifi_prov_sta_fail_reason_t

WiFi STA connection fail reason.

Values:

WIFI_PROV_STA_AUTH_ERROR

WIFI_PROV_STA_AP_NOT_FOUND

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 *provisioning* 目录下。

2.6 存储 API

2.6.1 FAT 文件系统

ESP-IDF 使用 *FatFs* 库来实现 FAT 文件系统。*FatFs* 库位于 *fatfs* 组件中，您可以直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS（虚拟文件系统）使用 *FatFs* 库的大多数功能。

此外，我们对 *FatFs* 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 *FatFs* 驱动映射到物理磁盘。

FatFs 与 VFS 配合使用

头文件 *fatfs/vfs/esp_vfs_fat.h* 定义了连接 *FatFs* 和 VFS 的函数。

函数 *esp_vfs_fat_register()* 分配一个 FATFS 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 *FatFs* API。函数 *esp_vfs_fat_unregister_path()* 删除在 VFS 中的注册，并释放 FATFS 结构。

多数应用程序在使用 *esp_vfs_fat_* 函数时，采用如下步骤：

1. 调用 *esp_vfs_fat_register()*，指定：
 - 挂载文件系统的路径前缀（例如，*"/sdcard"* 或 *"/spiflash"*）
 - *FatFs* 驱动编号
 - 一个用于接收指向 FATFS 结构指针的变量
2. 调用 *ff_diskio_register()* 为步骤 1 中的驱动编号注册磁盘 I/O 驱动；
3. 调用 *FatFs* 函数 *f_mount*，随后调用 *f_fdisk* 或 *f_mkfs*，并使用与传递到 *esp_vfs_fat_register()* 相同的驱动编号挂载文件系统。请参考 *FatFs* 文档，查看更多信息；

4. 调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，"/sdcard/hello.txt"）执行打开、读取、写入、擦除、复制等操作。文件系统默认使用 8.3 文件名格式 (SFN)。若您需要使用长文件名 (LFN)，启用 `CONFIG_FATFS_LONG_FILENAMES` 选项。请参考 [here](#)，查看更多信息；
5. 您可以选择启用 `CONFIG_FATFS_USE_FASTSEEK` 选项，使用 POSIX `lseek` 来快速执行。快速查找不适用于编辑模式下的文件，所以，使用快速查找时，应在只读模式下打开（或者关闭然后重新打开）文件；
6. 您也可以选择直接调用 FatFs 库函数，但需要使用没有 VFS 前缀的路径（例如，"/hello.txt"）；
7. 关闭所有打开的文件；
8. 调用 FatFs 函数 `f_mount` 并使用 `NULL` `FATFS*` 参数，为与上述编号相同的驱动卸载文件系统；
9. 调用 FatFs 函数 `ff_diskio_register()` 并使用 `NULL` `ff_diskio_impl_t*` 参数和相同的驱动编号，来释放注册的磁盘 I/O 驱动。
10. 调用 `esp_vfs_fat_unregister_path()` 并使用文件系统挂载的路径将 FatFs 从 VFS 中移除，并释放步骤 1 中分配的 `FATFS` 结构。

便捷函数 `esp_vfs_fat_sdmmc_mount`，`esp_vfs_fat_sdspi_mount`，和 `esp_vfs_fat_sdmmc_unmount` 对上述步骤进行了封装，并加入了对 SD 卡初始化的处理。我们将在下一章节详细介绍这两个函数。

esp_err_t esp_vfs_fat_register (`const char *base_path`, `const char *fat_drive`, `size_t max_files`, `FATFS **out_fs`)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

Note This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

Parameters

- `base_path`: path prefix where FATFS should be registered
- `fat_drive`: FATFS drive specification; if only one drive is used, can be an empty string
- `max_files`: maximum number of files which can be open at the same time
- `[out] out_fs`: pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

esp_err_t esp_vfs_fat_unregister_path (`const char *base_path`)

Un-register FATFS from VFS.

Note FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_ctx`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if FATFS is not registered in VFS

Parameters

- `base_path`: path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

FatFs 与 VFS 和 SD 卡配合使用

头文件 `fatfs/vfs/esp_vfs_fat.h` 定义了两个便捷函数 `esp_vfs_fat_sdmmc_mount()` 和 `esp_vfs_fat_sdmmc_unmount()`。这两个函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码并将更多高级功能集成到产品应用中。

便捷函数 `esp_vfs_fat_sdmmc_unmount()` 用于卸载文件系统并释放从 `esp_vfs_fat_sdmmc_mount()` 函数获取的资源。

```
esp_err_t esp_vfs_fat_sdmmc_mount (const char *base_path, const sdmmc_host_t *host_config,
                                   const void *slot_config, const esp_vfs_fat_mount_config_t
                                   *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters

- `base_path`: path where partition should be registered (e.g. `"/sdcard"`)
- `host_config`: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. (Deprecated) For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT()`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: if not NULL, pointer to the card information structure will be returned via this argument

```
esp_err_t esp_vfs_fat_sdspi_mount (const char *base_path, const sdmmc_host_t
                                   *host_config_input, const sdspi_device_config_t *slot_config,
                                   const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

Return

- ESP_OK on success

- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters

- `base_path`: path where partition should be registered (e.g. “/sdcard”)
- `host_config_input`: Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

struct esp_vfs_fat_mount_config_t

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

Public Members

bool format_if_mount_failed

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files

Max number of open files.

size_t allocation_unit_size

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and $128 * \text{sector size}$. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_sdcard_unmount (const char *base_path, sdmmc_card_t *card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

FatFs 与 VFS 配合使用 (只读模式下)

头文件 `fatfs/vfs/esp_vfs_fat.h` 也定义了两个便捷函数 `esp_vfs_fat_rawflash_mount()` 和 `esp_vfs_fat_rawflash_unmount()`。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂配置时写入一次，之后在整个硬件生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

esp_err_t esp_vfs_fat_rawflash_mount (const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined `partition_label`. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library

- registers FATFS library with VFS, with prefix given by `base_prefix` variable

Note Wear levelling is not used when FAT is mounted in read-only mode using this function.

Return

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if the partition table does not contain FATFS partition with given label
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_rawflash_mount` was already called for the same partition
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

Parameters

- `base_path`: path where FATFS partition should be mounted (e.g. `"/spiflash"`)
- `partition_label`: label of the partition which should be used
- `mount_config`: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflash_unmount (const char *base_path, const char
                                         *partition_label)
```

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_rawflash_mount`.

Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount` hasn't been called

Parameters

- `base_path`: path where partition should be registered (e.g. `"/spiflash"`)
- `partition_label`: label of partition to be unmounted

FatFs 磁盘 I/O 层

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 函数注册指定的 FatFs 驱动编号。

```
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of `disk_xxx` functions for driver number `pdrv`, corresponding function in `discio_impl` for given `pdrv` will be called.

Parameters

- `pdrv`: drive number
- `discio_impl`: pointer to `ff_diskio_impl_t` structure with diskio functions or `NULL` to unregister and free previously registered drive

```
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

`DSTATUS (*init)` (unsigned char pdrv)
disk initialization function

`DSTATUS (*status)` (unsigned char pdrv)
disk status check function

`DRESULT (*read)` (unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
sector read function

DRESULT (***write**) (unsigned char pdrv, **const** unsigned char *buff, uint32_t sector, unsigned count)
sector write function

DRESULT (***ioctl**) (unsigned char pdrv, unsigned char cmd, void *buff)
function to get info about disk and do some misc operations

void **ff_diskio_register_sdmmc** (unsigned char pdrv, *sdmmc_card_t* *card)
Register SD/MMC diskio driver

Parameters

- pdrv: drive number
- card: pointer to *sdmmc_card_t* structure describing a card; card should be initialized before calling `f_mount`.

esp_err_t **ff_diskio_register_wl_partition** (unsigned char pdrv, *wl_handle_t* flash_handle)
Register spi flash partition

Parameters

- pdrv: drive number
- flash_handle: handle of the wear levelling partition.

esp_err_t **ff_diskio_register_raw_partition** (unsigned char pdrv, **const** *esp_partition_t* *part_handle)
Register spi flash partition

Parameters

- pdrv: drive number
- part_handle: pointer to raw flash partition.

2.6.2 量产程序

介绍

这一程序主要用于量产时为每一设备创建工厂 NVS（非易失性存储器）分区映像。NVS 分区映像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制映像，您需要使用以下工具将映像烧录到设备上：

- `esptool.py`
- Flash 下载工具（仅适用于 Windows）
- 直接烧录程序

准备工作

该程序需要用到分区公用程序。

- 操作系统要求：
 - Linux、MacOS 或 Windows（标准版）
- 安装依赖包：
 - Python: <https://www.python.org/downloads/>。

注解：

使用该程序之前，请确保：

- Python 路径已添加到 PATH 环境变量中；
 - 已经安装 `requirement.txt` 中的软件包，`requirement.txt` 在 `esp-idf` 根目录下。
-

具体流程

CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。例如定义 `firmware_key` (key) 的 `type` 为 `data`，`encoding` 为 `hex2bin`。

配置文件中数据格式如下 (*REPEAT* 标签可选)：

```

name1,namespace,    <-- 第一行为 "namespace" 条目
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
  
```

注解： 文件第一行应始终为 `namespace` 条目。

每行应包含三个参数：`key`、`type` 和 `encoding`，并以逗号分隔。如果有 `REPEAT` 标签，则主 CSV 文件中所有设备此键值均相同。

有关各个参数的详细说明，请参阅 *NVS* 分区生成程序的 *README* 文件。

CSV 配置文件示例如下：

```

app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT <-- "serial_no" 被标记为 "REPEAT"
device_no,data,i32
  
```

注解：

请确保：

- 逗号 ‘,’ 前后无空格；
- CSV 文件每行末尾无空格。

主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行均对应一个设备实体。主 CSV 文件中的 `key` 应首先在 CSV 配置文件中定义。

主 CSV 文件的数据格式如下：

```

key1,key2,key3,....
value1,value2,value3,.... <-- 对应一个设备实体
value4,value5,value6,.... <-- 对应一个设备实体
value7,value8,value9,.... <-- 对应一个设备实体
  
```

注解：文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列 (键)，这些列将被视为元数据，而不会编译进最终二进制文件。

每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行 (即第一个条目) 输入对应的值，后面其他行为空。

参数描述如下：

value Data value

value 是与键对应的键值。

主 CSV 文件示例如下：

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101 <-- 对应一个设备实体 (在 CSV 配置文件中标记为 `REPEAT` 的键, 除第一个条目外, 其他均为空)
2,1a2b3c4d5e6fccdd,,102 <-- 对应一个设备实体
3,1a2b3c4d5e6feeff,,103 <-- 对应一个设备实体
```

注解：如果出现 REPEAT 标签，则会在相同目录下生成一个新的主 CSV 文件用作主输入文件，并在每行为带有 REPEAT 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。

中间 CSV 文件的格式如下：

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

运行量产程序

使用方法：

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

可选参数：

序号	参数	描述
1	-h, -help	显示帮助信息并退出

命令：

运行 `mfg_gen.py {command} -h` 查看更多帮助信息

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥

为每个设备生成工厂映像 (默认)

使用方法：

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                          [--keyfile KEYFILE] [--inputkey INPUTKEY]
                          [--outdir OUTDIR]
                          conf values prefix size
```

位置参数:

参数	描述
conf	待解析的 CSV 配置文件路径
values	待解析的主 CSV 文件路径
prefix	每个输出文件名前缀的唯一名称
size	NVS 分区大小 (以字节为单位, 且为 4096 的整数倍)

可选参数:

参数	描述
-h, -help	显示帮助信息并退出
-fileid FILEID	每个文件名后缀的唯一文件标识符 (主 CSV 文件中的任意键), 默认为数值 1、2、3...
-version {1,2}	<ul style="list-style-type: none"> • 设置多页 Blob 版本。 • 版本 1 - 禁用多页 Blob; • 版本 2 - 启用多页 Blob; • 默认版本: 版本 2
-keygen	生成 NVS 分区加密密钥
-inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
-outdir OUTDIR	输出目录, 用于存储创建的文件 (默认当前目录)

请运行以下命令为每个设备生成工厂映像, 量产程序同时提供了一个 CSV 示例文件:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000
```

主 CSV 文件应在 file 类型下设置一个相对路径, 指向运行该程序的当前目录。

为每个设备生成工厂加密映像

运行以下命令为每一设备生成工厂加密映像, 量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

注解: 创建的加密密钥格式为 <outdir>/keys/keys-<prefix>-<fileid>.bin。

注解: 加密密钥存储于新建文件的 keys/ 目录下, 与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 提供加密密钥用作二进制输入文件来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

仅生成加密密钥

使用方法:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数:

参数	描述
-h, --help	显示帮助信息并退出
--keyfile KEYFILE	加密密钥文件的输出路径
--outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令仅生成加密密钥:

```
python mfg_gen.py generate-key
```

注解: 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。时间戳格式为: %m-%d_%H-%M。

注解: 如需自定义目标文件名，请使用--keyfile 参数。

生成的加密密钥二进制文件还可以用于为每个设备的工厂映像加密。

fileid 参数的默认值为 1、2、3...，与主 CSV 文件中的行一一对应，内含设备配置值。

运行量产程序时，将在指定的 outdir 目录下创建以下文件夹:

- bin/ 存储生成的二进制文件
- csv/ 存储生成的中间 CSV 文件
- keys/ 存储加密密钥（创建工厂加密映像时会用到）

2.6.3 非易失性存储库

简介

非易失性存储 (NVS) 库主要用于在 flash 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

底层存储 NVS 库通过调用 `esp_partition` API 使用主 flash 的部分空间，包括 data 类型和 nvs 子类型的所有分区。应用程序可调用 `nvs_open()` API 选择使用带有 nvs 标签的分区，也可以通过调用 `nvs_open_from_partition()` API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端，来将数据保存至其他 flash 芯片（SPI 或 I2C 接口）、RTC 或 FRAM 中。

注解: 如果 NVS 分区被截断（例如，更改分区表布局时），则应擦除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase-flash` 命令擦除 flash 上的所有内容。

注解: NVS 最适合存储一些较小的数据，而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串，请考虑使用基于磨损均衡库的 FAT 文件系统。

键值对 NVS 的操作对象为键值对，其中键是 ASCII 字符串，当前支持的最大键长为 15 个字符。值可以为以下几种类型：

- 整数型：uint8_t、int8_t、uint16_t、int16_t、uint32_t、int32_t、uint64_t 和 int64_t；
- 以 0 结尾的字符串；
- 可变长度的二进制数据 (BLOB)

注解：字符串值当前上限为 4000 字节，其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小的 97.6% 减去 4000 字节，以较低值为准。

后续可能会增加对 float 和 double 等其他类型数据的支持。

键必须唯一。为现有的键写入新的值可能产生如下结果：

- 如果新旧值数据类型相同，则更新值；
- 如果新旧值数据类型不同，则返回错误。

读取值时也会执行数据类型检查。如果读取操作的数据类型与该值的数据类型不匹配，则返回错误。

命名空间 为了减少不同组件之间键名的潜在冲突，NVS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则，例如，最多可占 15 个字符。命名空间的名称在调用 `nvs_open()` 或 `nvs_open_from_partition` 中指定，调用后将返回一个不透明句柄，用于后续调用 `nvs_get_*`、`nvs_set_*` 和 `nvs_commit` 函数。这样，一个句柄关联一个命名空间，键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVS 分区中具有相同名称的命名空间将被视为不同的命名空间。

NVS 迭代器 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVS 中存储的键值对。

您可以使用以下函数，执行相关操作：

- `nvs_entry_find`：返回一个不透明句柄，用于后续调用 `nvs_entry_next` 和 `nvs_entry_info` 函数；
- `nvs_entry_next`：返回指向下一个键值对的迭代器；
- `nvs_entry_info`：返回每个键值对的信息。

如果未找到符合标准的键值对，`nvs_entry_find` 和 `nvs_entry_next` 将返回 NULL，此时不必释放迭代器。若不再需要迭代器，可使用 `nvs_release_iterator` 释放迭代器。

安全性、篡改性及鲁棒性 NVS 与 ESP32-S3 flash 加密系统不直接兼容。但如果 NVS 加密与 ESP32-S3 flash 加密一起使用时，数据仍可以加密形式存储。详情请参阅 [NVS 加密](#)。

如果未启用 NVS 加密，任何对 flash 芯片有物理访问权限的用户都可以修改、擦除或添加键值对。NVS 加密启用后，如果不知道相应的 NVS 加密密钥，则无法修改或添加键值对并将其识别为有效键值对。但是，针对擦除操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVS 库会尝试恢复。在任何时间点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库还应当能对 flash 中的任意数据进行正确初始化。

NVS 加密

NVS 分区内存储的数据可使用 AES-XTS 进行加密，类似于 IEEE P1619 磁盘加密标准中提到的加密方式。为了实现加密，每个条目被均视为一个扇区，并将条目相对地址（相对于分区开头）传递给加密算法，用作扇区号。可通过 `CONFIG_NVS_ENCRYPTION` 启用 NVS 加密。NVS 加密所需的密钥存储于其他分区，并进行了 [Flash 加密](#)。因此，在使用 NVS 加密前应先启用 [Flash 加密](#)。

启用 [Flash 加密](#) 时，默认启用 NVS 加密。这是因为 Wi-Fi 驱动在默认的 NVS 分区中存储了凭证（如 SSID 和口令）。启用平台级加密后，仍需将它们作为默认选项进行加密。

使用 NVS 加密，分区表必须包含 **NVS 密钥分区**。在分区表选项 (menuconfig->Partition Table) 下，为 NVS 加密提供了两个包含 **NVS 密钥分区** 的分区表，您可以通过工程配置菜单 (idf.py menuconfig) 进行选择。请参考 [security/flash_encryption](#) 中的例子，了解如何配置和使用 NVS 加密功能。

NVS 密钥分区

应用程序如果想使用 NVS 加密，则需要编译进一个类型为 *data*，子类型为 *key* 的密钥分区。该分区应标记为 **已加密** 且最小为 4096 字节。如需了解更多详细信息，请参考 [分区表](#)。在分区表选项 (menuconfig->Partition Table) 下提供了两个包含 **NVS 密钥分区** 的额外分区表，可以直接用于 **NVS 加密**。这些分区的具体结构见下表：

-----+-----+-----+-----+-----
XTS encryption key (32)
-----+-----+-----+-----+-----
XTS tweak key (32)
-----+-----+-----+-----+-----
CRC32 (4)
-----+-----+-----+-----+-----

可以通过以下两种方式生成 **NVS 密钥分区** 中的 XTS 加密密钥：

1. 在 ESP 芯片上生成密钥：

启用 NVS 加密时，可用 `nvs_flash_init()` API 函数来初始化加密的默认 NVS 分区，在内部生成 ESP 芯片上的 XTS 加密密钥。在找到 **NVS 密钥分区** 后，API 函数利用 `nvs_flash/include/nvs_flash.h` 提供的 `nvs_flash_generate_keys()` 函数，自动生成并存储该分区中的 NVS 密钥。只有当各自的密钥分区为空时，才会生成并存储新的密钥。可以借助 `nvs_flash_secure_init_partition()` 用同一个密钥分区来读取安全配置，以初始化一个定制的加密 NVS 分区。

API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 不在内部产生密钥。当这些 API 函数用于初始化加密的 NVS 分区时，可以在启动后使用 `nvs_flash.h` 提供的 `nvs_flash_generate_keys()` API 函数生成密钥，以加密的形式把密钥写到密钥分区上。

2. 使用预先生成的密钥分区：

若 **NVS 密钥分区** 中的密钥不是由应用程序生成，则需要使用预先生成的密钥分区。可以使用 **NVS 分区生成工具** 生成包含 XTS 加密密钥的 **NVS 密钥分区**。用户可以借助以下两个命令，将预先生成的密钥分区储存在 flash 上：

i) 建立并烧录分区表

```
idf.py partition_table partition_table-flash
```

ii) 调用 `parttool.py`，将密钥存储在 flash 上的 **NVS 密钥分区** 中。详见 `doc:分区表` </api-guides/partition-tables> 的分区工具部分。

```
parttool.py -port /dev/ttyUSB0 -partition-table-offset "nvs_key partition offset"
write_partition -partition-name=" name of nvs_key partition" -input "nvs_key partition"
```

由于分区已标记为 **已加密**，而且启用了 **Flash 加密**，引导程序在首次启动时将使用 flash 加密对密钥分区进行加密。

应用程序可以使用不同的密钥对不同的 NVS 分区进行加密，这样就会需要多个加密密钥分区。应用程序应为加解密操作提供正确的密钥或密钥分区。

加密读取/写入 `nvs_get_*` 和 `nvs_set_*` 等 NVS API 函数同样可以对 NVS 加密分区执行读写操作。

加密默认的 NVS 分区： 无需额外步骤即可启用默认 NVS 分区的加密。启用 `CONFIG_NVS_ENCRYPTION` 时，`nvs_flash_init()` API 函数会在内部使用找到的第一个 **NVS 密钥分区** 执行额外步骤，以启用默认 NVS 分区的加密（详情请参考 API 文档）。另外，`nvs_flash_secure_init()` API 函数也可以用来启用默认 NVS 分区的加密。

加密一个自定义的 NVS 分区： 使用 `nvs_flash_secure_init_partition()` API 函数启用自定义 NVS 分区的加密，而非 `nvs_flash_init_partition()`。

使用 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` API 函数时，应用程序如需在加密状态下执行 NVS 读写操作，应遵循以下步骤：

1. 使用 `esp_partition_find*` API 查找密钥分区和 NVS 数据分区；
2. 使用 `nvs_flash_read_security_cfg` 或 `nvs_flash_generate_keys` API 填充 `nvs_sec_cfg_t` 结构；
3. 使用 `nvs_flash_secure_init` 或 `nvs_flash_secure_init_partition` API 初始化 NVS flash 分区；
4. 使用 `nvs_open` 或 `nvs_open_from_partition` API 打开命名空间；
5. 使用 `nvs_get_*` 或 `nvs_set_*` API 执行 NVS 读取/写入操作；
6. 使用 `nvs_flash_deinit` API 释放已初始化的 NVS 分区。

NVS 分区生成程序

NVS 分区生成程序帮助生成 NVS 分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由 CSV 文件提供，详情请参考 [NVS 分区生成程序](#)。

应用示例

ESP-IDF `storage` 目录下提供了数个代码示例：

[storage/nvs_rw_value](#)

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32-S3 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。诊断程序以纯文本形式提供，帮助您追踪程序流程，及时发现问题。

[storage/nvs_rw_blob](#)

演示如何读取及写入 NVS 单个整数值和 Blob（二进制大对象），并在 NVS 中存储这一数值，即便 ESP32-S3 模组重启也不会消失。

- `value` - 记录 ESP32-S3 模组软重启次数和硬重启次数。
- `blob` - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。每次手动软重启后，表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉 GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

[storage/nvs_rw_value_cxx](#)

这个例子与 [storage/nvs_rw_value](#) 完全一样，只是使用了 C++ 的 NVS 处理类。

内部实现

键值对日志 NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在日志最后增加一对新的键值对，同时将旧的键值对标记为已擦除。

页面和条目 NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分的整体日志。逻辑页面对应 flash 的一个物理扇区，正在使用中的页面具有与之相关联的序列号。序列号赋予了页面顺序，较高的序列号对应较晚创建的页面。页面有以下几种状态：

空或未初始化 页面对应的 flash 扇区为空白状态（所有字节均为 `0xff`）。此时，页面未存储任何数据且没有关联的序列号。

活跃状态 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，可写入数据。任意时刻，至多有一个页面处于活跃状态。

写满状态 Flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入新键值对，但仍可将一些键值对标记为已擦除。

擦除状态 未擦除的键值对将移至其他页面，以便擦除当前页面。这一状态仅为暂时性状态，即 API 调用返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未擦除的键值对移至其他页面，并继续擦除当前页面。

损坏状态 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无法访问。相应的 flash 扇区并不会被立即擦除，而是与其他处于未初始化状态的扇区一起等待后续使用。这一状态可能对调试有用。

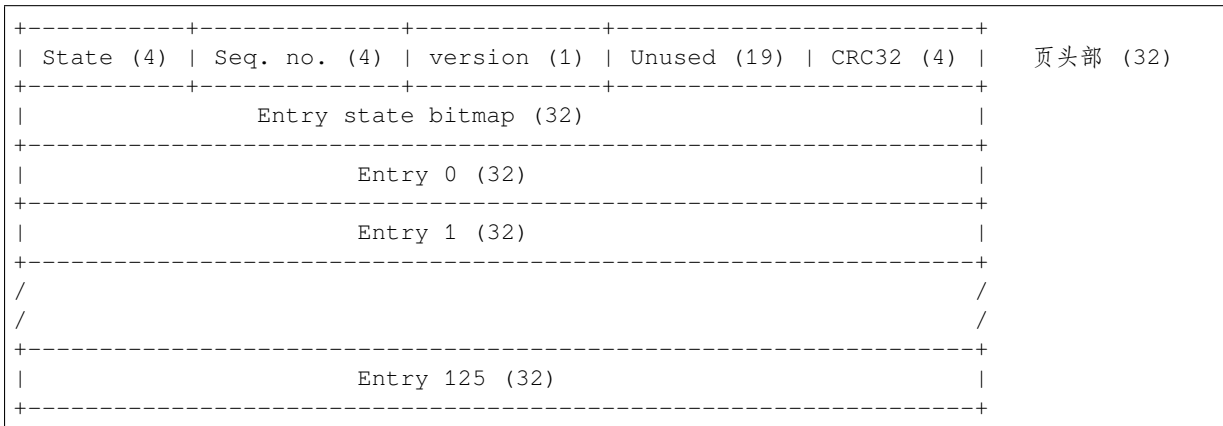

Flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序列号组织页面。

页面结构 当前，我们假设 flash 扇区大小为 4096 字节，并且 ESP32-S3 flash 加密硬件在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适配具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32-S3 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息详见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）。

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32-S3 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其变更为擦除状态。

头部中的 version 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 0xff 开始依次递减（例如，version-1 为 0xff，version-2 为 0xfe，以此类推）。

头部中 CRC32 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 0xff 字节填充。

条目结构和条目状态位图的详细信息见下文描述。

条目和条目状态位图 每个条目可处于以下三种状态之一，每个状态在条目状态位图中用两位表示。位图中的最后四位 (256 - 2 * 126) 未使用。

空 (2' b11) 条目还未写入任何内容，处于未初始化状态（全部字节为 0xff）。

写入 (2' b10) 一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。

擦除 (2' b00) 条目中的键值对已丢弃，条目内容不再解析。

条目结构 如果键值类型为基础类型，即 1 - 8 个字节长度的整型，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，即以新格式储存至条目。

条目结构中各个字段含义如下：

命名空间 (NS, NameSpace) 该条目的命名空间索引，详细信息参见命名空间实现章节。

类型 (Type) 一个字节表示的值的的数据类型，[nvs_flash/include/nvs_handle.hpp](#) 下的 `ItemType` 枚举了可能的类型。

跨度 (Span) 该键值对所用的条目数量。如果键值为整型，条目数量即为 1。如果键值为字符串或 BLOB，则条目数量取决于值的长度。

块索引 (ChunkIndex) 用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 0xff。

CRC32 对条目下所有字节进行校验后，所得的校验和（CRC32 字段不计算在内）。

键 (Key) 即以零结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字节的零终止符。

数据 (Data) 如果键值类型为整型，则数据字段仅包含键值。如果键值小于八个字节，使用 0xff 填充未使用的部分（右侧）。

如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- **块大小** 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。
- **ChunkCount** 存储过程中 BLOB 分成的数据块总量。该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块索引，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：

- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，此字段也应将零终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字节的校验和，该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 *Span* 字段将指明使用了多少条目。

命名空间 如上所述，每个键值对属于一个命名空间。命名空间标识符（字符串）也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。

+-----+ NS=0 Type=uint8_t Key="wifi" Value=1	Entry describing namespace "wifi"
+-----+ NS=1 Type=uint32_t Key="channel" Value=6	Key "channel" in namespace "wifi"
+-----+ NS=0 Type=uint8_t Key="pwm" Value=2	Entry describing namespace "pwm"
+-----+ NS=2 Type=uint16_t Key="channel" Value=20	Key "channel" in namespace "pwm"
+-----+	

条目哈希列表 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。Page::findItem 首先从哈希列表中检索条目哈希值，如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目、两个链表指针和一个 32 位计数字段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

API 参考

Header File

- components/nvs_flash/include/nvs_flash.h

Functions

`esp_err_t nvs_flash_init` (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

1. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
2. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
3. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Return

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

- error codes from `nvs_flash_read_security_cfg` API (when “NVS_ENCRYPTION” is enabled).
- error codes from `nvs_flash_generate_keys` API (when “NVS_ENCRYPTION” is enabled).
- error codes from `nvs_flash_secure_init_partition` API (when “NVS_ENCRYPTION” is enabled).

`esp_err_t nvs_flash_init_partition(const char *partition_label)`

Initialize NVS flash storage for the specified partition.

Return

- `ESP_OK` if storage was successfully initialized.
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_NOT_FOUND` if specified partition is not found in the partition table
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters

- [in] `partition_label`: Label of the partition. Must be no longer than 16 characters.

`esp_err_t nvs_flash_init_partition_ptr(const esp_partition_t *partition)`

Initialize NVS flash storage for the partition specified by partition pointer.

Return

- `ESP_OK` if storage was successfully initialized
- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_INVALID_ARG` in case partition is NULL
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters

- [in] `partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_deinit(void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Return

- `ESP_OK` on success (storage was deinitialized)
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition(const char *partition_label)`

Deinitialize NVS storage for the given NVS partition.

Return

- `ESP_OK` on success
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage for given partition was not initialized prior to this call

Parameters

- [in] `partition_label`: Label of the partition

`esp_err_t nvs_flash_erase(void)`

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn't happen)

`esp_err_t nvs_flash_erase_partition(const char *part_name)`

Erase specified NVS partition.

Erase all content of a specified NVS partition

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

Parameters

- [in] `part_name`: Name (label) of the partition which should be erased

`esp_err_t nvs_flash_erase_partition_ptr(const esp_partition_t *partition)`

Erase custom partition.

Erase all content of specified custom partition.

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

Parameters

- [in] `partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_secure_init(nvs_sec_cfg_t *cfg)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

Return

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters

- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is NULL, no encryption is used.

`esp_err_t nvs_flash_secure_init_partition(const char *partition_label, nvs_sec_cfg_t *cfg)`

Initialize NVS flash storage for the specified partition.

Return

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

Parameters

- [in] `partition_label`: Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is null, no encryption/decryption is used.

`esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)`

Generate and store NVS keys in the provided esp partition.

Return -ESP_OK, if `cfg` was read successfully; -ESP_INVALID_ARG, if `partition` or `cfg`; -or error codes from `esp_partition_write/erase` APIs.

Parameters

- [in] `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- [out] `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

esp_err_t **nvs_flash_read_security_cfg**(const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration from a partition.

Note Provided partition is assumed to be marked ‘encrypted’.

Return -ESP_OK, if `cfg` was read successfully; -ESP_INVALID_ARG, if `partition` or `cfg`; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

Parameters

- [in] `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- [out] `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL.

Structures

struct nvs_sec_cfg_t

Key for encryption and decryption.

Public Members

Macros

NVS_KEY_SIZE

Header File

- [components/nvs_flash/include/nvs.h](#)

Functions

esp_err_t **nvs_set_i8**(*nvs_handle_t* handle, const char *key, int8_t value)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

Parameters

- [in] `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.

- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- [in] value: The value to set.

esp_err_t nvs_set_u8 (*nvs_handle_t handle*, **const** char *key, uint8_t value)
set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_i16 (*nvs_handle_t handle*, **const** char *key, int16_t value)
set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_u16 (*nvs_handle_t handle*, **const** char *key, uint16_t value)
set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_i32 (*nvs_handle_t handle*, **const** char *key, int32_t value)
set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_u32 (*nvs_handle_t handle*, **const** char *key, uint32_t value)
set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_i64 (*nvs_handle_t handle*, **const** char *key, int64_t value)
set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_u64 (*nvs_handle_t handle*, **const** char *key, uint64_t value)
set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t nvs_set_str (*nvs_handle_t handle*, **const** char *key, **const** char *value)
set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

Parameters

- [in] handle: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- [in] value: The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

esp_err_t nvs_get_i8 (*nvs_handle_t handle*, **const** char *key, int8_t *out_value)
get int8_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

Parameters

- `[in] handle`: Handle obtained from `nvs_open` function.
- `[in] key`: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- `out_value`: Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in `length` argument.

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`
get `uint8_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`
get `int16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`
get `uint16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`
get `int32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`
get `uint32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)`
get `int64_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64(nvs_handle_t handle, const char *key, uint64_t *out_value)`
get `uint64_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str(nvs_handle_t handle, const char *key, char *out_value, size_t *length)`
get string value for given key

These functions retrieve the data of an entry, given its key. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if `length` is not sufficient to store data

Parameters

- `[in]` `handle`: Handle obtained from `nvs_open` function.
- `[in]` `key`: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- `[out]` `out_value`: Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in `length` argument.
- `[inout]` `length`: A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

esp_err_t `nvs_get_blob`(*nvs_handle_t* `handle`, `const` `char`*`key`, `void`*`out_value`, `size_t`*`length`)
get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

esp_err_t `nvs_open`(`const` `char`*`name`, *nvs_open_mode_t* `open_mode`, *nvs_handle_t**`out_handle`)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

Return

- `ESP_OK` if storage handle was opened successfully
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label "nvs" is not found
- `ESP_ERR_NVS_NOT_FOUND` id namespace doesn't exist yet and mode is `NVS_READONLY`
- `ESP_ERR_NVS_INVALID_NAME` if namespace name doesn't satisfy constraints
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

Parameters

- `[in]` `name`: Namespace name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.

- [in] `open_mode`: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] `out_handle`: If successful (return code is zero), handle will be returned in this argument.

esp_err_t `nvs_open_from_partition`(`const` char **part_name*, `const` char **name*,
nvs_open_mode_t *open_mode*, *nvs_handle_t* **out_handle*)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

Return

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

Parameters

- [in] `part_name`: Label (name) of the partition of interest for object read/write/erase
- [in] `name`: Namespace name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- [in] `open_mode`: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] `out_handle`: If successful (return code is zero), handle will be returned in this argument.

esp_err_t `nvs_set_blob`(*nvs_handle_t* *handle*, `const` char **key*, `const` void **value*, *size_t* *length*)

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

Parameters

- [in] `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- [in] `value`: The value to set.
- [in] `length`: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

esp_err_t `nvs_erase_key`(*nvs_handle_t* *handle*, `const` char **key*)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

Return

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only

- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

Parameters

- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.

esp_err_t **nvs_erase_all** (*nvs_handle_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

Return

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

Parameters

- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

esp_err_t **nvs_commit** (*nvs_handle_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

Return

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

Parameters

- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

void **nvs_close** (*nvs_handle_t* handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

Parameters

- [in] handle: Storage handle to close

esp_err_t **nvs_get_stats** (**const** char *part_name, *nvs_stats_t* *nvs_stats)

Fill structure *nvs_stats_t*. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free_
↪entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↪entries);
```

Return

- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "name" is not found. Return param nvs_stats will be filled 0.

- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `nvs_stats` equal to `NULL`.
- `ESP_ERR_INVALID_STATE` if there is page with the status of `INVALID`. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first `INVALID` page.

Parameters

- [in] `part_name`: Partition name NVS in the partition table. If pass a `NULL` than will use `NVS_DEFAULT_PART_NAME` ("nvs").
- [out] `nvs_stats`: Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

esp_err_t **nvs_get_used_entry_count** (*nvs_handle_t* handle, size_t *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs.
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

Return

- `ESP_OK` if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- `ESP_ERR_NVS_INVALID_HANDLE` if `handle` has been closed or is `NULL`. Return param `used_entries` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `used_entries` equal to `NULL`.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

Parameters

- [in] `handle`: Handle obtained from `nvs_open` function.
- [out] `used_entries`: Returns amount of used entries from a namespace.

nvs_iterator_t **nvs_entry_find** (**const** char *part_name, **const** char *namespace_name, *nvs_type_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified.
↳partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no.
↳other
// element for specified criteria was found.
}
```

Return Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any more.

Parameters

- [in] `part_name`: Partition name
- [in] `namespace_name`: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- [in] `type`: One of `nvs_type_t` values.

nvs_iterator_t **nvs_entry_next** (*nvs_iterator_t* iterator)

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

Return NULL if no entry was found, valid `nvs_iterator_t` otherwise.

Parameters

- [in] `iterator`: Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

void **nvs_entry_info** (*nvs_iterator_t* iterator, *nvs_entry_info_t* *out_info)

Fills *nvs_entry_info_t* structure with information about entry pointed to by the iterator.

Parameters

- [in] `iterator`: Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- [out] `out_info`: Structure to which entry information is copied.

void **nvs_release_iterator** (*nvs_iterator_t* iterator)

Release iterator.

Parameters

- [in] `iterator`: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

Structures

struct nvs_entry_info_t

information about entry obtained from `nvs_entry_info` function

Public Members

char **namespace_name**[16]

Namespace to which key-value belong

char **key**[NVS_KEY_NAME_MAX_SIZE]

Key of stored key-value pair

nvs_type_t **type**

Type of stored key-value pair

struct nvs_stats_t

Note Info about storage space NVS.

Public Members

size_t **used_entries**

Amount of used entries.

size_t **free_entries**

Amount of free entries.

size_t **total_entries**

Amount all available entries.

`size_t namespace_count`
Amount name space.

Macros

ESP_ERR_NVS_BASE

Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED

The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND

Id namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH

The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY

Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE

There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME

Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE

Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG

Key name is too long

ESP_ERR_NVS_PAGE_FULL

Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH

String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG

String or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND

Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND

NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED

XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED

XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED

XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND

XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED

NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED

NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART

NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS

Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME

Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE

maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE

Maximal length of NVS key name (including null terminator)

Type Definitions**typedef** uint32_t **nvs_handle_t**

Opaque pointer type representing non-volatile storage handle

typedef *nvs_handle_t* **nvs_handle****typedef** *nvs_open_mode_t* **nvs_open_mode****typedef** struct nvs_opaque_iterator_t ***nvs_iterator_t**

Opaque pointer type representing iterator to nvs entries

Enumerations**enum** **nvs_open_mode_t**

Mode of opening the non-volatile storage.

*Values:***NVS_READONLY**

Read only

NVS_READWRITE

Read and write

enum **nvs_type_t**

Types of variables.

*Values:***NVS_TYPE_U8** = 0x01

Type uint8_t

NVS_TYPE_I8 = 0x11

Type int8_t

NVS_TYPE_U16 = 0x02

Type uint16_t

NVS_TYPE_I16 = 0x12

Type int16_t

NVS_TYPE_U32 = 0x04

Type uint32_t

```

NVS_TYPE_I32 = 0x14
    Type int32_t
NVS_TYPE_U64 = 0x08
    Type uint64_t
NVS_TYPE_I64 = 0x18
    Type int64_t
NVS_TYPE_STR = 0x21
    Type string
NVS_TYPE_BLOB = 0x42
    Type blob
NVS_TYPE_ANY = 0xff
    Must be last

```

2.6.4 NVS 分区生成程序

介绍

NVS 分区生成程序 (`nvs_flash/nvs_partition_generator/nvs_partition_gen.py`) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与非易失性存储器 (NVS) 中定义的 NVS 结构兼容。NVS 分区生成程序适用于生成二进制数据 (Blob)，其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个固件的基础上，通过自定义参数，如序列号等，为每个设备生成不同配置。

准备工作

在加密模式下使用该程序，需安装下列软件包：

- cryptography package

根目录下的 `requirements.txt` 包含必需 python 包，请预先安装。

CSV 文件格式

.csv 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表：

序号	参数	描述	说明
1	Key	主键，应用程序可通过查询此键来获取数据。	
2	Type	支持 file、data 和 namespace。	
3	Encoding	支持 u8、i8、u16、u32、i32、string、hex2bin、base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。	file 类型当前仅支持 hex2bin、base64、string 和 binary 编码。
4	Value	Data value	namespace 字段的 encoding 和 value 应为空。namespace 的 encoding 和 value 为固定值，不可设置。这些单元格中的所有值都会被忽视。

注解： CSV 文件的第一行应为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下：

```
key, type, encoding, value    <-- 列标题
namespace_name, namespace,,  <-- 第一个条目为 "namespace"
key1, data, u8, 1
key2, file, string, /path/to/file
```

注解:

请确保:

- 逗号 ‘,’ 前后无空格;
- CSV 文件每行末尾无空格。

NVS 条目和命名空间 (namespace)

如 CSV 文件中出现命名空间条目, 后续条目均会被视为该命名空间的一部分, 直至找到下一个命名空间条目。找到新命名空间条目后, 后续所有条目都会被视为新命名空间的一部分。

注解: CSV 文件中第一个条目应始终为 namespace。

支持多页 Blob

默认情况下, 二进制 Blob 可跨多页, 格式参考[条目结构](#) 章节。如需使用旧版格式, 可在程序中禁用该功能。

支持加密

NVS 分区生成程序还可使用 AES-XTS 加密生成二进制加密文件。更多信息详见[NVS 加密](#)。

支持解密

如果 NVS 二进制文件采用了 AES-XTS 加密, 该程序还可对此类文件进行解密, 更多信息详见[NVS 加密](#)。

运行程序

使用方法:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

可选参数:

序号	参数	描述
1	-h, -help	显示帮助信息并退出

命令:

```
运行 nvs_partition_gen.py {command} -h 查看更多帮助信息
```

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥
3	encrypt	加密 NVS 分区
4	decrypt	解密 NVS 分区

生成 NVS 分区 (默认模式)

使用方法:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
                                     input output size
```

位置参数:

参数	描述
input	待解析的 CSV 文件路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小 (以字节为单位, 且为 4096 的整数倍)

可选参数:

参数	描述
-h, -help	显示帮助信息并退出
--version {1,2}	<ul style="list-style-type: none"> 设置多页 Blob 版本。 版本 1: 禁用多页 Blob; 版本 2: 启用多页 Blob; 默认版本: 版本 2。
--outdir OUTDIR	输出目录, 用于存储创建的文件。(默认当前目录)

运行如下命令创建 NVS 分区, 该程序同时会提供 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

仅生成加密密钥

使用方法:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                         [--outdir OUTDIR]
```

可选参数:

参数	描述
-h, -help	显示帮助信息并退出
--keyfile KEYFILE	加密密钥文件的输出路径
--outdir OUTDIR	输出目录, 用于存储创建的文件。(默认当前目录)

运行以下命令仅生成加密密钥:

```
python nvs_partition_gen.py generate-key
```

生成 NVS 加密分区 使用方法:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                     [--keyfile KEYFILE] [--inputkey INPUTKEY]
                                     [--outdir OUTDIR]
                                     input output size
```

位置参数：

参数	描述
input	待解析 CSV 文件的路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小（以字节为单位，且为 4096 的整数倍）

可选参数：

参数	描述
-h, -help	显示帮助信息并退出
-version {1,2}	<ul style="list-style-type: none"> 设置多页 Blob 版本。 版本 1：禁用多页 Blob； 版本 2：启用多页 Blob； 默认版本：版本 2。
-keygen	生成 NVS 分区加密密钥
-keyfile KEYFILE	密钥文件的输出路径
-inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
-outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密：

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen
```

注解： 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

- 通过 NVS 分区生成程序生成加密密钥，并将密钥存储于自定义的文件中：

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen --keyfile sample_keys.bin
```

注解： 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

注解： 加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 将加密密钥用作二进制输入文件来进行加密：

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --inputkey sample_keys.bin
```

解密 NVS 分区 使用方法：

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

位置参数：

参数	描述
input	待解析的 NVS 加密分区文件路径
key	含有解密密钥的文件路径
output	已解密的二进制文件输出路径

可选参数:

参数	描述
-h, -help	显示帮助信息并退出
-outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令解密已加密的 NVS 分区:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

您可以自定义格式版本号:

- 版本 1: 禁用多页 Blob
- 版本 2: 启用多页 Blob

版本 1: 禁用多页 Blob 如需禁用多页 Blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --
↪-version 1
```

版本 2: 启用多页 Blob 如需启用多页 Blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↪version 2
```

注解: NVS 分区最小为 0x3000 字节。

注解: 将二进制文件烧录至设备时，请确保与应用的 sdkconfig 设置一致。

说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键；
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

2.6.5 SD/SDIO/MMC 驱动程序

概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动 ([driver/include/driver/sdmmc_host.h](#) 和 [driver/include/driver/sdsapi_host.h](#)) 为以下功能提供 API:

- 发送命令至从设备
- 接收和发送数据
- 处理总线错误

初始化函数及配置函数：

- 如需初始化和配置 SDMMC 主机，请参阅 [SDMMC 主机 API](#)
- 如需初始化和配置 SD SPI 主机，请参阅 [SD SPI 主机 API](#)

本文中所述的 SDMMC 协议层仅处理 SD 协议相关事项，例如卡初始化和数据传输命令。

协议层通过 `sdmmc_host_t` 结构体和主机协同工作，该结构体包含指向主机各类函数的指针。

应用示例

ESP-IDF [storage/sd_card](#) 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例，演示了先初始化卡，然后使用 POSIX 和 C 库 API 向卡读写数据。请参考示例目录下 README.md 文件，查看更多详细信息。

复合卡（存储 + IO） 该驱动程序不支持 SD 复合卡，复合卡会被视为 IO 卡。

线程安全 多数应用程序仅需在一个任务中使用协议层。因此，协议层在 `sdmmc_card_t` 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时不使用任何类型的锁。这种锁通常在较高层级实现，例如文件系统驱动程序。

协议层 API

协议层具备 `sdmmc_host_t` 结构体，此结构体描述了 SD/MMC 主机驱动，列出了其功能，并提供指向驱动程序函数的指针。协议层将卡信息储存于 `sdmmc_card_t` 结构体中。向 SD/MMC 主机发送命令时，协议层调用时需要一个 `sdmmc_command_t` 结构体来描述命令、参数、预期返回值和需传输的数据（如有）。

用于 SD 存储卡的 API

1. 初始化主机，请调用主机驱动函数，例如 `sdmmc_host_init()` 和 `sdmmc_host_init_slot()`；
2. 初始化卡，请调用 `sdmmc_card_init()`，并将参数 `host`（主机驱动信息）和参数 `card`（指向 `sdmmc_card_t` 结构体的指针）传递此函数。函数运行结束后，将会向 `sdmmc_card_t` 结构体填充该卡的信息；
3. 读取或写入卡的扇区，请分别调用 `sdmmc_read_sectors()` 和 `sdmmc_write_sectors()`，并将参数 `card`（指向卡信息结构的指针）传递给函数；
4. 如果不再使用该卡，请调用主机驱动函数，例如 `sdmmc_host_deinit()`，以禁用主机外设，并释放驱动程序分配的资源。

用于 eMMC 芯片的 API 从协议层的角度而言，eMMC 存储芯片与 SD 存储卡相同。尽管 eMMC 是芯片，不具备卡的外形，但由于协议相似 (`sdmmc_card_t`, `sdmmc_card_init`)，用于 SD 卡的一些概念同样适用于 eMMC 芯片。注意，eMMC 芯片不可通过 SPI 使用，因此它与 SD API 主机驱动不兼容。

如需初始化 eMMC 内存并执行读/写操作，请参照上一章节 SD 卡操作步骤。

用于 SDIO 卡的 API SDIO 卡初始化和检测过程与 SD 存储卡相同，唯一的区别是 SDIO 模式下数据传输命令不同。

在卡初始化和卡检测（通过运行 `sdmmc_card_init()`）期间，驱动仅配置 IO 卡如下寄存器：

1. I/O 中止 (0x06) 寄存器：在该寄存器中设置 RES 位可重置卡的 IO 部分；
2. 总线接口控制 (0x07) 寄存器：如果主机和插槽配置中启用 4 线模式，则驱动程序会尝试在该寄存器中设置总线宽度字段。如果字段设置成功，则从机支持 4 线模式，主机也切换至 4 线模式；
3. 高速 (0x13) 寄存器：如果主机配置中启用高速模式，则会在该寄存器中设置 SHS 位。

注意，驱动程序不会在 (1) I/O 使能寄存器和 Int 使能寄存器，及 (2) I/O 块大小中，设置任何位。应用程序可通过调用 `sdmmc_io_write_byte()` 来设置相关位。

如需设置卡配置或传输数据，请根据您的具体情况选择下表中的函数：

Action	Read Function	Write Function
Read and write a single byte using IO_RW_DIRECT (CMD52)	<code>sdmmc_io_read_byte()</code>	<code>sdmmc_io_write_byte()</code>
Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode	<code>sdmmc_io_read_bytes()</code>	<code>sdmmc_io_write_bytes()</code>
Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode	<code>sdmmc_io_read_blocks()</code>	<code>sdmmc_io_write_blocks()</code>

使用 `sdmmc_io_enable_int()` 函数，应用程序可启用 SDIO 中断。在单线模式下使用 SDIO 时，还需要连接 D1 线来启用 SDIO 中断。

如果您需要应用程序保持等待直至发生 SDIO 中断，请使用 `sdmmc_io_wait_int()` 函数。

如果您需要与 ESP32 的 SDIO 从设备通信，请使用 ESSL 组件（ESP 串行从设备链接）。请参阅 [ESP Serial Slave Link](#) and example [peripherals/sdio/host](#)

API 参考

Header File

- [components/sdmmc/include/sdmmc_cmd.h](#)

Functions

`esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)`

Probe and initialize SD/MMC card using given host

Note Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

Return

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters

- `host`: pointer to structure defining host controller
- `out_card`: pointer to structure which will receive information about the card when the function completes

void `sdmmc_card_print_info(FILE *stream, const sdmmc_card_t *card)`

Print information about the card to a stream.

Parameters

- `stream`: stream obtained using `fopen` or `fdopen`
- `card`: card information structure initialized using `sdmmc_card_init`

`esp_err_t sdmmc_get_status(sdmmc_card_t *card)`

Get status of SD/MMC card

Return

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`

`esp_err_t sdmmc_write_sectors(sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)`

Write given number of sectors to SD/MMC card

Return

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `src`: pointer to data buffer to read data from; data size must be equal to `sector_count * card->csd.sector_size`
- `start_sector`: sector where to start writing
- `sector_count`: number of sectors to write

esp_err_t **sdmmc_read_sectors** (*sdmmc_card_t* **card*, void **dst*, size_t *start_sector*, size_t *sector_count*)

Read given number of sectors from the SD/MMC card

Return

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `dst`: pointer to data buffer to write into; buffer size must be at least `sector_count * card->csd.sector_size`
- `start_sector`: sector where to start reading
- `sector_count`: number of sectors to read

esp_err_t **sdmmc_io_read_byte** (*sdmmc_card_t* **card*, uint32_t *function*, uint32_t *reg*, uint8_t **out_byte*)

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

Return

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `reg`: byte address within IO function
- [out] `out_byte`: output, receives the value read from the card

esp_err_t **sdmmc_io_write_byte** (*sdmmc_card_t* **card*, uint32_t *function*, uint32_t *reg*, uint8_t *in_byte*, uint8_t **out_byte*)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

Return

- ESP_OK on success
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `reg`: byte address within IO function
- `in_byte`: value to be written
- [out] `out_byte`: if not NULL, receives new byte value read from the card (read-after-write).

esp_err_t **sdmmc_io_read_bytes** (*sdmmc_card_t* **card*, uint32_t *function*, uint32_t *addr*, void **dst*, size_t *size*)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if `size` exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`

- `function`: IO function number
- `addr`: byte address within IO function where reading starts
- `dst`: buffer which receives the data read from card
- `size`: number of bytes to read

esp_err_t **sdmmc_io_write_bytes** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `src`: data to be written
- `size`: number of bytes to write

esp_err_t **sdmmc_io_read_blocks** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `dst`: buffer which receives the data read from card
- `size`: number of bytes to read, must be divisible by the card block size.

esp_err_t **sdmmc_io_write_blocks** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `src`: data to be written
- `size`: number of bytes to read, must be divisible by the card block size.

esp_err_t **sdmmc_io_enable_int** (*sdmmc_card_t* *card)

Enable SDIO interrupt in the SDMMC host

Return

- ESP_OK on success

- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`

`esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)`

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Return

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `timeout_ticks`: time to wait for the interrupt, in RTOS ticks

`esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)`

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Return

- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `out_buffer`: Output buffer of the CIS data
- `buffer_size`: Size of the buffer.
- `inout_cis_size`: Mandatory, pointer to a size, input and output.
 - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
 - output: The size required to store all the CIS data, if CIS_CODE_END is found.

`esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)`

Parse and print the CIS information of an SDIO card.

Note Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

Return

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

Parameters

- `buffer`: Buffer to parse
- `buffer_size`: Size of the buffer.
- `fp`: File pointer to print to, set to NULL to print to stdout.

Header File

- `components/driver/include/driver/sdmmc_types.h`

Structures**struct sdmmc_csd_t**

Decoded values from SD card Card Specific Data register

Public Membersint **csd_ver**

CSD structure format

int **mmc_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector_size**

sector size in bytes

int **read_block_len**

block length for reads

int **card_command_class**

Card Command Class for SD

int **tr_speed**

Max transfer speed

struct sdmmc_cid_t

Decoded values from SD card Card IDentification register

Public Membersint **mfg_id**

manufacturer identification number

int **oem_id**

OEM/product identification number

char **name**[8]

product name (MMC v1 has the longest)

int **revision**

product revision

int **serial**

product serial number

int **date**

manufacturing date

struct sdmmc_scr_t

Decoded values from SD Configuration Register

Public Membersint **sd_spec**

SD Physical layer specification version, reported by card

int **bus_width**

bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

struct sdmmc_ext_csd_t

Decoded values of Extended Card Specific Data

Public Members

`uint8_t power_class`
Power class used by the card

`struct sdmmc_switch_func_rsp_t`
SD SWITCH_FUNC response buffer

Public Members

`uint32_t data[512 / 8 / sizeof(uint32_t)]`
response data

`struct sdmmc_command_t`
SD/MMC command information

Public Members

`uint32_t opcode`
SD or MMC command index

`uint32_t arg`
SD/MMC command argument

`sdmmc_response_t response`
response buffer

`void *data`
buffer to send or read into

`size_t datalen`
length of data buffer

`size_t blklen`
block length

`int flags`
see below

`esp_err_t error`
error returned from transfer

`int timeout_ms`
response timeout, in milliseconds

`struct sdmmc_host_t`
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

`uint32_t flags`
flags defining host properties

`int slot`
slot number, to be passed to host functions

`int max_freq_khz`
max frequency supported by the host

float io_voltage
I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (*init) (void)
Host function to initialize the driver

esp_err_t (*set_bus_width) (int slot, size_t width)
host function to set bus width

size_t (*get_bus_width) (int slot)
host function to get bus width

esp_err_t (*set_bus_ddr_mode) (int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t (*set_card_clk) (int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t (*do_transaction) (int slot, *sdmmc_command_t* *cmdinfo)
host function to do a transaction

esp_err_t (*deinit) (void)
host function to deinitialize the driver

esp_err_t (*deinit_p) (int slot)
host function to deinitialize the driver, called with the `slot`

esp_err_t (*io_int_enable) (int slot)
Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait) (int slot, TickType_t timeout_ticks)
Host function to wait for SDIO interrupt line to be active

int command_timeout_ms
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
SD/MMC card information structure

Public Members

sdmmc_host_t host
Host with which the card is associated

uint32_t ocr
OCR (Operation Conditions Register) value

sdmmc_cid_t cid
decoded CID (Card IDentification) register value

sdmmc_response_t raw_cid
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t csd
decoded CSD (Card-Specific Data) register value

sdmmc_scr_t scr
decoded SCR (SD card Configuration Register) value

sdmmc_ext_csd_t ext_csd
decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
RCA (Relative Card Address)

uint16_t max_freq_khz
Maximum frequency, in kHz, supported by the card

`uint32_t is_mem` : 1
Bit indicates if the card is a memory card

`uint32_t is_sdio` : 1
Bit indicates if the card is an IO card

`uint32_t is_mmc` : 1
Bit indicates if the card is MMC

`uint32_t num_io_functions` : 3
If `is_sdio` is 1, contains the number of IO functions on the card

`uint32_t log_bus_width` : 2
 $\log_2(\text{bus width supported by card})$

`uint32_t is_ddr` : 1
Card supports DDR mode

`uint32_t reserved` : 23
Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT
host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT
host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT
host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI
host supports SPI protocol

SDMMC_HOST_FLAG_DDR
host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG
host `deinit` function called with the slot argument

SDMMC_FREQ_DEFAULT
SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED
SD High speed (limited by clock divider)

SDMMC_FREQ_PROBING
SD/MMC probing speed

SDMMC_FREQ_52M
MMC 52MHz speed

SDMMC_FREQ_26M
MMC 26MHz speed

Type Definitions

typedef `uint32_t sdmmc_response_t`[4]
SD/MMC command response buffer

2.6.6 SPI Flash API

概述

Spi_flash 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数，同时也提供了更高级别的，面向分区的 API 函数（定义在分区表中）。

与 ESP-IDF V4.0 之前的 API 不同，这一版 `esp_flash_*` API 功能并不局限于主 SPI Flash 芯片（即运行程序的 SPI Flash 芯片）。使用不同的芯片指针，您可以访问连接到 SPI0/1 或 SPI2 总线的外部 flash 芯片。

注解：大多数 `esp_flash_*` API 使用 SPI1, SPI2 等外设而非通过 SPI0 上的 cache。这使得它们不仅能访问主 flash，也能访问外部 flash。

而由于 cache 的限制，所有经过 cache 的操作都只能对主 flash 进行。这些操作的地址同样受到 cache 能力的限制。Cache 无法访问外部 flash 或者高于它能力的地址段。这些 cache 操作包括：mmap，加密读写，执行代码或者访问在 flash 中的变量。

注解：ESP-IDF V4.0 之后的 flash API 不再是原子的。因此，如果 flash 操作地址有重叠，且写操作与读操作同时执行，读操作可能会返回一部分写入之前的数据和一部分写入之后的数据。

Kconfig 选项 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 可将 `spi_flash_*` 函数切换至 ESP-IDF V4.0 之前的实现。但是，如果同时使用新旧 API，代码量可能会增多。

即便未启用 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`，加密读取和加密写入操作也均使用旧实现。因此，仅有主 flash 芯片支持加密操作，外接（经 SPI1 使用其他不同片选访问，或经其它 SPI 总线访问）的 flash 芯片则不支持加密操作。也仅有主 flash 支持从 cache 当中读取，因为这是由硬件决定的。

Flash 特性支持情况

不同厂家的 flash 特性有不同的操作方式，因此需要特殊的驱动支持。当前驱动支持大多数厂家 Flash 24 位地址范围内的快速/慢速读，以及二线模式 (DIO / DOUT)，因为他们不需要任何厂家的自定义命令。

当前驱动支持以下厂家/型号的 flash 的四线模式 (QIO/QOUT)：

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

下列 flash 芯片支持八线模式 (OPI)：

1. MXIC

关于如何为具有不同 flash 和 PSRAM 容量的开发板设置 menuconfig，请参考 [SPI flash](#) 和 [片外 SPI RAM 设置](#)。

当前驱动支持以下厂家/型号的 flash 的 32 位地址范围的访问：

1. W25Q256
2. GD25Q256

如果有需要，也可以自定义 flash 芯片驱动，参见 [Overriding Default Chip Drivers](#)。

警告： Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
 - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
 - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
 - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly.

注解:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
 1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
 2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support `suspend` and `read unique id`).
 3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom_flash_driver](#).

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the

following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```
idf_component_get_property(spi_flash_lib      spi_flash      COMPONENT_LIB)
set_property(TARGET      ${spi_flash_lib}    APPEND      PROPERTY    INTER-
FACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>)
```

5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [链接器脚本生成机制](#) for more details. Make sure this file covers all the source files that you add.
6. Build your project, and you will see the new flash driver is used.

Example See also `storage/custom_flash_driver`.

初始化 Flash 设备

在使用 `esp_flash_*` API 之前，您需要在 SPI 总线上初始化芯片。

1. 调用 `spi_bus_initialize()` 初始化 SPI 总线，此函数将初始化总线上设备间共享的资源，如 I/O、DMA 及中断等。
2. 调用 `spi_bus_add_flash_device()` 将 flash 设备连接到总线上。然后分配内存，填充 `esp_flash_t` 结构体，同时初始化 CS I/O。
3. 调用 `esp_flash_init()` 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

注解：当前，多个 flash 芯片可连接到同一总线。但尚不支持在同一个 SPI 总线上使用 `esp_flash_*` 和 `spi_device_*` 设备。

SPI Flash 访问 API

如下所示为处理 flash 中数据的函数集：

- `esp_flash_read()`：将数据从 flash 读取到 RAM；
- `esp_flash_write()`：将数据从 RAM 写入到 flash；
- `esp_flash_erase_region()`：擦除 flash 中指定区域的数据；
- `esp_flash_erase_chip()`：擦除整个 flash；
- `esp_flash_get_chip_size()`：返回 `menuconfig` 中设置的 flash 芯片容量（以字节为单位）。

一般来说，请尽量避免对主 SPI flash 芯片直接使用原始 SPI flash 函数，如需对主 SPI flash 芯片进行操作，请使用 [分区专用函数](#)。

SPI Flash 容量

SPI flash 容量存储于引导程序映像头部（烧录偏移量为 0x1000）的一个字段。

默认情况下，引导程序写入 flash 时，`esptool.py` 将引导程序写入 flash 时，会自动检测 SPI flash 容量，同时使用正确容量更新引导程序的头部。您也可以配置 `CONFIG_ESPTOOLPY_FLASHSIZE`，生成固定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量，请配置 `g_rom_flashchip` 结构中的 `chip_size`。`esp_flash_*` 函数使用此容量（于软件和 ROM 中）进行边界检查。

SPI1 Flash 并发约束

SPI1 Flash 并发约束 指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI Flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，对 SPI1 外设的操作会对整个系统造成显著的影响。这类操作包括调用 SPI Flash API 或者其他 SPI1 总线上的驱动，任何 flash 操作（如读取、写入、擦除）或者其他用户定义的 SPI 操作，无论是对主 flash 或者其他各类的 SPI 从机。

在 ESP32-S3 上，flash 读取/写入/擦除时 cache 必须被禁用。

当 cache 被禁用时 这意味着当 flash 擦写操作发生时，所有的 CPU 都只能执行 IRAM 中的代码，而且必须从 DRAM 中读取数据。如果您使用本文中 API 函数，上述限制将自动生效且透明（无需您额外关注），但这些限制可能会影响系统中的其他任务的性能。

除 SPI0/1 以外的 SPI 总线上的其它 flash 芯片则不受这种限制。

请参阅[应用程序内存分布](#)，查看 IRAM、DRAM 和 flash cache 的区别。

为避免意外读取 flash cache，一个 CPU 在启动 flash 写入或擦除操作时，另一个 CPU 将阻塞，并且在 flash 操作完成前，所有 CPU 上，所有的非 IRAM 安全的中断都会被禁用。

另请参阅[OS 函数](#) 和 [SPI Bus Lock](#)。

IRAM 安全中断处理程序 如果您需要在 flash 操作期间运行中断处理程序（比如低延迟操作），请在[注册中断处理程序](#) 时设置 ESP_INTR_FLAG_IRAM。

请确保中断处理程序访问的所有数据和函数（包括其调用的数据和函数）都存储在 IRAM 或 DRAM 中。有两种方法可供使用：

使用属性宏 为函数添加 IRAM_ATTR 属性：

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

为常量添加 DRAM_ATTR 和 DRAM_STR 属性：

```
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

辨别哪些数据应标记为 DRAM_ATTR 可能会比较困难，除非明确标记为 DRAM_ATTR，否则编译器依然可能将某些变量或表达式当做常量（即便没有 const 标记），并将其放入 flash。

使用链接脚本 参见[链接器脚本生成机制](#)。

如果函数或符号未被正确放入 IRAM/DRAM 中，当中断处理程序在 flash 操作期间从 flash cache 中读取数据，则会产生非法指令异常（这是因为代码未被正确放入 IRAM）或读取垃圾数据（这是因为常数未被正确放入 DRAM），而导致崩溃。

注意： 指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，在 SPI1 总线上调用 SPI Flash API（包括访问主 flash）会对整个系统造成显著的影响。更多细节，参见[SPI1 Flash 并发约束](#)。

分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息，包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参考[here](#)，查看详细信息。

该组件在 esp_partition.h 中声明了一些 API 函数，用以枚举在分区表中找到的分区，并对这些分区执行操作：

- `esp_partition_find()`：在分区表中查找特定类型的条目，返回一个不透明迭代器；
- `esp_partition_get()`：返回一个结构，描述给定迭代器的分区；

- `esp_partition_next()`: 将迭代器移至下一个找到的分区;
- `esp_partition_iterator_release()`: 释放 `esp_partition_find` 中返回的迭代器;
- `esp_partition_find_first()`: 返回描述 `esp_partition_find` 中找到的第一个分区的结构;
- `esp_partition_read()`、`esp_partition_write()` 和 `esp_partition_erase_range()` 等同于 `spi_flash_read()`、`spi_flash_write()` 和 `spi_flash_erase_range()`, 但在分区边界内执行。

注解: 请在应用程序代码中使用上述 `esp_partition_*` API 函数, 而非低层级的 `esp_flash_*` API 函数。分区表 API 函数根据存储在分区表中的数据, 进行边界检查并计算在 flash 中的正确偏移量。

SPI Flash 加密

您可以对 SPI flash 内容进行加密, 并在硬件层对其进行透明解密。

请参阅 [Flash 加密文档](#), 查看详细信息。

内存映射 API

ESP32-S3 内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间, 此映射仅用于读操作。不能通过写入 flash 映射的存储区域来改变 flash 中的内容。

Flash 在 64 KB 页进行映射。内存映射硬件既可将 flash 映射到数据地址空间, 也能映射到指令地址空间。请查看技术参考手册, 了解内存映射硬件的详细信息及有关限制。

请注意, 有些页被用于将应用程序映射到内存中, 因此实际可用的页会少于硬件提供的总数。

启用 [Flash 加密](#) 时, 使用内存映射区域从 flash 读取数据是解密 flash 的唯一方法, 解密需在硬件层进行。

内存映射 API 在 `esp_spi_flash.h` 和 `esp_partition.h` 中声明:

- `spi_flash_mmap()`: 将 flash 物理地址区域映射到 CPU 指令空间或数据空间;
- `spi_flash_munmap()`: 取消上述区域的映射;
- `esp_partition_mmap()`: 将分区的一部分映射至 CPU 指令空间或数据空间;

`spi_flash_mmap()` 和 `esp_partition_mmap()` 的区别如下:

- `spi_flash_mmap()`: 需要给定一个 64 KB 对齐的物理地址;
- `esp_partition_mmap()`: 给定分区内任意偏移量即可, 此函数根据需要将返回的指针调整至指向映射内存。

内存映射以页为单位, 即使传递给 `esp_partition_mmap` 的是一个分区, 分区外的数据也是可以读到的, 不会受到分区边界的影响。

注解: 由于 `mmap` 是由 cache 支持的, 因此, `mmap` 也仅能用在主 flash 上。

SPI Flash 实现

`esp_flash_t` 结构包含芯片数据和该 API 的三个重要部分:

1. 主机驱动, 为访问芯片提供硬件支持;
2. 芯片驱动, 为不同芯片提供兼容性服务;
3. OS 函数, 在不同阶段 (一级或二级 Boot 或者应用程序阶段) 为部分 OS 函数 (如锁、延迟) 提供支持。

主机驱动 主机驱动依赖 `hal/include/hal` 文件夹下 `spi_flash_types.h` 定义的 `spi_flash_host_driver_t` 接口。该接口提供了一些常用的函数，用于与芯片通信。

在 SPI HAL 文件中，有些函数是基于现有的 ESP32-S3 `memory-spi` 来实现的。但是，由于 ESP32-S3 的速度限制，HAL 层无法提供某些读命令的高速实现（所以这些命令根本没有在 HAL 的文件中被实现）。`memspi_host_driver.h` 和 `.c` 文件使用 HAL 提供的 `common_command` 函数实现上述读命令的高速版本，并将所有它实现的以及 HAL 函数封装为 `spi_flash_host_driver_t` 供更上层调用。

您甚至可以仅通过 GPIO 来实现自己的主机驱动。只要实现了 `spi_flash_host_driver_t` 中所有函数，不管底层硬件是什么，`esp_flash` API 都可以访问 flash。

芯片驱动 芯片驱动在 `spi_flash_chip_driver.h` 中进行定义，并将主机驱动提供的基本函数进行封装以供 API 层使用。

有些操作需在执行前先发送命令，或在执行后读取状态，因此有些芯片需要不同的命令或值以及通信方式。

`generic chip` 芯片代表了常见的 flash 芯片，其他芯片驱动可以在这种通用芯片的基础上进行开发。

芯片驱动依赖主机驱动。

OS 函数 OS 函数层目前提供访问锁和延迟的方法。

锁（见 [SPI Bus Lock](#)）用于解决同一 SPI 总线上的设备访问和 SPI Flash 芯片访问之间的冲突。例如：

1. 经 SPI1 总线访问 flash 芯片时，应当禁用 cache（平时用于取代码和 PSRAM 数据）。
2. 经其他总线访问 flash 芯片时，应当禁用 flash 上 SPI 主驱动器注册的 ISR 以避免冲突。
3. SPI 主驱动器上某些没有 CS 线或者 CS 线受软件（如 SDSPI）控制的设备需要在一段时间内独占总线。

延时则用于某些长时操作，需要主机处于等待状态或执行轮询。

顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件，并提供参数检查。

另请参考

- [分区表](#)
- [OTA API](#) 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- [NVS API](#) 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

实现细节

必须确保操作期间，两个 CPU 均未从 flash 运行代码，实现细节如下：- 单核模式下，SDK 在执行 flash 操作前将禁用中断或调度算法。- 双核模式下，实现细节较为复杂，SDK 需确保两个 CPU 均未运行 flash 代码。

如果有 SPI flash API 在 CPU A（PRO 或 APP）上调用，它使用 `esp_ipc_call` API 在 CPU B 上运行 `spi_flash_op_block_func` 函数。`esp_ipc_call` API 会在 CPU B 上唤醒一个高优先级任务，即运行 `spi_flash_op_block_func` 函数。运行该函数将禁用 CPU B 上的 cache，并使用 `s_flash_op_can_start` 旗帜来标志 cache 已禁用。然后，CPU A 上的任务也会禁用 cache 并继续执行 flash 操作。

执行 flash 操作时，CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中，如果新添加了中断分配 API，则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

Flash 操作完成后，CPU A 上的函数将设置另一标志位，即 `s_flash_op_complete`，用以通知 CPU B 上的任务可以重新启用 cache 并释放 CPU。接着，CPU A 上的函数也重新启用 cache，并将控制权返还给调用者。

另外，所有 API 函数均受互斥量 `s_flash_op_mutex` 保护。

在单核环境中（启用 `CONFIG_FREERTOS_UNICORE`），您需要禁用上述两个 cache 以防发生 CPU 间通信。

SPI Flash API 参考

Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

Functions

`esp_err_t spi_bus_add_flash_device` (`esp_flash_t` `out_chip`, `const esp_flash_spi_device_config_t` `config`)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Return

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

Parameters

- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

`esp_err_t spi_bus_remove_flash_device` (`esp_flash_t` `chip`)

Remove a SPI Flash device from the SPI bus.

Return

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

Parameters

- `chip`: The flash device to remove.

Structures

`struct esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

Public Members

`spi_host_device_t` `host_id`

Bus to use.

int `cs_io_num`

GPIO pin to output the CS signal.

`esp_flash_io_mode_t` `io_mode`

IO mode to read from the Flash.

`esp_flash_speed_t` `speed`

Speed of the Flash clock.

int `input_delay_ns`

Input delay of the data pins, in ns. Set to 0 if unknown.

int `cs_id`

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

Header File

- `components/spi_flash/include/esp_flash.h`

Functions**esp_err_t esp_flash_init** (*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.**Note** If the `chip->drv` pointer is NULL, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.**Return** ESP_OK on success, or a flash error code if initialisation fails.**Parameters**

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

bool esp_flash_chip_driver_initialized (**const** *esp_flash_t* *chip)

Check if appropriate chip driver is set.

Return true if set, otherwise false.**Parameters**

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

esp_err_t esp_flash_read_id (*esp_flash_t* *chip, *uint32_t* *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] `out_id`: Pointer to receive ID value.

Return ESP_OK on success, or a flash error code if operation failed.**esp_err_t esp_flash_get_size** (*esp_flash_t* *chip, *uint32_t* *out_size)

Detect flash size based on flash ID.

Note Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.**Return** ESP_OK on success, or a flash error code if operation failed.**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] `out_size`: Detected size in bytes.

esp_err_t esp_flash_read_unique_chip_id (*esp_flash_t* *chip, *uint64_t* *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- [out] `out_id`: Pointer to receive unique ID value.

Return

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

esp_err_t esp_flash_erase_chip (*esp_flash_t* *chip)

Erase flash chip contents.

Return

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by `WREN = 1` after the command is sent.
- Other flash error code if operation failed.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

esp_err_t **esp_flash_erase_region** (*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Parameters

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- *start*: Address to start erasing flash. Must be sector aligned.
- *len*: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Return

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect** (*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

Note A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] *write_protected*: Pointer to boolean, set to the value of the write protect flag.

esp_err_t **esp_flash_set_chip_write_protect** (*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- *write_protect*: Boolean value for the write protect flag

Return ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions** (const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- [out] *out_regions*: Pointer to receive a pointer to the array of protectable regions of the chip.
- [out] *out_num_regions*: Pointer to an integer receiving the count of protectable regions in the array returned in 'regions' .

esp_err_t **esp_flash_get_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

Note It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

Return `ESP_OK` on success, or a flash error code if operation failed.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- `[out] out_protected`: Pointer to a flag which is set based on the protected status for this region.

esp_err_t **esp_flash_set_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

Note It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

Note Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

Return `ESP_OK` on success, or a flash error code if operation failed.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- `protect`: Write protection flag to set.

esp_err_t **esp_flash_read** (*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `buffer`: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- `address`: Address on flash to read from. Must be less than `chip->size` field.
- `length`: Length (in bytes) of data to read.

Note If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

Return

- `ESP_OK`: success
- `ESP_ERR_NO_MEM`: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write** (*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `address`: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- `length`: Length (in bytes) of data to write.

Return

- `ESP_OK` on success,

- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

Note Both address & length must be 16 byte aligned, as this is the encryption block size

Return

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

Parameters

- `chip`: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- `address`: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write.
- `length`: Length (in bytes) of data to write. 16 byte aligned.

`esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Return

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi_flash_read_encrypted().

Parameters

- `chip`: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- `address`: Address on flash to read from.
- `out_buffer`: Pointer to a buffer for the data to read to.
- `length`: Length (in bytes) of data to read.

`static bool esp_flash_is_quad_mode(const esp_flash_t *chip)`

Returns true if chip is configured for Quad I/O or Quad Fast Read.

Return true if flash works in quad mode, otherwise false

Parameters

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Structures

`struct esp_flash_region_t`

Structure for describing a region of flash.

Public Members

`uint32_t offset`

Start address of this region.

`uint32_t size`

Size of the region.

`struct esp_flash_os_functions_t`

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t (***start**) (void *arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t (***end**) (void *arg)

Called after completing any flash operation.

esp_err_t (***region_protected**) (void *arg, size_t start_addr, size_t size)

Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (***delay_us**) (void *arg, uint32_t us)

Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’ .

void (***get_temp_buffer**) (void *arg, size_t request_size, size_t *out_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (***release_temp_buffer**) (void *arg, void *temp_buf)

Called for release temp buffer.

esp_err_t (***check_yield**) (void *arg, uint32_t chip_status, uint32_t *out_request)

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (***yield**) (void *arg, uint32_t *out_status)

Yield to other tasks. Called during erase operations.

int64_t (***get_system_time**) (void *arg)

Called for get system time.

struct esp_flash_t

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t ***host**

Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const *spi_flash_chip_t* ***chip_drv**

Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.
