

# ESP32-S3

## ESP-IDF Programming Guide

Release v4.4.2  
乐鑫信息科技  
2022年08月02日

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 快速入门</b>	<b>3</b>
1.1 概述	3
1.2 准备工作	3
1.3 开发板简介	4
1.3.1 ESP32-S3-DevKitC-1	4
1.4 详细安装步骤	9
1.4.1 设置开发环境	10
1.4.2 创建您的第一个工程	10
1.5 第一步：安装准备	10
1.5.1 Windows 平台工具链的标准设置	10
1.5.2 Linux 平台工具链的标准设置	14
1.5.3 macOS 平台工具链的标准设置	15
1.6 第二步：获取 ESP-IDF	17
1.6.1 Linux 和 macOS 操作系统	17
1.6.2 Windows 操作系统	17
1.7 第三步：设置工具	17
1.7.1 Windows 操作系统	17
1.7.2 Linux 和 macOS 操作系统	18
1.7.3 下载工具备选方案	18
1.7.4 自定义工具安装路径	18
1.8 第四步：设置环境变量	18
1.8.1 Windows 操作系统	19
1.8.2 Linux 和 macOS 操作系统	19
1.9 第五步：开始创建工程	19
1.9.1 Linux 和 macOS 操作系统	19
1.9.2 Windows 操作系统	19
1.10 第六步：连接设备	20
1.11 第七步：配置	20
1.11.1 Linux 和 macOS 操作系统	20
1.11.2 Windows 操作系统	20
1.12 第八步：编译工程	21
1.13 第九步：烧录到设备	21
1.13.1 烧录过程中可能遇到的问题	22
1.13.2 常规操作	22
1.14 第十步：监视器	23
1.15 更新 ESP-IDF	24
1.16 相关文档	24
1.16.1 与 ESP32-S3 创建串口连接	24
1.16.2 Eclipse IDE 创建和烧录指南	30
1.16.3 VS Code IDE 快速入门	30
1.16.4 IDF 监视器	31
1.16.5 工具链的自定义设置	35
<b>2 API 参考</b>	<b>41</b>
2.1 蓝牙 API	41

2.1.1	Controller && VHCI	41
2.1.2	BT COMMON	50
2.1.3	BT LE	56
2.1.4	NimBLE-based host APIs	174
2.1.5	ESP-BLE-MESH	177
2.2	连网 API	460
2.2.1	Wi-Fi	460
2.2.2	以太网	561
2.2.3	Thread	581
2.2.4	IP 网络层协议	587
2.2.5	应用层协议	605
2.3	外设 API	605
2.3.1	Analog to Digital Converter (ADC)	605
2.3.2	GPIO & RTC GPIO	630
2.3.3	通用定时器	653
2.3.4	Dedicated GPIO	664
2.3.5	Hash-based Message Authentication Code (HMAC)	668
2.3.6	Digital Signature (DS)	672
2.3.7	I2C 驱动程序	677
2.3.8	Inter-IC Sound (I2S)	694
2.3.9	LCD	711
2.3.10	LED PWM 控制器	726
2.3.11	Motor Control Pulse Width Modulator (MCPWM)	743
2.3.12	Pulse Counter (PCNT)	772
2.3.13	Remote Control (RMT)	783
2.3.14	SD Pull-up Requirements	804
2.3.15	SDMMC Host Driver	805
2.3.16	SD SPI Host Driver	811
2.3.17	Sigma-delta Modulation	816
2.3.18	SPI Master Driver	818
2.3.19	SPI Slave Driver	838
2.3.20	Temperature Sensor	844
2.3.21	触摸传感器	847
2.3.22	Two-Wire Automotive Interface (TWAI)	873
2.3.23	Universal Asynchronous Receiver/Transmitter (UART)	891
2.3.24	USB Device Driver	916
2.3.25	USB Host	924
2.4	应用层协议	960
2.4.1	mDNS 服务	960
2.4.2	ESP-TLS	975
2.4.3	OpenSSL-APIs	987
2.4.4	ESP HTTP Client	1014
2.4.5	ESP WebSocket Client	1030
2.4.6	HTTP 服务器	1038
2.4.7	HTTPS server	1064
2.4.8	ICMP Echo	1067
2.4.9	ASIO port	1071
2.4.10	ESP-MQTT	1072
2.4.11	ESP-Modbus	1085
2.4.12	ESP Local Control	1109
2.4.13	ESP Serial Slave Link	1118
2.4.14	ESP x509 Certificate Bundle	1132
2.4.15	IP 网络层协议	1134
2.5	配网 API	1135
2.5.1	Unified Provisioning	1135
2.5.2	Protocol Communication	1138
2.5.3	Wi-Fi Provisioning	1151
2.6	存储 API	1169

2.6.1	FAT 文件系统	1169
2.6.2	量产程序	1174
2.6.3	非易失性存储库	1178
2.6.4	NVS 分区生成程序	1199
2.6.5	SD/SDIO/MMC 驱动程序	1204
2.6.6	SPI Flash API	1215
2.6.7	SPIFFS 文件系统	1244
2.6.8	虚拟文件系统组件	1248
2.6.9	磨损均衡 API	1261
2.7	System API	1265
2.7.1	App Image Format	1265
2.7.2	Application Level Tracing	1272
2.7.3	The Async memcpy API	1276
2.7.4	控制台终端	1280
2.7.5	eFuse Manager	1288
2.7.6	Error Codes and Helper Functions	1310
2.7.7	ESP HTTPS OTA	1312
2.7.8	POSIX Threads Support	1316
2.7.9	Event Loop Library	1320
2.7.10	FreeRTOS	1339
2.7.11	FreeRTOS Additions	1450
2.7.12	Heap Memory Allocation	1469
2.7.13	Heap Memory Debugging	1481
2.7.14	High Resolution Timer	1493
2.7.15	Inter-Processor Call	1498
2.7.16	Call function with external stack	1503
2.7.17	Interrupt allocation	1504
2.7.18	Logging library	1511
2.7.19	Miscellaneous System APIs	1518
2.7.20	空中升级 (OTA)	1523
2.7.21	Performance Monitor	1535
2.7.22	电源管理	1537
2.7.23	Random Number Generation	1543
2.7.24	Sleep Modes	1545
2.7.25	Watchdogs	1556
2.7.26	System Time	1560
2.7.27	Internal and Unstable APIs	1564
2.8	API Conventions	1565
2.8.1	Error handling	1565
2.8.2	Configuration structures	1565
2.8.3	Private APIs	1566
2.8.4	Components in example projects	1566
2.8.5	API Stability	1567
2.9	Project Configuration	1568
2.9.1	Introduction	1568
2.9.2	Project Configuration Menu	1568
2.9.3	Using sdkconfig.defaults	1568
2.9.4	Kconfig Formatting Rules	1568
2.9.5	Backward Compatibility of Kconfig Options	1569
2.9.6	Configuration Options Reference	1569
2.9.7	Customisations	1820
2.10	Error Codes Reference	1820
<b>3</b>	<b>ESP32-S3 H/W 硬件参考</b>	<b>1827</b>
3.1	芯片系列对比	1827
3.1.1	相关文档	1829
<b>4</b>	<b>API 指南</b>	<b>1831</b>

4.1	应用层跟踪库	1831
4.1.1	概述	1831
4.1.2	运行模式	1831
4.1.3	配置选项与依赖项	1832
4.1.4	如何使用这个库	1833
4.2	应用程序的启动流程	1841
4.2.1	一级引导程序	1841
4.2.2	二级引导程序	1842
4.2.3	应用程序启动阶段	1842
4.3	BluFi	1844
4.3.1	概览	1844
4.3.2	BluFi 流程	1844
4.3.3	BluFi 流程图	1846
4.3.4	BluFi 中定义的帧格式	1846
4.3.5	ESP32-S3 端的安全实现	1849
4.3.6	GATT 相关说明	1850
4.4	引导加载程序 (Bootloader)	1850
4.4.1	引导加载程序兼容性	1850
4.4.2	日志级别	1851
4.4.3	恢复出厂设置	1851
4.4.4	从测试固件启动	1852
4.4.5	回滚	1852
4.4.6	看门狗	1852
4.4.7	引导加载程序大小	1852
4.4.8	从深度睡眠中快速启动	1853
4.4.9	自定义引导加载程序	1853
4.5	构建系统 (CMake 版)	1853
4.5.1	概述	1853
4.5.2	使用构建系统	1854
4.5.3	示例项目	1857
4.5.4	项目 CMakeLists 文件	1858
4.5.5	组件 CMakeLists 文件	1859
4.5.6	组件配置	1861
4.5.7	预处理器定义	1861
4.5.8	组件依赖	1862
4.5.9	组件 CMakeLists 示例	1866
4.5.10	自定义 sdkconfig 的默认值	1870
4.5.11	Flash 参数	1870
4.5.12	构建 Bootloader	1871
4.5.13	选择目标芯片	1871
4.5.14	编写纯 CMake 组件	1871
4.5.15	组件中使用第三方 CMake 项目	1872
4.5.16	组件中使用预建库	1873
4.5.17	在自定义 CMake 项目中使用 ESP-IDF	1873
4.5.18	ESP-IDF CMake 构建系统 API	1873
4.5.19	文件通配 & 增量构建	1877
4.5.20	构建系统的元数据	1877
4.5.21	构建系统内部	1878
4.5.22	从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统	1879
4.6	Deep Sleep Wake Stubs	1881
4.6.1	Rules for Wake Stubs	1881
4.6.2	Implementing A Stub	1881
4.6.3	Loading Code Into RTC Memory	1882
4.6.4	Loading Data Into RTC Memory	1882
4.6.5	CRC Check For Wake Stubs	1883
4.7	Device Firmware Upgrade through USB	1883
4.7.1	Building the DFU Image	1884
4.7.2	Flashing the Chip with the DFU Image	1884

4.8	错误处理	1885
4.8.1	概述	1885
4.8.2	错误码	1885
4.8.3	错误码到错误消息	1886
4.8.4	ESP_ERROR_CHECK 宏	1886
4.8.5	ESP_ERROR_CHECK_WITHOUT_ABORT 宏	1886
4.8.6	ESP_RETURN_ON_ERROR 宏	1887
4.8.7	ESP_GOTO_ON_ERROR 宏	1887
4.8.8	ESP_RETURN_ON_FALSE 宏	1887
4.8.9	ESP_GOTO_ON_FALSE 宏	1887
4.8.10	CHECK 宏使用示例	1887
4.8.11	错误处理模式	1888
4.8.12	C++ 异常	1888
4.9	ESP-BLE-MESH	1888
4.9.1	概述	1889
4.9.2	ESP-BLE-MESH 快速入门	1889
4.9.3	ESP-BLE-MESH 示例	1895
4.9.4	ESP-BLE-MESH 演示视频	1896
4.9.5	ESP-BLE-MESH 常见问题手册	1896
4.9.6	相关文档	1896
4.10	ESP-WIFI-MESH	1922
4.10.1	概述	1922
4.10.2	简介	1923
4.10.3	ESP-WIFI-MESH 概念	1924
4.10.4	建立网络	1928
4.10.5	管理网络	1933
4.10.6	数据传输	1935
4.10.7	信道切换	1938
4.10.8	性能	1940
4.10.9	更多注意事项	1941
4.11	Core Dump	1941
4.11.1	Overview	1941
4.11.2	Configurations	1941
4.11.3	Save core dump to flash	1942
4.11.4	Print core dump to UART	1942
4.11.5	ROM Functions in Backtraces	1942
4.11.6	Dumping variables on demand	1943
4.11.7	Running <code>espcoredump.py</code>	1943
4.12	Event Handling	1944
4.12.1	Wi-Fi, Ethernet, and IP Events	1944
4.12.2	Mesh Events	1945
4.12.3	Bluetooth Events	1946
4.13	片外 RAM	1946
4.13.1	简介	1946
4.13.2	硬件	1946
4.13.3	配置片外 RAM	1947
4.13.4	片外 RAM 使用限制	1948
4.13.5	初始化失败	1948
4.14	严重错误	1948
4.14.1	概述	1948
4.14.2	紧急处理程序	1948
4.14.3	寄存器转储与回溯	1949
4.14.4	GDB Stub	1951
4.14.5	Guru Meditation 错误	1952
4.14.6	其他严重错误	1953
4.15	Flash 加密	1955
4.15.1	概述	1955
4.15.2	相关 eFuses	1956

4.15.3	Flash 的加密过程	1957
4.15.4	Flash 加密设置	1957
4.15.5	可能出现的错误	1960
4.15.6	ESP32-S3 flash 加密状态	1962
4.15.7	在加密的 flash 中读写数据	1962
4.15.8	更新加密的 flash	1963
4.15.9	关闭 flash 加密	1963
4.15.10	Flash 加密的要点	1963
4.15.11	Flash 加密的局限性	1964
4.15.12	Flash 加密与安全启动	1964
4.15.13	Flash 加密的高级功能	1964
4.15.14	片外 RAM	1966
4.15.15	技术细节	1966
4.16	SPI Flash and External SPI RAM Configuration	1966
4.16.1	Terminology	1966
4.16.2	How to configure Flash and PSRAM	1967
4.16.3	All Supported Modes and Speeds	1967
4.16.4	Error handling	1968
4.17	ESP-IDF FreeRTOS (SMP)	1969
4.17.1	Overview	1969
4.17.2	Symmetric Multiprocessing	1970
4.17.3	Tasks	1971
4.17.4	SMP Scheduler	1972
4.17.5	Critical Sections	1975
4.17.6	Misc	1977
4.18	Hardware Abstraction	1977
4.18.1	Architecture	1978
4.18.2	LL (Low Level) Layer	1979
4.18.3	HAL (Hardware Abstraction Layer)	1980
4.19	High-Level Interrupts	1981
4.19.1	Interrupt Levels	1981
4.19.2	Notes	1981
4.20	JTAG 调试	1982
4.20.1	引言	1982
4.20.2	工作原理	1983
4.20.3	选择 JTAG 适配器	1983
4.20.4	安装 OpenOCD	1984
4.20.5	配置 ESP32-S3 目标板	1984
4.20.6	启动调试器	1987
4.20.7	调试范例	1987
4.20.8	从源码构建 OpenOCD	1987
4.20.9	注意事项和补充内容	1991
4.20.10	相关文档	1995
4.21	链接器脚本生成机制	2020
4.21.1	概述	2020
4.21.2	快速上手	2020
4.21.3	链接器脚本生成机制内核	2023
4.22	lwIP	2028
4.22.1	Supported APIs	2029
4.22.2	BSD Sockets API	2029
4.22.3	Netconn API	2033
4.22.4	lwIP FreeRTOS Task	2033
4.22.5	IPv6 Support	2033
4.22.6	esp-lwip custom modifications	2034
4.22.7	Performance Optimization	2035
4.23	OpenThread	2036
4.23.1	Mode of the OpenThread stack	2036
4.23.2	How To Write an OpenThread Application	2037

4.23.3	The OpenThread border router	2038
4.24	存储器类型	2038
4.24.1	DRAM (数据 RAM)	2038
4.24.2	RTC FAST memory (RTC 快速存储器)	2040
4.24.3	DROM (数据存储在 flash 中)	2040
4.24.4	RTC Slow memory (RTC 慢速存储器)	2040
4.24.5	具备 DMA 功能	2040
4.24.6	在堆栈中放置 DMA 缓冲区	2041
4.25	分区表	2041
4.25.1	概述	2041
4.25.2	内置分区表	2042
4.25.3	创建自定义分区表	2042
4.25.4	生成二进制分区表	2044
4.25.5	分区大小检查	2045
4.25.6	烧写分区表	2045
4.25.7	分区工具 (parttool.py)	2045
4.26	Performance	2047
4.26.1	How to Optimize Performance	2047
4.26.2	Guides	2047
4.27	RF calibration	2063
4.27.1	Partial calibration	2063
4.27.2	Full calibration	2063
4.27.3	No calibration	2064
4.27.4	PHY initialization data	2064
4.28	Secure Boot V2	2064
4.28.1	Background	2064
4.28.2	Advantages	2065
4.28.3	Secure Boot V2 Process	2065
4.28.4	Signature Block Format	2065
4.28.5	Verifying a Signature Block	2066
4.28.6	Verifying an Image	2066
4.28.7	Bootloader Size	2066
4.28.8	eFuse usage	2066
4.28.9	How To Enable Secure Boot V2	2067
4.28.10	Restrictions after Secure Boot is enabled	2068
4.28.11	Generating Secure Boot Signing Key	2068
4.28.12	Remote Signing of Images	2068
4.28.13	Secure Boot Best Practices	2068
4.28.14	Key Management	2069
4.28.15	Multiple Keys	2069
4.28.16	Key Revocation	2069
4.28.17	Technical Details	2070
4.28.18	Secure Boot & Flash Encryption	2070
4.28.19	Signed App Verification Without Hardware Secure Boot	2070
4.28.20	Advanced Features	2071
4.29	Thread Local Storage	2071
4.29.1	Overview	2071
4.29.2	FreeRTOS Native API	2071
4.29.3	Pthread API	2072
4.29.4	C11 Standard	2072
4.30	工具	2072
4.30.1	Downloadable Tools	2072
4.30.2	IDF Docker Image	2081
4.30.3	IDF Windows Installer	2083
4.30.4	IDF Component Manager	2084
4.30.5	IDF Clang Tidy	2086
4.31	ULP 协处理器编程	2087
4.31.1	安装工具链	2087

4.31.2	编写 ULP FSM	2087
4.31.3	编译 ULP 代码	2119
4.31.4	访问 ULP FSM 程序变量	2120
4.31.5	启动 ULP FSM 程序	2120
4.31.6	ESP32-S3 ULP 程序流	2121
4.31.7	应用示例	2121
4.31.8	API 参考	2121
4.32	ULP RISC-V 协处理器编程	2124
4.32.1	安装 ULP RISC-V 工具链	2124
4.32.2	编译 ULP RISC-V 代码	2124
4.32.3	访问 ULP RISC-V 程序变量	2124
4.32.4	启动 ULP RISC-V 程序	2125
4.32.5	ULP RISC-V 程序流	2126
4.32.6	应用示例	2126
4.32.7	API 参考	2126
4.33	ESP32-S3 中的单元测试	2126
4.33.1	添加常规测试用例	2127
4.33.2	添加多设备测试用例	2127
4.33.3	添加多阶段测试用例	2128
4.33.4	应用于不同芯片的单元测试	2129
4.33.5	编译单元测试程序	2129
4.33.6	运行单元测试	2130
4.33.7	带缓存补偿定时器的定时代码	2131
4.33.8	Mocks	2132
4.34	Unit Testing on Linux	2133
4.34.1	Embedded Software Tests	2133
4.34.2	IDF Unit Tests on Linux Host	2133
4.35	USB OTG Console	2134
4.35.1	Hardware Requirements	2134
4.35.2	Software Configuration	2135
4.35.3	Uploading the Application	2135
4.35.4	Limitations	2135
4.36	USB Serial/JTAG Controller Console	2136
4.36.1	Hardware Requirements	2136
4.36.2	Software Configuration	2137
4.36.3	Uploading the Application	2137
4.36.4	Limitations	2137
4.37	Wi-Fi 驱动程序	2137
4.37.1	ESP32-S3 Wi-Fi 功能列表	2137
4.37.2	如何编写 Wi-Fi 应用程序	2138
4.37.3	ESP32-S3 Wi-Fi API 错误代码	2138
4.37.4	初始化 ESP32-S3 Wi-Fi API 参数	2139
4.37.5	ESP32-S3 Wi-Fi 编程模型	2139
4.37.6	ESP32-S3 Wi-Fi 事件描述	2139
4.37.7	ESP32-S3 Wi-Fi station 一般情况	2142
4.37.8	ESP32-S3 Wi-Fi AP 一般情况	2145
4.37.9	ESP32-S3 Wi-Fi 扫描	2145
4.37.10	ESP32-S3 Wi-Fi station 连接场景	2152
4.37.11	找到多个 AP 时的 ESP32-S3 Wi-Fi station 连接	2156
4.37.12	Wi-Fi 重新连接	2156
4.37.13	Wi-Fi beacon 超时	2156
4.37.14	ESP32-S3 Wi-Fi 配置	2156

这里是乐鑫 IoT 开发框架 (esp-idf) 的文档中心。ESP-IDF 是 ESP32、ESP32-S 和 ESP32-C 系列芯片的官方开发框架。

本文档仅包含针对 ESP32-S3 芯片的 ESP-IDF 使用。

		
<a href="#">快速入门</a>	<a href="#">API 参考</a>	<a href="#">H/W 参考</a>
		
<a href="#">API 指南</a>	<a href="#">贡献代码</a>	<a href="#">相关资源</a>

# Chapter 1

## 快速入门

本文档旨在指导用户搭建 ESP32-S3 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32-S3 开发板等步骤。

---

**备注：**这是 ESP-IDF 稳定版本 v4.4.2 的文档，还有其他版本的文档[ESP-IDF 版本简介](#) 供参考。

---

### 1.1 概述

ESP32-S3 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 低功耗蓝牙
- 高性能 Xtensa® 32 位 LX7 双核处理器
- 运行 RISC-V 或 FSM 内核的超低功耗协处理器
- 多种外设
- 内置安全硬件
- USB OTG 接口
- USB 串口/JTAG 控制器

ESP32-S3 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32-S3 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

### 1.2 准备工作

硬件：

- 一款 **ESP32-S3** 开发板
- **USB 数据线** (A 转 Micro-B)
- 电脑 (Windows、Linux 或 Mac OS)

软件：

您可以选择下载并手动安装以下软件：

- 设置 **工具链**，用于编译 ESP32-S3 代码；
- **编译构建工具**——CMake 和 Ninja 编译构建工具，用于编译 ESP32-S3 应用程序；

- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32-S3 使用的 API（软件库和源代码）和运行 **工具链** 的脚本；

或者，您可以通过以下集成开发环境 (IDE) 中的官方插件完成安装流程：

- [Eclipse 插件 \(安装\)](#)
- [VS Code 插件 \(安装\)](#)

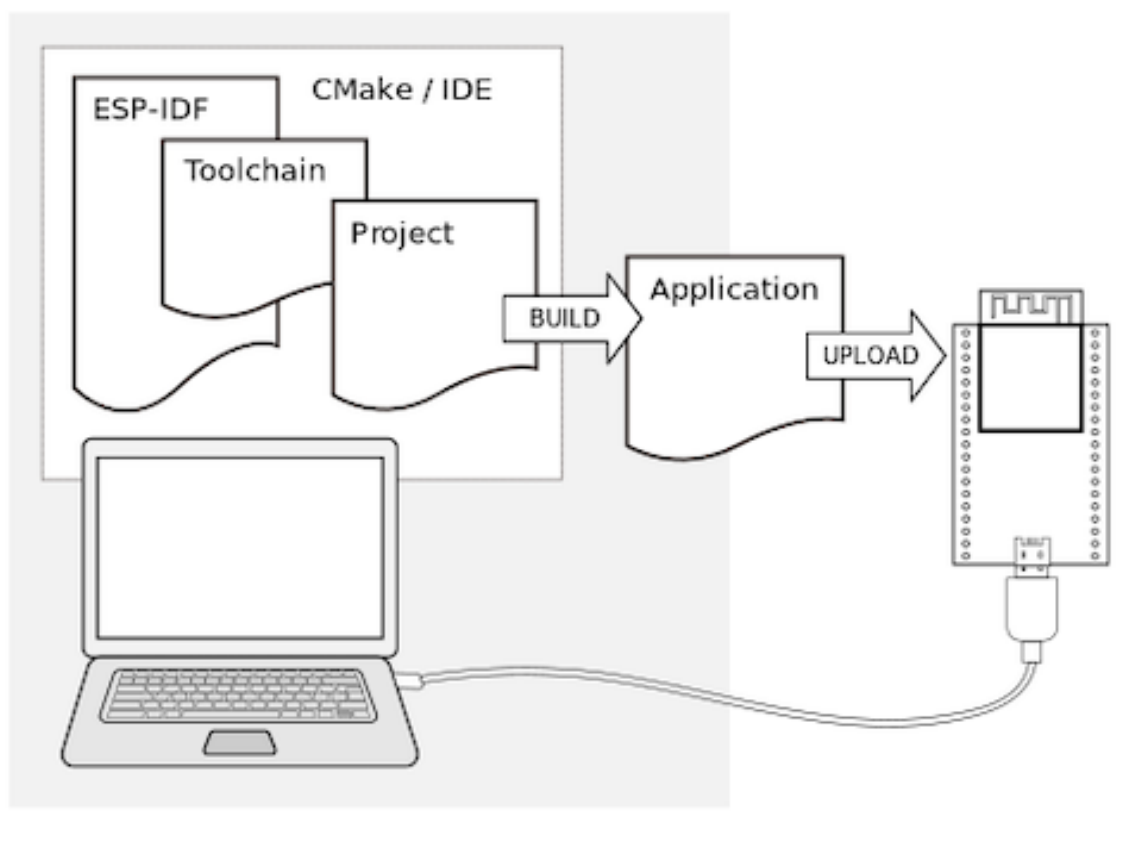

图 1: ESP32-S3 应用程序开发

## 1.3 开发板简介

请点击下方连接，了解有关开发板的详细信息。

### 1.3.1 ESP32-S3-DevKitC-1

本指南将帮助您快速上手 ESP32-S3-DevKitC-1，并提供该款开发板的详细信息。

ESP32-S3-DevKitC-1 是一款入门级开发板，搭载的是 Wi-Fi + Bluetooth® LE 模组 ESP32-S3-WROOM-1 或 ESP32-S3-WROOM-1U。

板上模组的大部分管脚均已引出至开发板两侧排针，开发人员可根据实际需求，轻松通过跳线连接多种外围设备，也可将开发板插在面包板上使用。

图 2: ESP32-S3-DevKitC-1（板载 ESP32-S3-WROOM-1 模组）

本指南包括如下内容：

- **入门指南**：简要介绍了开发板和硬件、软件设置指南。
- **硬件参考**：详细介绍了开发板的硬件。
- **硬件版本**：介绍硬件历史版本和已知问题，并提供链接至历史版本开发板的入门指南（如有）。
- **相关文档**：列出了相关文档的链接。

## 入门指南

本小节将简要介绍 ESP32-S3-DevKitC-1，说明如何在 ESP32-S3-DevKitC-1 上烧录固件及相关准备工作。

图 3: ESP32-S3-DevKitC-1 - 正面

**组件介绍** 以下按照逆时针的顺序依次介绍开发板上的主要组件。

主要组件	介绍
ESP32-S3-WROOM-1/1U	ESP32-S3-WROOM-1 和 ESP32-S3-WROOM-1U 是通用型 Wi-Fi + 低功耗蓝牙 MCU 模组，具有丰富的外设接口、强大的神经网络运算能力和信号处理能力，专为人工智能和 AIoT 市场打造。ESP32-S3-WROOM-1 采用 PCB 板载天线，ESP32-S3-WROOM-1U 采用连接器连接外部天线。
5 V to 3.3 V LDO (5 V 转 3.3 V LDO)	电源转换器，输入 5 V，输出 3.3 V。
Pin Headers (排针)	所有可用 GPIO 管脚 (除 flash 的 SPI 总线) 均已引出至开发板的排针。请查看 <a href="#">排针</a> 获取更多信息。
USB-to-UART Port (USB 转 UART 接口)	Micro-USB 接口，可用作开发板的供电接口，可烧录固件至芯片，也可作为通信接口，通过板载 USB 转 UART 桥接器与芯片通信。
Boot Button (Boot 键)	下载按键。按住 <b>Boot</b> 键的同时按一下 <b>Reset</b> 键进入“固件下载”模式，通过串口下载固件。
Reset Button (Reset 键)	复位按键。
ESP32-S3 USB Port (ESP32-S3 USB 接口)	ESP32-S3 USB OTG 接口，支持全速 USB 1.1 标准。ESP32-S3 USB 接口可用作开发板的供电接口，可烧录固件至芯片，可通过 USB 协议与芯片通信，也可用于 JTAG 调试。
USB-to-UART Bridge (USB 转 UART 桥接器)	单芯片 USB 至 UART 桥接器，可提供高达 3 Mbps 的传输速率。
RGB LED	可寻址 RGB 发光二极管，由 GPIO48 驱动。
3.3 V Power On LED (3.3 V 电源指示灯)	开发板连接 USB 电源后，该指示灯亮起。

**开始开发应用** 通电前，请确保开发板完好无损。

### 必备硬件

- ESP32-S3-DevKitC-1
- USB 2.0 数据线 (标准 A 型转 Micro-B 型)
- 电脑 (Windows、Linux 或 macOS)

**备注：**请确保使用适当的 USB 数据线。部分数据线仅可用于充电，无法用于数据传输和编程。

**硬件设置** 通过 **USB 转 UART 接口** 连接开发板与电脑。软件暂不支持通过 **ESP32-S3 USB 接口** 连接。在后续步骤中，默认使用 **USB 转 UART 接口**。

**软件设置** 请前往 [快速入门](#)，在 [详细安装步骤](#) 小节查看如何快速设置开发环境，将应用程序烧录至您的开发板。

### 内含组件和包装

**零售订单** 如购买样品，每个开发板将以防静电袋或零售商选择的其他方式包装。

零售订单请前往 <https://www.espressif.com/zh-hans/company/contact/buy-a-sample>。

**批量订单** 如批量购买，开发板将以大纸板箱包装。

批量订单请前往 <https://www.espressif.com/zh-hans/contact-us/sales-questions>。

## 硬件参考

**功能框图** ESP32-S3-DevKitC-1 的主要组件和连接方式如下图所示。

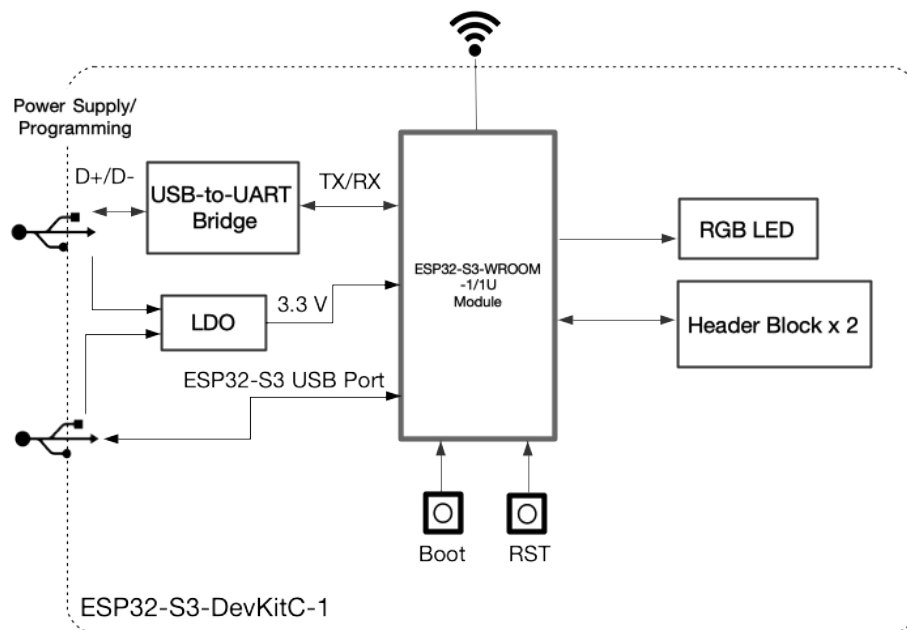

图 4: ESP32-S3-DevKitC-1 (点击放大)

**电源选项** 您可从以下三种供电方式中任选其一给开发板供电：

- USB 转 UART 接口供电或 ESP32-S3 USB 接口供电（选择其一或同时供电），默认供电方式（推荐）
- 5V 和 G (GND) 排针供电
- 3V3 和 G (GND) 排针供电

**排针** 下表列出了开发板两侧排针（J1 和 J3）的 **名称** 和 **功能**，排针的名称如图 [ESP32-S3-DevKitC-1 - 正面](#) 所示，排针的序号与 [开发板原理图 \(PDF\)](#) 一致。

## J1

序号	名称	类型 <sup>Page 8, 1</sup>	功能
1	3V3	P	3.3 V 电源
2	3V3	P	3.3 V 电源
3	RST	I	EN
4	4	I/O/T	RTC_GPIO4, GPIO4, TOUCH4, ADC1_CH3
5	5	I/O/T	RTC_GPIO5, GPIO5, TOUCH5, ADC1_CH4
6	6	I/O/T	RTC_GPIO6, GPIO6, TOUCH6, ADC1_CH5
7	7	I/O/T	RTC_GPIO7, GPIO7, TOUCH7, ADC1_CH6
8	15	I/O/T	RTC_GPIO15, GPIO15, U0RTS, ADC2_CH4, XTAL_32K_P
9	16	I/O/T	RTC_GPIO16, GPIO16, U0CTS, ADC2_CH5, XTAL_32K_N
10	17	I/O/T	RTC_GPIO17, GPIO17, U1TXD, ADC2_CH6
11	18	I/O/T	RTC_GPIO18, GPIO18, U1RXD, ADC2_CH7, CLK_OUT3
12	8	I/O/T	RTC_GPIO8, GPIO8, TOUCH8, ADC1_CH7, SUBSPICS1
13	3	I/O/T	RTC_GPIO3, GPIO3, TOUCH3, ADC1_CH2
14	46	I/O/T	GPIO46
15	9	I/O/T	RTC_GPIO9, GPIO9, TOUCH9, ADC1_CH8, FSPIHD, SUBSPIHD
16	10	I/O/T	RTC_GPIO10, GPIO10, TOUCH10, ADC1_CH9, FSPICS0, FSPIIO4, SUBSPICS0
17	11	I/O/T	RTC_GPIO11, GPIO11, TOUCH11, ADC2_CH0, FSPID, FSPIIO5, SUBSPID
18	12	I/O/T	RTC_GPIO12, GPIO12, TOUCH12, ADC2_CH1, FSPICLK, FSPIIO6, SUBSPICLK
19	13	I/O/T	RTC_GPIO13, GPIO13, TOUCH13, ADC2_CH2, FSPIQ, FSPIIO7, SUBSPIQ
20	14	I/O/T	RTC_GPIO14, GPIO14, TOUCH14, ADC2_CH3, FSPIWP, FSPIDQS, SUBSPIWP
21	5V	P	5 V 电源
22	G	G	接地

## J3

序号	名称	类型	功能
1	G	G	接地
2	TX	I/O/T	U0TXD, GPIO43, CLK_OUT1
3	RX	I/O/T	U0RXD, GPIO44, CLK_OUT2
4	1	I/O/T	RTC_GPIO1, GPIO1, TOUCH1, ADC1_CH0
5	2	I/O/T	RTC_GPIO2, GPIO2, TOUCH2, ADC1_CH1
6	42	I/O/T	MTMS, GPIO42
7	41	I/O/T	MTDI, GPIO41, CLK_OUT1
8	40	I/O/T	MTDO, GPIO40, CLK_OUT2
9	39	I/O/T	MTCK, GPIO39, CLK_OUT3, SUBSPICS1
10	38	I/O/T	GPIO38, FSPIWP, SUBSPIWP
11	37	I/O/T	SPIDQS, GPIO37, FSPIQ, SUBSPIQ
12	36	I/O/T	SPIIO7, GPIO36, FSPICLK, SUBSPICLK
13	35	I/O/T	SPIIO6, GPIO35, FSPID, SUBSPID
14	0	I/O/T	RTC_GPIO0, GPIO0
15	45	I/O/T	GPIO45
16	48	I/O/T	GPIO48, SPICLK_N, SUBSPICLK_N_DIFF, RGB LED
17	47	I/O/T	GPIO47, SPICLK_P, SUBSPICLK_P_DIFF
18	21	I/O/T	RTC_GPIO21, GPIO21
19	20	I/O/T	RTC_GPIO20, GPIO20, U1CTS, ADC2_CH9, CLK_OUT1, USB_D+
20	19	I/O/T	RTC_GPIO19, GPIO19, U1RTS, ADC2_CH8, CLK_OUT2, USB_D-
21	G	G	接地
22	G	G	接地

<sup>1</sup> P: 电源; I: 输入; O: 输出; T: 可设置为高阻。

有关管脚功能名称的解释，请参考 [芯片规格书 \(PDF\)](#)。

## ESP32-S3-DevKitC-1

## 1.4 详细安装步骤

请根据下方详细步骤，完成安装过程。

## 1.4.1 设置开发环境

- 第一步：安装准备 (*Windows*、*Linux* 和 *macOS*)
- 第二步：获取 *ESP-IDF*
- 第三步：设置工具
- 第四步：设置环境变量

## 1.4.2 创建您的第一个工程

- 第五步：开始创建工程
- 第六步：连接设备
- 第七步：配置
- 第八步：编译工程
- 第九步：烧录到设备
- 第十步：监视器

## 1.5 第一步：安装准备

在正式开始创建工程前，请先完成工具的安装，具体步骤见下：

### 1.5.1 Windows 平台工具链的标准设置

#### 概述

ESP-IDF 需要安装一些必备工具，才能围绕 ESP32-S3 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过 **命令提示符** 进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 *Eclipse* 或其他支持 CMake 的图形化工具 IDE。

---

**备注：**限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致构建失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地域-勾选选项“Beta：使用 Unicode UTF-8 支持全球语言”-点击确定-重启电脑。

---

#### ESP-IDF 工具安装器

安装 ESP-IDF 必备工具最简易的方式是从 <https://dl.espressif.com/dl/esp-idf/?idf=4.4> 中下载 ESP-IDF 工具安装器。

**在线安装与离线安装的区别** 在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 *Git For Windows* 安装器。在线安装程序会将下载的文件存储在缓存目录 `%userprofile%/espressif` 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 *Git For Windows* 安装器。

**安装内容** 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 %userprofile%\Desktop\esp-idf 目录下，其中 %userprofile% 代表家目录。

**启动 ESP-IDF 环境** 安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (cmd.exe)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

图 6: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

### 使用命令提示符

在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 cmd.exe），并运行 export.bat 脚本以设置各环境变量（比如 PATH，IDF\_PATH 等）。此外，您还可还可以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

```
ESP-IDF PowerShell

Using Python in C:/Users/developer/.espressif/python_env/idf4.1_py3.8_env/scripts
Python 3.8.7
Using Git in C:/Program Files/Git/cmd/
git version 2.29.2.windows.1
Setting IDF_PATH: C:/Users/developer/Desktop/esp-idf
Adding ESP-IDF tools to PATH...
C:/Users/developer/.espressif/tools/xtensa-esp32-elf/esp-2020r3-8.4.0/xtensa-esp32-elf/bin
C:/Users/developer/.espressif/tools/xtensa-esp32s2-elf/esp-2020r3-8.4.0/xtensa-esp32s2-elf/bin
C:/Users/developer/.espressif/tools/esp32ulp-elf/2.28.51-esp-20191205/esp32ulp-elf-binutils/bin
C:/Users/developer/.espressif/tools/esp32s2ulp-elf/2.28.51-esp-20191205/esp32s2ulp-elf-binutils/bin
C:/Users/developer/.espressif/tools/cmake/3.13.4/bin
C:/Users/developer/.espressif/tools/openocd-esp32/v0.10.0-esp32-20200709/openocd-esp32/bin
C:/Users/developer/.espressif/tools/ninja/1.9.0/
C:/Users/developer/.espressif/tools/idf-exe/1.0.1/
C:/Users/developer/.espressif/tools/ccache/3.7/
C:/Users/developer/Desktop/esp-idf/tools
Checking if Python packages are up to date...
Python requirements from C:/Users/developer/Desktop/esp-idf/requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:
  idf.py build

PS C:/Users/developer/Desktop/esp-idf>
```

图 7: ESP-IDF PowerShell

图 8: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF Command Prompt (cmd.exe)

```
ESP-IDF Command Prompt (cmd.exe)
Using Python in C:\Users\test\AppData\Local\Programs\Python\Python37\
Python 3.7.8
Using Git in C:\Users\test\Git\cmd\
git version 2.30.0.windows.1
Setting IDF_PATH: C:\Users\test\esp\esp-idf

Adding ESP-IDF tools to PATH...
  C:\Users\test\.espressif\tools\xtensa-esp32-elf\esp-2020r3-8.4.0\xtensa-esp32-elf\bin

  C:\Users\test\.espressif\tools\ninja\1.10.0\
  C:\Users\test\.espressif\tools\idf-exe\1.0.1\
  C:\Users\test\.espressif\tools\ccache\3.7\
  C:\Users\test\.espressif\tools\dfu-util\0.9\dfu-util-0.9-win64
  C:\Users\test\.espressif\python_env\idf4.3_py3.7_env\Scripts
  C:\Users\test\esp\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

  idf.py build

C:\Users\test\esp\esp-idf>
```

图 9: ESP-IDF 命令提示符窗口

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 `cmd.exe`，并切换至您希望使用的 ESP-IDF 目录，然后运行 `export.bat`。注意，这种方法要求 `PATH` 中存在 `Python` 和 `Git`。如果您在使用时遇到有关“找不到 `Python` 或 `Git`”的错误信息，请使用第一种方法。

## 后续步骤

当 ESP-IDF 工具安装器安装成功后，开发环境设置也到此结束。后续开发步骤，请前往[第五步：开始创建工程](#)查看。

## 相关文档

想要自定义安装流程的高阶用户可参照：

## 在 Windows 环境下更新 ESP-IDF 工具

**使用脚本安装 ESP-IDF 工具** 请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行：

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行：

```
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为：`C:\Users\username\.espressif`。

**使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量** ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 ESP-IDF，您可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 `export.bat`，具体命令如下：

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 `export.ps1`，具体命令如下：

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

## 1.5.2 Linux 平台工具链的标准设置

## 安装准备

编译 ESP-IDF 需要以下软件包。请根据使用的系统，选择合适的安装命令，如下所示：

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-
↳setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.
↳0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3_
↳python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja_
↳ccache dfu-util libusb
```

### 备注:

- 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装 “cmake3” 软件包（不是安装 “cmake”）。
- 如果上述列表中，并没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。

## 其他提示

**权限问题 /dev/ttyUSB0** 使用某些 Linux 版本向 ESP32-S3 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 [Linux Dialout 组](#)。

## 兼容的 Python 版本

ESP-IDF 支持 Python 3.6 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

## 后续步骤

继续设置开发环境，请前往 [第二步：获取 ESP-IDF](#) 章节。

## 1.5.3 macOS 平台工具链的标准设置

### 安装准备

ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 pip:

```
sudo easy_install pip
```

- 安装 CMake 和 Ninja 编译工具:

- 若有 [HomeBrew](#)，您可以运行：

```
brew install cmake ninja dfu-util
```

- 若有 [MacPorts](#)，您可以运行：

```
sudo port install cmake ninja dfu-util
```

- 若以上均不适用，请访问 [CMake](#) 和 [Ninja](#) 主页，查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 [ccache](#) 以获得更快的编译速度。如有 [HomeBrew](#)，可通过 [MacPorts](#) 上的 `brew install ccache` 或 `sudo port install ccache` 完成安装。

**备注：** 如您在上述任何步骤中遇到以下错误：

```
``xcrun: error: invalid active developer path (/Library/Developer/
↳CommandLineTools), missing xcrun at:/Library/Developer/CommandLineTools/usr/bin/
↳xcrun``
```

则必须安装 XCode 命令行工具，具体可运行 `xcode-select --install`。

**安装 Python 3** [Catalina 10.15 发布说明](#) 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本：

```
python --version
```

如果输出结果是 Python 2.7.17，则代表您的默认解析器是 Python 2.7。这时需要您运行以下命令检查电脑上是否已经安装过 Python 3：

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3：

- 使用 [HomeBrew](#) 进行安装的方法如下：

```
brew install python3
```

- 使用 [MacPorts](#) 进行安装的方法如下：

```
sudo port install python38
```

## 后续步骤

请前往 [第二步](#)：获取 [ESP-IDF](#) 章节继续设置开发环境。

**备注：**在本文档中，Linux 和 macOS 操作系统中 ESP-IDF 的默认安装路径为 `~/esp`；Windows 操作系统中的默认安装路径为 `%userprofile%\esp`。您也可以将 ESP-IDF 安装在任何其他路径下，但请注意在使用命令行时进行相应替换。注意，ESP-IDF 不支持带有空格的路径。

---

## 1.6 第二步：获取 ESP-IDF

在围绕 ESP32-S3 构建应用程序之前，请先获取乐鑫提供的软件库文件 [ESP-IDF 仓库](#)。

获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

### 1.6.1 Linux 和 macOS 操作系统

打开终端，后运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4.2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

### 1.6.2 Windows 操作系统

除了安装必要工具外，第一步中介绍的 [ESP-IDF 工具安装器](#) 也能同时下载 ESP-IDF 本地副本。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

除了使用 ESP-IDF 工具安装器，您也可以参考 [指南](#) 手动下载 ESP-IDF。

## 1.7 第三步：设置工具

除了 ESP-IDF 本身，您还需要安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

### 1.7.1 Windows 操作系统

请根据第一步中对 Windows ([ESP-IDF 工具安装器](#)) 的介绍，安装所有必需工具。

除了使用 ESP-IDF 工具安装器，您可以通过 **命令提示符窗口** 手动安装这些工具。具体步骤见下：

```
cd %userprofile%\esp\esp-idf
install.bat esp32s3
```

或使用 Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32s3
```

## 1.7.2 Linux 和 macOS 操作系统

```
cd ~/esp/esp-idf
./install.sh esp32s3
```

或使用 Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32s3
```

**备注：**通过一次性指定多个目标，可为多个目标芯片同时安装工具，如运行 `./install.sh esp32, esp32c3, esp32s3`。通过运行 `./install.sh` 或 `./install.sh all` 可一次性为所有支持的目标芯片安装工具。

## 1.7.3 下载工具备选方案

ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，则可以设置一个环境变量，实现优先选择 Espressif 的下载服务器进行 Github 资源下载。

**备注：**该设置只影响从 Github 发布版本中下载单个工具，它并不会改变访问任何 Git 仓库的 URL。

### Windows 操作系统

如果希望在运行 ESP-IDF 工具安装器时优先选择 Espressif 下载服务器，请在 **Select Components** 窗口中的 **Optimization** 部分勾选 **Use Espressif download mirror instead of GitHub** 选项。

### Linux 和 macOS 操作系统

要在安装工具时优先选择 Espressif 下载服务器，请在运行 `install.sh` 时使用以下命令：

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

## 1.7.4 自定义工具安装路径

本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 和 macOS 系统中的 `$HOME/.espressif` 和 Windows 系统的 `%USERPROFILE%\espressif`。此外，您可以将工具安装到其他目录中，但在运行安装脚本前，重新设置环境变量 `IDF_TOOLS_PATH`。注意，请确保您的用户已经具备了读写该路径的权限。

如果修改了 `IDF_TOOLS_PATH` 变量，请确保该变量在每次执行安装脚本 (`install.bat`、`install.ps1` 或 `install.sh`) 和导出脚本 (`export.bat`、`export.ps1` 或 `export.sh`) 均保持一致。

## 1.8 第四步：设置环境变量

此时，您刚刚安装的工具尚未添加至 `PATH` 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量，这可以通过 ESP-IDF 提供的另一个脚本完成。

## 1.8.1 Windows 操作系统

Windows 安装器 (*ESP-IDF 工具安装器*) 可在“开始”菜单创建一个“ESP-IDF Command Prompt”快捷方式。该快捷方式可以打开命令提示符窗口，并设置所有环境变量。您可以点击该快捷方式，然后继续下一步。

此外，如果您希望在当下命令提示符窗口使用 ESP-IDF，请使用下方代码：

```
%userprofile%\esp\esp-idf\export.bat
```

或使用 Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

## 1.8.2 Linux 和 macOS 操作系统

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
.$HOME/esp/esp-idf/export.sh
```

对于 fish shell (仅支持 fish 3.0.0 及以上版本)，请运行以下命令：

```
.$HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 `export.sh` 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中 (`.profile`, `.bashrc`, `.zprofile` 等)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 `esp-idf` 环境。

这里不建议您直接将 `export.sh` 添加到 shell 的配置文件。因为这会导致在每个终端会话中都激活 IDF 虚拟环境 (包括无需使用 IDF 的情况)，从而破坏使用虚拟环境的目的，并可能影响其他软件的使用。

## 1.9 第五步：开始创建工程

现在，您可以开始准备开发 ESP32-S3 应用程序了。您可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

将 `get-started/hello_world` 工程复制至您本地的 `~/esp` 目录下：

### 1.9.1 Linux 和 macOS 操作系统

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

### 1.9.2 Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 [examples](#) 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

---

**重要：** ESP-IDF 编译系统不支持带有空格的路径。

---

## 1.10 第六步：连接设备

现在，请将您的 ESP32-S3 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Windows 操作系统：** COM1 等
- **Linux 操作系统：** 以 `/dev/tty` 开始
- **macOS 操作系统：** 以 `/dev/cu.` 开始

有关如何查看串口名称的详细信息，请见与 [ESP32-S3 创建串口连接](#)。

---

**备注：** 请记住串口名，您会在下面的步骤中用到。

---

## 1.11 第七步：配置

请进入 [第五步：开始创建工程](#) 中提到的 `hello_world` 目录，并运行工程配置工具 `menuconfig`。

### 1.11.1 Linux 和 macOS 操作系统

```
cd ~/esp/hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

### 1.11.2 Windows 操作系统

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

打开一个新项目后，应首先设置“目标”芯片 `idf.py set-target esp32s3`。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见 [选择目标芯片](#)。

如果之前的步骤都正确，则会显示下面的菜单：

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。 `hello_world` 示例项目会以默认配置运行，因此可以跳过使用 `menuconfig` 进行项目配置这一步骤。

---

**备注：** 您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。更多信息，请运行 `idf.py menuconfig --help` 命令。

---

图 10: 工程配置—主窗口

## 1.12 第八步：编译工程

请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 `bootloader`、分区表和应用程序二进制文件。

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git:/usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../.././././components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

如果一切正常，编译完成后将生成 `.bin` 文件。

## 1.13 第九步：烧录到设备

请使用以下命令，将刚刚生成的二进制文件 (`bootloader.bin`, `partition-table.bin` 和 `hello_world.bin`) 烧录至您的 ESP32-S3 开发板：

```
idf.py -p PORT [-b BAUD] flash
```

请将 `PORT` 替换为 ESP32-S3 开发板的串口名称，具体可见 [第六步：连接设备](#)。

您还可以将 `BAUD` 替换为您希望的烧录波特率。默认波特率为 460800。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

**备注：**勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

### 1.13.1 烧录过程中可能遇到的问题

如果在运行给定命令时出现如“连接失败”这样的错误，原因之一则可能是运行 `esptool.py` 出现错误。`esptool.py` 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。解决该问题的一个简单的方法就是按照以下步骤进行手动复位。如果问题仍未解决，请参考 [Troubleshooting](#) 获取更多信息。

`esptool.py` 通过使 USB 转串口转换器芯片（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32-S3（请参考 [与 ESP32-S3 创建串口连接](#) 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32-S3 的 GPIO0 和 CHIP\_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32-S3 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 [原理图](#)。

一般来说，使用官方的 `esp-idf` 开发板不会出现问题。但是，`esptool.py` 在以下情况下不能自动重置硬件。

- 您的硬件没有连接到 GPIO0 和 CHIP\_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同
- 根本没有这样的串行控制线路

根据您的硬件的种类，也可以将您 ESP32-S3 开发板手动设置成固件下载模式（复位）。

- 对于 Espressif 的开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 **Boot** 按钮 (GPIO0) 再按住 **EN** 按钮 (CHIP\_PU) 来手动复位 `esp-idf` 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

### 1.13.2 常规操作

在烧录过程中，您会看到类似如下的输出日志：

```
...
esptool.py esp32s3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
↪reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB 0x0_
↪bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
↪partition-table.bin
esptool.py v3.2-dev
Serial port /dev/ttyUSB0
Connecting....
Chip is ESP32-S3
Features: WiFi, BLE
Crystal is 40MHz
MAC: 7c:df:a1:e0:00:64
Uploading stub...

↳kbit/s)...
Hash of data verified.

Leaving...
Hard resetting via RTS pin...
Done
```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello\_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 [Eclipse 指南](#)，以及 [VS Code 指南](#)。

## 1.14 第十步：监视器

您可以使用 idf.py -p PORT monitor 命令，监视“hello\_world”工程的运行情况。注意，不要忘记将 PORT 替换为您的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动：

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↳world/build/hello_world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
...
Hello world!
Restarting in 10 seconds...
This is esp32s3 chip with 2 CPU core(s), This is esp32s3 chip with 2 CPU core(s),
↳WiFi/BLE, silicon revision 0, 2MB external flash
Minimum free heap size: 390684 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 `Ctrl+]`，退出 IDF 监视器。

---

**备注：**您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

---

**备注：**如果带有八线 flash 的开发板在二级引导加载程序之前复位，请参考[八线 flash 错误处理](#)。

---

此外，

- 请前往[IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往[idf.py](#)，查看更多 `idf.py` 命令和选项。

**恭喜，您已完成 ESP32-S3 的入门学习！**

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

---

**重要：**一些示例程序不支持 ESP32-S3，因为 ESP32-S3 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32-S3，或者不存在这个表格，那么即表示 ESP32-S3 支持这个示例程序。

---

## 1.15 更新 ESP-IDF

乐鑫会不时推出更新版本的 ESP-IDF，修复 bug 或提供新的功能。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 `esp-idf` 文件夹，然后按照[第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

此外，您可以仅更新变更部分。具体方式，请前往[更新](#) 章节查看。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考[第三步：设置工具](#)。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考[第四步：设置环境变量](#)。

## 1.16 相关文档

### 1.16.1 与 ESP32-S3 创建串口连接

本章节主要介绍如何创建 ESP32-S3 和 PC 之间的串口连接。

#### 连接 ESP32-S3 和 PC

用 USB 线将 ESP32-S3 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32-S3 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在[网上搜索驱动程序](#)，并进行手动安装。

以下是乐鑫 ESP32-S3 开发板驱动程序的链接：

- CP210x: [CP210x USB 至 UART 桥 VCP 驱动程序](#)
- FTDI: [FTDI 虚拟 COM 端口驱动程序](#)

以上驱动仅供参考，请参考开发板用户指南，查看开发板具体使用的 USB 转串口芯片。一般情况下，当 ESP32-S3 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

## 在 Windows 上查看端口

检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32-S3 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

图 11: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

## 在 Linux 和 macOS 上查看端口

查看 ESP32-S3 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32-S3 对应的串口：

Linux:

```
ls /dev/tty*
```

macOS:

```
ls /dev/cu.*
```

**备注：**对于 macOS 用户：若你没有看到串口，请检查你是否已按照《入门指南》安装了适用于你特定开发板的 USB/串口驱动程序。对于 macOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的加载，具体可打开系统偏好设置 -> 安全和隐私 -> 通用，检查是否有信息显示：“来自开发人员的系统软件…”，其中开发人员的名称为 Silicon Labs 或 FTDI。

图 12: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

## 在 Linux 中添加用户到 dialout

当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，从而获许读写权限：

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限生效。

## 确认串口连接

现在，请使用串口终端程序，查看重置 ESP32-S3 后终端上是否有输出，从而验证串口连接是否可用。

**Windows 和 Linux 操作系统** 在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。你也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200，数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

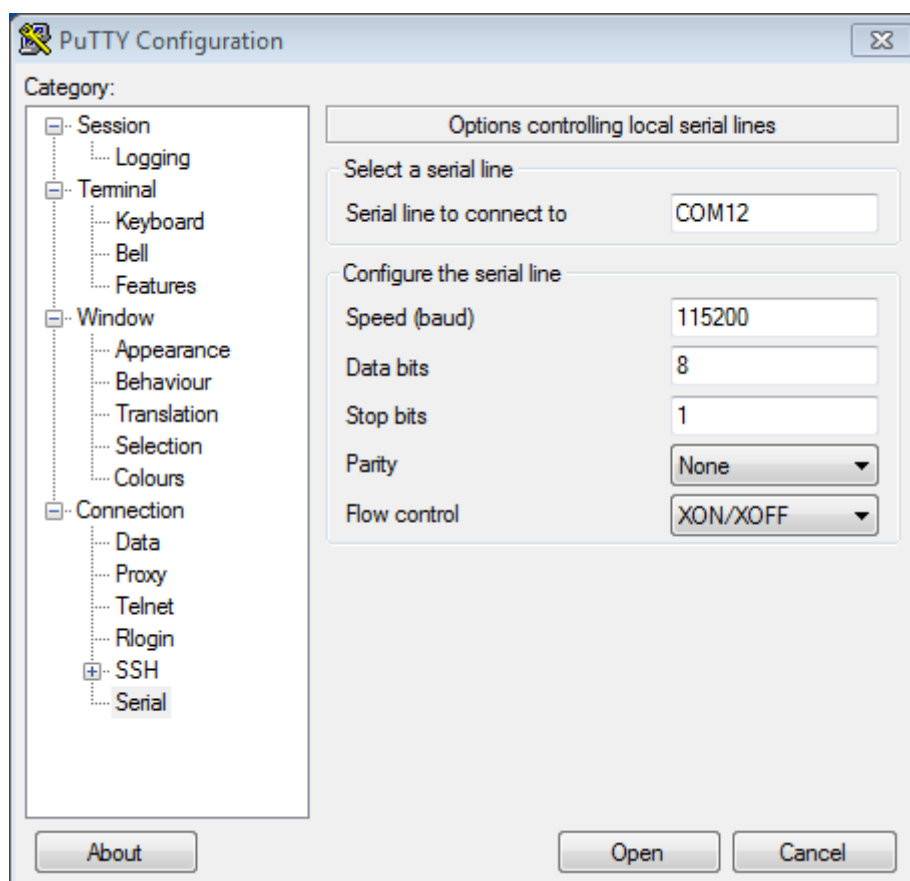

图 13: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

然后，请检查 ESP32-S3 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32-S3 的应用程序，请参考[输出示例](#)。

图 14: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

**备注：**请在验证完串口通信正常后，关闭串口终端。如果您让终端一直保持打开的状态，之后上传固件时将无法访问串口。

**macOS 操作系统** macOS 提供了 **屏幕命令**，因此您不用安装串口终端程序。

- 参考在 [Linux](#) 和 [macOS](#) 上查看端口，运行以下命令：

```
ls /dev/cu.*
```

- 您会看到类似如下输出：

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- 根据您的连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令：

```
screen /dev/cu.device_name 115200
```

将 device\_name 替换为运行 `ls /dev/cu.*` 后出现的设备串口号。

- 您需要的正是 **屏幕** 显示的日志。日志内容取决于加载到 ESP32-S3 的应用程序，请参考 [输出示例](#)。请使用 `Ctrl-A + \` 键退出 **屏幕** 会话。

**备注：**请在验证完串口通信正常后，关闭 **屏幕** 会话。如果直接关闭终端窗口而没有关闭 **屏幕**，之后上传固件时将无法访问串口。

**输出示例** 以下是 ESP32-S3 的一个日志示例。如果没看到任何输出，请尝试重置开发板。

```

I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32-S3。

**备注：**在某些串口接线方式下，在 ESP32-S3 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 [esptool 文档](#)。

如果您在安装 ESP32-S3 硬件开发的软件环境时，从 [第六步：连接设备](#) 跳转到了这里，请从 [第七步：配置](#) 继续阅读。

## 1.16.2 Eclipse IDE 创建和烧录指南

ESP-IDF V4.0 默认采用基于 CMake 的构建系统。

针对 CMake 构建系统，ESP-IDF 有一款新的 Eclipse 插件。具体操作指南，请见 [ESP-IDF Eclipse 插件](#)。

---

**备注：** [ESP-IDF Eclipse 插件](#) 中使用的是 macOS 截图，但安装指南对 Windows、Linux 和 macOS 均适用。

---

## 1.16.3 VS Code IDE 快速入门

我们支持 VS code，并且致力于为所有与 ESP-IDF 相关的操作提供完善的端到端支持，包括构建、烧录、监控、调试、追踪、core-dump、以及系统追踪查看器等操作。

### 快速安装指南

推荐您从 [VS Code 插件市场](#) 中下载 ESP-IDF VS Code 插件，或根据 [快速安装指南](#) 安装 ESP-IDF VS Code 插件。

查看 [ESP-IDF VS Code 插件教程](https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md) <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>> 了解如何使用所有功能。

### 支持如下功能

- **安装程序：**帮助您迅速安装 ESP-IDF 及其相关工具链。
- **构建：**通过一键构建和多目标构建，轻松构建并部署您的应用程序。
- **烧录：**UART 和 JTAG 均可完成烧录。
- **监控：**内置终端带有监控功能，您可以在 VS Code 中启用 IDF 监控命令，操作方法和传统终端一样。
- **调试** <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>>：提供立即可用的硬件调试功能，同时支持事后剖析调试如 core-dump 功能，分析 bug 更加方便。
- **GUI 菜单配置：**提供简化的用户界面，用于配置您的芯片。
- **应用程序追踪 & 堆追踪：**支持从应用程序中收集跟踪，并提供简化的用户界面分析跟踪。
- **系统视图查看器：**读取并显示 .svdat 文件到用户追踪界面，同时支持多个内核追踪视图。
- **IDF 二进制大小分析：**为分析二进制文件大小提供用户界面。
- **Rainmaker Cloud：**我们有内置的 Rainmaker Cloud 支持，您可以轻松编辑/读取连接的物联网设备的状态。
- **代码覆盖：**我们有内置的代码覆盖支持，将用颜色突出显示已经覆盖的行。我们也会在 IDE 内部直接渲染现有的 HTML 报告。

### Bugs 问题 & 功能请求

如果您在使用 VS Code 或其某些功能上遇到问题，建议您在 [论坛](#) 或是 [github](#) 上提出您的问题，我们开发团队会对问题进行解答。

我们也欢迎您提出新的功能需求，正是由于用户要求新功能或是建议对现有功能进行改善，才成就我们今天所具备的大多数功能。欢迎您在 [github](#) 上提出功能请求。

### 1.16.4 IDF 监视器

IDF 监视器是一个串行终端程序，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用以下目标函数可以启用此监视器：

- 若使用 CMake 编译系统，则请调用：`idf.py monitor`
- 若使用传统 GNU Make 编译系统，请调用：`make monitor`

#### 操作快捷键

为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。

快捷键	操作	描述
Ctrl+] ]	退出监视器程序	
Ctrl+T	菜单退出键	按下如下给出的任意键之一，并按指示操作。
• Ctrl+T	将菜单字符发送至远程	
• Ctrl+] ]	将 exit 字符发送至远程	
• Ctrl+P	重置目标设备，进入 Bootloader，通过 RTS 线暂停应用程序	重置目标设备，通过 RTS 线（如已连接）进入 Bootloader，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。
• Ctrl+R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl+F	编译并烧录此项目	暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+A (或者 A)	仅编译及烧录应用程序	暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+Y	停止/恢复在屏幕上打印日志输出	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl+L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）
• Ctrl+I (或者 I)	停止/恢复打印时间标记	IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 --timestamp-format 命令行参数来改变。
• Ctrl+H (或者 H)	显示所有快捷键	
• Ctrl+X (或者 X)	退出监视器程序	
Ctrl+C	中断正在运行的应用程序	暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启:ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。

除了 Ctrl+] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

### 兼具 IDF 特性

**自动解码地址** ESP-IDF 输出形式为 0x4\_\_\_\_\_ 的十六进制代码地址后，IDF 监视器将使用 `addr2line` 查找该地址在源代码中的位置和对应的函数名。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:
PC      : 0x400f360d  PS      : 0x00060330  A0      : 0x800dbf56  A1      :

```

IDF 监视器在后台运行以下命令, 解码各地址:

```
xtensa-esp32s3-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**备注:** 将环境变量 ESP\_MONITOR\_DECODE 设置为 0 或者调用 `idf_monitor.py` 的特定命令行选项:

`idf_monitor.py --disable-address-decoding` 来禁止地址解码。

**配置 GDBStub 以启用 GDB** 默认情况下，如果 ESP-IDF 应用程序发生 crash 事件，panic 处理器将在串口上打印相关寄存器和堆栈转储（类似上述情况），然后重置开发板。

此外，可以配置应用程序在后台运行 GDBStub 并处理运行中的应用程序突然中断事件 (Ctrl+C)。

或者选择配置 panic 处理器以运行 GDBStub，GDBStub 工具可以与 GDB 项目调试器进行通信，允许读取内存、检查调用堆栈帧和变量等。GDBStub 虽然没有 JTAG 通用，但不需要使用特殊硬件。

如需在发生 panic 事件时启用 GDBStub，请运行 `idf.py menuconfig` 打开项目配置菜单，并将 `CONFIG_ESP_SYSTEM_PANIC` 选项设置为 GDBStub on panic，或者将 `CONFIG_ESP_SYSTEM_PANIC` 设置为 GDBStub on runtime。

在这种情况下，如果 panic 处理器被触发或应用程序突然中断 (Ctrl+C)，只要 IDF 监视器监控到 GDBStub 已经加载，panic 处理器就会自动暂停串行监控并使用必要的参数运行 GDB。GDB 退出后，通过 RTS 串口线复位开发板。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

IDF 监视器在后台运行如下命令：

```
xtensa-esp32s3-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex \
↳ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**输出筛选** 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，可打印任何内容。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 {N, E, W, I, D, V, \*} 集合中的一个字母，指的是日志级别。

例如，`PRINT_FILTER="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

**备注：**编译时，可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 \*、冒号 :，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

### 筛选规则示例

- \* 可用于匹配任何类型标签。但 `PRINT_FILTER="*:I tag1:E"` 打印关于 tag1 的输出时会报错，这是因为 tag1 规则比 \* 规则的优先级高。
- 默认规则（空）等价于 `*:v`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `*:N` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 详细度级别或更低级别打印 tag1，在 Warning 详细度级别或更低级别打印 tag2。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 tag3:N 指定 tag3 不打印。

- tag3:N 在规则 "tag1:I tag2:W tag3:N \*:V" 中更有意义，这是因为如果没有 tag3:N，tag3 信息就可能打印出来了；tag1 和 tag2 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

**高级筛选规则示例** 如下日志是在没有设置任何筛选选项的情况下获得的：

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT\_FILTER="wifi esp\_image:E light\_driver:I" 筛选选项捕获的输出如下所示：

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT\_FILTER="light\_driver:D esp\_image:N boot:N cpu\_start:N vfs:N wifi:N \*:V" 选项的输出如下：

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

## IDF 监视器已知问题

### Windows 环境下已知问题

- 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
- 偶然情况下，idf.py 或 make 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
- GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

## 1.16.5 工具链的自定义设置

除了从乐鑫官网（请见[第三步：设置工具](#)）下载二进制工具链外，您还可以自行编译工具链。

如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译工具链：

- 需要定制工具链编译配置
- 需要使用其他 GCC 版本（如 4.8.5）
- 需要破解 gcc、newlib 或 libstdc++
- 有相关兴趣或时间充裕
- 不信任从网站下载的 bin 文件

如需自行编译工具链，请查看以下文档：

## 从零开始设置 Windows 环境下的工具链

除了使用 [ESP-IDF 工具安装器](#)，用户也可以手动设置 Windows 环境下的工具链，这正是本文的主要内容。手动安装工具可以更好地控制安装流程，同时也方便高阶用户进行自定义安装。

使用 ESP-IDF 工具安装器对工具链及其他工具进行快速标准设置，请参照 [Windows 平台工具链的标准设置](#)。

---

**备注：**基于 GNU Make 的构建系统要求 Windows 兼容 MSYS2 Unix，基于 CMake 的构建系统则无此要求。

---

### 获取 ESP-IDF

**备注：**较早版本 ESP-IDF 使用了 MSYS2 bash 终端命令行。目前，基于 CMake 的编译系统可使用常见的 Windows 命令窗口，即本指南中使用的终端。

请注意，如果您使用基于 bash 的终端或 PowerShell 终端，一些命令语法将与下面描述有所不同。

---

打开命令提示符，运行以下命令：

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4.2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 %userprofile%\esp\esp-idf。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

---

**备注：**git clone 命令的 -b v4.4.2 选项告诉 git 从 ESP-IDF 仓库中克隆与此版本的文档对应的分支。

---

**备注：**作为备份，还可以从 [Releases page](#) 下载此稳定版本的 zip 文件。不要下载由 GitHub 自动生成的“源代码”的 zip 文件，它们不适用于 ESP-IDF。

---

**备注：**在克隆远程仓库时，请加上可选参数 --recursive。如果你已经克隆了 ESP-IDF 但没有加上此参数，请运行以下命令获取所有子模块

```
cd esp-idf
git submodule update --init
```

---

## 工具

**CMake 工具** 下载最新发布的 Windows 平台稳定版 CMake，并运行安装器。

当安装器询问“安装选项”时，选择“Add CMake to the system PATH for all users”（为所有用户的系统路径添加 CMake）或“Add CMake to the system PATH for the current user”（为当前用户的系统路径添加 CMake）。

### Ninja 编译工具

**备注：**目前，Ninja 仅提供支持 64 位 Windows 版本的 bin 文件。您也可以配合其他编译工具（如 mingw-make）在 32 位 Windows 版本中使用 CMake 和 idf.py。但是目前暂无关于此工具的说明文档。

---

请从 [下载页面](#) 下载最新发布的 Windows 平台稳定版 [Ninja](#)。

适用于 Windows 平台的 Ninja 下载文件是一个 .zip 文件，包含一个 `ninja.exe` 文件。您需要将该文件解压到目录，并[添加到 Path 环境变量](#)（或者选择解压到 Path 变量中已有的目录）。

**Python** 下载并运行适用于 Windows 安装器的最新版 [Python](#)。

Python 安装器的“自定义”菜单可为您提供一系列选项，最后一项为“Add python.exe to Path”（添加 python.exe 到 Path 环境变量中），请将该选项更改为“Will be installed”（将会安装）。

Python 安装完成后，从 Windows 开始菜单中打开“命令提示符”窗口，并运行以下命令：

```
pip install --user pyserial
```

**工具链设置** 下载预编译的 Windows 工具链：

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2021r2-patch3-win32.zip](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch3-win32.zip)

将压缩包文件解压到 `C:\Program Files\``（或其他位置）。压缩包文件包含一个 `\`xtensa-esp32s3-elf` 目录。

然后，请将该目录下的 `bin` 子目录[添加到 Path 环境变量](#)。例如，将目录 `C:\Program Files\xtensa-esp32s3-elf\bin` 添加到 Path 环境变量。

---

**备注：**如果您已安装 MSYS2 环境（适用“GNU Make”编译系统），则可以跳过下载那一步，直接添加目录 `C:\msys32\opt\xtensa-esp32s3-elf\bin` 到 Path 环境变量，因为 MSYS2 环境已包含工具链。

---

**添加目录到 Path 环境变量** 在 Windows 环境下，向 Path 环境变量增加任何新目录，请：

打开系统“控制面板”，找到环境变量对话框（Windows 10 用户请前往“高级系统设置”）。

双击 Path 变量（选择“用户路径”或“系统路径”，具体取决于您是否希望其他用户的 Path 中也存在该目录）。最后在值的末尾增加 `;<new value>`。

**后续步骤** 请前往[第三步：设置工具](#) 章节继续设置开发环境。

## 从零开始设置 Linux 环境下的工具链

除了从乐鑫官网直接下载已编译好的二进制工具链外，您还可以按照本文介绍，从头开始设置自己的工具链。如需快速使用已编译好的二进制工具链，可回到[Linux 平台工具链的标准设置](#) 章节。

---

**备注：**设置自己的工具链可以解决 Y2K38 问题（`time_t` 从 32 位扩展到 64 位）。

---

**安装准备** 编译 ESP-IDF 需要以下软件包：

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf_
↳python3 python3-pip cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
↳pip python3-setuptools python3-serial python3-cryptography python3-future
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev
↳libssl-dev dfu-util libusb-1.0-0
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial
↳python-cryptography python-future python-pyparsing python-pyelftools cmake
↳ninja ccache dfu-util libusb
```

**备注:** 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装 “cmake3” 软件包（不是安装 “cmake”）。

### 从源代码编译工具链 安装依赖项:

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel
↳automake bison flex texinfo help2man libtool make
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
↳automake bison flex texinfo help2man libtool make
```

- Ubuntu 16.04 或以上

```
sudo apt-get install gawk gperf grep gettext python python-dev automake bison
↳flex texinfo help2man libtool libtool-bin make
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
↳automake bison flex texinfo help2man libtool libtool-bin make
```

- Arch:

```
sudo pacman -Sy --needed python-pip
```

创建工作目录，并进入该目录:

```
mkdir -p ~/esp
cd ~/esp
```

下载并编译 crosstool-NG:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

**备注:** 在设置支持 64 位 `time_t` 的工具链时，您需要将 `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` 文件中第 33 和 43 行的可选参数 `--enable-newlib-long-time_t` 删除。

编译工具链:

```
./ct-ng xtensa-esp32s3-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32s3-elf
```

编译得到的工具链会被保存至 `~/esp/crosstool-NG/builds/xtensa-esp32s3-elf`。

**添加工具链到 PATH 环境变量** 需要将自定义工具链复制到一个二进制目录中，并将其添加到 PATH 中。例如，您可以将编译好的工具链复制到 `~/esp/xtensa-esp32s3-elf/` 目录中。

为了正常使用工具链，您需要更新 `~/.profile` 文件中 PATH 环境变量。此外，您还可以在 `~/.profile` 文件中增加以下代码。这样，所有终端窗口均可以使用 `xtensa-esp32s3-elf`：

```
export PATH="$HOME/esp/xtensa-esp32s3-elf/bin:$PATH"
```

**备注：**如果您已将 `/bin/bash` 设置为登录 shell，且同时存在 `.bash_profile` 和 `.profile` 两个文件，则请更新 `.bash_profile`。在 CentOS 环境下，`alias` 需要添加到 `.bashrc` 文件中。

退出并重新登录以使 `.profile` 的更改生效。运行以下命令来检查 PATH 设置是否正确：

```
printenv PATH
```

此时您需要检查输出结果的开头中是否包含类似如下的工具链路径：

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32s3-elf/bin:/home/user-name/bin:/home/user-name/.
↪local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
↪games:/usr/local/games:/snap/bin
```

注意这里的 `/home/user-name` 应该替换成您安装的主路径。

**后续步骤** 请前往 [第二步：获取 ESP-IDF](#) 章节继续设置开发环境。

## 从零开始设置 macOS 环境下的工具链

**软件包管理器** 从零开始设置工具链，您需要安装 [MacPorts](#) 或 [Homebrew](#) 软件包管理器。或者，您也可以直接下载 [预编译的工具链](#)。

MacPorts 需要完整的 XCode 软件，而 Homebrew 只需要安装 XCode 命令行工具即可。

请参考 [工具链自定义设置](#) 章节，查看可能需从头开始设置工具链的情况。

### 安装准备

- 安装 pip:

```
sudo easy_install pip
```

- 安装 pyserial:

```
pip install --user pyserial
```

- 安装 CMake 和 Ninja 编译工具：
  - 若有 Homebrew，您可以运行：

```
brew install cmake ninja dfu-util
```

- 若有 MacPorts, 您可以运行:

```
sudo port install cmake ninja dfu-util
```

**从源代码编译工具链** 安装依赖项:

- 对于 MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf_
↳ automake make
```

- 对于 Homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool_
↳ autoconf automake make
```

创建一个文件系统镜像 (区分大小写) :

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_
↳ HFS+"
```

挂载:

```
hdiutil mount ~/esp/crosstool.dmg
```

创建指向您工作目录的符号链接:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

前往新创建的目录:

```
cd ~/esp/ctng-volume
```

下载并编译 crosstool-NG:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

编译工具链:

```
./ct-ng xtensa-esp32s3-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32s3-elf
```

编译得到的工具链会被保存到 `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32s3-elf`。使用工具链前, 请将 `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32s3-elf/bin` 添加至 `PATH` 环境变量。

**后续步骤** 请前往 [第二步: 获取 ESP-IDF](#) 章节继续设置开发环境。

## Chapter 2

# API 参考

## 2.1 蓝牙 API

### 2.1.1 Controller && VHCI

#### Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller\\_vhci\\_ble\\_adv](#).

#### API Reference

##### Header File

- `components/bt/include/esp32/include/esp_bt.h`

##### Functions

`esp_err_t esp_ble_tx_power_set` (`esp_ble_power_type_t` power\_type, `esp_power_level_t` power\_level)

Set BLE TX power Connection Tx power should only be set after connection created.

##### 参数

- **power\_type** -: The type of which tx power, could set Advertising/Connection/Default and etc
- **power\_level** -Power level(index) corresponding to absolute value(dbm)

返回 ESP\_OK - success, other - failed

`esp_power_level_t esp_ble_tx_power_get` (`esp_ble_power_type_t` power\_type)

Get BLE TX power Connection Tx power should only be get after connection created.

参数 **power\_type** -: The type of which tx power, could set Advertising/Connection/Default and etc

返回 `>= 0` - Power level, `< 0` - Invalid

*esp\_err\_t* **esp\_bredr\_tx\_power\_set** (*esp\_power\_level\_t* min\_power\_level, *esp\_power\_level\_t* max\_power\_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

#### 参数

- **min\_power\_level** –The minimum power level
- **max\_power\_level** –The maximum power level

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bredr\_tx\_power\_get** (*esp\_power\_level\_t* \*min\_power\_level, *esp\_power\_level\_t* \*max\_power\_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

#### 参数

- **min\_power\_level** –The minimum power level
- **max\_power\_level** –The maximum power level

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bredr\_sco\_datapath\_set** (*esp\_sco\_data\_path\_t* data\_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

参数 **data\_path** –SCO data path

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_init** (*esp\_bt\_controller\_config\_t* \*cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

参数 **cfg** –Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_deinit** (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_enable** (*esp\_bt\_mode\_t* mode)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

参数 **mode** –: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument.

This mode must be equal as the mode in "cfg" of `esp_bt_controller_init()`.

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_disable** (void)

Disable BT controller.

返回 ESP\_OK - success, other - failed

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

返回 status value

bool **esp\_vhci\_host\_check\_send\_available** (void)

esp\_vhci\_host\_check\_send\_available used for check actively if the host can send packet to controller or not.

返回 true for ready to send, false means cannot send packet

void **esp\_vhci\_host\_send\_packet** (uint8\_t \*data, uint16\_t len)

esp\_vhci\_host\_send\_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

参数

- **data** –the packet point
- **len** –the packet length

*esp\_err\_t* **esp\_vhci\_host\_register\_callback** (const *esp\_vhci\_host\_callback\_t* \*callback)

esp\_vhci\_host\_register\_callback register the vhci reference callback struct defined by vhci\_host\_callback structure.

参数 **callback** –*esp\_vhci\_host\_callback* type variable

返回 ESP\_OK - success, ESP\_FAIL - failed

*esp\_err\_t* **esp\_bt\_controller\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_controller\_mem\_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp\_bt\_controller\_mem\_release(mode) should be called only before esp\_bt\_controller\_init() or after esp\_bt\_controller\_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp\_bt\_controller\_enable(ESP\_BT\_MODE\_BLE) to use BLE only then it is safe to call esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_CLASSIC\_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP\_BT\_MODE\_BTDM, then it may be useful to call API esp\_bt\_mem\_release(ESP\_BT\_MODE\_BTDM) instead, which internally calls esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp\_bt\_mem\_release() function

参数 **mode** –: the mode want to release memory

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_mem\_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp\_bt\_controller\_mem\_release(). Additionally, if the mode is set to ESP\_BT\_MODE\_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

---

**备注:** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

---

**参数 mode** –: the mode whose memory is to be released  
**返回** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_sleep\_enable** (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

**返回**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_bt\_sleep\_disable** (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

If `esp_bt_sleep_disable()` is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the time for wakeup.

**返回**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush** (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in `menuconfig`.

---

**备注:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

---

**返回**

- ESP\_OK : success
- other : failed

void **esp\_wifi\_bt\_power\_domain\_on** (void)

bt Wi-Fi power domain power on

void **esp\_wifi\_bt\_power\_domain\_off** (void)

bt Wi-Fi power domain power off

**Structures**

struct **esp\_bt\_controller\_config\_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

uint16\_t **controller\_task\_stack\_size**

Bluetooth controller task stack size

uint8\_t **controller\_task\_prio**

Bluetooth controller task priority

uint8\_t **hci\_uart\_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32\_t **hci\_uart\_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8\_t **scan\_duplicate\_mode**

scan duplicate mode

uint8\_t **scan\_duplicate\_type**

scan duplicate type

uint16\_t **normal\_adv\_size**

Normal adv size for scan duplicate

uint16\_t **mesh\_adv\_size**

Mesh adv size for scan duplicate

uint16\_t **send\_adv\_reserved\_size**

Controller minimum memory value

uint32\_t **controller\_debug\_flag**

Controller debug log flag

uint8\_t **mode**

Controller mode: BR/EDR, BLE or Dual Mode

uint8\_t **ble\_max\_conn**

BLE maximum connection numbers

uint8\_t **bt\_max\_acl\_conn**

BR/EDR maximum ACL connection numbers

uint8\_t **bt\_sco\_datapath**

SCO data path, i.e. HCI or PCM module

bool **auto\_latency**

BLE auto latency, used to enhance classic BT performance

bool **bt\_legacy\_auth\_vs\_evt**

BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8\_t **bt\_max\_sync\_conn**

BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8\_t **ble\_sca**

BLE low power crystal accuracy index

uint8\_t **pcm\_role**

PCM role (master & slave)

uint8\_t **pcm\_polar**

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint32\_t **magic**

Magic number

struct **esp\_vhci\_host\_callback**

*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Public Members

void (\***notify\_host\_send\_available**)(void)

callback used to notify that the host can send packet to controller

int (\***notify\_host\_recv**)(uint8\_t \*data, uint16\_t len)

callback used to notify that the controller has a packet to send to the host

### Macros

**ESP\_BT\_CONTROLLER\_CONFIG\_MAGIC\_VAL**

**BT\_CONTROLLER\_INIT\_CONFIG\_DEFAULT** ( )

## Type Definitions

typedef struct *esp\_vhci\_host\_callback* **esp\_vhci\_host\_callback\_t**

*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

## Enumerations

enum **esp\_bt\_mode\_t**

Bluetooth mode for controller enable/disable.

*Values:*

enumerator **ESP\_BT\_MODE\_IDLE**

Bluetooth is not running

enumerator **ESP\_BT\_MODE\_BLE**

Run BLE mode

enumerator **ESP\_BT\_MODE\_CLASSIC\_BT**

Run Classic BT mode

enumerator **ESP\_BT\_MODE\_BTDM**

Run dual mode

enum [**anonymous**]

BLE sleep clock accuracy(SCA), values for ble\_sca field in *esp\_bt\_controller\_config\_t*, currently only ESP\_BLE\_SCA\_500PPM and ESP\_BLE\_SCA\_250PPM are supported.

*Values:*

enumerator **ESP\_BLE\_SCA\_500PPM**

BLE SCA at 500ppm

enumerator **ESP\_BLE\_SCA\_250PPM**

BLE SCA at 250ppm

enumerator **ESP\_BLE\_SCA\_150PPM**

BLE SCA at 150ppm

enumerator **ESP\_BLE\_SCA\_100PPM**

BLE SCA at 100ppm

enumerator **ESP\_BLE\_SCA\_75PPM**

BLE SCA at 75ppm

enumerator **ESP\_BLE\_SCA\_50PPM**

BLE SCA at 50ppm

enumerator **ESP\_BLE\_SCA\_30PPM**

BLE SCA at 30ppm

enumerator **ESP\_BLE\_SCA\_20PPM**

BLE SCA at 20ppm

enum **esp\_bt\_controller\_status\_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_IDLE**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_INITED**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_ENABLED**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_NUM**

enum **esp\_ble\_power\_type\_t**

BLE tx power type **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0-8**: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. **ESP\_BLE\_PWR\_TYPE\_ADV** : for advertising/scan response. **ESP\_BLE\_PWR\_TYPE\_SCAN** : for scan. **ESP\_BLE\_PWR\_TYPE\_DEFAULT** : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use **ESP\_PWR\_LVL\_P3** as default for ADV/SCAN/CONN0-9.

*Values:*

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0**

For connection handle 0

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL1**

For connection handle 1

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL2**

For connection handle 2

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL3**

For connection handle 3

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL4**

For connection handle 4

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL5**

For connection handle 5

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL6**

For connection handle 6

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL7**

For connection handle 7

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL8**

For connection handle 8

enumerator **ESP\_BLE\_PWR\_TYPE\_ADV**

For advertising

enumerator **ESP\_BLE\_PWR\_TYPE\_SCAN**

For scan

enumerator **ESP\_BLE\_PWR\_TYPE\_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP\_BLE\_PWR\_TYPE\_NUM**

TYPE numbers

enum **esp\_power\_level\_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

*Values:*

enumerator **ESP\_PWR\_LVL\_N12**

Corresponding to -12dbm

enumerator **ESP\_PWR\_LVL\_N9**

Corresponding to -9dbm

enumerator **ESP\_PWR\_LVL\_N6**

Corresponding to -6dbm

enumerator **ESP\_PWR\_LVL\_N3**

Corresponding to -3dbm

enumerator **ESP\_PWR\_LVL\_N0**

Corresponding to 0dbm

enumerator **ESP\_PWR\_LVL\_P3**

Corresponding to +3dbm

enumerator **ESP\_PWR\_LVL\_P6**

Corresponding to +6dbm

enumerator **ESP\_PWR\_LVL\_P9**

Corresponding to +9dbm

enumerator **ESP\_PWR\_LVL\_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP\_PWR\_LVL\_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP\_PWR\_LVL\_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP\_PWR\_LVL\_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP\_PWR\_LVL\_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP\_PWR\_LVL\_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP\_PWR\_LVL\_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP\_PWR\_LVL\_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp\_sco\_data\_path\_t**

Bluetooth audio data transport path.

*Values:*

enumerator **ESP\_SCO\_DATA\_PATH\_HCI**

data over HCI transport

enumerator **ESP\_SCO\_DATA\_PATH\_PCM**

data over PCM interface

## 2.1.2 BT COMMON

### BT GENERIC DEFINES

#### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_defs.h](#)

#### Structures

struct **esp\_bt\_uuid\_t**

UUID type.

#### Public Members

uint16\_t **len**

UUID length, 16bit, 32bit or 128bit

`uint16_t uuid16`

16bit UUID

`uint32_t uuid32`

32bit UUID

`uint8_t uuid128[16]`

128bit UUID

union *esp\_bt\_uuid\_t*::[anonymous] `uuid`

UUID

### Macros

**ESP\_BLUEDROID\_STATUS\_CHECK** (status)

**ESP\_BT\_OCTET16\_LEN**

**ESP\_BT\_OCTET8\_LEN**

**ESP\_DEFAULT\_GATT\_IF**

Default GATT interface id.

**ESP\_BLE\_PRIM\_ADV\_INT\_MIN**

Minimum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_PRIM\_ADV\_INT\_MAX**

Maximum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_CONN\_INT\_MIN**

relate to `BTM_BLE_CONN_INT_MIN` in `stack/btm_ble_api.h`

**ESP\_BLE\_CONN\_INT\_MAX**

relate to `BTM_BLE_CONN_INT_MAX` in `stack/btm_ble_api.h`

**ESP\_BLE\_CONN\_LATENCY\_MAX**

relate to `ESP_BLE_CONN_LATENCY_MAX` in `stack/btm_ble_api.h`

**ESP\_BLE\_CONN\_SUP\_TOUT\_MIN**

relate to `BTM_BLE_CONN_SUP_TOUT_MIN` in `stack/btm_ble_api.h`

**ESP\_BLE\_CONN\_SUP\_TOUT\_MAX**

relate to `ESP_BLE_CONN_SUP_TOUT_MAX` in `stack/btm_ble_api.h`

**ESP\_BLE\_CONN\_PARAM\_UNDEF**

**ESP\_BLE\_SCAN\_PARAM\_UNDEF**

**ESP\_BLE\_IS\_VALID\_PARAM** (x, min, max)

Check the param is valid or not.

**ESP\_UUID\_LEN\_16**

**ESP\_UUID\_LEN\_32**

**ESP\_UUID\_LEN\_128**

**ESP\_BD\_ADDR\_LEN**

Bluetooth address length.

**ESP\_BLE\_ENC\_KEY\_MASK**

Used to exchange the encryption key in the init key & response key.

**ESP\_BLE\_ID\_KEY\_MASK**

Used to exchange the IRK key in the init key & response key.

**ESP\_BLE\_CSR\_KEY\_MASK**

Used to exchange the CSRK key in the init key & response key.

**ESP\_BLE\_LINK\_KEY\_MASK**

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP\_APP\_ID\_MIN**

Minimum of the application id.

**ESP\_APP\_ID\_MAX**

Maximum of the application id.

**ESP\_BD\_ADDR\_STR**

**ESP\_BD\_ADDR\_HEX** (addr)

### Type Definitions

```
typedef uint8_t esp_bt_octet16_t[16]
```

```
typedef uint8_t esp_bt_octet8_t[8]
```

```
typedef uint8_t esp_link_key[16]
```

```
typedef uint8_t esp_bd_addr_t[6]
```

Bluetooth device address.

```
typedef uint8_t esp_ble_key_mask_t
```

### Enumerations

enum **esp\_bt\_status\_t**

Status Return Value.

*Values:*

enumerator **ESP\_BT\_STATUS\_SUCCESS**

enumerator **ESP\_BT\_STATUS\_FAIL**

enumerator **ESP\_BT\_STATUS\_NOT\_READY**

enumerator **ESP\_BT\_STATUS\_NOMEM**

enumerator **ESP\_BT\_STATUS\_BUSY**

enumerator **ESP\_BT\_STATUS\_DONE**

enumerator **ESP\_BT\_STATUS\_UNSUPPORTED**

enumerator **ESP\_BT\_STATUS\_PARM\_INVALID**

enumerator **ESP\_BT\_STATUS\_UNHANDLED**

enumerator **ESP\_BT\_STATUS\_AUTH\_FAILURE**

enumerator **ESP\_BT\_STATUS\_RMT\_DEV\_DOWN**

enumerator **ESP\_BT\_STATUS\_AUTH\_REJECTED**

enumerator **ESP\_BT\_STATUS\_INVALID\_STATIC\_RAND\_ADDR**

enumerator **ESP\_BT\_STATUS\_PENDING**

enumerator **ESP\_BT\_STATUS\_UNACCEPT\_CONN\_INTERVAL**

enumerator **ESP\_BT\_STATUS\_PARAM\_OUT\_OF\_RANGE**

enumerator **ESP\_BT\_STATUS\_TIMEOUT**

enumerator **ESP\_BT\_STATUS\_PEER\_LE\_DATA\_LEN\_UNSUPPORTED**

enumerator **ESP\_BT\_STATUS\_CONTROL\_LE\_DATA\_LEN\_UNSUPPORTED**

enumerator **ESP\_BT\_STATUS\_ERR\_ILLEGAL\_PARAMETER\_FMT**

enumerator **ESP\_BT\_STATUS\_MEMORY\_FULL**

enumerator **ESP\_BT\_STATUS\_EIR\_TOO\_LARGE**

enum **esp\_bt\_dev\_type\_t**

Bluetooth device type.

*Values:*

enumerator **ESP\_BT\_DEVICE\_TYPE\_BREDR**

enumerator **ESP\_BT\_DEVICE\_TYPE\_BLE**

enumerator **ESP\_BT\_DEVICE\_TYPE\_DUMO**

enum **esp\_ble\_addr\_type\_t**

BLE device address type.

*Values:*

enumerator **BLE\_ADDR\_TYPE\_PUBLIC**

enumerator **BLE\_ADDR\_TYPE\_RANDOM**

enumerator **BLE\_ADDR\_TYPE\_RPA\_PUBLIC**

enumerator **BLE\_ADDR\_TYPE\_RPA\_RANDOM**

enum **esp\_ble\_wl\_addr\_type\_t**

white list address type

*Values:*

enumerator **BLE\_WL\_ADDR\_TYPE\_PUBLIC**

enumerator **BLE\_WL\_ADDR\_TYPE\_RANDOM**

## BT MAIN API

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_main.h](#)

#### Functions

*esp\_bluedroid\_status\_t* **esp\_bluedroid\_get\_status** (void)

Get bluetooth stack status.

返回 Bluetooth stack status

*esp\_err\_t* **esp\_bluedroid\_enable** (void)

Enable bluetooth, must after esp\_bluedroid\_init().

返回

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_disable** (void)

Disable bluetooth, must prior to esp\_bluedroid\_deinit().

返回

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

返回

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

返回

- ESP\_OK : Succeed
- Other : Failed

## Enumerations

enum **esp\_bluedroid\_status\_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

*Values:*

enumerator **ESP\_BLUEDROID\_STATUS\_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP\_BLUEDROID\_STATUS\_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP\_BLUEDROID\_STATUS\_ENABLED**

Bluetooth initialized and enabled

## BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_device.h](#)

## Functions

`const uint8_t *esp_bt_dev_get_address` (void)

Get bluetooth device address. Must use after “esp\_bluedroid\_enable” .

返回 bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

`esp_err_t esp_bt_dev_set_device_name` (const char \*name)

Set bluetooth device name. This function should be called after esp\_bluedroid\_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

参数 **name** –[in] : device name to be set

返回

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP\_ERR\_INVALID\_STATE : if bluetooth stack is not yet enabled
- ESP\_FAIL : others

## 2.1.3 BT LE

### GAP API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_client](#)
  - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_server](#)

## Functions

`esp_err_t esp_ble_gap_register_callback` (`esp_gap_ble_cb_t` callback)

This function is called to occur gap event, such as scan result.

参数 **callback** –[in] callback function

返回

- ESP\_OK : success
- other : failed

`esp_err_t esp_ble_gap_config_adv_data` (`esp_ble_adv_data_t` \*adv\_data)

This function is called to override the BTA default ADV parameters.

参数 **adv\_data** –[in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of config\_adv\_data is received.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_scan\_params** (*esp\_ble\_scan\_params\_t* \*scan\_params)

This function is called to set scan parameters.

**参数 scan\_params** –[in] Pointer to User defined scan\_params data structure. This memory space can not be freed until callback of set\_scan\_params

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_scanning** (uint32\_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

**参数 duration** –[in] Keeping the scanning time, the unit is second.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_advertising** (*esp\_ble\_adv\_params\_t* \*adv\_params)

This function is called to start advertising.

**参数 adv\_params** –[in] pointer to User defined adv\_params data structure.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_advertising** (void)

This function is called to stop advertising.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_conn\_params** (*esp\_ble\_conn\_update\_params\_t* \*params)

Update connection parameters, can only be used when connection is up.

**参数 params** –[in] - connection update parameters

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_pkt\_data\_len** (*esp\_bd\_addr\_t* remote\_device, uint16\_t tx\_data\_length)

This function is to set maximum LE data packet size.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_rand\_addr** (*esp\_bd\_addr\_t* rand\_addr)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**参数 rand\_addr** –[in] the random address which should be setting

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_rand\_addr** (void)

This function clears the random address for the application.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_privacy** (bool privacy\_enable)

Enable/disable privacy on the local device.

参数 **privacy\_enable** –[in] - enable/disable privacy on remote device.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_icon** (uint16\_t icon)

set local gap appearance icon

参数 **icon** –[in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf>

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_whitelist** (bool add\_remove, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_wl\_addr\_type\_t* wl\_addr\_type)

Add or remove device from white list.

参数

- **add\_remove** –[in] the value is true if added the ble device to the white list, and false remove to the white list.
- **remote\_bda** –[in] the remote device address add/remove from the white list.
- **wl\_addr\_type** –[in] whitelist address type

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_whitelist** (void)

Clear all white list.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_whitelist\_size** (uint16\_t \*length)

Get the whitelist size in the controller.

参数 **length** –[out] the white list length.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_prefer\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, uint16\_t min\_conn\_int, uint16\_t max\_conn\_int, uint16\_t slave\_latency, uint16\_t supervision\_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

参数

- **bd\_addr** –[in] BD address of the peripheral
- **min\_conn\_int** –[in] minimum preferred connection interval
- **max\_conn\_int** –[in] maximum preferred connection interval
- **slave\_latency** –[in] preferred slave latency

- **supervision\_tout** –[in] preferred supervision timeout
- 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_device\_name** (const char \*name)

Set device name to the local device.

参数 **name** –[in] - device name.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_local\_used\_addr** (*esp\_bd\_addr\_t* local\_used\_addr, uint8\_t \*addr\_type)

This function is called to get local used address and address type. uint8\_t \*esp\_bt\_dev\_get\_address(void) get the public address.

参数

- **local\_used\_addr** –[in] - current local used ble address (six bytes)
- **addr\_type** –[in] - ble address type

返回 - ESP\_OK : success

- other : failed

uint8\_t \***esp\_ble\_resolve\_adv\_data** (uint8\_t \*adv\_data, uint8\_t type, uint8\_t \*length)

This function is called to get ADV data for a specific type.

参数

- **adv\_data** –[in] - pointer of ADV data which to be resolved
- **type** –[in] - finding ADV data type
- **length** –[out] - return the length of ADV data not including type

返回 pointer of ADV data

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data\_raw** (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

参数

- **raw\_data** –[in] : raw advertising data
- **raw\_data\_len** –[in] : raw advertising data length , less than 31 bytes

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_scan\_rsp\_data\_raw** (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

参数

- **raw\_data** –[in] : raw scan response data
- **raw\_data\_len** –[in] : raw scan response data length , less than 31 bytes

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_read\_rssi** (*esp\_bd\_addr\_t* remote\_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT event.

参数 **remote\_addr** –[in] : The remote connection device address.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_add\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to add a device info into the duplicate scan exceptional list.

#### 参数

- **type** –[in] device info type, it is defined in `esp_ble_duplicate_exceptional_info_type_t` when type is `MESH_BEACON_TYPE`, `MESH_PROV_SRV_ADV` or `MESH_PROXY_SRV_ADV`, device\_info is invalid.
- **device\_info** –[in] the device information.

#### 返回

- `ESP_OK` : success
- other : failed

`esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device` (`esp_ble_duplicate_exceptional_info_type_t` type, `esp_duplicate_info_t` device\_info)

This function is called to remove a device info from the duplicate scan exceptional list.

#### 参数

- **type** –[in] device info type, it is defined in `esp_ble_duplicate_exceptional_info_type_t` when type is `MESH_BEACON_TYPE`, `MESH_PROV_SRV_ADV` or `MESH_PROXY_SRV_ADV`, device\_info is invalid.
- **device\_info** –[in] the device information.

#### 返回

- `ESP_OK` : success
- other : failed

`esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list` (`esp_duplicate_scan_exceptional_list_type_t` list\_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**参数 list\_type** –[in] duplicate scan exceptional list type, the value can be one or more of `esp_duplicate_scan_exceptional_list_type_t`.

#### 返回

- `ESP_OK` : success
- other : failed

`esp_err_t esp_ble_gap_set_security_param` (`esp_ble_sm_param_t` param\_type, void \*value, uint8\_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only secure connection mode, it is necessary do as following:

- Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (param\_type is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
- Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (param\_type is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

#### 参数

- **param\_type** –[in] : the type of the param which to be set
- **value** –[in] : the param value
- **len** –[in] : the length of the param value

#### 返回

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_security\_rsp** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Grant security request access.

**参数**

- **bd\_addr** **–[in]** : BD address of the peer
- **accept** **–[in]** : accept the security request or not

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_set\_encryption** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_sec\_act\_t* sec\_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

**参数**

- **bd\_addr** **–[in]** : the address of the peer device need to encryption
- **sec\_act** **–[in]** : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_passkey\_reply** (*esp\_bd\_addr\_t* bd\_addr, bool accept, uint32\_t passkey)

Reply the key value to the peer device in the legacy connection stage.

**参数**

- **bd\_addr** **–[in]** : BD address of the peer
- **accept** **–[in]** : passkey entry successful or declined.
- **passkey** **–[in]** : passkey value, must be a 6 digit number, can be lead by 0.

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_confirm\_reply** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

**参数**

- **bd\_addr** **–[in]** : BD address of the peer device
- **accept** **–[in]** : numbers to compare are the same or different.

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_remove\_bond\_device** (*esp\_bd\_addr\_t* bd\_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**参数** **bd\_addr** **–[in]** : BD address of the peer device

**返回** - ESP\_OK : success  
 • other : failed

int **esp\_ble\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**返回** - >= 0 : bonded devices number.  
 • ESP\_FAIL : failed

*esp\_err\_t* **esp\_ble\_get\_bond\_device\_list** (int \*dev\_num, *esp\_ble\_bond\_dev\_t* \*dev\_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**参数**

- **dev\_num** **–[inout]** Indicate the dev\_list array(buffer) size as input. If dev\_num is large enough, it means the actual number as output. Suggest that dev\_num value equal to esp\_ble\_get\_bond\_device\_num().
- **dev\_list** **–[out]** an array(buffer) of *esp\_ble\_bond\_dev\_t* type. Use for storing the bonded devices address. The dev\_list should be allocated by who call this API.

**返回** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_oob\_req\_reply** (*esp\_bd\_addr\_t* bd\_addr, uint8\_t \*TK, uint8\_t len)

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_OOB\_REQ\_EVT.

**参数**

- **bd\_addr** –[in] BD address of the peer device.
- **TK** –[in] TK value, the TK value shall be a 128-bit random number
- **len** –[in] length of tk, should always be 128-bit

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_disconnect** (*esp\_bd\_addr\_t* remote\_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app\_id registered. esp\_ble\_gattc\_close (esp\_gatt\_if\_t gattc\_if, uint16\_t conn\_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp\_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device) disconnect the physical connection directly.

**参数** **remote\_device** –[in] : BD address of the peer device

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_get\_current\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, *esp\_gap\_conn\_params\_t* \*conn\_params)

This function is called to read the connection parameters information of the device.

**参数**

- **bd\_addr** –[in] BD address of the peer device.
- **conn\_params** –[out] the connection parameters information

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_gap\_ble\_set\_channels** (*esp\_gap\_ble\_channels\_t* channels)

BLE set channels.

**参数** **channels** –[in] : The n<sup>th</sup> such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**返回** - ESP\_OK : success  
 • ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled  
 • other : failed

*esp\_err\_t* **esp\_gap\_ble\_set\_authorization** (*esp\_bd\_addr\_t* bd\_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**参数**

- **bd\_addr** –[in] BD address of the peer device.
- **authorize** –[out] Authorized the link or not.

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_read\_phy** (*esp\_bd\_addr\_t* bd\_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**参数** **bd\_addr** –[in] : BD address of the peer device

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_prefered\_default\_phy** (*esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask)

This function is used to allow the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

#### 参数

- **tx\_phy\_mask** –[in]: indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx\_phy\_mask** –[in]: indicates the receiver PHYs that the Host prefers the Controller to use

返回 - ESP\_OK : success  
 • other : failed

*esp\_err\_t esp\_ble\_gap\_set\_prefered\_phy* (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_gap\_all\_phys\_t* all\_phys\_mask, *esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask, *esp\_ble\_gap\_prefer\_phy\_options\_t* phy\_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

#### 参数

- **bd\_addr** –[in]: remote address
- **all\_phys\_mask** –[in]: a bit field that allows the Host to specify
- **tx\_phy\_mask** –[in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx\_phy\_mask** –[in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- **phy\_options** –[in]: a bit field that allows the Host to specify options for PHYs

返回 - ESP\_OK : success  
 • other : failed

*esp\_err\_t esp\_ble\_gap\_ext\_adv\_set\_rand\_addr* (*uint8\_t* instance, *esp\_bd\_addr\_t* rand\_addr)

This function is used by the Host to set the random device address specified by the Random\_Address parameter.

#### 参数

- **instance** –[in]: Used to identify an advertising set
- **rand\_addr** –[in]: Random Device Address

返回 - ESP\_OK : success  
 • other : failed

*esp\_err\_t esp\_ble\_gap\_ext\_adv\_set\_params* (*uint8\_t* instance, const *esp\_ble\_gap\_ext\_adv\_params\_t* \*params)

This function is used by the Host to set the advertising parameters.

#### 参数

- **instance** –[in]: identifies the advertising set whose parameters are being configured.
- **params** –[in]: advertising parameters

返回 - ESP\_OK : success  
 • other : failed

*esp\_err\_t esp\_ble\_gap\_config\_ext\_adv\_data\_raw* (*uint8\_t* instance, *uint16\_t* length, const *uint8\_t* \*data)

This function is used to set the data used in advertising PDUs that have a data field.

#### 参数

- **instance** –[in]: identifies the advertising set whose data are being configured
- **length** –[in]: data length
- **data** –[in]: data information

返回 - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_ext\_scan\_rsp\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*scan\_rsp\_data)

This function is used to provide scan response data used in scanning response PDUs.

**参数**

- **instance** –[in] : identifies the advertising set whose response data are being configured.
- **length** –[in] : responsedata length
- **scan\_rsp\_data** –[in] : response data information

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_start** (uint8\_t num\_adv, const *esp\_ble\_gap\_ext\_adv\_t* \*ext\_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**参数**

- **num\_adv** –[in] : Number of advertising sets to enable or disable
- **ext\_adv** –[in] : adv parameters

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_stop** (uint8\_t num\_adv, const uint8\_t \*ext\_adv\_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**参数**

- **num\_adv** –[in] : Number of advertising sets to enable or disable
- **ext\_adv\_inst** –[in] : ext adv instance

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_remove** (uint8\_t instance)

This function is used to remove an advertising set from the Controller.

**参数** **instance** –[in] : Used to identify an advertising set

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_set\_params** (uint8\_t instance, const *esp\_ble\_gap\_periodic\_adv\_params\_t* \*params)

This function is used by the Host to set the parameters for periodic advertising.

**参数**

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** –[in] : periodic adv parameters

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_periodic\_adv\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*data)

This function is used to set the data used in periodic advertising PDUs.

**参数**

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** –[in] : the length of periodic data

- **data** –[in] : periodic data information
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_start** (uint8\_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

- 参数 **instance** –[in] : Used to identify an advertising set
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_stop** (uint8\_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

- 参数 **instance** –[in] : Used to identify an advertising set
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_ext\_scan\_params** (const *esp\_ble\_ext\_scan\_params\_t* \*params)

This function is used to set the extended scan parameters to be used on the advertising channels.

- 参数 **params** –[in] : scan parameters
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_ext\_scan** (uint32\_t duration, uint16\_t period)

This function is used to enable scanning.

- 参数
- **duration** –[in] : Scan duration
  - **period** –[in] : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_ext\_scan** (void)

This function is used to disable scanning.

- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_create\_sync** (const *esp\_ble\_gap\_periodic\_adv\_sync\_params\_t* \*params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

- 参数 **params** –[in] : sync parameters
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_cancel** (void)

This function is used to cancel the LE\_Periodic\_Advertising\_Create\_Sync command while it is pending.

- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_terminate** (uint16\_t sync\_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

- 参数 **sync\_handle** –[in] : identify the periodic advertiser
- 返回 - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_add\_dev\_to\_list** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, uint8\_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**参数**

- **addr\_type** -[in] : address type
- **addr** -[in] : Device Address
- **sid** -[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_remove\_dev\_from\_list** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, uint8\_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**参数**

- **addr\_type** -[in] : address type
- **addr** -[in] : Device Address
- **sid** -[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_clear\_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**返回** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_prefer\_ext\_connect\_params\_set** (*esp\_bd\_addr\_t* addr, *esp\_ble\_gap\_phy\_mask\_t* phy\_mask, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_1m\_conn\_params, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_2m\_conn\_params, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_coded\_conn\_params)

This function is used to set aux connection parameters.

**参数**

- **addr** -[in] : device address
- **phy\_mask** -[in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy\_1m\_conn\_params** -[in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy\_2m\_conn\_params** -[in] : Connection parameters for the LE 2M PHY are provided.
- **phy\_coded\_conn\_params** -[in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**返回** - ESP\_OK : success  
 • other : failed

## Unions

union **esp\_ble\_key\_value\_t**

*#include <esp\_gap\_ble\_api.h>* union type of the security key value

**Public Members**

*esp\_ble\_penc\_keys\_t* **penc\_key**  
received peer encryption key

*esp\_ble\_pcsrkeys\_t* **pcsrkey**  
received peer device SRK

*esp\_ble\_pidkeys\_t* **pid\_key**

```

**Public Members***esp\_bt\_status\_t* **status**

Indicate scan stop operation success status

```
struct ble_set_channels_evt_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.
```

**Public Members***esp\_bt\_status\_t* **stat**

BLE set channel status

```
struct ble_set_ext_scan_params_cmpl_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

**Public Members***esp\_bt\_status\_t* **status**

Indicate extend advertising parameters set status

```
struct ble_set_perf_def_phy_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate perf default phy set status

```
struct ble_set_perf_phy_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate perf phy set status

```
struct ble_set_rand_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate set static rand address operation success status

```
struct ble_update_conn_params_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate update connection parameters success status

*esp\_bd\_addr\_t* **bda**

Bluetooth device address

uint16\_t **min\_int**

Min connection interval

uint16\_t **max\_int**

Max connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **conn\_int**

Current connection interval

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec

struct **ble\_update\_duplicate\_exceptional\_list\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT.

**Public Members***esp\_bt\_status\_t* **status**

Indicate update duplicate scan exceptional list operation success status

**uint8\_t subcode**

Define in esp\_bt\_duplicate\_exceptional\_subcode\_type\_t

**uint16\_t length**

The length of device\_info

*esp\_duplicate\_info\_t* **device\_info**

device information, when subcode is ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN, the value is invalid

struct **ble\_update\_whitelist\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT.

**Public Members***esp\_bt\_status\_t* **status**

Indicate the add or remove whitelist operation success status

*esp\_ble\_wl\_operation\_t* **wl\_operation**

The value is ESP\_BLE\_WHITELIST\_ADD if add address to whitelist operation success, ESP\_BLE\_WHITELIST\_REMOVE if remove address from the whitelist operation success

**Structures**

struct **esp\_ble\_adv\_params\_t**

Advertising parameters.

**Public Members****uint16\_t adv\_int\_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec

`uint16_t adv_int_max`

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

`esp_ble_adv_type_t adv_type`

Advertising type

`esp_ble_addr_type_t own_addr_type`

Owner bluetooth device address type

`esp_bd_addr_t peer_addr`

Peer device bluetooth device address

`esp_ble_addr_type_t peer_addr_type`

Peer device bluetooth device address type, only support public address type and random address type

`esp_ble_adv_channel_t channel_map`

Advertising channel map

`esp_ble_adv_filter_t adv_filter_policy`

Advertising filter policy

struct `esp_ble_adv_data_t`

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

### Public Members

bool `set_scan_rsp`

Set this advertising data as scan response or not

bool `include_name`

Advertising data include device name or not

bool `include_txpower`

Advertising data include TX power

int `min_interval`

Advertising data show slave preferred connection min interval. The connection interval in the following manner:  $\text{connIntervalmin} = \text{Conn\_Interval\_Min} * 1.25 \text{ ms}$  Conn\_Interval\_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int `max_interval`

Advertising data show slave preferred connection max interval. The connection interval in the following manner:  $\text{connIntervalmax} = \text{Conn\_Interval\_Max} * 1.25 \text{ ms}$  Conn\_Interval\_Max range: 0x0006 to 0x0C80 Conn\_Interval\_Max shall be equal to or greater than the Conn\_Interval\_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int `appearance`

External appearance of device

uint16\_t **manufacturer\_len**

Manufacturer data length

uint8\_t \***p\_manufacturer\_data**

Manufacturer data point

uint16\_t **service\_data\_len**

Service data length

uint8\_t \***p\_service\_data**

Service data point

uint16\_t **service\_uuid\_len**

Service uuid length

uint8\_t \***p\_service\_uuid**

Service uuid array point

uint8\_t **flag**

Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

struct **esp\_ble\_scan\_params\_t**

Ble scan parameters.

### Public Members

*esp\_ble\_scan\_type\_t* **scan\_type**

Scan type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner address type

*esp\_ble\_scan\_filter\_t* **scan\_filter\_policy**

Scan filter policy

uint16\_t **scan\_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16\_t **scan\_window**

Scan window. The duration of the LE scan. LE\_Scan\_Window shall be less than or equal to LE\_Scan\_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10240 msec

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

The Scan\_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE\_SCAN\_DUPLICATE\_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp\_gap\_conn\_params\_t**  
connection parameters information

### Public Members

uint16\_t **interval**  
connection interval

uint16\_t **latency**  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**  
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

struct **esp\_ble\_conn\_update\_params\_t**  
Connection update parameters.

### Public Members

*esp\_bd\_addr\_t* **bda**  
Bluetooth device address

uint16\_t **min\_int**  
Min connection interval

uint16\_t **max\_int**  
Max connection interval

uint16\_t **latency**  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**  
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

struct **esp\_ble\_pkt\_data\_length\_params\_t**  
BLE pkt data length keys.

### Public Members

uint16\_t **rx\_len**  
pkt rx data length value

uint16\_t **tx\_len**  
pkt tx data length value

struct **esp\_ble\_penc\_keys\_t**

BLE encryption keys.

**Public Members**

*esp\_bt\_octet16\_t* **ltk**

The long term key

*esp\_bt\_octet8\_t* **rand**

The random number

uint16\_t **ediv**

The ediv value

uint8\_t **sec\_level**

The security level of the security link

uint8\_t **key\_size**

The key size(7~16) of the security link

struct **esp\_ble\_pcsrkeys\_t**

BLE CSRK keys.

**Public Members**

uint32\_t **counter**

The counter

*esp\_bt\_octet16\_t* **csrkey**

The csrkey

uint8\_t **sec\_level**

The security level

struct **esp\_ble\_pidkeys\_t**

BLE pid keys.

**Public Members**

*esp\_bt\_octet16\_t* **irk**

The irk value

*esp\_ble\_addr\_type\_t* **addr\_type**

The address type

*esp\_bd\_addr\_t* **static\_addr**

The static address

struct **esp\_ble\_lenc\_keys\_t**

BLE Encryption reproduction keys.

### Public Members

*esp\_bt\_octet16\_t* **ltk**

The long term key

uint16\_t **div**

The div value

uint8\_t **key\_size**

The key size of the security link

uint8\_t **sec\_level**

The security level of the security link

struct **esp\_ble\_lcsrkeys\_t**

BLE SRK keys.

### Public Members

uint32\_t **counter**

The counter value

uint16\_t **div**

The div value

uint8\_t **sec\_level**

The security level of the security link

*esp\_bt\_octet16\_t* **csrkey**

The csrkey value

struct **esp\_ble\_sec\_key\_notif\_t**

Structure associated with ESP\_KEY\_NOTIF\_EVT.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

uint32\_t **passkey**

the numeric value for comparison. If `just_works`, do not show this number to UI

struct **esp\_ble\_sec\_req\_t**

Structure of the security request.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

struct **esp\_ble\_bond\_key\_info\_t**

struct type of the bond key information value

### Public Members

*esp\_ble\_key\_mask\_t* **key\_mask**

the key mask to indicate which key is present

*esp\_ble\_penc\_keys\_t* **penc\_key**

received peer encryption key

*esp\_ble\_pcsrkeys\_t* **pcsrk\_key**

received peer device SRK

*esp\_ble\_pidkeys\_t* **pid\_key**

peer device ID key

struct **esp\_ble\_bond\_dev\_t**

struct type of the bond device value

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

*esp\_ble\_bond\_key\_info\_t* **bond\_key**

the bond key information

struct **esp\_ble\_key\_t**

union type of the security key value

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

*esp\_ble\_key\_type\_t* **key\_type**

key type of the security link

*esp\_ble\_key\_value\_t* **p\_key\_value**

the pointer to the key value

struct **esp\_ble\_local\_id\_keys\_t**

structure type of the ble local id keys value

### Public Members

*esp\_bt\_octet16\_t* **ir**

the 16 bits of the ir value

*esp\_bt\_octet16\_t* **irk**

the 16 bits of the ir key value

*esp\_bt\_octet16\_t* **dhk**

the 16 bits of the dh key value

struct **esp\_ble\_auth\_cmpl\_t**

Structure associated with ESP\_AUTH\_CMPL\_EVT.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

BD address peer device.

bool **key\_present**

Valid link key value in key element

*esp\_link\_key* **key**

Link key associated with peer device.

uint8\_t **key\_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8\_t **fail\_reason**

The HCI reason/error code for when success=FALSE

*esp\_ble\_addr\_type\_t* **addr\_type**

Peer device address type

*esp\_bt\_dev\_type\_t* **dev\_type**

Device type

*esp\_ble\_auth\_req\_t* **auth\_mode**

authentication mode

struct **esp\_ble\_gap\_ext\_adv\_params\_t**

ext adv parameters

### Public Members

*esp\_ble\_ext\_adv\_type\_mask\_t* **type**

ext adv type

uint32\_t **interval\_min**

ext adv minimum interval

uint32\_t **interval\_max**

ext adv maximum interval

*esp\_ble\_adv\_channel\_t* **channel\_map**

ext adv channel map

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

ext adv own addresss type

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**

ext adv peer address type

*esp\_bd\_addr\_t* **peer\_addr**

ext adv peer address

*esp\_ble\_adv\_filter\_t* **filter\_policy**

ext adv filter policy

int8\_t **tx\_power**

ext adv tx power

*esp\_ble\_gap\_pri\_phy\_t* **primary\_phy**

ext adv primary phy

uint8\_t **max\_skip**

ext adv maximum skip

*esp\_ble\_gap\_phy\_t* **secondary\_phy**

ext adv secondary phy

uint8\_t **sid**  
ext adv sid

bool **scan\_req\_notif**  
ext adv sacn request event notify

struct **esp\_ble\_ext\_scan\_cfg\_t**  
ext scan config

### Public Members

*esp\_ble\_scan\_type\_t* **scan\_type**  
ext scan type

uint16\_t **scan\_interval**  
ext scan interval

uint16\_t **scan\_window**  
ext scan window

struct **esp\_ble\_ext\_scan\_params\_t**  
ext scan parameters

### Public Members

*esp\_ble\_addr\_type\_t* **own\_addr\_type**  
ext scan own addresss type

*esp\_ble\_scan\_filter\_t* **filter\_policy**  
ext scan filter policy

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**  
ext scan duplicate scan

*esp\_ble\_ext\_scan\_cfg\_mask\_t* **cfg\_mask**  
ext scan config mask

*esp\_ble\_ext\_scan\_cfg\_t* **uncoded\_cfg**  
ext scan uncoded config parameters

*esp\_ble\_ext\_scan\_cfg\_t* **coded\_cfg**  
ext scan coded config parameters

struct **esp\_ble\_gap\_conn\_params\_t**  
create extend connection parameters

**Public Members**

uint16\_t **scan\_interval**  
init scan interval

uint16\_t **scan\_window**  
init scan window

uint16\_t **interval\_min**  
minimum interval

uint16\_t **interval\_max**  
maximum interval

uint16\_t **latency**  
ext scan type

uint16\_t **supervision\_timeout**  
connection supervision timeout

uint16\_t **min\_ce\_len**  
minimum ce length

uint16\_t **max\_ce\_len**  
maximum ce length

struct **esp\_ble\_gap\_ext\_adv\_t**  
extend adv enable parameters

**Public Members**

uint8\_t **instance**  
advertising handle

int **duration**  
advertising duration

int **max\_events**  
maximum number of extended advertising events

struct **esp\_ble\_gap\_periodic\_adv\_params\_t**  
periodic adv parameters

**Public Members**

uint16\_t **interval\_min**  
periodic advertising minimum interval

uint16\_t **interval\_max**  
periodic advertising maximum interval

uint8\_t **properties**  
periodic advertising properties

struct **esp\_ble\_gap\_periodic\_adv\_sync\_params\_t**  
periodic adv sync parameters

### Public Members

*esp\_ble\_gap\_sync\_t* **filter\_policy**  
periodic advertising sync filter policy

uint8\_t **sid**  
periodic advertising sid

*esp\_ble\_addr\_type\_t* **addr\_type**  
periodic advertising address type

*esp\_bd\_addr\_t* **addr**  
periodic advertising address

uint16\_t **skip**  
the maximum number of periodic advertising events that can be skipped

uint16\_t **sync\_timeout**  
synchronization timeout

struct **esp\_ble\_gap\_ext\_adv\_reprot\_t**  
extend adv report parameters

### Public Members

*esp\_ble\_gap\_adv\_type\_t* **event\_type**  
extend advertising type

uint8\_t **addr\_type**  
extend advertising address type

*esp\_bd\_addr\_t* **addr**  
extend advertising address

*esp\_ble\_gap\_pri\_phy\_t* **primary\_phy**  
extend advertising primary phy

*esp\_ble\_gap\_phy\_t* **secondly\_phy**

extend advertising secondary phy

uint8\_t **sid**

extend advertising sid

uint8\_t **tx\_power**

extend advertising tx power

int8\_t **rss\_i**

extend advertising rssi

uint16\_t **per\_adv\_interval**

periodic advertising interval

uint8\_t **dir\_addr\_type**

direct address type

*esp\_bd\_addr\_t* **dir\_addr**

direct address

*esp\_ble\_gap\_ext\_adv\_data\_status\_t* **data\_status**

data type

uint8\_t **adv\_data\_len**

extend advertising data length

uint8\_t **adv\_data**[251]

extend advertising data

struct **esp\_ble\_gap\_periodic\_adv\_report\_t**

periodic adv report parameters

### Public Members

uint16\_t **sync\_handle**

periodic advertising train handle

uint8\_t **tx\_power**

periodic advertising tx power

int8\_t **rss\_i**

periodic advertising rssi

*esp\_ble\_gap\_ext\_adv\_data\_status\_t* **data\_status**

periodic advertising data type

`uint8_t data_length`  
periodic advertising data length

`uint8_t data[251]`  
periodic advertising data

struct `esp_ble_gap_periodic_adv_sync_estab_t`  
periodic adv sync establish parameters

### Public Members

`uint8_t status`  
periodic advertising sync status

`uint16_t sync_handle`  
periodic advertising train handle

`uint8_t sid`  
periodic advertising sid

`esp_ble_addr_type_t addr_type`  
periodic advertising address type

`esp_bd_addr_t adv_addr`  
periodic advertising address

`esp_ble_gap_phy_t adv_phy`  
periodic advertising adv phy type

`uint16_t period_adv_interval`  
periodic advertising interval

`uint8_t adv_clk_accuracy`  
periodic advertising clock accuracy

### Macros

typedef void (\***esp\_gap\_ble\_cb\_t**)(*esp\_gap\_ble\_cb\_event\_t* event, *esp\_ble\_gap\_cb\_param\_t* \*param)

GAP callback function type.

**Param event** : Event type

**Param param** : Point to callback parameter, currently is union type

## Enumerations

enum **esp\_gap\_ble\_cb\_event\_t**

GAP BLE callback event type.

*Values:*

enumerator **ESP\_GAP\_BLE\_ADV\_DATA\_SET\_COMPLETE\_EVT**

When advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

When scan response data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_PARAM\_SET\_COMPLETE\_EVT**

When scan parameters set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT**

When one scan result ready, the event comes each time

enumerator **ESP\_GAP\_BLE\_ADV\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_ADV\_START\_COMPLETE\_EVT**

When start advertising complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT**

When start scan complete, the event comes

enumerator **ESP\_GAP\_BLE\_AUTH\_CMPL\_EVT**

enumerator **ESP\_GAP\_BLE\_KEY\_EVT**

enumerator **ESP\_GAP\_BLE\_SEC\_REQ\_EVT**

enumerator **ESP\_GAP\_BLE\_PASSKEY\_NOTIF\_EVT**

enumerator **ESP\_GAP\_BLE\_PASSKEY\_REQ\_EVT**

enumerator **ESP\_GAP\_BLE\_OOB\_REQ\_EVT**

enumerator **ESP\_GAP\_BLE\_LOCAL\_IR\_EVT**

enumerator **ESP\_GAP\_BLE\_LOCAL\_ER\_EVT**

enumerator **ESP\_GAP\_BLE\_NC\_REQ\_EVT**

enumerator **ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT**

When stop adv complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT**

When stop scan complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT**

When set the static rand address complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT**

When update connection parameters complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT**

When set pkt length complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**

When remove the bond device complete, the event comes

enumerator **ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT**

When get the bond device list complete, the event comes

enumerator **ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT**

When read the rssi complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP\_GAP\_BLE\_READ\_PHY\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_SET\_PREFERED\_DEFAULT\_PHY\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_SET\_PREFERED\_PHY\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_RAND\_ADDR\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_PARAMS\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_DATA\_SET\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_START\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_STOP\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_REMOVE\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_CLEAR\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SET\_PARAMS\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_DATA\_SET\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_START\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_STOP\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_CREATE\_SYNC\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_CANCEL\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TERMINATE\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_ADD\_DEV\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_REMOVE\_DEV\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_CLEAR\_DEV\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_SET\_EXT\_SCAN\_PARAMS\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_START\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_STOP\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PREFER\_EXT\_CONN\_PARAMS\_SET\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_PHY\_UPDATE\_COMPLETE\_EVT**

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_REPORT\_EVT**

enumerator **ESP\_GAP\_BLE\_SCAN\_TIMEOUT\_EVT**

enumerator **ESP\_GAP\_BLE\_ADV\_TERMINATED\_EVT**

enumerator **ESP\_GAP\_BLE\_SCAN\_REQ\_RECEIVED\_EVT**

enumerator **ESP\_GAP\_BLE\_CHANNEL\_SELETE\_ALGORITHM\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_REPORT\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_LOST\_EVT**

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_ESTAB\_EVT**

enumerator **ESP\_GAP\_BLE\_EVT\_MAX**

enum **esp\_ble\_adv\_data\_type**

The type of advertising data(not adv\_type)

*Values:*

enumerator **ESP\_BLE\_AD\_TYPE\_FLAG**

enumerator **ESP\_BLE\_AD\_TYPE\_16SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_16SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_32SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_128SERVICE\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SECURE\_CONFIRM**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SECURE\_RANDOM**

enumerator **ESP\_BLE\_AD\_TYPE\_URI**

enumerator **ESP\_BLE\_AD\_TYPE\_INDOOR\_POSITION**

enumerator **ESP\_BLE\_AD\_TYPE\_TRANS\_DISC\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SUPPORT\_FEATURE**

enumerator **ESP\_BLE\_AD\_TYPE\_CHAN\_MAP\_UPDATE**

enumerator **ESP\_BLE\_AD\_MANUFACTURER\_SPECIFIC\_TYPE**

enum **esp\_ble\_adv\_type\_t**

Advertising mode.

*Values:*

enumerator **ADV\_TYPE\_IND**

enumerator **ADV\_TYPE\_DIRECT\_IND\_HIGH**

enumerator **ADV\_TYPE\_SCAN\_IND**

enumerator **ADV\_TYPE\_NONCONN\_IND**

enumerator **ADV\_TYPE\_DIRECT\_IND\_LOW**

enum **esp\_ble\_adv\_channel\_t**

Advertising channel mask.

*Values:*

enumerator **ADV\_CHNL\_37**

enumerator **ADV\_CHNL\_38**

enumerator **ADV\_CHNL\_39**

enumerator **ADV\_CHNL\_ALL**

enum **esp\_ble\_adv\_filter\_t**

*Values:*

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_WLST**

Allow scan and connection requests from White List devices only.

enum **esp\_ble\_sec\_act\_t**

*Values:*

enumerator **ESP\_BLE\_SEC\_ENCRYPT**

enumerator **ESP\_BLE\_SEC\_ENCRYPT\_NO\_MITM**

enumerator **ESP\_BLE\_SEC\_ENCRYPT\_MITM**

enum **esp\_ble\_sm\_param\_t**

*Values:*

enumerator **ESP\_BLE\_SM\_PASSKEY**

enumerator **ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE**

enumerator **ESP\_BLE\_SM\_IOCAP\_MODE**

enumerator **ESP\_BLE\_SM\_SET\_INIT\_KEY**

enumerator **ESP\_BLE\_SM\_SET\_RSP\_KEY**

enumerator **ESP\_BLE\_SM\_MAX\_KEY\_SIZE**

enumerator **ESP\_BLE\_SM\_MIN\_KEY\_SIZE**

enumerator **ESP\_BLE\_SM\_SET\_STATIC\_PASSKEY**

enumerator **ESP\_BLE\_SM\_CLEAR\_STATIC\_PASSKEY**

enumerator **ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH**

enumerator **ESP\_BLE\_SM\_OOB\_SUPPORT**

enumerator **ESP\_BLE\_APP\_ENC\_KEY\_SIZE**

enumerator **ESP\_BLE\_SM\_MAX\_PARAM**

enum **esp\_ble\_scan\_type\_t**

Ble scan type.

*Values:*

enumerator **BLE\_SCAN\_TYPE\_PASSIVE**

Passive scan

enumerator **BLE\_SCAN\_TYPE\_ACTIVE**

Active scan

enum **esp\_ble\_scan\_filter\_t**

Ble scan filter type.

*Values:*

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_ALL**

Accept all :

- i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_ONLY\_WLST**

Accept only :

- i. advertisement packets from devices where the advertiser' s address is in the White list.
- ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_UND\_RPA\_DIR**

Accept all :

- i. undirected advertisement packets, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_WLIST\_RPA\_DIR**

Accept all :

- i. advertisement packets from devices where the advertiser' s address is in the White list, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enum **esp\_ble\_scan\_duplicate\_t**

Ble scan duplicate type.

*Values:*

enumerator **BLE\_SCAN\_DUPLICATE\_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE\_SCAN\_DUPLICATE\_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE\_SCAN\_DUPLICATE\_MAX**

0x02 –0xFF, Reserved for future use

enum **esp\_gap\_search\_evt\_t**

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

*Values:*

enumerator **ESP\_GAP\_SEARCH\_INQ\_RES\_EVT**

Inquiry result for a peer device.

enumerator **ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT**

Inquiry complete.

enumerator **ESP\_GAP\_SEARCH\_DISC\_RES\_EVT**

Discovery result for a peer device.

enumerator **ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT**

Discovery complete.

enumerator **ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT**

Discovery complete.

enumerator **ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT**

Search cancelled

enumerator **ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT**

The number of pkt discarded by flow control

enum **esp\_ble\_evt\_type\_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

enumerator **ESP\_BLE\_EVT\_CONN\_ADV**

Connectable undirected advertising (ADV\_IND)

enumerator **ESP\_BLE\_EVT\_CONN\_DIR\_ADV**

Connectable directed advertising (ADV\_DIRECT\_IND)

enumerator **ESP\_BLE\_EVT\_DISC\_ADV**

Scannable undirected advertising (ADV\_SCAN\_IND)

enumerator **ESP\_BLE\_EVT\_NON\_CONN\_ADV**

Non connectable undirected advertising (ADV\_NONCONN\_IND)

enumerator **ESP\_BLE\_EVT\_SCAN\_RSP**

Scan Response (SCAN\_RSP)

enum **esp\_ble\_wl\_opration\_t**

*Values:*

enumerator **ESP\_BLE\_WHITELIST\_REMOVE**

remove mac from whitelist

enumerator **ESP\_BLE\_WHITELIST\_ADD**

add address to whitelist

enum **esp\_bt\_duplicate\_exceptional\_subcode\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD**

Add device info into duplicate scan exceptional list

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE**

Remove device info from duplicate scan exceptional list

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN**

Clean duplicate scan exceptional list

enum **esp\_ble\_duplicate\_exceptional\_info\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_ADV\_ADDR**

BLE advertising address , device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_LINK\_ID**

BLE mesh link ID, it is for BLE mesh, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_BEACON\_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROV\_SRV\_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SRV\_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enum **esp\_duplicate\_scan\_exceptional\_list\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST**

duplicate scan exceptional addr list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_BEACON\_TYPE\_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROV\_SRV\_ADV\_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SRV\_ADV\_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ALL\_LIST**

duplicate scan exceptional all list

## GATT DEFINES

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_gatt\\_defs.h](#)

#### Unions

union **esp\_gatt\_rsp\_t**

*#include <esp\_gatt\_defs.h>* GATT remote read request response type.

### Public Members

*esp\_gatt\_value\_t* **attr\_value**

Gatt attribute structure

uint16\_t **handle**

Gatt attribute handle

### Structures

struct **esp\_gatt\_id\_t**

Gatt id, include uuid and instance id.

### Public Members

*esp\_bt\_uuid\_t* **uuid**

UUID

uint8\_t **inst\_id**

Instance id

struct **esp\_gatt\_srvc\_id\_t**

Gatt service id, include id (uuid and instance id) and primary flag.

### Public Members

*esp\_gatt\_id\_t* **id**

Gatt id, include uuid and instance

bool **is\_primary**

This service is primary or not

struct **esp\_attr\_desc\_t**

Attribute description (used to create database)

### Public Members

uint16\_t **uuid\_length**

UUID length

uint8\_t \***uuid\_p**

UUID value

uint16\_t **perm**

Attribute permission

uint16\_t **max\_length**

Maximum length of the element

uint16\_t **length**

Current length of the element

uint8\_t \***value**

Element value array

struct **esp\_attr\_control\_t**

attribute auto response flag

### Public Members

uint8\_t **auto\_rsp**

if `auto_rsp` set to `ESP_GATT_RSP_BY_APP`, means the response of Write/Read operation will be replied by application. if `auto_rsp` set to `ESP_GATT_AUTO_RSP`, means the response of Write/Read operation will be replied by GATT stack automatically.

struct **esp\_gatts\_attr\_db\_t**

attribute type added to the gatt server database

### Public Members

*esp\_attr\_control\_t* **attr\_control**

The attribute control type

*esp\_attr\_desc\_t* **att\_desc**

The attribute type

struct **esp\_attr\_value\_t**

set the attribute value type

### Public Members

uint16\_t **attr\_max\_len**

attribute max value length

uint16\_t **attr\_len**

attribute current value length

uint8\_t \***attr\_value**

the pointer to attribute value

struct **esp\_gatts\_incl\_svc\_desc\_t**

Gatt include service entry element.

**Public Members****uint16\_t start\_hdl**

Gatt start handle value of included service

**uint16\_t end\_hdl**

Gatt end handle value of included service

**uint16\_t uuid**

Gatt attribute value UUID of included service

struct **esp\_gatts\_incl128\_svc\_desc\_t**

Gatt include 128 bit service entry element.

**Public Members****uint16\_t start\_hdl**

Gatt start handle value of included 128 bit service

**uint16\_t end\_hdl**

Gatt end handle value of included 128 bit service

struct **esp\_gatt\_value\_t**

Gatt attribute value.

**Public Members****uint8\_t value[600]**

Gatt attribute value

**uint16\_t handle**

Gatt attribute handle

**uint16\_t offset**

Gatt attribute value offset

**uint16\_t len**

Gatt attribute value length

**uint8\_t auth\_req**

Gatt authentication request

struct **esp\_gatt\_conn\_params\_t**

Connection parameters information.

**Public Members****uint16\_t interval**

connection interval

**uint16\_t latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 secondsstruct **esp\_gattc\_multi\_t**

read multiple attribute

**Public Members****uint8\_t num\_attr**

The number of the attribute

**uint16\_t handles[10]**

The handles list

struct **esp\_gattc\_db\_elem\_t**

data base attribute element

**Public Members***esp\_gatt\_db\_attr\_type\_t* **type**

The attribute type

**uint16\_t attribute\_handle**

The attribute handle, it' s valid for all of the type

**uint16\_t start\_handle**

The service start handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

**uint16\_t end\_handle**

The service end handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties, it' s valid only when the type = ESP\_GATT\_DB\_CHARACTERISTIC

*esp\_bt\_uuid\_t* **uuid**

The attribute uuid, it' s valid for all of the type

struct **esp\_gattc\_service\_elem\_t**  
service element

### Public Members

bool **is\_primary**  
The service flag, true if the service is primary service, else is secondary service

uint16\_t **start\_handle**  
The start handle of the service

uint16\_t **end\_handle**  
The end handle of the service

*esp\_bt\_uuid\_t* **uuid**  
The uuid of the service

struct **esp\_gattc\_char\_elem\_t**  
characteristic element

### Public Members

uint16\_t **char\_handle**  
The characteristic handle

*esp\_gatt\_char\_prop\_t* **properties**  
The characteristic properties

*esp\_bt\_uuid\_t* **uuid**  
The characteristic uuid

struct **esp\_gattc\_descr\_elem\_t**  
descriptor element

### Public Members

uint16\_t **handle**  
The characteristic descriptor handle

*esp\_bt\_uuid\_t* **uuid**  
The characteristic descriptor uuid

struct **esp\_gattc\_incl\_svc\_elem\_t**  
include service element

## Public Members

`uint16_t handle`

The include service current attribute handle

`uint16_t incl_srvc_s_handle`

The start handle of the service which has been included

`uint16_t incl_srvc_e_handle`

The end handle of the service which has been included

*esp\_bt\_uuid\_t* `uuid`

The include service uuid

**ESP\_GATT\_PERM\_WRITE\_ENCRYPTED**

**ESP\_GATT\_PERM\_WRITE\_ENC\_MITM**

**ESP\_GATT\_PERM\_WRITE\_SIGNED**

**ESP\_GATT\_PERM\_WRITE\_SIGNED\_MITM**

**ESP\_GATT\_PERM\_READ\_AUTHORIZATION**

**ESP\_GATT\_PERM\_WRITE\_AUTHORIZATION**

**ESP\_GATT\_CHAR\_PROP\_BIT\_BROADCAST**

**ESP\_GATT\_CHAR\_PROP\_BIT\_READ**

**ESP\_GATT\_CHAR\_PROP\_BIT\_WRITE\_NR**

**ESP\_GATT\_CHAR\_PROP\_BIT\_WRITE**

**ESP\_GATT\_CHAR\_PROP\_BIT\_NOTIFY**

**ESP\_GATT\_CHAR\_PROP\_BIT\_INDICATE**

**ESP\_GATT\_CHAR\_PROP\_BIT\_AUTH**

**ESP\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP**

**ESP\_GATT\_MAX\_ATTR\_LEN**

GATT maximum attribute length.

**ESP\_GATT\_RSP\_BY\_APP**

**ESP\_GATT\_AUTO\_RSP**

**ESP\_GATT\_IF\_NONE**

If callback report `gattc_if/gatts_if` as this macro, means this event is not correspond to any app

### Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different `gatt_if`

## Enumerations

enum **esp\_gatt\_prep\_write\_type**

Attribute write data type from the client.

*Values:*

enumerator **ESP\_GATT\_PREP\_WRITE\_CANCEL**

Prepare write cancel

enumerator **ESP\_GATT\_PREP\_WRITE\_EXEC**

Prepare write execute

enum **esp\_gatt\_status\_t**

GATT success code and error codes.

*Values:*

enumerator **ESP\_GATT\_OK**

enumerator **ESP\_GATT\_INVALID\_HANDLE**

enumerator **ESP\_GATT\_READ\_NOT\_PERMIT**

enumerator **ESP\_GATT\_WRITE\_NOT\_PERMIT**

enumerator **ESP\_GATT\_INVALID\_PDU**

enumerator **ESP\_GATT\_INSUF\_AUTHENTICATION**

enumerator **ESP\_GATT\_REQ\_NOT\_SUPPORTED**

enumerator **ESP\_GATT\_INVALID\_OFFSET**

enumerator **ESP\_GATT\_INSUF\_AUTHORIZATION**

enumerator **ESP\_GATT\_PREPARE\_Q\_FULL**

enumerator **ESP\_GATT\_NOT\_FOUND**

enumerator **ESP\_GATT\_NOT\_LONG**

enumerator **ESP\_GATT\_INSUF\_KEY\_SIZE**

enumerator **ESP\_GATT\_INVALID\_ATTR\_LEN**

enumerator **ESP\_GATT\_ERR\_UNLIKELY**

enumerator **ESP\_GATT\_INSUF\_ENCRYPTION**

enumerator **ESP\_GATT\_UNSUPPORT\_GRP\_TYPE**

enumerator **ESP\_GATT\_INSUF\_RESOURCE**

enumerator **ESP\_GATT\_NO\_RESOURCES**

enumerator **ESP\_GATT\_INTERNAL\_ERROR**

enumerator **ESP\_GATT\_WRONG\_STATE**

enumerator **ESP\_GATT\_DB\_FULL**

enumerator **ESP\_GATT\_BUSY**

enumerator **ESP\_GATT\_ERROR**

enumerator **ESP\_GATT\_CMD\_STARTED**

enumerator **ESP\_GATT\_ILLEGAL\_PARAMETER**

enumerator **ESP\_GATT\_PENDING**

enumerator **ESP\_GATT\_AUTH\_FAIL**

enumerator **ESP\_GATT\_MORE**

enumerator **ESP\_GATT\_INVALID\_CFG**

enumerator **ESP\_GATT\_SERVICE\_STARTED**

enumerator **ESP\_GATT\_ENCRYPED\_MITM**

enumerator **ESP\_GATT\_ENCRYPED\_NO\_MITM**

enumerator **ESP\_GATT\_NOT\_ENCRYPTED**

enumerator **ESP\_GATT\_CONGESTED**

enumerator **ESP\_GATT\_DUP\_REG**

enumerator **ESP\_GATT\_ALREADY\_OPEN**

enumerator **ESP\_GATT\_CANCEL**

enumerator **ESP\_GATT\_STACK\_RSP**

enumerator **ESP\_GATT\_APP\_RSP**

enumerator **ESP\_GATT\_UNKNOWN\_ERROR**

enumerator **ESP\_GATT\_CCC\_CFG\_ERR**

enumerator **ESP\_GATT\_PRC\_IN\_PROGRESS**

enumerator **ESP\_GATT\_OUT\_OF\_RANGE**

enum **esp\_gatt\_conn\_reason\_t**

Gatt Connection reason enum.

*Values:*

enumerator **ESP\_GATT\_CONN\_UNKNOWN**

Gatt connection unknown

enumerator **ESP\_GATT\_CONN\_L2C\_FAILURE**

General L2cap failure

enumerator **ESP\_GATT\_CONN\_TIMEOUT**

Connection timeout

enumerator **ESP\_GATT\_CONN\_TERMINATE\_PEER\_USER**

Connection terminate by peer user

enumerator **ESP\_GATT\_CONN\_TERMINATE\_LOCAL\_HOST**

Connection terminated by local host

enumerator **ESP\_GATT\_CONN\_FAIL\_ESTABLISH**

Connection fail to establish

enumerator **ESP\_GATT\_CONN\_LMP\_TIMEOUT**

Connection fail for LMP response tout

enumerator **ESP\_GATT\_CONN\_CONN\_CANCEL**

L2CAP connection cancelled

enumerator **ESP\_GATT\_CONN\_NONE**

No connection to cancel

enum **esp\_gatt\_auth\_req\_t**

Gatt authentication request type.

*Values:*

enumerator **ESP\_GATT\_AUTH\_REQ\_NONE**

enumerator **ESP\_GATT\_AUTH\_REQ\_NO\_MITM**

enumerator **ESP\_GATT\_AUTH\_REQ\_MITM**

enumerator **ESP\_GATT\_AUTH\_REQ\_SIGNED\_NO\_MITM**

enumerator **ESP\_GATT\_AUTH\_REQ\_SIGNED\_MITM**

enum **esp\_service\_source\_t**

*Values:*

enumerator **ESP\_GATT\_SERVICE\_FROM\_REMOTE\_DEVICE**

enumerator **ESP\_GATT\_SERVICE\_FROM\_NVS\_FLASH**

enumerator **ESP\_GATT\_SERVICE\_FROM\_UNKNOWN**

enum **esp\_gatt\_write\_type\_t**

Gatt write type.

*Values:*

enumerator **ESP\_GATT\_WRITE\_TYPE\_NO\_RSP**

Gatt write attribute need no response

enumerator **ESP\_GATT\_WRITE\_TYPE\_RSP**

Gatt write attribute need remote response

enum **esp\_gatt\_db\_attr\_type\_t**

the type of attribute element

*Values:*

enumerator **ESP\_GATT\_DB\_PRIMARY\_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP\_GATT\_DB\_SECONDARY\_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP\_GATT\_DB\_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP\_GATT\_DB\_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP\_GATT\_DB\_INCLUDED\_SERVICE**

Gattc include service attribute type in the cache

enumerator **ESP\_GATT\_DB\_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

## GATT SERVER API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - [bluetooth/bluedroid/ble/gatt\\_server\\_service\\_table](#)
  - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - [bluetooth/bluedroid/ble/gatt\\_server](#)
  - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_server](#)

## API Reference

### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_gatts\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_gatts\_register\_callback** (*esp\_gatts\_cb\_t* callback)

This function is called to register application callbacks with BTA GATTS module.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_register** (uint16\_t app\_id)

This function is called to register application identifier.

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_unregister** (*esp\_gatt\_if\_t* gatts\_if)

unregister with GATT Server.

参数 **gatts\_if** –[in] GATT server access interface

返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_create\_service** (*esp\_gatt\_if\_t* gatts\_if, *esp\_gatt\_srvc\_id\_t* \*service\_id, uint16\_t num\_handle)

Create a service. When service creation is done, a callback event ESP\_GATTS\_CREATE\_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

参数

- **gatts\_if** –[in] GATT server access interface

- **service\_id** –[in] service ID.
- **num\_handle** –[in] number of handle requested for this service.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_create\_attr\_tab** (const *esp\_gatts\_attr\_db\_t* \*gatts\_attr\_db, *esp\_gatt\_if\_t* gatts\_if, uint8\_t max\_nb\_attr, uint8\_t srvc\_inst\_id)

Create a service attribute tab.

**参数**

- **gatts\_attr\_db** –[in] the pointer to the service attr tab
- **gatts\_if** –[in] GATT server access interface
- **max\_nb\_attr** –[in] the number of attribute to be added to the service database.
- **srvc\_inst\_id** –[in] the instance id of the service

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_included\_service** (uint16\_t service\_handle, uint16\_t included\_service\_handle)

This function is called to add an included service. This function have to be called between ‘esp\_ble\_gatts\_create\_service’ and ‘esp\_ble\_gatts\_add\_char’. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

**参数**

- **service\_handle** –[in] service handle to which this included service is to be added.
- **included\_service\_handle** –[in] the service ID to be included.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_char** (uint16\_t service\_handle, *esp\_bt\_uuid\_t* \*char\_uuid, *esp\_gatt\_perm\_t* perm, *esp\_gatt\_char\_prop\_t* property, *esp\_attr\_value\_t* \*char\_val, *esp\_attr\_control\_t* \*control)

This function is called to add a characteristic into a service.

**参数**

- **service\_handle** –[in] service handle to which this included service is to be added.
- **char\_uuid** –[in] : Characteristic UUID.
- **perm** –[in] : Characteristic value declaration attribute permission.
- **property** –[in] : Characteristic Properties
- **char\_val** –[in] : Characteristic value
- **control** –[in] : attribute response control byte

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_char\_descr** (uint16\_t service\_handle, *esp\_bt\_uuid\_t* \*descr\_uuid, *esp\_gatt\_perm\_t* perm, *esp\_attr\_value\_t* \*char\_descr\_val, *esp\_attr\_control\_t* \*control)

This function is called to add characteristic descriptor. When it’s done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

**参数**

- **service\_handle** –[in] service handle to which this characteristic descriptor is to be added.
- **perm** –[in] descriptor access permission.
- **descr\_uuid** –[in] descriptor UUID.
- **char\_descr\_val** –[in] : Characteristic descriptor value
- **control** –[in] : attribute response control byte

## 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_delete\_service** (uint16\_t service\_handle)

This function is called to delete a service. When this is done, a callback event ESP\_GATTS\_DELETE\_EVT is report with the status.

**参数** **service\_handle** –[in] service\_handle to be deleted.

## 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_start\_service** (uint16\_t service\_handle)

This function is called to start a service.

**参数** **service\_handle** –[in] the service handle to be started.

## 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_stop\_service** (uint16\_t service\_handle)

This function is called to stop a service.

**参数** **service\_handle** –[in] - service to be topped.

## 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_indicate** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint16\_t attr\_handle, uint16\_t value\_len, uint8\_t \*value, bool need\_confirm)

Send indicate or notify to GATT client. Set param need\_confirm as false will send notification, otherwise indication.

## 参数

- **gatts\_if** –[in] GATT server access interface
- **conn\_id** –[in] - connection id to indicate.
- **attr\_handle** –[in] - attribute handle to indicate.
- **value\_len** –[in] - indicate value length.
- **value** –[in] value to indicate.
- **need\_confirm** –[in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

## 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_response** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint32\_t trans\_id, *esp\_gatt\_status\_t* status, *esp\_gatt\_rsp\_t* \*rsp)

This function is called to send a response to a request.

## 参数

- **gatts\_if** –[in] GATT server access interface
- **conn\_id** –[in] - connection identifier.
- **trans\_id** –[in] - transfer id
- **status** –[in] - response status
- **rsp** –[in] - response data.

## 返回

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_set\_attr\_value** (uint16\_t attr\_handle, uint16\_t length, const uint8\_t \*value)

This function is called to set the attribute value by the application.

**参数**

- **attr\_handle** –[in] the attribute handle which to be set
- **length** –[in] the value length
- **value** –[in] the pointer to the attribute value

**返回**

- ESP\_OK : success
- other : failed

*esp\_gatt\_status\_t* **esp\_ble\_gatts\_get\_attr\_value** (uint16\_t attr\_handle, uint16\_t \*length, const uint8\_t \*\*value)

Retrieve attribute value.

**参数**

- **attr\_handle** –[in] Attribute handle.
- **length** –[out] pointer to the attribute value length
- **value** –[out] Pointer to attribute value payload, the value cannot be modified by user

**返回**

- ESP\_GATT\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_open** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda, bool is\_direct)

Open a direct open connection or add a background auto connection.

**参数**

- **gatts\_if** –[in] GATT server access interface
- **remote\_bda** –[in] remote device bluetooth device address.
- **is\_direct** –[in] direct connection or background auto connection

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_close** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id)

Close a connection a remote device.

**参数**

- **gatts\_if** –[in] GATT server access interface
- **conn\_id** –[in] connection ID to be closed.

**返回**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_service\_change\_indication** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda)

Send service change indication.

**参数**

- **gatts\_if** –[in] GATT server access interface
- **remote\_bda** –[in] remote device bluetooth device address. If remote\_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

**返回**

- ESP\_OK : success
- other : failed

**Unions**

union **esp\_ble\_gatts\_cb\_param\_t**

#include <esp\_gatts\_api.h> Gatt server callback parameters union.

**Public Members**

- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_reg\_evt\_param* **reg**  
Gatt server callback param of ESP\_GATTS\_REG\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_read\_evt\_param* **read**  
Gatt server callback param of ESP\_GATTS\_READ\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_write\_evt\_param* **write**  
Gatt server callback param of ESP\_GATTS\_WRITE\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_exec\_write\_evt\_param* **exec\_write**  
Gatt server callback param of ESP\_GATTS\_EXEC\_WRITE\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_mtu\_evt\_param* **mtu**  
Gatt server callback param of ESP\_GATTS\_MTU\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_conf\_evt\_param* **conf**  
Gatt server callback param of ESP\_GATTS\_CONF\_EVT (confirm)
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_create\_evt\_param* **create**  
Gatt server callback param of ESP\_GATTS\_CREATE\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_incl\_srvc\_evt\_param* **add\_incl\_srvc**  
Gatt server callback param of ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_char\_evt\_param* **add\_char**  
Gatt server callback param of ESP\_GATTS\_ADD\_CHAR\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_char\_descr\_evt\_param* **add\_char\_descr**  
Gatt server callback param of ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_delete\_evt\_param* **del**  
Gatt server callback param of ESP\_GATTS\_DELETE\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_start\_evt\_param* **start**  
Gatt server callback param of ESP\_GATTS\_START\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_stop\_evt\_param* **stop**  
Gatt server callback param of ESP\_GATTS\_STOP\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_connect\_evt\_param* **connect**  
Gatt server callback param of ESP\_GATTS\_CONNECT\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_disconnect\_evt\_param* **disconnect**  
Gatt server callback param of ESP\_GATTS\_DISCONNECT\_EVT
- struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_open\_evt\_param* **open**  
Gatt server callback param of ESP\_GATTS\_OPEN\_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open  
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close  
    Gatt server callback param of ESP_GATTS_CLOSE_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest  
    Gatt server callback param of ESP_GATTS_CONGEST_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp  
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab  
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val  
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change  
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

The attribute handle

*esp\_gatt\_status\_t* **status**

Operation status

struct **gatts\_start\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_START\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

struct **gatts\_stop\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_STOP\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

struct **gatts\_write\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_WRITE\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint32\_t **trans\_id**

Transfer id

*esp\_bd\_addr\_t* **bda**

The bluetooth device address which been written

uint16\_t **handle**

The attribute handle

uint16\_t **offset**

Offset of the value, if the value is too long

bool **need\_rsp**

The write operation need to do response

bool **is\_prep**

This write operation is prepare write

uint16\_t **len**

The write attribute value length

uint8\_t \***value**

The write attribute value

### Macros

**ESP\_GATT\_PREP\_WRITE\_CANCEL**

Prepare write flag to indicate cancel prepare write

**ESP\_GATT\_PREP\_WRITE\_EXEC**

Prepare write flag to indicate execute prepare write

## Type Definitions

```
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

**Param event** : Event type

**Param gatts\_if** : GATT server access interface, normally different gatts\_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

## Enumerations

```
enum esp_gatts_cb_event_t
```

GATT Server callback function events.

*Values:*

enumerator **ESP\_GATTS\_REG\_EVT**

When register application id, the event comes

enumerator **ESP\_GATTS\_READ\_EVT**

When gatt client request read operation, the event comes

enumerator **ESP\_GATTS\_WRITE\_EVT**

When gatt client request write operation, the event comes

enumerator **ESP\_GATTS\_EXEC\_WRITE\_EVT**

When gatt client request execute write, the event comes

enumerator **ESP\_GATTS\_MTU\_EVT**

When set mtu complete, the event comes

enumerator **ESP\_GATTS\_CONF\_EVT**

When receive confirm, the event comes

enumerator **ESP\_GATTS\_UNREG\_EVT**

When unregister application id, the event comes

enumerator **ESP\_GATTS\_CREATE\_EVT**

When create service complete, the event comes

enumerator **ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT**

When add included service complete, the event comes

enumerator **ESP\_GATTS\_ADD\_CHAR\_EVT**

When add characteristic complete, the event comes

enumerator **ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT**

When add descriptor complete, the event comes

enumerator **ESP\_GATTS\_DELETE\_EVT**

When delete service complete, the event comes

enumerator **ESP\_GATTS\_START\_EVT**

When start service complete, the event comes

enumerator **ESP\_GATTS\_STOP\_EVT**

When stop service complete, the event comes

enumerator **ESP\_GATTS\_CONNECT\_EVT**

When gatt client connect, the event comes

enumerator **ESP\_GATTS\_DISCONNECT\_EVT**

When gatt client disconnect, the event comes

enumerator **ESP\_GATTS\_OPEN\_EVT**

When connect to peer, the event comes

enumerator **ESP\_GATTS\_CANCEL\_OPEN\_EVT**

When disconnect from peer, the event comes

enumerator **ESP\_GATTS\_CLOSE\_EVT**

When gatt server close, the event comes

enumerator **ESP\_GATTS\_LISTEN\_EVT**

When gatt listen to be connected the event comes

enumerator **ESP\_GATTS\_CONGEST\_EVT**

When congest happen, the event comes

enumerator **ESP\_GATTS\_RESPONSE\_EVT**

When gatt send response complete, the event comes

enumerator **ESP\_GATTS\_CREAT\_ATTR\_TAB\_EVT**

When gatt create table complete, the event comes

enumerator **ESP\_GATTS\_SET\_ATTR\_VAL\_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT**

When gatt send service change indication complete, the event comes

## GATT CLIENT API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - [bluetooth/bluedroid/ble/gatt\\_client](#)

- [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - [bluetooth/bluedroid/ble/gattc\\_multi\\_connect](#)
  - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_client](#)

## API Reference

### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_gattc\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_gattc\_register\_callback** (*esp\_gattc\_cb\_t* callback)

This function is called to register application callbacks with GATTC module.

**参数 callback** –[in] : pointer to the application callback function.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_app\_register** (uint16\_t app\_id)

This function is called to register application callbacks with GATTC module.

**参数 app\_id** –[in] : Application Identify (UUID), for different application

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_app\_unregister** (*esp\_gatt\_if\_t* gattc\_if)

This function is called to unregister an application from GATTC module.

**参数 gattc\_if** –[in] Gatt client access interface.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

Open a direct connection or add a background auto connection.

**参数**

- **gattc\_if** –[in] Gatt client access interface.
- **remote\_bda** –[in] remote device bluetooth device address.
- **remote\_addr\_type** –[in] remote device bluetooth device the address type.
- **is\_direct** –[in] direct connection or background auto connection (by now, background auto connection is not supported).

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_aux\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app\_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp\_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device).

**参数**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID to be closed.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_send\_mtu\_req** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp\_ble\_gatt\_set\_local\_mtu() to configure the local MTU size.

**参数**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID.

**返回**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_search\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*filter\_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

**参数**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID.
- **filter\_uuid** –[in] a UUID of the service application is interested in. If Null, discover for all services.

**返回**

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*svc\_uuid, *esp\_gattc\_service\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc\_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp\_ble\_gattc\_cache\_refresh, then call esp\_ble\_gattc\_get\_service again.

**参数**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **svc\_uuid** –[in] the pointer to the service uuid.
- **result** –[out] The pointer to the service which has been found in the gattc cache.
- **count** –[inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** –[in] Offset of the service position to get.

**返回**

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_all\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_gattc\_char\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle.
- **end\_handle** –[in] the attribute end handle
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** –[in] Offset of the characteristic position to get.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_all\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t char\_handle, *esp\_gattc\_descr\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **char\_handle** –[in] the given characteristic handle
- **result** –[out] The pointer to the descriptor in the characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** –[in] Offset of the descriptor position to get.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_char\_by\_uuid** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* char\_uuid, *esp\_gattc\_char\_elem\_t* \*result, uint16\_t \*count)

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **char\_uuid** –[in] the characteristic uuid
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_descr\_by\_uuid** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* char\_uuid, *esp\_bt\_uuid\_t* descr\_uuid, *esp\_gattc\_descr\_elem\_t* \*result, uint16\_t \*count)

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local

cache, won't get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **char\_uuid** –[in] the characteristic uuid.
- **descr\_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_descr\_by\_char\_handle** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t char\_handle, *esp\_bt\_uuid\_t* descr\_uuid, *esp\_gattc\_descr\_elem\_t* \*result, uint16\_t \*count)

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **char\_handle** –[in] the characteristic handle.
- **descr\_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_include\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* \*incl\_uuid, *esp\_gattc\_incl\_svc\_elem\_t* \*result, uint16\_t \*count)

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **incl\_uuid** –[in] the include service uuid
- **result** –[out] The pointer to the include service in the given service.
- **count** –[inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_attr\_count** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gatt\_db\_attr\_type\_t* type, uint16\_t start\_handle, uint16\_t end\_handle, uint16\_t char\_handle, uint16\_t \*count)

Find the attribute count with the given service or characteristic in the gattc cache.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **type** –[in] the attribute type.
- **start\_handle** –[in] the attribute start handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- **end\_handle** –[in] the attribute end handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- **char\_handle** –[in] the characteristic handle, this parameter valid when the type is ESP\_GATT\_DB\_DESCRIPTOR. If the type isn' t ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore.
- **count** –[out] output the number of attribute has been found in the gattc cache with the given attribute type.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_db** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_gattc\_db\_elem\_t* \*db, uint16\_t \*count)

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won' t get from remote devices.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **conn\_id** –[in] connection ID which identify the server.
- **db** –[in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** –[in] number of elements in database.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a service' s characteristics of the given characteristic handle.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteritic handle to read.
- **auth\_req** –[in] : authenticate request type

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_by\_type** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* \*uuid, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a service' s characteristics of the given characteristic UUID.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **start\_handle** –[in] : the attribute start handle.
- **end\_handle** –[in] : the attribute end handle
- **uuid** –[in] : The UUID of attribute which will be read.

- **auth\_req** –[in] : authenticate request type
- 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_multiple** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gattc\_multi\_t* \*read\_multi, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read multiple characteristic or characteristic descriptors.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **read\_multi** –[in] : pointer to the read multiple parameter.
- **auth\_req** –[in] : authenticate request type

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a characteristics descriptor.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : descriptor handle to read.
- **auth\_req** –[in] : authenticate request type

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_write\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_write\_type\_t* write\_type, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to write characteristic value.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to write.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write\_type** –[in] : the type of attribute write operation.
- **auth\_req** –[in] : authentication request.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_write\_type\_t* write\_type, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to write characteristic descriptor value.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID
- **handle** –[in] : descriptor handle to write.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write\_type** –[in] : the type of attribute write operation.
- **auth\_req** –[in] : authentication request.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic value.

## 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth\_req** –[in] : authentication request.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic descriptor value.

## 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteristic descriptor handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth\_req** –[in] : authentication request.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_execute\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, bool is\_execute)

This function is called to execute write a prepare write sequence.

## 参数

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **is\_execute** –[in] : execute or cancel.

## 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_register\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to register for notification of a service.

## 参数

- **gattc\_if** –[in] Gatt client access interface.
- **server\_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

## 返回

- ESP\_OK: registration succeeds
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_unregister\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, *uint16\_t* handle)

This function is called to de-register for notification of a service.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **server\_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

#### 返回

- ESP\_OK: unregister succeeds
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* remote\_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

参数 **remote\_bda** –[in] remote device BD address.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_assoc** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* src\_addr, *esp\_bd\_addr\_t* assoc\_addr, bool is\_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to use the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

#### 参数

- **gattc\_if** –[in] Gatt client access interface.
- **src\_addr** –[in] the source address which provide the attribute table.
- **assoc\_addr** –[in] the associated device address which went to share the attribute table with the source address.
- **is\_assoc** –[in] true add the associated device address, false remove the associated device address.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_get\_addr\_list** (*esp\_gatt\_if\_t* gattc\_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP\_GATTC\_GET\_ADDR\_LIST\_EVT event when get address list complete.

参数 **gattc\_if** –[in] Gatt client access interface.

#### 返回

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_clean** (*esp\_bd\_addr\_t* remote\_bda)

Clean the service cache of this device in the gattc stack,.

参数 **remote\_bda** –[in] remote device BD address.

#### 返回

- ESP\_OK: success
- other: failed

## Unions

union **esp\_ble\_gattc\_cb\_param\_t**

*#include <esp\_gattc\_api.h>* Gatt client callback parameters union.

### Public Members

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_reg\_evt\_param* **reg**

Gatt client callback param of ESP\_GATTC\_REG\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_open\_evt\_param* **open**

Gatt client callback param of ESP\_GATTC\_OPEN\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_close\_evt\_param* **close**

Gatt client callback param of ESP\_GATTC\_CLOSE\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_cfg\_mtu\_evt\_param* **cfg\_mtu**

Gatt client callback param of ESP\_GATTC\_CFG\_MTU\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_search\_cmpl\_evt\_param* **search\_cmpl**

Gatt client callback param of ESP\_GATTC\_SEARCH\_CMPL\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_search\_res\_evt\_param* **search\_res**

Gatt client callback param of ESP\_GATTC\_SEARCH\_RES\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_read\_char\_evt\_param* **read**

Gatt client callback param of ESP\_GATTC\_READ\_CHAR\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_write\_evt\_param* **write**

Gatt client callback param of ESP\_GATTC\_WRITE\_DESCR\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_exec\_cmpl\_evt\_param* **exec\_cmpl**

Gatt client callback param of ESP\_GATTC\_EXEC\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_notify\_evt\_param* **notify**

Gatt client callback param of ESP\_GATTC\_NOTIFY\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_srvc\_chg\_evt\_param* **srvc\_chg**

Gatt client callback param of ESP\_GATTC\_SRVC\_CHG\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_congest\_evt\_param* **congest**

Gatt client callback param of ESP\_GATTC\_CONGEST\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_reg\_for\_notify\_evt\_param* **reg\_for\_notify**

Gatt client callback param of ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_unreg\_for\_notify\_evt\_param* **unreg\_for\_notify**

Gatt client callback param of ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT

```
struct esp_ble_gattc_cb_param_t::gattc_connect_evt_param connect  
    Gatt client callback param of ESP_GATTC_CONNECT_EVT  
  
struct esp_ble_gattc_cb_param_t::gattc_disconnect_evt_param disconnect  
    Gatt client callback param of ESP_GATTC_DISCONNECT_EVT  
  
struct esp_ble_gattc_cb_param_t::gattc_set_assoc_addr_cmp_evt_param set_assoc_cmp  
    Gatt client callback param of ESP_GATTC_SET_ASSOC_EVT  
  
struct esp_ble_gattc_cb_param_t::gattc_get_addr_list_evt_param get_addr_list  
    Gatt client callback param of ESP_GATTC_GET_ADDR_LIST_EVT  
  
struct esp_ble_gattc_cb_param_t::gattc_queue_full_evt_param queue_full  
    Gatt client callback param of ESP_GATTC_QUEUE_FULL_EVT  
  
struct esp_ble_gattc_cb_param_t::gattc_dis_srvc_cmpl_evt_param dis_srvc_cmpl  
    Gatt client callback param of ESP_GATTC_DIS_SRVC_CMPL_EVT  
  
struct gattc_cfg_mtu_evt_param  
    #include <esp_gattc_api.h> ESP_GATTC_CFG_MTU_EVT.
```

### Public Members

```

    #include <esp_gattc_api.h> ESP_GATTC_CLOSE_EVT.
```

### Public Members

```
esp_gatt_status_t status  
    Operation status  
  
uint16_t conn_id  
    Connection id  
  
esp_bd_addr_t remote_bda  
    Remote bluetooth device address
```

*esp\_gatt\_conn\_reason\_t* **reason**

The reason of gatt connection close

struct **gattc\_congest\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_CONGEST\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

bool **congested**

Congested or not

struct **gattc\_connect\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_CONNECT\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint8\_t **link\_role**

Link role : master role = 0 ; slave role = 1

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

*esp\_gatt\_conn\_params\_t* **conn\_params**

current connection parameters

struct **gattc\_dis\_srvc\_cmpl\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

struct **gattc\_disconnect\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_DISCONNECT\_EVT.

### Public Members

*esp\_gatt\_conn\_reason\_t* **reason**

disconnection reason

uint16\_t **conn\_id**

Connection id

uint8\_t **link\_role**

Link role : master role = 0 ; slave role = 1

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

struct **gattc\_exec\_cmpl\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_EXEC\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

struct **gattc\_get\_addr\_list\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_GET\_ADDR\_LIST\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint8\_t **num\_addr**

The number of address in the gattc cache address list

*esp\_bd\_addr\_t* \***addr\_list**

The pointer to the address list which has been get from the gattc cache

struct **gattc\_notify\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_NOTIFY\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

uint16\_t **handle**

The Characteristic or descriptor handle

uint16\_t **value\_len**

Notify attribute value

uint8\_t \***value**

Notify attribute value

bool **is\_notify**

True means notify, false means indicate

struct **gattc\_open\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_OPEN\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

uint16\_t **mtu**

MTU size

struct **gattc\_queue\_full\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_QUEUE\_FULL\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

bool **is\_full**

The gattc command queue is full or not

struct **gattc\_read\_char\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_READ\_CHAR\_EVT, ESP\_GATTC\_READ\_DESCR\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

uint16\_t **handle**

Characteristic handle

uint8\_t \***value**

Characteristic value

uint16\_t **value\_len**

Characteristic value length

struct **gattc\_reg\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_REG\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **app\_id**

Application id which input in register API

struct **gattc\_reg\_for\_notify\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **handle**

The characteristic or descriptor handle

struct **gattc\_search\_cmpl\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SEARCH\_CMPL\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

*esp\_service\_source\_t* **searched\_service\_source**

The source of the service information

struct **gattc\_search\_res\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SEARCH\_RES\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint16\_t **start\_handle**

Service start handle

uint16\_t **end\_handle**

Service end handle

*esp\_gatt\_id\_t* **srvc\_id**

Service id, include service uuid and other information

bool **is\_primary**

True if this is the primary service

struct **gattc\_set\_assoc\_addr\_cmp\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SET\_ASSOC\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

struct **gattc\_srvc\_chg\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SRVC\_CHG\_EVT.

### Public Members

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

struct **gattc\_unreg\_for\_notify\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **handle**

The characteristic or descriptor handle

struct **gattc\_write\_evt\_param**

```
#include <esp_gattc_api.h> ESP_GATTC_WRITE_CHAR_EVT, ESP_GATTC_PREP_WRITE_EVT,  
ESP_GATTC_WRITE_DESCR_EVT.
```

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

uint16\_t **handle**

The Characteristic or descriptor handle

uint16\_t **offset**

The prepare write offset, this value is valid only when prepare write

### Type Definitions

```
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t  
*param)
```

GATT Client callback function type.

**Param event** : Event type

**Param gattc\_if** : GATT client access interface, normally different gattc\_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

### Enumerations

enum **esp\_gattc\_cb\_event\_t**

GATT Client callback function events.

*Values:*

enumerator **ESP\_GATTC\_REG\_EVT**

When GATT client is registered, the event comes

enumerator **ESP\_GATTC\_UNREG\_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP\_GATTC\_OPEN\_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP\_GATTC\_READ\_CHAR\_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP\_GATTC\_WRITE\_CHAR\_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP\_GATTC\_CLOSE\_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP\_GATTC\_SEARCH\_CMPL\_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP\_GATTC\_SEARCH\_RES\_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP\_GATTC\_READ\_DESCR\_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP\_GATTC\_WRITE\_DESCR\_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP\_GATTC\_NOTIFY\_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP\_GATTC\_PREP\_WRITE\_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP\_GATTC\_EXEC\_EVT**

When write execution completes, the event comes

enumerator **ESP\_GATTC\_ACL\_EVT**

When ACL connection is up, the event comes

enumerator **ESP\_GATTC\_CANCEL\_OPEN\_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP\_GATTC\_SRVC\_CHG\_EVT**

When “service changed” occurs, the event comes

enumerator **ESP\_GATTC\_ENC\_CMPL\_CB\_EVT**

When encryption procedure completes, the event comes

enumerator **ESP\_GATTC\_CFG\_MTU\_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP\_GATTC\_ADV\_DATA\_EVT**

When advertising of data, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_ENB\_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_UPD\_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_DATA\_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_DIS\_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP\_GATTC\_CONGEST\_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_ENB\_EVT**

When batch scan is enabled, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_CFG\_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_RD\_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_THR\_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_PARAM\_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_DIS\_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_CFG\_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_PARAM\_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_STATUS\_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP\_GATTC\_ADV\_VSC\_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP\_GATTC\_CONNECT\_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP\_GATTC\_DISCONNECT\_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP\_GATTC\_READ\_MULTIPLE\_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP\_GATTC\_QUEUE\_FULL\_EVT**

When the gattc command queue full, the event comes

enumerator **ESP\_GATTC\_SET\_ASSOC\_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP\_GATTC\_GET\_ADDR\_LIST\_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT**

When the ble discover service complete, the event comes

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example** Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’ s wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

## API Reference

### Header File

- [components/bt/common/api/include/api/esp\\_blufi\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_blufi\_register\_callbacks** (*esp\_blufi\_callbacks\_t* \*callbacks)

This function is called to receive blufi callback event.

参数 **callbacks** –[in] callback functions

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_init** (void)

This function is called to initialize blufi\_profile.

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_deinit** (void)

This function is called to de-initialize blufi\_profile.

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_conn\_report** (*wifi\_mode\_t* opmode, *esp\_blufi\_sta\_conn\_state\_t* sta\_conn\_state, *uint8\_t* softap\_conn\_num, *esp\_blufi\_extra\_info\_t* \*extra\_info)

This function is called to send wifi connection report.

参数

- **opmode** –: wifi opmode
- **sta\_conn\_state** –: station is already in connection or not
- **softap\_conn\_num** –: softap connection number
- **extra\_info** –: extra information, such as sta\_ssid, softap\_ssid and etc.

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_list** (*uint16\_t* apCount, *esp\_blufi\_ap\_record\_t* \*list)

This function is called to send wifi list.

参数

- **apCount** –: wifi list count
- **list** –: wifi list

返回 ESP\_OK - success, other - failed

*uint16\_t* **esp\_blufi\_get\_version** (void)

Get BLUFI profile version.

返回 Most 8bit significant is Great version, Least 8bit is Sub version

*esp\_err\_t* **esp\_blufi\_send\_error\_info** (*esp\_blufi\_error\_state\_t* state)

This function is called to send blufi error information.

参数 **state** –: error state

返回 ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_custom\_data** (*uint8\_t* \*data, *uint32\_t* data\_len)

This function is called to custom data.

参数

- **data** –: custom data value
- **data\_len** –: the length of custom data

返回 ESP\_OK - success, other - failed

**Unions**

union **esp\_blufi\_cb\_param\_t**

#include <esp\_blufi\_api.h> BLUFI callback parameters union.

## Public Members

struct *esp\_blufi\_cb\_param\_t::blufi\_init\_finish\_evt\_param* **init\_finish**  
Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

struct *esp\_blufi\_cb\_param\_t::blufi\_deinit\_finish\_evt\_param* **deinit\_finish**  
Blufi callback param of ESP\_BLUFI\_EVENT\_DEINIT\_FINISH

struct *esp\_blufi\_cb\_param\_t::blufi\_set\_wifi\_mode\_evt\_param* **wifi\_mode**  
Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

struct *esp\_blufi\_cb\_param\_t::blufi\_connect\_evt\_param* **connect**  
Blufi callback param of ESP\_BLUFI\_EVENT\_CONNECT

struct *esp\_blufi\_cb\_param\_t::blufi\_disconnect\_evt\_param* **disconnect**  
Blufi callback param of ESP\_BLUFI\_EVENT\_DISCONNECT

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_bssid\_evt\_param* **sta\_bssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_BSSID

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_ssid\_evt\_param* **sta\_ssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_SSID

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_passwd\_evt\_param* **sta\_passwd**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_PASSWD

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_ssid\_evt\_param* **softap\_ssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_SSID

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_passwd\_evt\_param* **softap\_passwd**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_PASSWD

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_max\_conn\_num\_evt\_param* **softap\_max\_conn\_num**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_MAX\_CONN\_NUM

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_auth\_mode\_evt\_param* **softap\_auth\_mode**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_AUTH\_MODE

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_channel\_evt\_param* **softap\_channel**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_CHANNEL

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_username\_evt\_param* **username**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_USERNAME

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_ca\_evt\_param* **ca**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_CA\_CERT

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_client\_cert\_evt\_param* **client\_cert**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_CLIENT\_CERT

```

struct **esp\_blufi\_ap\_record\_t**

Description of an WiFi AP.

### Public Members

uint8\_t **ssid**[33]

SSID of AP

int8\_t **rssi**

signal strength of AP

struct **esp\_blufi\_callbacks\_t**

BLUFI callback functions type.

### Public Members

*esp\_blufi\_event\_cb\_t* **event\_cb**

BLUFI event callback

*esp\_blufi\_negotiate\_data\_handler\_t* **negotiate\_data\_handler**

BLUFI negotiate data function for negotiate share key

*esp\_blufi\_encrypt\_func\_t* **encrypt\_func**

BLUFI encrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_decrypt\_func\_t* **decrypt\_func**

BLUFI decrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_checksum\_func\_t* **checksum\_func**

BLUFI check sum function (FCS)

### Macros

**ESP\_BD\_ADDR\_LEN**

Bluetooth address length.

### Type Definitions

typedef uint8\_t **esp\_bd\_addr\_t**[6]

Bluetooth device address.

typedef void (\***esp\_blufi\_event\_cb\_t**)(*esp\_blufi\_cb\_event\_t* event, *esp\_blufi\_cb\_param\_t* \*param)

BLUFI event callback function type.

**Param event** : Event type

**Param param** : Point to callback parameter, currently is union type

```
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data,
int *output_len, bool *need_free)
```

BLUFI negotiate data handler.

**Param data** : data from phone

**Param len** : length of data from phone

**Param output\_data** : data want to send to phone

**Param output\_len** : length of data want to send to phone

**Param need\_free** : output reporting if memory needs to be freed or not \*

```
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI encrypt the data after negotiate a share key.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt\_data** : plain text and encrypted data, the encrypt function must support autochthonous encrypt

**Param crypt\_len** : length of plain text

**Return** Nonnegative number is encrypted length, if error, return negative number;

```
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt\_data** : encrypted data and plain text, the encrypt function must support autochthonous decrypt

**Param crypt\_len** : length of encrypted text

**Return** Nonnegative number is decrypted length, if error, return negative number;

```
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number

**Param data** : data need to checksum

**Param len** : length of data

## Enumerations

## 2.1.4 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and

FreeRTOS. The underlying controller is still the same (as in case of Blueroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

## Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

图 1: ESP NimBLE Stack

## Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

## Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

**Typical programming sequence with NimBLE stack consists of the following steps:**

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

## API Reference

### Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

**Functions****`esp_err_t esp_nimble_hci_init`** (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**返回**

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

**`esp_err_t esp_nimble_hci_and_controller_init`** (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

**返回**

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

**`esp_err_t esp_nimble_hci_deinit`** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

---

**备注:** This function should be called after the NimBLE host is deinitialized.

---

**返回**

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

**`esp_err_t esp_nimble_hci_and_controller_deinit`** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

```
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with
↳error: %d", ret);
    }
}
```

If `nimble_port_freertos_init()` is used during initialization, then `nimble_port_freertos_deinit()` should be called in the host task after `nimble_port_run()`.

---

**备注:** This function should not be executed in the context of Bluetooth host task.

---

---

**备注:** This function should be called after the NimBLE host is deinitialized.

---

#### 返回

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

#### Macros

**BLE\_HCI\_UART\_H4\_NONE**

**BLE\_HCI\_UART\_H4\_CMD**

**BLE\_HCI\_UART\_H4\_ACL**

**BLE\_HCI\_UART\_H4\_SCO**

**BLE\_HCI\_UART\_H4\_EVT**

### 2.1.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [ESP-BLE-MESH 快速入门](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH 架构](#).

## Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH 示例](#) and [ESP-BLE-MESH 演示视频](#).

## API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

## ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

## Header File

- [components/bt/esp\\_ble\\_mesh/api/esp\\_ble\\_mesh\\_defs.h](#)

## Unions

union **esp\_ble\_mesh\_prov\_cb\_param\_t**

*#include <esp\_ble\_mesh\_defs.h>* BLE Mesh Node/Provisioner callback parameters union.

## Public Members

provisioner_delete_node_with_uuid_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_UUID\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param
provisioner_delete_node_with_addr_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_ADDR\_COMP\_EVT

int **err\_code**

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner

Indicate the result of setting the heartbeat filter type by the Provisioner

Indicate the result of setting the heartbeat filter address by the Provisioner

Indicate the result of directly erasing settings by the Provisioner

Indicate the result of opening settings with index by the Provisioner

Indicate the result of opening settings with user id by the Provisioner

Indicate the result of closing settings with index by the Provisioner

Indicate the result of closing settings with user id by the Provisioner

Indicate the result of deleting settings with index by the Provisioner

Indicate the result of deleting settings with user id by the Provisioner

bool **enable**

Indicate enabling or disabling receiving heartbeat messages

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_enable_heartbeat_rcv_comp
```

ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT

uint8\_t **type**

Type of the filter used for receiving heartbeat messages

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_type_comp
```

ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT

uint8\_t **op**

Operation (add, remove, clean)

uint16\_t **hb\_src**

Heartbeat source address

uint16\_t **hb\_dst**

Heartbeat destination address

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]

**provisioner\_set\_heartbeat\_filter\_info\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT

uint8\_t **init\_ttl**

Heartbeat InitTTL

uint8\_t **rx\_ttl**

Heartbeat RxTTL

uint8\_t **hops**

Heartbeat hops (InitTTL - RxTTL + 1)

uint16\_t **feature**

Bit field of currently active features of the node

int8\_t **rss\_i**

RSSI of the heartbeat message

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous] **provisioner\_recv\_heartbeat**

ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]

**provisioner\_direct\_erase\_settings\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_DRIECT\_ERASE\_SETTINGS\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_DRIECT\_ERASE\_SETTINGS\_COMP\_EVT

uint8\_t **index**

Index of Provisioner settings

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]

**provisioner\_open\_settings\_with\_index\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT.

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT

char **uid**[20 + 1]

Provisioner settings user id

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]

**provisioner\_open\_settings\_with\_uid\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_index_comp
    ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
    Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_close_settings_with_uid_comp
    ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_index_comp
    ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
    Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_delete_settings_with_uid_comp
    ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.

### Public Members

```
uint16_t lpn_addr
```

Low Power Node unicast address

```
struct ble_mesh_friend_friendship_terminate_param
```

```
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
```

### Public Types

```
enum [anonymous]
```

This enum value is the reason of friendship termination on the friend node side

*Values:*

```
enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
```

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

```
enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
```

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

```
enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
```

Receive Friend Request from existing Low Power Node

```
enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
```

Receive Friend Clear from other friend node

enumerator **ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_DISABLE**

Friend feature disabled or corresponding NetKey is deleted

### Public Members

uint16\_t **lpn\_addr**

Low Power Node unicast address

enum *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_friend\_friendship\_terminate\_param::[anonymous]*  
**reason**

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

Indicate the result of setting BLE Mesh device name

union **esp\_ble\_mesh\_server\_state\_value\_t***#include <esp\_ble\_mesh\_defs.h>* Server model state value union.**Public Members****uint8\_t onoff**

The value of the Generic OnOff state

The value of the Light LC Light OnOff state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_onoff**

The Generic OnOff state

**int16\_t level**

The value of the Generic Level state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_level**

The Generic Level state

**uint8\_t onpowerup**

The value of the Generic OnPowerUp state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_onpowerup**  
The Generic OnPowerUp state

uint16\_t **power**  
The value of the Generic Power Actual state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_power\_actual**  
The Generic Power Actual state

uint16\_t **lightness**  
The value of the Light Lightness Actual state  
The value of the Light Lightness Linear state  
The value of the Light CTL Lightness state  
The value of the Light HSL Lightness state  
The value of the Light xyL Lightness state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_lightness\_actual**  
The Light Lightness Actual state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_lightness\_linear**  
The Light Lightness Linear state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_ctl\_lightness**  
The Light CTL Lightness state

uint16\_t **temperature**  
The value of the Light CTL Temperature state

int16\_t **delta\_uv**  
The value of the Light CTL Delta UV state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_ctl\_temp\_delta\_uv**  
The Light CTL Temperature & Delta UV states

uint16\_t **hue**  
The value of the Light HSL Hue state

uint16\_t **saturation**  
The value of the Light HSL Saturation state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl**  
The Light HSL composite state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl\_lightness**  
The Light HSL Lightness state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl\_hue**  
The Light HSL Hue state

```
struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
```

The Light HSL Saturation state

```
struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
```

The Light xyL Lightness state

```
struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
```

The Light LC Light OnOff state

```
union esp_ble_mesh_model_cb_param_t
```

```
#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.
```

### Public Members

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
```

Event parameter of ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param
```

```
client_send_timeout
```

Event parameter of ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param
```

```
model_publish_update
```

Event parameter of ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param
```

```
server_model_update_state
```

Event parameter of ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT

```
struct ble_mesh_client_model_send_timeout_param
```

```
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.
```

### Public Members

```
uint32_t opcode
```

Opcode of the previously sent message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which sends the previous message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Pointer to the context of the previous message

struct **ble\_mesh\_mod\_rcv\_publish\_msg\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT.

### Public Members

uint32\_t **opcode**

Opcode of the unsolicited received message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Pointer to the context of the message

uint16\_t **length**

Length of the received message

uint8\_t \***msg**

Value of the received message

struct **ble\_mesh\_model\_operation\_evt\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT.

### Public Members

uint32\_t **opcode**

Opcode of the received message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Pointer to the context of the received message

uint16\_t **length**

Length of the received message

uint8\_t \***msg**

Value of the received message

struct **ble\_mesh\_model\_publish\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of publishing a message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which publishes the message

struct **ble\_mesh\_model\_publish\_update\_evt\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT.

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which is going to update its publish message

struct **ble\_mesh\_model\_send\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of sending a message

uint32\_t **opcode**

Opcode of the message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which sends the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Context of the message

struct **ble\_mesh\_server\_model\_update\_state\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of updating server model state

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the server model which state value is updated

*esp\_ble\_mesh\_server\_state\_type\_t* **type**

Type of the updated server state

## Structures

struct **esp\_ble\_mesh\_deinit\_param\_t**

BLE Mesh deinit parameters

### Public Members

bool **erase\_flash**

Indicate if erasing flash when deinit mesh stack

struct **esp\_ble\_mesh\_elem\_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

### Public Members

uint16\_t **element\_addr**

Element Address, assigned during provisioning.

const uint16\_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8\_t **sig\_model\_count**

SIG Model count

const uint8\_t **vnd\_model\_count**

Vendor Model count

*esp\_ble\_mesh\_model\_t* \***sig\_models**

SIG Models

*esp\_ble\_mesh\_model\_t* \***vnd\_models**

Vendor Models

struct **esp\_ble\_mesh\_model\_pub\_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16\_t **publish\_addr**

Publish Address.

uint16\_t **app\_idx**

Publish AppKey Index.

uint16\_t **cred**

Friendship Credentials Flag.

uint16\_t **send\_rel**

Force reliable sending (segment acks)

uint8\_t **ttl**

Publish Time to Live.

uint8\_t **retransmit**

Retransmit Count & Interval Steps.

uint8\_t **period**

Publish Period.

uint8\_t **period\_div**

Divisor for the Period.

uint8\_t **fast\_period**

Use FastPeriodDivisor

uint8\_t **count**

Retransmissions left.

uint32\_t **period\_start**

Start of the current period.

struct net\_buf\_simple \***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

```
ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);
```

*esp\_ble\_mesh\_cb\_t* **update**

Callback used to update publish message. Initialized by the stack.

struct k\_delayed\_work **timer**

Publish Period Timer. Initialized by the stack.

uint8\_t **dev\_role**

Role of the device that is going to publish messages

struct **esp\_ble\_mesh\_model\_op\_t**

Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

### Public Members

const uint32\_t **opcode**

Message opcode

const size\_t **min\_len**

Message minimum length

*esp\_ble\_mesh\_cb\_t* **param\_cb**

Callback used to handle message. Initialized by the stack.

struct **esp\_ble\_mesh\_model\_cbs\_t**

Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

### Public Members

*esp\_ble\_mesh\_cb\_t* **init\_cb**

Callback used during model initialization. Initialized by the stack.

struct **esp\_ble\_mesh\_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`.

### Public Members

const uint16\_t **model\_id**

16-bit model identifier

uint16\_t **company\_id**

16-bit company identifier

uint16\_t **model\_id**

16-bit model identifier

struct *esp\_ble\_mesh\_model::*[anonymous]*::*[anonymous] **vnd**

Structure encapsulating a model ID with a company ID

union *esp\_ble\_mesh\_model::*[anonymous] **[anonymous]**

Model ID

uint8\_t **element\_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8\_t **model\_idx**

Is the Nth model in the element

uint16\_t **flags**

Information about what has changed

*esp\_ble\_mesh\_elem\_t* \***element**

The Element to which this Model belongs

*esp\_ble\_mesh\_model\_pub\_t* \*const **pub**

Model Publication

uint16\_t **keys**[CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT]

AppKey List

uint16\_t **groups**[CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT]

Subscription List (group or virtual addresses)

*esp\_ble\_mesh\_model\_op\_t* \***op**

Model operation context

*esp\_ble\_mesh\_model\_cb\_t* \***cb**

Model callback structure

void \***user\_data**

Model-specific user data

struct **esp\_ble\_mesh\_msg\_ctx\_t**

Message sending context. This structure is associated with struct `bt_mesh_msg_ctx` in `mesh_access.h`

### Public Members

uint16\_t **net\_idx**

NetKey Index of the subnet through which to send the message.

uint16\_t **app\_idx**

AppKey Index for message encryption.

uint16\_t **addr**

Remote address.

uint16\_t **recv\_dst**

Destination address of a received message. Not used for sending.

int8\_t **recv\_rssi**

RSSI of received packet. Not used for sending.

uint8\_t **recv\_ttl**

Received TTL value. Not used for sending.

uint8\_t **send\_rel**

Force sending reliably by using segment acknowledgement

uint8\_t **send\_ttl**

TTL, or ESP\_BLE\_MESH\_TTL\_DEFAULT for default TTL.

uint32\_t **recv\_op**

Opcode of a received message. Not used for sending message.

*esp\_ble\_mesh\_model\_t* \***model**

Model corresponding to the message, no need to be initialized before sending message

bool **srv\_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp\_ble\_mesh\_prov\_t**

Provisioning properties & capabilities. This structure is associated with struct bt\_mesh\_prov in mesh\_access.h

struct **esp\_ble\_mesh\_comp\_t**

Node Composition data context. This structure is associated with struct bt\_mesh\_comp in mesh\_access.h

### Public Members

uint16\_t **cid**

16-bit SIG-assigned company identifier

uint16\_t **pid**

16-bit vendor-assigned product identifier

uint16\_t **vid**

16-bit vendor-assigned product version identifier

size\_t **element\_count**

Element count

*esp\_ble\_mesh\_elem\_t* \***elements**

A sequence of elements

struct **esp\_ble\_mesh\_unprov\_dev\_add\_t**

Information of the device which is going to be added for provisioning.

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint16\_t **oob\_info**

Device OOB Info ADD\_DEV\_START\_PROV\_NOW\_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

*esp\_ble\_mesh\_prov\_bearer\_t* **bearer**

Provisioning Bearer

struct **esp\_ble\_mesh\_device\_delete\_t**

Information of the device which is going to be deleted.

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint8\_t **flag**

BIT0: device address; BIT1: device UUID

struct **esp\_ble\_mesh\_prov\_data\_info\_t**

Information of the provisioner which is going to be updated.

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **flags**

Flags

uint32\_t **iv\_index**

IV Index

uint8\_t **flag**

BIT0: net\_idx; BIT1: flags; BIT2: iv\_index

struct **esp\_ble\_mesh\_node\_t**

Information of the provisioned node

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Node device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Node device address type

uint8\_t **dev\_uuid**[16]

Device UUID

uint16\_t **oob\_info**

Node OOB information

uint16\_t **unicast\_addr**

Node unicast address

uint8\_t **element\_num**

Node element number

uint16\_t **net\_idx**

Node NetKey Index

uint8\_t **flags**

Node key refresh flag and iv update flag

uint32\_t **iv\_index**

Node IV Index

uint8\_t **dev\_key**[16]

Node device key

char **name**[31 + 1]

Node name

uint16\_t **comp\_length**

Length of Composition Data

uint8\_t \***comp\_data**

Value of Composition Data

struct **esp\_ble\_mesh\_fast\_prov\_info\_t**

Context of fast provisioning which need to be set.

**Public Members****uint16\_t unicast\_min**

Minimum unicast address used for fast provisioning

**uint16\_t unicast\_max**

Maximum unicast address used for fast provisioning

**uint16\_t net\_idx**

Netkey index used for fast provisioning

**uint8\_t flags**

Flags used for fast provisioning

**uint32\_t iv\_index**

IV Index used for fast provisioning

**uint8\_t offset**

Offset of the UUID to be compared

**uint8\_t match\_len**

Length of the UUID to be compared

**uint8\_t match\_val[16]**

Value of UUID to be compared

struct **esp\_ble\_mesh\_heartbeat\_filter\_info\_t**

Context of Provisioner heartbeat filter information to be set

**Public Members****uint16\_t hb\_src**

Heartbeat source address (unicast address)

**uint16\_t hb\_dst**

Heartbeat destination address (unicast address or group address)

struct **esp\_ble\_mesh\_client\_op\_pair\_t**

BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

**Public Members****uint32\_t cli\_op**

The client message opcode

uint32\_t **status\_op**

The server status opcode corresponding to the client message opcode

struct **esp\_ble\_mesh\_client\_t**

Client Model user data context.

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model. Initialized by the stack.

int **op\_pair\_size**

Size of the op\_pair

const *esp\_ble\_mesh\_client\_op\_pair\_t* \***op\_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32\_t **publish\_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void \***internal\_data**

Pointer to the internal data of client model

uint8\_t **msg\_role**

Role of the device (Node/Provisioner) that is going to send messages

struct **esp\_ble\_mesh\_client\_common\_param\_t**

Common parameters of the messages sent by Client Model.

### Public Members

*esp\_ble\_mesh\_opcode\_t* **opcode**

Message opcode

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

The context used to send message

int32\_t **msg\_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8\_t **msg\_role**

Role of the device - Node/Provisioner

struct **esp\_ble\_mesh\_state\_transition\_t**

Parameters of the server model state transition

### Public Functions

**BLE\_MESH\_ATOMIC\_DEFINE** (flag, *ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp\_ble\_mesh\_state\_transition\_t* sets “set\_auto\_rsp” to *ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

### Public Members

bool **just\_started**

Indicate if the state transition has just started

uint8\_t **trans\_time**

State transition time

uint8\_t **remain\_time**

Remaining time of state transition

uint8\_t **delay**

Delay before starting state transition

uint32\_t **quo\_tt**

Duration of each divided transition step

uint32\_t **counter**

Number of steps which the transition duration is divided

uint32\_t **total\_duration**

State transition total duration

int64\_t **start\_timestamp**

Time when the state transition is started

struct k\_delayed\_work **timer**

Timer used for state transition

struct **esp\_ble\_mesh\_last\_msg\_info\_t**

Parameters of the server model received last same set message.

### Public Members

`uint8_t tid`

Transaction number of the last message

`uint16_t src`

Source address of the last message

`uint16_t dst`

Destination address of the last message

`int64_t timestamp`

Time when the last message is received

struct `esp_ble_mesh_server_rsp_ctrl_t`

Parameters of the Server Model response control

### Public Members

`uint8_t get_auto_rsp`

BLE Mesh Server Response Option.

- i. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
  - ii. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
  - iii. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
  - iv. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
  - v. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
  - vi. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;
- Response control for Client Get messages

`uint8_t set_auto_rsp`

Response control for Client Set messages

`uint8_t status_auto_rsp`

Response control for Server Status messages

### Macros

`ESP_BLE_MESH_SDU_MAX_LEN`

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

`ESP_BLE_MESH_MIC_SHORT`

Length of a long Mesh MIC.

`ESP_BLE_MESH_MIC_LONG`

The maximum length of a BLE Mesh provisioned node name

**ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN**

The maximum length of a BLE Mesh unprovisioned device name

**ESP\_BLE\_MESH\_DEVICE\_NAME\_MAX\_LEN**

The maximum length of settings user id

**ESP\_BLE\_MESH\_SETTINGS\_UID\_SIZE**

Invalid settings index

**ESP\_BLE\_MESH\_INVALID\_SETTINGS\_IDX**

Define the BLE Mesh octet 16 bytes size

**ESP\_BLE\_MESH\_OCTET16\_LEN**

**ESP\_BLE\_MESH\_OCTET8\_LEN**

**ESP\_BLE\_MESH\_CID\_NVAL**

Special TTL value to request using configured default TTL

**ESP\_BLE\_MESH\_TTL\_DEFAULT**

Maximum allowed TTL value

**ESP\_BLE\_MESH\_TTL\_MAX**

**ESP\_BLE\_MESH\_ADDR\_UNASSIGNED**

**ESP\_BLE\_MESH\_ADDR\_ALL\_NODES**

**ESP\_BLE\_MESH\_ADDR\_PROXIES**

**ESP\_BLE\_MESH\_ADDR\_FRIENDS**

**ESP\_BLE\_MESH\_ADDR\_RELAYS**

**ESP\_BLE\_MESH\_KEY\_UNUSED**

**ESP\_BLE\_MESH\_KEY\_DEV**

**ESP\_BLE\_MESH\_KEY\_PRIMARY**

**ESP\_BLE\_MESH\_KEY\_ANY**

Primary Network Key index

**ESP\_BLE\_MESH\_NET\_PRIMARY**

Relay state value

**ESP\_BLE\_MESH\_RELAY\_DISABLED**

**ESP\_BLE\_MESH\_RELAY\_ENABLED**

**ESP\_BLE\_MESH\_RELAY\_NOT\_SUPPORTED**

Beacon state value

**ESP\_BLE\_MESH\_BEACON\_DISABLED**

**ESP\_BLE\_MESH\_BEACON\_ENABLED**

GATT Proxy state value

**ESP\_BLE\_MESH\_GATT\_PROXY\_DISABLED**

**ESP\_BLE\_MESH\_GATT\_PROXY\_ENABLED**

**ESP\_BLE\_MESH\_GATT\_PROXY\_NOT\_SUPPORTED**

Friend state value

**ESP\_BLE\_MESH\_FRIEND\_DISABLED**

**ESP\_BLE\_MESH\_FRIEND\_ENABLED**

**ESP\_BLE\_MESH\_FRIEND\_NOT\_SUPPORTED**

Node identity state value

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_STOPPED**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_RUNNING**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_NOT\_SUPPORTED**

Supported features

**ESP\_BLE\_MESH\_FEATURE\_RELAY**

**ESP\_BLE\_MESH\_FEATURE\_PROXY**

**ESP\_BLE\_MESH\_FEATURE\_FRIEND**

**ESP\_BLE\_MESH\_FEATURE\_LOW\_POWER**

**ESP\_BLE\_MESH\_FEATURE\_ALL\_SUPPORTED**

**ESP\_BLE\_MESH\_ADDR\_IS\_UNICAST** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_GROUP** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_VIRTUAL** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_RFU** (addr)

**ESP\_BLE\_MESH\_INVALID\_NODE\_INDEX****ESP\_BLE\_MESH\_TRANSMIT** (count, int\_ms)

Encode transmission count & interval steps.

---

**备注:** For example, ESP\_BLE\_MESH\_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

---

**参数**

- **count** –Number of retransmissions (first transmission is excluded).
- **int\_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**返回** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_COUNT** (transmit)

Decode transmit count from a transmit value.

**参数**

- **transmit** –Encoded transmit count & interval value.

**返回** Transmission count (actual transmissions equal to N + 1).

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**参数**

- **transmit** –Encoded transmit count & interval value.

**返回** Transmission interval in milliseconds.

**ESP\_BLE\_MESH\_PUBLISH\_TRANSMIT** (count, int\_ms)

Encode Publish Retransmit count & interval steps.

**参数**

- **count** –Number of retransmissions (first transmission is excluded).
- **int\_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**返回** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**参数**

- **transmit** –Encoded Publish Retransmit count & interval value.

**返回** Retransmission count (actual transmissions equal to N + 1).

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**参数**

- **transmit** –Encoded Publish Retransmit count & interval value.

**返回** Transmission interval in milliseconds.

**ESP\_BLE\_MESH\_PROV\_STATIC\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_OUTPUT\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_INPUT\_OOB\_MAX\_LEN**

Macros used to define message opcode

**ESP\_BLE\_MESH\_MODEL\_OP\_1** (b0)**ESP\_BLE\_MESH\_MODEL\_OP\_2** (b0, b1)**ESP\_BLE\_MESH\_MODEL\_OP\_3** (b0, cid)

This macro is associated with BLE\_MESH\_MODEL\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_SIG\_MODEL** (\_id, \_op, \_pub, \_user\_data)

This macro is associated with BLE\_MESH\_MODEL\_VND\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_VENDOR\_MODEL** (\_company, \_id, \_op, \_pub, \_user\_data)**ESP\_BLE\_MESH\_ELEMENT** (\_loc, \_mods, \_vnd\_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP\_BLE\_MESH\_MODEL\_NONE can be given instead.

---

**备注:** This macro is associated with BLE\_MESH\_ELEM in mesh\_access.h

---

**参数**

- **\_loc** –Location Descriptor.
- **\_mods** –Array of SIG models.
- **\_vnd\_mods** –Array of vendor models.

**ESP\_BLE\_MESH\_PROV** (uuid, sta\_val, sta\_val\_len, out\_size, out\_act, in\_size, in\_act)**BT\_OCTET32\_LEN****BD\_ADDR\_LEN****ESP\_BLE\_MESH\_ADDR\_TYPE\_PUBLIC****ESP\_BLE\_MESH\_ADDR\_TYPE\_RANDOM****ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_PUBLIC****ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_RANDOM****ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE** (\_name, \_msg\_len, \_role)

Define a model publication context.

**参数**

- **\_name** –Variable name given to the context.
- **\_msg\_len** –Length of the publication message.
- **\_role** –Role of the device which contains the model.

**ESP\_BLE\_MESH\_MODEL\_OP** (\_opcode, \_min\_len)

Define a model operation context.

**参数**

- **\_opcode** –Message opcode.
- **\_min\_len** –Message minimum length.

**ESP\_BLE\_MESH\_MODEL\_OP\_END**

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

**ESP\_BLE\_MESH\_MODEL\_NONE**

Helper to define an empty model array. This structure is associated with BLE\_MESH\_MODEL\_NONE in mesh\_access.h

**ADD\_DEV\_RM\_AFTER\_PROV\_FLAG**

Device will be removed from queue after provisioned successfully

**ADD\_DEV\_START\_PROV\_NOW\_FLAG**

Start provisioning device immediately

**ADD\_DEV\_FLUSHABLE\_DEV\_FLAG**

Device can be remove when queue is full and new device is going to added

**DEL\_DEV\_ADDR\_FLAG****DEL\_DEV\_UUID\_FLAG****PROV\_DATA\_NET\_IDX\_FLAG****PROV\_DATA\_FLAGS\_FLAG****PROV\_DATA\_IV\_INDEX\_FLAG****ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_ACCEPTLIST****ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_REJECTLIST**

Provisioner heartbeat filter operation

**ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_ADD****ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_REMOVE****ESP\_BLE\_MESH\_MODEL\_ID\_CONFIG\_SRV**

BLE Mesh models related Model ID and Opcode definitions.

Response will be sent internally

### Type Definitions

typedef uint8\_t **esp\_ble\_mesh\_octet16\_t**[16]

Define the BLE Mesh octet 8 bytes size

typedef uint8\_t **esp\_ble\_mesh\_octet8\_t**[8]

Invalid Company ID

typedef uint32\_t **esp\_ble\_mesh\_cb\_t**

typedef uint8\_t **UINT8**

typedef uint16\_t **UINT16**

typedef uint32\_t **UINT32**

typedef uint64\_t **UINT64**

typedef *UINT8* **BT\_OCTET32**[32]

typedef uint8\_t **BD\_ADDR**[6]

typedef uint8\_t **esp\_ble\_mesh\_bd\_addr\_t**[6]

typedef uint8\_t **esp\_ble\_mesh\_addr\_type\_t**

BLE device address type.

typedef struct *esp\_ble\_mesh\_model* **esp\_ble\_mesh\_model\_t**

typedef uint8\_t **esp\_ble\_mesh\_dev\_add\_flag\_t**

typedef uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_get\_t**

esp\_ble\_mesh\_opcode\_config\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_get\_state function.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_set\_t**

esp\_ble\_mesh\_opcode\_config\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_set\_state function.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_config\_status\_t**

esp\_ble\_mesh\_opcode\_config\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

typedef uint8\_t **esp\_ble\_mesh\_cfg\_status\_t**

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_get\_t**

esp\_ble\_mesh\_opcode\_health\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_get\_state function.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_set\_t**

esp\_ble\_mesh\_opcode\_health\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_set\_state function.

typedef uint32\_t **esp\_ble\_mesh\_health\_model\_status\_t**

esp\_ble\_mesh\_health\_model\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

typedef uint32\_t **esp\_ble\_mesh\_generic\_message\_opcode\_t**

esp\_ble\_mesh\_generic\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_generic\_client\_get\_state & esp\_ble\_mesh\_generic\_client\_set\_state. Generic OnOff Message Opcode

typedef uint32\_t **esp\_ble\_mesh\_sensor\_message\_opcode\_t**

esp\_ble\_mesh\_sensor\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_sensor\_client\_get\_state & esp\_ble\_mesh\_sensor\_client\_set\_state. Sensor Message Opcode

typedef uint32\_t **esp\_ble\_mesh\_time\_scene\_message\_opcode\_t**

esp\_ble\_mesh\_time\_scene\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_time\_scene\_client\_get\_state & esp\_ble\_mesh\_time\_scene\_client\_set\_state. Time Message Opcode

typedef uint32\_t **esp\_ble\_mesh\_light\_message\_opcode\_t**

esp\_ble\_mesh\_light\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is

only used to locate the opcodes used by functions `esp_ble_mesh_light_client_get_state` & `esp_ble_mesh_light_client_set_state`. Light Lightness Message Opcode

```
typedef uint32_t esp_ble_mesh_opcode_t
```

End of defines of `esp_ble_mesh_opcode_t`

```
typedef uint8_t esp_ble_mesh_model_status_t
```

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

### Enumerations

```
enum esp_ble_mesh_cb_type_t
```

*Values:*

enumerator `ESP_BLE_MESH_TYPE_PROV_CB`

enumerator `ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB`

enumerator `ESP_BLE_MESH_TYPE_OUTPUT_STR_CB`

enumerator `ESP_BLE_MESH_TYPE_INTPUT_CB`

enumerator `ESP_BLE_MESH_TYPE_LINK_OPEN_CB`

enumerator `ESP_BLE_MESH_TYPE_LINK_CLOSE_CB`

enumerator `ESP_BLE_MESH_TYPE_COMPLETE_CB`

enumerator `ESP_BLE_MESH_TYPE_RESET_CB`

```
enum esp_ble_mesh_oob_method_t
```

*Values:*

enumerator `ESP_BLE_MESH_NO_OOB`

enumerator `ESP_BLE_MESH_STATIC_OOB`

enumerator `ESP_BLE_MESH_OUTPUT_OOB`

enumerator `ESP_BLE_MESH_INPUT_OOB`

```
enum esp_ble_mesh_output_action_t
```

*Values:*

enumerator `ESP_BLE_MESH_NO_OUTPUT`

enumerator `ESP_BLE_MESH_BLINK`

enumerator **ESP\_BLE\_MESH\_BEEP**

enumerator **ESP\_BLE\_MESH\_VIBRATE**

enumerator **ESP\_BLE\_MESH\_DISPLAY\_NUMBER**

enumerator **ESP\_BLE\_MESH\_DISPLAY\_STRING**

enum **esp\_ble\_mesh\_input\_action\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_NO\_INPUT**

enumerator **ESP\_BLE\_MESH\_PUSH**

enumerator **ESP\_BLE\_MESH\_TWIST**

enumerator **ESP\_BLE\_MESH\_ENTER\_NUMBER**

enumerator **ESP\_BLE\_MESH\_ENTER\_STRING**

enum **esp\_ble\_mesh\_prov\_bearer\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_PROV\_ADV**

enumerator **ESP\_BLE\_MESH\_PROV\_GATT**

enum **esp\_ble\_mesh\_prov\_oob\_info\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_OTHER**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_URI**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_2D\_CODE**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_BAR\_CODE**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_NFC**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_NUMBER**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_STRING**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_ON\_BOX**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_IN\_BOX**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_ON\_PAPER**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_IN\_MANUAL**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_ON\_DEV**

enum **esp\_ble\_mesh\_dev\_role\_t**

*Values:*

enumerator **ROLE\_NODE**

enumerator **ROLE\_PROVISIONER**

enumerator **ROLE\_FAST\_PROV**

enum **esp\_ble\_mesh\_fast\_prov\_action\_t**

*Values:*

enumerator **FAST\_PROV\_ACT\_NONE**

enumerator **FAST\_PROV\_ACT\_ENTER**

enumerator **FAST\_PROV\_ACT\_SUSPEND**

enumerator **FAST\_PROV\_ACT\_EXIT**

enumerator **FAST\_PROV\_ACT\_MAX**

enum **esp\_ble\_mesh\_proxy\_filter\_type\_t**

*Values:*

enumerator **PROXY\_FILTER\_WHITELIST**

enumerator **PROXY\_FILTER\_BLACKLIST**

enum **esp\_ble\_mesh\_prov\_cb\_event\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_PROV\_REGISTER\_COMP\_EVT**

Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator **ESP\_BLE\_MESH\_NODE\_SET\_UNPROV\_DEV\_NAME\_COMP\_EVT**

Set the unprovisioned device name completion event

- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_ENABLE\_COMP\_EVT**  
Enable node provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_DISABLE\_COMP\_EVT**  
Disable node provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_OPEN\_EVT**  
Establish a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_CLOSE\_EVT**  
Close a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_OOB\_PUB\_KEY\_EVT**  
Generate Node input OOB public key event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_NUMBER\_EVT**  
Generate Node Output Number event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_STRING\_EVT**  
Generate Node Output String event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT**  
Event requiring the user to input a number or string
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_COMPLETE\_EVT**  
Provisioning done event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_RESET\_EVT**  
Provisioning reset event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_SET\_OOB\_PUB\_KEY\_COMP\_EVT**  
Node set oob public key completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Node input number completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Node input string completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROXY\_IDENTITY\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh Proxy Identity advertising completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh GATT Proxy Service completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_DISABLE\_COMP\_EVT**  
Disable BLE Mesh GATT Proxy Service completion event

- enumerator **ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Node add NetKey locally completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Node add AppKey locally completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Node bind AppKey to model locally completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_ENABLE\_COMP\_EVT**  
Provisioner enable provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DISABLE\_COMP\_EVT**  
Provisioner disable provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT**  
Provisioner receives unprovisioned device beacon event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_EVT**  
Provisioner read unprovisioned device OOB public key event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_EVT**  
Provisioner input value for provisioning procedure event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_OUTPUT\_EVT**  
Provisioner output value for provisioning procedure event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_OPEN\_EVT**  
Provisioner establish a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_CLOSE\_EVT**  
Provisioner close a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT**  
Provisioner provisioning done event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ADD\_UNPROV\_DEV\_COMP\_EVT**  
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DEV\_WITH\_ADDR\_COMP\_EVT**  
Provisioner start to provision an unprovisioned device completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_DEV\_COMP\_EVT**  
Provisioner delete a device from the list, close provisioning link with the device completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_DEV\_UUID\_MATCH\_COMP\_EVT**  
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_PROV\_DATA\_INFO\_COMP\_EVT**  
Provisioner set net\_idx/flags/iv\_index used for provisioning completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_STATIC\_OOB\_VALUE\_COMP\_EVT**  
Provisioner set static oob value used for provisioning completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_PRIMARY\_ELEM\_ADDR\_COMP\_EVT**  
Provisioner set unicast address of primary element completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_COMP\_EVT**  
Provisioner read unprovisioned device OOB public key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Provisioner input number completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Provisioner input string completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_NODE\_NAME\_COMP\_EVT**  
Provisioner set node name completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner add local app key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner update local app key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Provisioner bind local model with local app key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner add local network key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner update local network key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_STORE\_NODE\_COMP\_DATA\_COMP\_EVT**  
Provisioner store node composition data completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_UUID\_COMP\_EVT**  
Provisioner delete node with uuid completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_ADDR\_COMP\_EVT**  
Provisioner delete node with unicast address completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT**  
Provisioner start to receive heartbeat message completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT**

Provisioner set the heartbeat filter type completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT**

Provisioner set the heartbeat filter information completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT**

Provisioner receive heartbeat message event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DIRECT\_ERASE\_SETTINGS\_COMP\_EVT**

Provisioner directly erase settings completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**

Provisioner open settings with index completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT**

Provisioner open settings with user id completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**

Provisioner close settings with index completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_UID\_COMP\_EVT**

Provisioner close settings with user id completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**

Provisioner delete settings with index completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_UID\_COMP\_EVT**

Provisioner delete settings with user id completion event

enumerator **ESP\_BLE\_MESH\_SET\_FAST\_PROV\_INFO\_COMP\_EVT**

Set fast provisioning information (e.g. unicast address range, net\_idx, etc.) completion event

enumerator **ESP\_BLE\_MESH\_SET\_FAST\_PROV\_ACTION\_COMP\_EVT**

Set fast provisioning action completion event

enumerator **ESP\_BLE\_MESH\_HEARTBEAT\_MESSAGE\_RECV\_EVT**

Receive Heartbeat message event

enumerator **ESP\_BLE\_MESH\_LPN\_ENABLE\_COMP\_EVT**

Enable Low Power Node completion event

enumerator **ESP\_BLE\_MESH\_LPN\_DISABLE\_COMP\_EVT**

Disable Low Power Node completion event

enumerator **ESP\_BLE\_MESH\_LPN\_POLL\_COMP\_EVT**

Low Power Node send Friend Poll completion event

enumerator **ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_ESTABLISH\_EVT**

Low Power Node establishes friendship event

enumerator **ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_TERMINATE\_EVT**

Low Power Node terminates friendship event

enumerator **ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_ESTABLISH\_EVT**

Friend Node establishes friendship event

enumerator **ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT**

Friend Node terminates friendship event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_ADV\_PKT\_EVT**

Proxy Client receives Network ID advertising packet event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECTED\_EVT**

Proxy Client establishes connection successfully event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECTED\_EVT**

Proxy Client terminates connection successfully event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_FILTER\_STATUS\_EVT**

Proxy Client receives Proxy Filter Status event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECT\_COMP\_EVT**

Proxy Client connect completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECT\_COMP\_EVT**

Proxy Client disconnect completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_SET\_FILTER\_TYPE\_COMP\_EVT**

Proxy Client set filter type completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_ADD\_FILTER\_ADDR\_COMP\_EVT**

Proxy Client add filter address completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_REMOVE\_FILTER\_ADDR\_COMP\_EVT**

Proxy Client remove filter address completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_SERVER\_CONNECTED\_EVT**

Proxy Server establishes connection successfully event

enumerator **ESP\_BLE\_MESH\_PROXY\_SERVER\_DISCONNECTED\_EVT**

Proxy Server terminates connection successfully event

enumerator **ESP\_BLE\_MESH\_MODEL\_SUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**

Local model subscribes group address completion event

enumerator **ESP\_BLE\_MESH\_MODEL\_UNSUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**

Local model unsubscribes group address completion event

enumerator **ESP\_BLE\_MESH\_DEINIT\_MESH\_COMP\_EVT**

De-initialize BLE Mesh stack completion event

enumerator **ESP\_BLE\_MESH\_PROV\_EVT\_MAX**

enum **[anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

*Values:*

enumerator **ESP\_BLE\_MESH\_SERVER\_TRANS\_TIMER\_START**

enumerator **ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX**

enum **esp\_ble\_mesh\_server\_state\_type\_t**

This enum value is the type of server model states

*Values:*

enumerator **ESP\_BLE\_MESH\_GENERIC\_ONOFF\_STATE**

enumerator **ESP\_BLE\_MESH\_GENERIC\_LEVEL\_STATE**

enumerator **ESP\_BLE\_MESH\_GENERIC\_ONPOWERUP\_STATE**

enumerator **ESP\_BLE\_MESH\_GENERIC\_POWER\_ACTUAL\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_ACTUAL\_STATE**

enumerator **ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT**

User-defined models send messages completion event

enumerator **ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT**

User-defined models publish messages completion event

enumerator **ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT**

User-defined client models receive publish messages event

enumerator **ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT**

Server models update state value completion event

enumerator **ESP\_BLE\_MESH\_MODEL\_EVT\_MAX**

## **ESP-BLE-MESH Core API Reference**

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

## **ESP-BLE-MESH Stack Initialization**

## Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h`

## Functions

`esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)`

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

---

**备注:** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

---

### 参数

- **prov** –[in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** –[in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

**返回** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_deinit (esp_ble_mesh_deinit_param_t *param)`

De-initialize BLE Mesh module.

---

**备注:** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

---

**参数** **param** –[in] Pointer to the structure of BLE Mesh deinit parameters.

**返回** ESP\_OK on success or error code otherwise.

## Reading of Local Data Information

### Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h`

### Functions

`int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)`

Get the model publish period, the unit is ms.

**参数** **model** –[in] Model instance pointer.

**返回** Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

`uint16_t esp_ble_mesh_get_primary_element_address (void)`

Get the address of the primary element.

**返回** Address of the primary element on success, or `ESP_BLE_MESH_ADDR_UNASSIGNED` on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)`

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

### 参数

- **model** –[in] Pointer to the model.
- **group\_addr** –[in] Group address.

**返回** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

*esp\_ble\_mesh\_elem\_t* \***esp\_ble\_mesh\_find\_element** (uint16\_t element\_addr)

Find the BLE Mesh element pointer via the element address.

**参数** **element\_addr** –[in] Element address.

**返回** Pointer to the element on success, or NULL on failure.

uint8\_t **esp\_ble\_mesh\_get\_element\_count** (void)

Get the number of elements that have been registered.

**返回** Number of elements.

*esp\_ble\_mesh\_model\_t* \***esp\_ble\_mesh\_find\_vendor\_model** (const *esp\_ble\_mesh\_elem\_t* \*element, uint16\_t company\_id, uint16\_t model\_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**参数**

- **element** –[in] Element to which the model belongs.
- **company\_id** –[in] A 16-bit company identifier assigned by the Bluetooth SIG.
- **model\_id** –[in] A 16-bit vendor-assigned model identifier.

**返回** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

*esp\_ble\_mesh\_model\_t* \***esp\_ble\_mesh\_find\_sig\_model** (const *esp\_ble\_mesh\_elem\_t* \*element, uint16\_t model\_id)

Find the SIG model with the given element and Model id.

**参数**

- **element** –[in] Element to which the model belongs.
- **model\_id** –[in] SIG model identifier.

**返回** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const *esp\_ble\_mesh\_comp\_t* \***esp\_ble\_mesh\_get\_composition\_data** (void)

Get the Composition data which has been registered.

**返回** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

*esp\_err\_t* **esp\_ble\_mesh\_model\_subscribe\_group\_addr** (uint16\_t element\_addr, uint16\_t company\_id, uint16\_t model\_id, uint16\_t group\_addr)

A local model of node or Provisioner subscribes a group address.

---

**备注:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

---

**参数**

- **element\_addr** –[in] Unicast address of the element to which the model belongs.
- **company\_id** –[in] A 16-bit company identifier.
- **model\_id** –[in] A 16-bit model identifier.
- **group\_addr** –[in] The group address to be subscribed.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_model\_unsubscribe\_group\_addr** (uint16\_t element\_addr, uint16\_t company\_id, uint16\_t model\_id, uint16\_t group\_addr)

A local model of node or Provisioner unsubscribes a group address.

---

**备注:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

---

**参数**

- **element\_addr** –[in] Unicast address of the element to which the model belongs.
- **company\_id** –[in] A 16-bit company identifier.
- **model\_id** –[in] A 16-bit model identifier.
- **group\_addr** –[in] The subscribed group address.

**返回** ESP\_OK on success or error code otherwise.

```
const uint8_t *esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)
```

This function is called by Node to get the local NetKey.

**参数** **net\_idx** –[in] NetKey index.

**返回** NetKey on success, or NULL on failure.

```
const uint8_t *esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)
```

This function is called by Node to get the local AppKey.

**参数** **app\_idx** –[in] AppKey index.

**返回** AppKey on success, or NULL on failure.

```
esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)
```

This function is called by Node to add a local NetKey.

---

**备注:** This function can only be called after the device is provisioned.

---

**参数**

- **net\_key** –[in] NetKey to be added.
- **net\_idx** –[in] NetKey Index.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx,
                                              uint16_t app_idx)
```

This function is called by Node to add a local AppKey.

---

**备注:** The net\_idx must be an existing one. This function can only be called after the device is provisioned.

---

**参数**

- **app\_key** –[in] AppKey to be added.
- **net\_idx** –[in] NetKey Index.
- **app\_idx** –[in] AppKey Index.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model (uint16_t element_addr, uint16_t
                                                         company_id, uint16_t model_id,
                                                         uint16_t app_idx)
```

This function is called by Node to bind AppKey to model locally.

---

**备注:** If going to bind app\_key with local vendor model, the company\_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

---

**参数**

- **element\_addr** –[in] Node local element address
- **company\_id** –[in] Node local company id
- **model\_id** –[in] Node local model id
- **app\_idx** –[in] Node local appkey index

返回 ESP\_OK on success or error code otherwise.

**Low Power Operation (Updating)****Header File**

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_low\\_power\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_enable** (void)

Enable BLE Mesh device LPN functionality.

---

**备注:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

---

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_disable** (bool force)

Disable BLE Mesh device LPN functionality.

**参数 force** –[in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_poll** (void)

LPN tries to poll messages from the Friend Node.

---

**备注:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

---

返回 ESP\_OK on success or error code otherwise.

**Send/Publish Messages, add Local AppKey, etc.****Header File**

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_networking\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_custom\_model\_callback** (*esp\_ble\_mesh\_model\_cb\_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

---

**备注:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

---

**参数** `callback` –[in] Pointer to the callback function.  
**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_model_msg_opcode_init` (uint8\_t \*data, uint32\_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

---

**备注:** This API is only used to set the opcode of the message.

---

**参数**

- `data` –[in] Pointer to the message data.
- `opcode` –[in] The message opcode.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_client_model_init` (*esp\_ble\_mesh\_model\_t* \*model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

**参数** `model` –[in] BLE Mesh Client model to which the message belongs.  
**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_client_model_deinit` (*esp\_ble\_mesh\_model\_t* \*model)

De-initialize the user-defined client model.

---

**备注:** This function shall be invoked before `esp_ble_mesh_deinit()` is called.

---

**参数** `model` –[in] Pointer of the Client model.  
**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_server_model_send_msg` (*esp\_ble\_mesh\_model\_t* \*model,  
*esp\_ble\_mesh\_msg\_ctx\_t* \*ctx, uint32\_t opcode,  
uint16\_t length, uint8\_t \*data)

Send server model messages (such as server model status messages).

**参数**

- `model` –[in] BLE Mesh Server Model to which the message belongs.
- `ctx` –[in] Message context, includes keys, TTL, etc.
- `opcode` –[in] Message opcode.
- `length` –[in] Message length (exclude the message opcode).
- `data` –[in] Parameters of Access Payload (exclude the message opcode) to be sent.

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_client_model_send_msg (esp_ble_mesh_model_t *model,
                                             esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
                                             uint16_t length, uint8_t *data, int32_t
                                             msg_timeout, bool need_rsp,
                                             esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

#### 参数

- **model** –[in] BLE Mesh Client Model to which the message belongs.
- **ctx** –[in] Message context, includes keys, TTL, etc.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg\_timeout** –[in] Time to get response to the message (in milliseconds).
- **need\_rsp** –[in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device\_role** –[in] Role of the device (Node/Provisioner) that sends the message.

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_model_publish (esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t
                                       length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

---

**备注:** Before calling this function, the user needs to ensure that the model publication message (*esp\_ble\_mesh\_model\_pub\_t::msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT with the message updated.

---

#### 参数

- **model** –[in] Mesh (client) Model publishing the message.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device\_role** –[in] Role of the device (node/provisioner) publishing the message of the type *esp\_ble\_mesh\_dev\_role\_t*.

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_server_model_update_state (esp_ble_mesh_model_t *model,
                                                  esp_ble_mesh_server_state_type_t type,
                                                  esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

---

**备注:** Currently this API is used to update bound state value, not for all server model states.

---

#### 参数

- **model** –[in] Server model which is going to update the state.
- **type** –[in] Server model state type.
- **value** –[in] Server model state value.

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_node_local_reset (void)
```

Reset the provisioning procedure of the local BLE Mesh node.

---

**备注:** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

---

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_node\_name** (uint16\_t index, const char \*name)

This function is called to set the node (provisioned device) name.

---

**备注:** index is obtained from the parameters of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

---

**参数**

- **index** –[in] Index of the node in the node queue.
- **name** –[in] Name (end by ‘\0’) to be set for the node.

返回 ESP\_OK on success or error code otherwise.

const char \***esp\_ble\_mesh\_provisioner\_get\_node\_name** (uint16\_t index)

This function is called to get the node (provisioned device) name.

---

**备注:** index is obtained from the parameters of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

---

**参数** **index** –[in] Index of the node in the node queue.

返回 Node name on success, or NULL on failure.

uint16\_t **esp\_ble\_mesh\_provisioner\_get\_node\_index** (const char \*name)

This function is called to get the node (provisioned device) index.

**参数** **name** –[in] Name of the node (end by ‘\0’).

返回 Node index on success, or an invalid value (0xFFFF) on failure.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_store\_node\_comp\_data** (uint16\_t unicast\_addr, uint8\_t \*data, uint16\_t length)

This function is called to store the Composition Data of the node.

**参数**

- **unicast\_addr** –[in] Element address of the node
- **data** –[in] Pointer of Composition Data
- **length** –[in] Length of Composition Data

返回 ESP\_OK on success or error code otherwise.

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_uuid** (const uint8\_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

**参数** **uuid** –[in] Device UUID of the node

返回 Pointer of the node info struct or NULL on failure.

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_addr** (uint16\_t unicast\_addr)

This function is called to get the provisioned node information with the node unicast address.

**参数** **unicast\_addr** –[in] Unicast address of the node

返回 Pointer of the node info struct or NULL on failure.

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_name** (const char \*name)

This function is called to get the provisioned node information with the node name.

**参数** **name** –[in] Name of the node (end by ‘\0’).

返回 Pointer of the node info struct or NULL on failure.

`uint16_t esp_ble_mesh_provisioner_get_prov_node_count` (void)

This function is called by Provisioner to get provisioned node count.

返回 Number of the provisioned nodes.

`const esp_ble_mesh_node_t** esp_ble_mesh_provisioner_get_node_table_entry` (void)

This function is called by Provisioner to get the entry of the node table.

---

**备注:** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t**node)` is NULL. For example: ““ `const esp_ble_mesh_node_t**entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { …… } }` ““

---

返回 Pointer to the start of the node table.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid` (const uint8\_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

参数 **uuid** –[in] Device UUID of the node

返回 ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr` (uint16\_t unicast\_addr)

This function is called to delete the provisioned node information with the node unicast address.

参数 **unicast\_addr** –[in] Unicast address of the node

返回 ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_add_local_app_key` (const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is called to add a local AppKey for Provisioner.

---

**备注:** `app_key`: If set to NULL, `app_key` will be generated internally. `net_idx`: Should be an existing one. `app_idx`: If it is going to be generated internally, it should be set to 0xFFFF, and the new `app_idx` will be reported via an event.

---

参数

- **app\_key** –[in] The app key to be set for the local BLE Mesh stack.
- **net\_idx** –[in] The network key index.
- **app\_idx** –[in] The app key index.

返回 ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_update_local_app_key` (const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is used to update a local AppKey for Provisioner.

参数

- **app\_key** –[in] Value of the AppKey.
- **net\_idx** –[in] Corresponding NetKey Index.
- **app\_idx** –[in] The AppKey Index

返回 ESP\_OK on success or error code otherwise.

```
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t
                                                         app_idx)
```

This function is called by Provisioner to get the local app key value.

**参数**

- **net\_idx** –[in] Network key index.
- **app\_idx** –[in] Application key index.

**返回** App key on success, or NULL on failure.

```
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr,
                                                                uint16_t app_idx,
                                                                uint16_t model_id,
                                                                uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.

---

**备注:** company\_id: If going to bind app\_key with local vendor model, company\_id should be set to 0xFFFF.

---

**参数**

- **element\_addr** –[in] Provisioner local element address
- **app\_idx** –[in] Provisioner local appkey index
- **model\_id** –[in] Provisioner local model id
- **company\_id** –[in] Provisioner local company id

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t net_key[16], uint16_t
                                                       net_idx)
```

This function is called by Provisioner to add local network key.

---

**备注:** net\_key: If set to NULL, net\_key will be generated internally. net\_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net\_idx will be reported via an event.

---

**参数**

- **net\_key** –[in] The network key to be added to the Provisioner local BLE Mesh stack.
- **net\_idx** –[in] The network key index.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16],
                                                         uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**参数**

- **net\_key** –[in] Value of the NetKey.
- **net\_idx** –[in] The NetKey Index.

**返回** ESP\_OK on success or error code otherwise.

```
const uint8_t *esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

**参数** **net\_idx** –[in] Network key index.

**返回** Network key on success, or NULL on failure.

```
esp_err_t esp_ble_mesh_provisioner_rcv_heartbeat (bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

---

**备注:** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

---

**参数** `enable` `–[in]` Enable or disable receiving heartbeat messages.  
**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_heartbeat_filter_type` (uint8\_t type)

This function is called by Provisioner to set the heartbeat filter type.

---

**备注:** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

- a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.
- 

**参数** `type` `–[in]` Heartbeat filter type (acceptlist or rejectlist).  
**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_heartbeat_filter_info` (uint8\_t op, *esp\_ble\_mesh\_heartbeat\_filter\_info\_t* \*info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

- a. If the operation is “REMOVE” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
    - The filter entry with the same SRC or DST will be removed.
- 

**备注:** 1. If the operation is “ADD” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
  - If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
  - If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.
- 

**参数**

- `op` `–[in]` Add or REMOVE
- `info` `–[in]` Heartbeat filter entry information, including: hb\_src - Heartbeat source address; hb\_dst - Heartbeat destination address;

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_direct_erase_settings` (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

---

**备注:** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

---

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_index** (uint8\_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

---

**备注:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

---

**参数** **index** –[in] Settings index.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_uid** (const char \*uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

---

**备注:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

---

**参数** **uid** –[in] Settings user id.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_index** (uint8\_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

---

**备注:** 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:
  - a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
  - b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
- b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
- c. The working process shall be as following:
  - a) Open settings A
  - b) Start to provision and control nodes
  - c) Close settings A
  - d) Open settings B
  - e) Start to provision and control other nodes
  - f) Close settings B
  - g) ... ..

---

**参数**

- **index** –[in] Settings index.

- **erase** –[in] Indicate if erasing mesh information.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_uid** (const char \*uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

---

**备注:** 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:
    - a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
    - b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
  - b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
  - c. The working process shall be as following:
    - a) Open settings A
    - b) Start to provision and control nodes
    - c) Close settings A
    - d) Open settings B
    - e) Start to provision and control other nodes
    - f) Close settings B
    - g) ... ..
-

**参数**

- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_index** (uint8\_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

---

**备注:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

---

**参数 index** –[in] Settings index.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_uid** (const char \*uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

---

**备注:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

---

**参数 uid** –[in] Settings user id.

返回 ESP\_OK on success or error code otherwise.

const char \***esp\_ble\_mesh\_provisioner\_get\_settings\_uid** (uint8\_t index)

This function is called by Provisioner to get settings user id.

**参数 index** –[in] Settings index.

返回 Setting user id on success or NULL on failure.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_settings\_index** (const char \*uid)

This function is called by Provisioner to get settings index.

**参数 uid** –[in] Settings user id.

返回 Settings index.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_free\_settings\_count** (void)

This function is called by Provisioner to get the number of free settings user id.

返回 Number of free settings user id.

const uint8\_t \***esp\_ble\_mesh\_get\_fast\_prov\_app\_key** (uint16\_t net\_idx, uint16\_t app\_idx)

This function is called to get fast provisioning application key.

**参数**

- **net\_idx** –[in] Network key index.
- **app\_idx** –[in] Application key index.

返回 Application key on success, or NULL on failure.

**Type Definitions**

```
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,  
esp_ble_mesh_model_cb_param_t *param)
```

: event, event code of user-defined model events; param, parameters of user-defined model events

**ESP-BLE-MESH Node/Provisioner Provisioning**

**Header File**

- components/bt/esp\_ble\_mesh/api/core/include/esp\_ble\_mesh\_provisioning\_api.h

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_prov\_callback** (*esp\_ble\_mesh\_prov\_cb\_t* callback)

Register BLE Mesh provisioning callback.

**参数** **callback** –[in] Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

bool **esp\_ble\_mesh\_node\_is\_provisioned** (void)

Check if a device has been provisioned.

**返回** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

---

**备注:** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

---

**参数** **bearers** –Bit-wise OR of provisioning bearers.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**参数** **bearers** –Bit-wise OR of provisioning bearers.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_set\_oob\_pub\_key** (uint8\_t pub\_key\_x[32], uint8\_t pub\_key\_y[32],  
uint8\_t private\_key[32])

Unprovisioned device set own oob public key & private key pair.

---

**备注:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

---

**参数**

- **pub\_key\_x** –[in] Unprovisioned device' s Public Key X
- **pub\_key\_y** –[in] Unprovisioned device' s Public Key Y
- **private\_key** –[in] Unprovisioned device' s Private Key

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_number** (uint32\_t number)

Provide provisioning input OOB number.

---

**备注:** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

---

**参数** **number** –[in] Number input by device.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_string** (const char \*string)

Provide provisioning input OOB string.

---

**备注:** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

---

**参数** **string** **–[in]** String input by device.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_unprovisioned\_device\_name** (const char \*name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

---

**备注:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn't apply to PB-ADV mode.

---

**参数** **name** **–[in]** Unprovisioned device name

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_read\_oob\_pub\_key** (uint8\_t link\_idx, uint8\_t pub\_key\_x[32], uint8\_t pub\_key\_y[32])

Provisioner inputs unprovisioned device's oob public key.

---

**备注:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

---

**参数**

- **link\_idx** **–[in]** The provisioning link index
- **pub\_key\_x** **–[in]** Unprovisioned device's Public Key X
- **pub\_key\_y** **–[in]** Unprovisioned device's Public Key Y

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_input\_string** (const char \*string, uint8\_t link\_idx)

Provide provisioning input OOB string.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* prov\_input\_num callback has been called with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

**参数**

- **string** **–[in]** String input by Provisioner.
- **link\_idx** **–[in]** The provisioning link index.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_input\_number** (uint32\_t number, uint8\_t link\_idx)

Provide provisioning input OOB number.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* prov\_input\_num callback has been called with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

**参数**

- **number** **–[in]** Number input by Provisioner.
- **link\_idx** **–[in]** The provisioning link index.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Enable one or more provisioning bearers.

---

**备注:** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

---

**参数 bearers** **–[in]** Bit-wise OR of provisioning bearers.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Disable one or more provisioning bearers.

---

**备注:** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

---

**参数 bearers** **–[in]** Bit-wise OR of provisioning bearers.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_unprov\_dev** (*esp\_ble\_mesh\_unprov\_dev\_add\_t* \*add\_dev, *esp\_ble\_mesh\_dev\_add\_flag\_t* flags)

Add unprovisioned device info to the unprov\_dev queue.

---

**备注:** : 1. Currently address type only supports public address and static random address.

- a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
  - b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device' s advertising packets, it will start provisioning the device internally.
    - In this situation, the Provisioner can set bearers with each one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled, and cannot set flags with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - c. Another example is when the Provisioner receives the unprovisioned device' s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
    - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_ADV enabled and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
    - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_GATT enabled, and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
    - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
    - Note: ESP\_BLE\_MESH\_PROV\_ADV, ESP\_BLE\_MESH\_PROV\_GATT and ADD\_DEV\_START\_PROV\_NOW\_FLAG can not be enabled at the same time.
-

**参数**

- **add\_dev** –[in] Pointer to a struct containing the device information
- **flags** –[in] Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_device\_with\_addr** (const uint8\_t uuid[16],  
   *esp\_ble\_mesh\_bd\_addr\_t* addr,  
   *esp\_ble\_mesh\_addr\_type\_t*  
   addr\_type,  
   *esp\_ble\_mesh\_prov\_bearer\_t*  
   bearer, uint16\_t oob\_info,  
   uint16\_t unicast\_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

---

**备注:** : 1. Currently address type only supports public address and static random address.

- Bearer must be equal to ESP\_BLE\_MESH\_PROV\_ADV or ESP\_BLE\_MESH\_PROV\_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT event.
  - If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
  - Recommend to use only one of the functions “esp\_ble\_mesh\_provisioner\_add\_unprov\_dev” and “esp\_ble\_mesh\_provisioner\_prov\_device\_with\_addr” by a Provisioner.
- 

**参数**

- **uuid** –[in] Device UUID of the unprovisioned device
- **addr** –[in] Device address of the unprovisioned device
- **addr\_type** –[in] Device address type of the unprovisioned device
- **bearer** –[in] Provisioning bearer going to be used by Provisioner
- **oob\_info** –[in] OOB info of the unprovisioned device
- **unicast\_addr** –[in] Unicast address going to be allocated for the unprovisioned device

**返回** Zero on success or (negative) error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_dev** (*esp\_ble\_mesh\_device\_delete\_t* \*del\_dev)

Delete device from queue, and reset current provisioning link with the device.

---

**备注:** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

---

**参数** **del\_dev** –[in] Pointer to a struct containing the device information.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_dev\_uuid\_match** (const uint8\_t \*match\_val, uint8\_t  
   match\_len, uint8\_t offset, bool  
   prov\_after\_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**参数**

- **match\_val** –[in] Value to be compared with the part of the device UUID.
- **match\_len** –[in] Length of the compared match value.

- **offset** –[in] Offset of the device UUID to be compared (based on zero).
- **prov\_after\_match** –[in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_prov\_data\_info** (*esp\_ble\_mesh\_prov\_data\_info\_t* \*prov\_data\_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

参数 **prov\_data\_info** –[in] Pointer to a struct containing net\_idx or flags or iv\_index.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_static\_oob\_value** (const uint8\_t \*value, uint8\_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

---

**备注:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

---

#### 参数

- **value** –[in] Pointer to the static oob value.
- **length** –[in] Length of the static oob value.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_primary\_elem\_addr** (uint16\_t addr)

This function is called by Provisioner to set own Primary element address.

---

**备注:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov\_unicast\_addr value in the struct *esp\_ble\_mesh\_prov\_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

---

参数 **addr** –[in] Unicast address of the Primary element of Provisioner.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_info** (*esp\_ble\_mesh\_fast\_prov\_info\_t* \*fast\_prov\_info)

This function is called to set provisioning data information before starting fast provisioning.

参数 **fast\_prov\_info** –[in] Pointer to a struct containing unicast address range, net\_idx, etc.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_action** (*esp\_ble\_mesh\_fast\_prov\_action\_t* action)

This function is called to start/suspend/exit fast provisioning.

参数 **action** –[in] fast provisioning action (i.e. enter, suspend, exit).

返回 ESP\_OK on success or error code otherwise.

## Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const
esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info,
esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Param addr [in]** Pointer to the unprovisioned device address.

**Param addr\_type [in]** Unprovisioned device address type.

**Param adv\_type [in]** Adv packet type(ADV\_IND or ADV\_NONCONN\_IND).

**Param dev\_uuid [in]** Unprovisioned device UUID pointer.

**Param oob\_info [in]** OOB information of the unprovisioned device.

**Param bearer [in]** Adv packet received from PB-GATT or PB-ADV bearer.

## ESP-BLE-MESH GATT Proxy Server

### Header File

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_proxy\\_api.h](#)

### Functions

```
esp_err_t esp_ble_mesh_proxy_identity_enable (void)
```

Enable advertising with Node Identity.

---

**备注:** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

---

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_proxy_gatt_enable (void)
```

Enable BLE Mesh GATT Proxy Service.

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_proxy_gatt_disable (void)
```

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

返回 ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr,
esp_ble_mesh_addr_type_t addr_type, uint16_t
net_idx)
```

Proxy Client creates a connection with the Proxy Server.

#### 参数

- **addr** –[in] Device address of the Proxy Server.
- **addr\_type** –[in] Device address type(public or static random).

- **net\_idx** –[in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_disconnect** (uint8\_t conn\_handle)

Proxy Client terminates a connection with the Proxy Server.

参数 **conn\_handle** –[in] Proxy connection handle.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_set\_filter\_type** (uint8\_t conn\_handle, uint16\_t net\_idx, *esp\_ble\_mesh\_proxy\_filter\_type\_t* filter\_type)

Proxy Client sets the filter type of the Proxy Server.

参数

- **conn\_handle** –[in] Proxy connection handle.
- **net\_idx** –[in] Corresponding NetKey Index.
- **filter\_type** –[in] whitelist or blacklist.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_add\_filter\_addr** (uint8\_t conn\_handle, uint16\_t net\_idx, uint16\_t \*addr, uint16\_t addr\_num)

Proxy Client adds address to the Proxy Server filter list.

参数

- **conn\_handle** –[in] Proxy connection handle.
- **net\_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr\_num** –[in] Number of the filter address.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_remove\_filter\_addr** (uint8\_t conn\_handle, uint16\_t net\_idx, uint16\_t \*addr, uint16\_t addr\_num)

Proxy Client removes address from the Proxy Server filter list.

参数

- **conn\_handle** –[in] Proxy connection handle.
- **net\_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr\_num** –[in] Number of the filter address.

返回 ESP\_OK on success or error code otherwise.

## ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

---

备注: Definitions related to Server Models are being updated, and will be released soon.

---

## Configuration Client/Server Models

### Header File

- components/bt/esp\_ble\_mesh/api/models/include/esp\_ble\_mesh\_config\_model\_api.h

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_config\_client\_callback** (*esp\_ble\_mesh\_cfg\_client\_cb\_t* callback)

Register BLE Mesh Config Client Model callback.

**参数** **callback** –[in] Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_config\_server\_callback** (*esp\_ble\_mesh\_cfg\_server\_cb\_t* callback)

Register BLE Mesh Config Server Model callback.

**参数** **callback** –[in] Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_get\_state\_t* \*get\_state)

Get the value of Config Server Model states using the Config Client Model get messages.

---

**备注:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_set\_state\_t* \*set\_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

---

**备注:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

### Unions

union **esp\_ble\_mesh\_cfg\_client\_get\_state\_t**

```
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
```

ESP\_BLE\_MESH\_MODEL\_OP\_MODEL\_PUB\_GET ESP\_BLE\_MESH\_MODEL\_OP\_FRIEND\_GET  
 ESP\_BLE\_MESH\_MODEL\_OP\_HEARTBEAT\_PUB\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEARTBEAT\_SUB\_GET  
 the `get_state` parameter in the `esp_ble_mesh_config_client_get_state` function should not be set to NULL.

### Public Members

*esp\_ble\_mesh\_cfg\_model\_pub\_get\_t* **model\_pub\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_MODEL\_PUB\_GET.

*esp\_ble\_mesh\_cfg\_composition\_data\_get\_t* **comp\_data\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_COMPOSITION\_DATA\_GET.

*esp\_ble\_mesh\_cfg\_sig\_model\_sub\_get\_t* **sig\_model\_sub\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_SIG\_MODEL\_SUB\_GET

*esp\_ble\_mesh\_cfg\_vnd\_model\_sub\_get\_t* **vnd\_model\_sub\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_VENDOR\_MODEL\_SUB\_GET

*esp\_ble\_mesh\_cfg\_app\_key\_get\_t* **app\_key\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_APP\_KEY\_GET.

*esp\_ble\_mesh\_cfg\_node\_identity\_get\_t* **node\_identity\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_NODE\_IDENTITY\_GET.

*esp\_ble\_mesh\_cfg\_sig\_model\_app\_get\_t* **sig\_model\_app\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_SIG\_MODEL\_APP\_GET

*esp\_ble\_mesh\_cfg\_vnd\_model\_app\_get\_t* **vnd\_model\_app\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_VENDOR\_MODEL\_APP\_GET

*esp\_ble\_mesh\_cfg\_kr\_phase\_get\_t* **kr\_phase\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_KEY\_REFRESH\_PHASE\_GET

*esp\_ble\_mesh\_cfg\_lpn\_polltimeout\_get\_t* **lpn\_pollto\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_LPN\_POLLTIMEOUT\_GET

union **esp\_ble\_mesh\_cfg\_client\_set\_state\_t**

```

For ESP\_BLE\_MESH\_MODEL\_OP\_NODE\_IDENTITY\_SET

*esp\_ble\_mesh\_cfg\_model\_app\_unbind\_t* **model\_app\_unbind**

For ESP\_BLE\_MESH\_MODEL\_OP\_MODEL\_APP\_UNBIND

*esp\_ble\_mesh\_cfg\_kr\_phase\_set\_t* **kr\_phase\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_KEY\_REFRESH\_PHASE\_SET

*esp\_ble\_mesh\_cfg\_net\_transmit\_set\_t* **net\_transmit\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_NETWORK\_TRANSMIT\_SET

union **esp\_ble\_mesh\_cfg\_client\_common\_cb\_param\_t**

*#include <esp\_ble\_mesh\_config\_model\_api.h>* Configuration Client Model received message union.

### Public Members

*esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t* **beacon\_status**

The beacon status value

*esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t* **comp\_data\_status**

The composition data status value

*esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t* **default\_ttl\_status**

The default\_ttl status value

*esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t* **gatt\_proxy\_status**

The gatt\_proxy status value

*esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t* **relay\_status**

The relay status value

*esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t* **model\_pub\_status**

The model publication status value

*esp\_ble\_mesh\_cfg\_model\_sub\_status\_cb\_t* **model\_sub\_status**

The model subscription status value

*esp\_ble\_mesh\_cfg\_net\_key\_status\_cb\_t* **netkey\_status**

The netkey status value

*esp\_ble\_mesh\_cfg\_app\_key\_status\_cb\_t* **appkey\_status**

The appkey status value

*esp\_ble\_mesh\_cfg\_mod\_app\_status\_cb\_t* **model\_app\_status**

The model app status value

*esp\_ble\_mesh\_cfg\_friend\_status\_cb\_t* **friend\_status**

The friend status value

*esp\_ble\_mesh\_cfg\_hb\_pub\_status\_cb\_t* **heartbeat\_pub\_status**

The heartbeat publication status value

*esp\_ble\_mesh\_cfg\_hb\_sub\_status\_cb\_t* **heartbeat\_sub\_status**

The heartbeat subscription status value

*esp\_ble\_mesh\_cfg\_net\_trans\_status\_cb\_t* **net\_transmit\_status**

The network transmit status value

*esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t* **model\_sub\_list**

The model subscription list value

*esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t* **netkey\_list**

The network key index list value

*esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t* **appkey\_list**

The application key index list value

*esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t* **node\_identity\_status**

The node identity status value

*esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t* **model\_app\_list**

The model application key index list value

*esp\_ble\_mesh\_cfg\_kr\_phase\_status\_cb\_t* **kr\_phase\_status**

The key refresh phase status value

*esp\_ble\_mesh\_cfg\_lpn\_pollto\_status\_cb\_t* **lpn\_timeout\_status**

The low power node poll timeout status value

union **esp\_ble\_mesh\_cfg\_server\_state\_change\_t**

*#include <esp\_ble\_mesh\_config\_model\_api.h>* Configuration Server model state change value union.

### Public Members

*esp\_ble\_mesh\_state\_change\_cfg\_mod\_pub\_set\_t* **mod\_pub\_set**

ESP\_BLE\_MESH\_CFG\_SERVER\_STATE\_CHANGE\_EVT

## Structures

struct **esp\_ble\_mesh\_cfg\_srv**  
Configuration Server Model context

## Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Configuration Server Model

uint8\_t **net\_transmit**  
Network Transmit state

uint8\_t **relay**  
Relay Mode state

uint8\_t **relay\_retransmit**  
Relay Retransmit state

uint8\_t **beacon**  
Secure Network Beacon state

uint8\_t **gatt\_proxy**  
GATT Proxy state

uint8\_t **friend\_state**  
Friend state

uint8\_t **default\_ttl**  
Default TTL

struct k\_delayed\_work **timer**  
Heartbeat Publication timer

uint16\_t **dst**  
Destination address for Heartbeat messages

uint16\_t **count**  
Number of Heartbeat messages to be sent  
Number of Heartbeat messages received

uint8\_t **period**  
Period for sending Heartbeat messages

`uint8_t ttl`

TTL to be used when sending Heartbeat messages

`uint16_t feature`

Bit field indicating features that trigger Heartbeat messages when changed

`uint16_t net_idx`

NetKey Index used by Heartbeat Publication

struct `esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub`

Heartbeat Publication

`int64_t expiry`

Timestamp when Heartbeat subscription period is expired

`uint16_t src`

Source address for Heartbeat messages

`uint8_t min_hops`

Minimum hops when receiving Heartbeat messages

`uint8_t max_hops`

Maximum hops when receiving Heartbeat messages

`esp_ble_mesh_cb_t heartbeat_recv_cb`

Optional heartbeat subscription tracking function

struct `esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub`

Heartbeat Subscription

struct `esp_ble_mesh_cfg_composition_data_get_t`

Parameters of Config Composition Data Get.

### Public Members

`uint8_t page`

Page number of the Composition Data.

struct `esp_ble_mesh_cfg_model_pub_get_t`

Parameters of Config Model Publication Get.

### Public Members

`uint16_t element_addr`

The element address

`uint16_t model_id`

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_sig\_model\_sub\_get\_t**

Parameters of Config SIG Model Subscription Get.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

struct **esp\_ble\_mesh\_cfg\_vnd\_model\_sub\_get\_t**

Parameters of Config Vendor Model Subscription Get.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_app\_key\_get\_t**

Parameters of Config AppKey Get.

### Public Members

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_node\_identity\_get\_t**

Parameters of Config Node Identity Get.

### Public Members

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_sig\_model\_app\_get\_t**

Parameters of Config SIG Model App Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

struct **esp\_ble\_mesh\_cfg\_vnd\_model\_app\_get\_t**

Parameters of Config Vendor Model App Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_kr\_phase\_get\_t**

Parameters of Config Key Refresh Phase Get.

**Public Members****uint16\_t net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_lpn\_polltimeout\_get\_t**

Parameters of Config Low Power Node PollTimeout Get.

**Public Members****uint16\_t lpn\_addr**

The unicast address of the Low Power node

struct **esp\_ble\_mesh\_cfg\_beacon\_set\_t**

Parameters of Config Beacon Set.

**Public Members****uint8\_t beacon**

New Secure Network Beacon state

struct **esp\_ble\_mesh\_cfg\_default\_ttl\_set\_t**

Parameters of Config Default TTL Set.

### Public Members

uint8\_t **ttl**

The default TTL state value

struct **esp\_ble\_mesh\_cfg\_friend\_set\_t**

Parameters of Config Friend Set.

### Public Members

uint8\_t **friend\_state**

The friend state value

struct **esp\_ble\_mesh\_cfg\_gatt\_proxy\_set\_t**

Parameters of Config GATT Proxy Set.

### Public Members

uint8\_t **gatt\_proxy**

The GATT Proxy state value

struct **esp\_ble\_mesh\_cfg\_relay\_set\_t**

Parameters of Config Relay Set.

### Public Members

uint8\_t **relay**

The relay value

uint8\_t **relay\_retransmit**

The relay retransmit value

struct **esp\_ble\_mesh\_cfg\_net\_key\_add\_t**

Parameters of Config NetKey Add.

### Public Members

uint16\_t **net\_idx**

The network key index

uint8\_t **net\_key[16]**

The network key value

struct **esp\_ble\_mesh\_cfg\_app\_key\_add\_t**

Parameters of Config AppKey Add.

### Public Members

uint16\_t **net\_idx**

The network key index

uint16\_t **app\_idx**

The app key index

uint8\_t **app\_key**[16]

The app key value

struct **esp\_ble\_mesh\_cfg\_model\_app\_bind\_t**

Parameters of Config Model App Bind.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **model\_app\_idx**

Index of the app key to bind with the model

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_pub\_set\_t**

Parameters of Config Model Publication Set.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **publish\_addr**

Value of the publish address

uint16\_t **publish\_app\_idx**

Index of the application key

bool **cred\_flag**

Value of the Friendship Credential Flag

uint8\_t **publish\_ttl**

Default TTL value for the publishing messages

uint8\_t **publish\_period**

Period for periodic status publishing

uint8\_t **publish\_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_add\_t**

Parameters of Config Model Subscription Add.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **sub\_addr**

The address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_delete\_t**

Parameters of Config Model Subscription Delete.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **sub\_addr**

The address to be removed from the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_overwrite\_t**

Parameters of Config Model Subscription Overwrite.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **sub\_addr**

The address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_va\_add\_t**

Parameters of Config Model Subscription Virtual Address Add.

### Public Members

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_va\_delete\_t**

Parameters of Config Model Subscription Virtual Address Delete.

### Public Members

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_va\_overwrite\_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

### Public Members

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_pub\_va\_set\_t**

Parameters of Config Model Publication Virtual Address Set.

### Public Members

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

Value of the Label UUID publish address

uint16\_t **publish\_app\_idx**

Index of the application key

bool **cred\_flag**

Value of the Friendship Credential Flag

uint8\_t **publish\_ttl**

Default TTL value for the publishing messages

uint8\_t **publish\_period**

Period for periodic status publishing

uint8\_t **publish\_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_delete\_all\_t**

Parameters of Config Model Subscription Delete All.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_net\_key\_update\_t**

Parameters of Config NetKey Update.

### **Public Members**

uint16\_t **net\_idx**

The network key index

uint8\_t **net\_key**[16]

The network key value

struct **esp\_ble\_mesh\_cfg\_net\_key\_delete\_t**

Parameters of Config NetKey Delete.

### **Public Members**

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_app\_key\_update\_t**

Parameters of Config AppKey Update.

### Public Members

uint16\_t **net\_idx**

The network key index

uint16\_t **app\_idx**

The app key index

uint8\_t **app\_key**[16]

The app key value

struct **esp\_ble\_mesh\_cfg\_app\_key\_delete\_t**

Parameters of Config AppKey Delete.

### Public Members

uint16\_t **net\_idx**

The network key index

uint16\_t **app\_idx**

The app key index

struct **esp\_ble\_mesh\_cfg\_node\_identity\_set\_t**

Parameters of Config Node Identity Set.

### Public Members

uint16\_t **net\_idx**

The network key index

uint8\_t **identity**

New Node Identity state

struct **esp\_ble\_mesh\_cfg\_model\_app\_unbind\_t**

Parameters of Config Model App Unbind.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **model\_app\_idx**

Index of the app key to bind with the model

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_kr\_phase\_set\_t**

Parameters of Config Key Refresh Phase Set.

### Public Members

uint16\_t **net\_idx**

The network key index

uint8\_t **transition**

New Key Refresh Phase Transition

struct **esp\_ble\_mesh\_cfg\_net\_transmit\_set\_t**

Parameters of Config Network Transmit Set.

### Public Members

uint8\_t **net\_transmit**

Network Transmit State

struct **esp\_ble\_mesh\_cfg\_heartbeat\_pub\_set\_t**

Parameters of Config Model Heartbeat Publication Set.

### Public Members

uint16\_t **dst**

Destination address for Heartbeat messages

uint8\_t **count**

Number of Heartbeat messages to be sent

uint8\_t **period**

Period for sending Heartbeat messages

uint8\_t **ttl**

TTL to be used when sending Heartbeat messages

uint16\_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16\_t **net\_idx**

NetKey Index

struct **esp\_ble\_mesh\_cfg\_heartbeat\_sub\_set\_t**

Parameters of Config Model Heartbeat Subscription Set.

### Public Members

uint16\_t **src**

Source address for Heartbeat messages

uint16\_t **dst**

Destination address for Heartbeat messages

uint8\_t **period**

Period for receiving Heartbeat messages

struct **esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t**

Parameter of Config Beacon Status

### Public Members

uint8\_t **beacon**

Secure Network Beacon state value

struct **esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t**

Parameters of Config Composition Data Status

### Public Members

uint8\_t **page**

Page number of the Composition Data

struct net\_buf\_simple \***composition\_data**

Pointer to Composition Data for the identified page

struct **esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t**

Parameter of Config Default TTL Status

### Public Members

uint8\_t **default\_ttl**

Default TTL state value

struct **esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t**

Parameter of Config GATT Proxy Status

### Public Members

uint8\_t **gatt\_proxy**

GATT Proxy state value

struct **esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t**

Parameters of Config Relay Status

### Public Members

uint8\_t **relay**

Relay state value

uint8\_t **retransmit**

Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct **esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t**

Parameters of Config Model Publication Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **element\_addr**

Address of the element

uint16\_t **publish\_addr**

Value of the publish address

uint16\_t **app\_idx**

Index of the application key

bool **cred\_flag**

Value of the Friendship Credential Flag

uint8\_t **t1**

Default TTL value for the outgoing messages

uint8\_t **period**

Period for periodic status publishing

`uint8_t transmit`

Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t company_id`

Company ID

`uint16_t model_id`

Model ID

struct `esp_ble_mesh_cfg_model_sub_status_cb_t`

Parameters of Config Model Subscription Status

### Public Members

`uint8_t status`

Status Code for the request message

`uint16_t element_addr`

Address of the element

`uint16_t sub_addr`

Value of the address

`uint16_t company_id`

Company ID

`uint16_t model_id`

Model ID

struct `esp_ble_mesh_cfg_net_key_status_cb_t`

Parameters of Config NetKey Status

### Public Members

`uint8_t status`

Status Code for the request message

`uint16_t net_idx`

Index of the NetKey

struct `esp_ble_mesh_cfg_app_key_status_cb_t`

Parameters of Config AppKey Status

### Public Members

`uint8_t status`

Status Code for the request message

`uint16_t net_idx`

Index of the NetKey

`uint16_t app_idx`

Index of the application key

struct `esp_ble_mesh_cfg_mod_app_status_cb_t`

Parameters of Config Model App Status

### Public Members

`uint8_t status`

Status Code for the request message

`uint16_t element_addr`

Address of the element

`uint16_t app_idx`

Index of the application key

`uint16_t company_id`

Company ID

`uint16_t model_id`

Model ID

struct `esp_ble_mesh_cfg_friend_status_cb_t`

Parameter of Config Friend Status

### Public Members

`uint8_t friend_state`

Friend state value

struct `esp_ble_mesh_cfg_hb_pub_status_cb_t`

Parameters of Config Heartbeat Publication Status

### Public Members

`uint8_t status`

Status Code for the request message

`uint16_t dst`

Destination address for Heartbeat messages

`uint8_t count`

Number of Heartbeat messages remaining to be sent

`uint8_t period`

Period for sending Heartbeat messages

`uint8_t ttl`

TTL to be used when sending Heartbeat messages

`uint16_t features`

Features that trigger Heartbeat messages when changed

`uint16_t net_idx`

Index of the NetKey

struct `esp_ble_mesh_cfg_hb_sub_status_cb_t`

Parameters of Config Heartbeat Subscription Status

### Public Members

`uint8_t status`

Status Code for the request message

`uint16_t src`

Source address for Heartbeat messages

`uint16_t dst`

Destination address for Heartbeat messages

`uint8_t period`

Remaining Period for processing Heartbeat messages

`uint8_t count`

Number of Heartbeat messages received

`uint8_t min_hops`

Minimum hops when receiving Heartbeat messages

`uint8_t max_hops`

Maximum hops when receiving Heartbeat messages

struct `esp_ble_mesh_cfg_net_trans_status_cb_t`

Parameters of Config Network Transmit Status

**Public Members****uint8\_t net\_trans\_count**

Number of transmissions for each Network PDU originating from the node

**uint8\_t net\_trans\_step**

Maximum hops when receiving Heartbeat messages

struct **esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t**

Parameters of Config SIG/Vendor Subscription List

**Public Members****uint8\_t status**

Status Code for the request message

**uint16\_t element\_addr**

Address of the element

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

struct net\_buf\_simple \***sub\_addr**

A block of all addresses from the Subscription List

struct **esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t**

Parameter of Config NetKey List

**Public Members**struct net\_buf\_simple \***net\_idx**

A list of NetKey Indexes known to the node

struct **esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t**

Parameters of Config AppKey List

**Public Members****uint8\_t status**

Status Code for the request message

**uint16\_t net\_idx**

NetKey Index of the NetKey that the AppKeys are bound to

struct net\_buf\_simple \***app\_idx**

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct **esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t**

Parameters of Config Node Identity Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

Index of the NetKey

uint8\_t **identity**

Node Identity state

struct **esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t**

Parameters of Config SIG/Vendor Model App List

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **element\_addr**

Address of the element

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct net\_buf\_simple \***app\_idx**

All AppKey indexes bound to the Model

struct **esp\_ble\_mesh\_cfg\_kr\_phase\_status\_cb\_t**

Parameters of Config Key Refresh Phase Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

Index of the NetKey

uint8\_t **phase**

Key Refresh Phase state

struct **esp\_ble\_mesh\_cfg\_lpn\_pollto\_status\_cb\_t**

Parameters of Config Low Power Node PollTimeout Status

### Public Members

uint16\_t **lpn\_addr**

The unicast address of the Low Power node

int32\_t **poll\_timeout**

The current value of the PollTimeout timer of the Low Power node

struct **esp\_ble\_mesh\_cfg\_client\_cb\_param\_t**

Configuration Client Model callback parameters

### Public Members

int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters

*esp\_ble\_mesh\_cfg\_client\_common\_cb\_param\_t* **status\_cb**

The config status message callback values

struct **esp\_ble\_mesh\_state\_change\_cfg\_mod\_pub\_set\_t**

Configuration Server model related context.

### Public Members

uint16\_t **element\_addr**

Element Address

uint16\_t **pub\_addr**

Publish Address

uint16\_t **app\_idx**

AppKey Index

bool **cred\_flag**  
Friendship Credential Flag

uint8\_t **pub\_ttl**  
Publish TTL

uint8\_t **pub\_period**  
Publish Period

uint8\_t **pub\_retransmit**  
Publish Retransmit

uint16\_t **company\_id**  
Company ID

uint16\_t **model\_id**  
Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_add\_t**  
Parameters of Config Model Subscription Add

### Public Members

uint16\_t **element\_addr**  
Element Address

uint16\_t **sub\_addr**  
Subscription Address

uint16\_t **company\_id**  
Company ID

uint16\_t **model\_id**  
Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_delete\_t**  
Parameters of Config Model Subscription Delete

### Public Members

uint16\_t **element\_addr**  
Element Address

uint16\_t **sub\_addr**  
Subscription Address

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_netkey\_add\_t**

Parameters of Config NetKey Add

### **Public Members**

uint16\_t **net\_idx**

NetKey Index

uint8\_t **net\_key**[16]

NetKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_netkey\_update\_t**

Parameters of Config NetKey Update

### **Public Members**

uint16\_t **net\_idx**

NetKey Index

uint8\_t **net\_key**[16]

NetKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_netkey\_delete\_t**

Parameter of Config NetKey Delete

### **Public Members**

uint16\_t **net\_idx**

NetKey Index

struct **esp\_ble\_mesh\_state\_change\_cfg\_appkey\_add\_t**

Parameters of Config AppKey Add

### **Public Members**

uint16\_t **net\_idx**

NetKey Index

uint16\_t **app\_idx**

AppKey Index

uint8\_t **app\_key**[16]  
AppKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_appkey\_update\_t**  
Parameters of Config AppKey Update

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

uint8\_t **app\_key**[16]  
AppKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_appkey\_delete\_t**  
Parameters of Config AppKey Delete

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_bind\_t**  
Parameters of Config Model App Bind

### Public Members

uint16\_t **element\_addr**  
Element Address

uint16\_t **app\_idx**  
AppKey Index

uint16\_t **company\_id**  
Company ID

uint16\_t **model\_id**  
Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_unbind\_t**  
Parameters of Config Model App Unbind

**Public Members****uint16\_t element\_addr**

Element Address

**uint16\_t app\_idx**

AppKey Index

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_kr\_phase\_set\_t**

Parameters of Config Key Refresh Phase Set

**Public Members****uint16\_t net\_idx**

NetKey Index

**uint8\_t kr\_phase**

New Key Refresh Phase Transition

struct **esp\_ble\_mesh\_cfg\_server\_cb\_param\_t**

Configuration Server model callback parameters

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the server model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received message

*esp\_ble\_mesh\_cfg\_server\_cb\_value\_t* **value**

Value of the received configuration messages

**Macros****ESP\_BLE\_MESH\_MODEL\_CFG\_SRV** (srv\_data)

Define a new Config Server Model.

---

**备注:** The Config Server Model can only be included by a Primary Element.

---

**参数**

- **srv\_data** –Pointer to a unique Config Server Model user\_data.

返回 New Config Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_CFG\_CLI** (cli\_data)

Define a new Config Client Model.

---

备注: The Config Client Model can only be included by a Primary Element.

---

参数

- **cli\_data** –Pointer to a unique struct *esp\_ble\_mesh\_client\_t*.

返回 New Config Client Model instance.

## Type Definitions

```
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```

Configuration Server Model context

```
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,  
esp_ble_mesh_cfg_client_cb_param_t *param)
```

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,  
esp_ble_mesh_cfg_server_cb_param_t *param)
```

Configuration Server Model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_cfg_client_cb_event_t
```

This enum value is the event of Configuration Client Model

Values:

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_cfg_server_cb_event_t
```

This enum value is the event of Configuration Server model

Values:

enumerator **ESP\_BLE\_MESH\_CFG\_SERVER\_STATE\_CHANGE\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_SERVER\_EVT\_MAX**

## Health Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_client\_callback** (*esp\_ble\_mesh\_health\_client\_cb\_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_server\_callback** (*esp\_ble\_mesh\_health\_server\_cb\_t* callback)

Register BLE Mesh Health Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_get\_state\_t* \*get\_state)

This function is called to get the Health Server states using the Health Client Model get messages.

---

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_set\_state\_t* \*set\_state)

This function is called to set the Health Server states using the Health Client Model set messages.

---

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_health\_server\_fault\_update** (*esp\_ble\_mesh\_elem\_t* \*element)

This function is called by the Health Server Model to update the context of its Health Current status.

**参数** **element** –[in] The element to which the Health Server Model belongs.  
**返回** ESP\_OK on success or error code otherwise.

## Unions

union **esp\_ble\_mesh\_health\_client\_get\_state\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_GET the get\_state parameter in the esp\_ble\_mesh\_health\_client\_get\_state function should not be set to NULL.

### Public Members

*esp\_ble\_mesh\_health\_fault\_get\_t* **fault\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET.

union **esp\_ble\_mesh\_health\_client\_set\_state\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK the set\_state parameter in the esp\_ble\_mesh\_health\_client\_set\_state function should not be set to NULL.

### Public Members

*esp\_ble\_mesh\_health\_attention\_set\_t* **attention\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK.

*esp\_ble\_mesh\_health\_period\_set\_t* **period\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK.

*esp\_ble\_mesh\_health\_fault\_test\_t* **fault\_test**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK.

*esp\_ble\_mesh\_health\_fault\_clear\_t* **fault\_clear**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK.

union **esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> Health Client Model received message union.

### Public Members

*esp\_ble\_mesh\_health\_current\_status\_cb\_t* **current\_status**

The health current status value

*esp\_ble\_mesh\_health\_fault\_status\_cb\_t* **fault\_status**

The health fault status value

*esp\_ble\_mesh\_health\_period\_status\_cb\_t* **period\_status**

The health period status value

*esp\_ble\_mesh\_health\_attention\_status\_cb\_t* **attention\_status**

The health attention status value

union **esp\_ble\_mesh\_health\_server\_cb\_param\_t**

#include <esp\_ble\_mesh\_health\_model\_api.h> Health Server Model callback parameters union.

### Public Members

*esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t* **fault\_update\_comp**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT

*esp\_ble\_mesh\_health\_fault\_clear\_cb\_t* **fault\_clear**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT

*esp\_ble\_mesh\_health\_fault\_test\_cb\_t* **fault\_test**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT

*esp\_ble\_mesh\_health\_attention\_on\_cb\_t* **attention\_on**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT

*esp\_ble\_mesh\_health\_attention\_off\_cb\_t* **attention\_off**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT

### Structures

struct **esp\_ble\_mesh\_health\_srv\_cb\_t**

ESP BLE Mesh Health Server callback

### Public Members

*esp\_ble\_mesh\_cb\_t* **fault\_clear**

Clear health registered faults. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **fault\_test**

Run a specific health test. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_on**

Health attention on callback. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_off**

Health attention off callback. Initialized by the stack.

struct **esp\_ble\_mesh\_health\_test\_t**  
ESP BLE Mesh Health Server test Context

### Public Members

uint8\_t **id\_count**  
Number of Health self-test ID

const uint8\_t \***test\_ids**  
Array of Health self-test IDs

uint16\_t **company\_id**  
Company ID used to identify the Health Fault state

uint8\_t **prev\_test\_id**  
Current test ID of the health fault test

uint8\_t **current\_faults**[32]  
Array of current faults

uint8\_t **registered\_faults**[32]  
Array of registered faults

struct **esp\_ble\_mesh\_health\_srv\_t**  
ESP BLE Mesh Health Server Model Context

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Health Server Model

*esp\_ble\_mesh\_health\_srv\_cb\_t* **health\_cb**  
Health callback struct

struct k\_delayed\_work **attention\_timer**  
Attention Timer state

bool **attention\_timer\_start**  
Attention Timer start flag

*esp\_ble\_mesh\_health\_test\_t* **health\_test**  
Health Server fault test

struct **esp\_ble\_mesh\_health\_fault\_get\_t**  
Parameter of Health Fault Get

### Public Members

uint16\_t **company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_attention\_set\_t**

Parameter of Health Attention Set

### Public Members

uint8\_t **attention**

Value of the Attention Timer state

struct **esp\_ble\_mesh\_health\_period\_set\_t**

Parameter of Health Period Set

### Public Members

uint8\_t **fast\_period\_divisor**

Divider for the Publish Period

struct **esp\_ble\_mesh\_health\_fault\_test\_t**

Parameter of Health Fault Test

### Public Members

uint16\_t **company\_id**

Bluetooth assigned 16-bit Company ID

uint8\_t **test\_id**

ID of a specific test to be performed

struct **esp\_ble\_mesh\_health\_fault\_clear\_t**

Parameter of Health Fault Clear

### Public Members

uint16\_t **company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_current\_status\_cb\_t**

Parameters of Health Current Status

**Public Members****uint8\_t test\_id**

ID of a most recently performed test

**uint16\_t company\_id**

Bluetooth assigned 16-bit Company ID

**struct net\_buf\_simple \*fault\_array**

FaultArray field contains a sequence of 1-octet fault values

**struct esp\_ble\_mesh\_health\_fault\_status\_cb\_t**

Parameters of Health Fault Status

**Public Members****uint8\_t test\_id**

ID of a most recently performed test

**uint16\_t company\_id**

Bluetooth assigned 16-bit Company ID

**struct net\_buf\_simple \*fault\_array**

FaultArray field contains a sequence of 1-octet fault values

**struct esp\_ble\_mesh\_health\_period\_status\_cb\_t**

Parameter of Health Period Status

**Public Members****uint8\_t fast\_period\_divisor**

Divider for the Publish Period

**struct esp\_ble\_mesh\_health\_attention\_status\_cb\_t**

Parameter of Health Attention Status

**Public Members****uint8\_t attention**

Value of the Attention Timer state

**struct esp\_ble\_mesh\_health\_client\_cb\_param\_t**

Health Client Model callback parameters

**Public Members****int error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t* **status\_cb**

The health message status callback values

struct **esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t**

Parameter of publishing Health Current Status completion event

**Public Members****int error\_code**

The result of publishing Health Current Status

*esp\_ble\_mesh\_elem\_t* \***element**

Pointer to the element which contains the Health Server Model

struct **esp\_ble\_mesh\_health\_fault\_clear\_cb\_t**

Parameters of Health Fault Clear event

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

**uint16\_t company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_fault\_test\_cb\_t**

Parameters of Health Fault Test event

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

**uint8\_t test\_id**

ID of a specific test to be performed

**uint16\_t company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_attention\_on\_cb\_t**

Parameter of Health Attention On event

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

uint8\_t **time**

Duration of attention timer on (in seconds)

struct **esp\_ble\_mesh\_health\_attention\_off\_cb\_t**

Parameter of Health Attention Off event

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

### Macros

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_SRV** (srv, pub)

Define a new Health Server Model.

---

备注: The Health Server Model can only be included by a Primary Element.

---

#### 参数

- **srv** –Pointer to the unique struct *esp\_ble\_mesh\_health\_srv\_t*.
- **pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.

返回 New Health Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_CLI** (cli\_data)

Define a new Health Client Model.

---

备注: This API needs to be called for each element on which the application needs to have a Health Client Model.

---

#### 参数

- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

返回 New Health Client Model instance.

**ESP\_BLE\_MESH\_HEALTH\_PUB\_DEFINE** (\_name, \_max, \_role)

A helper to define a health publication context

#### 参数

- **\_name** –Name given to the publication context variable.
- **\_max** –Maximum number of faults the element can have.
- **\_role** –Role of the device which contains the model.

**ESP\_BLE\_MESH\_HEALTH\_STANDARD\_TEST**

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP\_BLE\_MESH\_NO\_FAULT**

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

**ESP\_BLE\_MESH\_BATTERY\_LOW\_WARNING**

**ESP\_BLE\_MESH\_BATTERY\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_ERROR**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_WARNING**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_ERROR**

**ESP\_BLE\_MESH\_NO\_LOAD\_WARNING**

**ESP\_BLE\_MESH\_NO\_LOAD\_ERROR**

**ESP\_BLE\_MESH\_OVERLOAD\_WARNING**

**ESP\_BLE\_MESH\_OVERLOAD\_ERROR**

**ESP\_BLE\_MESH\_OVERHEAT\_WARNING**

**ESP\_BLE\_MESH\_OVERHEAT\_ERROR**

**ESP\_BLE\_MESH\_CONDENSATION\_WARNING**

**ESP\_BLE\_MESH\_CONDENSATION\_ERROR**

**ESP\_BLE\_MESH\_VIBRATION\_WARNING**

**ESP\_BLE\_MESH\_VIBRATION\_ERROR**

**ESP\_BLE\_MESH\_CONFIGURATION\_WARNING**

**ESP\_BLE\_MESH\_CONFIGURATION\_ERROR**

ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_WARNING

ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_ERROR

ESP\_BLE\_MESH\_MEMORY\_WARNING

ESP\_BLE\_MESH\_MEMORY\_ERROR

ESP\_BLE\_MESH\_SELF\_TEST\_WARNING

ESP\_BLE\_MESH\_SELF\_TEST\_ERROR

ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_WARNING

ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_ERROR

ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_WARNING

ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_ERROR

ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_WARNING

ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_ERROR

ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_WARNING

ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_ERROR

ESP\_BLE\_MESH\_HOUSING\_OPENED\_WARNING

ESP\_BLE\_MESH\_HOUSING\_OPENED\_ERROR

ESP\_BLE\_MESH\_TAMPER\_WARNING

ESP\_BLE\_MESH\_TAMPER\_ERROR

ESP\_BLE\_MESH\_DEVICE\_MOVED\_WARNING

ESP\_BLE\_MESH\_DEVICE\_MOVED\_ERROR

ESP\_BLE\_MESH\_DEVICE\_DROPPED\_WARNING

ESP\_BLE\_MESH\_DEVICE\_DROPPED\_ERROR

ESP\_BLE\_MESH\_OVERFLOW\_WARNING

**ESP\_BLE\_MESH\_OVERFLOW\_ERROR**

**ESP\_BLE\_MESH\_EMPTY\_WARNING**

**ESP\_BLE\_MESH\_EMPTY\_ERROR**

**ESP\_BLE\_MESH\_INTERNAL\_BUS\_WARNING**

**ESP\_BLE\_MESH\_INTERNAL\_BUS\_ERROR**

**ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_WARNING**

**ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_ERROR**

**ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE**

### Type Definitions

```
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event,  
esp_ble_mesh_health_client_cb_param_t *param)
```

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event,  
esp_ble_mesh_health_server_cb_param_t *param)
```

Health Server Model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_health_client_cb_event_t
```

This enum value is the event of Health Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_EVT\_MAX**

enum **esp\_ble\_mesh\_health\_server\_cb\_event\_t**

This enum value is the event of Health Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_EVT\_MAX**

## Generic Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_generic\_client\_callback** (*esp\_ble\_mesh\_generic\_client\_cb\_t* callback)

Register BLE Mesh Generic Client Model callback.

**参数** **callback** –[in] Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_generic\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_get\_state\_t* \*get\_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

---

**备注:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to generic get message value. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_generic\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_set\_state\_t* \*set\_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

---

**备注:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

---

### 参数

- **params** `–[in]` Pointer to BLE Mesh common client parameters.
- **set\_state** `–[in]` Pointer to generic set message value. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_register_generic_server_callback` (`esp_ble_mesh_generic_server_cb_t` callback)

Register BLE Mesh Generic Server Model callback.

**参数** **callback** `–[in]` Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

## Unions

union **esp\_ble\_mesh\_generic\_client\_get\_state\_t**

`#include <esp_ble_mesh_generic_model_api.h>` Generic Client Model get message union.

### Public Members

### Structures

struct **esp\_ble\_mesh\_gen\_onoff\_set\_t**

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

### Public Members

bool **op\_en**

Indicate if optional parameters are included

`uint8_t onoff`

Target value of Generic OnOff state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_gen_level_set_t`

Parameters of Generic Level Set.

### Public Members

bool `op_en`

Indicate if optional parameters are included

`int16_t level`

Target value of Generic Level state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_gen_delta_set_t`

Parameters of Generic Delta Set.

### Public Members

bool `op_en`

Indicate if optional parameters are included

`int32_t level`

Delta change of Generic Level state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_gen_move_set_t`

Parameters of Generic Move Set.

### Public Members

bool `op_en`

Indicate if optional parameters are included

int16\_t `delta_level`

Delta Level step to calculate Move speed for Generic Level state

uint8\_t `tid`

Transaction ID

uint8\_t `trans_time`

Time to complete state transition (optional)

uint8\_t `delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_gen_def_trans_time_set_t`

Parameter of Generic Default Transition Time Set.

### Public Members

uint8\_t `trans_time`

The value of the Generic Default Transition Time state

struct `esp_ble_mesh_gen_onpowerup_set_t`

Parameter of Generic OnPowerUp Set.

### Public Members

uint8\_t `onpowerup`

The value of the Generic OnPowerUp state

struct `esp_ble_mesh_gen_power_level_set_t`

Parameters of Generic Power Level Set.

### Public Members

bool `op_en`

Indicate if optional parameters are included

uint16\_t **power**

Target value of Generic Power Actual state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_gen\_power\_default\_set\_t**

Parameter of Generic Power Default Set.

### Public Members

uint16\_t **power**

The value of the Generic Power Default state

struct **esp\_ble\_mesh\_gen\_power\_range\_set\_t**

Parameters of Generic Power Range Set.

### Public Members

uint16\_t **range\_min**

Value of Range Min field of Generic Power Range state

uint16\_t **range\_max**

Value of Range Max field of Generic Power Range state

struct **esp\_ble\_mesh\_gen\_loc\_global\_set\_t**

Parameters of Generic Location Global Set.

### Public Members

int32\_t **global\_latitude**

Global Coordinates (Latitude)

int32\_t **global\_longitude**

Global Coordinates (Longitude)

int16\_t **global\_altitude**

Global Altitude

struct **esp\_ble\_mesh\_gen\_loc\_local\_set\_t**

Parameters of Generic Location Local Set.

**Public Members****int16\_t local\_north**

Local Coordinates (North)

**int16\_t local\_east**

Local Coordinates (East)

**int16\_t local\_altitude**

Local Altitude

**uint8\_t floor\_number**

Floor Number

**uint16\_t uncertainty**

Uncertainty

struct **esp\_ble\_mesh\_gen\_user\_property\_get\_t**

Parameter of Generic User Property Get.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic User Property

struct **esp\_ble\_mesh\_gen\_user\_property\_set\_t**

Parameters of Generic User Property Set.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic User Property

struct net\_buf\_simple \***property\_value**

Raw value for the User Property

struct **esp\_ble\_mesh\_gen\_admin\_property\_get\_t**

Parameter of Generic Admin Property Get.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Admin Property

struct **esp\_ble\_mesh\_gen\_admin\_property\_set\_t**

Parameters of Generic Admin Property Set.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Admin Property

**uint8\_t user\_access**

Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**

Raw value for the Admin Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_get\_t**

Parameter of Generic Manufacturer Property Get.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_set\_t**

Parameters of Generic Manufacturer Property Set.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Manufacturer Property

**uint8\_t user\_access**

Enumeration indicating user access

**struct esp\_ble\_mesh\_gen\_client\_properties\_get\_t**

Parameter of Generic Client Properties Get.

**Public Members****uint16\_t property\_id**

A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_gen\_onoff\_status\_cb\_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

**Public Members**

bool **op\_en**

Indicate if optional parameters are included

uint8\_t **present\_onoff**

Current value of Generic OnOff state

uint8\_t **target\_onoff**

Target value of Generic OnOff state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_gen\_level\_status\_cb\_t**

Parameters of Generic Level Status.

### Public Members

bool **op\_en**

Indicate if optional parameters are included

int16\_t **present\_level**

Current value of Generic Level state

int16\_t **target\_level**

Target value of the Generic Level state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_status\_cb\_t**

Parameter of Generic Default Transition Time Status.

### Public Members

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_onpowerup\_status\_cb\_t**

Parameter of Generic OnPowerUp Status.

### Public Members

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_level\_status\_cb\_t**

Parameters of Generic Power Level Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t present\_power**

Current value of Generic Power Actual state

**uint16\_t target\_power**

Target value of Generic Power Actual state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_gen\_power\_last\_status\_cb\_t**

Parameter of Generic Power Last Status.

**Public Members****uint16\_t power**

The value of the Generic Power Last state

struct **esp\_ble\_mesh\_gen\_power\_default\_status\_cb\_t**

Parameter of Generic Power Default Status.

**Public Members****uint16\_t power**

The value of the Generic Default Last state

struct **esp\_ble\_mesh\_gen\_power\_range\_status\_cb\_t**

Parameters of Generic Power Range Status.

**Public Members****uint8\_t status\_code**

Status Code for the request message

**uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

struct **esp\_ble\_mesh\_gen\_battery\_status\_cb\_t**

Parameters of Generic Battery Status.

**Public Members****uint32\_t battery\_level**

Value of Generic Battery Level state

**uint32\_t time\_to\_discharge**

Value of Generic Battery Time to Discharge state

**uint32\_t time\_to\_charge**

Value of Generic Battery Time to Charge state

**uint32\_t flags**

Value of Generic Battery Flags state

struct **esp\_ble\_mesh\_gen\_loc\_global\_status\_cb\_t**

Parameters of Generic Location Global Status.

**Public Members****int32\_t global\_latitude**

Global Coordinates (Latitude)

**int32\_t global\_longitude**

Global Coordinates (Longitude)

**int16\_t global\_altitude**

Global Altitude

struct **esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t**

Parameters of Generic Location Local Status.

**Public Members****int16\_t local\_north**

Local Coordinates (North)

**int16\_t local\_east**

Local Coordinates (East)

**int16\_t local\_altitude**

Local Altitude

**uint8\_t floor\_number**

Floor Number

**uint16\_t uncertainty**

Uncertainty

struct **esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t**  
Parameter of Generic User Properties Status.

### Public Members

struct net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N User Property IDs

struct **esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t**  
Parameters of Generic User Property Status.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic User Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

struct net\_buf\_simple \***property\_value**  
Raw value for the User Property (C.1)

struct **esp\_ble\_mesh\_gen\_admin\_properties\_status\_cb\_t**  
Parameter of Generic Admin Properties Status.

### Public Members

struct net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N Admin Property IDs

struct **esp\_ble\_mesh\_gen\_admin\_property\_status\_cb\_t**  
Parameters of Generic Admin Property Status.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic Admin Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

struct net\_buf\_simple **\*property\_value**  
Raw value for the Admin Property (C.1)

struct **esp\_ble\_mesh\_gen\_manufacturer\_properties\_status\_cb\_t**  
Parameter of Generic Manufacturer Properties Status.

### Public Members

struct net\_buf\_simple **\*property\_ids**  
Buffer contains a sequence of N Manufacturer Property IDs

struct **esp\_ble\_mesh\_gen\_manufacturer\_property\_status\_cb\_t**  
Parameters of Generic Manufacturer Property Status.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic Manufacturer Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

struct net\_buf\_simple **\*property\_value**  
Raw value for the Manufacturer Property (C.1)

struct **esp\_ble\_mesh\_gen\_client\_properties\_status\_cb\_t**  
Parameter of Generic Client Properties Status.

### Public Members

struct net\_buf\_simple **\*property\_ids**  
Buffer contains a sequence of N Client Property IDs

struct **esp\_ble\_mesh\_generic\_client\_cb\_param\_t**  
Generic Client Model callback parameters

### Public Members

int **error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* **\*params**  
The client common parameters.

*esp\_ble\_mesh\_gen\_client\_status\_cb\_t* **status\_cb**

The generic status message callback values

struct **esp\_ble\_mesh\_gen\_onoff\_state\_t**

Parameters of Generic OnOff state

### Public Members

uint8\_t **onoff**

The present value of the Generic OnOff state

uint8\_t **target\_onoff**

The target value of the Generic OnOff state

struct **esp\_ble\_mesh\_gen\_onoff\_srv\_t**

User data of Generic OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onoff\_state\_t* **state**

Parameters of the Generic OnOff state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

struct **esp\_ble\_mesh\_gen\_level\_state\_t**

Parameters of Generic Level state

### Public Members

int16\_t **level**

The present value of the Generic Level state

int16\_t **target\_level**

The target value of the Generic Level state

int16\_t **last\_level**

When a new transaction starts, level should be set to last\_last, and use “level + incoming delta” to calculate the target level. In another word, “last\_level” is used to record “level” of the last transaction, and “last\_delta” is used to record the previously received delta\_level value. The last value of the Generic Level state

int32\_t **last\_delta**

The last delta change of the Generic Level state

bool **move\_start**

Indicate if the transition of the Generic Level state has been started

bool **positive**

Indicate if the transition is positive or negative

struct **esp\_ble\_mesh\_gen\_level\_srv\_t**

User data of Generic Level Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_level\_state\_t* **state**

Parameters of the Generic Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_level**

Delta change value of level state transition

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t**

Parameter of Generic Default Transition Time state

### Public Members

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t**

User data of Generic Default Transition Time Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t* **state**

Parameters of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_onpowerup\_state\_t**

Parameter of Generic OnPowerUp state

### Public Members

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t**

User data of Generic Power OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t**

User data of Generic Power OnOff Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_level\_state\_t**

Parameters of Generic Power Level state

### Public Members

uint16\_t **power\_actual**

The present value of the Generic Power Actual state

uint16\_t **target\_power\_actual**

The target value of the Generic Power Actual state

uint16\_t **power\_last**

The value of the Generic Power Last state

uint16\_t **power\_default**

The value of the Generic Power Default state

uint8\_t **status\_code**

The status code of setting Generic Power Range state

uint16\_t **power\_range\_min**

The minimum value of the Generic Power Range state

uint16\_t **power\_range\_max**

The maximum value of the Generic Power Range state

struct **esp\_ble\_mesh\_gen\_power\_level\_srv\_t**

User data of Generic Power Level Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_power\_level\_state\_t* \***state**

Parameters of the Generic Power Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_level**

Delta change value of level state transition

struct **esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t**

User data of Generic Power Level Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_power\_level\_state\_t* \***state**

Parameters of the Generic Power Level state

struct **esp\_ble\_mesh\_gen\_battery\_state\_t**

Parameters of Generic Battery state

### Public Members

uint32\_t **battery\_level**

The value of the Generic Battery Level state

uint32\_t **time\_to\_discharge**

The value of the Generic Battery Time to Discharge state

uint32\_t **time\_to\_charge**

The value of the Generic Battery Time to Charge state

uint32\_t **battery\_flags**

The value of the Generic Battery Flags state

struct **esp\_ble\_mesh\_gen\_battery\_srv\_t**

User data of Generic Battery Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Battery Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_battery\_state\_t* **state**

Parameters of the Generic Battery state

struct **esp\_ble\_mesh\_gen\_location\_state\_t**

Parameters of Generic Location state

### Public Members

int32\_t **global\_latitude**

The value of the Global Latitude field

int32\_t **global\_longitude**

The value of the Global Longitude field

int16\_t **global\_altitude**

The value of the Global Altitude field

int16\_t **local\_north**

The value of the Local North field

int16\_t **local\_east**

The value of the Local East field

int16\_t **local\_altitude**

The value of the Local Altitude field

uint8\_t **floor\_number**

The value of the Floor Number field

uint16\_t **uncertainty**

The value of the Uncertainty field

struct **esp\_ble\_mesh\_gen\_location\_srv\_t**

User data of Generic Location Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

struct **esp\_ble\_mesh\_gen\_location\_setup\_srv\_t**

User data of Generic Location Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

struct **esp\_ble\_mesh\_generic\_property\_t**

Parameters of Generic Property states

### Public Members

uint16\_t **id**

The value of User/Admin/Manufacturer Property ID

uint8\_t **user\_access**

The value of User Access field

uint8\_t **admin\_access**

The value of Admin Access field

uint8\_t **manu\_access**

The value of Manufacturer Access field

struct net\_buf\_simple \***val**

The value of User/Admin/Manufacturer Property

struct **esp\_ble\_mesh\_gen\_user\_prop\_srv\_t**

User data of Generic User Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic User Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic User Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**

Parameters of the Generic User Property state

struct **esp\_ble\_mesh\_gen\_admin\_prop\_srv\_t**  
User data of Generic Admin Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Admin Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

uint8\_t **property\_count**  
Generic Admin Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**  
Parameters of the Generic Admin Property state

struct **esp\_ble\_mesh\_gen\_manu\_prop\_srv\_t**  
User data of Generic Manufacturer Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

uint8\_t **property\_count**  
Generic Manufacturer Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**  
Parameters of the Generic Manufacturer Property state

struct **esp\_ble\_mesh\_gen\_client\_prop\_srv\_t**  
User data of Generic Client Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Client Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

`uint8_t id_count`

Generic Client Property ID count

`uint16_t *property_ids`

Parameters of the Generic Client Property state

struct `esp_ble_mesh_state_change_gen_onoff_set_t`

Parameter of Generic OnOff Set state change event

### Public Members

`uint8_t onoff`

The value of Generic OnOff state

struct `esp_ble_mesh_state_change_gen_level_set_t`

Parameter of Generic Level Set state change event

### Public Members

`int16_t level`

The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_delta_set_t`

Parameter of Generic Delta Set state change event

### Public Members

`int16_t level`

The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_move_set_t`

Parameter of Generic Move Set state change event

### Public Members

`int16_t level`

The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_def_trans_time_set_t`

Parameter of Generic Default Transition Time Set state change event

### Public Members

`uint8_t trans_time`

The value of Generic Default Transition Time state

struct **esp\_ble\_mesh\_state\_change\_gen\_onpowerup\_set\_t**  
Parameter of Generic OnPowerUp Set state change event

#### **Public Members**

uint8\_t **onpowerup**  
The value of Generic OnPowerUp state

struct **esp\_ble\_mesh\_state\_change\_gen\_power\_level\_set\_t**  
Parameter of Generic Power Level Set state change event

#### **Public Members**

uint16\_t **power**  
The value of Generic Power Actual state

struct **esp\_ble\_mesh\_state\_change\_gen\_power\_default\_set\_t**  
Parameter of Generic Power Default Set state change event

#### **Public Members**

uint16\_t **power**  
The value of Generic Power Default state

struct **esp\_ble\_mesh\_state\_change\_gen\_power\_range\_set\_t**  
Parameters of Generic Power Range Set state change event

#### **Public Members**

uint16\_t **range\_min**  
The minimum value of Generic Power Range state

uint16\_t **range\_max**  
The maximum value of Generic Power Range state

struct **esp\_ble\_mesh\_state\_change\_gen\_loc\_global\_set\_t**  
Parameters of Generic Location Global Set state change event

#### **Public Members**

int32\_t **latitude**  
The Global Latitude value of Generic Location state

int32\_t **longitude**  
The Global Longitude value of Generic Location state

`int16_t altitude`

The Global Altitude value of Generic Location state

struct `esp_ble_mesh_state_change_gen_loc_local_set_t`

Parameters of Generic Location Local Set state change event

### Public Members

`int16_t north`

The Local North value of Generic Location state

`int16_t east`

The Local East value of Generic Location state

`int16_t altitude`

The Local Altitude value of Generic Location state

`uint8_t floor_number`

The Floor Number value of Generic Location state

`uint16_t uncertainty`

The Uncertainty value of Generic Location state

struct `esp_ble_mesh_state_change_gen_user_property_set_t`

Parameters of Generic User Property Set state change event

### Public Members

`uint16_t id`

The property id of Generic User Property state

struct `net_buf_simple *value`

The property value of Generic User Property state

struct `esp_ble_mesh_state_change_gen_admin_property_set_t`

Parameters of Generic Admin Property Set state change event

### Public Members

`uint16_t id`

The property id of Generic Admin Property state

`uint8_t access`

The property access of Generic Admin Property state

struct net\_buf\_simple \***value**

The property value of Generic Admin Property state

struct **esp\_ble\_mesh\_state\_change\_gen\_manu\_property\_set\_t**

Parameters of Generic Manufacturer Property Set state change event

### Public Members

uint16\_t **id**

The property id of Generic Manufacturer Property state

uint8\_t **access**

The property value of Generic Manufacturer Property state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_get\_t**

Context of the received Generic User Property Get message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic User Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_get\_t**

Context of the received Generic Admin Property Get message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Admin Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_get\_t**

Context of the received Generic Manufacturer Property message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Manufacturer Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_client\_properties\_get\_t**

Context of the received Generic Client Properties Get message

### Public Members

uint16\_t **property\_id**

A starting Client Property ID present within an element

struct **esp\_ble\_mesh\_server\_rcv\_gen\_onoff\_set\_t**  
Context of the received Generic OnOff Set message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint8\_t **onoff**  
Target value of Generic OnOff state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_level\_set\_t**  
Context of the received Generic Level Set message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **level**  
Target value of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_delta\_set\_t**  
Context of the received Generic Delta Set message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

int32\_t **delta\_level**

Delta change of Generic Level state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_recv\_gen\_move\_set\_t**

Context of the received Generic Move Set message

### **Public Members**

bool **op\_en**

Indicate if optional parameters are included

int16\_t **delta\_level**

Delta Level step to calculate Move speed for Generic Level state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_recv\_gen\_def\_trans\_time\_set\_t**

Context of the received Generic Default Transition Time Set message

### **Public Members**

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_server\_recv\_gen\_onpowerup\_set\_t**

Context of the received Generic OnPowerUp Set message

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_power\_level\_set\_t**

Context of the received Generic Power Level Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t power**

Target value of Generic Power Actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_power\_default\_set\_t**

Context of the received Generic Power Default Set message

**Public Members****uint16\_t power**

The value of the Generic Power Default state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_power\_range\_set\_t**

Context of the received Generic Power Range Set message

**Public Members****uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_loc\_global\_set\_t**

Context of the received Generic Location Global Set message

**Public Members****int32\_t global\_latitude**

Global Coordinates (Latitude)

**int32\_t global\_longitude**

Global Coordinates (Longitude)

**int16\_t global\_altitude**

Global Altitude

struct **esp\_ble\_mesh\_server\_rcv\_gen\_loc\_local\_set\_t**

Context of the received Generic Location Local Set message

**Public Members****int16\_t local\_north**

Local Coordinates (North)

**int16\_t local\_east**

Local Coordinates (East)

**int16\_t local\_altitude**

Local Altitude

**uint8\_t floor\_number**

Floor Number

**uint16\_t uncertainty**

Uncertainty

struct **esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_set\_t**

Context of the received Generic User Property Set message

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic User Property

struct net\_buf\_simple \***property\_value**

Raw value for the User Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_set\_t**

Context of the received Generic Admin Property Set message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Admin Property

uint8\_t **user\_access**

Enumeration indicating user access

struct net\_buf\_simple \***property\_value**

Raw value for the Admin Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_set\_t**

Context of the received Generic Manufacturer Property Set message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Manufacturer Property

uint8\_t **user\_access**

Enumeration indicating user access

struct **esp\_ble\_mesh\_generic\_server\_cb\_param\_t**

Generic Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Generic Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_generic\_server\_cb\_value\_t* **value**

Value of the received Generic Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_CLI** (cli\_pub, cli\_data)

Define a new Generic OnOff Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

---

#### 参数

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic OnOff Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Level Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Level Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Generic Default Transition Time Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Default Transition Time Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power OnOff Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Power OnOff Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power Level Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Power Level Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Battery Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Battery Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_CLI** (cli\_pub, cli\_data)

Define a new Generic Location Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Location Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_PROPERTY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Property Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Generic Location Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_SRV** (srv\_pub, srv\_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

---

**备注:** 1. The Generic OnOff Server Model is a root model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_onoff\_srv\_t*.

**返回** New Generic OnOff Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Level Server Model.

---

**备注:** 1. The Generic Level Server Model is a root model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_level\_srv\_t*.

**返回** New Generic Level Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_SRV** (srv\_pub, srv\_data)

Define a new Generic Default Transition Time Server Model.

---

**备注:** 1. The Generic Default Transition Time Server Model is a root model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t*.

**返回** New Generic Default Transition Time Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power OnOff Server Model.

---

**备注:** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

- a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
  - b. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t*.

**返回** New Generic Power OnOff Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power OnOff Setup Server Model.

---

**备注:** 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t*.

**返回** New Generic Power OnOff Setup Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power Level Server Model.

---

**备注:** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_srv\_t*.

**返回** New Generic Power Level Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power Level Setup Server Model.

---

**备注:** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t*.

**返回** New Generic Power Level Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_SRV** (srv\_pub, srv\_data)

Define a new Generic Battery Server Model.

---

**备注:** 1. The Generic Battery Server Model is a root model.

- a. This model shall support model publication and model subscription.
  - b. The model may be used to represent an element that is powered by a battery.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_battery\_srv\_t*.

**返回** New Generic Battery Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SRV** (srv\_pub, srv\_data)

Define a new Generic Location Server Model.

---

**备注:** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model may be used to represent an element that knows its location (global or local).
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_location\_srv\_t*.

**返回** New Generic Location Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Location Setup Server Model.

---

**备注:** 1. The Generic Location Setup Server model extends the Generic Location Server model.

- a. This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_location\_setup\_srv\_t*.

**返回** New Generic Location Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_USER\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic User Property Server Model.

---

**备注:** 1. The Generic User Property Server model is a root model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_user\_prop\_srv\_t*.

**返回** New Generic User Property Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ADMIN\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Admin Property Server Model.

---

**备注:** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_admin\_prop\_srv\_t*.

**返回** New Generic Admin Property Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_MANUFACTURER\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Manufacturer Property Server Model.

---

**备注:** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_manu\_prop\_srv\_t*.

**返回** New Generic Manufacturer Property Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_CLIENT\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic User Property Server Model.

---

**备注:** 1. The Generic Client Property Server model is a root model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_client\_prop\_srv\_t*.

**返回** New Generic Client Property Server Model instance.

## Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,  
esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,  
esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

*Values:*

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_PROHIBIT**

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_READ**

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_WRITE**

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_READ\_WRITE**

```
enum esp_ble_mesh_gen_admin_prop_access_t
```

This enum value is the access value of Generic Admin Property

*Values:*

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_NOT\_USER\_PROP**

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_READ**

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_WRITE**

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_READ\_WRITE**

enum **esp\_ble\_mesh\_gen\_manu\_prop\_access\_t**

This enum value is the access value of Generic Manufacturer Property

*Values:*

enumerator **ESP\_BLE\_MESH\_GEN\_MANU\_NOT\_USER\_PROP**

enumerator **ESP\_BLE\_MESH\_GEN\_MANU\_ACCESS\_READ**

enum **esp\_ble\_mesh\_generic\_server\_cb\_event\_t**

This enum value is the event of Generic Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_EVT\_MAX**

## Sensor Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

### Functions

`esp_err_t esp_ble_mesh_register_sensor_client_callback` (`esp_ble_mesh_sensor_client_cb_t` callback)

Register BLE Mesh Sensor Client Model callback.

**参数** `callback` –[in] Pointer to the callback function.  
**返回** `ESP_OK` on success or error code otherwise.

---

```
esp_err_t esp_ble_mesh_sensor_client_get_state (esp_ble_mesh_client_common_param_t
                                                *params, esp_ble_mesh_sensor_client_get_state_t
                                                *get_state)
```

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

---

**备注:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to sensor get message value. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_sensor_client_set_state (esp_ble_mesh_client_common_param_t
                                                *params, esp_ble_mesh_sensor_client_set_state_t
                                                *set_state)
```

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

---

**备注:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to sensor set message value. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_sensor_server_callback (esp_ble_mesh_sensor_server_cb_t
                                                         callback)
```

Register BLE Mesh Sensor Server Model callback.

**参数** **callback** –[in] Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

## Unions

```
union esp_ble_mesh_sensor_client_get_state_t
    #include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.
```

## Public Members

```
esp_ble_mesh_sensor_descriptor_get_t descriptor_get

### Structures

struct **esp\_ble\_mesh\_sensor\_descriptor\_get\_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID of a sensor (optional)

struct **esp\_ble\_mesh\_sensor\_cadence\_get\_t**

Parameter of Sensor Cadence Get

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

struct **esp\_ble\_mesh\_sensor\_cadence\_set\_t**

Parameters of Sensor Cadence Set

**Public Members****uint16\_t property\_id**

Property ID for the sensor

**uint8\_t fast\_cadence\_period\_divisor**

Divisor for the publish period

**uint8\_t status\_trigger\_type**

The unit and format of the Status Trigger Delta fields

**struct net\_buf\_simple \*status\_trigger\_delta\_down**

Delta down value that triggers a status message

**struct net\_buf\_simple \*status\_trigger\_delta\_up**

Delta up value that triggers a status message

**uint8\_t status\_min\_interval**

Minimum interval between two consecutive Status messages

**struct net\_buf\_simple \*fast\_cadence\_low**

Low value for the fast cadence range

**struct net\_buf\_simple \*fast\_cadence\_high**

Fast value for the fast cadence range

**struct esp\_ble\_mesh\_sensor\_settings\_get\_t**

Parameter of Sensor Settings Get

**Public Members****uint16\_t sensor\_property\_id**

Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_get\_t**

Parameters of Sensor Setting Get

**Public Members****uint16\_t sensor\_property\_id**

Property ID of a sensor

**uint16\_t sensor\_setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_set\_t**

Parameters of Sensor Setting Set

**Public Members**

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

struct net\_buf\_simple \***sensor\_setting\_raw**  
Raw value for the setting

struct **esp\_ble\_mesh\_sensor\_get\_t**  
Parameters of Sensor Get

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID for the sensor (optional)

struct **esp\_ble\_mesh\_sensor\_column\_get\_t**  
Parameters of Sensor Column Get

**Public Members**

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x**  
Raw value identifying a column

struct **esp\_ble\_mesh\_sensor\_series\_get\_t**  
Parameters of Sensor Series Get

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x1**  
Raw value identifying a starting column (optional)

struct net\_buf\_simple \***raw\_value\_x2**  
Raw value identifying an ending column (C.1)

struct **esp\_ble\_mesh\_sensor\_descriptor\_status\_cb\_t**  
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.  
Parameter of Sensor Descriptor Status

### Public Members

struct net\_buf\_simple \***descriptor**  
Sequence of 8-octet sensor descriptors (optional)

struct **esp\_ble\_mesh\_sensor\_cadence\_status\_cb\_t**  
Parameters of Sensor Cadence Status

### Public Members

uint16\_t **property\_id**  
Property for the sensor

struct net\_buf\_simple \***sensor\_cadence\_value**  
Value of sensor cadence state

struct **esp\_ble\_mesh\_sensor\_settings\_status\_cb\_t**  
Parameters of Sensor Settings Status

### Public Members

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

struct net\_buf\_simple \***sensor\_setting\_property\_ids**  
A sequence of N sensor setting property IDs (optional)

struct **esp\_ble\_mesh\_sensor\_setting\_status\_cb\_t**  
Parameters of Sensor Setting Status

### Public Members

bool **op\_en**  
Indicate id optional parameters are included

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

uint8\_t **sensor\_setting\_access**  
Read/Write access rights for the setting (optional)

struct net\_buf\_simple \***sensor\_setting\_raw**  
Raw value for the setting

struct **esp\_ble\_mesh\_sensor\_status\_cb\_t**  
Parameter of Sensor Status

### Public Members

struct net\_buf\_simple \***marshalled\_sensor\_data**  
Value of sensor data state (optional)

struct **esp\_ble\_mesh\_sensor\_column\_status\_cb\_t**  
Parameters of Sensor Column Status

### Public Members

uint16\_t **property\_id**  
Property identifying a sensor and the Y axis

struct net\_buf\_simple \***sensor\_column\_value**  
Left values of sensor column status

struct **esp\_ble\_mesh\_sensor\_series\_status\_cb\_t**  
Parameters of Sensor Series Status

### Public Members

uint16\_t **property\_id**  
Property identifying a sensor and the Y axis

struct net\_buf\_simple \***sensor\_series\_value**  
Left values of sensor series status

struct **esp\_ble\_mesh\_sensor\_client\_cb\_param\_t**  
Sensor Client Model callback parameters

### Public Members

int **error\_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_sensor\_client\_status\_cb\_t* **status\_cb**

The sensor status message callback values

struct **esp\_ble\_mesh\_sensor\_descriptor\_t**

Parameters of Sensor Descriptor state

### Public Members

uint32\_t **positive\_tolerance**

The value of Sensor Positive Tolerance field

uint32\_t **negative\_tolerance**

The value of Sensor Negative Tolerance field

uint32\_t **sampling\_function**

The value of Sensor Sampling Function field

uint8\_t **measure\_period**

The value of Sensor Measurement Period field

uint8\_t **update\_interval**

The value of Sensor Update Interval field

struct **esp\_ble\_mesh\_sensor\_setting\_t**

Parameters of Sensor Setting state

### Public Members

uint16\_t **property\_id**

The value of Sensor Setting Property ID field

uint8\_t **access**

The value of Sensor Setting Access field

struct net\_buf\_simple \***raw**

The value of Sensor Setting Raw field

struct **esp\_ble\_mesh\_sensor\_cadence\_t**

Parameters of Sensor Cadence state

### Public Members

`uint8_t period_divisor`

The value of Fast Cadence Period Divisor field

`uint8_t trigger_type`

The value of Status Trigger Type field

`struct net_buf_simple *trigger_delta_down`

Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

`struct net_buf_simple *trigger_delta_up`

The value of Status Trigger Delta Up field

`uint8_t min_interval`

The value of Status Min Interval field

`struct net_buf_simple *fast_cadence_low`

The value of Fast Cadence Low field

`struct net_buf_simple *fast_cadence_high`

The value of Fast Cadence High field

`struct esp_ble_mesh_sensor_data_t`

Parameters of Sensor Data state

### Public Members

`uint8_t format`

Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).  
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

`uint8_t length`

The value of the Sensor Data length

`struct net_buf_simple *raw_value`

The value of Sensor Data raw value

`struct esp_ble_mesh_sensor_series_column_t`

Parameters of Sensor Series Column state

### Public Members

struct net\_buf\_simple \***raw\_value\_x**  
The value of Sensor Raw Value X field

struct net\_buf\_simple \***column\_width**  
The value of Sensor Column Width field

struct net\_buf\_simple \***raw\_value\_y**  
The value of Sensor Raw Value Y field

struct **esp\_ble\_mesh\_sensor\_state\_t**  
Parameters of Sensor states

### Public Members

uint16\_t **sensor\_property\_id**  
The value of Sensor Property ID field

*esp\_ble\_mesh\_sensor\_descriptor\_t* **descriptor**  
Parameters of the Sensor Descriptor state

const uint8\_t **setting\_count**  
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

*esp\_ble\_mesh\_sensor\_setting\_t* \***settings**  
Parameters of the Sensor Setting state

*esp\_ble\_mesh\_sensor\_cadence\_t* \***cadence**  
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”.Parameters of the Sensor Cadence state

*esp\_ble\_mesh\_sensor\_data\_t* **sensor\_data**  
Parameters of the Sensor Data state

*esp\_ble\_mesh\_sensor\_series\_column\_t* **series\_column**  
Parameters of the Sensor Series Column state

struct **esp\_ble\_mesh\_sensor\_srv\_t**  
User data of Sensor Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Sensor Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

const uint8\_t **state\_count**

Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**

Parameters of the Sensor states

struct **esp\_ble\_mesh\_sensor\_setup\_srv\_t**

User data of Sensor Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

const uint8\_t **state\_count**

Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**

Parameters of the Sensor states

struct **esp\_ble\_mesh\_state\_change\_sensor\_cadence\_set\_t**

Parameters of Sensor Cadence Set state change event

### Public Members

uint16\_t **property\_id**

The value of Sensor Property ID state

uint8\_t **period\_divisor**

The value of Fast Cadence Period Divisor state

uint8\_t **trigger\_type**

The value of Status Trigger Type state

struct net\_buf\_simple \***trigger\_delta\_down**

The value of Status Trigger Delta Down state

struct net\_buf\_simple \***trigger\_delta\_up**

The value of Status Trigger Delta Up state

uint8\_t **min\_interval**

The value of Status Min Interval state

struct net\_buf\_simple \***fast\_cadence\_low**

The value of Fast Cadence Low state

struct net\_buf\_simple \***fast\_cadence\_high**

The value of Fast Cadence High state

struct **esp\_ble\_mesh\_state\_change\_sensor\_setting\_set\_t**

Parameters of Sensor Setting Set state change event

### Public Members

uint16\_t **property\_id**

The value of Sensor Property ID state

uint16\_t **setting\_property\_id**

The value of Sensor Setting Property ID state

struct net\_buf\_simple \***setting\_value**

The value of Sensor Property Value state

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_descriptor\_get\_t**

Context of the received Sensor Descriptor Get message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID of a sensor (optional)

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_get\_t**

Context of the received Sensor Cadence Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_settings\_get\_t**

Context of the received Sensor Settings Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_get\_t**  
Context of the received Sensor Setting Get message

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

uint16\_t **setting\_property\_id**  
Setting ID identifying a setting within a sensor

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_get\_t**  
Context of the received Sensor Get message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID for the sensor (optional)

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_column\_get\_t**  
Context of the received Sensor Column Get message

### Public Members

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x**  
Raw value identifying a column

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_series\_get\_t**  
Context of the received Sensor Series Get message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value**  
Raw value containing X1 and X2 (optional)

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_set\_t**  
Context of the received Sensor Cadence Set message

### Public Members

uint16\_t **property\_id**  
Property ID for the sensor

struct net\_buf\_simple \***cadence**  
Value of Sensor Cadence state

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_set\_t**  
Context of the received Sensor Setting Set message

### Public Members

uint16\_t **property\_id**  
Property ID identifying a sensor

uint16\_t **setting\_property\_id**  
Setting ID identifying a setting within a sensor

struct net\_buf\_simple \***setting\_raw**  
Raw value for the setting

struct **esp\_ble\_mesh\_sensor\_server\_cb\_param\_t**  
Sensor Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Sensor Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**  
Context of the received messages

*esp\_ble\_mesh\_sensor\_server\_cb\_value\_t* **value**  
Value of the received Sensor Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_CLI** (cli\_pub, cli\_data)  
Define a new Sensor Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Sensor Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Sensor Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SRV** (srv\_pub, srv\_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

---

**备注:** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

- This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_sensor\_srv\_t*.

**返回** New Sensor Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Sensor Setup Server Model.

---

**备注:** 1. The Sensor Setup Server model extends the Sensor Server model.

- This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_sensor\_setup\_srv\_t*.

**返回** New Sensor Setup Server Model instance.

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_PROPERTY\_ID**

Invalid Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_PROPERTY\_ID\_LEN**

Length of Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_DESCRIPTOR\_LEN**

Length of Sensor Descriptor state

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_POS\_TOLERANCE**

Unspecified Sensor Positive Tolerance

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_NEG\_TOLERANCE**

Unspecified Sensor Negative Tolerance

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_MEASURE\_PERIOD**

Not applicable Sensor Measurement Period

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_UPDATE\_INTERVAL**

Not applicable Sensor Update Interval

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_SETTING\_PROPERTY\_ID**

Invalid Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_PROPERTY\_ID\_LEN**

Length of Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_LEN**

Length of Sensor Setting Access

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ**

Sensor Setting Access - Read

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ\_WRITE**

Sensor Setting Access - Read & Write

**ESP\_BLE\_MESH\_SENSOR\_DIVISOR\_TRIGGER\_TYPE\_LEN**

Length of Sensor Divisor Trigger Type

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_LEN**

Length of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_PERIOD\_DIVISOR\_MAX\_VALUE**

Maximum value of Sensor Period Divisor

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_MAX**

Maximum value of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_CHAR**

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_UINT16**

Sensor Status Trigger Type - Format Type “uint16”

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A**

Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B**

Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID\_LEN**

MPID length of Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID\_LEN**

MPID length of Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_ZERO\_LEN**

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_FORMAT** (\_data)

Get format of the sensor data.

---

**备注:** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the format of the corresponding sensor data.

---

**参数**

- **\_data** –Pointer to the start of the sensor data.

**返回** Format of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_LENGTH** (\_data, \_fmt)

Get length of the sensor data.

---

**备注:** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the length of the corresponding sensor data.

---

**参数**

- **\_data** –Pointer to the start of the sensor data.
- **\_fmt** –Format of the sensor data.

**返回** Length (zero-based) of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_PROPERTY\_ID** (\_data, \_fmt)

Get Sensor Property ID of the sensor data.

---

**备注:** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

---

**参数**

- **\_data** –Pointer to the start of the sensor data.
- **\_fmt** –Format of the sensor data.

**返回** Sensor Property ID of the sensor data.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID** (\_len, \_id)

Generate a MPID value for sensor data with Format A.

---

**备注:** 1. The Format field is 0b0 and indicates that Format A is used.

- a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
  - b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
  - c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.
- 

**参数**

- **\_len** –Length of Sensor Raw value.
- **\_id** –Sensor Property ID.

**返回** 2-octet MPID value for sensor data with Format A.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID** (\_len, \_id)

Generate a MPID value for sensor data with Format B.

---

**备注:** 1. The Format field is 0b1 and indicates Format B is used.

---

- a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
- b. The Property ID is a 16-bit bit field representing a Property ID.
- c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
- d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**参数**

- **\_len** –Length of Sensor Raw value.
- **\_id** –Sensor Property ID.

**返回** 3-octet MPID value for sensor data with Format B.

**Type Definitions**

```
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,
esp_ble_mesh_sensor_client_cb_param_t *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,
esp_ble_mesh_sensor_server_cb_param_t *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

**Enumerations**

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

*Values:*

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_UNSPECIFIED**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_INSTANTANEOUS**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ARITHMETIC\_MEAN**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_RMS**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MAXIMUM**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MINIMUM**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ACCUMULATED**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_COUNT**

enum **esp\_ble\_mesh\_sensor\_server\_cb\_event\_t**

This enum value is the event of Sensor Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_EVT\_MAX**

## Time and Scenes Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_time\_scene\_client\_callback** (*esp\_ble\_mesh\_time\_scene\_client\_cb\_t* callback)

Register BLE Mesh Time Scene Client Model callback.

**参数** `callback` –[in] Pointer to the callback function.

**返回** `ESP_OK` on success or error code otherwise.

---

```
esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_get_state_t
                                                    *get_state)
```

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

---

**备注:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to time scene get message value. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_set_state_t
                                                    *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

---

**备注:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to time scene set message value. Shall not be set to NULL.

**返回** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t
                                                           callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

**参数** **callback** –[in] Pointer to the callback function.

**返回** ESP\_OK on success or error code otherwise.

## Unions

### Structures

struct **esp\_ble\_mesh\_time\_set\_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

### Public Members

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

uint8\_t **sub\_second**

The sub-second time in units of 1/256 second

uint8\_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority**

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta**

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_time\_zone\_set\_t**

Parameters of Time Zone Set

### Public Members

uint8\_t **time\_zone\_offset\_new**

Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_tai\_utc\_delta\_set\_t**

Parameters of TAI-UTC Delta Set

### Public Members

uint16\_t **tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

uint16\_t **padding**

Always 0b0. Other values are Prohibited.

uint8\_t **tai\_delta\_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_time\_role\_set\_t**

Parameter of Time Role Set

### Public Members

uint8\_t **time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_scene\_store\_t**

Parameter of Scene Store

### Public Members

uint16\_t **scene\_number**

The number of scenes to be stored

struct **esp\_ble\_mesh\_scene\_recall\_t**

Parameters of Scene Recall

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **scene\_number**

The number of scenes to be recalled

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_scene\_delete\_t**

Parameter of Scene Delete

### Public Members

uint16\_t **scene\_number**

The number of scenes to be deleted

struct **esp\_ble\_mesh\_scheduler\_act\_get\_t**

Parameter of Scheduler Action Get

### Public Members

uint8\_t **index**

Index of the Schedule Register entry to get

struct **esp\_ble\_mesh\_scheduler\_act\_set\_t**

Parameters of Scheduler Action Set

### Public Members

uint64\_t **index**

Index of the Schedule Register entry to set

uint64\_t **year**

Scheduled year for the action

uint64\_t **month**

Scheduled month for the action

uint64\_t **day**

Scheduled day of the month for the action

uint64\_t **hour**

Scheduled hour for the action

uint64\_t **minute**

Scheduled minute for the action

uint64\_t **second**

Scheduled second for the action

uint64\_t **day\_of\_week**

Schedule days of the week for the action

uint64\_t **action**

Action to be performed at the scheduled time

uint64\_t **trans\_time**

Transition time for this action

uint16\_t **scene\_number**

Transition time for this action

struct **esp\_ble\_mesh\_time\_status\_cb\_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

### Public Members

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

uint8\_t **sub\_second**

The sub-second time in units of 1/256 second

uint8\_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority**

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta**

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_time\_zone\_status\_cb\_t**

Parameters of Time Zone Status

### Public Members

uint8\_t **time\_zone\_offset\_curr**

Current local time zone offset

uint8\_t **time\_zone\_offset\_new**

Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_tai\_utc\_delta\_status\_cb\_t**

Parameters of TAI-UTC Delta Status

**Public Members****uint16\_t tai\_utc\_delta\_curr**

Current difference between TAI and UTC in seconds

**uint16\_t padding\_1**

Always 0b0. Other values are Prohibited.

**uint16\_t tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

**uint16\_t padding\_2**

Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_time\_role\_status\_cb\_t**

Parameter of Time Role Status

**Public Members****uint8\_t time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_scene\_status\_cb\_t**

Parameters of Scene Status

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint8\_t status\_code**

Status code of the last operation

**uint16\_t current\_scene**

Scene Number of the current scene

**uint16\_t target\_scene**

Scene Number of the target scene (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_scene\_register\_status\_cb\_t**

Parameters of Scene Register Status

**Public Members****uint8\_t status\_code**

Status code for the previous operation

**uint16\_t current\_scene**

Scene Number of the current scene

**struct net\_buf\_simple \*scenes**

A list of scenes stored within an element

**struct esp\_ble\_mesh\_scheduler\_status\_cb\_t**

Parameter of Scheduler Status

**Public Members****uint16\_t schedules**

Bit field indicating defined Actions in the Schedule Register

**struct esp\_ble\_mesh\_scheduler\_act\_status\_cb\_t**

Parameters of Scheduler Action Status

**Public Members****uint64\_t index**

Enumerates (selects) a Schedule Register entry

**uint64\_t year**

Scheduled year for the action

**uint64\_t month**

Scheduled month for the action

**uint64\_t day**

Scheduled day of the month for the action

**uint64\_t hour**

Scheduled hour for the action

**uint64\_t minute**

Scheduled minute for the action

**uint64\_t second**

Scheduled second for the action

**uint64\_t day\_of\_week**

Schedule days of the week for the action

uint64\_t **action**

Action to be performed at the scheduled time

uint64\_t **trans\_time**

Transition time for this action

uint16\_t **scene\_number**

Transition time for this action

struct **esp\_ble\_mesh\_time\_scene\_client\_cb\_param\_t**

Time Scene Client Model callback parameters

### Public Members

int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_time\_scene\_client\_status\_cb\_t* **status\_cb**

The scene status message callback values

struct **esp\_ble\_mesh\_time\_state\_t**

Parameters of Time state

### Public Members

uint8\_t **tai\_seconds**[5]

The value of the TAI Seconds state

uint8\_t **subsecond**

The value of the Subsecond field

uint8\_t **uncertainty**

The value of the Uncertainty field

uint8\_t **time\_zone\_offset\_curr**

The value of the Time Zone Offset Current field

uint8\_t **time\_zone\_offset\_new**

The value of the Time Zone Offset New state

uint8\_t **tai\_zone\_change**[5]

The value of the TAI of Zone Chaneg field

uint16\_t **time\_authority**

The value of the Time Authority bit

uint16\_t **tai\_utc\_delta\_curr**

The value of the TAI-UTC Delta Current state

uint16\_t **tai\_utc\_delta\_new**

The value of the TAI-UTC Delta New state

uint8\_t **tai\_delta\_change**[5]

The value of the TAI of Delta Change field

struct *esp\_ble\_mesh\_time\_state\_t*::[anonymous] **time**

Parameters of the Time state

uint8\_t **time\_role**

The value of the Time Role state

struct **esp\_ble\_mesh\_time\_srv\_t**

User data of Time Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_time\_state\_t* \***state**

Parameters of the Time state

struct **esp\_ble\_mesh\_time\_setup\_srv\_t**

User data of Time Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Time Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_time\_state\_t* \***state**

Parameters of the Time state

struct **esp\_ble\_mesh\_scene\_register\_t**

- a. Scene Store is an operation of storing values of a present state of an element.
- b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
- c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
- d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

### Public Members

uint16\_t **scene\_number**

The value of the Scene Number

uint8\_t **scene\_type**

The value of the Scene Type

struct net\_buf\_simple \***scene\_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp\_ble\_mesh\_scenes\_state\_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

### Public Members

const uint16\_t **scene\_count**

The Scenes state's scene count

*esp\_ble\_mesh\_scene\_register\_t* \***scenes**

Parameters of the Scenes state

uint16\_t **current\_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

#### **uint16\_t target\_scene**

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

#### **uint8\_t status\_code**

The status code of the last scene operation

#### **bool in\_progress**

Indicate if the scene transition is in progress

#### **struct esp\_ble\_mesh\_scene\_srv\_t**

User data of Scene Server Model

### **Public Members**

#### *esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scene Server Model. Initialized internally.

#### *esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

#### *esp\_ble\_mesh\_scenes\_state\_t* \***state**

Parameters of the Scenes state

#### *esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

#### *esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

#### **struct esp\_ble\_mesh\_scene\_setup\_srv\_t**

User data of Scene Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scene Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scenes\_state\_t* \***state**

Parameters of the Scenes state

struct **esp\_ble\_mesh\_schedule\_register\_t**

Parameters of Scheduler Register state

### Public Members

bool **in\_use**

Indicate if the registered schedule is in use

uint64\_t **year**

The value of Scheduled year for the action

uint64\_t **month**

The value of Scheduled month for the action

uint64\_t **day**

The value of Scheduled day of the month for the action

uint64\_t **hour**

The value of Scheduled hour for the action

uint64\_t **minute**

The value of Scheduled minute for the action

uint64\_t **second**

The value of Scheduled second for the action

uint64\_t **day\_of\_week**

The value of Schedule days of the week for the action

uint64\_t **action**

The value of Action to be performed at the scheduled time

uint64\_t **trans\_time**

The value of Transition time for this action

uint16\_t **scene\_number**

The value of Scene Number to be used for some actions

struct **esp\_ble\_mesh\_scheduler\_state\_t**

Parameters of Scheduler state

### Public Members

const uint8\_t **schedule\_count**

Scheduler count

*esp\_ble\_mesh\_schedule\_register\_t* \***schedules**

Up to 16 scheduled entries

struct **esp\_ble\_mesh\_scheduler\_srv\_t**

User data of Scheduler Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scheduler Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scheduler\_state\_t* \***state**

Parameters of the Scheduler state

struct **esp\_ble\_mesh\_scheduler\_setup\_srv\_t**

User data of Scheduler Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scheduler\_state\_t* \***state**

Parameters of the Scheduler state

struct **esp\_ble\_mesh\_state\_change\_time\_set\_t**

Parameters of Time Set state change event

### Public Members

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_status_t`

Parameters of Time Status state change event

### Public Members

`uint8_t tai_seconds[5]`

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_zone_set_t`

Parameters of Time Zone Set state change event

### Public Members

`uint8_t time_zone_offset_new`

Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t**

Parameters of TAI UTC Delta Set state change event

### Public Members

uint16\_t **tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

uint8\_t **tai\_delta\_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_state\_change\_time\_role\_set\_t**

Parameter of Time Role Set state change event

### Public Members

uint8\_t **time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_state\_change\_scene\_store\_t**

Parameter of Scene Store state change event

### Public Members

uint16\_t **scene\_number**

The number of scenes to be stored

struct **esp\_ble\_mesh\_state\_change\_scene\_recall\_t**

Parameter of Scene Recall state change event

### Public Members

uint16\_t **scene\_number**

The number of scenes to be recalled

struct **esp\_ble\_mesh\_state\_change\_scene\_delete\_t**

Parameter of Scene Delete state change event

### Public Members

uint16\_t **scene\_number**

The number of scenes to be deleted

struct **esp\_ble\_mesh\_state\_change\_scheduler\_act\_set\_t**  
Parameter of Scheduler Action Set state change event

### Public Members

uint64\_t **index**  
Index of the Schedule Register entry to set

uint64\_t **year**  
Scheduled year for the action

uint64\_t **month**  
Scheduled month for the action

uint64\_t **day**  
Scheduled day of the month for the action

uint64\_t **hour**  
Scheduled hour for the action

uint64\_t **minute**  
Scheduled minute for the action

uint64\_t **second**  
Scheduled second for the action

uint64\_t **day\_of\_week**  
Schedule days of the week for the action

uint64\_t **action**  
Action to be performed at the scheduled time

uint64\_t **trans\_time**  
Transition time for this action

uint16\_t **scene\_number**  
Scene number to be used for some actions

struct **esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_get\_t**  
Context of the received Scheduler Action Get message

### Public Members

uint8\_t **index**  
Index of the Schedule Register entry to get

struct **esp\_ble\_mesh\_server\_rcv\_time\_set\_t**  
Context of the received Time Set message

**Public Members****uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t subsecond**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

**uint16\_t time\_authority**

0 = No Time Authority, 1 = Time Authority

**uint16\_t tai\_utc\_delta**

Current difference between TAI and UTC in seconds

**uint8\_t time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_server\_rcv\_time\_zone\_set\_t**

Context of the received Time Zone Set message

**Public Members****uint8\_t time\_zone\_offset\_new**

Upcoming local time zone offset

**uint8\_t tai\_zone\_change[5]**

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_server\_rcv\_tai\_utc\_delta\_set\_t**

Context of the received TAI UTC Delta Set message

**Public Members****uint16\_t tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

**uint16\_t padding**

Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_server\_rcv\_time\_role\_set\_t**

Context of the received Time Role Set message

**Public Members****uint8\_t time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_server\_rcv\_scene\_store\_t**

Context of the received Scene Store message

**Public Members****uint16\_t scene\_number**

The number of scenes to be stored

struct **esp\_ble\_mesh\_server\_rcv\_scene\_recall\_t**

Context of the received Scene Recall message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t scene\_number**

The number of scenes to be recalled

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_scene\_delete\_t**

Context of the received Scene Delete message

**Public Members****uint16\_t scene\_number**

The number of scenes to be deleted

struct **esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_set\_t**

Context of the received Scheduler Action Set message

**Public Members****uint64\_t index**

Index of the Schedule Register entry to set

**uint64\_t year**

Scheduled year for the action

**uint64\_t month**

Scheduled month for the action

**uint64\_t day**

Scheduled day of the month for the action

**uint64\_t hour**

Scheduled hour for the action

**uint64\_t minute**

Scheduled minute for the action

**uint64\_t second**

Scheduled second for the action

**uint64\_t day\_of\_week**

Schedule days of the week for the action

**uint64\_t action**

Action to be performed at the scheduled time

**uint64\_t trans\_time**

Transition time for this action

**uint16\_t scene\_number**

Scene number to be used for some actions

struct **esp\_ble\_mesh\_server\_rcv\_time\_status\_t**

Context of the received Time Status message

**Public Members****uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t subsecond**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority**

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta**

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_time\_scene\_server\_cb\_param\_t**

Time Scene Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Time and Scenes Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_time\_scene\_server\_cb\_value\_t* **value**

Value of the received Time and Scenes Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Time Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Time Client Model.

---

#### 参数

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Time Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI** (cli\_pub, cli\_data)

Define a new Scene Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Scene Client Model.

---

#### 参数

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Scene Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI** (cli\_pub, cli\_data)

Define a new Scheduler Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Scheduler Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SRV** (srv\_pub, srv\_data)

Time Scene Server Models related context.

Define a new Time Server Model.

---

**备注:** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_time\_srv\_t*.

**返回** New Time Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SETUP\_SRV** (srv\_data)

Define a new Time Setup Server Model.

---

**备注:** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

- a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
  - b. This model does not support subscribing nor publishing.
- 

**参数**

- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_time\_setup\_srv\_t*.

**返回** New Time Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SRV** (srv\_pub, srv\_data)

Define a new Scene Server Model.

---

**备注:** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model may be present only on the Primary element of a node.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scene\_srv\_t*.

返回 New Scene Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Scene Setup Server Model.

---

**备注:** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
  - b. The model may be present only on the Primary element of a node.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scene\_setup\_srv\_t*.

返回 New Scene Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SRV** (srv\_pub, srv\_data)

Define a new Scheduler Server Model.

---

**备注:** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model may be present only on the Primary element of a node.
  - c. The model requires the Time Server model shall be present on the element.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scheduler\_srv\_t*.

返回 New Scheduler Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Scheduler Setup Server Model.

---

**备注:** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

- a. This model shall support model subscription.
  - b. The model may be present only on the Primary element of a node.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scheduler\_setup\_srv\_t*.

返回 New Scheduler Setup Server Model instance.

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_SECONDS**

Unknown TAI Seconds

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_ZONE\_CHANGE**

Unknown TAI of Zone Change

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_DELTA\_CHANGE**

Unknown TAI of Delta Change

**ESP\_BLE\_MESH\_TAI.UTC\_DELTA\_MAX\_VALUE**

Maximum TAI-UTC Delta value

**ESP\_BLE\_MESH\_TAI.SECONDS\_LEN**

Length of TAI Seconds

**ESP\_BLE\_MESH\_TAI.OF\_ZONE\_CHANGE\_LEN**

Length of TAI of Zone Change

**ESP\_BLE\_MESH\_TAI.OF\_DELTA\_CHANGE\_LEN**

Length of TAI of Delta Change

**ESP\_BLE\_MESH\_INVALID\_SCENE\_NUMBER**

Invalid Scene Number

**ESP\_BLE\_MESH\_SCENE\_NUMBER\_LEN**

Length of the Scene Number

**ESP\_BLE\_MESH\_SCHEDULE\_YEAR\_ANY\_YEAR**

Any year of the Scheduled year

**ESP\_BLE\_MESH\_SCHEDULE\_DAY\_ANY\_DAY**

Any day of the Scheduled day

**ESP\_BLE\_MESH\_SCHEDULE\_HOUR\_ANY\_HOUR**

Any hour of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_HOUR\_ONCE\_A\_DAY**

Any hour of the Scheduled Day

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ANY\_OF\_HOUR**

Any minute of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_EVERY\_15\_MIN**

Every 15 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_EVERY\_20\_MIN**

Every 20 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ONCE\_AN\_HOUR**

Once of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ANY\_OF\_MIN**

Any second of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_EVERY\_15\_SEC**

Every 15 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_20\_SEC**

Every 20 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC ONCE\_AN\_MIN**

Once of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_OFF**

Scheduled Action - Turn Off

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_ON**

Scheduled Action - Turn On

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_SCENE\_RECALL**

Scheduled Action - Scene Recall

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_NO\_ACTION**

Scheduled Action - No Action

**ESP\_BLE\_MESH\_SCHEDULE\_SCENE\_NO\_SCENE**

Scheduled Scene - No Scene

**ESP\_BLE\_MESH\_SCHEDULE\_ENTRY\_MAX\_INDEX**

Maximum number of Scheduled entries

**ESP\_BLE\_MESH\_TIME\_NONE**

Time Role - None

**ESP\_BLE\_MESH\_TIME\_AUTHORITY**

Time Role - Mesh Time Authority

**ESP\_BLE\_MESH\_TIME\_RELAY**

Time Role - Mesh Time Relay

**ESP\_BLE\_MESH\_TIME\_CLINET**

Time Role - Mesh Time Client

**ESP\_BLE\_MESH\_SCENE\_SUCCESS**

Scene operation - Success

**ESP\_BLE\_MESH\_SCENE\_REG\_FULL**

Scene operation - Scene Register Full

**ESP\_BLE\_MESH\_SCENE\_NOT\_FOUND**

Scene operation - Scene Not Found

## Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_time_scene_client_cb_event_t
```

This enum value is the event of Time Scene Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_time_scene_server_cb_event_t
```

This enum value is the event of Time Scene Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When status\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_EVT\_MAX**

## Lighting Client/Server Models

### Header File

- components/bt/esp\_ble\_mesh/api/models/include/esp\_ble\_mesh\_lighting\_model\_api.h

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_light\_client\_callback** (*esp\_ble\_mesh\_light\_client\_cb\_t* callback)

Register BLE Mesh Light Client Model callback.

参数 **callback** –[in] pointer to the callback function.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_light\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_get\_state\_t* \*get\_state)

Get the value of Light Server Model states using the Light Client Model get messages.

---

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_light\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer of light get message value. Shall not be set to NULL.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_light\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_set\_state\_t* \*set\_state)

Set the value of Light Server Model states using the Light Client Model set messages.

---

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_light\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

---

#### 参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer of light set message value. Shall not be set to NULL.

返回 ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_lighting\_server\_callback** (*esp\_ble\_mesh\_lighting\_server\_cb\_t* callback)

Register BLE Mesh Lighting Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP\_OK on success or error code otherwise.

## Unions

union **esp\_ble\_mesh\_light\_client\_get\_state\_t**

### Structures

struct **esp\_ble\_mesh\_light\_lightness\_set\_t**

Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.

Parameters of Light Lightness Set

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **lightness**

Target value of light lightness actual state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_linear\_set\_t**

Parameters of Light Lightness Linear Set

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **lightness**

Target value of light lightness linear state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default Set

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Default state

struct **esp\_ble\_mesh\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range Set

**Public Members****uint16\_t range\_min**

Value of range min field of light lightness range state

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_hsl_default_set_t`

Parameters of Light HSL Default Set

### Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_light_hsl_range_set_t`

Parameters of Light HSL Range Set

### Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_light_xyl_set_t`

Parameters of Light xyL Set

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint16\_t **xy1\_lightness**

The target value of the Light xyL Lightness state

uint16\_t **xy1\_x**

The target value of the Light xyL x state

uint16\_t **xy1\_y**

The target value of the Light xyL y state

uint8\_t **tid**

Transaction Identifier

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_xy1\_default\_set\_t**

Parameters of Light xyL Default Set

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Default state

uint16\_t **xy1\_x**

The value of the Light xyL x Default state

uint16\_t **xy1\_y**

The value of the Light xyL y Default state

struct **esp\_ble\_mesh\_light\_xy1\_range\_set\_t**

Parameters of Light xyL Range Set

### Public Members

uint16\_t **xy1\_x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **xy1\_x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16\_t **xy1\_y\_range\_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16\_t **xy1\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp\_ble\_mesh\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode Set

### Public Members

uint8\_t **mode**

The target value of the Light LC Mode state

struct **esp\_ble\_mesh\_light\_lc\_om\_set\_t**

Parameter of Light LC OM Set

### Public Members

uint8\_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t**

Parameters of Light LC Light OnOff Set

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint8\_t **light\_onoff**

The target value of the Light LC Light OnOff state

uint8\_t **tid**

Transaction Identifier

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_lc\_property\_get\_t**

Parameter of Light LC Property Get

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct **esp\_ble\_mesh\_light\_lc\_property\_set\_t**

Parameters of Light LC Property Set

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct net\_buf\_simple \***property\_value**

Raw value for the Light LC Property

struct **esp\_ble\_mesh\_light\_lightness\_status\_cb\_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

**Public Members**bool **op\_en**

Indicate if optional parameters are included

**uint16\_t present\_lightness**

Current value of light lightness actual state

**uint16\_t target\_lightness**

Target value of light lightness actual state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_linear\_status\_cb\_t**

Parameters of Light Lightness Linear Status

**Public Members**bool **op\_en**

Indicate if optional parameters are included

**uint16\_t present\_lightness**

Current value of light lightness linear state

uint16\_t **target\_lightness**

Target value of light lightness linear state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_last\_status\_cb\_t**

Parameter of Light Lightness Last Status

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Last state

struct **esp\_ble\_mesh\_light\_lightness\_default\_status\_cb\_t**

Parameter of Light Lightness Default Status

### Public Members

uint16\_t **lightness**

The value of the Light Lightness default State

struct **esp\_ble\_mesh\_light\_lightness\_range\_status\_cb\_t**

Parameters of Light Lightness Range Status

### Public Members

uint8\_t **status\_code**

Status Code for the request message

uint16\_t **range\_min**

Value of range min field of light lightness range state

uint16\_t **range\_max**

Value of range max field of light lightness range state

struct **esp\_ble\_mesh\_light\_ctl\_status\_cb\_t**

Parameters of Light CTL Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_ctl\_lightness**

Current value of light ctl lightness state

uint16\_t **present\_ctl\_temperature**

Current value of light ctl temperature state

uint16\_t **target\_ctl\_lightness**

Target value of light ctl lightness state (optional)

uint16\_t **target\_ctl\_temperature**

Target value of light ctl temperature state (C.1)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_ctl\_temperature\_status\_cb\_t**

Parameters of Light CTL Temperature Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_ctl\_temperature**

Current value of light ctl temperature state

uint16\_t **present\_ctl\_delta\_uv**

Current value of light ctl delta UV state

uint16\_t **target\_ctl\_temperature**

Target value of light ctl temperature state (optional)

uint16\_t **target\_ctl\_delta\_uv**

Target value of light ctl delta UV state (C.1)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_ctl\_temperature\_range\_status\_cb\_t**

Parameters of Light CTL Temperature Range Status

### Public Members

uint8\_t **status\_code**

Status code for the request message

uint16\_t **range\_min**

Value of temperature range min field of light ctl temperature range state

uint16\_t **range\_max**

Value of temperature range max field of light ctl temperature range state

struct **esp\_ble\_mesh\_light\_ctl\_default\_status\_cb\_t**

Parameters of Light CTL Default Status

### Public Members

uint16\_t **lightness**

Value of light lightness default state

uint16\_t **temperature**

Value of light temperature default state

int16\_t **delta\_uv**

Value of light delta UV default state

struct **esp\_ble\_mesh\_light\_hsl\_status\_cb\_t**

Parameters of Light HSL Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **hsl\_lightness**

Current value of light hsl lightness state

uint16\_t **hsl\_hue**

Current value of light hsl hue state

uint16\_t **hsl\_saturation**

Current value of light hsl saturation state

uint8\_t **remain\_time**

Time to complete state transition (optional)

struct **esp\_ble\_mesh\_light\_hsl\_target\_status\_cb\_t**

Parameters of Light HSL Target Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **hsl\_lightness\_target**  
Target value of light hsl lightness state

uint16\_t **hsl\_hue\_target**  
Target value of light hsl hue state

uint16\_t **hsl\_saturation\_target**  
Target value of light hsl saturation state

uint8\_t **remain\_time**  
Time to complete state transition (optional)

struct **esp\_ble\_mesh\_light\_hsl\_hue\_status\_cb\_t**  
Parameters of Light HSL Hue Status

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **present\_hue**  
Current value of light hsl hue state

uint16\_t **target\_hue**  
Target value of light hsl hue state (optional)

uint8\_t **remain\_time**  
Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_hsl\_saturation\_status\_cb\_t**  
Parameters of Light HSL Saturation Status

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **present\_saturation**  
Current value of light hsl saturation state

uint16\_t **target\_saturation**  
Target value of light hsl saturation state (optional)

uint8\_t **remain\_time**  
Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_hsl\_default\_status\_cb\_t**  
Parameters of Light HSL Default Status

**Public Members****uint16\_t lightness**

Value of light lightness default state

**uint16\_t hue**

Value of light hue default state

**uint16\_t saturation**

Value of light saturation default state

struct **esp\_ble\_mesh\_light\_hsl\_range\_status\_cb\_t**

Parameters of Light HSL Range Status

**Public Members****uint8\_t status\_code**

Status code for the request message

**uint16\_t hue\_range\_min**

Value of hue range min field of light hsl hue range state

**uint16\_t hue\_range\_max**

Value of hue range max field of light hsl hue range state

**uint16\_t saturation\_range\_min**

Value of saturation range min field of light hsl saturation range state

**uint16\_t saturation\_range\_max**

Value of saturation range max field of light hsl saturation range state

struct **esp\_ble\_mesh\_light\_xyl\_status\_cb\_t**

Parameters of Light xyL Status

**Public Members****bool op\_en**

Indicate whether optional parameters included

**uint16\_t xyl\_lightness**

The present value of the Light xyL Lightness state

**uint16\_t xyl\_x**

The present value of the Light xyL x state

**uint16\_t xyl\_y**

The present value of the Light xyL y state

`uint8_t remain_time`

Time to complete state transition (optional)

struct `esp_ble_mesh_light_xyl_target_status_cb_t`

Parameters of Light xyL Target Status

### Public Members

`bool op_en`

Indicate whether optional parameters included

`uint16_t target_xyl_lightness`

The target value of the Light xyL Lightness state

`uint16_t target_xyl_x`

The target value of the Light xyL x state

`uint16_t target_xyl_y`

The target value of the Light xyL y state

`uint8_t remain_time`

Time to complete state transition (optional)

struct `esp_ble_mesh_light_xyl_default_status_cb_t`

Parameters of Light xyL Default Status

### Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

`uint16_t xyl_x`

The value of the Light xyL x Default state

`uint16_t xyl_y`

The value of the Light xyL y Default state

struct `esp_ble_mesh_light_xyl_range_status_cb_t`

Parameters of Light xyL Range Status

### Public Members

`uint8_t status_code`

Status Code for the requesting message

uint16\_t **xyL\_x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **xyL\_x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16\_t **xyL\_y\_range\_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16\_t **xyL\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp\_ble\_mesh\_light\_lc\_mode\_status\_cb\_t**

Parameter of Light LC Mode Status

### Public Members

uint8\_t **mode**

The present value of the Light LC Mode state

struct **esp\_ble\_mesh\_light\_lc\_om\_status\_cb\_t**

Parameter of Light LC OM Status

### Public Members

uint8\_t **mode**

The present value of the Light LC Occupancy Mode state

struct **esp\_ble\_mesh\_light\_lc\_light\_onoff\_status\_cb\_t**

Parameters of Light LC Light OnOff Status

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint8\_t **present\_light\_onoff**

The present value of the Light LC Light OnOff state

uint8\_t **target\_light\_onoff**

The target value of the Light LC Light OnOff state (Optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t**

Parameters of Light LC Property Status

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct net\_buf\_simple \***property\_value**

Raw value for the Light LC Property

struct **esp\_ble\_mesh\_light\_client\_cb\_param\_t**

Lighting Client Model callback parameters

**Public Members**int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_light\_client\_status\_cb\_t* **status\_cb**

The light status message callback values

struct **esp\_ble\_mesh\_light\_lightness\_state\_t**

Parameters of Light Lightness state

**Public Members**uint16\_t **lightness\_linear**

The present value of Light Lightness Linear state

uint16\_t **target\_lightness\_linear**

The target value of Light Lightness Linear state

uint16\_t **lightness\_actual**

The present value of Light Lightness Actual state

uint16\_t **target\_lightness\_actual**

The target value of Light Lightness Actual state

uint16\_t **lightness\_last**

The value of Light Lightness Last state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint8\_t **status\_code**

The status code of setting Light Lightness Range state

uint16\_t **lightness\_range\_min**

The minimum value of Light Lightness Range state

uint16\_t **lightness\_range\_max**

The maximum value of Light Lightness Range state

struct **esp\_ble\_mesh\_light\_lightness\_srv\_t**

User data of Light Lightness Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* \***state**

Parameters of the Light Lightness state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **actual\_transition**

Parameters of state transition

*esp\_ble\_mesh\_state\_transition\_t* **linear\_transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness\_actual**

Delta change value of lightness actual state transition

int32\_t **tt\_delta\_lightness\_linear**

Delta change value of lightness linear state transition

struct **esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t**

User data of Light Lightness Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* \*state

Parameters of the Light Lightness state

struct **esp\_ble\_mesh\_light\_ctl\_state\_t**

Parameters of Light CTL state

### Public Members

uint16\_t **lightness**

The present value of Light CTL Lightness state

uint16\_t **target\_lightness**

The target value of Light CTL Lightness state

uint16\_t **temperature**

The present value of Light CTL Temperature state

uint16\_t **target\_temperature**

The target value of Light CTL Temperature state

int16\_t **delta\_uv**

The present value of Light CTL Delta UV state

int16\_t **target\_delta\_uv**

The target value of Light CTL Delta UV state

uint8\_t **status\_code**

The statue code of setting Light CTL Temperature Range state

uint16\_t **temperature\_range\_min**

The minimum value of Light CTL Temperature Range state

uint16\_t **temperature\_range\_max**

The maximum value of Light CTL Temperature Range state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **temperature\_default**

The value of Light CTL Temperature Default state

int16\_t **delta\_uv\_default**

The value of Light CTL Delta UV Default state

struct **esp\_ble\_mesh\_light\_ctl\_srv\_t**

User data of Light CTL Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_temperature**

Delta change value of temperature state transition

int32\_t **tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

struct **esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t**

User data of Light CTL Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

struct **esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t**

User data of Light CTL Temperature Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_temperature**

Delta change value of temperature state transition

int32\_t **tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

struct **esp\_ble\_mesh\_light\_hsl\_state\_t**

Parameters of Light HSL state

### Public Members

uint16\_t **lightness**

The present value of Light HSL Lightness state

uint16\_t **target\_lightness**

The target value of Light HSL Lightness state

uint16\_t **hue**

The present value of Light HSL Hue state

uint16\_t **target\_hue**

The target value of Light HSL Hue state

uint16\_t **saturation**

The present value of Light HSL Saturation state

uint16\_t **target\_saturation**

The target value of Light HSL Saturation state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **hue\_default**

The value of Light HSL Hue Default state

`uint16_t saturation_default`

The value of Light HSL Saturation Default state

`uint8_t status_code`

The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`

The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`

The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`

The minimum value of Light HSL Saturation state

`uint16_t saturation_range_max`

The maximum value of Light HSL Saturation state

struct `esp_ble_mesh_light_hsl_srv_t`

User data of Light HSL Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Lighting HSL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`

Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`

Parameters of state transition

`int32_t tt_delta_lightness`

Delta change value of lightness state transition

`int32_t tt_delta_hue`

Delta change value of hue state transition

`int32_t tt_delta_saturation`

Delta change value of saturation state transition

struct `esp_ble_mesh_light_hsl_setup_srv_t`

User data of Light HSL Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

struct **esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t**

User data of Light HSL Hue Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_hue**

Delta change value of hue state transition

struct **esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t**

User data of Light HSL Saturation Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_saturation**

Delta change value of saturation state transition

struct **esp\_ble\_mesh\_light\_xyL\_state\_t**

Parameters of Light xyL state

### **Public Members**

uint16\_t **lightness**

The present value of Light xyL Lightness state

uint16\_t **target\_lightness**

The target value of Light xyL Lightness state

uint16\_t **x**

The present value of Light xyL x state

uint16\_t **target\_x**

The target value of Light xyL x state

uint16\_t **y**

The present value of Light xyL y state

uint16\_t **target\_y**

The target value of Light xyL y state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **x\_default**

The value of Light xyL x Default state

uint16\_t **y\_default**

The value of Light xyL y Default state

uint8\_t **status\_code**

The status code of setting Light xyL x & y Range state

uint16\_t **x\_range\_min**

The minimum value of Light xyL x Range state

uint16\_t **x\_range\_max**

The maximum value of Light xyL x Range state

uint16\_t **y\_range\_min**

The minimum value of Light xyL y Range state

uint16\_t **y\_range\_max**

The maximum value of Light xyL y Range state

struct **esp\_ble\_mesh\_light\_xyl\_srv\_t**

User data of Light xyL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_x**

Delta change value of x state transition

int32\_t **tt\_delta\_y**

Delta change value of y state transition

struct **esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t**

User data of Light xyL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

struct **esp\_ble\_mesh\_light\_lc\_state\_t**

Parameters of Light LC states

### Public Members

uint32\_t **mode**

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32\_t **occupancy\_mode**

The value of Light LC Occupancy Mode state

uint32\_t **light\_onoff**

The present value of Light LC Light OnOff state

uint32\_t **target\_light\_onoff**

The target value of Light LC Light OnOff state

uint32\_t **occupancy**

The value of Light LC Occupancy state

uint32\_t **ambient\_luxlevel**

The value of Light LC Ambient LuxLevel state

uint16\_t **linear\_output**

- Light LC Linear Output =  $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct **esp\_ble\_mesh\_light\_lc\_property\_state\_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

### Public Members

**uint32\_t time\_occupancy\_delay**

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

**uint32\_t time\_fade\_on**

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

**uint32\_t time\_run\_on**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

**uint32\_t time\_fade**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Fade state

**uint32\_t time\_prolong**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

**uint32\_t time\_fade\_standby\_auto**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

**uint32\_t time\_fade\_standby\_manual**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

**uint16\_t lightness\_on**

A lightness state that determines the perceptible light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16\_t lightness\_prolong**

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16\_t lightness\_standby**

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16\_t ambient\_luxlevel\_on**

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16\_t ambient\_luxlevel\_prolong**

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

**uint16\_t ambient\_luxlevel\_standby**

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

**float regulator\_kiu**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

**float regulator\_kid**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

**float regulator\_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

**float regulator\_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

**int8\_t regulator\_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

**uint32\_t set\_occupancy\_to\_1\_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t**

Parameters of Light LC state machine

**Public Members****uint8\_t fade\_on**

The value of transition time of Light LC Time Fade On

**uint8\_t fade**

The value of transition time of Light LC Time Fade

`uint8_t fade_standby_auto`

The value of transition time of Light LC Time Fade Standby Auto

`uint8_t fade_standby_manual`

The value of transition time of Light LC Time Fade Standby Manual

struct `esp_ble_mesh_light_lc_state_machine_t`::[anonymous] `trans_time`

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

`esp_ble_mesh_lc_state_t state`

The value of Light LC state machine state

struct `k_delayed_work timer`

Timer of Light LC state machine

struct `esp_ble_mesh_light_control_t`

Parameters of Light Lightness controller

### Public Members

`esp_ble_mesh_light_lc_state_t state`

Parameters of Light LC state

`esp_ble_mesh_light_lc_property_state_t prop_state`

Parameters of Light LC Property state

`esp_ble_mesh_light_lc_state_machine_t state_machine`

Parameters of Light LC state machine

struct `esp_ble_mesh_light_lc_srv_t`

User data of Light LC Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Lighting LC Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_light_control_t *lc`

Parameters of the Light controller

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

struct **esp\_ble\_mesh\_light\_lc\_setup\_srv\_t**

User data of Light LC Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \***lc**

Parameters of the Light controller

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_set\_t**

Parameter of Light Lightness Actual state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Actual state

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_linear\_set\_t**

Parameter of Light Lightness Linear state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Linear state

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Default state

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range state change event

**Public Members****uint16\_t range\_min**

The minimum value of Light Lightness Range state

**uint16\_t range\_max**

The maximum value of Light Lightness Range state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_set\_t**

Parameters of Light CTL state change event

**Public Members****uint16\_t lightness**

The value of Light CTL Lightness state

**uint16\_t temperature**

The value of Light CTL Temperature state

**int16\_t delta\_uv**

The value of Light CTL Delta UV state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_set\_t**

Parameters of Light CTL Temperature state change event

**Public Members****uint16\_t temperature**

The value of Light CTL Temperature state

**int16\_t delta\_uv**

The value of Light CTL Delta UV state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_range\_set\_t**

Parameters of Light CTL Temperature Range state change event

**Public Members****uint16\_t range\_min**

The minimum value of Light CTL Temperature Range state

**uint16\_t range\_max**

The maximum value of Light CTL Temperature Range state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_default\_set\_t**

Parameters of Light CTL Default state change event

**Public Members****uint16\_t lightness**

The value of Light Lightness Default state

**uint16\_t temperature**

The value of Light CTL Temperature Default state

**int16\_t delta\_uv**

The value of Light CTL Delta UV Default state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_set\_t**

Parameters of Light HSL state change event

**Public Members****uint16\_t lightness**

The value of Light HSL Lightness state

**uint16\_t hue**

The value of Light HSL Hue state

**uint16\_t saturation**

The value of Light HSL Saturation state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_hue\_set\_t**

Parameter of Light HSL Hue state change event

**Public Members****uint16\_t hue**

The value of Light HSL Hue state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_saturation\_set\_t**

Parameter of Light HSL Saturation state change event

**Public Members****uint16\_t saturation**

The value of Light HSL Saturation state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_default\_set\_t**

Parameters of Light HSL Default state change event

**Public Members****uint16\_t lightness**

The value of Light HSL Lightness Default state

**uint16\_t hue**

The value of Light HSL Hue Default state

**uint16\_t saturation**

The value of Light HSL Saturation Default state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_range\_set\_t**

Parameters of Light HSL Range state change event

**Public Members****uint16\_t hue\_range\_min**

The minimum hue value of Light HSL Range state

**uint16\_t hue\_range\_max**

The maximum hue value of Light HSL Range state

**uint16\_t saturation\_range\_min**

The minimum saturation value of Light HSL Range state

**uint16\_t saturation\_range\_max**

The maximum saturation value of Light HSL Range state

struct **esp\_ble\_mesh\_state\_change\_light\_xyL\_set\_t**

Parameters of Light xyL state change event

**Public Members****uint16\_t lightness**

The value of Light xyL Lightness state

**uint16\_t x**

The value of Light xyL x state

**uint16\_t y**

The value of Light xyL y state

struct **esp\_ble\_mesh\_state\_change\_light\_xyL\_default\_set\_t**

Parameters of Light xyL Default state change event

**Public Members****uint16\_t lightness**

The value of Light Lightness Default state

**uint16\_t x**

The value of Light xyL x Default state

**uint16\_t y**

The value of Light xyL y Default state

struct **esp\_ble\_mesh\_state\_change\_light\_xyl\_range\_set\_t**

Parameters of Light xyL Range state change event

**Public Members****uint16\_t x\_range\_min**

The minimum value of Light xyL x Range state

**uint16\_t x\_range\_max**

The maximum value of Light xyL x Range state

**uint16\_t y\_range\_min**

The minimum value of Light xyL y Range state

**uint16\_t y\_range\_max**

The maximum value of Light xyL y Range state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode state change event

**Public Members****uint8\_t mode**

The value of Light LC Mode state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_om\_set\_t**

Parameter of Light LC Occupancy Mode state change event

**Public Members****uint8\_t mode**

The value of Light LC Occupancy Mode state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_light\_onoff\_set\_t**

Parameter of Light LC Light OnOff state change event

**Public Members****uint8\_t onoff**

The value of Light LC Light OnOff state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_property\_set\_t**

Parameters of Light LC Property state change event

**Public Members****uint16\_t property\_id**

The property id of Light LC Property state

struct net\_buf\_simple \***property\_value**

The property value of Light LC Property state

struct **esp\_ble\_mesh\_state\_change\_sensor\_status\_t**

Parameters of Sensor Status state change event

**Public Members****uint16\_t property\_id**

The value of Sensor Property ID

**uint8\_t occupancy**

The value of Light LC Occupancy state

**uint32\_t set\_occupancy\_to\_1\_delay**

The value of Light LC Set Occupancy to 1 Delay state

**uint32\_t ambient\_luxlevel**

The value of Light LC Ambient Luxlevel state

union *esp\_ble\_mesh\_state\_change\_sensor\_status\_t*::[anonymous] **state**

Parameters of Sensor Status related state

struct **esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_get\_t**

Context of the received Light LC Property Get message

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_set\_t**

Context of the received Light Lightness Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light lightness actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_linear\_set\_t**

Context of the received Light Lightness Linear Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light lightness linear state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_default\_set\_t**

Context of the received Light Lightness Default Set message

**Public Members****uint16\_t lightness**

The value of the Light Lightness Default state

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_range\_set\_t**

Context of the received Light Lightness Range Set message

**Public Members****uint16\_t range\_min**

Value of range min field of light lightness range state

**uint16\_t range\_max**

Value of range max field of light lightness range state

struct **esp\_ble\_mesh\_server\_recv\_light\_ctl\_set\_t**

Context of the received Light CTL Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light ctl lightness state

**uint16\_t temperature**

Target value of light ctl temperature state

**int16\_t delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_recv\_light\_ctl\_temperature\_set\_t**

Context of the received Light CTL Temperature Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t temperature**

Target value of light ctl temperature state

**int16\_t delta\_uv**

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_ctl_temperature_range_set_t`

Context of the received Light CTL Temperature Range Set message

### Public Members

`uint16_t range_min`

Value of temperature range min field of light ctl temperature range state

`uint16_t range_max`

Value of temperature range max field of light ctl temperature range state

struct `esp_ble_mesh_server_rcv_light_ctl_default_set_t`

Context of the received Light CTL Default Set message

### Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t temperature`

Value of light temperature default state

`int16_t delta_uv`

Value of light delta UV default state

struct `esp_ble_mesh_server_rcv_light_hsl_set_t`

Context of the received Light HSL Set message

### Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t lightness`

Target value of light hsl lightness state

`uint16_t hue`

Target value of light hsl hue state

`uint16_t saturation`

Target value of light hsl saturation state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_hue_set_t`

Context of the received Light HSL Hue Set message

### Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t hue`

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_saturation_set_t`

Context of the received Light HSL Saturation Set message

### Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t saturation`

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_default_set_t`

Context of the received Light HSL Default Set message

### Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_server_rcv_light_hsl_range_set_t`

Context of the received Light HSL Range Set message

### Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_server_rcv_light_xyl_set_t`

Context of the received Light xyL Set message

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint16\_t **lightness**

The target value of the Light xyL Lightness state

uint16\_t **x**

The target value of the Light xyL x state

uint16\_t **y**

The target value of the Light xyL y state

uint8\_t **tid**

Transaction Identifier

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_xyl\_default\_set\_t**

Context of the received Light xyL Default Set message

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Default state

uint16\_t **x**

The value of the Light xyL x Default state

uint16\_t **y**

The value of the Light xyL y Default state

struct **esp\_ble\_mesh\_server\_rcv\_light\_xyl\_range\_set\_t**

Context of the received Light xyl Range Set message

### Public Members

uint16\_t **x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

struct `esp_ble_mesh_server_rcv_light_lc_mode_set_t`

Context of the received Light LC Mode Set message

### Public Members

`uint8_t mode`

The target value of the Light LC Mode state

struct `esp_ble_mesh_server_rcv_light_lc_om_set_t`

Context of the received Light OM Set message

### Public Members

`uint8_t mode`

The target value of the Light LC Occupancy Mode state

struct `esp_ble_mesh_server_rcv_light_lc_light_onoff_set_t`

Context of the received Light LC Light OnOff Set message

### Public Members

bool `op_en`

Indicate whether optional parameters included

`uint8_t light_onoff`

The target value of the Light LC Light OnOff state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_lc_property_set_t`

Context of the received Light LC Property Set message

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct net\_buf\_simple \***property\_value**

Raw value for the Light LC Property

struct **esp\_ble\_mesh\_server\_recv\_sensor\_status\_t**

Context of the received Sensor Status message

**Public Members**struct net\_buf\_simple \***data**

Value of sensor data state (optional)

struct **esp\_ble\_mesh\_lighting\_server\_cb\_param\_t**

Lighting Server Model callback parameters

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to Lighting Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_lighting\_server\_cb\_value\_t* **value**

Value of the received Lighting Messages

**Macros****ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_CLI** (cli\_pub, cli\_data)

Define a new Light Lightness Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Light Lightness Client Model instance.**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_CLI** (cli\_pub, cli\_data)

Define a new Light CTL Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Light CTL Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_CLI** (cli\_pub, cli\_data)

Define a new Light HSL Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Light HSL Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_CLI** (cli\_pub, cli\_data)

Define a new Light xyL Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Light xyL Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_CLI** (cli\_pub, cli\_data)

Define a new Light LC Client Model.

---

**备注:** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

---

**参数**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**返回** New Light LC Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SRV** (srv\_pub, srv\_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

---

**备注:** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_srv\_t*.

返回 New Light Lightness Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light Lightness Setup Server Model.

---

**备注:** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t*.

返回 New Light Lightness Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Server Model.

---

**备注:** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_srv\_t*.

返回 New Light CTL Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Setup Server Model.

---

**备注:** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t*.

返回 New Light CTL Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_TEMP\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Temperature Server Model.

---

**备注:** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

- a. This model shall support model publication and model subscription.
-

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t*.

**返回** New Light CTL Temperature Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Server Model.

---

**备注:** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

- This model shall support model publication and model subscription.
  - The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_srv\_t*.

**返回** New Light HSL Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Setup Server Model.

---

**备注:** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

- This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t*.

**返回** New Light HSL Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_HUE\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Hue Server Model.

---

**备注:** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t*.

**返回** New Light HSL Hue Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SAT\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Saturation Server Model.

---

**备注:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t*.

**返回** New Light HSL Saturation Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SRV** (srv\_pub, srv\_data)

Define a new Light xyL Server Model.

---

**备注:** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_xyl\_srv\_t*.

**返回** New Light xyL Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light xyL Setup Server Model.

---

**备注:** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t*.

**返回** New Light xyL Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SRV** (srv\_pub, srv\_data)

Define a new Light LC Server Model.

---

**备注:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.
- 

**参数**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lc\_srv\_t*.

返回 New Light LC Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light LC Setup Server Model.

---

**备注:** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

- a. This model shall support model publication and model subscription.
  - b. This model may be used to configure setup parameters for the Light LC Server model.
- 

#### 参数

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lc\_setup\_srv\_t*.

返回 New Light LC Setup Server Model instance.

### Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,
esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,
esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

Values:

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

Values:

enumerator **ESP\_BLE\_MESH\_LC\_OFF**

enumerator **ESP\_BLE\_MESH\_LC\_STANDBY**

enumerator **ESP\_BLE\_MESH\_LC\_FADE\_ON**

enumerator **ESP\_BLE\_MESH\_LC\_RUN**

enumerator **ESP\_BLE\_MESH\_LC\_FADE**

enumerator **ESP\_BLE\_MESH\_LC\_PROLONG**

enumerator **ESP\_BLE\_MESH\_LC\_FADE\_STANDBY\_AUTO**

enumerator **ESP\_BLE\_MESH\_LC\_FADE\_STANDBY\_MANUAL**

enum **esp\_ble\_mesh\_lighting\_server\_cb\_event\_t**

This enum value is the event of Lighting Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_EVT\_MAX**

蓝牙 API 的示例代码存放于 ESP-IDF [bluetooth/bluedroid](#) 示例目录下，请查看。

下面的示例给出了详细介绍：

- [GATT 客户端示例](#)

## 2.2 连网 API

### 2.2.1 Wi-Fi

#### Wi-Fi 库

**概述** Wi-Fi 库支持配置及监控 ESP32-S3 Wi-Fi 连网功能。

支持配置：

- 基站模式（即 STA 模式或 Wi-Fi 客户端模式），此时 ESP32-S3 连接到接入点 (AP)。
- AP 模式（即 Soft-AP 模式或接入点模式），此时基站连接到 ESP32-S3。
- AP-STA 共存模式（ESP32-S3 既是接入点，同时又作为基站连接到另外一个接入点）。
- 上述模式的各种安全模式（WPA、WPA2 及 WEP 等）。
- 扫描接入点（包括主动扫描及被动扫描）。
- 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

**应用示例** ESP-IDF 示例项目的 `wifi` 目录下包含以下应用程序：

- Wi-Fi 示例代码；
- 另外一个简单的应用程序 `esp-idf-template`，演示了如何将 ESP32-S3 模组连接到 AP。

#### API 参考

##### Header File

- `components/esp_wifi/include/esp_wifi.h`

##### Functions

`esp_err_t esp_wifi_init` (const `wifi_init_config_t` \*config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field ‘magic’ of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

**参数** `config` –pointer to WiFi initialized configuration structure; can point to a temporary variable.

**返回**

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

**esp\_err\_t esp\_wifi\_deinit** (void)

Deinit WiFi Free all resource allocated in esp\_wifi\_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**esp\_err\_t esp\_wifi\_set\_mode** (wifi\_mode\_t mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

**参数 mode** –WiFi operating mode

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error code in esp\_err.h

**esp\_err\_t esp\_wifi\_get\_mode** (wifi\_mode\_t \*mode)

Get current operating mode of WiFi.

**参数 mode** –[out] store current WiFi mode

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**esp\_err\_t esp\_wifi\_start** (void)

Start WiFi according to current configuration If mode is WIFI\_MODE\_STA, it create station control block and start station If mode is WIFI\_MODE\_AP, it create soft-AP control block and start soft-AP If mode is WIFI\_MODE\_APSTA, it create soft-AP and station control block and start soft-AP and station.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

**esp\_err\_t esp\_wifi\_stop** (void)

Stop WiFi If mode is WIFI\_MODE\_STA, it stop station and free station control block If mode is WIFI\_MODE\_AP, it stop soft-AP and free soft-AP control block If mode is WIFI\_MODE\_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**esp\_err\_t esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_set\_bandwidth,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**esp\_err\_t esp\_wifi\_connect** (void)

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If the ESP32 is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_start\_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn't exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI\_REASON\_NO\_AP\_FOUND.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_ERR\_WIFI\_SSID: SSID of AP which station connects is invalid

**esp\_err\_t esp\_wifi\_disconnect** (void)

Disconnect the ESP32 WiFi station from the AP.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi was not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_FAIL: other WiFi internal errors

**esp\_err\_t esp\_wifi\_clear\_fast\_connect** (void)

Currently this API is just an stub API.

**返回**

- ESP\_OK: succeed
- others: fail

**esp\_err\_t esp\_wifi\_deauth\_sta** (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

**参数** aid –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong

**esp\_err\_t esp\_wifi\_scan\_start** (const *wifi\_scan\_config\_t* \*config, bool block)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp\_wifi\_scan\_get\_ap\_records, so generally, call esp\_wifi\_scan\_get\_ap\_records to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

#### 参数

- **config** –configuration of scanning
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_TIMEOUT: blocking scan is timeout
- ESP\_ERR\_WIFI\_STATE: wifi still connecting when invoke esp\_wifi\_scan\_start
- others: refer to error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_scan\_stop** (void)

Stop the scan in process.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_num** (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

参数 **number** –[out] store number of APIs found in last scan

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_records** (uint16\_t \*number, *wifi\_ap\_record\_t* \*ap\_records)

Get AP list found in last scan.

#### 参数

- **number** –[inout] As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- **ap\_records** –*wifi\_ap\_record\_t* array to hold the found APs

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_sta\_get\_ap\_info** (*wifi\_ap\_record\_t* \*ap\_info)

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

参数 **ap\_info** –the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

*esp\_err\_t* **esp\_wifi\_set\_ps** (*wifi\_ps\_type\_t* type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

参数 **type** –power save type

返回 ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_get\_ps** (*wifi\_ps\_type\_t* \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

参数 **type** –[out] store current power save type

返回 ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_protocol** (*wifi\_interface\_t* ifx, uint8\_t protocol\_bitmap)

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_LR)

**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

参数

- **ifx** –interfaces
- **protocol\_bitmap** –WiFi protocol bitmap

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_protocol** (*wifi\_interface\_t* ifx, uint8\_t \*protocol\_bitmap)

Get the current protocol bitmap of the specified interface.

参数

- **ifx** –interface
- **protocol\_bitmap** –[out] store current WiFi protocol bitmap of interface ifx

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_set\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* bw)

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

#### 参数

- **ifx** –interface to be configured
- **bw** –bandwidth

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* \*bw)

Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

#### 参数

- **ifx** –interface to be configured
- **bw** –[out] store bandwidth of interface ifx

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_channel** (uint8\_t primary, *wifi\_second\_chan\_t* second)

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp\_wifi\_start()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

#### 参数

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_channel** (uint8\_t \*primary, *wifi\_second\_chan\_t* \*second)

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

#### 参数

- **primary** –store current primary channel
- **second** –[out] store current second channel

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_country** (const *wifi\_country\_t* \*country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp\_wifi\_set\_country\_code instead.

**Attention** 2. The default country is CHINA {.cc=" CN" , .schan=1, .nchan=13, policy=WIFI\_COUNTRY\_POLICY\_AUTO}

**Attention** 3. When the country policy is WIFI\_COUNTRY\_POLICY\_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=" USA" , .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc=" JP" , .schan=1, .nchan=14} then the country info that will be used is {.cc=" JP" , .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc=" US" , .schan=1, .nchan=11} in the example.

**Attention** 4. When the country policy is WIFI\_COUNTRY\_POLICY\_MANUAL, then the configured country info is used always.

**Attention** 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 6. The country configuration is stored into flash.

**Attention** 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**参数** **country** –the configured country info

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country** (*wifi\_country\_t* \*country)

get the current country info

**参数** **country** –country info

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_mac** (*wifi\_interface\_t* ifx, const uint8\_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX" , but can not be "15:XX:XX:XX:XX:XX" .

**参数**

- **ifx** –interface
- **mac** –the MAC address

**返回**

- ESP\_OK: succeed

- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MAC: invalid mac address
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_mac** (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**参数**

- **ifx** –interface
- **mac** –[out] store mac of the interface ifx

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**参数** **cb** –callback

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**参数** **en** –false - disable, true - enable

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**参数** **en** –[out] store the current status of promiscuous mode

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

---

**备注:** The default filter is to filter all packets except WIFI\_PKT\_MISC

---

**参数** **filter** –the packet type filtered in promiscuous mode.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**参数** **filter** –[out] store the current status of promiscuous filter

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

---

**备注:** The default filter is to filter none control packet.

---

**参数** *filter* –the subtype of the control packet filtered in promiscuous mode.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**参数** *filter* –[out] store the current status of subtype filter of the control packet in promiscuous mode

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**参数**

- **interface** –interface
- **conf** –station or soft-AP configuration

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the erro code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Get configuration of specified interface.

**参数**

- **interface** –interface
- **conf** –[out] station or soft-AP configuration

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

- ESP\_ERR\_WIFI\_IF: invalid interface

`esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)`

Get STAs associated with soft-AP.

**Attention** SSC only API

**参数** **sta** **–[out]** station list ap can get the connected sta' s phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the `wifi_sta_info_t` struct. For example, phy\_11b = 1 imply that sta support 802.11b mode

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)`

Get AID of STA connected with soft-AP.

**参数**

- **mac** –STA' s mac address
- **aid** **–[out]** Store the AID corresponding to STA mac

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: Requested resource not found
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_set_storage (wifi_storage_t storage)`

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI\_STORAGE\_FLASH

**参数** **storage** –: storage type

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

`esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

**参数**

- **enable** –If true, specified IE is enabled. If false, specified IE is removed.
- **type** –Information Element type. Determines the frame type to associate with the IE.
- **idx** –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- **vnd\_ie** –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init()

- ESP\_ERR\_INVALID\_ARG: Invalid argument, including if first byte of vnd\_ie is not WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD) or second byte is an invalid length.
- ESP\_ERR\_NO\_MEM: Out of memory

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie\_cb** (*esp\_vendor\_ie\_cb\_t* cb, void \*ctx)

Register Vendor-Specific Information Element monitoring callback.

#### 参数

- **cb** –Callback function
- **ctx** –Context argument, passed to callback function.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_max\_tx\_power** (int8\_t power)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max\_tx\_power of the structure *wifi\_country\_t* variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**参数 power** –Maximum WiFi transmitting power.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is out of range

*esp\_err\_t* **esp\_wifi\_get\_max\_tx\_power** (int8\_t \*power)

Get maximum transmitting power after WiFi start.

**参数 power** –Maximum WiFi transmitting power, unit is 0.25dBm.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_event\_mask** (uint32\_t mask)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI\_EVENT\_MASK\_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**参数 mask** –WiFi event mask.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

`esp_err_t esp_wifi_get_event_mask (uint32_t *mask)`

Get mask of WiFi events.

**参数** `mask` –WiFi event mask.

**返回**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument

`esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**参数**

- `ifx` –interface if the Wi-Fi mode is Station, the ifx should be `WIFI_IF_STA`. If the Wi-Fi mode is SoftAP, the ifx should be `WIFI_IF_AP`. If the Wi-Fi mode is Station+SoftAP, the ifx should be `WIFI_IF_STA` or `WIFI_IF_AP`. If the ifx is wrong, the API returns `ESP_ERR_WIFI_IF`.
- `buffer` –raw ieee80211 buffer
- `len` –the length of raw buffer, the len must be  $\leq 1500$  Bytes and  $\geq 24$  Bytes
- `en_sys_seq` –indicate whether use the internal sequence number. If `en_sys_seq` is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if `esp_wifi_80211_tx` is called before the Wi-Fi connection has been set up, both `en_sys_seq==true` and `en_sys_seq==false` are fine. However, if the API is called after the Wi-Fi connection has been set up, `en_sys_seq` must be true, otherwise `ESP_ERR_WIFI_ARG` is returned.

**返回**

- `ESP_OK`: success
- `ESP_ERR_WIFI_IF`: Invalid interface
- `ESP_ERR_INVALID_ARG`: Invalid parameter
- `ESP_ERR_WIFI_NO_MEM`: out of memory

`esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)`

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**参数**

- `cb` –callback
- `ctx` –context argument, passed to callback function

**返回**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)`

Set CSI data configuration.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_START`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

**参数** `config` –configuration

`esp_err_t esp_wifi_set_csi` (bool en)

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_NOT\_START: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

参数 **en** – true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio` (const `wifi_ant_gpio_config_t` \*config)

Set antenna GPIO configuration.

参数 **config** –Antenna GPIO configuration.

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

`esp_err_t esp_wifi_get_ant_gpio` (`wifi_ant_gpio_config_t` \*config)

Get current antenna GPIO configuration.

参数 **config** –Antenna GPIO configuration.

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

`esp_err_t esp_wifi_set_ant` (const `wifi_ant_config_t` \*config)

Set antenna configuration.

参数 **config** –Antenna configuration.

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

`esp_err_t esp_wifi_get_ant` (`wifi_ant_config_t` \*config)

Get current antenna configuration.

参数 **config** –Antenna configuration.

返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

`int64_t esp_wifi_get_tsf_time` (`wifi_interface_t` interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

参数 **interface** –The interface whose `tsf_time` is to be retrieved.

返回 0 or the TSF time

`esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)`

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force death the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

#### 参数

- **ifx** –interface to be configured.
- **sec** –Inactive time. Unit seconds.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

`esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)`

Get inactive time of specified interface.

#### 参数

- **ifx** –Interface to be configured.
- **sec** –Inactive time. Unit seconds.

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

`esp_err_t esp_wifi_stats_dump (uint32_t modules)`

Dump WiFi statistics.

参数 **modules** –statistic modules to be dumped

#### 返回

- ESP\_OK: succeed
- others: failed

`esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)`

Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event is received.

参数 **rssi** –threshold value in dbm between -100 to 0

#### 返回

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

`esp_err_t esp_wifi_ftm_initiate_session (wifi_ftm_initiator_cfg_t *cfg)`

Start an FTM Initiator session by sending FTM request If successful, event WIFI\_EVENT\_FTM\_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**参数** `cfg` –FTM Initiator session configuration  
**返回**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* `esp_wifi_ftm_end_session` (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**返回**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* `esp_wifi_ftm_resp_set_offset` (int16\_t offset\_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**参数** `offset_cm` –T1 Offset to be added in centimeters

**返回**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* `esp_wifi_config_11b_rate` (*wifi\_interface\_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**Attention** 2. Only when really need to disable 11b rate call this API otherwise don't call this.

**参数**

- `ifx` –Interface to be configured.
- `disable` –true means disable 11b rate while false means enable 11b rate.

**返回**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* `esp_wifi_set_connectionless_wake_interval` (uint16\_t interval)

Set interval for station to wake up periodically at disconnected.

**Attention** 1. Only when `ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status

**Attention** 3. This configuration would influence nothing until some module configure `wake_window`

**Attention** 4. A sensible interval which is not too small is recommended (e.g. 100ms)

**参数** `interval` –how much micriosecond would the chip wake up, from 1 to 65535.

*esp\_err\_t* `esp_wifi_set_country_code` (const char \*country, bool ieee80211d\_enabled)

configure country

- Attention** 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
- Attention** 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.
- Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
- Attention** 4. The country configuration is stored into flash.
- Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
- Attention** 6. Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”
- Attention** 7. When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.
- Attention** 8. The default country is “CN” and `ieee80211d_enabled` is TRUE.

**参数**

- **country** –the configured country ISO code
- **ieee80211d\_enabled** –802.11d is enabled or not

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

`esp_err_t esp_wifi_get_country_code (char *country)`

get the current country code

**参数** **country** –country code

**返回**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

`esp_err_t esp_wifi_config_80211_tx_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)`

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**参数**

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

**返回**

- ESP\_OK: succeed
- others: failed

`esp_err_t esp_wifi_disable_pmf_config (wifi_interface_t ifx)`

Disable PMF configuration for specified interface.

**Attention** This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

**参数** **ifx** –Interface to be configured.

**返回**

- ESP\_OK: succeed
- others: failed

## Structures

struct **wifi\_init\_config\_t**

WiFi stack configuration parameters passed to esp\_wifi\_init call.

## Public Members

*system\_event\_handler\_t* **event\_handler**

WiFi event handler

wifi\_osi\_funcs\_t \***osi\_funcs**

WiFi OS functions

wpa\_crypto\_funcs\_t **wpa\_crypto\_funcs**

WiFi station crypto functions when connect

int **static\_rx\_buf\_num**

WiFi static RX buffer number

int **dynamic\_rx\_buf\_num**

WiFi dynamic RX buffer number

int **tx\_buf\_type**

WiFi TX buffer type

int **static\_tx\_buf\_num**

WiFi static TX buffer number

int **dynamic\_tx\_buf\_num**

WiFi dynamic TX buffer number

int **cache\_tx\_buf\_num**

WiFi TX cache buffer number

int **csi\_enable**

WiFi channel state information enable flag

int **ampdu\_rx\_enable**

WiFi AMPDU RX feature enable flag

int **ampdu\_tx\_enable**

WiFi AMPDU TX feature enable flag

int **amsdu\_tx\_enable**

WiFi AMSDU TX feature enable flag

int **nvs\_enable**

WiFi NVS flash enable flag

int **nano\_enable**

Nano option for printf/scan family enable flag

int **rx\_ba\_win**

WiFi Block Ack RX window size

int **wifi\_task\_core\_id**

WiFi Task Core ID

int **beacon\_max\_len**

WiFi softAP maximum length of the beacon

int **mgmt\_sbuf\_num**

WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64\_t **feature\_caps**

Enables additional WiFi features and capabilities

bool **sta\_disconnected\_pm**

WiFi Power Management for station at disconnected status

int **magic**

WiFi init magic number, it should be the last field

## Macros

**ESP\_ERR\_WIFI\_NOT\_INIT**

WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**

WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**

WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**

WiFi interface error

**ESP\_ERR\_WIFI\_MODE**

WiFi mode error

**ESP\_ERR\_WIFI\_STATE**

WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**

WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**

WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**

MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**

SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**

Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**

Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**

WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**

The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**

Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**

Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**

Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**

Returned when WiFi is stopping

**ESP\_ERR\_WIFI\_NOT\_ASSOC**

The WiFi connection is not associated

**ESP\_ERR\_WIFI\_TX\_DISALLOW**

The WiFi TX is disallowed

**WIFI\_STATIC\_TX\_BUFFER\_NUM**

**WIFI\_CACHE\_TX\_BUFFER\_NUM**

### Type Definitions

typedef void (\***wifi\_promiscuous\_cb\_t**)(void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Param buf** Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.

**Param type** promiscuous packet type.

typedef void (\***esp\_vendor\_ie\_cb\_t**)(void \*ctx, *wifi\_vendor\_ie\_type\_t* type, const uint8\_t sa[6], const *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

**Param ctx** Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.

**Param type** Information element type, based on frame type received.

**Param sa** Source 802.11 address.

**Param vnd\_ie** Pointer to the vendor specific element data received.

**Param rssi** Received signal strength indication.

```
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

**Param ctx** context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.

**Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

### Header File

- `components/esp_wifi/include/esp_wifi_types.h`

### Unions

```
union wifi_config_t
```

*#include <esp\_wifi\_types.h>* Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

### Public Members

*wifi\_ap\_config\_t* **ap**

configuration of AP

*wifi\_sta\_config\_t* **sta**

configuration of STA

### Structures

```
struct wifi_country_t
```

Structure describing WiFi country-based regional restrictions.

### Public Members

char **cc**[3]

country code string

uint8\_t **schan**

start channel

uint8\_t **nchan**

total channel number

int8\_t **max\_tx\_power**

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

*wifi\_country\_policy\_t* **policy**

country policy

struct **wifi\_active\_scan\_time\_t**

Range of active scan times per channel.

### Public Members

uint32\_t **min**

minimum active scan time per channel, units: millisecond

uint32\_t **max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi\_scan\_time\_t**

Aggregate of active & passive scan time per channel.

### Public Members

*wifi\_active\_scan\_time\_t* **active**

active scan time per channel, units: millisecond.

uint32\_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi\_scan\_config\_t**

Parameters for an SSID scan.

### Public Members

uint8\_t \***ssid**

SSID of AP

uint8\_t \***bssid**

MAC address of AP

uint8\_t **channel**

channel, scan the specific channel

bool **show\_hidden**

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

scan time per channel

struct **wifi\_ap\_record\_t**

Description of a WiFi AP.

### Public Members

uint8\_t **bssid**[6]

MAC address of AP

uint8\_t **ssid**[33]

SSID of AP

uint8\_t **primary**

channel of AP

*wifi\_second\_chan\_t* **second**

secondary channel of AP

int8\_t **rsqi**

signal strength of AP

*wifi\_auth\_mode\_t* **authmode**

authmode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**

pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**

group cipher of AP

*wifi\_ant\_t* **ant**

antenna used to receive beacon from AP

uint32\_t **phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **wps**

bit: 4 flag to identify if WPS is supported or not

uint32\_t **ftm\_responder**

bit: 5 flag to identify if FTM is supported in responder mode

uint32\_t **ftm\_initiator**

bit: 6 flag to identify if FTM is supported in initiator mode

uint32\_t **reserved**

bit: 7..31 reserved

*wifi\_country\_t* **country**

country information of AP

struct **wifi\_scan\_threshold\_t**

Structure describing parameters for a WiFi fast scan.

### Public Members

int8\_t **rssi**

The minimum rssi to accept in the fast scan mode

*wifi\_auth\_mode\_t* **authmode**

The weakest authmode to accept in the fast scan mode

struct **wifi\_pmf\_config\_t**

Configuration structure for Protected Management Frame

### Public Members

bool **capable**

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct **wifi\_ap\_config\_t**

Soft-AP configuration settings for the ESP32.

### Public Members

uint8\_t **ssid**[32]

SSID of ESP32 soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

uint8\_t **password**[64]

Password of ESP32 soft-AP.

uint8\_t **ssid\_len**

Optional length of SSID field.

uint8\_t **channel**

Channel of ESP32 soft-AP

*wifi\_auth\_mode\_t* **authmode**

Auth mode of ESP32 soft-AP. Do not support AUTH\_WEP in soft-AP mode

uint8\_t **ssid\_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

uint8\_t **max\_connection**

Max number of stations allowed to connect in, default 4, max 10

uint16\_t **beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

*wifi\_cipher\_type\_t* **pairwise\_cipher**

pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI\_CIPHER\_TYPE\_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI\_CIPHER\_TYPE\_TKIP, WIFI\_CIPHER\_TYPE\_CCMP and WIFI\_CIPHER\_TYPE\_TKIP\_CCMP.

bool **ftm\_responder**

Enable FTM Responder mode

struct **wifi\_sta\_config\_t**

STA configuration settings for the ESP32.

### Public Members

uint8\_t **ssid**[32]

SSID of target AP.

uint8\_t **password**[64]

Password of target AP.

*wifi\_scan\_method\_t* **scan\_method**

do all channel scan or fast scan

bool **bssid\_set**

whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8\_t **bssid**[6]

MAC address of target AP

uint8\_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16\_t **listen\_interval**

Listen interval for ESP32 station to receive beacon when WIFI\_PS\_MAX\_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

*wifi\_sort\_method\_t* **sort\_method**

sort the connect AP in the list by rssi or security mode

*wifi\_scan\_threshold\_t* **threshold**

When `sort_method` is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

*wifi\_pmf\_config\_t* **pmf\_cfg**

Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

uint32\_t **rm\_enabled**

Whether Radio Measurements are enabled for the connection

uint32\_t **btm\_enabled**

Whether BSS Transition Management is enabled for the connection

uint32\_t **mbo\_enabled**

Whether MBO is enabled for the connection

uint32\_t **reserved**

Reserved for future feature set

struct **wifi\_sta\_info\_t**

Description of STA associated with AP.

### Public Members

uint8\_t **mac**[6]

mac address

int8\_t **rssi**

current average rssi of sta connected

uint32\_t **phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **is\_mesh\_child**

bit: 4 flag to identify mesh child

uint32\_t **reserved**

bit: 5..31 reserved

struct **wifi\_sta\_list\_t**

List of stations associated with the ESP32 Soft-AP.

### Public Members

*wifi\_sta\_info\_t* **sta**[(10)]

station list

int **num**

number of stations in the list (other entries are invalid)

struct **vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

### Public Members

uint8\_t **element\_id**

Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]

Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**

Vendor-specific OUI type.

uint8\_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi\_pkt\_rx\_ctrl\_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

### Public Members

signed **rssi**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **\_\_pad0\_\_**

reserved

unsigned **sig\_mode**

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **\_\_pad1\_\_**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **\_\_pad2\_\_**

reserved

unsigned **smoothing**

reserved

unsigned **not\_sounding**

reserved

unsigned **\_\_pad3\_\_**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec\_coding**

Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **\_\_pad4\_\_**

reserved

unsigned **ampdu\_cnt**

ampdu cnt

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary\_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **\_\_pad5\_\_**

reserved

unsigned **timestamp**

timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **\_\_pad6\_\_**

reserved

signed **noise\_floor**

noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **\_\_pad7\_\_**

reserved

unsigned **\_\_pad8\_\_**

reserved

unsigned **\_\_pad9\_\_**

reserved

unsigned **ant**

antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **\_\_pad10\_\_**

reserved

unsigned **\_\_pad11\_\_**

reserved

unsigned **\_\_pad12\_\_**

reserved

unsigned **sig\_len**

length of packet including Frame Check Sequence(FCS)

unsigned **\_\_pad13\_\_**

reserved

unsigned **rx\_state**

state of the packet. 0: no error; others: error numbers which are not public

struct **wifi\_promiscuous\_pkt\_t**

Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

metadata header

uint8\_t **payload[0]**

Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

struct **wifi\_promiscuous\_filter\_t**

Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**

OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

struct **wifi\_csi\_config\_t**

Channel state information(CSI) configuration type.

### Public Members

bool **lltf\_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf\_en**

enable to receive HT long training field(htltf) data. Default enabled

bool **stbc\_htltf2\_en**

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf\_merge\_en**

enable to generate htltf data by averaging lltf and ht\_ltf data when receiving HT packet. Otherwise, use ht\_ltf data directly. Default enabled

bool **channel\_filter\_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu\_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8\_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct **wifi\_csi\_info\_t**

CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

received packet radio metadata header of the CSI data

uint8\_t **mac**[6]

source MAC address of the CSI data

bool **first\_word\_invalid**

first four bytes of the CSI data is invalid or not

int8\_t \***buf**

buffer of CSI data

uint16\_t **len**

length of CSI data

struct **wifi\_ant\_gpio\_t**

WiFi GPIO configuration for antenna selection.

### Public Members

uint8\_t **gpio\_select**

Whether this GPIO is connected to external antenna switch

uint8\_t **gpio\_num**

The GPIO number that connects to external antenna switch

struct **wifi\_ant\_gpio\_config\_t**

WiFi GPIOs configuration for antenna selection.

### Public Members

*wifi\_ant\_gpio\_t* **gpio\_cfg**[4]

The configurations of GPIOs that connect to external antenna switch

struct **wifi\_ant\_config\_t**

WiFi antenna configuration.

### Public Members

*wifi\_ant\_mode\_t* **rx\_ant\_mode**

WiFi antenna mode for receiving

*wifi\_ant\_t* **rx\_ant\_default**

Default antenna mode for receiving, it's ignored if **rx\_ant\_mode** is not **WIFI\_ANT\_MODE\_AUTO**

*wifi\_ant\_mode\_t* **tx\_ant\_mode**

WiFi antenna mode for transmission, it can be set to **WIFI\_ANT\_MODE\_AUTO** only if **rx\_ant\_mode** is set to **WIFI\_ANT\_MODE\_AUTO**

uint8\_t **enabled\_ant0**

Index (in antenna GPIO configuration) of enabled **WIFI\_ANT\_MODE\_ANT0**

uint8\_t **enabled\_ant1**

Index (in antenna GPIO configuration) of enabled **WIFI\_ANT\_MODE\_ANT1**

struct **wifi\_action\_tx\_req\_t**

Action Frame Tx Request.

### Public Members

*wifi\_interface\_t* **ifx**

WiFi interface to send request to

uint8\_t **dest\_mac**[6]

Destination MAC address

bool **no\_ack**

Indicates no ack required

*wifi\_action\_rx\_cb\_t* **rx\_cb**

Rx Callback to receive any response

uint32\_t **data\_len**

Length of the appended Data

uint8\_t **data**[0]

Appended Data payload

struct **wifi\_ftm\_initiator\_cfg\_t**

FTM Initiator configuration.

### Public Members

uint8\_t **resp\_mac**[6]

MAC address of the FTM Responder

uint8\_t **channel**

Primary channel of the FTM Responder

uint8\_t **frm\_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16\_t **burst\_period**

Requested time period between consecutive FTM bursts in 100<sup>7</sup> s of milliseconds (0 - No pref)

struct **wifi\_event\_sta\_scan\_done\_t**

Argument structure for WIFI\_EVENT\_SCAN\_DONE event

### Public Members

uint32\_t **status**

status of scanning APs: 0 — success, 1 - failure

uint8\_t **number**

number of scan results

uint8\_t **scan\_id**

scan sequence number, used for block scan

struct **wifi\_event\_sta\_connected\_t**

Argument structure for WIFI\_EVENT\_STA\_CONNECTED event

### Public Members

uint8\_t **ssid**[32]

SSID of connected AP

uint8\_t **ssid\_len**

SSID length of connected AP

uint8\_t **bssid**[6]

BSSID of connected AP

uint8\_t **channel**

channel of connected AP

*wifi\_auth\_mode\_t* **authmode**

authentication mode used by AP

struct **wifi\_event\_sta\_disconnected\_t**

Argument structure for WIFI\_EVENT\_STA\_DISCONNECTED event

### Public Members

uint8\_t **ssid**[32]

SSID of disconnected AP

uint8\_t **ssid\_len**

SSID length of disconnected AP

uint8\_t **bssid**[6]

BSSID of disconnected AP

uint8\_t **reason**

reason of disconnection

struct **wifi\_event\_sta\_authmode\_change\_t**

Argument structure for WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE event

### Public Members

*wifi\_auth\_mode\_t* **old\_mode**

the old auth mode of AP

*wifi\_auth\_mode\_t* **new\_mode**

the new auth mode of AP

struct **wifi\_event\_sta\_wps\_er\_pin\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_PIN event

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_sta\_wps\_er\_success\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event

**Public Members**

uint8\_t **ap\_cred\_cnt**

Number of AP credentials received

uint8\_t **ssid**[32]

SSID of AP

uint8\_t **passphrase**[64]

Passphrase for the AP

struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] **ap\_cred**[3]

All AP credentials received from WPS handshake

struct **wifi\_event\_ap\_staconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

**Public Members**

uint8\_t **mac**[6]

MAC address of the station connected to ESP32 soft-AP

uint8\_t **aid**

the aid that ESP32 soft-AP gives to the station connected to

bool **is\_mesh\_child**

flag to identify mesh child

struct **wifi\_event\_ap\_stadisconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

**Public Members**

uint8\_t **mac**[6]

MAC address of the station disconnects to ESP32 soft-AP

uint8\_t **aid**

the aid that ESP32 soft-AP gave to the station disconnects to

bool **is\_mesh\_child**

flag to identify mesh child

struct **wifi\_event\_ap\_probe\_req\_rx\_t**

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

**Public Members****int rssi**

Received probe request signal strength

**uint8\_t mac[6]**

MAC address of the station which send probe request

struct **wifi\_event\_bss\_rssi\_low\_t**

Argument structure for WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event

**Public Members****int32\_t rssi**

RSSI value of bss

struct **wifi\_ftm\_report\_entry\_t**

Argument structure for

**Public Members****uint8\_t dlog\_token**

Dialog Token of the FTM frame

**int8\_t rssi**

RSSI of the FTM frame received

**uint32\_t rtt**

Round Trip Time in pSec with a peer

**uint64\_t t1**

Time of departure of FTM frame from FTM Responder in pSec

**uint64\_t t2**

Time of arrival of FTM frame at FTM Initiator in pSec

**uint64\_t t3**

Time of departure of ACK from FTM Initiator in pSec

**uint64\_t t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi\_event\_ftm\_report\_t**

Argument structure for WIFI\_EVENT\_FTM\_REPORT event

**Public Members**

uint8\_t **peer\_mac**[6]

MAC address of the FTM Peer

*wifi\_ftm\_status\_t* **status**

Status of the FTM operation

uint32\_t **rtt\_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32\_t **rtt\_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32\_t **dist\_est**

Estimated one-way distance in Centi-Meters

*wifi\_ftm\_report\_entry\_t* \***ftm\_report\_data**

Pointer to FTM Report with multiple entries, should be freed after use

uint8\_t **ftm\_report\_num\_entries**

Number of entries in the FTM Report data

struct **wifi\_event\_action\_tx\_status\_t**

Argument structure for WIFI\_EVENT\_ACTION\_TX\_STATUS event

**Public Members**

*wifi\_interface\_t* **ifx**

WiFi interface to send request to

uint32\_t **context**

Context to identify the request

uint8\_t **da**[6]

Destination MAC address

uint8\_t **status**

Status of the operation

struct **wifi\_event\_roc\_done\_t**

Argument structure for WIFI\_EVENT\_ROC\_DONE event

**Public Members**

uint32\_t **context**

Context to identify the request

## Macros

**WIFI\_OFFCHAN\_TX\_REQ**

**WIFI\_OFFCHAN\_TX\_CANCEL**

**WIFI\_ROC\_REQ**

**WIFI\_ROC\_CANCEL**

**WIFI\_PROTOCOL\_11B**

**WIFI\_PROTOCOL\_11G**

**WIFI\_PROTOCOL\_11N**

**WIFI\_PROTOCOL\_LR**

**ESP\_WIFI\_MAX\_CONN\_NUM**

max number of stations which can connect to ESP32 soft-AP

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**

filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**

filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**

filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**

filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**

filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**

filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**

filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**

filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**

filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**

filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**

filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**

filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**

filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**

filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**

filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**

filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**

filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**

filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**

mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**

mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED**

mask SYSTEM\_EVENT\_AP\_PROBEREQRECVED event

**MAX\_SSID\_LEN**

**MAX\_PASSPHRASE\_LEN**

**MAX\_WPS\_AP\_CRED**

**WIFI\_STATIS\_BUFFER**

**WIFI\_STATIS\_RXTX**

**WIFI\_STATIS\_HW**

**WIFI\_STATUS\_DIAG**

**WIFI\_STATUS\_PS**

**WIFI\_STATUS\_ALL**

### Type Definitions

typedef int (**wifi\_action\_rx\_cb\_t**)(uint8\_t \*hdr, uint8\_t \*payload, size\_t len, uint8\_t channel)

The Rx callback function of Action Tx operations.

**Param hdr** pointer to the IEEE 802.11 Header structure

**Param payload** pointer to the Payload following 802.11 Header

**Param len** length of the Payload

**Param channel** channel number the frame is received on

### Enumerations

enum **wifi\_mode\_t**

*Values:*

enumerator **WIFI\_MODE\_NULL**

null mode

enumerator **WIFI\_MODE\_STA**

WiFi station mode

enumerator **WIFI\_MODE\_AP**

WiFi soft-AP mode

enumerator **WIFI\_MODE\_APSTA**

WiFi station + soft-AP mode

enumerator **WIFI\_MODE\_MAX**

enum **wifi\_interface\_t**

*Values:*

enumerator **WIFI\_IF\_STA**

enumerator **WIFI\_IF\_AP**

enum **wifi\_country\_policy\_t**

*Values:*

enumerator **WIFI\_COUNTRY\_POLICY\_AUTO**

Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI\_COUNTRY\_POLICY\_MANUAL**

Country policy is manual, always use the configured country info

enum **wifi\_auth\_mode\_t**

*Values:*

enumerator **WIFI\_AUTH\_OPEN**

authenticate mode : open

enumerator **WIFI\_AUTH\_WEP**

authenticate mode : WEP

enumerator **WIFI\_AUTH\_WPA\_PSK**

authenticate mode : WPA\_PSK

enumerator **WIFI\_AUTH\_WPA2\_PSK**

authenticate mode : WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA\_WPA2\_PSK**

authenticate mode : WPA\_WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA2\_ENTERPRISE**

authenticate mode : WPA2\_ENTERPRISE

enumerator **WIFI\_AUTH\_WPA3\_PSK**

authenticate mode : WPA3\_PSK

enumerator **WIFI\_AUTH\_WPA2\_WPA3\_PSK**

authenticate mode : WPA2\_WPA3\_PSK

enumerator **WIFI\_AUTH\_WAPI\_PSK**

authenticate mode : WAPI\_PSK

enumerator **WIFI\_AUTH\_MAX**

enum **wifi\_err\_reason\_t**

*Values:*

enumerator **WIFI\_REASON\_UNSPECIFIED**

enumerator **WIFI\_REASON\_AUTH\_EXPIRE**

enumerator **WIFI\_REASON\_AUTH\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_EXPIRE**

enumerator **WIFI\_REASON\_ASSOC\_TOOMANY**

enumerator **WIFI\_REASON\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_NOT\_ASSOCED**

enumerator **WIFI\_REASON\_ASSOC\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_DISASSOC\_PWRCAP\_BAD**

enumerator **WIFI\_REASON\_DISASSOC\_SUPCHAN\_BAD**

enumerator **WIFI\_REASON\_BSS\_TRANSITION\_DISASSOC**

enumerator **WIFI\_REASON\_IE\_INVALID**

enumerator **WIFI\_REASON\_MIC\_FAILURE**

enumerator **WIFI\_REASON\_4WAY\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_GROUP\_KEY\_UPDATE\_TIMEOUT**

enumerator **WIFI\_REASON\_IE\_IN\_4WAY\_DIFFERS**

enumerator **WIFI\_REASON\_GROUP\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_PAIRWISE\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_AKMP\_INVALID**

enumerator **WIFI\_REASON\_UNSUPP\_RSN\_IE\_VERSION**

enumerator **WIFI\_REASON\_INVALID\_RSN\_IE\_CAP**

enumerator **WIFI\_REASON\_802\_1X\_AUTH\_FAILED**

enumerator **WIFI\_REASON\_CIPHER\_SUITE\_REJECTED**

enumerator **WIFI\_REASON\_INVALID\_PMKID**

enumerator **WIFI\_REASON\_BEACON\_TIMEOUT**

enumerator **WIFI\_REASON\_NO\_AP\_FOUND**

enumerator **WIFI\_REASON\_AUTH\_FAIL**

enumerator **WIFI\_REASON\_ASSOC\_FAIL**

enumerator **WIFI\_REASON\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_CONNECTION\_FAIL**

enumerator **WIFI\_REASON\_AP\_TSF\_RESET**

enumerator **WIFI\_REASON\_ROAMING**

enum **wifi\_second\_chan\_t**

*Values:*

enumerator **WIFI\_SECOND\_CHAN\_NONE**

the channel width is HT20

enumerator **WIFI\_SECOND\_CHAN\_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI\_SECOND\_CHAN\_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi\_scan\_type\_t**

*Values:*

enumerator **WIFI\_SCAN\_TYPE\_ACTIVE**

active scan

enumerator **WIFI\_SCAN\_TYPE\_PASSIVE**

passive scan

enum **wifi\_cipher\_type\_t**

*Values:*

enumerator **WIFI\_CIPHER\_TYPE\_NONE**

the cipher type is none

enumerator **WIFI\_CIPHER\_TYPE\_WEP40**

the cipher type is WEP40

enumerator **WIFI\_CIPHER\_TYPE\_WEP104**

the cipher type is WEP104

enumerator **WIFI\_CIPHER\_TYPE\_TKIP**

the cipher type is TKIP

enumerator **WIFI\_CIPHER\_TYPE\_CCMP**

the cipher type is CCMP

enumerator **WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI\_CIPHER\_TYPE\_AES\_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_SMS4**

the cipher type is SMS4

enumerator **WIFI\_CIPHER\_TYPE\_GCMP**

the cipher type is GCMP

enumerator **WIFI\_CIPHER\_TYPE\_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI\_CIPHER\_TYPE\_UNKNOWN**

the cipher type is unknown

enum **wifi\_ant\_t**

WiFi antenna.

*Values:*

enumerator **WIFI\_ANT\_ANT0**

WiFi antenna 0

enumerator **WIFI\_ANT\_ANT1**

WiFi antenna 1

enumerator **WIFI\_ANT\_MAX**

Invalid WiFi antenna

enum **wifi\_scan\_method\_t**

*Values:*

enumerator **WIFI\_FAST\_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI\_ALL\_CHANNEL\_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi\_sort\_method\_t**

*Values:*

enumerator **WIFI\_CONNECT\_AP\_BY\_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI\_CONNECT\_AP\_BY\_SECURITY**

Sort match AP in scan list by security mode

enum **wifi\_ps\_type\_t**

*Values:*

enumerator **WIFI\_PS\_NONE**

No power save

enumerator **WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI\_PS\_MAX\_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi\\_sta\\_config\\_t](#)

enum **wifi\_bandwidth\_t**

*Values:*

enumerator **WIFI\_BW\_HT20**

enumerator **WIFI\_BW\_HT40**

enum **wifi\_storage\_t**

*Values:*

enumerator **WIFI\_STORAGE\_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI\_STORAGE\_RAM**

all configuration will only store in the memory

enum **wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:*

enumerator **WIFI\_VND\_IE\_TYPE\_BEACON**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

enum **wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

*Values:*

enumerator **WIFI\_VND\_IE\_ID\_0**

enumerator **WIFI\_VND\_IE\_ID\_1**

enum **wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

*Values:*

enumerator **WIFI\_PKT\_MGMT**

Management frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_CTRL**

Control frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_DATA**

Data frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_MISC**

Other type, such as MIMO etc. ‘buf’ argument is *wifi\_promiscuous\_pkt\_t* but the payload is zero length.

enum **wifi\_ant\_mode\_t**

WiFi antenna mode.

*Values:*

enumerator **WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

enum **wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

*Values:*

- enumerator **WIFI\_PHY\_RATE\_1M\_L**  
1 Mbps with long preamble
- enumerator **WIFI\_PHY\_RATE\_2M\_L**  
2 Mbps with long preamble
- enumerator **WIFI\_PHY\_RATE\_5M\_L**  
5.5 Mbps with long preamble
- enumerator **WIFI\_PHY\_RATE\_11M\_L**  
11 Mbps with long preamble
- enumerator **WIFI\_PHY\_RATE\_2M\_S**  
2 Mbps with short preamble
- enumerator **WIFI\_PHY\_RATE\_5M\_S**  
5.5 Mbps with short preamble
- enumerator **WIFI\_PHY\_RATE\_11M\_S**  
11 Mbps with short preamble
- enumerator **WIFI\_PHY\_RATE\_48M**  
48 Mbps
- enumerator **WIFI\_PHY\_RATE\_24M**  
24 Mbps
- enumerator **WIFI\_PHY\_RATE\_12M**  
12 Mbps
- enumerator **WIFI\_PHY\_RATE\_6M**  
6 Mbps
- enumerator **WIFI\_PHY\_RATE\_54M**  
54 Mbps
- enumerator **WIFI\_PHY\_RATE\_36M**  
36 Mbps
- enumerator **WIFI\_PHY\_RATE\_18M**  
18 Mbps
- enumerator **WIFI\_PHY\_RATE\_9M**  
9 Mbps
- enumerator **WIFI\_PHY\_RATE\_MCS0\_LGI**  
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS1\_LGI**

MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS2\_LGI**

MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS3\_LGI**

MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS4\_LGI**

MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS5\_LGI**

MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS6\_LGI**

MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS7\_LGI**

MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS0\_SGI**

MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS1\_SGI**

MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS2\_SGI**

MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS3\_SGI**

MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS4\_SGI**

MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS5\_SGI**

MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS6\_SGI**

MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS7\_SGI**

MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_LORA\_250K**

250 Kbps

enumerator **WIFI\_PHY\_RATE\_LORA\_500K**

500 Kbps

enumerator **WIFI\_PHY\_RATE\_MAX**

enum **wifi\_event\_t**

WiFi event declarations

*Values:*

enumerator **WIFI\_EVENT\_WIFI\_READY**

ESP32 WiFi ready

enumerator **WIFI\_EVENT\_SCAN\_DONE**

ESP32 finish scanning AP

enumerator **WIFI\_EVENT\_STA\_START**

ESP32 station start

enumerator **WIFI\_EVENT\_STA\_STOP**

ESP32 station stop

enumerator **WIFI\_EVENT\_STA\_CONNECTED**

ESP32 station connected to AP

enumerator **WIFI\_EVENT\_STA\_DISCONNECTED**

ESP32 station disconnected from AP

enumerator **WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**

the auth mode of AP connected by ESP32 station changed

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**

ESP32 station wps succeeds in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**

ESP32 station wps fails in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

ESP32 station wps timeout in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

ESP32 station wps pin code in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

ESP32 station wps overlap in enrollee mode

enumerator **WIFI\_EVENT\_AP\_START**

ESP32 soft-AP start

enumerator **WIFI\_EVENT\_AP\_STOP**

ESP32 soft-AP stop

enumerator **WIFI\_EVENT\_AP\_STACONNECTED**

a station connected to ESP32 soft-AP

enumerator **WIFI\_EVENT\_AP\_STADISCONNECTED**

a station disconnected from ESP32 soft-AP

enumerator **WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

enumerator **WIFI\_EVENT\_FTM\_REPORT**

Receive report of FTM procedure

enumerator **WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW**

AP' s RSSI crossed configured threshold

enumerator **WIFI\_EVENT\_ACTION\_TX\_STATUS**

Status indication of Action Tx operation

enumerator **WIFI\_EVENT\_ROC\_DONE**

Remain-on-Channel operation complete

enumerator **WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

ESP32 station beacon timeout

enumerator **WIFI\_EVENT\_MAX**

Invalid WiFi event ID

enum **wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event

*Values:*

enumerator **WPS\_FAIL\_REASON\_NORMAL**

ESP32 WPS normal fail reason

enumerator **WPS\_FAIL\_REASON\_RECV\_M2D**

ESP32 WPS receive M2D frame

enumerator **WPS\_FAIL\_REASON\_MAX**

enum **wifi\_ftm\_status\_t**

FTM operation status types.

*Values:*

enumerator **FTM\_STATUS\_SUCCESS**

FTM exchange is successful

enumerator **FTM\_STATUS\_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM\_STATUS\_CONF\_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM\_STATUS\_NO\_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM\_STATUS\_FAIL**

Unknown error during FTM exchange

## SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-S3 devices, check [配网 API](#).

**Application Example** Connect ESP32-S3 to target AP using SmartConfig: [wifi/smart\\_config](#).

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_smartconfig.h](#)

### Functions

const char \***esp\_smartconfig\_get\_version** (void)

Get the version of SmartConfig.

返回

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (const *smartconfig\_start\_config\_t* \*config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

**参数** **config** –pointer to smartconfig start configure structure

返回

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

返回

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

参数 **time\_s** –range 15s~255s, offset:45s.

返回

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

参数 **type** –Choose from the `smartconfig_type_t`.

返回

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API `esp_smartconfig_start`.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

参数 **enable** –false-disable(default); true-enable;

返回

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_get\_rvd\_data** (uint8\_t \*rvd\_data, uint8\_t len)

Get reserved data of ESPTouch v2.

参数

- **rvd\_data** –reserved data
- **len** –length of reserved data

返回

- ESP\_OK: succeed
- others: fail

## Structures

struct **smartconfig\_event\_got\_ssid\_pswd\_t**  
Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

### Public Members

uint8\_t **ssid**[32]  
SSID of the AP. Null terminated string.

uint8\_t **password**[64]  
Password of the AP. Null terminated string.

bool **bssid\_set**  
whether set MAC address of target AP or not.

uint8\_t **bssid**[6]  
MAC address of target AP.

*smartconfig\_type\_t* **type**  
Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**  
Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]  
IP address of cellphone.

struct **smartconfig\_start\_config\_t**  
Configure structure for esp\_smartconfig\_start

### Public Members

bool **enable\_log**  
Enable smartconfig logs.

bool **esp\_touch\_v2\_enable\_crypt**  
Enable ESPTouch v2 crypt.

char \***esp\_touch\_v2\_key**  
ESPTouch v2 crypt key, len should be 16.

## Macros

**SMARTCONFIG\_START\_CONFIG\_DEFAULT** ()

## Enumerations

enum **smartconfig\_type\_t**

*Values:*

enumerator **SC\_TYPE\_ESPTOUCH**

protocol: ESPTouch

enumerator **SC\_TYPE\_AIRKISS**

protocol: AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_V2**

protocol: ESPTouch v2

enum **smartconfig\_event\_t**

Smartconfig event declarations

*Values:*

enumerator **SC\_EVENT\_SCAN\_DONE**

ESP32 station smartconfig has finished to scan for APs

enumerator **SC\_EVENT\_FOUND\_CHANNEL**

ESP32 station smartconfig has found the channel of the target AP

enumerator **SC\_EVENT\_GOT\_SSID\_PSWD**

ESP32 station smartconfig got the SSID and password

enumerator **SC\_EVENT\_SEND\_ACK\_DONE**

ESP32 station smartconfig has sent ACK to cellphone

## ESP-NOW

**概述** ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用于保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

**帧格式** ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为：

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示：

元素 ID	长度	组织标识符	类型	版本	正文
1 字节	1 字节	3 字节	1 字节	1 字节	0 ~ 250 字节

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。
- 长度：长度是组织标识符、类型、版本和正文的总长度。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

## 安全

ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始

- PMK 可使用 AES-128 算法加密 LMK。请调用 `esp_now_set_pmk()` 设置 PMK。如果未设置 PMK，将使用默认 PMK。
- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密，最多拥有 6 个不同的 LMK。如果未设置配对设备的 LMK，则动作帧不进行加密。

目前，不支持加密组播供应商特定的动作帧。

**初始化和反初始化** 调用 `esp_now_init()` 初始化 ESP-NOW，调用 `esp_now_deinit()` 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 `esp_now_deinit()` 时，配对设备的所有信息都将被删除。

**添加配对设备** 在将数据发送到其他设备之前，请先调用 `esp_now_add_peer()` 将其添加到配对设备列表中。如果启用了加密，则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。

配对设备的最大数量是 20，其中加密设备的数量不超过 16，默认值是 6。

在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 ~ 14。如果信道设置为 0，数据将在当前信道上发送。否则，必须使用本地设备所在的通道。

**发送 ESP-NOW 数据** 调用 `esp_now_send()` 发送 ESP-NOW 数据，调用 `esp_now_register_send_cb()` 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则，它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，则调用 `esp_now_send()` 一次性发送不大于 250 字节的数据。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此，建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发布到队列，并交给优先级较低的任务处理。

**接收 ESP-NOW 数据** 调用 `esp_now_register_recv_cb()` 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发布到队列，并交给优先级较低的任务处理。

**配置 ESP-NOW 速率** 调用 `esp_wifi_config_espnow_rate()` 配置指定接口的 ESPNOW 速率。确保在配置速率之前使能接口。这个 API 应该在 `esp_wifi_start()` 之后调用。

### 应用示例

- 如何在设备间传输 ESP-NOW 数据: [wifi/espnow](#)。
- 了解更多 ESP-NOW 的应用示例，请参考 [README.md](#) 文件。

### API 参考

#### Header File

- [components/esp\\_wifi/include/esp\\_now.h](#)

#### Functions

`esp_err_t esp_now_init (void)`

Initialize ESPNOW function.

##### 返回

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_INTERNAL : Internal error

`esp_err_t esp_now_deinit (void)`

De-initialize ESPNOW function.

##### 返回

- ESP\_OK : succeed

`esp_err_t esp_now_get_version (uint32_t *version)`

Get the version of ESPNOW.

**参数** `version` –ESPNOW version

##### 返回

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

`esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)`

Register callback function of receiving ESPNOW data.

**参数** `cb` –callback function of receiving ESPNOW data

##### 返回

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

`esp_err_t esp_now_unregister_recv_cb (void)`

Unregister callback function of receiving ESPNOW data.

##### 返回

- ESP\_OK : succeed

- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

`esp_err_t esp_now_register_send_cb` (`esp_now_send_cb_t` cb)

Register callback function of sending ESPNOW data.

**参数** `cb` –callback function of sending ESPNOW data

**返回**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_INTERNAL` : internal error

`esp_err_t esp_now_unregister_send_cb` (void)

Unregister callback function of sending ESPNOW data.

**返回**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

`esp_err_t esp_now_send` (const uint8\_t \*peer\_addr, const uint8\_t \*data, size\_t len)

Send ESPNOW data.

**Attention** 1. If `peer_addr` is not NULL, send data to the peer whose MAC address matches `peer_addr`

**Attention** 2. If `peer_addr` is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than `ESP_NOW_MAX_DATA_LEN`

**Attention** 4. The buffer pointed to by `data` argument does not need to be valid after `esp_now_send` returns

**参数**

- `peer_addr` –peer MAC address
- `data` –data to send
- `len` –length of data

**返回**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory, when this happens, you can delay a while before sending the next data
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

`esp_err_t esp_now_add_peer` (const `esp_now_peer_info_t` \*peer)

Add a peer to peer list.

**参数** `peer` –peer information

**返回**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

`esp_err_t esp_now_del_peer` (const uint8\_t \*peer\_addr)

Delete a peer from peer list.

**参数** `peer_addr` –peer MAC address

**返回**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument

- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

`esp_err_t esp_now_mod_peer` (const `esp_now_peer_info_t` \*peer)

Modify a peer.

参数 `peer` –peer information

返回

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

`esp_err_t esp_wifi_config_espnow_rate` (`wifi_interface_t` ifx, `wifi_phy_rate_t` rate)

Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_start()`.

参数

- `ifx` –Interface to be configured.
- `rate` –Phy rate to be configured.

返回

- `ESP_OK`: succeed
- others: failed

`esp_err_t esp_now_get_peer` (const uint8\_t \*peer\_addr, `esp_now_peer_info_t` \*peer)

Get a peer whose MAC address matches peer\_addr from peer list.

参数

- `peer_addr` –peer MAC address
- `peer` –peer information

返回

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

`esp_err_t esp_now_fetch_peer` (bool from\_head, `esp_now_peer_info_t` \*peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

参数

- `from_head` –fetch from head of list or not
- `peer` –peer information

返回

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

bool `esp_now_is_peer_exist` (const uint8\_t \*peer\_addr)

Peer exists or not.

参数 `peer_addr` –peer MAC address

返回

- true : peer exists
- false : peer not exists

`esp_err_t esp_now_get_peer_num` (`esp_now_peer_num_t` \*num)

Get the number of peers.

参数 `num` –number of peers

**返回**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_pmk** (const uint8\_t \*pmk)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**参数** **pmk** –primary master key

**返回**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_wake\_window** (uint16\_t window)

Set esp\_now wake window for sta\_disconnected power management.

**Attention** 1. Only when ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status

**Attention** 3. If more than one module has configured its wake\_window, chip would choose the largest one to stay waked

**Attention** 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time

**Attention** 5. If never configured wake\_window, the chip would keep waked at disconnected once it uses esp\_now

**参数** **window** –how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**返回**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

**Structures**

struct **esp\_now\_peer\_info**

ESPNOW peer information parameters.

**Public Members**

uint8\_t **peer\_addr**[6]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[16]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void **\*priv**

ESPNOW peer private data

struct **esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

### Public Members

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

### Macros

**ESP\_ERR\_ESPNOW\_BASE**

ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT**

ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG**

Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM**

Out of memory

**ESP\_ERR\_ESPNOW\_FULL**

ESPNOW peer list is full

**ESP\_ERR\_ESPNOW\_NOT\_FOUND**

ESPNOW peer is not found

**ESP\_ERR\_ESPNOW\_INTERNAL**

Internal error

**ESP\_ERR\_ESPNOW\_EXIST**

ESPNOW peer has existed

**ESP\_ERR\_ESPNOW\_IF**

Interface error

**ESP\_NOW\_ETH\_ALEN**

Length of ESPNOW peer MAC address

**ESP\_NOW\_KEY\_LEN**

Length of ESPNOW peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNOW total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of ESPNOW data which is sent very time

**Type Definitions**

```
typedef struct esp_now_peer_info esp_now_peer_info_t
```

ESPNOW peer information parameters.

```
typedef struct esp_now_peer_num esp_now_peer_num_t
```

Number of ESPNOW peers which exist currently.

```
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
```

Callback function of receiving ESPNOW data.

**Param mac\_addr** peer MAC address

**Param data** received data

**Param data\_len** length of received data

```
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

**Param mac\_addr** peer MAC address

**Param status** status of sending ESPNOW data (succeed or fail)

**Enumerations**

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

*Values:*

enumerator **ESP\_NOW\_SEND\_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP\_NOW\_SEND\_FAIL**

Send ESPNOW data fail

## ESP-WIFI-MESH 编程指南

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. [ESP-WIFI-MESH 编程模型](#)
2. [编写 ESP-WIFI-MESH 应用程序](#)
3. [自组网](#)
4. [应用实例](#)
5. [API 参考](#)

有关 ESP-WIFI-MESH 协议的文档，请见[ESP-WIFI-MESH API 指南](#)。有关 ESP-WIFI-MESH 开发框架的更多内容，请见[ESP-WIFI-MESH 开发框架](#)。

## ESP-WIFI-MESH 编程模型

**软件栈** ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

图 2: ESP-WIFI-MESH 软件栈

**系统事件** 应用程序可通过 **ESP-WIFI-MESH 事件** 与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 **Wi-Fi 事件任务** 与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

图 3: ESP-WIFI-MESH 系统事件交付

`mesh_event_id_t` 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过 `esp_event_handler_register()`

将 **Mesh 事件处理程序** 注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

Mesh 事件的典型应用场景包括：使用 `MESH_EVENT_PARENT_CONNECTED` 和 `MESH_EVENT_CHILD_CONNECTED` 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用 `IP_EVENT_STA_GOT_IP` 和 `IP_EVENT_STA_LOST_IP` 事件来指示根节点何时可以向外部 IP 网络传输数据。

**警告：** 在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为。因此，用户不应该在 `esp_mesh_start()` 和 `esp_mesh_stop()` 之间调用 Wi-Fi API。

**LwIP & ESP-WIFI-MESH** 应用程序无需通过 LwIP 层便可直接访问 ESP-WIFI-MESH 软件栈，LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

每个节点都需要通过调用 `tcpip_adapter_init()` 初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序应该在 LwIP 初始化完成后停止以下服务：

- SoftAP 接口上的 DHCP 服务器服务。
- Station 接口上的 DHCP 客户端服务。

下方代码片段展示如何为 ESP-WIFI-MESH 应用程序进行 LwIP 初始化。

```
/* tcpip 初始化 */
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
 * 默认情况下，在 Station 接口上停止 DHCP 客户端
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));
```

**备注：** ESP-WIFI-MESH 的根节点必须与路由器连接。因此，当一个节点成为根节点时，**该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址**。这样做将允许其他节点开始向/从外部 IP 网络发送/接收数据包。但是，如果使用静态 IP 设置，则不需要执行此步骤。

**编写 ESP-WIFI-MESH 应用程序** ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。

```
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
 * 默认情况下，在 Station 接口上停止 DHCP 客户端
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));

/*事件初始化*/
ESP_ERROR_CHECK(esp_event_loop_create_default());

/*Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
```

(下页继续)

(续上页)

```

/*注册 IP 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());

```

在完成 LwIP 和 Wi-Fi 的初始化后，需完成以下三个步骤以启动并运行 ESP-WIFI-MESH。

1. 初始化 Mesh
2. 配置 ESP-WIFI-MESH 网络
3. 启动 Mesh

**初始化 Mesh** 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```

/*Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/*注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));

```

**配置 ESP-WIFI-MESH 网络** ESP-WIFI-MESH 可通过 `esp_mesh_set_config()` 进行配置，并使用 `mesh_cfg_t` 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数：

参数	描述
Channel (信道)	1 到 14 信道
Mesh ID	ESP-WIFI-MESH 网络的 ID，见 <code>mesh_addr_t</code> 。
Router (路由器)	路由器配置，见 <code>mesh_router_t</code> 。
Mesh AP	Mesh AP 配置，见 <code>mesh_ap_cfg_t</code>
Crypto Functions (加密函数)	Mesh IE 的加密函数，见 <code>mesh_crypto_funcs_t</code> 。

下方代码片段展示如何配置 ESP-WIFI-MESH。

```

/* 默认启用 MESH IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* Mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 信道 (需与路由器信道匹配) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
↪strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
↪strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

**启动 Mesh** 下方代码片段展示如何启动 ESP-WIFI-MESH。

```

/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());

```

启动 ESP-WIFI-MESH 后，应用程序应检查 ESP-WIFI-MESH 事件，以确定它是何时连接到网络的。连接后，应用程序可使用 `esp_mesh_send()` 和 `esp_mesh_recv()` 在 ESP-WIFI-MESH 网络中发送、接收数据包。

**自组网** 自组网是 ESP-WIFI-MESH 的功能之一，允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性，可适应变化的动态网络拓扑结构和环境。启用自组网功能后，ESP-WIFI-MESH 网络中的节点能够自主完成以下操作：

- 选择或选举根节点（见[建立网络](#)中的[自动根节点选择](#)）
- 选择首选的父节点（见[建立网络](#)中的[父节点选择](#)）
- 网络断开时自动重新连接（见[管理网络](#)中的[中间父节点失败](#)）

启用自组网功能后，ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此，**在启用自组网功能时，应用层不得调用 Wi-Fi API，否则会干扰 ESP-WIFI-MESH 的工作。**

**开关自组网** 应用程序可以在运行时通过调用 `esp_mesh_set_self_organized()` 函数，启用或禁用自组网功能。该函数具有以下两个参数：

- `bool enable` 指定启用或禁用自组网功能。
- `bool select_parent` 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态，选择新的父节点具有不同的作用。在禁用自组网功能时，此参数不使用。

**禁用自组网** 下方代码片段展示了如何禁用自组网功能。

```
//禁用自组网
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

**启用自组网** ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

是否选择父节点	是否为根结点	作用
N	N	已连接到父节点的节点将保持连接。 之前扫描父节点的节点将停止扫描。调用 <code>esp_mesh_connect()</code> 重新启动。
	Y	已连接到路由器的根节点将保持连接。 从路由器断开的根节点需调用 <code>esp_mesh_connect()</code> 进行重连。
Y	N	没有父节点的节点将自动选择首选父节点并连接。 已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。
	Y	根结点在连接至父节点前必须放弃“根结点”的角色。因此，根节点将断开与路由器和所有子节点的连接，选择首选父节点并进行连接。

下方代码片段展示了如何启用自组网功能。

```
//启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...

//启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**调用 Wi-Fi API** 在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描邻近的接入点 (AP)。但在应用程序调用任何 **Wi-Fi API** 之前，必须先禁用自组网。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。

应用程序不应在 `esp_mesh_set_self_organized()` 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用 `esp_wifi_scan_start()`。

```
//禁用自组网
esp_mesh_set_self_organized(0, 0);

//停止任何正在进行的扫描
esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();

//进程扫描结果
...

//如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);
...

//如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);
...

//如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0); //不选择新的父节点
esp_mesh_connect(); //手动重新连接到路由器
```

**应用实例** ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目：

**内部通信示例** 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。

**手动连网示例** 展示了如何在禁用自组网功能的情况下使用 ESP-WIFI-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

## API 参考

### Header File

- `components/esp_wifi/include/esp_mesh.h`

### Functions

`esp_err_t esp_mesh_init (void)`

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

### 返回

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

返回

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

返回

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI\_PS\_NONE.

返回

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_send** (const *mesh\_addr\_t* \*to, const *mesh\_data\_t* \*data, int flag, const *mesh\_opt\_t* opt[], int opt\_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

## 参数

- **to** –[in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –[in] pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
- **flag** –[in] bitmap for data sent
  - Speed up the route search
    - \* If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ( “to” parameter isn’ t NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - \* If needs non-blocking, MESH\_DATA\_NONBLOCK should be set. Otherwise, may use esp\_mesh\_send\_block\_time() to specify a blocking time.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’ t read out in time by esp\_mesh\_rcv\_toDS().  
Generally, we suggest esp\_mesh\_rcv\_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp\_mesh\_rcv\_toDS() which avoids unnecessary memory copy.
- **opt** –[in] options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- **opt\_count** –[in] option count
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

## 返回

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

*esp\_err\_t* **esp\_mesh\_send\_block\_time** (uint32\_t time\_ms)

Set blocking time of esp\_mesh\_send()

**Attention** This API shall be called before mesh is started.

**参数** `time_ms` –[in] blocking time of `esp_mesh_send()`, unit:ms

**返回**

- ESP\_OK

`esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**参数**

- **from** –[out] the address of the original source of the packet
- **data** –[out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout\_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** –[out] bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network
- **opt** –[out] options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- **opt\_count** –[in] option count desired to receive
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

#### 参数

- **from** –[**out**] the address of the original source of the packet
- **to** –[**out**] the address contains remote IP address and port (IPv4:PORT)
- **data** –[**out**] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout\_ms** –[**in**] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** –[**out**] bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –[**out**] options desired to receive
- **opt\_count** –[**in**] option count desired to receive

#### 返回

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

*esp\_err\_t* **esp\_mesh\_set\_config** (const *mesh\_cfg\_t* \*config)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max\_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**参数** **config** –[**in**] pointer to mesh stack configuration

#### 返回

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_get\_config** (*mesh\_cfg\_t* \*config)

Get mesh stack configuration.

**参数** **config** –[**out**] pointer to mesh stack configuration

#### 返回

- ESP\_OK

- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_router** (const *mesh\_router\_t* \*router)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**参数** **router** –[in] pointer to router configuration

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_router** (*mesh\_router\_t* \*router)

Get router configuration.

**参数** **router** –[out] pointer to router configuration

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_id** (const *mesh\_addr\_t* \*id)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**参数** **id** –[in] pointer to mesh network ID

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

*esp\_err\_t* **esp\_mesh\_get\_id** (*mesh\_addr\_t* \*id)

Get mesh network ID.

**参数** **id** –[out] pointer to mesh network ID

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_type** (*mesh\_type\_t* type)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**参数** **type** –[in] device type

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*mesh\_type\_t* **esp\_mesh\_get\_type** (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

返回 mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer** (int max\_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

参数 **max\_layer** **–[in]** max layer value

返回

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

int **esp\_mesh\_get\_max\_layer** (void)

Get max layer value.

返回 max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password** (const uint8\_t \*pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

参数

- **pwd** **–[in]** pointer to the password
- **len** **–[in]** password length

返回

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

参数 **authmode** **–[in]** authentication mode

返回

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

返回 authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**参数** **connections** **–[in]** the number of max connections

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

int **esp\_mesh\_get\_ap\_connections** (void)

Get mesh max connection configuration.

**返回** the number of mesh max connections

int **esp\_mesh\_get\_non\_mesh\_connections** (void)

Get non-mesh max connection configuration.

**返回** the number of non-mesh max connections

int **esp\_mesh\_get\_layer** (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**返回** layer value

*esp\_err\_t* **esp\_mesh\_get\_parent\_bssid** (*mesh\_addr\_t* \*bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**参数** **bssid** **–[out]** pointer to parent BSSID

**返回**

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_is\_root** (void)

Return whether the device is the root node of the network.

**返回** true/false

*esp\_err\_t* **esp\_mesh\_set\_self\_organized** (bool enable, bool select\_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

#### 参数

- **enable** –[in] enable or disable self-organized networking
- **select\_parent** –[in] Only valid when self-organized networking is enabled.
  - if select\_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

#### 返回

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_get\_self\_organized** (void)

Return whether enable self-organized networking or not.

返回 true/false

*esp\_err\_t* **esp\_mesh\_waive\_root** (const *mesh\_vote\_t* \*vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

#### 参数

- **vote** –[in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is\_rc\_specified shall be false.
  - Field attempts shall be at least 15 times.
- **reason** –[in] only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

#### 返回

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_set\_vote\_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

参数 **percentage** –[in] vote percentage threshold

返回

- ESP\_OK
- ESP\_FAIL

float **esp\_mesh\_get\_vote\_percentage** (void)

Get vote percentage threshold for approval of being a root.

返回 percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

参数 **seconds** –[in] the expired time

返回

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

返回 seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

返回 total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

返回 the number of devices over this device's sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \*mac, int len, int \*size)

Get routing table of this device's sub-network (including itself)

参数

- **mac** –[out] pointer to routing table
- **len** –[in] routing table size(in bytes)
- **size** –[out] pointer to the number of devices in routing table (including itself)

返回

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool reachable)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

参数 **reachable** –[in] this state represents whether the root is able to access external IP network

返回

- ESP\_OK

- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \*pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**参数** **pending** **–[out]** pointer to the TX pending

**返回**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \*pending)

Return the number of packets available in the queue waiting to be received by applications.

**参数** **pending** **–[out]** pointer to the RX pending

**返回**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \*addr, uint32\_t \*xseqno\_in)

Return the number of packets could be accepted from the specified address.

**参数**

- **addr** **–[in]** self address or an associate children address
- **xseqno\_in** **–[out]** sequence number of the last received packet from the specified address

**返回** the number of upQ for a certain address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int qsize)

Set the number of queue.

**Attention** This API shall be called before mesh is started.

**参数** **qsize** **–[in]** default:32 (min:16)

**返回**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**返回** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

**参数** **allowed** **–[in]** allow or not

**返回**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)

Check whether allow more than one root to exist in one network.

**返回** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Set group ID addresses.

**参数**

- **addr** **–[in]** pointer to new group ID addresses
- **num** **–[in]** the number of group ID addresses

## 返回

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Delete group ID addresses.

## 参数

- **addr** –[in] pointer to deleted group ID address
- **num** –[in] the number of group ID addresses

## 返回

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_group\_num** (void)

Get the number of group ID addresses.

返回 the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \*addr, int num)

Get group ID addresses.

## 参数

- **addr** –[out] pointer to group ID addresses
- **num** –[in] the number of group ID addresses

## 返回

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \*addr)

Check whether the specified group address is my group.

返回 true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int num)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

参数 **num** –[in] mesh network capacity

## 返回

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_capacity\_num** (void)

Get mesh network capacity.

返回 mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (const *mesh\_crypto\_funcs\_t* \*crypto\_funcs)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

参数 **crypto\_funcs** –[in] crypto functions for mesh IE

- If *crypto\_funcs* is set to NULL, mesh IE is no longer encrypted.

## 返回

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (const char \*key, int len)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**参数**

- **key** –[in] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

**返回**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \*key, int len)

Get mesh IE crypto key.

**参数**

- **key** –[out] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

**返回**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int delay\_ms)

Set delay time before starting root healing.

**参数** **delay\_ms** –[in] delay time in milliseconds

**返回**

- ESP\_OK

int **esp\_mesh\_get\_root\_healing\_delay** (void)

Get delay time before network starts root healing.

**返回** delay time in milliseconds

*esp\_err\_t* **esp\_mesh\_fix\_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**参数** **enable** –[in] enable or not

**返回**

- ESP\_OK

bool **esp\_mesh\_is\_root\_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**返回** true/false

*esp\_err\_t* **esp\_mesh\_set\_parent** (const *wifi\_config\_t* \*parent, const *mesh\_addr\_t* \*parent\_mesh\_id, *mesh\_type\_t* my\_type, int my\_layer)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

#### 参数

- **parent** –[in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent\_mesh\_id** –[in] parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- **my\_type** –[in] mesh type
  - MESH\_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my\_type shall set MESH\_ROOT and my\_layer shall set MESH\_ROOT\_LAYER.
- **my\_layer** –[in] mesh layer
  - my\_layer of the device may change after joining the network.
  - If my\_type is set MESH\_NODE, my\_layer shall be greater than MESH\_ROOT\_LAYER.
  - If my\_type is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

#### 返回

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_ie\_len** (int \*len)

Get mesh networking IE length of one AP.

**参数** **len** –[out] mesh networking IE length

#### 返回

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_record** (*wifi\_ap\_record\_t* \*ap\_record, void \*buffer)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual\_networking” example.

#### 参数

- **ap\_record** –[out] pointer to one AP record
- **buffer** –[out] pointer to the mesh networking IE of this AP

#### 返回

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* **esp\_mesh\_flush\_upstream\_packets** (void)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

#### 返回

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_num** (const *mesh\_addr\_t* \*child\_mac, int \*nodes\_num)

Get the number of nodes in the subnet of a specific child.

**参数**

- **child\_mac** –[in] an associated child address of this device
- **nodes\_num** –[out] pointer to the number of nodes in the subnet of a specific child

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_list** (const *mesh\_addr\_t* \*child\_mac, *mesh\_addr\_t* \*nodes, int nodes\_num)

Get nodes in the subnet of a specific child.

**参数**

- **child\_mac** –[in] an associated child address of this device
- **nodes** –[out] pointer to nodes in the subnet of a specific child
- **nodes\_num** –[in] the number of nodes in the subnet of a specific child

**返回**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_disconnect** (void)

Disconnect from current parent.

**返回**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_connect** (void)

Connect to current parent.

**返回**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_flush\_scan\_result** (void)

Flush scan result.

**返回**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_switch\_channel** (const uint8\_t \*new\_bssid, int csa\_newchan, int csa\_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**参数**

- **new\_bssid** –[in] the new router BSSID if the router changes
- **csa\_newchan** –[in] the new channel number to which the whole network is moving
- **csa\_count** –[in] channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**返回**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_router\_bssid** (uint8\_t \*router\_bssid)

Get the router BSSID.

**参数** **router\_bssid** –[out] pointer to the router BSSID

**返回**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG

int64\_t **esp\_mesh\_get\_tsf\_time** (void)

Get the TSF time.

**返回** the TSF time

*esp\_err\_t* **esp\_mesh\_set\_topology** (*esp\_mesh\_topology\_t* topo)

Set mesh topology. The default value is MESH\_TOPO\_TREE.

- MESH\_TOPO\_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**参数** **topo** –[in] MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

**返回**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_mesh\_topology\_t* **esp\_mesh\_get\_topology** (void)

Get mesh topology.

**返回** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

*esp\_err\_t* **esp\_mesh\_enable\_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**返回**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_disable\_ps** (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**返回**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

bool **esp\_mesh\_is\_ps\_enabled** (void)

Check whether the mesh Power Save function is enabled.

**返回** true/false

bool **esp\_mesh\_is\_device\_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

返回 true/false

*esp\_err\_t* **esp\_mesh\_set\_active\_duty\_cycle** (int dev\_duty, int dev\_duty\_type)

Set the device duty cycle and type.

- The range of dev\_duty values is 1 to 100. The default value is 10.
- dev\_duty = 100, the PS will be stopped.
- dev\_duty is better to not less than 5.
- dev\_duty\_type could be MESH\_PS\_DEVICE\_DUTY\_REQUEST or MESH\_PS\_DEVICE\_DUTY\_DEMAND.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the device will use a nwk\_duty provided by the network.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the device will use the specified dev\_duty.

**Attention** This API can be called at any time after mesh is started.

#### 参数

- **dev\_duty** **–[in]** device duty cycle
- **dev\_duty\_type** **–[in]** device PS duty cycle type, not accept MESH\_PS\_NETWORK\_DUTY\_MASTER

#### 返回

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_active\_duty\_cycle** (int \*dev\_duty, int \*dev\_duty\_type)

Get device duty cycle and type.

#### 参数

- **dev\_duty** **–[out]** device duty cycle
- **dev\_duty\_type** **–[out]** device PS duty cycle type

#### 返回

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_network\_duty\_cycle** (int nwk\_duty, int duration\_mins, int applied\_rule)

Set the network duty cycle, duration and rule.

- The range of nwk\_duty values is 1 to 100. The default value is 10.
- nwk\_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk\_duty is known as a NWK-DUTY-MASTER.
- duration\_mins specifies how long the specified nwk\_duty will be used. Once duration\_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration\_mins = (-1) represents nwk\_duty will be used until a new NWK-DUTY-MASTER with a different nwk\_duty appears.
- Only the root can set duration\_mins to (-1).
- If applied\_rule is set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE, the nwk\_duty will be used by the entire network.

- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins(-1)` set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to (-1); (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

#### 参数

- **`nwk_duty`** `-[in]` network duty cycle
- **`duration_mins`** `-[in]` duration (unit: minutes)
- **`applied_rule`** `-[in]` only support `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### 返回

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* **`esp_mesh_get_network_duty_cycle`** (int \*nwk\_duty, int \*duration\_mins, int \*dev\_duty\_type, int \*applied\_rule)

Get the network duty cycle, duration, type and rule.

#### 参数

- **`nwk_duty`** `-[out]` current network duty cycle
- **`duration_mins`** `-[out]` the duration of current `nwk_duty`
- **`dev_duty_type`** `-[out]` if it includes `MESH_PS_DEVICE_DUTY_MASTER`, this device is the current NWK-DUTY-MASTER.
- **`applied_rule`** `-[out]` `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### 返回

- `ESP_OK`

int **`esp_mesh_get_running_active_duty_cycle`** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**返回** the running active duty cycle

*esp\_err\_t* **esp\_mesh\_ps\_duty\_signaling** (int fwd\_times)

Duty signaling.

参数 **fwd\_times** –[in] the times of forwarding duty signaling packets

返回

- ESP\_OK

## Unions

union **mesh\_addr\_t**

*#include <esp\_mesh.h>* Mesh address.

### Public Members

uint8\_t **addr**[6]

mac address

*mip\_t* **mip**

mip address

union **mesh\_event\_info\_t**

*#include <esp\_mesh.h>* Mesh event information.

### Public Members

*mesh\_event\_channel\_switch\_t* **channel\_switch**

channel switch

*mesh\_event\_child\_connected\_t* **child\_connected**

child connected

*mesh\_event\_child\_disconnected\_t* **child\_disconnected**

child disconnected

*mesh\_event\_routing\_table\_change\_t* **routing\_table**

routing table change

*mesh\_event\_connected\_t* **connected**

parent connected

*mesh\_event\_disconnected\_t* **disconnected**

parent disconnected

*mesh\_event\_no\_parent\_found\_t* **no\_parent**

no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**

layer change

***mesh\_event\_toDS\_state\_t* toDS\_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

***mesh\_event\_vote\_started\_t* vote\_started**

vote started

***mesh\_event\_root\_address\_t* root\_addr**

root address

***mesh\_event\_root\_switch\_req\_t* switch\_req**

root switch request

***mesh\_event\_root\_conflict\_t* root\_conflict**

other powerful root

***mesh\_event\_root\_fixed\_t* root\_fixed**

fixed root

***mesh\_event\_scan\_done\_t* scan\_done**

scan done

***mesh\_event\_network\_state\_t* network\_state**

network state, such as whether current mesh network has a root.

***mesh\_event\_find\_network\_t* find\_network**

network found that can join

***mesh\_event\_router\_switch\_t* router\_switch**

new router information

***mesh\_event\_ps\_duty\_t* ps\_duty**

PS duty information

union **mesh\_rc\_config\_t**

*#include <esp\_mesh.h>* Vote address configuration.

**Public Members**

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

***mesh\_addr\_t* rc\_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

## Structures

struct **mip\_t**  
IP address and port.

### Public Members

ip4\_addr\_t **ip4**  
IP address

uint16\_t **port**  
port

struct **mesh\_event\_channel\_switch\_t**  
Channel switch information.

### Public Members

uint8\_t **channel**  
new channel

struct **mesh\_event\_connected\_t**  
Parent connected information.

### Public Members

*wifi\_event\_sta\_connected\_t* **connected**  
parent information, same as Wi-Fi event SYSTEM\_EVENT\_STA\_CONNECTED does

uint16\_t **self\_layer**  
layer

uint8\_t **duty**  
parent duty

struct **mesh\_event\_no\_parent\_found\_t**  
No parent found information.

### Public Members

int **scan\_times**  
scan times being through

struct **mesh\_event\_layer\_change\_t**  
Layer change information.

**Public Members**

uint16\_t **new\_layer**  
new layer

struct **mesh\_event\_vote\_started\_t**  
vote started information

**Public Members**

int **reason**  
vote reason, vote could be initiated by children or by the root itself

int **attempts**  
max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**  
root address specified by users via API `esp_mesh_waive_root()`

struct **mesh\_event\_find\_network\_t**  
find a mesh network that this device can join

**Public Members**

uint8\_t **channel**  
channel number of the new found network

uint8\_t **router\_bssid**[6]  
router BSSID

struct **mesh\_event\_root\_switch\_req\_t**  
Root switch request information.

**Public Members**

int **reason**  
root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh\_addr\_t* **rc\_addr**  
the address of root switch requester

struct **mesh\_event\_root\_conflict\_t**  
Other powerful root address.

### Public Members

int8\_t **rss\_i**

rss\_i with router

uint16\_t **capacity**

the number of devices in current network

uint8\_t **addr**[6]

other powerful root address

struct **mesh\_event\_routing\_table\_change\_t**

Routing table change.

### Public Members

uint16\_t **rt\_size\_new**

the new value

uint16\_t **rt\_size\_change**

the changed value

struct **mesh\_event\_root\_fixed\_t**

Root fixed.

### Public Members

bool **is\_fixed**

status

struct **mesh\_event\_scan\_done\_t**

Scan done event information.

### Public Members

uint8\_t **number**

the number of APs scanned

struct **mesh\_event\_network\_state\_t**

Network state information.

### Public Members

bool **is\_rootless**

whether current mesh network has a root

struct **mesh\_event\_ps\_duty\_t**

PS duty information.

### Public Members

uint8\_t **duty**

parent or child duty

[\*mesh\\_event\\_child\\_connected\\_t\*](#) **child\_connected**

child info

struct **mesh\_opt\_t**

Mesh option.

### Public Members

uint8\_t **type**

option type

uint16\_t **len**

option length

uint8\_t \***val**

option value

struct **mesh\_data\_t**

Mesh data for esp\_mesh\_send() and esp\_mesh\_rcv()

### Public Members

uint8\_t \***data**

data

uint16\_t **size**

data size

[\*mesh\\_proto\\_t\*](#) **proto**

data protocol

[\*mesh\\_tos\\_t\*](#) **tos**

data type of service

struct **mesh\_router\_t**

Router configuration.

**Public Members**

uint8\_t **ssid**[32]  
SSID

uint8\_t **ssid\_len**  
length of SSID

uint8\_t **bssid**[6]  
BSSID, if this value is specified, users should also specify “allow\_router\_switch” .

uint8\_t **password**[64]  
password

bool **allow\_router\_switch**

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh\_attempts\_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct **mesh\_ap\_cfg\_t**  
Mesh softAP configuration.

**Public Members**

uint8\_t **password**[64]  
mesh softAP password

uint8\_t **max\_connection**  
max number of stations allowed to connect in, default 6, max 10 = max\_connection + non-mesh\_max\_connectionmax mesh connections

uint8\_t **nonmesh\_max\_connection**  
max non-mesh connections

struct **mesh\_cfg\_t**  
Mesh initialization configuration.

**Public Members**

uint8\_t **channel**  
channel, the mesh network on

bool **allow\_channel\_switch**  
if this value is set, when “fail” (mesh\_attempts\_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

*mesh\_addr\_t* **mesh\_id**

mesh network identification

*mesh\_router\_t* **router**

router configuration

*mesh\_ap\_cfg\_t* **mesh\_ap**

mesh softAP configuration

const *mesh\_crypto\_funcs\_t* \***crypto\_funcs**

crypto functions

struct **mesh\_vote\_t**

Vote.

### Public Members

float **percentage**

vote percentage threshold for approval of being a root

bool **is\_rc\_specified**

if true, rc\_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

*mesh\_rc\_config\_t* **config**

vote address configuration

struct **mesh\_tx\_pending\_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

### Public Members

int **to\_parent**

to parent queue

int **to\_parent\_p2p**

to parent (P2P) queue

int **to\_child**

to child queue

int **to\_child\_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

struct **mesh\_rx\_pending\_t**

The number of packets available in the queue waiting to be received by applications.

### Public Members

int **toDS**

to external DS

int **toSelf**

to self

### Macros

**MESH\_ROOT\_LAYER**

root layer value

**MESH\_MTU**

max transmit unit(in bytes)

**MESH\_MPS**

max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**

Mesh error code definition.

Wi-Fi isn't started

**ESP\_ERR\_MESH\_NOT\_INIT**

mesh isn't initialized

**ESP\_ERR\_MESH\_NOT\_CONFIG**

mesh isn't configured

**ESP\_ERR\_MESH\_NOT\_START**

mesh isn't started

**ESP\_ERR\_MESH\_NOT\_SUPPORT**

not supported yet

**ESP\_ERR\_MESH\_NOT\_ALLOWED**

operation is not allowed

**ESP\_ERR\_MESH\_NO\_MEMORY**

out of memory

**ESP\_ERR\_MESH\_ARGUMENT**

illegal argument

**ESP\_ERR\_MESH\_EXCEED\_MTU**

packet size exceeds MTU

**ESP\_ERR\_MESH\_TIMEOUT**

timeout

**ESP\_ERR\_MESH\_DISCONNECTED**

disconnected with parent on station interface

**ESP\_ERR\_MESH\_QUEUE\_FAIL**

queue fail

**ESP\_ERR\_MESH\_QUEUE\_FULL**

queue full

**ESP\_ERR\_MESH\_NO\_PARENT\_FOUND**

no parent found to join the mesh network

**ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND**

no route found to forward the packet

**ESP\_ERR\_MESH\_OPTION\_NULL**

no option found

**ESP\_ERR\_MESH\_OPTION\_UNKNOWN**

unknown option

**ESP\_ERR\_MESH\_XON\_NO\_WINDOW**

no window for software flow control on upstream

**ESP\_ERR\_MESH\_INTERFACE**

low-level Wi-Fi interface error

**ESP\_ERR\_MESH\_DISCARD\_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP\_ERR\_MESH\_DISCARD**

discard the packet

**ESP\_ERR\_MESH\_VOTING**

vote in progress

**ESP\_ERR\_MESH\_XMIT**

XMIT

**ESP\_ERR\_MESH\_QUEUE\_READ**

error in reading queue

**ESP\_ERR\_MESH\_PS**

mesh PS is not specified as enable or disable

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_rcv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_rcv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_rcv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with esp\_mesh\_send() and esp\_mesh\_rcv()

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

Flag of mesh networking IE.

vote in progress

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

root conflict is found

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

fixed root

**MESH\_PS\_DEVICE\_DUTY\_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH\_PS\_DEVICE\_DUTY\_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH\_PS\_NETWORK\_DUTY\_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK****MESH\_INIT\_CONFIG\_DEFAULT ()****Type Definitions**

typedef *mesh\_addr\_t* **mesh\_event\_root\_address\_t**

Root address.

typedef *wifi\_event\_sta\_disconnected\_t* **mesh\_event\_disconnected\_t**

Parent disconnected information.

typedef *wifi\_event\_ap\_staconnected\_t* **mesh\_event\_child\_connected\_t**

Child connected information.

typedef *wifi\_event\_ap\_stadisconnected\_t* **mesh\_event\_child\_disconnected\_t**

Child disconnected information.

typedef *wifi\_event\_sta\_connected\_t* **mesh\_event\_router\_switch\_t**

New router information.

**Enumerations**

enum **mesh\_event\_id\_t**

Enumerated list of mesh event id.

*Values:*

enumerator **MESH\_EVENT\_STARTED**

mesh is started

enumerator **MESH\_EVENT\_STOPPED**

mesh is stopped

enumerator **MESH\_EVENT\_CHANNEL\_SWITCH**

channel switch

enumerator **MESH\_EVENT\_CHILD\_CONNECTED**

a child is connected on softAP interface

enumerator **MESH\_EVENT\_CHILD\_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_ADD**

routing table is changed by adding newly joined children

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_REMOVE**

routing table is changed by removing leave children

enumerator **MESH\_EVENT\_PARENT\_CONNECTED**

parent is connected on station interface

enumerator **MESH\_EVENT\_PARENT\_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

enumerator **MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

enumerator **MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network

enumerator **MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

enumerator **MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**enumerator MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

**enumerator MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

**enumerator MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

**enumerator MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**enumerator MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**enumerator MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**enumerator MESH\_EVENT\_PS\_PARENT\_DUTY**

parent duty

**enumerator MESH\_EVENT\_PS\_CHILD\_DUTY**

child duty

**enumerator MESH\_EVENT\_PS\_DEVICE\_DUTY**

device duty

**enumerator MESH\_EVENT\_MAX****enum mesh\_type\_t**

Device type.

*Values:*

**enumerator MESH\_IDLE**

hasn't joined the mesh network yet

**enumerator MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

**enumerator MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

**enumerator MESH\_LEAF**

has no forwarding ability

enumerator **MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

enumerator **MESH\_PROTO\_BIN**

binary

enumerator **MESH\_PROTO\_HTTP**

HTTP protocol

enumerator **MESH\_PROTO\_JSON**

JSON format

enumerator **MESH\_PROTO\_MQTT**

MQTT protocol

enumerator **MESH\_PROTO\_AP**

IP network mesh communication of node' s AP interface

enumerator **MESH\_PROTO\_STA**

IP network mesh communication of node' s STA interface

enum **mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

enumerator **MESH\_TOS\_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH\_TOS\_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH\_TOS\_DEF**

no retransmission on mesh stack

enum **mesh\_vote\_reason\_t**

Vote reason.

*Values:*

enumerator **MESH\_VOTE\_REASON\_ROOT\_INITIATED**

vote is initiated by the root

enumerator **MESH\_VOTE\_REASON\_CHILD\_INITIATED**

vote is initiated by children

enum **mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:*

enumerator **MESH\_REASON\_CYCLIC**

cyclic is detected

enumerator **MESH\_REASON\_PARENT\_IDLE**

parent is idle

enumerator **MESH\_REASON\_LEAF**

the connected device is changed to a leaf

enumerator **MESH\_REASON\_DIFF\_ID**

in different mesh ID

enumerator **MESH\_REASON\_ROOTS**

root conflict is detected

enumerator **MESH\_REASON\_PARENT\_STOPPED**

parent has stopped the mesh

enumerator **MESH\_REASON\_SCAN\_FAIL**

scan fail

enumerator **MESH\_REASON\_IE\_UNKNOWN**

unknown IE

enumerator **MESH\_REASON\_WAIVE\_ROOT**

waive root

enumerator **MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

enumerator **MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp\_mesh\_topology\_t**

Mesh topology.

*Values:*

enumerator **MESH\_TOPO\_TREE**

tree topology

enumerator **MESH\_TOPO\_CHAIN**

chain topology

enum **mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:*

enumerator **MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH\_TODS\_REACHABLE**

the root is able to access external IP network

### Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-S3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-S3 using a supported smartphone: [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

### API Reference

#### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_dpp.h](#)

#### Functions

`esp_err_t esp_supp_dpp_init` (`esp_supp_dpp_event_cb_t` evt\_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP\_OK: Success
- ESP\_FAIL: Failure

**参数** `evt_cb` –Callback function to receive DPP related events

void `esp_supp_dpp_deinit` (void)

De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

*esp\_err\_t* `esp_supp_dpp_bootstrap_gen` (const char \*chan\_list, *esp\_supp\_dpp\_bootstrap\_t* type, const char \*key, const char \*info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**参数**

- **chan\_list** –List of channels device will be available on for listening
- **type** –Bootstrap method type, only QR Code method is supported for now.
- **key** –(Optional) Private Key used to generate a Bootstrapping Public Key
- **info** –(Optional) Ancilliary Device Information like Serial Number

**返回**

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* `esp_supp_dpp_start_listen` (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel from Channel List for a pre-defined wait time.

**返回**

- ESP\_OK: Success
- ESP\_FAIL: Generic Failure
- ESP\_ERR\_INVALID\_STATE: ROC attempted before WiFi is started
- ESP\_ERR\_NO\_MEM: Memory allocation failed while posting ROC request

void `esp_supp_dpp_stop_listen` (void)

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

## Macros

**ESP\_ERR\_DPP\_FAILURE**

Generic failure during DPP Operation

**ESP\_ERR\_DPP\_TX\_FAILURE**

DPP Frame Tx failed OR not Acked

**ESP\_ERR\_DPP\_INVALID\_ATTR**

Encountered invalid DPP Attribute

## Type Definitions

typedef enum *dpp\_bootstrap\_type* `esp_supp_dpp_bootstrap_t`

Types of Bootstrap Methods for DPP.

```
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
```

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

**Param evt** DPP event ID

**Param data** Event data payload

### Enumerations

```
enum dpp_bootstrap_type
```

Types of Bootstrap Methods for DPP.

*Values:*

```
enumerator DPP_BOOTSTRAP_QR_CODE
```

QR Code Method

```
enumerator DPP_BOOTSTRAP_PKEX
```

Proof of Knowledge Method

```
enumerator DPP_BOOTSTRAP_NFC_URI
```

NFC URI record Method

```
enum esp_supp_dpp_event_t
```

Types of Callback Events received from DPP Supplicant.

*Values:*

```
enumerator ESP_SUPP_DPP_URI_READY
```

URI is ready through Bootstrapping

```
enumerator ESP_SUPP_DPP_CFG_RECVD
```

Config received via DPP Authentication

```
enumerator ESP_SUPP_DPP_FAIL
```

DPP Authentication failure

本部分的 Wi-Fi API 示例代码存放在 ESP-IDF 示例项目的 [wifi](#) 目录下。

ESP-WIFI-MESH 的示例代码存放在 ESP-IDF 示例项目的 [mesh](#) 目录下。

## 2.2.2 以太网

### 以太网

#### 应用示例

- 以太网基本示例: [ethernet/basic](#).

## API 参考-驱动程序模型

### Header File

- [components/esp\\_eth/include/esp\\_eth.h](#)

### Functions

*esp\_err\_t* **esp\_eth\_driver\_install** (const *esp\_eth\_config\_t* \*config, *esp\_eth\_handle\_t* \*out\_hdl)

Install Ethernet driver.

#### 参数

- **config** –[in] configuration of the Ethernet driver
- **out\_hdl** –[out] handle of Ethernet driver

#### 返回

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_driver\_uninstall** (*esp\_eth\_handle\_t* hdl)

Uninstall Ethernet driver.

---

**备注:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

---

**参数** **hdl** –[in] handle of Ethernet driver

#### 返回

- ESP\_OK: uninstall esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: uninstall esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: uninstall esp\_eth driver failed because it has more than one reference
- ESP\_FAIL: uninstall esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

---

**备注:** This API will start driver state machine and internal software timer (for checking link status).

---

**参数** **hdl** –[in] handle of Ethernet driver

**返回**

- **ESP\_OK**: start esp\_eth driver successfully
- **ESP\_ERR\_INVALID\_ARG**: start esp\_eth driver failed because of some invalid argument
- **ESP\_ERR\_INVALID\_STATE**: start esp\_eth driver failed because driver has started already
- **ESP\_FAIL**: start esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

---

**备注:** This function does the oppsite operation of `esp_eth_start`.

---

**参数** **hdl** –[in] handle of Ethernet driver

**返回**

- **ESP\_OK**: stop esp\_eth driver successfully
- **ESP\_ERR\_INVALID\_ARG**: stop esp\_eth driver failed because of some invalid argument
- **ESP\_ERR\_INVALID\_STATE**: stop esp\_eth driver failed because driver has not started yet
- **ESP\_FAIL**: stop esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input)(*esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv), void \*priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

---

**备注:** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

---

**参数**

- **hdl** –[in] handle of Ethernet driver
- **stack\_input** –[in] function pointer, which does the actual process on incoming packets
- **priv** –[in] private resource, which gets passed to `stack_input` callback without any modification

**返回**

- **ESP\_OK**: update input path successfully
- **ESP\_ERR\_INVALID\_ARG**: update input path failed because of some invalid argument
- **ESP\_FAIL**: update input path failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, size\_t length)

General Transmit.

**参数**

- **hdl** –[in] handle of Ethernet driver
- **buf** –[in] buffer of the packet to transfer
- **length** –[in] length of the buffer to transfer

**返回**

- **ESP\_OK**: transmit frame buffer successfully

- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

*esp\_err\_t* `esp_eth_receive` (*esp\_eth\_handle\_t* hdl, *uint8\_t* \*buf, *uint32\_t* \*length)

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

---

**备注:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

---

---

**备注:** This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn't support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

---

#### 参数

- **hdl** –[in] handle of Ethernet driver
- **buf** –[out] buffer to preserve the received packet
- **length** –[out] length of the received packet

#### 返回

- `ESP_OK`: receive frame buffer successfully
- `ESP_ERR_INVALID_ARG`: receive frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_SIZE`: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- `ESP_FAIL`: receive frame buffer failed because some other error occurred

*esp\_err\_t* `esp_eth_ioctl` (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Ethernet driver.

The following IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. *data* argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. *data* argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. *data* argument is pointer to memory of *uint32\_t* datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. *data* argument is pointer to memory of *uint32\_t* datatype to which the PHY address is to be stored.
- `ETH_CMD_G_SPEED` gets current Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype to which the speed is to be stored.
- `ETH_CMD_S_PROMISCUOUS` sets/resets Ethernet interface promiscuous mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- `ETH_CMD_S_FLOW_CTRL` sets/resets Ethernet interface flow control. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. *data* argument is pointer to memory of *eth\_duplex\_t* datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.

#### 参数

- **hdl** –[in] handle of Ethernet driver
- **cmd** –[in] IO control command
- **data** –[inout] address of data for `set` command or address where to store the data when used with `get` command

**返回**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

---

**备注:** Ethernet driver handle can be obtained by os timer, netif, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

---

**参数** **hdl** **[in]** handle of Ethernet driver

**返回**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**参数** **hdl** **[in]** handle of Ethernet driver

**返回**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

## Structures

struct **esp\_eth\_config\_t**

Configuration of Ethernet driver.

## Public Members

*esp\_eth\_mac\_t* \***mac**

Ethernet MAC object.

*esp\_eth\_phy\_t* \***phy**

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Param eth\_handle** **[in]** handle of Ethernet driver

**Param buffer** **[in]** frame buffer that will get input to upper stack

**Param length** **[in]** length of the frame buffer

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

*esp\_err\_t* (\***on\_lowlevel\_init\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

*esp\_err\_t* (\***on\_lowlevel\_deinit\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

---

**备注:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

---

**备注:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

## Macros

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

## Type Definitions

typedef void \***esp\_eth\_handle\_t**

Handle of Ethernet driver.

## API 参考-通用接口

### Header File

- components/esp\_eth/include/esp\_eth\_com.h

### Functions

*esp\_err\_t* **esp\_eth\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, int \*detected\_addr)

Detect PHY address.

#### 参数

- **eth** –[in] mediator of Ethernet driver
- **detected\_addr** –[out] a valid address after detection

#### 返回

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

### Structures

struct **esp\_eth\_mediator\_s**

Ethernet mediator.

### Public Members

*esp\_err\_t* (**\*phy\_reg\_read**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param eth** [in] mediator of Ethernet driver

**Param phy\_addr** [in] PHY Chip address (0~31)

**Param phy\_reg** [in] PHY register index code

**Param reg\_value** [out] PHY register value

#### Return

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

*esp\_err\_t* (**\*phy\_reg\_write**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param eth** [in] mediator of Ethernet driver

**Param phy\_addr** [in] PHY Chip address (0~31)

**Param phy\_reg** [in] PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Param eth [in]** mediator of Ethernet driver

**Param buffer [in]** packet buffer

**Param length [in]** length of the packet

**Return**

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

*esp\_err\_t* (**\*on\_state\_changed**)(*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

**Param eth [in]** mediator of Ethernet driver

**Param state [in]** new state

**Param args [in]** optional argument for the new state

**Return**

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

## Macros

**ETH\_MAX\_PAYLOAD\_LEN**

Maximum Ethernet payload size.

**ETH\_MIN\_PAYLOAD\_LEN**

Minimum Ethernet payload size.

**ETH\_HEADER\_LEN**

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

**ETH\_VLAN\_TAG\_LEN**

Optional 802.1q VLAN Tag length.

**ETH\_JUMBO\_FRAME\_PAYLOAD\_LEN**

Jumbo frame payload size.

**ETH\_MAX\_PACKET\_SIZE**

Maximum frame size (1522 Bytes)

**ETH\_MIN\_PACKET\_SIZE**

Minimum frame size (64 Bytes)

## Type Definitions

typedef struct *esp\_eth\_mediator\_s* **esp\_eth\_mediator\_t**

Ethernet mediator.

## Enumerations

enum **esp\_eth\_state\_t**

Ethernet driver state.

*Values:*

enumerator **ETH\_STATE\_LLINIT**

Lowlevel init done

enumerator **ETH\_STATE\_DEINIT**

Deinit done

enumerator **ETH\_STATE\_LINK**

Link status changed

enumerator **ETH\_STATE\_SPEED**

Speed updated

enumerator **ETH\_STATE\_DUPLEX**

Duplex updated

enumerator **ETH\_STATE\_PAUSE**

Pause ability updated

enum **esp\_eth\_io\_cmd\_t**

Command list for ioctl API.

*Values:*

enumerator **ETH\_CMD\_G\_MAC\_ADDR**

Get MAC address

enumerator **ETH\_CMD\_S\_MAC\_ADDR**

Set MAC address

enumerator **ETH\_CMD\_G\_PHY\_ADDR**

Get PHY address

enumerator **ETH\_CMD\_S\_PHY\_ADDR**

Set PHY address

enumerator **ETH\_CMD\_G\_SPEED**

Get Speed

enumerator **ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH\_CMD\_S\_FLOW\_CTRL**

Set flow control

enumerator **ETH\_CMD\_G\_DUPLEX\_MODE**

Get Duplex mode

enumerator **ETH\_CMD\_S\_PHY\_LOOPBACK**

Set PHY loopback

enum **eth\_event\_t**

Ethernet event declarations.

*Values:*

enumerator **ETHERNET\_EVENT\_START**

Ethernet driver start

enumerator **ETHERNET\_EVENT\_STOP**

Ethernet driver stop

enumerator **ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

## API 参考-MAC 接口

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac.h](#)

### Unions

union **eth\_mac\_clock\_config\_t**

*#include <esp\_eth\_mac.h>* Ethernet MAC Clock Configuration.

### Public Members

struct *eth\_mac\_clock\_config\_t::*[anonymous] **mii**

EMAC MII Clock Configuration

*emac\_rmii\_clock\_mode\_t* **clock\_mode**

RMII Clock Mode Configuration

*emac\_rmii\_clock\_gpio\_t* **clock\_gpio**

RMII Clock GPIO Configuration

struct *eth\_mac\_clock\_config\_t::*[anonymous] **rmii**

EMAC RMII Clock Configuration

## Structures

struct **esp\_eth\_mac\_s**

Ethernet MAC.

## Public Members

*esp\_err\_t* (**\*set\_mediator**)(*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param eth [in]** Ethernet mediator

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

*esp\_err\_t* (**\*init**)(*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

*esp\_err\_t* (**\*deinit**)(*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

*esp\_err\_t* (**\*start**)(*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

*esp\_err\_t* (**\*stop**)(*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

*esp\_err\_t* (**\*transmit**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param buf [in]** packet buffer to transmit

**Param length [in]** length of packet

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_ARG: transmit packet failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: transmit packet failed because of wrong state of MAC
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***receive**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

---

**备注:** Memory of buf is allocated in the Layer2, make sure it get free after process.

---

---

**备注:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [out]** packet buffer which will preserve the received frame

**Param length [out]** length of the received packet

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [in]** MAC address

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [out]** MAC address

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_mac\_t* \*mac, eth\_speed\_t speed)

Set speed of MAC.

**Param mac [in]** Ethernet MAC instance

**Param speed [in]** MAC speed

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_mac\_t* \*mac, eth\_duplex\_t duplex)

Set duplex mode of MAC.

**Param mac [in]** Ethernet MAC instance

**Param duplex [in]** MAC duplex

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_mac\_t* \*mac, eth\_link\_t link)

Set link status of MAC.

**Param mac [in]** Ethernet MAC instance

**Param link [in]** Link status

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

*esp\_err\_t* (\***set\_promiscuous**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

*esp\_err\_t* (**\*enable\_flow\_ctrl**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Enable flow control on MAC layer or not.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable flow control; set false to disable flow control

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

*esp\_err\_t* (**\*set\_peer\_pause\_ability**)(*esp\_eth\_mac\_t* \*mac, uint32\_t ability)

Set the PAUSE ability of peer node.

**Param mac [in]** Ethernet MAC instance

**Param ability [in]** zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

*esp\_err\_t* (**\*del**)(*esp\_eth\_mac\_t* \*mac)

Free memory of Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

### Public Members

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

int **smi\_mdc\_gpio\_num**

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int **smi\_mdio\_gpio\_num**

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

uint32\_t **flags**

Flags that specify extra capability for mac driver

eth\_data\_interface\_t **interface**

EMAC Data interface to PHY (MII/RMII)

*eth\_mac\_clock\_config\_t* **clock\_config**

EMAC Interface clock configuration

### Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG()**

Default configuration for Ethernet MAC object.

### Type Definitions

typedef struct *esp\_eth\_mac\_s* **esp\_eth\_mac\_t**

Ethernet MAC.

### Enumerations

enum **emac\_rmii\_clock\_mode\_t**

RMII Clock Mode Options.

*Values:*

enumerator **EMAC\_CLK\_DEFAULT**

Default values configured using Kconfig are going to be used when “Default” selected.

enumerator **EMAC\_CLK\_EXT\_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

---

**备注:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

---

enumerator **EMAC\_CLK\_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac\_rmii\_clock\_gpio\_t**

RMII Clock GPIO number Options.

*Values:*

enumerator **EMAC\_CLK\_IN\_GPIO**

MAC will get RMII clock from outside at this GPIO.

---

**备注:** ESP32 only supports GPIO0 to input the RMII clock.

---

enumerator **EMAC\_APPL\_CLK\_OUT\_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

---

**备注:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

---

enumerator **EMAC\_CLK\_OUT\_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC\_CLK\_OUT\_180\_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

## API 参考-PHY 接口

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy.h](#)

### Functions

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ip101** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of IP101.

**参数 config** –[in] configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_rt18201** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of RTL8201.

**参数 config** –[in] configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan87xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of LAN87xx.

**参数 config** –[in] configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

static inline *esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan8720** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of LAN8720.

---

**备注:** For ESP-IDF backwards compatibility reasons. In all other cases, use `esp_eth_phy_new_lan87xx` instead.

---

**参数 config** –[in] configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_dp83848 (const eth_phy_config_t *config)`

Create a PHY instance of DP83848.

**参数** `config` **[in]** configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_ksz8041 (const eth_phy_config_t *config)`

Create a PHY instance of KSZ8041.

**参数** `config` **[in]** configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_ksz8081 (const eth_phy_config_t *config)`

Create a PHY instance of KSZ8081.

**参数** `config` **[in]** configuration of PHY

**返回**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Structures**

struct `esp_eth_phy_s`

Ethernet PHY.

**Public Members**

`esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)`

Set mediator for PHY.

**Param** `phy` **[in]** Ethernet PHY instance

**Param** `mediator` **[in]** mediator of Ethernet driver

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

`esp_err_t (*reset)(esp_eth_phy_t *phy)`

Software Reset Ethernet PHY.

**Param** `phy` **[in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

`esp_err_t (*reset_hw)(esp_eth_phy_t *phy)`

Hardware Reset Ethernet PHY.

---

**备注:** Hardware reset is mostly done by pull down and up PHY's nRST pin

---

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Param phyL [in]** Ethernet PHY instance

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***negotiate**)(*esp\_eth\_phy\_t* \*phy)

Start auto negotiation.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***pwrctrl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** set true to power on Ethernet PHY; set false to power off Ethernet PHY

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [in]** PHY chip address

**Return**

- ESP\_OK: set Ethernet PHY address successfully

- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

*esp\_err\_t* (**\*get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** PHY chip address

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

*esp\_err\_t* (**\*advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, uint32\_t ability)

Advertise pause function supported by MAC layer.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** Pause ability

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

*esp\_err\_t* (**\*loopback**)(*esp\_eth\_phy\_t* \*phy, bool enable)

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** enables or disables PHY loopback

**Return**

- ESP\_OK: configures PHY instance loopback function successfully
- ESP\_FAIL: PHY instance loopback configuration failed because some error occurred

*esp\_err\_t* (**\*del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

struct **eth\_phy\_config\_t**

Ethernet PHY configuration.

### Public Members

int32\_t **phy\_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset\_gpio\_num**

Reset GPIO number, -1 means no hardware reset

## Macros

**ESP\_ETH\_PHY\_ADDR\_AUTO**

**ETH\_PHY\_DEFAULT\_CONFIG()**

Default configuration for Ethernet PHY object.

## Type Definitions

typedef struct *esp\_eth\_phy\_s* **esp\_eth\_phy\_t**

Ethernet PHY.

## API 参考-esp\_netif 相关使用

### Header File

- `components/esp_eth/include/esp_eth_netif_glue.h`

### Functions

*esp\_eth\_netif\_glue\_handle\_t* **esp\_eth\_new\_netif\_glue** (*esp\_eth\_handle\_t* eth\_hdl)

Create a netif glue for Ethernet driver.

---

**备注:** netif glue is used to attach io driver to TCP/IP netif

---

**参数** *eth\_hdl* –Ethernet driver handle

**返回** glue object, which inherits `esp_netif_driver_base_t`

*esp\_err\_t* **esp\_eth\_del\_netif\_glue** (*esp\_eth\_netif\_glue\_handle\_t* eth\_netif\_glue)

Delete netif glue of Ethernet driver.

**参数** *eth\_netif\_glue* –netif glue

**返回** -ESP\_OK: delete netif glue successfully

*esp\_err\_t* **esp\_eth\_set\_default\_handlers** (void \*esp\_netif)

Register default IP layer handlers for Ethernet.

---

**备注:** : Ethernet handle might not yet properly initialized when setting up these default handlers

---

**警告:** : This function is deprecated and is kept here only for compatibility reasons. Registration of default IP layer handlers for Ethernet is now handled automatically. Do not call this function if you want to use multiple Ethernet instances at a time.

**参数** *esp\_netif* –[in] esp network interface handle created for Ethernet driver

**返回**

- ESP\_ERR\_INVALID\_ARG: invalid parameter (*esp\_netif* is NULL)
- ESP\_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp\_event handler

*esp\_err\_t* **esp\_eth\_clear\_default\_handlers** (void \*esp\_netif)

Unregister default IP layer handlers for Ethernet.

**警告:** : This function is deprecated and is kept here only for compatibility reasons. Unregistration of default IP layer handlers for Ethernet is now handled automatically if not registered by calling `esp_eth_set_default_handlers`.

**参数** `esp_netif` **–[in]** esp network interface handle created for Ethernet driver

**返回**

- `ESP_ERR_INVALID_ARG`: invalid parameter (`esp_netif` is NULL)
- `ESP_OK`: clear default IP layer handlers successfully
- others: other failure occurred during unregister `esp_event` handler

## Type Definitions

```
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

本部分的以太网 API 示例代码存放在 ESP-IDF 示例项目的 `ethernet` 目录下。

## 2.2.3 Thread

### Thread

**Introduction** `Thread` is a IP-based mesh networking protocol. It's based on the 802.15.4 physical and MAC layer.

**Application Examples** The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`.
- The Thread border router `openthread/ot_br`.
- The Thread radio co-processor `openthread/ot_rcp`.

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

### Header File

- `components/openthread/include/esp_openthread.h`

### Functions

`esp_err_t esp_openthread_init` (const `esp_openthread_platform_config_t` \*init\_config)

Initializes the full OpenThread stack.

---

**备注:** The OpenThread instance will also be initialized in this function.

---

**参数** `init_config` **–[in]** The initialization configuration.

**返回**

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed
- `ESP_ERR_INVALID_ARG` if radio or host connection mode not supported
- `ESP_ERR_INVALID_STATE` if already initialized

*esp\_err\_t* **esp\_openthread\_launch\_mainloop** (void)

Launches the OpenThread main loop.

---

**备注:** This function will not return unless error happens when running the OpenThread stack.

---

**返回**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized

otInstance \***esp\_openthread\_get\_instance** (void)

This function acquires the underlying OpenThread instance.

---

**备注:** This function can be called on other tasks without lock.

---

**返回** The OpenThread instance pointer

## Header File

- [components/openthread/include/esp\\_openthread\\_types.h](#)

## Structures

struct **esp\_openthread\_mainloop\_context\_t**

This structure represents a context for a select() based mainloop.

### Public Members

fd\_set **read\_fds**

The read file descriptors

fd\_set **write\_fds**

The write file descriptors

fd\_set **error\_fds**

The error file descriptors

int **max\_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp\_openthread\_uart\_config\_t**

The uart port config for OpenThread.

### Public Members

*uart\_port\_t* **port**

UART port number

*uart\_config\_t* **uart\_config**

UART configuration, see *uart\_config\_t* docs

int **rx\_pin**

UART RX pin

int **tx\_pin**

UART TX pin

struct **esp\_openthread\_radio\_config\_t**

The OpenThread radio configuration.

### Public Members

*esp\_openthread\_radio\_mode\_t* **radio\_mode**

The radio mode

*esp\_openthread\_uart\_config\_t* **radio\_uart\_config**

The uart configuration to RCP

struct **esp\_openthread\_host\_connection\_config\_t**

The OpenThread host connection configuration.

### Public Members

*esp\_openthread\_host\_connection\_mode\_t* **host\_connection\_mode**

The host connection mode

*esp\_openthread\_uart\_config\_t* **host\_uart\_config**

The uart configuration to host

struct **esp\_openthread\_port\_config\_t**

The OpenThread port specific configuration.

### Public Members

const char \***storage\_partition\_name**

The partition for storing OpenThread dataset

uint8\_t **netif\_queue\_size**

The packet queue size for the network interface

uint8\_t **task\_queue\_size**

The task queue size

struct **esp\_openthread\_platform\_config\_t**

The OpenThread platform configuration.

### Public Members

*esp\_openthread\_radio\_config\_t* **radio\_config**

The radio configuration

*esp\_openthread\_host\_connection\_config\_t* **host\_config**

The host connection configuration

*esp\_openthread\_port\_config\_t* **port\_config**

The port configuration

### Enumerations

enum **esp\_openthread\_event\_t**

OpenThread event declarations.

*Values:*

enumerator **OPENTHREAD\_EVENT\_START**

OpenThread stack start

enumerator **OPENTHREAD\_EVENT\_STOP**

OpenThread stack stop

enumerator **OPENTHREAD\_EVENT\_IF\_UP**

OpenThread network interface up

enumerator **OPENTHREAD\_EVENT\_IF\_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD\_EVENT\_GOT\_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD\_EVENT\_LOST\_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_LEAVE**

OpenThread stack left IPv6 multicast group

enum **esp\_openthread\_radio\_mode\_t**

The radio mode of OpenThread.

*Values:*

enumerator **RADIO\_MODE\_NATIVE**

Use the native 15.4 radio

enumerator **RADIO\_MODE\_UART\_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_SPI\_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp\_openthread\_host\_connection\_mode\_t**

How OpenThread connects to the host.

*Values:*

enumerator **HOST\_CONNECTION\_MODE\_NONE**

Disable host connection

enumerator **HOST\_CONNECTION\_MODE\_CLI\_UART**

CLI UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_UART**

RCP UART connection to the host

### Header File

- [components/openthread/include/esp\\_openthread\\_lock.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_lock\_init** (void)

This function initializes the OpenThread API lock.

返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized

void **esp\_openthread\_lock\_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp\_openthread\_lock\_acquire** (TickType\_t block\_ticks)

This functions acquires the OpenThread API lock.

---

**备注:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

---

参数 **block\_ticks** –[in] The maximum number of RTOS ticks to wait for the lock.  
 返回

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_lock\_release** (void)

This function releases the OpenThread API lock.

### Header File

- [components/openthread/include/esp\\_openthread\\_netif\\_glue.h](#)

### Functions

void \***esp\_openthread\_netif\_glue\_init** (const *esp\_openthread\_platform\_config\_t* \*config)

This function initializes the OpenThread network interface glue.

参数 **config** –[in] The platform configuration.

返回

- glue pointer on success
- NULL on failure

void **esp\_openthread\_netif\_glue\_deinit** (void)

This function deinitializes the OpenThread network interface glue.

*esp\_netif\_t* \***esp\_openthread\_get\_netif** (void)

This function acquires the OpenThread netif.

返回 The OpenThread netif or NULL if not initialized.

### Header File

- [components/openthread/include/esp\\_openthread\\_border\\_router.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_border\_router\_init** (*esp\_netif\_t* \*backbone\_netif)

Initializes the border router features of OpenThread.

---

备注: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG\_OPENTHREAD\_BORDER\_ROUTER is required.

---

参数 **backbone\_netif** –[in] The backbone network interface (WiFi or ethernet)

返回

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if feature not supported
- ESP\_ERR\_INVALID\_STATE if already initialized
- ESP\_FIAL on other failures

*esp\_err\_t* **esp\_openthread\_border\_router\_deinit** (void)

Deinitializes the border router features of OpenThread.

返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized
- ESP\_FIAL on other failures

`esp_netif_t *esp_openthread_get_backbone_netif (void)`

Gets the backbone interface of OpenThread border router.

**返回** The backbone interface or NULL if border router not initialized.

本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 `openthread` 目录下。

## 2.2.4 IP 网络层协议

### ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

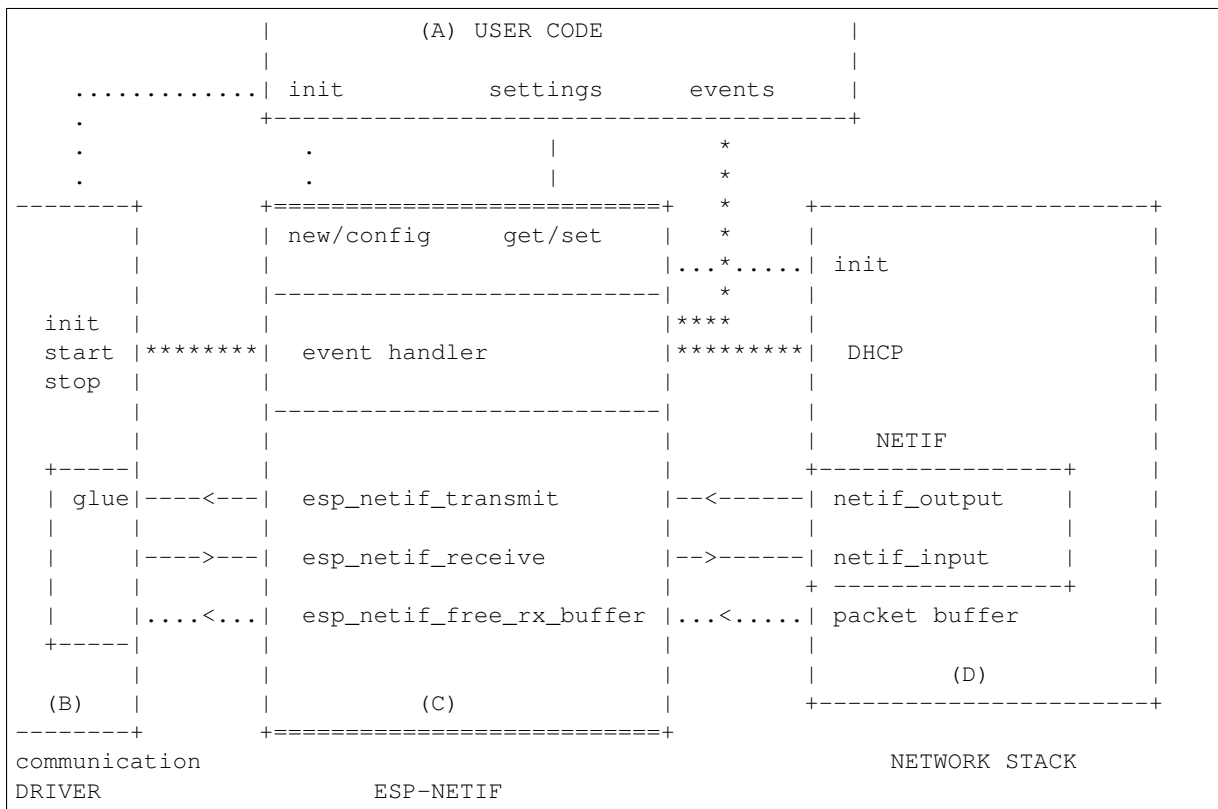

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the `tcpip_adapter`, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the [TCP/IP 适配器迁移指南](#) section in case existing applications to be ported to use the `esp-netif` API instead.

### ESP-NETIF architecture

### Data and event flow in the diagram

- . . . . . Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF, former tcpip\_adapter** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down

- DHCP server and client API
- DNS API

## 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**ESP-NETIF programmer' s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- WiFi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- [esp\\_netif\\_create\\_default\\_wifi\\_ap\(\)](#)
- [esp\\_netif\\_create\\_default\\_wifi\\_sta\(\)](#)

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using [esp\\_netif\\_destroy\\_default\\_wifi\(\)](#).
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using [esp\\_netif\\_destroy\(\)](#).
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- [components/esp\\_netif/include/esp\\_netif.h](#)

### Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

---

**备注:** This function should be called exactly once from application code, when the application starts up.

---

#### 返回

- ESP\_OK on success
- ESP\_FAIL if initializing failed

`esp_err_t esp_netif_deinit` (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

#### 返回

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

`esp_netif_t *esp_netif_new` (const `esp_netif_config_t` \*`esp_netif_config`)

Creates an instance of new esp-netif object based on provided config.

**参数** `esp_netif_config` **–[in]** pointer esp-netif configuration

**返回**

- pointer to esp-netif object on success
- NULL otherwise

void `esp_netif_destroy` (`esp_netif_t` \*`esp_netif`)

Destroys the esp\_netif object.

**参数** `esp_netif` **–[in]** pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config` (`esp_netif_t` \*`esp_netif`, const `esp_netif_driver_ifconfig_t` \*`driver_config`)

Configures driver related options of esp\_netif object.

**参数**

- `esp_netif` **–[inout]** pointer to the object to be configured
- `driver_config` **–[in]** pointer esp-netif io driver related configuration

**返回**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

`esp_err_t esp_netif_attach` (`esp_netif_t` \*`esp_netif`, `esp_netif_io_driver_handle_t` `driver_handle`)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

**参数**

- `esp_netif` **–[inout]** pointer to esp\_netif object to be attached
- `driver_handle` **–[in]** pointer to the driver handle

**返回**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's post\_attach callback failed

`esp_err_t esp_netif_receive` (`esp_netif_t` \*`esp_netif`, void \*`buffer`, `size_t` `len`, void \*`eb`)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**参数**

- `esp_netif` **–[in]** Handle to esp-netif instance
- `buffer` **–[in]** Received data
- `len` **–[in]** Length of the data frame
- `eb` **–[in]** Pointer to internal buffer (used in Wi-Fi driver)

**返回**

- ESP\_OK

void `esp_netif_action_start` (void \*`esp_netif`, `esp_event_base_t` `base`, `int32_t` `event_id`, void \*`data`)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

---

**备注:** This API can be directly used as event handler

---

**参数**

- `esp_netif` **–[in]** Handle to esp-netif instance

- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_stop** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)  
Default building block for network interface action upon IO driver stop event.

---

备注: This API can be directly used as event handler

---

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_connected** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)  
Default building block for network interface action upon IO driver connected event.

---

备注: This API can be directly used as event handler

---

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_disconnected** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver disconnected event.

---

备注: This API can be directly used as event handler

---

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_got\_ip** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)  
Default building block for network interface action upon network got IP event.

---

备注: This API can be directly used as event handler

---

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_join\_ip6\_multicast\_group** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group join.

---

**备注:** This API can be directly used as event handler

---

**参数**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_leave\_ip6\_multicast\_group** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group leave.

---

**备注:** This API can be directly used as event handler

---

**参数**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_add\_ip6\_address** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

---

**备注:** This API can be directly used as event handler

---

**参数**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_remove\_ip6\_address** (void \*esp\_netif, *esp\_event\_base\_t* base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

---

**备注:** This API can be directly used as event handler

---

**参数**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Set the mac address for the interface instance.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **mac** **–[in]** Desired mac address for the related network interface

**返回**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_get\_mac** (esp\_netif\_t \*esp\_netif, uint8\_t mac[])

Get the mac address for the interface instance.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **mac** **–[out]** Resultant mac address for the related network interface

**返回**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_set\_hostname** (esp\_netif\_t \*esp\_netif, const char \*hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG\_LWIP\_LOCAL\_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **hostname** **–[in]** New hostname for the interface. Maximum length 32 bytes.

**返回**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

*esp\_err\_t* **esp\_netif\_get\_hostname** (esp\_netif\_t \*esp\_netif, const char \*\*hostname)

Get interface hostname.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **hostname** **–[out]** Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**返回**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

bool **esp\_netif\_is\_netif\_up** (esp\_netif\_t \*esp\_netif)

Test if supplied interface is up or down.

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance

**返回**

- true - Interface is up
- false - Interface is down

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (esp\_netif\_t \*esp\_netif, esp\_netif\_ip\_info\_t \*ip\_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance

- **ip\_info** –[out] If successful, IP information will be returned in this argument.
- 返回
- ESP\_OK
  - ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (esp\_netif\_t \*esp\_netif, esp\_netif\_ip\_info\_t \*ip\_info)

Get interface's old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[out] If successful, IP information will be returned in this argument.

#### 返回

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (esp\_netif\_t \*esp\_netif, const esp\_netif\_ip\_info\_t \*ip\_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**备注:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

---

**备注:** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

---

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[in] IP information to set on the specified interface

#### 返回

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED If DHCP server or client is still running

*esp\_err\_t* **esp\_netif\_set\_old\_ip\_info** (esp\_netif\_t \*esp\_netif, const esp\_netif\_ip\_info\_t \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[in] Store the old IP information for the specified interface

## 返回

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

int **esp\_netif\_get\_netif\_impl\_index** (esp\_netif\_t \*esp\_netif)

Get net interface index from network stack implementation.

---

**备注:** This index could be used in `setsockopt()` to bind socket with multicast interface

---

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance

**返回** implementation specific index of interface represented with supplied esp\_netif

*esp\_err\_t* **esp\_netif\_get\_netif\_impl\_name** (esp\_netif\_t \*esp\_netif, char \*name)

Get net interface name from network stack implementation.

---

**备注:** This name could be used in `setsockopt()` to bind socket with appropriate interface

---

## 参数

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **name** **–[out]** Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

## 返回

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_dhcps\_option** (esp\_netif\_t \*esp\_netif, esp\_netif\_dhcp\_option\_mode\_t opt\_op, esp\_netif\_dhcp\_option\_id\_t opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP server option.

## 参数

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **opt\_op** **–[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** **–[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** **–[inout]** Pointer to the option parameter.
- **opt\_len** **–[in]** Length of the option parameter.

## 返回

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (esp\_netif\_t \*esp\_netif, esp\_netif\_dhcp\_option\_mode\_t opt\_op, esp\_netif\_dhcp\_option\_id\_t opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

## 参数

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **opt\_op** **–[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** **–[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** **–[inout]** Pointer to the option parameter.
- **opt\_len** **–[in]** Length of the option parameter.

## 返回

- ESP\_OK

- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (esp\_netif\_t \*esp\_netif)

Start DHCP client (only if enabled in interface object)

---

**备注:** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

---

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance  
**返回**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (esp\_netif\_t \*esp\_netif)

Stop DHCP client (only if enabled in interface object)

---

**备注:** Calling action\_netif\_stop() will also stop the DHCP Client if it is running.

---

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance  
**返回**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (esp\_netif\_t \*esp\_netif, esp\_netif\_dhcp\_status\_t \*status)

Get DHCP client status.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **status** **–[out]** If successful, the status of DHCP client will be returned in this argument.

**返回**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (esp\_netif\_t \*esp\_netif, esp\_netif\_dhcp\_status\_t \*status)

Get DHCP Server status.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **status** **–[out]** If successful, the status of the DHCP server will be returned in this argument.

**返回**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_start** (esp\_netif\_t \*esp\_netif)

Start DHCP server (only if enabled in interface object)

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance  
**返回**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (esp\_netif\_t \*esp\_netif)

Stop DHCP server (only if enabled in interface object)

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance

**返回**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (esp\_netif\_t \*esp\_netif, esp\_netif\_dns\_type\_t type, esp\_netif\_dns\_info\_t \*dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **type** **–[in]** Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** **–[in]** DNS Server address to set

**返回**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (esp\_netif\_t \*esp\_netif, esp\_netif\_dns\_type\_t type, esp\_netif\_dns\_info\_t \*dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to [esp\\_netif\\_set\\_dns\\_info\(\)](#). If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **type** **–[in]** Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** **–[out]** DNS Server result is written here on success

**返回**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (esp\_netif\_t \*esp\_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance

## 返回

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (*esp\_netif\_t* \**esp\_netif*, *esp\_ip6\_addr\_t* \**if\_ip6*)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

## 参数

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* IPv6 information will be returned in this argument if successful.

## 返回

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (*esp\_netif\_t* \**esp\_netif*, *esp\_ip6\_addr\_t* \**if\_ip6*)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

## 参数

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* IPv6 information will be returned in this argument if successful.

## 返回

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp\_netif\_get\_all\_ip6** (*esp\_netif\_t* \**esp\_netif*, *esp\_ip6\_addr\_t* *if\_ip6*[])

Get all IPv6 addresses of the specified interface.

## 参数

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* Array of IPv6 addresses will be copied to the argument

返回 number of returned IPv6 addresses

void **esp\_netif\_set\_ip4\_addr** (*esp\_ip4\_addr\_t* \**addr*, *uint8\_t* *a*, *uint8\_t* *b*, *uint8\_t* *c*, *uint8\_t* *d*)

Sets IPv4 address to the specified octets.

## 参数

- **addr** *–[out]* IP address to be set
- **a** *–* the first octet (127 for IP 127.0.0.1)
- **b** *–*
- **c** *–*
- **d** *–*

char \***esp\_ip4addr\_ntoa** (const *esp\_ip4\_addr\_t* \**addr*, char \**buf*, int *buflen*)

Converts numeric IP address into decimal dotted ASCII representation.

## 参数

- **addr** *–* ip address in network order to convert
- **buf** *–* target buffer where the string is stored
- **buflen** *–* length of *buf*

返回 either pointer to *buf* which now holds the ASCII representation of *addr* or NULL if *buf* was too small

*uint32\_t* **esp\_ip4addr\_aton** (const char \**addr*)

Ascii internet address interpretation routine The value returned is in network order.

参数 **addr** *–* IP address in ascii representation (e.g. “127.0.0.1” )

返回 ip address in network order

*esp\_err\_t* **esp\_netif\_str\_to\_ip4** (const char \*src, esp\_ip4\_addr\_t \*dst)

Converts Ascii internet IPv4 address into esp\_ip4\_addr\_t.

参数

- **src** **–[in]** IPv4 address in ascii representation (e.g. “127.0.0.1” )
- **dst** **–[out]** Address of the target esp\_ip4\_addr\_t structure to receive converted address

返回

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

*esp\_err\_t* **esp\_netif\_str\_to\_ip6** (const char \*src, esp\_ip6\_addr\_t \*dst)

Converts Ascii internet IPv6 address into esp\_ip6\_addr\_t Zeros in the IP address can be stripped or completely ommited: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1” )

参数

- **src** **–[in]** IPv6 address in ascii representation (e.g. “2001:db8:85a3:0000:0000:0000:0002:0001” )
- **dst** **–[out]** Address of the target esp\_ip6\_addr\_t structure to receive converted address

返回

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

esp\_netif\_iedriver\_handle **esp\_netif\_get\_io\_driver** (esp\_netif\_t \*esp\_netif)

Gets media driver handle for this esp-netif instance.

参数 **esp\_netif** **–[in]** Handle to esp-netif instance

返回 opaque pointer of related IO driver

esp\_netif\_t \***esp\_netif\_get\_handle\_from\_ifkey** (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

参数 **if\_key** **–**Textual description of network interface

返回 Handle to esp-netif instance

esp\_netif\_flags\_t **esp\_netif\_get\_flags** (esp\_netif\_t \*esp\_netif)

Returns configured flags for this interface.

参数 **esp\_netif** **–[in]** Handle to esp-netif instance

返回 Configuration flags

const char \***esp\_netif\_get\_ifkey** (esp\_netif\_t \*esp\_netif)

Returns configured interface key for this esp-netif instance.

参数 **esp\_netif** **–[in]** Handle to esp-netif instance

返回 Textual description of related interface

const char \***esp\_netif\_get\_desc** (esp\_netif\_t \*esp\_netif)

Returns configured interface type for this esp-netif instance.

参数 **esp\_netif** **–[in]** Handle to esp-netif instance

返回 Enumerated type of this interface, such as station, AP, ethernet

int **esp\_netif\_get\_route\_prio** (esp\_netif\_t \*esp\_netif)

Returns configured routing priority number.

参数 **esp\_netif** **–[in]** Handle to esp-netif instance

返回 Integer representing the instance' s route-prio, or -1 if invalid paramters

int32\_t **esp\_netif\_get\_event\_id** (esp\_netif\_t \*esp\_netif, esp\_netif\_ip\_event\_type\_t event\_type)

Returns configured event for this esp-netif instance and supplied event type.

**参数**

- **esp\_netif** **–[in]** Handle to esp-netif instance
- **event\_type** **–**(either get or lost IP)

**返回** specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event\_type is not known

esp\_netif\_t \***esp\_netif\_next** (esp\_netif\_t \*esp\_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**参数** **esp\_netif** **–[in]** Handle to esp-netif instance

**返回** First netif from the list if supplied parameter is NULL, next one otherwise

size\_t **esp\_netif\_get\_nr\_of\_ifs** (void)

Returns number of registered esp\_netif objects.

**返回** Number of esp\_netifs

void **esp\_netif\_netstack\_buf\_ref** (void \*netstack\_buf)

increase the reference counter of net stack buffer

**参数** **netstack\_buf** **–[in]** the net stack buffer

void **esp\_netif\_netstack\_buf\_free** (void \*netstack\_buf)

free the netstack buffer

**参数** **netstack\_buf** **–[in]** the net stack buffer

**Macros**

**\_ESP\_NETIF\_SUPPRESS\_LEGACY\_WARNING\_**

**WiFi default API reference****Header File**

- [components/esp\\_wifi/include/esp\\_wifi\\_default.h](#)

**Functions**

*esp\_err\_t* **esp\_netif\_attach\_wifi\_station** (esp\_netif\_t \*esp\_netif)

Attaches wifi station interface to supplied netif.

**参数** **esp\_netif** **–**instance to attach the wifi station to

**返回**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (esp\_netif\_t \*esp\_netif)

Attaches wifi soft AP interface to supplied netif.

**参数** **esp\_netif** **–**instance to attach the wifi AP to

**返回**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**返回**

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for AP interface.

返回

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void \*esp\_netif)

Clears default wifi event handlers for supplied network interface.

参数 **esp\_netif** –instance of corresponding if object

返回

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

---

**备注:** The API creates esp\_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

---

返回 pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

---

**备注:** The API creates esp\_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

---

返回 pointer to esp-netif instance

void **esp\_netif\_destroy\_default\_wifi** (void \*esp\_netif)

Destroys default WIFI netif created with esp\_netif\_create\_default\_wifi\_...() API.

---

**备注:** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp\_netif is NULL)

---

参数 **esp\_netif** –[in] object to detach from WiFi and destroy

*esp\_netif\_t* \***esp\_netif\_create\_wifi** (*wifi\_interface\_t* wifi\_if, *esp\_netif\_inherent\_config\_t* \*esp\_netif\_config)

Creates esp\_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

参数

- **wifi\_if** –[in] type of wifi interface
- **esp\_netif\_config** –[in] inherent esp-netif configuration pointer

返回 pointer to esp-netif instance

*esp\_err\_t* **esp\_netif\_create\_default\_wifi\_mesh\_netifs** (*esp\_netif\_t* \*\*p\_netif\_sta, *esp\_netif\_t* \*\*p\_netif\_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

#### 参数

- `p_netif_sta` –[out] pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap` –[out] pointer where the resultant AP interface is saved (if non NULL)

返回 ESP\_OK on success

## TCP/IP 适配器迁移指南

TCP/IP 适配器是在 IDF V4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` 移出至其后续者 *ESP-NETIF* 的过程。

### 更新网络连接代码

**网络软件栈初始化** 只需将 `tcpip_adapter_init()` 替换为 `esp_netif_init()`。请注意，*ESP-NETIF* 初始化 API 可返回标准错误代码，还可以使用 `esp_netif_deinit()` 进行去初始化。

此外，还需将 `#include "tcpip_adapter.h"` 替换为 `#include "esp_netif.h"`。

**创建网络接口** TCP/IP 适配器静态定义了三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

网络接口的设计应严格参考 *ESP-NETIF*，以使其能够连接到 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`；或 `esp_netif_create_default_wifi_ap()`。请参阅这三个接口的初始化代码示例：

- Wi-Fi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- Wi-Fi AP: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- 以太网: [ethernet/basic/main/ethernet\\_example\\_main.c](#)

**更换其他 `tcpip_adapter` API** 所有 `tcpip_adapter` 函数都有对应的 `esp-netif`。具体请见 `esp_netif` 的内容：

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

**默认事件处理程序** 事件处理程序已经从 `tcpip_adapter` 移动到相应的驱动程序代码。从应用程序的角度来看，这不会带来任何影响，所有事件仍以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 `esp-netif` 结构体的形式接收 IP 地址（不是 LwIP 结构，但兼容二进制格式）。这是打印地址的首选方式：

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

而不是

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

由于 `ip4addr_ntoa()` 为 LwIP API，因此 `esp-netif` 还提供了替代函数 `esp_ip4addr_ntoa()`，但整体而言仍推荐上述方法。

**IP 地址** 推荐使用 esp-netif 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。  
\* [esp-netif IP address definitions](#)

**下一步** 为了移植应用程序使其可以使用 *ESP-NETIF* 还需完成的步骤包括：在组件配置中禁用 tcpip\_adapter 兼容层。方法为：ESP NETIF Adapter -> Enable backward compatible tcpip\_adapter interface，并检查工程是否编译成功。TCP/IP 适配器涉及大量依赖项，这一步可能有助于将应用程序与使用特定 TCP/IP 软件栈的 API 分离开来。

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳ driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as
↳ esp-netif driver */
    driver_impl_t *h;                       /*!< handle of driver
↳ implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```

static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}

```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}

```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

### Header File

- [components/esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)

### Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl` (void \*dev)

Returns esp-netif handle.

**参数 dev** –[in] opaque ptr to network interface of specific TCP/IP stack

**返回** handle to related esp-netif instance

`void *esp_netif_get_netif_impl` (esp\_netif\_t \*esp\_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**参数 esp\_netif** –[in] Handle to esp-netif instance

**返回** handle to related network stack netif handle

`esp_err_t esp_netif_transmit` (esp\_netif\_t \*esp\_netif, void \*data, size\_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**参数**

- **esp\_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted

- **len** –[in] Length of the data frame
- 返回 ESP\_OK on success, an error passed from the I/O driver otherwise

`esp_err_t esp_netif_transmit_wrap` (esp\_netif\_t \*esp\_netif, void \*data, size\_t len, void \*netstack\_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame
- **netstack\_buf** –[in] net stack buffer

返回 ESP\_OK on success, an error passed from the I/O driver otherwise

void `esp_netif_free_rx_buffer` (void \*esp\_netif, void \*buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

#### 参数

- **esp\_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 [protocols/sockets](#) 目录下。

## 2.2.5 应用层协议

应用层网络协议（IP 网络层协议之上）的相关文档存放在 [应用层协议](#)。

## 2.3 外设 API

### 2.3.1 Analog to Digital Converter (ADC)

#### ADC Channels

The ESP32-S3 integrates 2 SAR ([Successive Approximation Register](#)) ADCs, supporting a total of 20 measurement channels (analog enabled pins).

These channels are supported:

#### ADC1:

- 10 channels: GPIO1 - GPIO10

#### ADC2:

- 10 channels: GPIO11 - GPIO20

#### ADC Attenuation

Vref is the reference voltage used internally by ESP32-S3 ADCs for measuring the input voltage. The ESP32-S3 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

Attenuation	Measurable input voltage range
ADC_ATTEN_DB_0	0 mV ~ 950 mV
ADC_ATTEN_DB_2_5	0 mV ~ 1250 mV
ADC_ATTEN_DB_6	0 mV ~ 1750 mV
ADC_ATTEN_DB_11	0 mV ~ 3100 mV

### ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32-S3 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, see <a href="#">ADC Attenuation</a> .
Dmax	Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 8191 under Continuous Read mode.

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See [ADC Calibration](#).

### ADC Limitations

备注:

- Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

### Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

备注: ADC readings from a pin not connected to any signal are random.

**ADC Single Read mode** The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in `peripherals/adc/single_read` directory of ESP-IDF examples.

This API provides convenient way to configure ADC1 for reading from `ULP`. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

---

**备注:** See [ADC Limitations](#) for the limitation of using ADC single read mode.

---

## Minimizing Noise

The ESP32-S3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

## ADC Calibration

ESP32-S3 ADC Calibration contains 2 steps: Hardware Calibration and Software Calibration.

**Hardware Calibration** Based on series of comparisons with the reference voltage, ESP32-S3 ADC determines each bit of the output digital result. Per design the ESP32-S3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. To minimize this difference, hardware calibration is introduced.

Hardware calibration contains 2 steps:

1. Set an auto-calibration parameter of bandgap voltage reference. In this way, the difference mentioned above can be minimized.
2. Correct the offset of the ADC  $V_{in}$ -Dout characteristics. ADC characteristics is generally a function:  $f(x) = A * x + B$ , where B is the offset.

An uncalibrated ADC characteristics is as follows:

The offset in the uncalibrated characteristics is significant. Step 2 is to correct the offset to 0.

After hardware calibration, the ADC characteristics would be like:

Hardware calibration is done internally by the ADC driver. The consequent results are raw data. A transformation is needed to get the final result, see [ADC Conversion](#).

**Software Calibration** To convert ADC raw data to calibrated digital data, following steps should be followed:

1. Check the eFuse to know if the software calibration is supported via `esp_adc_cal_check_efuse()`.
2. Calculate the ADC calibration characteristics via `esp_adc_cal_characterize()`. The ADC software calibration characteristics are per ADC module and per attenuation. For example, characteristics of ADC1 channel 0 under 11 dB attenuation are the same as characteristics of ADC1 channel 2 under 11 dB attenuation. But characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC2 channel 0 under 11 dB attenuation. Also characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC1 channel 0 under 6 dB attenuation.
3. Get the actual voltage value via `esp_adc_cal_raw_to_voltage()`.

After software calibration, the ADC characteristics would be like:

The results provided by the ADC calibration APIs indicate the actual voltage values. ADC software calibration example can be found in [peripherals/adc/single\\_read](#) directory of ESP-IDF examples.

### GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0.
2. `ADC1_GPIOn_CHANNEL` is the ADC1 channel number of GPIO n.

### API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

### ADC driver

#### Header File

- [components/driver/include/driver/adc.h](#)

#### Functions

void `adc_power_on` (void)

Enable ADC power.

*Deprecated:*

Use `adc_power_acquire` and `adc_power_release` instead.

void **adc\_power\_off** (void)

Power off SAR ADC.

*Deprecated:*

Use `adc_power_acquire` and `adc_power_release` instead. This function will force power down for ADC. This function is deprecated because forcing power ADC power off may disrupt operation of other components which may be using the ADC.

void **adc\_power\_acquire** (void)

Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.

void **adc\_power\_release** (void)

Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

*esp\_err\_t* **adc1\_pad\_get\_io\_num** (*adc1\_channel\_t* channel, *gpio\_num\_t* \*gpio\_num)

Get the GPIO number of a specific ADC1 channel.

参数

- **channel** –Channel to get the GPIO number
- **gpio\_num** –output buffer to hold the GPIO number

返回

- ESP\_OK if success
- ESP\_ERR\_INVALID\_ARG if channel not valid

*esp\_err\_t* **adc1\_config\_channel\_atten** (*adc1\_channel\_t* channel, *adc\_atten\_t* atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

---

**备注:** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

---

---

**备注:** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

---

**参数**

- **channel** –ADC1 channel to configure
- **atten** –Attenuation level

**返回**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* `adc1_config_width` (*adc\_bits\_width\_t* width\_bit)

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**参数** **width\_bit** –Bit capture width for ADC1

**返回**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

int `adc1_get_raw` (*adc1\_channel\_t* channel)

Take an ADC1 reading from a single channel.

---

**备注:** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

---

---

**备注:** Call `adc1_config_width()` before the first time this function is called.

---

---

**备注:** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

---

**参数** **channel** –ADC1 channel to read

**返回**

- -1: Parameter error
- Other: ADC1 channel reading.

*esp\_err\_t* `adc_set_data_inv` (*adc\_unit\_t* adc\_unit, bool inv\_en)

Set ADC data invert.

**参数**

- **adc\_unit** –ADC unit index
- **inv\_en** –whether enable data invert

**返回**

- ESP\_OK success

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **adc\_set\_clk\_div** (uint8\_t clk\_div)

Set ADC source clock.

参数 **clk\_div** –ADC clock divider, ADC clock is divided from APB clock

返回

- ESP\_OK success

*esp\_err\_t* **adc\_set\_data\_width** (*adc\_unit\_t* adc\_unit, *adc\_bits\_width\_t* width\_bit)

Configure ADC capture width.

参数

- **adc\_unit** –ADC unit index
- **width\_bit** –Bit capture width for ADC unit.

返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

void **adc1\_ulp\_enable** (void)

Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw()` function.

Note that `adc1_config_channel_atten`, `adc1_config_width()` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

*esp\_err\_t* **adc2\_pad\_get\_io\_num** (*adc2\_channel\_t* channel, *gpio\_num\_t* \*gpio\_num)

Get the GPIO number of a specific ADC2 channel.

参数

- **channel** –Channel to get the GPIO number
- **gpio\_num** –output buffer to hold the GPIO number

返回

- ESP\_OK if success
- ESP\_ERR\_INVALID\_ARG if channel not valid

*esp\_err\_t* **adc2\_config\_channel\_atten** (*adc2\_channel\_t* channel, *adc\_atten\_t* atten)

Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300

(下页继续)

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**备注:** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**备注:** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

#### 参数

- **channel** –ADC2 channel to configure
- **atten** –Attenuation level

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **adc2\_get\_raw** (*adc\_channel\_t* channel, *adc\_bits\_width\_t* width\_bit, int \*raw\_out)

Take an ADC2 reading on a single channel.

**备注:** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**备注:** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP\_ERR\_TIMEOUT.

**备注:** ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

#### 参数

- **channel** –ADC2 channel to read
- **width\_bit** –Bit capture width for ADC2
- **raw\_out** –the variable to hold the output data.

#### 返回

- ESP\_OK if success
- ESP\_ERR\_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP\_ERR\_INVALID\_STATE The controller status is invalid. Please try again.

*esp\_err\_t* **adc\_vref\_to\_gpio** (*adc\_unit\_t* adc\_unit, *gpio\_num\_t* gpio)

Output ADC1 or ADC2’s reference voltage to `adc2_chan_t`’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2' s channels. This reference voltage can then be manually measured for calibration purposes.

---

**备注:** ESP32 only supports output of ADC2' s internal reference voltage.

---

#### 参数

- **adc\_unit** –[in] ADC unit index
- **gpio** –[in] GPIO number (Only ADC2' s channels IO are supported)

#### 返回

- ESP\_OK: v\_ref successfully routed to selected GPIO
- ESP\_ERR\_INVALID\_ARG: Unsupported GPIO

*esp\_err\_t* **adc2\_vref\_to\_gpio** (*gpio\_num\_t* gpio)

Output ADC2 reference voltage to *adc2\_channe\_t* ' s IO.

This function routes the internal reference voltage of ADCn to one of ADC2' s channels. This reference voltage can then be manually measured for calibration purposes.

*Deprecated:*

Use *adc\_vref\_to\_gpio* instead.

**参数** **gpio** –[in] GPIO number (ADC2' s channels are supported)

#### 返回

- ESP\_OK: v\_ref successfully routed to selected GPIO
- ESP\_ERR\_INVALID\_ARG: Unsupported GPIO

*esp\_err\_t* **adc\_digi\_initialize** (const *adc\_digi\_init\_config\_t* \*init\_config)

Initialize the Digital ADC.

**参数** **init\_config** –Pointer to Digital ADC initialization config. Refer to *adc\_digi\_init\_config\_t*.

#### 返回

- ESP\_ERR\_INVALID\_ARG If the combination of arguments is invalid.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_NO\_MEM If out of memory
- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_read\_bytes** (*uint8\_t* \*buf, *uint32\_t* length\_max, *uint32\_t* \*out\_length, *uint32\_t* timeout\_ms)

Read bytes from Digital ADC through DMA.

#### 参数

- **buf** –[out] Buffer to read from ADC.
- **length\_max** –[in] Expected length of data read from the ADC.
- **out\_length** –[out] Real length of data read from the ADC via this API.
- **timeout\_ms** –[in] Time to wait for data via this API, in millisecond.

#### 返回

- ESP\_ERR\_INVALID\_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP\_ERR\_TIMEOUT Operation timed out
- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_start** (void)

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

#### 返回

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.

- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_stop** (void)

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

返回

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_deinitialize** (void)

Deinitialize the Digital ADC.

返回

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_controller\_configure** (const *adc\_digi\_configuration\_t* \*config)

Setting the digital controller.

参数 **config** –Pointer to digital controller paramter. Refer to *adc\_digi\_config\_t*.

返回

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_ERR\_INVALID\_ARG If the combination of arguments is invalid.
- ESP\_OK On success

## Structures

struct **adc\_digi\_init\_config\_s**

ADC DMA driver configuration.

## Public Members

uint32\_t **max\_store\_buf\_size**

Max length of the converted data that driver can store before they are processed.

uint32\_t **conv\_num\_each\_intr**

Bytes of data that can be converted in 1 interrupt.

uint32\_t **adc1\_chan\_mask**

Channel list of ADC1 to be initialized.

uint32\_t **adc2\_chan\_mask**

Channel list of ADC2 to be initialized.

struct **adc\_digi\_configuration\_t**

ADC digital controller settings.

## Public Members

bool **conv\_limit\_en**

To limit ADC conversion times. Conversion stops after finishing **conv\_limit\_num** times conversion.

uint32\_t **conv\_limit\_num**

Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32\_t **pattern\_num**

Number of ADC channels that will be used.

*adc\_digi\_pattern\_config\_t* \***adc\_pattern**

List of configs for each ADC channel that will be used.

uint32\_t **sample\_freq\_hz**

The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz  $F_s = F_d / \text{interval} / 2$   $F_s$ : sampling frequency;  $F_d$ : digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

*adc\_digi\_convert\_mode\_t* **conv\_mode**

ADC DMA conversion mode, see *adc\_digi\_convert\_mode\_t*.

*adc\_digi\_output\_format\_t* **format**

ADC DMA conversion output format, see *adc\_digi\_output\_format\_t*.

## Macros

**ADC\_ATTEN\_0db**

ADC rtc controller attenuation option.

---

备注: This definitions are only for being back-compatible

---

**ADC\_ATTEN\_2\_5db**

**ADC\_ATTEN\_6db**

**ADC\_ATTEN\_11db**

**ADC\_WIDTH\_BIT\_DEFAULT**

The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by `SOC_ADC_MAX_BITWIDTH` defined in `soc_caps.h`.

**ADC\_WIDTH\_9Bit**

**ADC\_WIDTH\_10Bit**

**ADC\_WIDTH\_11Bit**

**ADC\_WIDTH\_12Bit**

**ADC\_MAX\_DELAY**

Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.

## Type Definitions

typedef struct *adc\_digi\_init\_config\_s* **adc\_digi\_init\_config\_t**  
ADC DMA driver configuration.

## Enumerations

enum **adc1\_channel\_t**

*Values:*

enumerator **ADC1\_CHANNEL\_0**  
ADC1 channel 0 is GPIO1

enumerator **ADC1\_CHANNEL\_1**  
ADC1 channel 1 is GPIO2

enumerator **ADC1\_CHANNEL\_2**  
ADC1 channel 2 is GPIO3

enumerator **ADC1\_CHANNEL\_3**  
ADC1 channel 3 is GPIO4

enumerator **ADC1\_CHANNEL\_4**  
ADC1 channel 4 is GPIO5

enumerator **ADC1\_CHANNEL\_5**  
ADC1 channel 5 is GPIO6

enumerator **ADC1\_CHANNEL\_6**  
ADC1 channel 6 is GPIO7

enumerator **ADC1\_CHANNEL\_7**  
ADC1 channel 7 is GPIO8

enumerator **ADC1\_CHANNEL\_8**  
ADC1 channel 8 is GPIO9

enumerator **ADC1\_CHANNEL\_9**  
ADC1 channel 9 is GPIO10

enumerator **ADC1\_CHANNEL\_MAX**

enum **adc2\_channel\_t**

*Values:*

enumerator **ADC2\_CHANNEL\_0**  
ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_1**  
ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_2**

ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_3**

ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_4**

ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_5**

ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_6**

ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_7**

ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_8**

ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_9**

ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

enumerator **ADC2\_CHANNEL\_MAX**

enum **adc\_i2s\_encode\_t**

ADC digital controller encode option.

*Deprecated:*

The ESP32-S2 doesn't use I2S DMA. Call `adc_digi_output_format_t` instead.

*Values:*

enumerator **ADC\_ENCODE\_12BIT**

ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data

enumerator **ADC\_ENCODE\_11BIT**

ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

enumerator **ADC\_ENCODE\_MAX**

## Header File

- [components/hal/include/hal/adc\\_types.h](#)

## Structures

struct **adc\_digi\_pattern\_config\_t**

ADC digital controller pattern configuration.

**Public Members****uint8\_t atten**

Attenuation of this ADC channel.

**uint8\_t channel**

ADC channel.

**uint8\_t unit**

ADC unit.

**uint8\_t bit\_width**

ADC output bit width.

struct **adc\_digi\_output\_data\_t**

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

**Public Members****uint32\_t data**

ADC real output data info. Resolution: 13 bit.

**uint32\_t channel**

ADC channel index info. If (channel &lt; ADC\_CHANNEL\_MAX), The data is valid. If (channel &gt; ADC\_CHANNEL\_MAX), The data is invalid.

**uint32\_t unit**

ADC unit index info. 0: ADC1; 1: ADC2.

**uint32\_t reserved17\_31**

Reserved17.

struct *adc\_digi\_output\_data\_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit. ADC\_DIGI\_FORMAT\_11BIT

**uint32\_t val**

Raw data value

struct **adc\_arbiter\_t**

ADC arbiter work mode and priority setting.

---

**备注:** ESP32-S2: Only ADC2 support arbiter.

---

**Public Members***adc\_arbiter\_mode\_t* **mode**Refer to *adc\_arbiter\_mode\_t*. Note: only support ADC2.

`uint8_t rtc_pri`

RTC controller priority. Range: 0 ~ 2.

`uint8_t dig_pri`

Digital controller priority. Range: 0 ~ 2.

`uint8_t pwdet_pri`

Wi-Fi controller priority. Range: 0 ~ 2.

struct `adc_digi_filter_t`

ADC digital controller (DMA mode) filter configuration.

---

**备注:** For ESP32-S2, The filter object of the ADC is fixed.

---

---

**备注:** For ESP32-S2, The filter object is always all enabled channels.

---

### Public Members

`adc_unit_t adc_unit`

Set adc number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

`adc_channel_t channel`

Set adc channel number for filter. For ESP32-S2, it' s always `ADC_CHANNEL_MAX`

`adc_digi_filter_mode_t mode`

Set adc filter mode for filter. See `adc_digi_filter_mode_t`.

struct `adc_digi_monitor_t`

ADC digital controller (DMA mode) monitor configuration.

---

**备注:** For ESP32-S2, The monitor object of the ADC is fixed.

---

---

**备注:** For ESP32-S2, The monitor object is always all enabled channels.

---

### Public Members

`adc_unit_t adc_unit`

Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

`adc_channel_t channel`

Set adc channel number for monitor. For ESP32-S2, it' s always `ADC_CHANNEL_MAX`

***adc\_digi\_monitor\_mode\_t* mode**

Set adc monitor mode. See `adc_digi_monitor_mode_t`.

**uint32\_t threshold**

Set monitor threshold of adc digital controller.

**Macros****ADC\_ARBITER\_CONFIG\_DEFAULT ()**

ADC arbiter default configuration.

---

**备注:** ESP32S2: Only ADC2 supports (needs) an arbiter.

---

**Enumerations**enum **adc\_unit\_t**

ADC unit enumeration.

---

**备注:** For ADC digital controller (DMA mode), ESP32 doesn't support `ADC_UNIT_2`, `ADC_UNIT_BOTH`, `ADC_UNIT_ALTER`.

---

*Values:*

enumerator **ADC\_UNIT\_1**

SAR ADC 1.

enumerator **ADC\_UNIT\_2**

SAR ADC 2.

enumerator **ADC\_UNIT\_BOTH**

SAR ADC 1 and 2.

enumerator **ADC\_UNIT\_ALTER**

SAR ADC 1 and 2 alternative mode.

enumerator **ADC\_UNIT\_MAX**enum **adc\_channel\_t**

ADC channels handle. See `adc1_channel_t`, `adc2_channel_t`.

---

**备注:** For ESP32 ADC1, don't use `ADC_CHANNEL_8`, `ADC_CHANNEL_9`. See `adc1_channel_t`.

---

*Values:*

enumerator **ADC\_CHANNEL\_0**

ADC channel

enumerator **ADC\_CHANNEL\_1**

ADC channel

enumerator **ADC\_CHANNEL\_2**

ADC channel

enumerator **ADC\_CHANNEL\_3**

ADC channel

enumerator **ADC\_CHANNEL\_4**

ADC channel

enumerator **ADC\_CHANNEL\_5**

ADC channel

enumerator **ADC\_CHANNEL\_6**

ADC channel

enumerator **ADC\_CHANNEL\_7**

ADC channel

enumerator **ADC\_CHANNEL\_8**

ADC channel

enumerator **ADC\_CHANNEL\_9**

ADC channel

enumerator **ADC\_CHANNEL\_MAX**

enum **adc\_atten\_t**

ADC attenuation parameter. Different parameters determine the range of the ADC. See `adc1_config_channel_atten`.

*Values:*

enumerator **ADC\_ATTEN\_DB\_0**

No input attenuation, ADC can measure up to approx. 800 mV.

enumerator **ADC\_ATTEN\_DB\_2\_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator **ADC\_ATTEN\_DB\_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator **ADC\_ATTEN\_DB\_11**

The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enumerator **ADC\_ATTEN\_MAX**

enum **adc\_bits\_width\_t**

ADC resolution setting option.

---

**备注:** Only used in single read mode

---

*Values:*

enumerator **ADC\_WIDTH\_BIT\_12**

ADC capture width is 12Bit.

enumerator **ADC\_WIDTH\_MAX**

enum **adc\_digi\_convert\_mode\_t**

ADC digital controller (DMA mode) work mode.

*Values:*

enumerator **ADC\_CONV\_SINGLE\_UNIT\_1**

Only use ADC1 for conversion.

enumerator **ADC\_CONV\_SINGLE\_UNIT\_2**

Only use ADC2 for conversion.

enumerator **ADC\_CONV\_BOTH\_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC\_CONV\_ALTER\_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ....

enumerator **ADC\_CONV\_UNIT\_MAX**

enum **adc\_digi\_output\_format\_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

enumerator **ADC\_DIGI\_FORMAT\_12BIT**

ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (*adc\_digi\_output\_data\_t*). Note: For single convert mode.

enumerator **ADC\_DIGI\_FORMAT\_11BIT**

ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (*adc\_digi\_output\_data\_t*). Note: For multi or alter convert mode.

enumerator **ADC\_DIGI\_FORMAT\_MAX**

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE1**

See *adc\_digi\_output\_data\_t.type1*

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE2**

See [adc\\_digi\\_output\\_data\\_t.type2](#)

enum **adc\_arbiter\_mode\_t**

ADC arbiter work mode option.

---

**备注:** ESP32-S2: Only ADC2 support arbiter.

---

*Values:*

enumerator **ADC\_ARB\_MODE\_SHIELD**

Force shield arbiter, Select the highest priority controller to work.

enumerator **ADC\_ARB\_MODE\_FIX**

Fixed priority switch controller mode.

enumerator **ADC\_ARB\_MODE\_LOOP**

Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch to the next controller after the measurement is completed.

enum **adc\_digi\_filter\_idx\_t**

ADC digital controller (DMA mode) filter index options.

---

**备注:** For ESP32-S2, The filter object of the ADC is fixed.

---

*Values:*

enumerator **ADC\_DIGI\_FILTER\_IDX0**

The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

enumerator **ADC\_DIGI\_FILTER\_IDX1**

The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

enumerator **ADC\_DIGI\_FILTER\_IDX\_MAX**

enum **adc\_digi\_filter\_mode\_t**

ADC digital controller (DMA mode) filter type options. Expression:  $\text{filter\_data} = (k-1)/k * \text{last\_data} + \text{new\_data} / k$ .

*Values:*

enumerator **ADC\_DIGI\_FILTER\_IIR\_2**

The filter mode is first-order IIR filter. The coefficient is 2.

enumerator **ADC\_DIGI\_FILTER\_IIR\_4**

The filter mode is first-order IIR filter. The coefficient is 4.

enumerator **ADC\_DIGI\_FILTER\_IIR\_8**

The filter mode is first-order IIR filter. The coefficient is 8.

enumerator **ADC\_DIGI\_FILTER\_IIR\_16**

The filter mode is first-order IIR filter. The coefficient is 16.

enumerator **ADC\_DIGI\_FILTER\_IIR\_64**

The filter mode is first-order IIR filter. The coefficient is 64.

enumerator **ADC\_DIGI\_FILTER\_IIR\_MAX**

enum **adc\_digi\_monitor\_idx\_t**

ADC digital controller (DMA mode) monitor index options.

---

**备注:** For ESP32-S2, The monitor object of the ADC is fixed.

---

*Values:*

enumerator **ADC\_DIGI\_MONITOR\_IDX0**

The monitor index 0. For ESP32-S2, It can only be used to monitor all enabled channels of ADC1 unit at the same time.

enumerator **ADC\_DIGI\_MONITOR\_IDX1**

The monitor index 1. For ESP32-S2, It can only be used to monitor all enabled channels of ADC2 unit at the same time.

enumerator **ADC\_DIGI\_MONITOR\_IDX\_MAX**

enum **adc\_digi\_monitor\_mode\_t**

Set monitor mode of adc digital controller. **MONITOR\_HIGH**: If  $ADC\_OUT > threshold$ , Generates monitor interrupt. **MONITOR\_LOW**: If  $ADC\_OUT < threshold$ , Generates monitor interrupt.

*Values:*

enumerator **ADC\_DIGI\_MONITOR\_HIGH**

If  $ADC\_OUT > threshold$ , Generates monitor interrupt.

enumerator **ADC\_DIGI\_MONITOR\_LOW**

If  $ADC\_OUT < threshold$ , Generates monitor interrupt.

enumerator **ADC\_DIGI\_MONITOR\_MAX**

enum **adc\_i2s\_source\_t**

ESP32 ADC DMA source selection.

*Deprecated:*

Not applicable on ESP32-S2 because ESP32-S2 doesn't use I2S DMA.

*Values:*

enumerator **ADC\_I2S\_DATA\_SRC\_IO\_SIG**

I2S data from GPIO matrix signal

enumerator **ADC\_I2S\_DATA\_SRC\_ADC**

I2S data from ADC

enumerator **ADC\_I2S\_DATA\_SRC\_MAX**

## ADC Calibration

### Header File

- [components/esp\\_adc\\_cal/include/esp\\_adc\\_cal.h](#)

### Functions

*esp\_err\_t* **esp\_adc\_cal\_check\_efuse** (*esp\_adc\_cal\_value\_t* value\_type)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

---

**备注:** in ESP32S2, only ESP\_ADC\_CAL\_VAL\_EFUSE\_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

---

**参数 value\_type** –Type of calibration value (ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF or ESP\_ADC\_CAL\_VAL\_EFUSE\_TP)

**返回**

- **ESP\_OK:** The calibration mode is supported in eFuse
- **ESP\_ERR\_NOT\_SUPPORTED:** Error, eFuse values are not burned
- **ESP\_ERR\_INVALID\_ARG:** Error, invalid argument (ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF)

*esp\_adc\_cal\_value\_t* **esp\_adc\_cal\_characterize** (*adc\_unit\_t* adc\_num, *adc\_atten\_t* atten, *adc\_bits\_width\_t* bit\_width, uint32\_t default\_vref, *esp\_adc\_cal\_characteristics\_t* \*chars)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of  $[y = \text{coeff\_a} * x + \text{coeff\_b}]$ . Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

---

**备注:** For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC\_WIDTH\_BIT\_13 is supported. The parameter default\_vref is unused.

---

**参数**

- **adc\_num** –[in] ADC to characterize (ADC\_UNIT\_1 or ADC\_UNIT\_2)
- **atten** –[in] Attenuation to characterize
- **bit\_width** –[in] Bit width configuration of ADC
- **default\_vref** –[in] Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)

- **chars** **–[out]** Pointer to empty structure used to store ADC characteristics
- 返回
- ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF: eFuse Vref used for characterization
  - ESP\_ADC\_CAL\_VAL\_EFUSE\_TP: Two Point value used for characterization (only in Linear Mode)
  - ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF: Default Vref used for characterization

uint32\_t **esp\_adc\_cal\_raw\_to\_voltage** (uint32\_t adc\_reading, const *esp\_adc\_cal\_characteristics\_t* \*chars)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC's characteristics.

---

**备注:** Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

---

#### 参数

- **adc\_reading** **–[in]** ADC reading
- **chars** **–[in]** Pointer to initialized structure containing ADC characteristics

返回 Voltage in mV

*esp\_err\_t* **esp\_adc\_cal\_get\_voltage** (*adc\_channel\_t* channel, const *esp\_adc\_cal\_characteristics\_t* \*chars, uint32\_t \*voltage)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

---

**备注:** The Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

---

#### 参数

- **channel** **–[in]** ADC Channel to read
- **chars** **–[in]** Pointer to initialized ADC characteristics structure
- **voltage** **–[out]** Pointer to store converted voltage

#### 返回

- ESP\_OK: ADC read and converted to mV
- ESP\_ERR\_INVALID\_ARG: Error due to invalid arguments
- ESP\_ERR\_INVALID\_STATE: Reading result is invalid. Try to read again.

## Structures

struct **esp\_adc\_cal\_characteristics\_t**

Structure storing characteristics of an ADC.

---

**备注:** Call `esp_adc_cal_characterize()` to initialize the structure

---

## Public Members

*adc\_unit\_t* **adc\_num**

ADC number

`adc_atten_t atten`

ADC attenuation

`adc_bits_width_t bit_width`

ADC bit width

`uint32_t coeff_a`

Gradient of ADC-Voltage curve

`uint32_t coeff_b`

Offset of ADC-Voltage curve

`uint32_t vref`

Vref used by lookup table

`const uint32_t *low_curve`

Pointer to low Vref curve of lookup table (NULL if unused)

`const uint32_t *high_curve`

Pointer to high Vref curve of lookup table (NULL if unused)

`uint8_t version`

ADC Calibration

## Enumerations

enum `esp_adc_cal_value_t`

Type of calibration value used in characterization.

*Values:*

enumerator `ESP_ADC_CAL_VAL_EFUSE_VREF`

Characterization based on reference voltage stored in eFuse

enumerator `ESP_ADC_CAL_VAL_EFUSE_TP`

Characterization based on Two Point values stored in eFuse

enumerator `ESP_ADC_CAL_VAL_DEFAULT_VREF`

Characterization based on default reference voltage

enumerator `ESP_ADC_CAL_VAL_EFUSE_TP_FIT`

Characterization based on Two Point values and fitting curve coefficients stored in eFuse

enumerator `ESP_ADC_CAL_VAL_MAX`

enumerator `ESP_ADC_CAL_VAL_NOT_SUPPORTED`

## 2.3.2 GPIO & RTC GPIO

### Overview

The ESP32-S3 chip features 45 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF]. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	RTC GPIO	Comment
GPIO0		RTC_GPIO0	Strapping pin
GPIO1	ADC1_CH0	RTC_GPIO1	
GPIO2	ADC1_CH1	RTC_GPIO2	
GPIO3	ADC1_CH2	RTC_GPIO3	Strapping pin
GPIO4	ADC1_CH3	RTC_GPIO4	
GPIO5	ADC1_CH4	RTC_GPIO5	
GPIO6	ADC1_CH5	RTC_GPIO6	
GPIO7	ADC1_CH6	RTC_GPIO7	
GPIO8	ADC1_CH7	RTC_GPIO8	
GPIO9	ADC1_CH8	RTC_GPIO9	
GPIO10	ADC1_CH9	RTC_GPIO10	
GPIO11	ADC2_CH0	RTC_GPIO11	
GPIO12	ADC2_CH1	RTC_GPIO12	
GPIO13	ADC2_CH2	RTC_GPIO13	
GPIO14	ADC2_CH3	RTC_GPIO14	
GPIO15	ADC2_CH4	RTC_GPIO15	
GPIO16	ADC2_CH5	RTC_GPIO16	
GPIO17	ADC2_CH6	RTC_GPIO17	
GPIO18	ADC2_CH7	RTC_GPIO18	
GPIO19	ADC2_CH8	RTC_GPIO19	USB-JTAG
GPIO20	ADC2_CH9	RTC_GPIO20	USB-JTAG
GPIO21		RTC_GPIO21	
GPIO26			SPI0/1
GPIO27			SPI0/1
GPIO28			SPI0/1
GPIO29			SPI0/1
GPIO30			SPI0/1
GPIO31			SPI0/1
GPIO32			SPI0/1
GPIO33			SPI0/1
GPIO34			SPI0/1
GPIO35			SPI0/1
GPIO36			SPI0/1
GPIO37			SPI0/1
GPIO38			
GPIO39			
GPIO40			
GPIO41			
GPIO42			
GPIO43			
GPIO44			
GPIO45			Strapping pin
GPIO46			Strapping pin
GPIO47			
GPIO48			

#### 备注:

- Strapping pin: GPIO0, GPIO3, GPIO45 and GPIO46 are strapping pins.
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses. When using Octal Flash or Octal PSRAM or both, GPIO33~37 are connected to SPI04 ~ SPI07 and SPIDQS. Therefore on ESP32-S3R8 / ESP32-S3R8V board GPIO33~37 are also not recommended for other uses.

- USB-JTAG: GPIO 19 and 20 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.

### Application Example

GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

### API Reference - Normal GPIO

#### Header File

- [components/driver/include/driver/gpio.h](#)

#### Functions

`esp_err_t gpio_config` (const `gpio_config_t` \*pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

**参数** `pGPIOConfig` –Pointer to GPIO configure struct

**返回**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t gpio_reset_pin` (`gpio_num_t` gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

---

**备注:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

---

**参数** `gpio_num` –GPIO number.

**返回** Always return ESP\_OK.

`esp_err_t gpio_set_intr_type` (`gpio_num_t` gpio\_num, `gpio_int_type_t` intr\_type)

GPIO set interrupt trigger type.

**参数**

- `gpio_num` –GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `intr_type` –Interrupt type, select from `gpio_int_type_t`

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t gpio_intr_enable` (`gpio_num_t` gpio\_num)

Enable GPIO module interrupt signal.

---

**备注:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

---

**参数** `gpio_num` –GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t gpio_intr_disable(gpio_num_t gpio_num)`

Disable GPIO module interrupt signal.

**参数** `gpio_num` –GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**返回**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)`

GPIO set output level.

**参数**

- `gpio_num` –GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level` –Output level. 0: low ; 1: high

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO number error

`int gpio_get_level(gpio_num_t gpio_num)`

GPIO get input level.

**警告:** If the pad is not configured for input (or input and output) the returned value is always 0.

**参数** `gpio_num` –GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**返回**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

`esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)`

GPIO set direction.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

**参数**

- `gpio_num` –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` –GPIO direction

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error

*esp\_err\_t* **gpio\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors.

---

**备注:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**参数**

- **gpio\_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** –GPIO pull up/down mode.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable GPIO wake-up function.

**参数**

- **gpio\_num** –GPIO number.
- **intr\_type** –GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO wake-up function.

**参数** **gpio\_num** –GPIO number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**参数**

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**返回**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-up on GPIO.

**参数** **gpio\_num** –GPIO number

**返回**

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-up on GPIO.

参数 **gpio\_num** –GPIO number

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpiopulldown\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-down on GPIO.

参数 **gpio\_num** –GPIO number

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpiopulldown\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-down on GPIO.

参数 **gpio\_num** –GPIO number

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

参数 **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

返回

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

参数

- **gpio\_num** –GPIO number
- **isr\_handler** –ISR handler function for the corresponding GPIO number.
- **args** –parameter for ISR handler.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (*gpio\_num\_t* gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**参数** *gpio\_num* –GPIO number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

**参数**

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

**参数**

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**参数** *gpio\_num* –GPIO number, only support output-capable GPIOs

**返回**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

*esp\_err\_t* **gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**参数** *gpio\_num* –GPIO number, only support output-capable GPIOs

**返回**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

void **gpio\_deep\_sleep\_hold\_en** (void)

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void **gpio\_deep\_sleep\_hold\_dis** (void)

Disable all digital gpio pad hold function during Deep-sleep.

void **gpio\_iomux\_in** (uint32\_t gpio\_num, uint32\_t signal\_idx)

Set pad input to a peripheral signal through the IOMUX.

参数

- **gpio\_num** –GPIO number of the pad.
- **signal\_idx** –Peripheral signal id to input. One of the \*\_IN\_IDX signals in `soc/gpio_sig_map.h`.

void **gpio\_iomux\_out** (uint8\_t gpio\_num, int func, bool oen\_inv)

Set peripheral output to an GPIO pad through the IOMUX.

参数

- **gpio\_num** –gpio\_num GPIO number of the pad.
- **func** –The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in `soc/io_mux_reg.h`.
- **oen\_inv** –True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_force\_hold\_all** (void)

Force hold digital and rtc gpio pad.

---

备注: GPIO force hold, whether the chip in sleep mode or wakeup mode.

---

*esp\_err\_t* **gpio\_force\_unhold\_all** (void)

Force unhold digital and rtc gpio pad.

---

备注: GPIO force unhold, whether the chip in sleep mode or wakeup mode.

---

*esp\_err\_t* **gpio\_sleep\_sel\_en** (*gpio\_num\_t* gpio\_num)

Enable SLP\_SEL to change GPIO status automantically in lightsleep.

参数 **gpio\_num** –GPIO number of the pad.

返回

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (*gpio\_num\_t* gpio\_num)

Disable SLP\_SEL to change GPIO status automantically in lightsleep.

参数 **gpio\_num** –GPIO number of the pad.

返回

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

参数

- **gpio\_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** –GPIO direction

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**备注:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**参数**

- **gpio\_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** –GPIO pull up/down mode.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

**Macros****GPIO\_PIN\_COUNT**

**GPIO\_IS\_VALID\_GPIO** (gpio\_num)

Check whether it is a valid GPIO number.

**GPIO\_IS\_VALID\_OUTPUT\_GPIO** (gpio\_num)

Check whether it can be a valid GPIO number of output mode.

**Type Definitions**

typedef *intr\_handle\_t* **gpio\_isr\_handle\_t**

**Header File**

- [components/hal/include/hal/gpio\\_types.h](#)

**Structures**

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for gpio\_config function.

**Public Members**

uint64\_t **pin\_bit\_mask**

GPIO pin: set with bit mask, each bit maps to a GPIO

*gpio\_mode\_t* **mode**

GPIO mode: set input/output mode

*gpio\_pullup\_t* pull\_up\_en

GPIO pull-up

*gpio\_pulldown\_t* pull\_down\_en

GPIO pull-down

*gpio\_int\_type\_t* intr\_type

GPIO interrupt type

enumerator **GPIO\_NUM\_47**  
GPIO47, input and output

enumerator **GPIO\_NUM\_48**  
GPIO48, input and output

enumerator **GPIO\_NUM\_MAX**

enum **gpio\_int\_type\_t**

*Values:*

enumerator **GPIO\_INTR\_DISABLE**  
Disable GPIO interrupt

enumerator **GPIO\_INTR\_POSEDGE**  
GPIO interrupt type : rising edge

enumerator **GPIO\_INTR\_NEGEDGE**  
GPIO interrupt type : falling edge

enumerator **GPIO\_INTR\_ANYEDGE**  
GPIO interrupt type : both rising and falling edge

enumerator **GPIO\_INTR\_LOW\_LEVEL**  
GPIO interrupt type : input low level trigger

enumerator **GPIO\_INTR\_HIGH\_LEVEL**  
GPIO interrupt type : input high level trigger

enumerator **GPIO\_INTR\_MAX**

enum **gpio\_mode\_t**

*Values:*

enumerator **GPIO\_MODE\_DISABLE**  
GPIO mode : disable input and output

enumerator **GPIO\_MODE\_INPUT**  
GPIO mode : input only

enumerator **GPIO\_MODE\_OUTPUT**

GPIO mode : output only mode

enumerator **GPIO\_MODE\_OUTPUT\_OD**

GPIO mode : output only with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT\_OD**

GPIO mode : output and input with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT**

GPIO mode : output and input mode

enum **gpio\_pullup\_t**

*Values:*

enumerator **GPIO\_PULLUP\_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO\_PULLUP\_ENABLE**

Enable GPIO pull-up resistor

enum **gpio\_pulldown\_t**

*Values:*

enumerator **GPIO\_PULLDOWN\_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO\_PULLDOWN\_ENABLE**

Enable GPIO pull-down resistor

enum **gpio\_pull\_mode\_t**

*Values:*

enumerator **GPIO\_PULLUP\_ONLY**

Pad pull up

enumerator **GPIO\_PULLDOWN\_ONLY**

Pad pull down

enumerator **GPIO\_PULLUP\_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO\_FLOATING**

Pad floating

enum **gpio\_drive\_cap\_t**

*Values:*

enumerator **GPIO\_DRIVE\_CAP\_0**

Pad drive capability: weak

enumerator **GPIO\_DRIVE\_CAP\_1**

Pad drive capability: stronger

enumerator **GPIO\_DRIVE\_CAP\_2**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_DEFAULT**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_3**

Pad drive capability: strongest

enumerator **GPIO\_DRIVE\_CAP\_MAX**

## API Reference - RTC GPIO

### Header File

- [components/driver/include/driver/rtc\\_io.h](#)

### Functions

static inline bool **rtc\_gpio\_is\_valid\_gpio** (*gpio\_num\_t* gpio\_num)

Determine if the specified GPIO is a valid RTC GPIO.

参数 **gpio\_num** –GPIO number

返回 true if GPIO is valid for RTC GPIO use. false otherwise.

static inline int **rtc\_io\_number\_get** (*gpio\_num\_t* gpio\_num)

Get RTC IO index number by gpio number.

参数 **gpio\_num** –GPIO number

返回 >=0: Index of rtcio. -1 : The gpio is not rtcio.

*esp\_err\_t* **rtc\_gpio\_init** (*gpio\_num\_t* gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

参数 **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_deinit** (*gpio\_num\_t* gpio\_num)

Init a GPIO as digital GPIO.

参数 **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

uint32\_t **rtc\_gpio\_get\_level** (*gpio\_num\_t* gpio\_num)

Get the RTC IO input level.

参数 **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- 1 High level
- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_level** (*gpio\_num\_t* gpio\_num, uint32\_t level)

Set the RTC IO output level.

**参数**

- **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)
- **level** –output level

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction** (*gpio\_num\_t* gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**参数**

- **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)
- **mode** –GPIO direction

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction\_in\_sleep** (*gpio\_num\_t* gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT\_ONLY mode. ESP32S2 support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**参数**

- **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)
- **mode** –GPIO direction

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**参数** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_en** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

**参数** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**参数** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**参数** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set RTC GPIO pad drive capability.

**参数**

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get RTC GPIO pad drive capability.

**参数**

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**参数** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**参数** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

***esp\_err\_t* rtc\_gpio\_isolate(*gpio\_num\_t* gpio\_num)**

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call `rtc_gpio_isolate(GPIO_NUM_12)` before entering deep sleep, to reduce deep sleep current.

**参数** `gpio_num` –GPIO number (e.g. `GPIO_NUM_12`).

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if GPIO is not an RTC IO

***esp\_err\_t* rtc\_gpio\_force\_hold\_all(void)**

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

***esp\_err\_t* rtc\_gpio\_force\_hold\_dis\_all(void)**

Disable force hold signal for all RTC IOs.

***esp\_err\_t* rtc\_gpio\_wakeup\_enable(*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)**

Enable wakeup from sleep mode using specific GPIO.

**参数**

- `gpio_num` –GPIO number
- `intr_type` –Wakeup on high level (`GPIO_INTR_HIGH_LEVEL`) or low level (`GPIO_INTR_LOW_LEVEL`)

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `gpio_num` is not an RTC IO, or `intr_type` is not one of `GPIO_INTR_HIGH_LEVEL`, `GPIO_INTR_LOW_LEVEL`.

***esp\_err\_t* rtc\_gpio\_wakeup\_disable(*gpio\_num\_t* gpio\_num)**

Disable wakeup from sleep mode using specific GPIO.

**参数** `gpio_num` –GPIO number

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `gpio_num` is not an RTC IO

**Macros**

`RTC_GPIO_IS_VALID_GPIO` (`gpio_num`)

**Header File**

- `components/hal/include/hal/rtc_io_types.h`

**Enumerations**

enum `rtc_gpio_mode_t`

RTCIO output/input mode type.

*Values:*

enumerator `RTC_GPIO_MODE_INPUT_ONLY`

Pad input

```

enumerator RTC_GPIO_MODE_OUTPUT_ONLY
    Pad output

enumerator RTC_GPIO_MODE_INPUT_OUTPUT
    Pad input + output

enumerator RTC_GPIO_MODE_DISABLED
    Pad (output + input) disable

enumerator RTC_GPIO_MODE_OUTPUT_OD
    Pad open-drain output

enumerator RTC_GPIO_MODE_INPUT_OUTPUT_OD
    Pad input + open-drain output

```

### 2.3.3 通用定时器

#### 简介

ESP32-S3 芯片提供两组硬件定时器，每组包含两个通用硬件定时器。所有通用定时器均基于 16 位预分频器和 54 位可自动重新加载向上/向下计数器。

#### 功能概述

下文介绍了配置和操作定时器的常规步骤：

- **定时器初始化** - 启动定时器前应设置的参数，以及每个设置提供的具体功能。
- **定时器控制** - 如何读取定时器的值，如何暂停/启动定时器以及如何改变定时器的操作方式。
- **警报** - 如何设置和使用警报。
- **处理中断事务** - 如何使用中断提供的回调函数。

**定时器初始化** 两个 ESP32-S3 定时器组中，每组都有两个定时器，两组共有四个定时器供使用。ESP32-S3 定时器组的类型为 `timer_group_t`，每组中的个体定时器类型为 `timer_idx_t`。

首先调用 `timer_init()` 函数，并将 `timer_config_t` 结构体传递给此函数，用于定义定时器的工作方式，实现定时器初始化。特别注意以下定时器参数可设置为：

- **时钟源**: 选择时钟源，与时钟分频器一起决定了定时器的分辨率。
- **分频器**: 设置定时器中计数器计数的速度，`divider` 的设置将用作输入时钟源的除数。默认的时钟源是 APB\_CLK (一般是 80 MHz)。更多有关 APB\_CLK 时钟频率信息，请查看 [ESP32-S3 技术参考手册 > 复位和时钟 \[PDF\]](#) 章节。
- **模式**: 设置计数器是递增还是递减。可通过从 `timer_count_dir_t` 中选取一个值，后使用 `counter_dir` 来选择模式。
- **计数器使能**: 如果计数器已使能，则在调用 `timer_init()` 后计数器将立即开始递增/递减。您可通过从 `timer_start_t` 中选取一个值，后使用 `counter_en` 改变此行为。
- **报警使能**: 可使用 `alarm_en` 设置。
- **自动重载**: 设置计数器是否应该在定时器警报上使用 `auto_reload` 自动重载首个计数值，还是继续递增或递减。

要获取定时器设置的当前值，请使用函数 `timer_get_config()`。

**定时器控制** 定时器使能后便开始计数。要启用定时器，可首先设置 `counter_en` 为 `true`，然后调用函数 `timer_init()`，或者直接调用函数 `timer_start()`。您可通过调用函数 `timer_set_counter_value()` 来指定定时器的首个计数值。要检查定时器的当前值，调用函数 `timer_get_counter_value()` 或 `timer_get_counter_time_sec()`。

可通过调用函数 `timer_pause()` 随时暂停定时器。要再次启动它，调用函数 `timer_start()`。

要重新配置定时器，可调用函数 `timer_init()`，该函数详细介绍见 [定时器初始化](#)。

除此之外，还可通过使用专有函数更改个别设置来重新配置定时器：

设置	专有函数	描述
分频器	<code>timer_set_divider()</code>	更改计数频率。为避免发生不可预测情况，更改分频器时应暂停定时器。如果定时器正在运行，则使用 <code>timer_set_divider()</code> 将其暂停并更改设置，然后重启定时器。
模式	<code>timer_set_counter_mode()</code>	设置计数器应递增还是递减
自动重载	<code>timer_set_auto_reload()</code>	设置是否应在定时器警报上重载首个计数值

**警报** 要设置警报，先调用函数 `timer_set_alarm_value()`，然后使用 `timer_set_alarm()` 使能警报。当调用函数 `timer_init()` 时，也可以在定时器初始化阶段使能警报。

警报已使能且定时器达到警报值后，根据配置，可能会出现以下两种行为：

- 如果先前已配置，此时将触发中断。有关如何配置中断，请参见 [处理中断事务](#)。
- 如 `auto_reload` 已使能，定时器的计数器将重新加载，从先前配置好的值开始再次计数。应使用函数 `timer_set_counter_value()` 预先设置该值。

#### 备注：

- 如果已设置警报值且定时器已超过该值，则将立即触发警报。
- 一旦触发后，警报将自动关闭，需要重新使能以再次触发。

要检查某特定的警报值，调用函数 `timer_get_alarm_value()`。

**处理中断事务** 调用 `timer_isr_callback_add()` 函数可以给某个定时器注册一个中断回调函数，顾名思义，该函数会在中断上下文中被执行，因此用户不能在回调函数中调用任何会阻塞 CPU 的 API。相较于从头编写中断处理程序，使用中断回调函数的好处是，用户无需检测和处理中断的状态位，这些操作会由驱动中默认的中断处理程序替我们完成。

有关如何使用中断回调函数，请参考如下应用示例。

#### 应用示例

54 位通用硬件定时器示例：[peripherals/timer\\_group](#)。

##### Header File

- [components/driver/include/driver/timer.h](#)

**Functions**

*esp\_err\_t* **timer\_get\_counter\_value** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, uint64\_t \*timer\_val)

Read the counter value of hardware timer.

**参数**

- **group\_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **timer\_val** –Pointer to accept timer counter value.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_get\_counter\_time\_sec** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, double \*time)

Read the counter value of hardware timer, in unit of a given scale.

**参数**

- **group\_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **time** –Pointer, type of double\*, to accept timer counter value, in seconds.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_set\_counter\_value** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, uint64\_t load\_val)

Set counter value to hardware timer.

**参数**

- **group\_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **load\_val** –Counter value to write to the hardware timer.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_start** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Start the counter of hardware timer.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_pause** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Pause the counter of hardware timer.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_set\_counter\_mode** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_count\_dir\_t* counter\_dir)

Set counting mode for hardware timer.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **counter\_dir** –Counting direction of timer, count-up or count-down

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_set\_auto\_reload** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_autoreload\_t* reload)

Enable or disable counter reload function when alarm event occurs.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **reload** –Counter reload mode.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_set\_divider** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *uint32\_t* divider)

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **divider** –Timer clock divider value. The divider' s range is from from 2 to 65536.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_set\_alarm\_value** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *uint64\_t* alarm\_value)

Set timer alarm value.

**参数**

- **group\_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **alarm\_value** –A 64-bit value to set the alarm value.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_get\_alarm\_value** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *uint64\_t* \*alarm\_value)

Get timer alarm value.

**参数**

- **group\_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **alarm\_value** –Pointer of A 64-bit value to accept the alarm value.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_set\_alarm** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_alarm\_t* alarm\_en)

Enable or disable generation of timer alarm events.

**参数**

- **group\_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- **alarm\_en** –To enable or disable timer alarm function.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_isr\_callback\_add** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_isr\_t* isr\_handler, void \*arg, int intr\_alloc\_flags)

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

If the intr\_alloc\_flags value ESP\_INTR\_FLAG\_IRAM is set, the handler function must be declared with IRAM\_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

---

**备注:** This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call timer\_isr\_register(...) to register ISR.

---

**参数**

- **group\_num** –Timer group number
- **timer\_num** –Timer index of timer group
- **isr\_handler** –Interrupt handler function, it is a callback function.
- **arg** –Parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_isr\_callback\_remove** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Remove ISR handle callback for the corresponding timer.

**参数**

- **group\_num** –Timer group number
- **timer\_num** –Timer index of timer group

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_isr\_register** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *timer\_isr\_handle\_t* \*handle)

Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the intr\_alloc\_flags value ESP\_INTR\_FLAG\_IRAM is set, the handler function must be declared with IRAM\_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

---

**备注:** If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call timer\_spinlock\_take(..) before your handling, and call timer\_spinlock\_give(...) after your handling.

---

**参数**

- **group\_num** –Timer group number
- **timer\_num** –Timer index of timer group
- **fn** –Interrupt handler function.

- **arg** –Parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_init(timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)`

Initializes and configure the timer.

#### 参数

- **group\_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer\_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- **config** –Pointer to timer initialization parameters.

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_deinit(timer_group_t group_num, timer_idx_t timer_num)`

Deinitializes the timer.

#### 参数

- **group\_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer\_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_get_config(timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)`

Get timer configure value.

#### 参数

- **group\_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer\_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- **config** –Pointer of struct to accept timer parameters.

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_group_intr_enable(timer_group_t group_num, timer_intr_t intr_mask)`

Enable timer group interrupt, by enable mask.

#### 参数

- **group\_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **intr\_mask** –Timer interrupt enable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_group_intr_disable(timer_group_t group_num, timer_intr_t intr_mask)`

Disable timer group interrupt, by disable mask.

#### 参数

- **group\_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **intr\_mask** –Timer interrupt disable mask.
  - `TIMER_INTR_T0`: t0 interrupt

- TIMER\_INTR\_T1: t1 interrupt
- TIMER\_INTR\_WDT: watchdog interrupt

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_enable\_intr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Enable timer interrupt.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_disable\_intr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Disable timer interrupt.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

void **timer\_group\_intr\_clr\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Clear timer interrupt status, just used in ISR.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.

void **timer\_group\_clr\_intr\_status\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Clear timer interrupt status, just used in ISR.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.

void **timer\_group\_enable\_alarm\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Enable alarm interrupt, just used in ISR.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.

uint64\_t **timer\_group\_get\_counter\_value\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Get the current counter value, just used in ISR.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.

**返回**

- Counter value

void **timer\_group\_set\_alarm\_value\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, uint64\_t alarm\_val)

Set the alarm threshold for the timer, just used in ISR.

**参数**

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

- **timer\_num** –Timer index.
- **alarm\_val** –Alarm threshold.

void **timer\_group\_set\_counter\_enable\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_start\_t* counter\_en)

Enable/disable a counter, just used in ISR.

参数

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index.
- **counter\_en** –Enable/disable.

*timer\_intr\_t* **timer\_group\_intr\_get\_in\_isr** (*timer\_group\_t* group\_num)

Get the masked interrupt status, just used in ISR.

参数

**group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

返回

- Interrupt status

uint32\_t **timer\_group\_get\_intr\_status\_in\_isr** (*timer\_group\_t* group\_num)

Get interrupt status, just used in ISR.

参数

**group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

返回

- Interrupt status

void **timer\_group\_clr\_intr\_sta\_in\_isr** (*timer\_group\_t* group\_num, *timer\_intr\_t* intr\_mask)

Clear the masked interrupt status, just used in ISR.

参数

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr\_mask** –Masked interrupt.

bool **timer\_group\_get\_auto\_reload\_in\_isr** (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Get auto reload enable status, just used in ISR.

参数

- **group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer\_num** –Timer index

返回

- True Auto reload enabled
- False Auto reload disabled

*esp\_err\_t* **timer\_spinlock\_take** (*timer\_group\_t* group\_num)

Take timer spinlock to enter critical protect.

---

备注: Deprecated, the recommended way is to use ISR callbacks instead, see timer\_group\_example\_main

---

参数

**group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **timer\_spinlock\_give** (*timer\_group\_t* group\_num)

Give timer spinlock to exit critical protect.

---

备注: Deprecated, the recommended way is to use ISR callbacks instead, see timer\_group\_example\_main

---

参数

**group\_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Macros****TIMER\_BASE\_CLK**

Frequency of the clock on the input of the timer groups

**Type Definitions**

```
typedef bool (*timer_isr_t)(void*)
```

Interrupt handle callback function. User need to retrun a bool value in callback.

---

**备注:** If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

---

**Return**

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

```
typedef intr_handle_t timer_isr_handle_t
```

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

**Header File**

- `components/hal/include/hal/timer_types.h`

**Structures**

```
struct timer_config_t
```

Data structure with timer' s configuration settings.

**Public Members**

*timer\_alarm\_t* **alarm\_en**

Timer alarm enable

*timer\_start\_t* **counter\_en**

Counter enable

*timer\_intr\_mode\_t* **intr\_type**

Interrupt mode

*timer\_count\_dir\_t* **counter\_dir**

Counter direction

*timer\_autoreload\_t* **auto\_reload**

Timer auto-reload

uint32\_t **divider**

Counter clock divider. The divider's range is from 2 to 65536.

*timer\_src\_clk\_t* **clk\_src**

Use XTAL as source clock.

## Enumerations

enum **timer\_group\_t**

Selects a Timer-Group out of 2 available groups.

*Values:*

enumerator **TIMER\_GROUP\_0**

Hw timer group 0

enumerator **TIMER\_GROUP\_1**

Hw timer group 1

enumerator **TIMER\_GROUP\_MAX**

enum **timer\_idx\_t**

Select a hardware timer from timer groups.

*Values:*

enumerator **TIMER\_0**

Select timer0 of GROUPx

enumerator **TIMER\_1**

Select timer1 of GROUPx

enumerator **TIMER\_MAX**

enum **timer\_count\_dir\_t**

Decides the direction of counter.

*Values:*

enumerator **TIMER\_COUNT\_DOWN**

Descending Count from cnt.hi|cnt.low

enumerator **TIMER\_COUNT\_UP**

Ascending Count from Zero

enumerator **TIMER\_COUNT\_MAX**

enum **timer\_start\_t**

Decides whether timer is on or paused.

*Values:*

enumerator **TIMER\_PAUSE**

Pause timer counter

enumerator **TIMER\_START**

Start timer counter

enum **timer\_intr\_t**

Interrupt types of the timer.

*Values:*

enumerator **TIMER\_INTR\_T0**

interrupt of timer 0

enumerator **TIMER\_INTR\_T1**

interrupt of timer 1

enumerator **TIMER\_INTR\_WDT**

interrupt of watchdog

enumerator **TIMER\_INTR\_NONE**

enum **timer\_alarm\_t**

Decides whether to enable alarm mode.

*Values:*

enumerator **TIMER\_ALARM\_DIS**

Disable timer alarm

enumerator **TIMER\_ALARM\_EN**

Enable timer alarm

enumerator **TIMER\_ALARM\_MAX**

enum **timer\_intr\_mode\_t**

Select interrupt type if running in alarm mode.

*Values:*

enumerator **TIMER\_INTR\_LEVEL**

Interrupt mode: level mode

enumerator **TIMER\_INTR\_MAX**

enum `timer_autoreload_t`

Select if Alarm needs to be loaded by software or automatically reload by hardware.

*Values:*

enumerator `TIMER_AUTORELOAD_DIS`

Disable auto-reload: hardware will not load counter value after an alarm event

enumerator `TIMER_AUTORELOAD_EN`

Enable auto-reload: hardware will load counter value after an alarm event

enumerator `TIMER_AUTORELOAD_MAX`

enum `timer_src_clk_t`

Select timer source clock.

*Values:*

enumerator `TIMER_SRC_CLK_APB`

Select APB as the source clock

enumerator `TIMER_SRC_CLK_XTAL`

Select XTAL as the source clock

## 2.3.4 Dedicated GPIO

### Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

### Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’ s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

---

**备注:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’ s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’ s impossible to control GPIOA.

---

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.

- `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
- `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

**备注:** `dedic_gpio_new_bundle()` doesn't cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

## GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that input to bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that output from bundle	<code>dedic_gpio_bundle_read_in()</code>

**备注:** The functions above just wrap the customized instructions defined for ESP32-S3, for the details of those instructions, please refer to [ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix \(GPIO, IO\\_MUX\) \[PDF\]](#).

## Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `cpu_ll_write_dedic_gpio_mask`) or write assembly code with that mask
4. The fasted way of toggling IO is to use the dedicated “set/clear” instructions:

CPU Arch	Set bits of GPIO	Clear bits of GPIO	Remarks
Xtensa	set_bit_gpio_out imm[7:0]	clr_bit_gpio_out imm[7:0]	immediate value width depends on the number of dedicated GPIO channels
RISC-V	csrrsi rd, csr, imm[4:0]	csrrci rd, csr, imm[4:0]	can only control the lowest 4 GPIO channels

For details of supported dedicated GPIO instructions, please refer to *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF]. The supported dedicated CPU instructions are also wrapped inside *soc/cpu\_ll.h* as helper inline functions.

**备注:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

### Application Example

Matrix keyboard example based on dedicated GPIO: [peripherals/gpio/matrix\\_keyboard](#).

### API Reference

#### Functions

*esp\_err\_t* **dedic\_gpio\_get\_out\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

Get allocated channel mask.

**备注:** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

**备注:** With the returned mask, user can directly invoke LL function like “cpu\_ll\_write\_dedic\_gpio\_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

#### 参数

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”
- **mask** –[out] Returned mask value for on specific direction (in or out)

#### 返回

- ESP\_OK: Get channel mask successfully
- ESP\_ERR\_INVALID\_ARG: Get channel mask failed because of invalid argument
- ESP\_FAIL: Get channel mask failed because of other error

*esp\_err\_t* **dedic\_gpio\_get\_in\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

*esp\_err\_t* **dedic\_gpio\_new\_bundle** (const *dedic\_gpio\_bundle\_config\_t* \*config, *dedic\_gpio\_bundle\_handle\_t* \*ret\_bundle)

Create GPIO bundle and return the handle.

**备注:** One has to enable at least input or output mode in “config” parameter.

#### 参数

- **config** –[in] Configuration of GPIO bundle
- **ret\_bundle** –[out] Returned handle of the new created GPIO bundle

**返回**

- ESP\_OK: Create GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Create GPIO bundle failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPIO bundle failed because of no capable memory
- ESP\_ERR\_NOT\_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP\_FAIL: Create GPIO bundle failed because of other error

*esp\_err\_t* **dedic\_gpio\_del\_bundle** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Destory GPIO bundle.

**参数** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**返回**

- ESP\_OK: Destory GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Destory GPIO bundle failed because of invalid argument
- ESP\_FAIL: Destory GPIO bundle failed because of other error

void **dedic\_gpio\_bundle\_write** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t mask, uint32\_t value)

Write value to GPIO bundle.

---

**备注:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

---

**备注:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**参数**

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”
- **mask** –[in] Mask of the GPIOs to be written in the given bundle
- **value** –[in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_out** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that output from the given GPIO bundle.

---

**备注:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**参数** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**返回** Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_in** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that input to the given GPIO bundle.

---

**备注:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**参数** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**返回** Value that input to the GPIO bundle, low bit represents low member in the bundle

## Structures

struct **dedic\_gpio\_bundle\_config\_t**

Type of Dedicated GPIO bundle configuration.

### Public Members

const int **\*gpio\_array**

Array of GPIO numbers, gpio\_array[0] ~ gpio\_array[size-1] <=> low\_dedic\_channel\_num ~ high\_dedic\_channel\_num

size\_t **array\_size**

Number of GPIOs in gpio\_array

unsigned int **in\_en**

Enable input

unsigned int **in\_invert**

Invert input signal

unsigned int **out\_en**

Enable output

unsigned int **out\_invert**

Invert output signal

struct *dedic\_gpio\_bundle\_config\_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

## Type Definitions

typedef struct dedic\_gpio\_bundle\_t **\*dedic\_gpio\_bundle\_handle\_t**

Type of Dedicated GPIO bundle.

### 2.3.5 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

#### Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.

- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

### HMAC on the ESP32-S3

On the ESP32-S3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-S3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

**eFuse Keys for HMAC** Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

#### HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.

#### HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC\_DOWN\_ALL (5) or HMAC\_DOWN\_JTAG (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit by `esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG)`. This will permanently disable JTAG unless the correct key value is provided by software.

#### JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

### Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp32s3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
                                     ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
                                     key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

### API Reference

#### Header File

- `components/esp_hw_support/include/soc/esp32s3/esp_hmac.h`

**Functions**

`esp_err_t esp_hmac_calculate` (`hmac_key_id_t` key\_id, const void \*message, size\_t message\_len, uint8\_t \*hmac)

Calculate the HMAC of a given message.

Calculate the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation (fixed on ESP32S3).

---

**备注:** Uses the HMAC peripheral in “upstream” mode.

---

**参数**

- **key\_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** –the message for which to calculate the HMAC
- **message\_len** –message length
- **hmac** –[out] the hmac result; the buffer behind the provided pointer must be 32 bytes long

**返回**

- ESP\_OK, if the calculation was successful,
- ESP\_ERR\_INVALID\_ARG if message or hmac is a nullptr or if key\_id out of range
- ESP\_FAIL, if the hmac calculation failed

`esp_err_t esp_hmac_jtag_enable` (`hmac_key_id_t` key\_id, const uint8\_t \*token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**参数**

- **key\_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** –Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

**返回**

- ESP\_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP\_FAIL, if the hmac calculation failed or JTAG is permanently disabled by EFUSE\_HARD\_DIS\_JTAG eFuse parameter.
- ESP\_ERR\_INVALID\_ARG, invalid input arguments

`esp_err_t esp_hmac_jtag_disable` (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling `esp_hmac_jtag_enable()` API.

**返回**

- ESP\_OK return ESP\_OK after writing the HMAC\_SET\_INVALIDATE\_JTAG\_REG with value 1.

**Enumerations**

enum `hmac_key_id_t`

The possible efuse keys for the HMAC peripheral

*Values:*

enumerator **HMAC\_KEY0**

enumerator **HMAC\_KEY1**

enumerator **HMAC\_KEY2**

enumerator **HMAC\_KEY3**

enumerator **HMAC\_KEY4**

enumerator **HMAC\_KEY5**

enumerator **HMAC\_KEY\_MAX**

### 2.3.6 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

#### Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,

2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

---

**备注:** Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

---

### Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-S3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC\_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC\_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the python script `configure_ds.py`. More details about the `configure_ds.py` script can be found at [mqtt example README](#).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. *Non Volatile Storage* can be used to store the encrypted private key parameters in flash. The script `configure_ds.py` creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-S3. The application then needs to read the DS data from NVS, which can be done with the function `esp_read_ds_data_from_nvs` in file `ssl_mutual_auth/main/app_main.c`

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

### Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through *ESP-MQTT*) to connect to broker `test.mosquitto.org` using `ssl` transport with mutual authentication. The `ssl` part is internally performed with *ESP-TLS*. See [example README](#) for more details.

### API Reference

#### Header File

- `components/esp_hw_support/include/soc/esp32s3/esp_ds.h`

#### Functions

*esp\_err\_t* **esp\_ds\_sign** (const void \*message, const *esp\_ds\_data\_t* \*data, *hmac\_key\_id\_t* key\_id, void \*signature)

Sign the message.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

---

**备注:** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

---

#### 参数

- **message** –the message to be signed; its length is determined by `data->rsa_length`
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** –the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long

#### 返回

- ESP\_OK if successful, the signature was written to the parameter `signature`.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP\_ERR\_HW\_CRYPTODS\_HMAC\_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP\_ERR\_NO\_MEM if there hasn't been enough memory to allocate the context object
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_KEY if there's a problem with passing the HMAC key to the DS component
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST if the message digest didn't match; the signature is invalid.
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

*esp\_err\_t* **esp\_ds\_start\_sign** (const void \*message, const *esp\_ds\_data\_t* \*data, *hmac\_key\_id\_t* key\_id, *esp\_ds\_context\_t* \*\*esp\_ds\_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process.

---

**备注:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

---

#### 参数

- **message** –the message to be signed; its length is determined by `data->rsa_length`
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp\_ds\_ctx** –the context object which is needed for finishing the signing process later

#### 返回

- ESP\_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP\_ERR\_HW\_CRYPTODS\_HMAC\_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP\_ERR\_NO\_MEM if there hasn't been enough memory to allocate the context object
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_KEY if there's a problem with passing the HMAC key to the DS component

bool **esp\_ds\_is\_busy** (void)

Return true if the DS peripheral is busy, otherwise false.

---

**备注:** Only valid if `esp_ds_start_sign()` was called before.

---

*esp\_err\_t* **esp\_ds\_finish\_sign** (void \*signature, *esp\_ds\_context\_t* \*esp\_ds\_ctx)

Finish the signing process.

#### 参数

- **signature** –the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long
- **esp\_ds\_ctx** –the context object retrieved by `esp_ds_start_sign()`

#### 返回

- ESP\_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST if the message digest didn't match; the signature is invalid.
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

*esp\_err\_t* **esp\_ds\_encrypt\_params** (*esp\_ds\_data\_t* \*data, const void \*iv, const *esp\_ds\_p\_data\_t* \*p\_data, const void \*key)

Encrypt the private key parameters.

#### 参数

- **data** –Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it's filled by DMA. Both is asserted at run time.
- **iv** –Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p\_data** –Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** –Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

#### 返回

- ESP\_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or `p_data->rsa_length` is too long

## Structures

struct **esp\_digital\_signature\_data**

Encrypted private key data. Recommended to store in flash in this format.

---

**备注:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

## Public Members

*esp\_digital\_signature\_length\_t* **rsa\_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 4096).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

---

**备注:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

---

uint8\_t **iv**[16]

IV value used to encrypt ‘c’

uint8\_t **c**[(12672 / 8)]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp\_ds\_p\_data\_t**

Plaintext parameters used by Digital Signature.

Not used for signing with DS peripheral, but can be encrypted in-device by calling `esp_ds_encrypt_params()`

---

**备注:** This documentation is mostly taken from the ROM code.

---

## Public Members

uint32\_t **Y**[(4096) / 32]

RSA exponent.

uint32\_t **M**[(4096) / 32]

RSA modulus.

uint32\_t **Rb**[(4096) / 32]

RSA r inverse operand.

uint32\_t **M\_prime**

RSA M prime operand.

*esp\_digital\_signature\_length\_t* **length**

RSA length.

## Macros

**ESP32S3\_ERR\_HW\_CRYPT0\_DS\_HMAC\_FAIL**

HMAC peripheral problem

**ESP32S3\_ERR\_HW\_CRYPT0\_DS\_INVALID\_KEY**

given HMAC key isn’t correct, HMAC peripheral problem

**ESP32S3\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST**

message digest check failed, result is invalid

**ESP32S3\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING**

padding check failed, but result is produced anyway and can be read

**ESP\_DS\_IV\_LEN****ESP\_DS\_C\_LEN**

## 2.3.7 I2C 驱动程序

### 概述

I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线 (SDA) 和串行时钟线 (SCL) 线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32-S3 有两个 I2C 控制器（也称为端口），负责处理在 I2C 两根总线上的通信。每个控制器都可以设置为主机或从机。例如，可以同时让一个控制器用作主机，另一个用作从机。

## 驱动程序的功能

I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

## 使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. **配置驱动程序** - 设置初始化参数（如主机模式或从机模式，SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. **安装驱动程序** - 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机
3. 根据是为主机还是从机配置驱动程序，选择合适的项目
  - a) **主机模式下通信** - 发起通信（主机模式）
  - b) **从机模式下通信** - 响应主机消息（从机模式）
4. **中断处理** - 配置 I2C 中断服务
5. **用户自定义配置** - 调整默认的 I2C 通信参数（如时序、位序等）
6. **错误处理** - 如何识别和处理驱动程序配置和通信错误
7. **删除驱动程序** - 在通信结束时释放 I2C 驱动程序所使用的资源

**配置驱动程序** 建立 I2C 通信第一步是配置驱动程序，这需要设置 `i2c_config_t` 结构中的几个参数：

- 设置 **I2C 工作模式** - 从 `i2c_mode_t` 中选择主机模式或从机模式
- 设置 **通信管脚**
  - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
  - 是否启用 ESP32-S3 的内部上拉电阻
- （仅限主机模式）设置 **I2C 时钟速度**
- （仅限从机模式）设置以下内容：
  - 是否应启用 **10 位寻址模式**
  - 定义 **从机地址**

然后，初始化给定 I2C 端口的配置，请使用端口号和 `i2c_config_t` 作为函数调用参数来调用 `i2c_param_config()` 函数。

配置示例（主机）：

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,   // select frequency specific to your_
↪project
    // .clk_flags = 0,           /*< Optional, you can use I2C_SCLK_SRC_FLAG_*_
↪flags to choose i2c source clock here. */
};
```

配置示例（从机）：

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select GPIO specific to your_
↪project
```

(下页继续)

(续上页)

```

.sda_pullup_en = GPIO_PULLUP_ENABLE,
.scl_io_num = I2C_SLAVE_SCL_IO,           // select GPIO specific to your
↪project
.scl_pullup_en = GPIO_PULLUP_ENABLE,
.mode = I2C_MODE_SLAVE,
.slave.addr_10bit_en = 0,
.slave.slave_addr = ESP_SLAVE_ADDR,      // address of your project
};

```

在此阶段，`i2c_param_config()` 还将其他 I2C 配置参数设置为 I2C 总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考[用户自定义配置](#)。

**源时钟配置** 增加了 **时钟源分配器**，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如 `i2c_config_t::clk_flags` 中的要求）。

当 `i2c_config_t::clk_flags` 为 0 时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如 APB 之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将 `i2c_config_t::clk_flags` 设置为 0。有关时钟特性，请参见下表。

**备注：**如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位（`clk_flags`）在时钟的功能中均为 0。

表 2: ESP32-S3 时钟源特性

时钟名称	时钟频率	SCL 的最大频率	时钟功能
XTAL 时钟	40 MHz	2 MHz	/
RTC 时钟	20 MHz	1 MHz	<code>I2C_SCLK_SRC_FLAG_AWARE_DFS</code> , <code>I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</code>

对 `i2c_config_t::clk_flags` 的解释如下：

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`：当 APB 时钟改变时，时钟的波特率不会改变。
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`：支持轻度睡眠模式，APB 时钟则不支持。
3. ESP32-S3 可能不支持某些标志，请在使用前阅读技术参考手册。

**备注：**在主机模式下，SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。

**安装驱动程序** 配置好 I2C 驱动程序后，使用以下参数调用函数 `i2c_driver_install()` 安装驱动程序：

- 端口号，从 `i2c_port_t` 中二选一
- 主机或从机模式，从 `i2c_mode_t` 中选择
- （仅限从机模式）分配用于在从机模式下发送和接收数据的缓存区大小。I2C 是一个以主机为中心的总线，数据只能根据主机的请求从从机传输到主机。因此，从机通常有一个发送缓存区，供从应用程序写入数据使用。数据保留在发送缓存区中，由主机自行读取。
- 用于分配中断的标志（请参考 `esp_hw_support/include/esp_intr_alloc.h` 中 `ESP_INTR_FLAG_*` 值）

**主机模式下通信** 安装 I2C 驱动程序后，ESP32-S3 即可与其他 I2C 设备通信。

ESP32-S3 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信，并发送命令让从机响应，如进行测量并将结果发给主机。

为优化通信流程，驱动程序提供一个名为“命令链接”的容器，该容器应填充一系列命令，然后传递给 I2C 控制器执行。

**主机写入数据** 下面的示例展示如何为 I2C 主机构建命令链接，从而向从机发送  $n$  个字节。

图 4: I2C command link - master write example

下面介绍如何为“主机写入数据”设置命令链接及其内部内容：

- 使用 `i2c_cmd_link_create()` 创建一个命令链接。  
然后，将一系列待发送给从机的数据填充命令链接：
  - 启动位** - `i2c_master_start()`
  - 从机地址** - `i2c_master_write_byte()`。提供单字节地址作为调用此函数的实参。
  - 数据** - 一个或多个字节的数据作为 `i2c_master_write()` 的实参。
  - 停止位** - `i2c_master_stop()`  
函数 `i2c_master_write_byte()` 和 `i2c_master_write()` 都有额外的实参，规定主机是否应确认其有无接受到 ACK 位。
- 通过调用 `i2c_master_cmd_begin()` 来触发 I2C 控制器执行命令链接。一旦开始执行，就不能再修改命令链接。
- 命令发送后，通过调用 `i2c_cmd_link_delete()` 释放命令链接使用的资源。

**主机读取数据** 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取  $n$  个字节。

在读取数据时，在上图的步骤 4 中，不是用 `i2c_master_write...`，而是用 `i2c_master_read_byte()` 和/或 `i2c_master_read()` 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

**指示写入或读取数据** 发送从机地址后（请参考上图中第 3 步），主机可以写入或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址  $(\text{ESP\_SLAVE\_ADDR} \ll 1) \mid \text{I2C\_MASTER\_WRITE}$ ，如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

图 5: I2C command link - master read example

同理，指示从从机读取数据的命令链接如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**从机模式下通信** 安装 I2C 驱动程序后，ESP32-S3 即可与其他 I2C 设备通信。

API 为从机提供以下功能：

- `i2c_slave_read_buffer()`  
当主机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数 `i2c_slave_read_buffer()`。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。
- `i2c_slave_write_buffer()`  
发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数 `i2c_slave_write_buffer()` 有一个参数，用于指定发送缓存区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。

在 `peripherals/i2c` 中可找到介绍如何使用这些功能的代码示例。

**中断处理** 安装驱动程序时，默认情况下会安装中断处理程序。但是，您可以通过调用函数 `i2c_isr_register()` 来注册自己的而不是默认的中断处理程序。在运行自己的中断处理程序时，可以参考 *ESP32-S3 技术参考手册 > I2C 控制器 (I2C) > 中断 [PDF]*，以获取有关 I2C 控制器触发的中断描述。

调用函数 `i2c_isr_free()` 删除中断处理程序。

**用户自定义配置** 如本节末尾所述 `配置驱动程序`，函数 `i2c_param_config()` 在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 `I2C 总线协议规范` 规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。APB 的频率在 `I2C_APB_CLK_FREQ` 中指定。

表 3: 其他可配置的 I2C 通信参数

要更改的参数	函数
SCL 脉冲周期的高电平和低电平	<code>i2c_set_period()</code>
在产生 <b>启动</b> 信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_start_timing()</code>
在产生 <b>停止</b> 信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_stop_timing()</code>
从机采样以及主机切换时, SCL 和 SDA 信号之间的时序关系	<code>i2c_set_data_timing()</code>
I2C 超时	<code>i2c_set_timeout()</code>
优先发送/接收最高有效位 (LSB) 或最低有效位 (MSB), 可在 <code>i2c_trans_mode_t</code> 定义的模式中选择	<code>i2c_set_data_mode()</code>

上述每个函数都有一个 `_get_` 对应项来检查当前设置的值。例如, 调用 `i2c_get_timeout()` 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值, 请参考文件 `driver/i2c.c` 并查找带有后缀 `_DEFAULT` 的定义。

通过函数 `i2c_set_pin()` 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值, 请使用函数 `i2c_param_config()`。

**备注:** ESP32-S3 的内部上拉电阻范围为几万欧姆, 因此在大多数情况下, 它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 **I2C 总线协议规范** 规定范围内的上拉电阻。

**错误处理** 大多数 I2C 驱动程序的函数在成功完成时会返回 `ESP_OK`, 或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息, 其中包含错误说明, 例如检查输入配置的正确性。有关详细信息, 请参考文件 `driver/i2c.c` 并用后缀 `_ERR_STR` 查找定义。

使用专用中断来捕获通信故障。例如, 如果从机将数据发送回主机耗费太长时间, 会触发 `I2C_TIME_OUT_INT` 中断。详细信息请参考 [中断处理](#)。

如果出现通信失败, 可以分别为发送和接收缓存区调用 `i2c_reset_tx_fifo()` 和 `i2c_reset_rx_fifo()` 来重置内部硬件缓存区。

**删除驱动程序** 当使用 `i2c_driver_install()` 建立 I2C 通信, 一段时间后不再需要 I2C 通信时, 可以通过调用 `i2c_driver_delete()` 来移除驱动程序以释放分配的资源。

由于函数 `i2c_driver_delete()` 无法保证线程安全性, 请在调用该函数移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

## 应用示例

I2C 主机和从机示例: [peripherals/i2c](#)。

## API 参考

### Header File

- `components/driver/include/driver/i2c.h`

### Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

Install an I2C driver.

---

**备注:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

---

**参数**

- **i2c\_num** – I2C port number
- **mode** – I2C mode (either master or slave)
- **slv\_rx\_buf\_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv\_tx\_buf\_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr\_alloc\_flags** – Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

`esp_err_t i2c_driver_delete (i2c_port_t i2c_num)`

Delete I2C driver.

---

**备注:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

---

**参数** **i2c\_num** – I2C port to delete

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t i2c_param_config (i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`

Configure an I2C bus with the given configuration.

**参数**

- **i2c\_num** – I2C port to configure
- **i2c\_conf** – Pointer to the I2C configuration

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t i2c_reset_tx_fifo (i2c_port_t i2c_num)`

reset I2C tx hardware fifo

**参数** **i2c\_num** – I2C port number

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t i2c_reset_rx_fifo (i2c_port_t i2c_num)`

reset I2C rx fifo

**参数** **i2c\_num** – I2C port number

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_isr\_register** (*i2c\_port\_t* i2c\_num, void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *intr\_handle\_t* \*handle)

Register an I2C ISR handler.

#### 参数

- **i2c\_num** –I2C port number to attach handler to
- **fn** –ISR handler function
- **arg** –Parameter for the ISR handler
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- **handle** –Handle return from esp\_intr\_alloc.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_isr\_free** (*intr\_handle\_t* handle)

Delete and free I2C ISR handle.

**参数** **handle** –Handle of isr to delete.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_pin** (*i2c\_port\_t* i2c\_num, int sda\_io\_num, int scl\_io\_num, bool sda\_pullup\_en, bool scl\_pullup\_en, *i2c\_mode\_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

#### 参数

- **i2c\_num** –I2C port number
- **sda\_io\_num** –GPIO number for I2C SDA signal
- **scl\_io\_num** –GPIO number for I2C SCL signal
- **sda\_pullup\_en** –Enable the internal pullup for SDA pin
- **scl\_pullup\_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_master\_write\_to\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, TickType\_t ticks\_to\_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

#### 参数

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **write\_buffer** –Bytes to send on the bus
- **write\_size** –Size, in bytes, of the write buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_read\_from\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to

`i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

#### 参数

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **read\_buffer** –Buffer to store the bytes received on the bus
- **read\_size** –Size, in bytes, of the read buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_write\_read\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

#### 参数

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **write\_buffer** –Bytes to send on the bus
- **write\_size** –Size, in bytes, of the write buffer
- **read\_buffer** –Buffer to store the bytes received on the bus
- **read\_size** –Size, in bytes, of the read buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create\_static** (uint8\_t \*buffer, uint32\_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

---

**备注:** It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

---

#### 参数

- **buffer** –Buffer to use for commands allocations
- **size** –Size in bytes of the buffer

**返回** Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is

required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

**返回** Handle to the I2C command link

void `i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)`

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

**参数** `cmd_handle` –I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void `i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)`

Free the I2C commands list.

**参数** `cmd_handle` –I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

`esp_err_t` `i2c_master_start(i2c_cmd_handle_t cmd_handle)`

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**参数** `cmd_handle` –I2C commands list

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t` `i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)`

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**参数**

- `cmd_handle` –I2C commands list
- `data` –Byte to send on the port
- `ack_en` –Enable ACK signal

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t` `i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)`

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**参数**

- `cmd_handle` –I2C commands list
- `data` –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- `data_len` –Length, in bytes, of the data buffer
- `ack_en` –Enable ACK signal

**返回**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t` `i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)`

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**参数**

- **cmd\_handle** –I2C commands list
- **data** –Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** –ACK signal

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM The static buffer used to create `cmd_handler` is too small
- ESP\_FAIL No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, size\_t data\_len, *i2c\_ack\_type\_t* ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**参数**

- **cmd\_handle** –I2C commands list
- **data** –Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- **data\_len** –Size, in bytes, of the data buffer
- **ack** –ACK signal

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM The static buffer used to create `cmd_handler` is too small
- ESP\_FAIL No more memory left on the heap

*esp\_err\_t* **i2c\_master\_stop** (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**参数** **cmd\_handle** –I2C commands list

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM The static buffer used to create `cmd_handler` is too small
- ESP\_FAIL No more memory left on the heap

*esp\_err\_t* **i2c\_master\_cmd\_begin** (*i2c\_port\_t* i2c\_num, *i2c\_cmd\_handle\_t* cmd\_handle, TickType\_t ticks\_to\_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

**参数**

- **i2c\_num** –I2C port number
- **cmd\_handle** –I2C commands list
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

int **i2c\_slave\_write\_buffer** (*i2c\_port\_t* i2c\_num, const uint8\_t \*data, int size, TickType\_t ticks\_to\_wait)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

---

**备注:** This function shall only be called in I2C slave mode.

---

**参数**

- **i2c\_num** –I2C port number
- **data** –Bytes to write into internal buffer
- **size** –Size, in bytes, of `data` buffer
- **ticks\_to\_wait** –Maximum ticks to wait.

**返回**

- ESP\_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

```
int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
```

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the `data` user buffer.

---

**备注:** This function shall only be called in I2C slave mode.

---

**参数**

- **i2c\_num** –I2C port number
- **data** –Buffer to fill with ringbuffer' s bytes
- **max\_size** –Maximum bytes to read
- **ticks\_to\_wait** –Maximum waiting ticks

**返回**

- ESP\_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

```
esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)
```

Set I2C master clock period.

**参数**

- **i2c\_num** –I2C port number
- **high\_period** –Clock cycle number during SCL is high level, `high_period` is a 14 bit value
- **low\_period** –Clock cycle number during SCL is low level, `low_period` is a 14 bit value

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

```
esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)
```

Get I2C master clock period.

**参数**

- **i2c\_num** –I2C port number
- **high\_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low\_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

```
esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns),

or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

---

**备注:** Enable filter will slow down the SCL clock.

---

#### 参数

- **i2c\_num** –I2C port number to filter
- **cyc\_num** –the APB cycles need to be filtered ( $0 \leq \text{cyc\_num} \leq 7$ ). When the period of a pulse is less than  $\text{cyc\_num} * \text{APB\_cycle}$ , the I2C controller will ignore this pulse.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_filter\_disable** (*i2c\_port\_t* i2c\_num)

Disable filter on I2C bus.

参数 **i2c\_num** –I2C port number

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_start\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master start signal timing

#### 参数

- **i2c\_num** –I2C port number
- **setup\_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- **hold\_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_start\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master start signal timing

#### 参数

- **i2c\_num** –I2C port number
- **setup\_time** –pointer to get setup time
- **hold\_time** –pointer to get hold time

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_stop\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master stop signal timing

#### 参数

- **i2c\_num** –I2C port number
- **setup\_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- **hold\_time** –clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_stop\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master stop signal timing

## 参数

- **i2c\_num** –I2C port number
- **setup\_time** –pointer to get setup time.
- **hold\_time** –pointer to get hold time.

## 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_timing** (*i2c\_port\_t* i2c\_num, int sample\_time, int hold\_time)

set I2C data signal timing

## 参数

- **i2c\_num** –I2C port number
- **sample\_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- **hold\_time** –clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

## 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_timing** (*i2c\_port\_t* i2c\_num, int \*sample\_time, int \*hold\_time)

get I2C data signal timing

## 参数

- **i2c\_num** –I2C port number
- **sample\_time** –pointer to get sample time
- **hold\_time** –pointer to get hold time

## 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_timeout** (*i2c\_port\_t* i2c\_num, int timeout)

set I2C timeout value

## 参数

- **i2c\_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

## 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_timeout** (*i2c\_port\_t* i2c\_num, int \*timeout)

get I2C timeout value

## 参数

- **i2c\_num** –I2C port number
- **timeout** –pointer to get timeout value

## 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* tx\_trans\_mode, *i2c\_trans\_mode\_t* rx\_trans\_mode)

set I2C data transfer mode

## 参数

- **i2c\_num** –I2C port number
- **tx\_trans\_mode** –I2C sending data mode
- **rx\_trans\_mode** –I2C receiving data mode

## 返回

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* \*tx\_trans\_mode, *i2c\_trans\_mode\_t* \*rx\_trans\_mode)

get I2C data transfer mode

#### 参数

- **i2c\_num** – I2C port number
- **tx\_trans\_mode** – pointer to get I2C sending data mode
- **rx\_trans\_mode** – pointer to get I2C receiving data mode

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **i2c\_config\_t**

I2C initialization parameters.

### Public Members

*i2c\_mode\_t* **mode**

I2C mode

int **sda\_io\_num**

GPIO number for I2C sda signal

int **scl\_io\_num**

GPIO number for I2C scl signal

bool **sda\_pullup\_en**

Internal GPIO pull mode for I2C sda signal

bool **scl\_pullup\_en**

Internal GPIO pull mode for I2C scl signal

uint32\_t **clk\_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c\_config\_t*::[anonymous]::[anonymous] **master**

I2C master config

uint8\_t **addr\_10bit\_en**

I2C 10bit address mode enable for slave mode

uint16\_t **slave\_addr**

I2C address for slave mode

uint32\_t **maximum\_speed**

I2C expected clock speed from SCL.

```
struct i2c_config_t::[anonymous]::[anonymous] slave
    I2C slave config

uint32_t clk_flags
    Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice
```

## Macros

### **I2C\_APB\_CLK\_FREQ**

I2C source clock is APB clock, 80MHz

### **I2C\_NUM\_MAX**

I2C port max

### **I2C\_NUM\_0**

I2C port 0

### **I2C\_NUM\_1**

I2C port 1

### **I2C\_SCLK\_SRC\_FLAG\_FOR\_NOMAL**

Any one clock source that is available for the specified frequency may be choosen

### **I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS**

For REF tick clock, it won't change with APB.

### **I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP**

For light sleep mode.

### **I2C\_INTERNAL\_STRUCT\_SIZE**

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

### **I2C\_LINK\_RECOMMENDED\_SIZE** (TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

## Type Definitions

```
typedef void *i2c_cmd_handle_t
    I2C command handle
```

## Header File

- `components/hal/include/hal/i2c_types.h`

## Macros

### **I2C\_CLK\_FREQ\_MAX**

Use the highest speed that is available for the clock source picked by `clk_flags`.

## Type Definitions

```
typedef int i2c_port_t
```

I2C port number, can be `I2C_NUM_0` ~ `(I2C_NUM_MAX-1)`.

## Enumerations

```
enum i2c_mode_t
```

*Values:*

```
enumerator I2C_MODE_SLAVE
```

I2C slave mode

```
enumerator I2C_MODE_MASTER
```

I2C master mode

```
enumerator I2C_MODE_MAX
```

```
enum i2c_rw_t
```

*Values:*

```
enumerator I2C_MASTER_WRITE
```

I2C write data

```
enumerator I2C_MASTER_READ
```

I2C read data

```
enum i2c_trans_mode_t
```

*Values:*

```
enumerator I2C_DATA_MODE_MSB_FIRST
```

I2C data msb first

```
enumerator I2C_DATA_MODE_LSB_FIRST
```

I2C data lsb first

```
enumerator I2C_DATA_MODE_MAX
```

```
enum i2c_addr_mode_t
```

*Values:*

```
enumerator I2C_ADDR_BIT_7
```

I2C 7bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_10**  
I2C 10bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_MAX**

enum **i2c\_ack\_type\_t**

*Values:*

enumerator **I2C\_MASTER\_ACK**  
I2C ack for each byte read

enumerator **I2C\_MASTER\_NACK**  
I2C nack for each byte read

enumerator **I2C\_MASTER\_LAST\_NACK**  
I2C nack for the last byte

enumerator **I2C\_MASTER\_ACK\_MAX**

enum **i2c\_sclk\_t**

I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.

*Values:*

enumerator **I2C\_SCLK\_DEFAULT**  
I2C source clock not selected

enumerator **I2C\_SCLK\_XTAL**  
I2C source clock from XTAL, 40M

enumerator **I2C\_SCLK\_RTC**  
I2C source clock from 8M RTC, 8M

enumerator **I2C\_SCLK\_MAX**

### 2.3.8 Inter-IC Sound (I2S)

#### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-S3 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

### Functional Overview

**Installing the Driver** Install the I2S driver by calling the function `:cpp:func'i2s_driver_install'` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `:cpp:func'i2s_driver_install'` returns `ESP_OK`, it means I2S has started.

Configuration example:

```
static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .bits_per_chan = I2S_BITS_PER_SAMPLE_16BIT
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins** Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `:cpp:func'i2s_set_pin'` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

---

**备注:** MCK only takes effect in `I2S_MODE_MASTER` mode.

---

```
static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication** To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```
i2s_read(I2S_NUM, data_rcv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read,
↪100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func:i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

### Application Example

A code example for the I2S driver can be found in the directory [peripherals/i2s](#).

In addition, there is a short configuration examples for the I2S driver.

**I2S configuration** Example for general usage.

```
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
```

(下页继续)

```

*/
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

I2S on ESP32-S3 support TDM mode, up to 16 channels are available in TDM mode. If you want to use TDM mode, set field `channel_format` of `i2s_config_t` to `I2S_CHANNEL_FMT_MULTIPLE`. Then enable the channels by setting `chan_mask` using masks in `i2s_channel_t`, the number of active channels and total channels will be calculate automatically. Also you can set a particular total channel number for it, but it shouldn't be smaller than the largest channel you use.

If active channels are discrete, the inactive channels within total channels will be filled by a constant automatically. But if `skip_msk` is enabled, these inactive channels will be skipped.

```

#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_MULTIPLE,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .chan_mask = I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH2
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_port_t i2s_num, 22050, bits_cfg, I2S_TDM_ACTIVE_CH0 | I2S_TDM_
↵ACTIVE_CH1); // set clock
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

## API Reference

### Header File

- [components/driver/include/driver/i2s.h](#)

**Functions**

*esp\_err\_t* **i2s\_set\_pin** (*i2s\_port\_t* i2s\_num, const *i2s\_pin\_config\_t* \*pin)

Set I2S pin number.

Inside the pin configuration structure, set I2S\_PIN\_NO\_CHANGE for any pin where the current configuration should not be changed.

---

**备注:** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

---

---

**备注:** if \*pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call *i2s\_set\_dac\_mode* instead.

---

**参数**

- **i2s\_num** –I2S port number
- **pin** –I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL IO error

*esp\_err\_t* **i2s\_set\_pdm\_rx\_down\_sample** (*i2s\_port\_t* i2s\_num, *i2s\_pdm\_dsr\_t* downsample)

Set PDM mode down-sample rate In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be (fpcm \* 64) or (fpcm \* 128) accordingly.

---

**备注:** After calling this function, it would call *i2s\_set\_clk* inside to update the clock frequency. Please call this function after I2S driver has been initialized.

---

**参数**

- **i2s\_num** –I2S port number
- **downsample** –i2s RX down sample rate for PDM mode.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

*esp\_err\_t* **i2s\_set\_pdm\_tx\_up\_sample** (*i2s\_port\_t* i2s\_num, const *i2s\_pdm\_tx\_upsample\_cfg\_t* \*upsample\_cfg)

Set TX PDM mode up-sample rate.

---

**备注:** If you have set PDM mode while calling 'i2s\_driver\_install', default PDM TX upsample parameters have already been set, no need to call this function again if you don't have to change the default configuration

---

**参数**

- **i2s\_num** –I2S port number
- **upsample\_cfg** –Set I2S PDM up-sample rate configuration

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

*esp\_err\_t* **i2s\_driver\_install** (*i2s\_port\_t* i2s\_num, const *i2s\_config\_t* \*i2s\_config, int queue\_size, void \*i2s\_queue)

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

#### 参数

- **i2s\_num** –I2S port number
- **i2s\_config** –I2S configurations - see *i2s\_config\_t* struct
- **queue\_size** –I2S event queue size/depth.
- **i2s\_queue** –I2S event queue handle, if set NULL, driver will not use an event queue.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory
- ESP\_ERR\_INVALID\_STATE Current I2S port is in use

*esp\_err\_t* **i2s\_driver\_uninstall** (*i2s\_port\_t* i2s\_num)

Uninstall I2S driver.

参数 **i2s\_num** –I2S port number

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE I2S port has been uninstalled by others (e.g. LCD i80)

*esp\_err\_t* **i2s\_write** (*i2s\_port\_t* i2s\_num, const void \*src, size\_t size, size\_t \*bytes\_written, TickType\_t ticks\_to\_wait)

Write data to I2S DMA transmit buffer.

#### 参数

- **i2s\_num** –I2S port number
- **src** –Source address to write from
- **size** –Size of data in bytes
- **bytes\_written** –[out] Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks\_to\_wait** –TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2s\_write\_expand** (*i2s\_port\_t* i2s\_num, const void \*src, size\_t size, size\_t src\_bits, size\_t aim\_bits, size\_t \*bytes\_written, TickType\_t ticks\_to\_wait)

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see *i2s\_config\_t*).

#### 参数

- **i2s\_num** –I2S port number
- **src** –Source address to write from

- **size** –Size of data in bytes
- **src\_bits** –Source audio bit
- **aim\_bits** –Bit wanted, no more than 32, and must be greater than src\_bits
- **bytes\_written** –[out] Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks\_to\_wait** –TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2s\_read** (*i2s\_port\_t* i2s\_num, void \*dest, size\_t size, size\_t \*bytes\_read, TickType\_t ticks\_to\_wait)

Read data from I2S DMA receive buffer.

---

**备注:** If the built-in ADC mode is enabled, we should call `i2s_adc_enable` and `i2s_adc_disable` around the whole reading process, to prevent the data getting corrupted.

---

**参数**

- **i2s\_num** –I2S port number
- **dest** –Destination address to read into
- **size** –Size of data in bytes
- **bytes\_read** –[out] Number of bytes read, if timeout, bytes read will be less than the size passed in.
- **ticks\_to\_wait** –RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX\_DELAY for no timeout.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2s\_set\_sample\_rates** (*i2s\_port\_t* i2s\_num, uint32\_t rate)

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and `i2s_config_t` configuration parameters (number of channels, `bits_per_sample`).

`bit_clock = rate * (number of channels) * bits_per_sample`

**参数**

- **i2s\_num** –I2S port number
- **rate** –I2S sample rate (ex: 8000, 44100...)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

*esp\_err\_t* **i2s\_stop** (*i2s\_port\_t* i2s\_num)

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

**参数** **i2s\_num** –I2S port number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

***esp\_err\_t* i2s\_start** (*i2s\_port\_t* i2s\_num)

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

**参数** `i2s_num` –I2S port number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

***esp\_err\_t* i2s\_zero\_dma\_buffer** (*i2s\_port\_t* i2s\_num)

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**参数** `i2s_num` –I2S port number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

***esp\_err\_t* i2s\_pcm\_config** (*i2s\_port\_t* i2s\_num, const *i2s\_pcm\_cfg\_t* \*pcm\_cfg)

Configure I2S a/u-law decompress or compress.

---

**备注:** This function should be called after i2s driver installed Only take effective when the i2s ‘communication\_format’ is set to ‘I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT’ or ‘I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG’

---

**参数**

- `i2s_num` –I2S port number
- `pcm_cfg` –including mode selection and a/u-law decompress or compress configuration paramater

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

***esp\_err\_t* i2s\_set\_clk** (*i2s\_port\_t* i2s\_num, uint32\_t rate, uint32\_t bits\_cfg, *i2s\_channel\_t* ch)

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

- stop i2s;
- calculate mclk, bck, bck\_factor
- malloc dma buffer;
- start i2s

**参数**

- `i2s_num` –I2S port number
- `rate` –I2S sample rate (ex: 8000, 44100…)
- `bits_cfg` –I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘`i2s_bits_per_sample_t`’) the high 16 bits is for total bits in one channel (see ‘`i2s_bits_per_chan_t`’) high 16bits =0 means same as the bits per sample.
- `ch` –I2S channel, (I2S\_CHANNEL\_MONO, I2S\_CHANNEL\_STEREO or specific channel in TDM mode)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

float **i2s\_get\_clk** (*i2s\_port\_t* i2s\_num)

get clock set on particular port number.

参数 **i2s\_num** –I2S port number

返回

- actual clock set by i2s driver

## Structures

struct **i2s\_pcm\_cfg\_t**

I2S PCM configuration.

## Public Members

*i2s\_pcm\_compress\_t* **pcm\_type**

I2S PCM a/u-law decompress or compress type

struct **i2s\_pdm\_tx\_upsample\_cfg\_t**

I2S PDM up-sample rate configuration.

---

**备注:** TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample\_rate / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate If the pdm receiver do not care the pdm serial clock, it' s recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be applied.

---

## Public Members

int **sample\_rate**

I2S PDM sample rate

int **fp**

I2S PDM TX upsampling paramater. Normally it should be set to 960

int **fs**

I2S PDM TX upsampling paramater. When it is set to 480, the pdm clock frequency Fpdm = 128 \* sample\_rate, when it is set to sample\_rate / 100, Fpdm will be fixed to 128\*48000

struct **i2s\_pin\_config\_t**

I2S pin number for i2s\_set\_pin.

## Public Members

int **mck\_io\_num**

MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int **bck\_io\_num**

BCK in out pin

int **ws\_io\_num**

WS in out pin

int **data\_out\_num**

DATA out pin

int **data\_in\_num**

DATA in pin

struct **i2s\_driver\_config\_t**

I2S driver configuration parameters.

### Public Members

*i2s\_mode\_t* **mode**

I2S work mode

uint32\_t **sample\_rate**

I2S sample rate

*i2s\_bits\_per\_sample\_t* **bits\_per\_sample**

I2S sample bits in one channel

*i2s\_channel\_fmt\_t* **channel\_format**

I2S channel format.

*i2s\_comm\_format\_t* **communication\_format**

I2S communication format

int **intr\_alloc\_flags**

Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info

int **dma\_buf\_count**

The total number of DMA buffers to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, 'dma\_desc\_num' can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to 'i2s\_read' and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

int **dma\_buf\_len**

Number of frames in a DMA buffer. A frame means the data of all channels in a WS cycle. The  $real\_dma\_buf\_size = dma\_buf\_len * chan\_num * bits\_per\_chan / 8$ . For example, if two channels in stereo mode (i.e., 'channel\_format' is set to 'I2S\_CHANNEL\_FMT\_RIGHT\_LEFT') are active, and each channel transfers 32 bits (i.e., 'bits\_per\_sample' is set to 'I2S\_BITS\_PER\_CHAN\_32BIT'), then the total number of bytes of a frame is 'channel\_format' \* 'bits\_per\_sample' = 2 \* 32 / 8 = 8 bytes. We assume that the current 'dma\_buf\_len' is 100, then the real length of the DMA buffer is 8 \* 100 = 800 bytes. Note that the length of an internal real DMA buffer shouldn't be greater than 4092.

bool **use\_apll**

I2S using APLL as main I2S clock, enable it to get accurate clock

bool **tx\_desc\_auto\_clear**

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int **fixed\_mclk**

I2S using fixed MCLK output. If use\_apll = true and fixed\_mclk > 0, then the clock output for i2s is fixed and equal to the fixed\_mclk value. If fixed\_mclk set, mclk\_multiple won't take effect

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of I2S master clock(MCLK) to sample rate

*i2s\_bits\_per\_chan\_t* **bits\_per\_chan**

I2S total bits in one channel, only take effect when larger than 'bits\_per\_sample', default '0' means equal to 'bits\_per\_sample'

*i2s\_channel\_t* **chan\_mask**

I2S active channel bit mask, set value in *i2s\_channel\_t* to enable specific channel, the bit map of active channel can not exceed (0x1<<total\_chan).

uint32\_t **total\_chan**

I2S Total number of channels. If it is smaller than the biggest active channel number, it will be set to this number automatically.

bool **left\_align**

Set to enable left alignment

bool **big\_edin**

Set to enable big edin

bool **bit\_order\_msb**

Set to enable msb order

bool **skip\_msk**

Set to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

struct **i2s\_event\_t**

Event structure used in I2S event queue.

## Public Members

*i2s\_event\_type\_t* **type**

I2S event type

size\_t **size**

I2S data size for I2S\_DATA event

## Macros

### **I2S\_PIN\_NO\_CHANGE**

Use in *i2s\_pin\_config\_t* for pins which should not be changed

### **I2S\_PDM\_DEFAULT\_UPSAMPLE\_CONFIG** (rate)

Default I2S PDM Up-Sampling Rate configuration.

## Type Definitions

```
typedef i2s_driver_config_t i2s_config_t
```

```
typedef intr_handle_t i2s_isr_handle_t
```

## Enumerations

### enum **i2s\_port\_t**

I2S port number, the max port number is (I2S\_NUM\_MAX -1).

*Values:*

enumerator **I2S\_NUM\_0**

I2S port 0

enumerator **I2S\_NUM\_1**

I2S port 1

enumerator **I2S\_NUM\_MAX**

I2S port max

### enum **i2s\_event\_type\_t**

I2S event queue types.

*Values:*

enumerator **I2S\_EVENT\_DMA\_ERROR**

enumerator **I2S\_EVENT\_TX\_DONE**

I2S DMA finish sent 1 buffer

enumerator **I2S\_EVENT\_RX\_DONE**

I2S DMA finish received 1 buffer

enumerator **I2S\_EVENT\_TX\_Q\_OVF**

I2S DMA sent queue overflow

enumerator **I2S\_EVENT\_RX\_Q\_OVF**

I2S DMA receive queue overflow

enumerator **I2S\_EVENT\_MAX**

I2S event max index

## Header File

- [components/hal/include/hal/i2s\\_types.h](#)

## Enumerations

enum **i2s\_bits\_per\_sample\_t**

I2S bit width per sample.

*Values:*

enumerator **I2S\_BITS\_PER\_SAMPLE\_8BIT**

data bit-width: 8

enumerator **I2S\_BITS\_PER\_SAMPLE\_16BIT**

data bit-width: 16

enumerator **I2S\_BITS\_PER\_SAMPLE\_24BIT**

data bit-width: 24

enumerator **I2S\_BITS\_PER\_SAMPLE\_32BIT**

data bit-width: 32

enum **i2s\_bits\_per\_chan\_t**

I2S bit width per chan.

*Values:*

enumerator **I2S\_BITS\_PER\_CHAN\_DEFAULT**

channel bit-width equals to data bit-width

enumerator **I2S\_BITS\_PER\_CHAN\_8BIT**

channel bit-width: 8

enumerator **I2S\_BITS\_PER\_CHAN\_16BIT**

channel bit-width: 16

enumerator **I2S\_BITS\_PER\_CHAN\_24BIT**

channel bit-width: 24

enumerator **I2S\_BITS\_PER\_CHAN\_32BIT**

channel bit-width: 32

enum **i2s\_channel\_t**

I2S channel.

*Values:*

enumerator **I2S\_CHANNEL\_MONO**

I2S channel (mono), one channel activated. In this mode, you only need to send one channel data but the fifo will copy same data for the other unactivated channels automatically, then both channels will transmit same data.

enumerator **I2S\_CHANNEL\_STEREO**

I2S channel (stereo), two (or more) channels activated. In this mode, these channels will transmit different data.

enumerator **I2S\_TDM\_ACTIVE\_CH0**

I2S channel 0 activated

enumerator **I2S\_TDM\_ACTIVE\_CH1**

I2S channel 1 activated

enumerator **I2S\_TDM\_ACTIVE\_CH2**

I2S channel 2 activated

enumerator **I2S\_TDM\_ACTIVE\_CH3**

I2S channel 3 activated

enumerator **I2S\_TDM\_ACTIVE\_CH4**

I2S channel 4 activated

enumerator **I2S\_TDM\_ACTIVE\_CH5**

I2S channel 5 activated

enumerator **I2S\_TDM\_ACTIVE\_CH6**

I2S channel 6 activated

enumerator **I2S\_TDM\_ACTIVE\_CH7**

I2S channel 7 activated

enumerator **I2S\_TDM\_ACTIVE\_CH8**

I2S channel 8 activated

enumerator **I2S\_TDM\_ACTIVE\_CH9**

I2S channel 9 activated

enumerator **I2S\_TDM\_ACTIVE\_CH10**

I2S channel 10 activated

enumerator **I2S\_TDM\_ACTIVE\_CH11**

I2S channel 11 activated

enumerator **I2S\_TDM\_ACTIVE\_CH12**

I2S channel 12 activated

enumerator **I2S\_TDM\_ACTIVE\_CH13**

I2S channel 13 activated

enumerator **I2S\_TDM\_ACTIVE\_CH14**

I2S channel 14 activated

enumerator **I2S\_TDM\_ACTIVE\_CH15**

I2S channel 15 activated

enum **i2s\_comm\_format\_t**

I2S communication standard format.

*Values:*

enumerator **I2S\_COMM\_FORMAT\_STAND\_I2S**

I2S communication I2S Philips standard, data launch at second BCK

enumerator **I2S\_COMM\_FORMAT\_STAND\_MSB**

I2S communication MSB alignment standard, data launch at first BCK

enumerator **I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT**

PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

enumerator **I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG**

PCM Long standard. The period of synchronization signal (WS) is channel\_bit\*bck cycles.

enumerator **I2S\_COMM\_FORMAT\_STAND\_MAX**

standard max

enumerator **I2S\_COMM\_FORMAT\_I2S**

I2S communication format I2S, correspond to I2S\_COMM\_FORMAT\_STAND\_I2S

enumerator **I2S\_COMM\_FORMAT\_I2S\_MSB**

I2S format MSB, (I2S\_COMM\_FORMAT\_I2S | I2S\_COMM\_FORMAT\_I2S\_MSB) correspond to I2S\_COMM\_FORMAT\_STAND\_I2S

enumerator **I2S\_COMM\_FORMAT\_I2S\_LSB**

I2S format LSB, (I2S\_COMM\_FORMAT\_I2S | I2S\_COMM\_FORMAT\_I2S\_LSB) correspond to I2S\_COMM\_FORMAT\_STAND\_MSB

enumerator **I2S\_COMM\_FORMAT\_PCM**

I2S communication format PCM, correspond to I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT

enumerator **I2S\_COMM\_FORMAT\_PCM\_SHORT**

PCM Short, (I2S\_COMM\_FORMAT\_PCM | I2S\_COMM\_FORMAT\_PCM\_SHORT) correspond to I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT

enumerator **I2S\_COMM\_FORMAT\_PCM\_LONG**

PCM Long, (I2S\_COMM\_FORMAT\_PCM | I2S\_COMM\_FORMAT\_PCM\_LONG) correspond to I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG

enum **i2s\_channel\_fmt\_t**

I2S channel format type.

*Values:*

enumerator **I2S\_CHANNEL\_FMT\_RIGHT\_LEFT**

Separated left and right channel

enumerator **I2S\_CHANNEL\_FMT\_ALL\_RIGHT**

Load right channel data in both two channels

enumerator **I2S\_CHANNEL\_FMT\_ALL\_LEFT**

Load left channel data in both two channels

enumerator **I2S\_CHANNEL\_FMT\_ONLY\_RIGHT**

Only load data in right channel (mono mode)

enumerator **I2S\_CHANNEL\_FMT\_ONLY\_LEFT**

Only load data in left channel (mono mode)

enumerator **I2S\_CHANNEL\_FMT\_MULTIPLE**

More than two channels are used

enum **i2s\_mode\_t**

I2S Mode.

*Values:*

enumerator **I2S\_MODE\_MASTER**

Master mode

enumerator **I2S\_MODE\_SLAVE**

Slave mode

enumerator **I2S\_MODE\_TX**

TX mode

enumerator **I2S\_MODE\_RX**

RX mode

enumerator **I2S\_MODE\_PDM**

I2S PDM mode

enum **i2s\_clock\_src\_t**

I2S source clock.

*Values:*

enumerator **I2S\_CLK\_D2CLK**

Clock from PLL\_D2\_CLK(160M)

enum **i2s\_mclk\_multiple\_t**

The multiple of mclk to sample rate.

*Values:*

enumerator **I2S\_MCLK\_MULTIPLE\_DEFAULT**

Default value.  $mclk = sample\_rate * 256$

enumerator **I2S\_MCLK\_MULTIPLE\_128**

$mclk = sample\_rate * 128$

enumerator **I2S\_MCLK\_MULTIPLE\_256**

$mclk = sample\_rate * 256$

enumerator **I2S\_MCLK\_MULTIPLE\_384**

$mclk = sample\_rate * 384$

enum **i2s\_pcm\_compress\_t**

A/U-law decompress or compress configuration.

*Values:*

enumerator **I2S\_PCM\_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S\_PCM\_A\_DECOMPRESS**

A-law decompress

enumerator **I2S\_PCM\_A\_COMPRESS**

A-law compress

enumerator **I2S\_PCM\_U\_DECOMPRESS**

U-law decompress

enumerator **I2S\_PCM\_U\_COMPRESS**

U-law compress

enum **i2s\_pdm\_dsr\_t**

I2S PDM RX downsample mode.

*Values:*

enumerator **I2S\_PDM\_DSR\_8S**

downsampling number is 8 for PDM RX mode

enumerator **I2S\_PDM\_DSR\_16S**

downsampling number is 16 for PDM RX mode

enumerator **I2S\_PDM\_DSR\_MAX**

enum **i2s\_pdm\_sig\_scale\_t**

*Values:*

enumerator **I2S\_PDM\_SIG\_SCALING\_DIV\_2**

I2S TX PDM sigmadelta signal scaling: /2

enumerator `I2S_PDM_SIG_SCALING_MUL_1`

I2S TX PDM sigmadelta signal scaling: x1

enumerator `I2S_PDM_SIG_SCALING_MUL_2`

I2S TX PDM sigmadelta signal scaling: x2

enumerator `I2S_PDM_SIG_SCALING_MUL_4`

I2S TX PDM sigmadelta signal scaling: x4

## 2.3.9 LCD

### Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

### Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

### Application Example

LCD examples are located under: [peripherals/lcd](#):

- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- LVGL porting and animation UI - [peripherals/lcd/lvgl](#)

### API Reference

#### Header File

- [components/hal/include/hal/lcd\\_types.h](#)

#### Enumerations

enum `lcd_clock_source_t`

LCD clock source.

---

**备注:** User should select the clock source based on the real requirement:

LCD clock source	Features	Power Management
LCD_CLK_SRC_PLL160M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_PLL240M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_APLL	Configurable resolution	ESP_PM_NO_LIGHT_SLEEP lock
LCD_CLK_SRC_XTAL	Medium resolution	No PM lock

*Values:*

enumerator **LCD\_CLK\_SRC\_PLL160M**  
Select PLL160M as the source clock

enumerator **LCD\_CLK\_SRC\_PLL240M**  
Select PLL240M as the source clock

enumerator **LCD\_CLK\_SRC\_APLL**  
Select APLL as the source clock

enumerator **LCD\_CLK\_SRC\_XTAL**  
Select XTAL as the source clock

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)

### Type Definitions

typedef struct esp\_lcd\_panel\_io\_t \***esp\_lcd\_panel\_io\_handle\_t**  
Type of LCD panel IO handle

typedef struct esp\_lcd\_panel\_t \***esp\_lcd\_panel\_handle\_t**  
Type of LCD panel handle

### Enumerations

enum **esp\_lcd\_color\_space\_t**  
LCD color space type definition.

*Values:*

enumerator **ESP\_LCD\_COLOR\_SPACE\_RGB**  
Color space: RGB

enumerator **ESP\_LCD\_COLOR\_SPACE\_BGR**  
Color space: BGR

enumerator **ESP\_LCD\_COLOR\_SPACE\_MONOCHROME**  
Color space: monochrome

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_panel\\_io.h](#)

**Functions**

*esp\_err\_t* **esp\_lcd\_panel\_io\_rx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**备注:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**参数**

- **io** **–[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **–[in]** The specific LCD command, set to -1 if no command needed
- **param** **–[out]** Buffer for the command data
- **param\_size** **–[in]** Size of param buffer

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_SUPPORTED if read is not supported by transport
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*param, size\_t param\_size)

Transmit LCD command and corresponding parameters.

---

**备注:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**参数**

- **io** **–[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **–[in]** The specific LCD command
- **param** **–[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param\_size** **–[in]** Size of param in memory, in bytes, set to zero if no parameter is needed for the command

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_color** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*color, size\_t color\_size)

Transmit LCD RGB data.

---

**备注:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

**参数**

- **io** **–[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

- **lcd\_cmd** –[in] The specific LCD command
- **color** –[in] Buffer that holds the RGB color data
- **color\_size** –[in] Size of `color` in memory, in bytes

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_del** (*esp\_lcd\_panel\_io\_handle\_t* io)

Destory LCD panel IO handle (deinitialize panel and free all corresponding resource)

**参数** **io** –[in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_spi** (*esp\_lcd\_spi\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_spi\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for SPI interface.

**参数**

- **bus** –[in] SPI bus handle
- **io\_config** –[in] IO configuration, for SPI interface
- **ret\_io** –[out] Returned IO handle

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c** (*esp\_lcd\_i2c\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface.

**参数**

- **bus** –[in] I2C bus handle
- **io\_config** –[in] IO configuration, for I2C interface
- **ret\_io** –[out] Returned IO handle

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_i80\_bus** (const *esp\_lcd\_i80\_bus\_config\_t* \*bus\_config, *esp\_lcd\_i80\_bus\_handle\_t* \*ret\_bus)

Create Intel 8080 bus handle.

**参数**

- **bus\_config** –[in] Bus configuration
- **ret\_bus** –[out] Returned bus handle

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_NOT\_FOUND if no free bus is available
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_del\_i80\_bus** (*esp\_lcd\_i80\_bus\_handle\_t* bus)

Destory Intel 8080 bus handle.

**参数** **bus** –[in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if there still be some device attached to the bus
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i80** (*esp\_lcd\_i80\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i80\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO, for Intel 8080 interface.

#### 参数

- **bus** –[in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io\_config** –[in] IO configuration, for i80 interface
- **ret\_io** –[out] Returned panel IO handle

#### 返回

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_SUPPORTED if some configuration can't be satisfied, e.g. pixel clock out of the range
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Structures

struct **esp\_lcd\_panel\_io\_event\_data\_t**

Type of LCD panel IO event data.

struct **esp\_lcd\_panel\_io\_spi\_config\_t**

Panel IO configuration structure, for SPI interface.

## Public Members

int **cs\_gpio\_num**

GPIO used for CS line

int **dc\_gpio\_num**

GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int **spi\_mode**

Traditional SPI mode (0~3)

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_as\_cmd\_phase**

D/C line value is encoded into SPI transaction command phase

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **lsb\_first**

transmit LSB bit first

struct *esp\_lcd\_panel\_io\_spi\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp\_lcd\_panel\_io\_i2c\_config\_t**

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t **dev\_addr**

I2C device address

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to *on\_color\_trans\_done*'s *user\_ctx*

size\_t **control\_phase\_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc\_bit\_offset**

Offset of the D/C selection bit in control phase

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable\_control\_phase**

If this flag is enabled, the control phase isn't used

struct *esp\_lcd\_panel\_io\_i2c\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

struct **esp\_lcd\_i80\_bus\_config\_t**

LCD Intel 8080 bus configuration structure.

### Public Members

int **dc\_gpio\_num**

GPIO used for D/C line

int **wr\_gpio\_num**

GPIO used for WR line

*lcd\_clock\_source\_t* **clk\_src**

Clock source for the I80 LCD peripheral

int **data\_gpio\_nums**[(16)]

GPIOs used for data lines

size\_t **bus\_width**

Number of data lines, 8 or 16

size\_t **max\_transfer\_bytes**

Maximum transfer size, this determines the length of internal DMA link

size\_t **psram\_trans\_align**

DMA transfer alignment for data allocated from PSRAM

size\_t **sram\_trans\_align**

DMA transfer alignment for data allocated from SRAM

struct **esp\_lcd\_panel\_io\_i80\_config\_t**

Panel IO configuration structure, for intel 8080 interface.

### Public Members

int **cs\_gpio\_num**

GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Transaction queue size, larger queue, higher throughput

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data was transferred done

void \***user\_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_idle\_level**

Level of DC line in IDLE phase

unsigned int **dc\_cmd\_level**

Level of DC line in CMD phase

unsigned int **dc\_dummy\_level**

Level of DC line in DUMMY phase

unsigned int **dc\_data\_level**

Level of DC line in DATA phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **dc\_levels**

Each i80 device might have its own D/C control logic

unsigned int **cs\_active\_high**

If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse\_color\_bits**

Reverse the data bits,  $D[N:0] \rightarrow D[0:N]$

unsigned int **swap\_color\_bytes**

Swap adjacent two color bytes

unsigned int **pclk\_active\_neg**

The display will write data lines when there's a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk\_idle\_low**

The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **flags**

Panel IO config flags

## Type Definitions

```
typedef void *esp_lcd_spi_bus_handle_t
```

Type of LCD SPI bus handle

```
typedef void *esp_lcd_i2c_bus_handle_t
```

Type of LCD I2C bus handle

```
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
```

Type of LCD intel 8080 bus handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io [in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Param edata [in]** Panel IO event data, fed by driver

**Param user\_ctx [in]** User data, passed from `esp_lcd_panel_io_XXX_config_t`

**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`

## Functions

```
esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)
```

Reset LCD panel.

---

**备注:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**参数 panel -[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**返回**

- ESP\_OK on success

```
esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)
```

Initialize LCD panel.

---

**备注:** Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

---

**参数 panel -[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**返回**

- ESP\_OK on success

```
esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)
```

Deinitialize the LCD panel.

**参数 panel -[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**返回**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_draw\_bitmap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_start, int y\_start, int x\_end, int y\_end, const void \*color\_data)

Draw bitmap on LCD panel.

#### 参数

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** –[in] Start index on x-axis (x\_start included)
- **y\_start** –[in] Start index on y-axis (y\_start included)
- **x\_end** –[in] End index on x-axis (x\_end not included)
- **y\_end** –[in] End index on y-axis (y\_end not included)
- **color\_data** –[in] RGB color data that will be dumped to the specific window range

#### 返回

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_mirror** (*esp\_lcd\_panel\_handle\_t* panel, bool mirror\_x, bool mirror\_y)

Mirror the LCD panel on specific axis.

---

**备注:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

#### 参数

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** –[in] Whether the panel will be mirrored about the x axis
- **mirror\_y** –[in] Whether the panel will be mirrored about the y axis

#### 返回

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_swap\_xy** (*esp\_lcd\_panel\_handle\_t* panel, bool swap\_axes)

Swap/Exchange x and y axis.

---

**备注:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

#### 参数

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** –[in] Whether to swap the x and y axis

#### 返回

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**备注:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

#### 参数

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** –[in] Extra gap on x axis, in pixels

- **y\_gap** **-[in]** Extra gap on y axis, in pixels
- 返回
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_invert\_color** (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)  
Invert the color (bit-wise invert the color data line)

#### 参数

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** **-[in]** Whether to invert the color data

#### 返回

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_disp\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool off)  
Turn off the display.

#### 参数

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** **-[in]** Whether to turn off the screen

#### 返回

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_panel\\_rgb.h](#)

### Functions

*esp\_err\_t* **esp\_lcd\_new\_rgb\_panel** (const *esp\_lcd\_rgb\_panel\_config\_t* \*rgb\_panel\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create RGB LCD panel.

#### 参数

- **rgb\_panel\_config** –RGB panel configuration
- **ret\_panel** –Returned LCD panel handle

#### 返回

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_NOT\_FOUND if no free RGB panel is available
- ESP\_OK on success

### Structures

struct **esp\_lcd\_rgb\_timing\_t**

LCD RGB timing structure.

(下页继续)

unsigned int **v\_res**

Vertical resolution, i.e. the number of lines in the frame

unsigned int **hsync\_pulse\_width**

Horizontal sync width, unit: PCLK period

unsigned int **hsync\_back\_porch**

Horizontal back porch, number of PCLK between hsync and start of line active data

unsigned int **hsync\_front\_porch**

Horizontal front porch, number of PCLK between the end of active data and the next hsync

unsigned int **vsync\_pulse\_width**

Vertical sync width, unit: number of lines

unsigned int **vsync\_back\_porch**

Vertical back porch, number of invalid lines between vsync and start of frame

unsigned int **vsync\_front\_porch**

Vertical front porch, number of invalid lines between the end of frame and the next vsync

unsigned int **hsync\_idle\_low**

The hsync signal is low in IDLE state

unsigned int **vsync\_idle\_low**

The vsync signal is low in IDLE state

unsigned int **de\_idle\_high**

The de signal is high in IDLE state

unsigned int **pclk\_active\_neg**

Whether the display data is clocked out at the falling edge of PCLK

unsigned int **pclk\_idle\_high**

The PCLK stays at high level in IDLE phase

struct *esp\_lcd\_rgb\_timing\_t*::[anonymous] **flags**

LCD RGB timing flags

struct **esp\_lcd\_rgb\_panel\_event\_data\_t**

Type of RGB LCD panel event data.

struct **esp\_lcd\_rgb\_panel\_config\_t**

LCD RGB panel configuration structure.

## Public Members

***lcd\_clock\_source\_t* clk\_src**

Clock source for the RGB LCD peripheral

***esp\_lcd\_rgb\_timing\_t* timings**

RGB timing parameters

**size\_t data\_width**

Number of data lines

**size\_t sram\_trans\_align**

Alignment for framebuffer that allocated in SRAM

**size\_t psram\_trans\_align**

Alignment for framebuffer that allocated in PSRAM

**int hsync\_gpio\_num**

GPIO used for HSYNC signal

**int vsync\_gpio\_num**

GPIO used for VSYNC signal

**int de\_gpio\_num**

GPIO used for DE signal, set to -1 if it's not used

**int pclk\_gpio\_num**

GPIO used for PCLK signal

**int data\_gpio\_nums[(16)]**

GPIOs used for data lines

**int disp\_gpio\_num**

GPIO used for display control signal, set to -1 if it's not used

***esp\_lcd\_rgb\_panel\_frame\_trans\_done\_cb\_t* on\_frame\_trans\_done**

Callback invoked when one frame buffer has transferred done

**void \*user\_ctx**

User data which would be passed to on\_frame\_trans\_done's user\_ctx

**unsigned int disp\_active\_low**

If this flag is enabled, a low level of display control signal can turn the screen on; vice versa

**unsigned int relax\_on\_idle**

If this flag is enabled, the host won't refresh the LCD if nothing changed in host's frame buffer (this is useful for LCD with built-in GRAM)

**unsigned int fb\_in\_psram**

If this flag is enabled, the frame buffer will be allocated from PSRAM preferentially

```
struct esp_lcd_rgb_panel_config_t::[anonymous] flags
    LCD RGB panel configuration flags
```

## Type Definitions

```
typedef bool (*esp_lcd_rgb_panel_frame_trans_done_cb_t)(esp_lcd_panel_handle_t panel,
esp_lcd_rgb_panel_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel [in]** LCD panel handle, returned from `esp_lcd_new_rgb_panel`  
**Param edata [in]** Panel event data, fed by driver  
**Param user\_ctx [in]** User data, passed from `esp_lcd_rgb_panel_config_t`  
**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

## Functions

```
esp_err_t esp_lcd_new_panel_st7789 (const esp_lcd_panel_io_handle_t io, const
    esp_lcd_panel_dev_config_t *panel_dev_config,
    esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

### 参数

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

### 返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

```
esp_err_t esp_lcd_new_panel_nt35510 (const esp_lcd_panel_io_handle_t io, const
    esp_lcd_panel_dev_config_t *panel_dev_config,
    esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

### 参数

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

### 返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

```
esp_err_t esp_lcd_new_panel_ssd1306 (const esp_lcd_panel_io_handle_t io, const
    esp_lcd_panel_dev_config_t *panel_dev_config,
    esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

### 参数

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

### 返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid

- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Structures

struct **esp\_lcd\_panel\_dev\_config\_t**

Configuration structure for panel device.

### Public Members

int **reset\_gpio\_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

*esp\_lcd\_color\_space\_t* **color\_space**

Set the color space used by the LCD panel

unsigned int **bits\_per\_pixel**

Color depth, in bpp

unsigned int **reset\_active\_high**

Setting this if the panel reset is high level active

struct *esp\_lcd\_panel\_dev\_config\_t*::[anonymous] **flags**

LCD panel config flags

void \***vendor\_config**

vendor specific configuration, optional, left as NULL if not used

## 2.3.10 LED PWM 控制器

### 概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 8 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

### 功能概览

设置 LEDC 通道分三步完成。注意，与 ESP32 不同，ESP32-S3 仅支持设置通道为低速模式。

1. **定时器配置** 指定 PWM 信号的频率和占空比分辨率。
2. **通道配置** 绑定定时器和输出 PWM 信号的 GPIO。
3. **改变 PWM 信号** 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

另一个可选步骤是在渐变终端设置一个中断。

图 6: LED PWM 控制器 API 的关键配置

**定时器配置** 要设置定时器，可调用函数 `ledc_timer_config()`，并将包括如下配置参数的数据结构 `ledc_timer_config_t` 传递给该函数：

- 速度模式（值必须为 `LEDC_LOW_SPEED_MODE`）
- 定时器索引 `ledc_timer_t`
- PWM 信号频率
- PWM 占空比分辨率

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见 [频率和占空比分辨率支持范围](#) 一节。

**通道配置** 定时器设置好后，请配置所需的通道（`ledc_channel_t` 之一）。配置通道需调用函数 `ledc_channel_config()`。

通道的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体 `ledc_channel_config_t`。

此时，通道会按照 `ledc_channel_config_t` 的配置开始运作，并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中，可以随时通过调用函数 `ledc_stop()` 将其暂停。

**改变 PWM 信号** 通道开始运行、生成具有恒定占空比和频率的 PWM 信号之后，有几种方式可以改变该信号。驱动 LED 时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM 信号的频率也可更改，详见 [改变 PWM 频率](#) 一节。

**使用软件改变 PWM 占空比** 调用函数 `ledc_set_duty()` 可以设置新的占空比。之后，调用函数 `ledc_update_duty()` 使新配置生效。要查看当前设置的占空比，可使用 `_get_` 函数 `ledc_get_duty()`。

另外一种设置占空比和其他通道参数的方式是调用 [通道配置](#) 一节提到的函数 `ledc_channel_config()`。

传递给函数的占空比数值范围取决于选定的 `duty_resolution`，应为  $0$  至  $(2^{**} \text{duty\_resolution}) - 1$ 。例如，如选定的占空比分辨率为  $10$ ，则占空比的数值范围为  $0$  至  $1023$ 。此时分辨率为  $\sim 0.1\%$ 。

**使用硬件改变 PWM 占空比** LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数 `ledc_fade_func_install()` 使能渐变，之后用下列可用渐变函数之一配置：

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

最后用 `ledc_fade_start()` 开启渐变。

如不需要渐变和渐变中断，可用函数 `ledc_fade_func_uninstall()` 关闭。

**改变 PWM 频率** LED PWM 控制器 API 有多种方式即时改变 PWM 频率：

- 通过调用函数 `ledc_set_freq()` 设置频率。可用函数 `ledc_get_freq()` 查看当前频率。
- 通过调用函数 `ledc_bind_channel_timer()` 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数 `ledc_channel_config()` 改变通道的定时器。

**控制 PWM 的更多方式** 有一些较底层的定时器特定函数可用于更改 PWM 设置：

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数 `ledc_channel_config()` 在后台运行，在定时器配置后启动。

**使用中断** 配置 LED PWM 控制器通道时，可在 `ledc_channel_config_t` 中选取参数 `ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数 `ledc_isr_register()`。

### 频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为  $5 \text{ kHz}$  时，占空比分辨率最大可为  $13$  位。这意味着占空比可为  $0$  至  $100\%$  之间的任意值，分辨率为  $\sim 0.012\%$  ( $2^{**} 13 = 8192$  LED 亮度的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器计时的时钟信号，LED PWM 控制器为通道提供时钟（具体可参考[定时器配置](#)和[ESP32-S3 技术参考手册 > LED PWM 计时器 \(LEDC\) \[PDF\]](#)）。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为  $40 \text{ MHz}$ ，占空比分辨率为  $1$  位。也就是说，占空比固定为  $50\%$ ，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为  $20 \text{ MHz}$ 、占空比分辨率设置为  $3$  位时，串行端口监视器上会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为  $2$  会解决这一问题，让占空比设置为  $25\%$  的倍数，即  $25\%$ 、 $50\%$  或  $75\%$ 。

如设置的频率和占空比分辨率低于所支持的最小值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用 `ledc_timer_bit_t` 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

### 应用实例

使用 LEDC 改变占空比和渐变控制的实例请参照 [peripherals/ledc/ledc\\_fade](#)。

使用 LEDC 基本实例请参照 [peripherals/ledc/ledc\\_basic](#)。

### API 参考

#### Header File

- [components/driver/include/driver/ledc.h](#)

#### Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

参数 `ledc_conf` –Pointer of LEDC channel configure struct

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t ledc_timer_config` (const `ledc_timer_config_t` \*timer\_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

参数 `timer_conf` –Pointer of LEDC timer configure struct

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

`esp_err_t ledc_update_duty` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

LEDC update channel parameters.

---

**备注:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**备注:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_pin** (int gpio\_num, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

*Deprecated:*

This function is redundant, please use `ledc_channel_config` to set gpio pins.

参数

- **gpio\_num** –The LEDC output gpio
- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **idle\_level** –Set output idle level after LEDC stops.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, uint32\_t freq\_hz)

LEDC set channel frequency (Hz)

参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** –LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** –Set the LEDC frequency

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

uint32\_t **ledc\_get\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** –LEDC timer index (0-3), select from `ledc_timer_t`

返回

- 0 error
- Others Current LEDC frequency

*esp\_err\_t* **ledc\_set\_duty\_with\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

---

**备注:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution) - 1]$
- **hpoint** –Set the LEDC hpoint value(max: 0xffff)

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

int `ledc_get_hpoint` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

LEDC get hpoint value, the counter value when the output is set high level.

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

#### 返回

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

`esp_err_t` `ledc_set_duty` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

---

**备注:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution) - 1]$

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

uint32\_t **ledc\_get\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

#### 返回

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, *ledc\_duty\_direction\_t* fade\_direction, uint32\_t step\_num, uint32\_t duty\_cycle\_num, uint32\_t duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** –Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **fade\_direction** –Set the direction of the gradient
- **step\_num** –Set the number of the gradient
- **duty\_cycle\_num** –Set how many LEDC tick each time the gradient lasts
- **duty\_scale** –Set gradient change amplitude

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

#### 参数

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** –Timer clock divide value, the timer clock is divided from the selected clock source
- **duty\_resolution** –Resolution of duty setting in number of bits. The range of duty values is [0, (2\*\*duty\_resolution)]
- **clk\_src** –Select LEDC source clock.

**返回**

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**参数**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

**参数**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

**参数**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

**参数**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

---

**备注:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**备注:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle\_num** –increase or decrease the duty every `cycle_num` cycles

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* `ledc_set_fade_with_time` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**备注:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**备注:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **max\_fade\_time\_ms** –The maximum time of the fading ( ms ).

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_fade\_func\_install** (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**参数** *intr\_alloc\_flags* –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function already installed.

void **ledc\_fade\_func\_uninstall** (void)

Uninstall LEDC fade function.

*esp\_err\_t* **ledc\_fade\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

---

**备注:** Call ledc\_fade\_func\_install() once before calling this function. Call this API right after ledc\_set\_fade\_with\_time or ledc\_set\_fade\_with\_step before to start fading.

---

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

**参数**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade\_mode** –Whether to block until fading done. See ledc\_types.h ledc\_fade\_mode\_t for more info. Note that this function will not return until fading to the target duty if LEDC\_FADE\_WAIT\_DONE mode is selected.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_ERR\_INVALID\_ARG Parameter error.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

**参数**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xffff)

---

```
esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t
target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t
fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**备注:** Call `ledc_fade_func_install()` once, before calling this function.

---

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **max\_fade\_time\_ms** –The maximum time of the fading ( ms ).
- **fade\_mode** –choose blocking or non-blocking mode

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

```
esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t
target_duty, uint32_t scale, uint32_t cycle_num,
ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

---

**备注:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**备注:** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle\_num** –increase or decrease the duty every cycle\_num cycles
- **fade\_mode** –choose blocking or non-blocking mode

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

```
esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void
*user_arg)
```

LEDC callback registration function.

---

**备注:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

#### 参数

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** –Group of LEDC callback functions
- **user\_arg** –user registered data for the callback function

#### 返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

### Structures

struct **ledc\_channel\_config\_t**

Configuration parameters of LEDC channel for `ledc_channel_config` function.

### Public Members

int **gpio\_num**

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

*ledc\_mode\_t* **speed\_mode**

LEDC speed `speed_mode`, high-speed mode or low-speed mode

*ledc\_channel\_t* **channel**

LEDC channel (0 - 7)

*ledc\_intr\_type\_t* **intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

*ledc\_timer\_t* **timer\_sel**

Select the timer source of channel (0 - 3)

uint32\_t **duty**

LEDC channel duty, the range of duty setting is  $[0, (2^{**duty\_resolution})]$

int **hpoint**

LEDC channel `hpoint` value, the max value is `0xffff`

unsigned int **output\_invert**

Enable (1) or disable (0) `gpio` output invert

struct *ledc\_channel\_config\_t*::[anonymous] **flags**

LEDC flags

struct **ledc\_timer\_config\_t**

Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

### Public Members

*ledc\_mode\_t* **speed\_mode**

LEDC speed `speed_mode`, high-speed mode or low-speed mode

*ledc\_timer\_bit\_t* **duty\_resolution**

LEDC channel duty resolution

*ledc\_timer\_bit\_t* **bit\_num**

Deprecated in ESP-IDF 3.0. This is an alias to ‘`duty_resolution`’ for backward compatibility with ESP-IDF 2.1

*ledc\_timer\_t* **timer\_num**

The timer source of channel (0 - 3)

uint32\_t **freq\_hz**

LEDC timer frequency (Hz)

*ledc\_clk\_cfg\_t* **clk\_cfg**

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel’s source clock must be `RTC8M_CLK`

struct **ledc\_cb\_param\_t**

LEDC callback parameter.

### Public Members

*ledc\_cb\_event\_t* **event**

Event name

uint32\_t **speed\_mode**

Speed mode of the LEDC channel group

uint32\_t **channel**

LEDC channel (0 - `LEDC_CHANNEL_MAX-1`)

uint32\_t **duty**

LEDC current duty of the channel, the range of duty is  $[0, (2^{**}duty\_resolution) - 1]$

struct **ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**备注:** The callbacks are all running under ISR environment

---

### Public Members

*ledc\_cb\_t* **fade\_cb**

LEDC fade\_end callback function

### Macros

**LEDC\_APB\_CLK\_HZ**

**LEDC\_REF\_CLK\_HZ**

**LEDC\_ERR\_DUTY**

**LEDC\_ERR\_VAL**

### Type Definitions

typedef *intr\_handle\_t* **ledc\_isr\_handle\_t**

typedef bool (\***ledc\_cb\_t**)(const *ledc\_cb\_param\_t* \*param, void \*user\_arg)

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

### Enumerations

enum **ledc\_cb\_event\_t**

LEDC callback event type.

*Values:*

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

### Header File

- [components/hal/include/hal/ledc\\_types.h](#)

### Enumerations

enum **ledc\_mode\_t**

*Values:*

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC\_SLOW\_CLK\_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC\_SLOW\_CLK\_XTAL**

LEDC low speed timer clock source XTAL clock

enum **ledc\_clk\_cfg\_t**

In theory, the following enumeration shall be placed in LEDC driver' s header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

*Values:*

enumerator **LEDC\_AUTO\_CLK**

The driver will automatically select the source clock(REF\_TICK or APB) based on the giving resolution and duty parameter when init the timer

enumerator **LEDC\_USE\_APB\_CLK**

LEDC timer select APB clock as source clock

enumerator **LEDC\_USE\_RTC8M\_CLK**

LEDC timer select RTC8M\_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enumerator **LEDC\_USE\_REF\_TICK**

LEDC timer select REF\_TICK clock as source clock

enumerator **LEDC\_USE\_XTAL\_CLK**

LEDC timer select XTAL clock as source clock

enum **ledc\_clk\_src\_t**

*Values:*

enumerator **LEDC\_REF\_TICK**

LEDC timer clock divided from reference tick (1Mhz)

enumerator **LEDC\_APB\_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC\_SCLK**

Selecting this value for LEDC\_TICK\_SEL\_TIMER let the hardware take its source clock from LEDC\_APB\_CLK\_SEL

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**

enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_6**

LEDC channel 6

enumerator **LEDC\_CHANNEL\_7**

LEDC channel 7

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC\_TIMER\_10\_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC\_TIMER\_11\_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC\_TIMER\_12\_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC\_TIMER\_13\_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC\_TIMER\_14\_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC\_TIMER\_BIT\_MAX**

enum **ledc\_fade\_mode\_t**

*Values:*

enumerator **LEDC\_FADE\_NO\_WAIT**

LEDC fade function will return immediately

enumerator **LEDC\_FADE\_WAIT\_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC\_FADE\_MAX**

### 2.3.11 Motor Control Pulse Width Modulator (MCPWM)

ESP32-S3 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled `PWMxA` / `PWMxB`.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as `SYNC SIGNALS`, detect `FAULT SIGNALS` like motor overcurrent or overvoltage, as well as obtain feedback with `CAPTURE SIGNALS` on e.g. a rotor position.

Description of this API starts with configuration of MCPWM's **Timer** and **Generator** submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a **Fault Handler**, signal **Capture** and **Carrier**.

#### Contents

- *Configure* a basic functionality of the outputs
- *Operate* the outputs to drive a motor
- *Adjust* how the motor is driven

图 7: MCPWM Overview

图 8: MCPWM Block Diagram

- *Synchronize* sync timers to work together
- *Capture* external signals to provide additional control over the outputs
- Use *Fault Handler* to detect and manage faults
- Add a higher frequency *Carrier*, if output signals are passed through an isolation transformer
- Extra configuration of *Resolution*.

## Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM's resources. An example circuit is shown below. It includes a *H-Bridge* to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

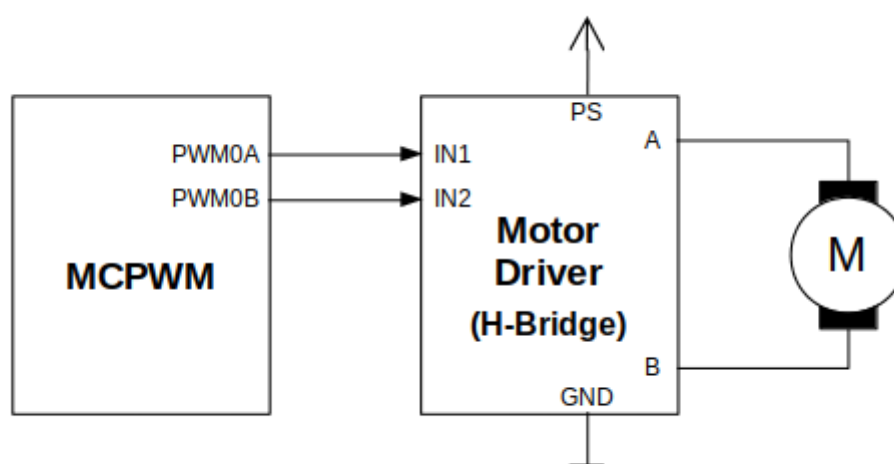

图 9: Example of Brushed DC Motor Control with MCPWM

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32-S3 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

## Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit's outputs. The outputs are organized into three pairs. Within a pair they are labeled "A" and "B" and each driven by a submodule called an "Generator". To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each

Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM's duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of options from `mcpwm_duty_type_t`.

---

**备注:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

---

## Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the *block diagram* of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

---

**备注:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

---

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see *ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM)* [PDF].

## Synchronize

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers' synchronization outputs or GPIO signals via the GPIO matrix. Timer's synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers

can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%~99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section *Configure*.

It's normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

Software sync event which triggered on one timer can be propagated to other timers on ESP32-S3, which can be used as a tricky way to get all three timers synced without any extra requirement.

```
// configure timer0 as trigger source
mcpwm_set_timer_sync_output(MCPWM_UNIT_0, MCPWM_TIMER_0, MCPWM_SWSYNC_SOURCE_
↪SYNCIN);
mcpwm_sync_config_t sync_conf = {
    .sync_sig = MCPWM_SELECT_TIMER0_SYNC,
    .timer_val = 0,
    .count_direction = MCPWM_TIMER_DIRECTION_UP,
};
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_0, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_1, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_2, &sync_conf);
// then send soft sync event to timer0
mcpwm_timer_trigger_soft_sync(MCPWM_UNIT_0, MCPWM_TIMER_0);
```

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

## Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal's edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section *Configure*.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`

图 10: Example of Brushless DC Motor Control with MCPWM

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer's value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler's internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

### Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
  - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
  - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

## Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see *ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule* [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

## Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

## Resolution

The default resolution for MCPWM group and MCPWM timer are configured to **10MHz** and **1MHz** in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won't update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

## Application Example

MCPWM example are located under: [peripherals/mcpwm](#):

### Enumerations

enum `mcpwm_timer_direction_t`

*Values:*

enumerator `MCPWM_TIMER_DIRECTION_UP`

Counting direction: Increase

enumerator `MCPWM_TIMER_DIRECTION_DOWN`

Counting direction: Decrease

enum `mcpwm_timer_event_t`

*Values:*

enumerator `MCPWM_TIMER_EVENT_ZERO`

MCPWM timer counts to zero

enumerator `MCPWM_TIMER_EVENT_PEAK`

MCPWM timer counts to peak

enum `mcpwm_timer_count_mode_t`

*Values:*

enumerator `MCPWM_TIMER_COUNT_MODE_PAUSE`

MCPWM timer paused

enumerator `MCPWM_TIMER_COUNT_MODE_UP`

MCPWM timer counting up

enumerator `MCPWM_TIMER_COUNT_MODE_DOWN`

MCPWM timer counting down

enumerator `MCPWM_TIMER_COUNT_MODE_UP_DOWN`

MCPWM timer counting up and down

enum **mcpwm\_timer\_execute\_cmd\_t**

*Values:*

enumerator **MCPWM\_TIMER\_STOP\_AT\_ZERO**

MCPWM timer stops when counting to zero

enumerator **MCPWM\_TIMER\_STOP\_AT\_PEAK**

MCPWM timer stops when counting to peak

enumerator **MCPWM\_TIMER\_START\_NO\_STOP**

MCPWM timer starts counting

enumerator **MCPWM\_TIMER\_START\_STOP\_AT\_ZERO**

MCPWM timer starts counting and stops when counting to zero

enumerator **MCPWM\_TIMER\_START\_STOP\_AT\_PEAK**

MCPWM timer starts counting and stops when counting to peak

enum **mcpwm\_generator\_action\_t**

*Values:*

enumerator **MCPWM\_GEN\_ACTION\_KEEP**

Generator action: Keep the same level

enumerator **MCPWM\_GEN\_ACTION\_LOW**

Generator action: Force to low level

enumerator **MCPWM\_GEN\_ACTION\_HIGH**

Generator action: Force to high level

enumerator **MCPWM\_GEN\_ACTION\_TOGGLE**

Generator action: Toggle level

enum **mcpwm\_trip\_type\_t**

*Values:*

enumerator **MCPWM\_TRIP\_TYPE\_CBC**

CBC trip type, shut down the operator cycle by cycle

enumerator **MCPWM\_TRIP\_TYPE\_OST**

OST trip type, shut down the operator in one shot

**Functions**

*esp\_err\_t* **mcpwm\_gpio\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_io\_signals\_t* io\_signal, int gpio\_num)

This function initializes each gpio signal for MCPWM.

---

**备注:** This function initializes one gpio at a time.

---

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **io\_signal** –set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC\_X, FAULT\_X, CAP\_X) ‘X’ is timer\_num(0-2)
- **gpio\_num** –set this to configure gpio for MCPWM, if you want to use gpio16, gpio\_num = 16

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_pin** (*mcpwm\_unit\_t* mcpwm\_num, const *mcpwm\_pin\_config\_t* \*mcpwm\_pin)

Initialize MCPWM gpio structure.

---

**备注:** This function initialize a group of MCPWM GPIOs at a time.

---

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **mcpwm\_pin** –MCPWM pin structure

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, const *mcpwm\_config\_t* \*mcpwm\_conf)

Initialize MCPWM parameters.

---

**备注:** The default resolution configured for MCPWM group and timer are  $160\text{M} / 16 = 10\text{M}$  and  $10\text{M} / 10 = 1\text{M}$ . The default resolution can be changed by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`, before calling this function.

---

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- **mcpwm\_conf** –configure structure *mcpwm\_config\_t*

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_group\_set\_resolution** (*mcpwm\_unit\_t* mcpwm\_num, unsigned long int resolution)

Set resolution of the MCPWM group.

---

**备注:** This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back.

---

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)

- **resolution** –set expected frequency resolution
- 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_timer\_set\_resolution** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, unsigned long int resolution)

Set resolution of each timer.

---

**备注:** This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back.

---

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **resolution** –set expected frequency resolution

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_frequency** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, uint32\_t frequency)

Set frequency(in Hz) of MCPWM timer.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **frequency** –set the frequency in Hz of each timer

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_duty** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen, float duty)

Set duty cycle of each operator(MCPWMXA/MCPWMB)

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMB), ‘X’ is operator number selected
- **duty** –set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_duty\_in\_us** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen, uint32\_t duty\_in\_us)

Set duty cycle of each operator(MCPWMXA/MCPWMB) in us.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMB), ‘x’ is operator number selected
- **duty\_in\_us** –set duty value in microseconds of each operator

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_duty\_type** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen, *mcpwm\_duty\_type\_t* duty\_type)

Set duty either active high or active low(out of phase/inverted)

---

**备注:** Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

---

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- **duty\_type** –set active low or active high duty type

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*uint32\_t* **mcpwm\_get\_frequency** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Get frequency of timer.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**返回**

- frequency of timer

*float* **mcpwm\_get\_duty** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_operator\_t* gen)

Get duty cycle of each operator.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

**返回**

- duty cycle in % of each operator(56.7 means duty is 56.7%)

*uint32\_t* **mcpwm\_get\_duty\_in\_us** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_operator\_t* gen)

Get duty cycle of each operator in us.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

**返回**

- duty cycle in us of each operator

*esp\_err\_t* **mcpwm\_set\_signal\_high** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen)

Use this function to set MCPWM signal high.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_signal\_low** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_generator\_t* gen)

Use this function to set MCPWM signal low.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_start** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Start MCPWM signal on timer ‘x’ .

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_stop** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Start MCPWM signal on timer ‘x’ .

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, const *mcpwm\_carrier\_config\_t* \*carrier\_conf)

Initialize carrier configuration.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier\_conf** –configure structure *mcpwm\_carrier\_config\_t*

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Enable MCPWM carrier submodule, for respective timer.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Disable MCPWM carrier submodule, for respective timer.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**返回**

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_set\_period** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, uint8\_t carrier\_period)

Set period of carrier.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier\_period** –set the carrier period of each timer, carrier period = (carrier\_period + 1)\*800ns (carrier\_period <= 15)

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_set\_duty\_cycle** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, uint8\_t carrier\_duty)

Set duty\_cycle of carrier.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier\_duty** –set duty\_cycle of carrier , carrier duty cycle = carrier\_duty\*12.5% (chop\_duty <= 7)

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_oneshot\_mode\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, uint8\_t pulse\_width)

Enable and set width of first pulse in carrier oneshot mode.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **pulse\_width** –set pulse width of first pulse in oneshot mode, width = (carrier period)\*(pulse\_width + 1) (pulse\_width <= 15)

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_oneshot\_mode\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Disable oneshot mode, width of first pulse = carrier period.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_carrier\_output\_invert** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_carrier\_out\_ivt\_t* carrier\_ivt\_mode)

Enable or disable carrier output inversion.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier\_ivt\_mode** –enable or disable carrier output inversion

#### 返回

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_deadtime\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_deadtime\_type\_t* dt\_mode, uint32\_t red, uint32\_t fed)

Enable and initialize deadtime for each MCPWM timer.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **dt\_mode** –set deadtime mode
- **red** –set rising edge delay = red\*100ns
- **fed** –set rising edge delay = fed\*100ns

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_deadtime\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Disable deadtime on MCPWM timer.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_fault\_init** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_fault\_input\_level\_t* input\_level, *mcpwm\_fault\_signal\_t* fault\_sig)

Initialize fault submodule, currently low level triggering is not supported.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **input\_level** –set fault signal level, which will cause fault to occur
- **fault\_sig** –set the fault pin, which needs to be enabled

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_fault\_set\_oneshot\_mode** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_fault\_signal\_t* fault\_sig, *mcpwm\_output\_action\_t* action\_on\_pwmxa, *mcpwm\_output\_action\_t* action\_on\_pwmxb)

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

---

**备注:** currently low level triggering is not supported

---

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **fault\_sig** –set the fault pin, which needs to be enabled for oneshot mode
- **action\_on\_pwmxa** –action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- **action\_on\_pwmxb** –action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_fault\_set\_cyc\_mode** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_fault\_signal\_t* fault\_sig, *mcpwm\_output\_action\_t* action\_on\_pwmxa, *mcpwm\_output\_action\_t* action\_on\_pwmxb)

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

---

**备注:** currently low level triggering is not supported

---

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **fault\_sig** –set the fault pin, which needs to be enabled for cyc mode
- **action\_on\_pwmxa** –action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- **action\_on\_pwmxb** –action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_fault\_deinit** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_fault\_signal\_t* fault\_sig)

Disable fault signal.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **fault\_sig** –fault pin, which needs to be disabled

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_capture\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_capture\_signal\_t* cap\_sig, *mcpwm\_capture\_on\_edge\_t* cap\_edge, *uint32\_t* num\_of\_pulse)

Initialize capture submodule.

---

**备注:** Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by `mcpwm_isr_register`, and in there, query the capture data.

---

---

**备注:** The capture timer uses APB\_CLK (typically 80MHz) as the count source.

---

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **cap\_edge** –set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- **cap\_sig** –capture pin, which needs to be enabled
- **num\_of\_pulse** –Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_capture\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_capture\_signal\_t* cap\_sig)

Disable capture signal.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)

- **cap\_sig** –capture pin, which needs to be disabled
- 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_capture\_enable\_channel** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_capture\_channel\_id\_t* cap\_channel, const *mcpwm\_capture\_config\_t* \*cap\_conf)

Enable capture channel.

参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **cap\_channel** –capture channel, which needs to be enabled
- **cap\_conf** –capture channel configuration

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_capture\_disable\_channel** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_capture\_channel\_id\_t* cap\_channel)

Disable capture channel.

参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **cap\_channel** –capture channel, which needs to be disabled

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*uint32\_t* **mcpwm\_capture\_signal\_get\_value** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_capture\_signal\_t* cap\_sig)

Get capture value.

参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **cap\_sig** –capture channel on which value is to be measured

返回 Captured value

*uint32\_t* **mcpwm\_capture\_signal\_get\_edge** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_capture\_signal\_t* cap\_sig)

Get edge of capture signal.

参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **cap\_sig** –capture channel of whose edge is to be determined

返回 Capture signal edge: 1 - positive edge, 2 - negtive edge

*esp\_err\_t* **mcpwm\_sync\_enable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_sync\_signal\_t* sync\_sig, *uint32\_t* phase\_val)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

---

备注: Count direction is undefined within this API

---

参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **sync\_sig** –set the synchronization input signal
- **phase\_val** –phase value in 1/1000 (for 86.7%, phase\_val = 867) which timer moves to on sync signal

返回

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_sync\_configure** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, const *mcpwm\_sync\_config\_t* \*sync\_conf)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **sync\_conf** –sync configuration on this timer

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_sync\_disable** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Disable sync submodule on given timer.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_set\_timer\_sync\_output** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num, *mcpwm\_timer\_sync\_trigger\_t* trigger)

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **trigger** –set the trigger that will cause the timer to generate a software sync signal. Specifically, MCPWM\_SWSYNC\_SOURCE\_DISABLED will disable the timer from generating sync signal.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mcpwm\_timer\_trigger\_soft\_sync** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_timer\_t* timer\_num)

Trigger a software sync event and sends it to a specific timer.

---

**备注:** This software sync event will have the same effect as hw one, except that:

- On esp32s3 the soft sync event can be routed to its output if MCPWM\_SWSYNC\_SOURCE\_SYNCIN is selected via `mcpwm_set_timer_sync_output()`
  - On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.
- 

#### 参数

- **mcpwm\_num** –set MCPWM unit(0-1)
- **timer\_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

*esp\_err\_t* **mcpwm\_sync\_invert\_gpio\_synchro** (*mcpwm\_unit\_t* mcpwm\_num, *mcpwm\_sync\_signal\_t* sync\_sig, bool invert)

Set external GPIO sync input inverter.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **sync\_sig** –set sync signal of MCPWM, only supports GPIO sync signal
- **invert** –whether GPIO sync source input is inverted (to get negative edge trigger)

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

*esp\_err\_t* **mcpwm\_isr\_register** (*mcpwm\_unit\_t* mcpwm\_num, void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *intr\_handle\_t* \*handle)

Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

**参数**

- **mcpwm\_num** –set MCPWM unit(0-1)
- **fn** –interrupt handler function.
- **arg** –user-supplied argument passed to the handler function.
- **intr\_alloc\_flags** –flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. see esp\_intr\_alloc.h for more info.
- **handle** –pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

**Structures**

struct **mcpwm\_pin\_config\_t**  
pin number for MCPWM

**Public Members**

int **mcpwm0a\_out\_num**  
MCPWM0A out pin

int **mcpwm0b\_out\_num**  
MCPWM0A out pin

int **mcpwm1a\_out\_num**  
MCPWM0A out pin

int **mcpwm1b\_out\_num**  
MCPWM0A out pin

int **mcpwm2a\_out\_num**  
MCPWM0A out pin

int **mcpwm2b\_out\_num**  
MCPWM0A out pin

int **mcpwm\_sync0\_in\_num**  
SYNC0 in pin

int **mcpwm\_sync1\_in\_num**  
SYNC1 in pin

int **mcpwm\_sync2\_in\_num**  
SYNC2 in pin

int **mcpwm\_fault0\_in\_num**  
FAULT0 in pin

int **mcpwm\_fault1\_in\_num**  
FAULT1 in pin

int **mcpwm\_fault2\_in\_num**  
FAULT2 in pin

int **mcpwm\_cap0\_in\_num**  
CAP0 in pin

int **mcpwm\_cap1\_in\_num**  
CAP1 in pin

int **mcpwm\_cap2\_in\_num**  
CAP2 in pin

struct **cap\_event\_data\_t**  
event data that will be passed into ISR callback

### Public Members

*mcpwm\_capture\_on\_edge\_t* **cap\_edge**  
Which signal edge is detected

uint32\_t **cap\_value**  
Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)

struct **mcpwm\_config\_t**  
MCPWM config structure.

### Public Members

uint32\_t **frequency**  
Set frequency of MCPWM in Hz

float **cmp\_r\_a**  
Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty\_a = 62.3

float **cmp\_r\_b**  
Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty\_b = 48.0

*mcpwm\_duty\_type\_t* **duty\_mode**

Set type of duty cycle

*mcpwm\_counter\_type\_t* **counter\_mode**

Set type of MCPWM counter

struct **mcpwm\_carrier\_config\_t**

MCPWM carrier configuration structure.

### Public Members

uint8\_t **carrier\_period**

Set carrier period = (carrier\_period + 1)\*800ns, carrier\_period should be < 16

uint8\_t **carrier\_duty**

Set carrier duty cycle, carrier\_duty should be less than 8 (increment every 12.5%)

uint8\_t **pulse\_width\_in\_os**

Set pulse width of first pulse in one shot mode = (carrier period)\*(pulse\_width\_in\_os + 1), should be less than 16

*mcpwm\_carrier\_os\_t* **carrier\_os\_mode**

Enable or disable carrier oneshot mode

*mcpwm\_carrier\_out\_ivt\_t* **carrier\_ivt\_mode**

Invert output of carrier

struct **mcpwm\_capture\_config\_t**

MCPWM config capture structure.

### Public Members

*mcpwm\_capture\_on\_edge\_t* **cap\_edge**

Set capture edge

uint32\_t **cap\_prescale**

Prescale of capture signal, ranging from 1 to 256

*cap\_isr\_cb\_t* **capture\_cb**

User defined capture event callback, running under interrupt context

void **\*user\_data**

User defined ISR callback function args

struct **mcpwm\_sync\_config\_t**

MCPWM config sync structure.

## Public Members

*mcpwm\_sync\_signal\_t* **sync\_sig**

Set sync input signal that will cause timer to sync

*uint32\_t* **timer\_val**

Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 \* peak

*mcpwm\_timer\_direction\_t* **count\_direction**

Counting direction to be set after sync

## Macros

**MCPWM\_OPR\_A**

*Deprecated:*

**MCPWM\_OPR\_B**

*Deprecated:*

No change in MCPWMXA output

**MCPWM\_FORCE\_MCPWMXA\_LOW**

*Deprecated:*

Make MCPWMXA output low

**MCPWM\_FORCE\_MCPWMXA\_HIGH**

*Deprecated:*

Make MCPWMXA output high

**MCPWM\_TOG\_MCPWMXA**

*Deprecated:*

Make MCPWMXA output toggle

**MCPWM\_NO\_CHANGE\_IN\_MCPWMB**

*Deprecated:*

No change in MCPWMXB output

#### **MCPWM\_FORCE\_MCPWMXB\_LOW**

*Deprecated:*

Make MCPWMXB output low

#### **MCPWM\_FORCE\_MCPWMXB\_HIGH**

*Deprecated:*

Make MCPWMXB output high

#### **MCPWM\_TOG\_MCPWMXB**

*Deprecated:*

Make MCPWMXB output toggle

### **Type Definitions**

```
typedef mcpwm_generator_t mcpwm_operator_t
```

*Deprecated:*

```
typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t
```

*Deprecated:*

MCPWM select action to be taken on MCPWMXA when fault occurs

```
typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t
```

*Deprecated:*

MCPWM select action to be taken on MCPWMXB when fault occurs

```
typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t
```

MCPWM capture channel ID alias.

```
typedef bool (*cap_isr_cb_t)(mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel, const cap_event_data_t *edata, void *user_data)
```

Type of capture event callback.

---

**备注:** Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR(usually has ‘\_ISR’ postfix)

---

**Param mcpwm** MCPWM unit(0-1)

**Param cap\_channel** capture channel ID

**Param edata** Capture event data, contains capture edge and capture value, fed by the driver

**Param user\_data** User registered data, passed from *mcpwm\_capture\_config\_t*

**Return** Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

## Enumerations

enum **mcpwm\_io\_signals\_t**

IO signals for the MCPWM.

- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

*Values:*

enumerator **MCPWM0A**

PWM0A output pin

enumerator **MCPWM0B**

PWM0B output pin

enumerator **MCPWM1A**

PWM1A output pin

enumerator **MCPWM1B**

PWM1B output pin

enumerator **MCPWM2A**

PWM2A output pin

enumerator **MCPWM2B**

PWM2B output pin

enumerator **MCPWM\_SYNC\_0**

SYNC0 input pin

enumerator **MCPWM\_SYNC\_1**

SYNC1 input pin

enumerator **MCPWM\_SYNC\_2**

SYNC2 input pin

enumerator **MCPWM\_FAULT\_0**

FAULT0 input pin

enumerator **MCPWM\_FAULT\_1**

FAULT1 input pin

enumerator **MCPWM\_FAULT\_2**

FAULT2 input pin

enumerator **MCPWM\_CAP\_0**

CAP0 input pin

enumerator **MCPWM\_CAP\_1**

CAP1 input pin

enumerator **MCPWM\_CAP\_2**

CAP2 input pin

enum **mcpwm\_unit\_t**

Select MCPWM unit.

*Values:*

enumerator **MCPWM\_UNIT\_0**

MCPWM unit0 selected

enumerator **MCPWM\_UNIT\_1**

MCPWM unit1 selected

enumerator **MCPWM\_UNIT\_MAX**

Max number of MCPWM units

enum **mcpwm\_timer\_t**

Select MCPWM timer.

*Values:*

enumerator **MCPWM\_TIMER\_0**

Select MCPWM timer0

enumerator **MCPWM\_TIMER\_1**

Select MCPWM timer1

enumerator **MCPWM\_TIMER\_2**

Select MCPWM timer2

enumerator **MCPWM\_TIMER\_MAX**

Max number of timers in a unit

enum **mcpwm\_generator\_t**

Select MCPWM operator.

*Values:*

enumerator **MCPWM\_GEN\_A**

Select MCPWMXA, where 'X' is operator number

enumerator **MCPWM\_GEN\_B**

Select MCPWMXB, where 'X' is operator number

enumerator **MCPWM\_GEN\_MAX**

Num of generators to each operator of MCPWM

enum **mcpwm\_carrier\_os\_t**

MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

*Values:*

enumerator **MCPWM\_ONESHOT\_MODE\_DIS**

Enable oneshot mode

enumerator **MCPWM\_ONESHOT\_MODE\_EN**

Disable oneshot mode

enum **mcpwm\_carrier\_out\_ivt\_t**

MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

*Values:*

enumerator **MCPWM\_CARRIER\_OUT\_IVT\_DIS**

Enable carrier output inversion

enumerator **MCPWM\_CARRIER\_OUT\_IVT\_EN**

Disable carrier output inversion

enum **mcpwm\_fault\_signal\_t**

MCPWM select fault signal input.

*Values:*

enumerator **MCPWM\_SELECT\_F0**

Select F0 as input

enumerator **MCPWM\_SELECT\_F1**

Select F1 as input

enumerator **MCPWM\_SELECT\_F2**

Select F2 as input

enum **mcpwm\_sync\_signal\_t**

MCPWM select sync signal input.

*Values:*

enumerator **MCPWM\_SELECT\_NO\_INPUT**

No sync input selected

enumerator **MCPWM\_SELECT\_TIMER0\_SYNC**

Select software sync signal from timer0 as input

enumerator **MCPWM\_SELECT\_TIMER1\_SYNC**

Select software sync signal from timer1 as input

enumerator **MCPWM\_SELECT\_TIMER2\_SYNC**

Select software sync signal from timer2 as input

enumerator **MCPWM\_SELECT\_GPIO\_SYNC0**

Select GPIO SYNC0 as input

enumerator **MCPWM\_SELECT\_GPIO\_SYNC1**

Select GPIO SYNC1 as input

enumerator **MCPWM\_SELECT\_GPIO\_SYNC2**

Select GPIO SYNC2 as input

enum **mcpwm\_timer\_sync\_trigger\_t**

MCPWM timer sync event trigger.

*Values:*

enumerator **MCPWM\_SWSYNC\_SOURCE\_SYNCIN**

the input sync signal will be routed to its sync output path

enumerator **MCPWM\_SWSYNC\_SOURCE\_TEZ**

sync signal generated when timer counts to zero

enumerator **MCPWM\_SWSYNC\_SOURCE\_TEP**

sync signal generated when timer counts to peak

enumerator **MCPWM\_SWSYNC\_SOURCE\_DISABLED**

timer does not generate sync signals

enum **mcpwm\_fault\_input\_level\_t**

MCPWM select triggering level of fault signal.

*Values:*

enumerator **MCPWM\_LOW\_LEVEL\_TGR**

Fault condition occurs when fault input signal goes from high to low

enumerator **MCPWM\_HIGH\_LEVEL\_TGR**

Fault condition occurs when fault input signal goes low to high

enum **mcpwm\_capture\_on\_edge\_t**

MCPWM select capture starts from which edge.

*Values:*

enumerator **MCPWM\_NEG\_EDGE**

Capture the negative edge

enumerator **MCPWM\_POS\_EDGE**

Capture the positive edge

enumerator **MCPWM\_BOTH\_EDGE**

Capture both edges

enum **mcpwm\_intr\_t**

Interrupt masks for MCPWM capture.

*Values:*

enumerator **MCPWM\_LL\_INTR\_CAP0**

Capture 0 happened.

enumerator **MCPWM\_LL\_INTR\_CAP1**

Capture 1 happened.

enumerator **MCPWM\_LL\_INTR\_CAP2**

Capture 2 happened.

enum **mcpwm\_counter\_type\_t**

Select type of MCPWM counter.

*Values:*

enumerator **MCPWM\_FREEZE\_COUNTER**

Counter freeze

enumerator **MCPWM\_UP\_COUNTER**

For asymmetric MCPWM

enumerator **MCPWM\_DOWN\_COUNTER**

For asymmetric MCPWM

enumerator **MCPWM\_UP\_DOWN\_COUNTER**

For symmetric MCPWM, frequency is half of MCPWM frequency set

enumerator **MCPWM\_COUNTER\_MAX**

Maximum counter mode

enum **mcpwm\_duty\_type\_t**

Select type of MCPWM duty cycle mode.

*Values:*

enumerator **MCPWM\_DUTY\_MODE\_0**

Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

enumerator **MCPWM\_DUTY\_MODE\_1**

Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

enumerator **MCPWM\_HAL\_GENERATOR\_MODE\_FORCE\_LOW**

enumerator **MCPWM\_HAL\_GENERATOR\_MODE\_FORCE\_HIGH**

enumerator **MCPWM\_DUTY\_MODE\_MAX**

Num of duty cycle modes

enum **mcpwm\_deadtime\_type\_t**

MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

*Values:*

enumerator **MCPWM\_DEADTIME\_BYPASS**

Bypass the deadtime

enumerator **MCPWM\_BYPASS\_RED**

MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator **MCPWM\_BYPASS\_FED**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

enumerator **MCPWM\_ACTIVE\_HIGH\_MODE**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator **MCPWM\_ACTIVE\_LOW\_MODE**

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

enumerator **MCPWM\_ACTIVE\_HIGH\_COMPLIMENT\_MODE**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

enumerator **MCPWM\_ACTIVE\_LOW\_COMPLIMENT\_MODE**

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator **MCPWM\_ACTIVE\_RED\_FED\_FROM\_PWMXA**

MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

enumerator **MCPWM\_ACTIVE\_RED\_FED\_FROM\_PWMXB**

MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

enumerator **MCPWM\_DEADTIME\_TYPE\_MAX**

Maximum number of supported dead time modes

enum **mcpwm\_output\_action\_t**

MCPWM select action to be taken on the output when event happens.

*Values:*

enumerator **MCPWM\_ACTION\_NO\_CHANGE**

No change in the output

enumerator **MCPWM\_ACTION\_FORCE\_LOW**

Make output low

enumerator **MCPWM\_ACTION\_FORCE\_HIGH**

Make output high

enumerator **MCPWM\_ACTION\_TOGGLE**

Make output toggle

enum **mcpwm\_capture\_signal\_t**

MCPWM select capture signal input.

*Values:*

enumerator **MCPWM\_SELECT\_CAP0**

Select CAP0 as input

enumerator **MCPWM\_SELECT\_CAP1**

Select CAP1 as input

enumerator **MCPWM\_SELECT\_CAP2**

Select CAP2 as input

## 2.3.12 Pulse Counter (PCNT)

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

### Functionality Overview

Description of functionality of this API has been broken down into four sections:

- *Configuration* - describes counter's configuration parameters and how to setup the counter.
- *Operating the Counter* - provides information on control functions to pause, measure and clear the counter.
- *Filtering Pulses* - describes options to filtering pulses and the counter control signals.
- *Using Interrupts* - presents how to trigger interrupts on specific states of the counter.

### Configuration

The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using *pcnt\_unit\_t*. Each unit has two independent channels numbered as 0 and 1 and specified with *pcnt\_channel\_t*.

The configuration is provided separately per unit's channel using *pcnt\_config\_t* and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

### Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter' s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

---

**备注:** For the counter not to miss any pulses, the pulse duration should be longer than one APB\_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB\_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a *filer*.

---

### Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB\_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB\_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

### Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`. and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

## Application Example

- Pulse counter with control signal and event interrupt example: [peripherals/pcnt/pulse\\_count\\_event](#).
- Parse the signal generated from rotary encoder: [peripherals/pcnt/rotary\\_encoder](#).

## API Reference

### Header File

- [components/driver/include/driver/pcnt.h](#)

### Functions

*esp\_err\_t* **pcnt\_unit\_config** (const *pcnt\_config\_t* \*pcnt\_config)

Configure Pulse Counter unit.

---

**备注:** This function will disable three events: PCNT\_EVT\_L\_LIM, PCNT\_EVT\_H\_LIM, PCNT\_EVT\_ZERO.

---

**参数** *pcnt\_config* –Pointer of Pulse Counter unit configure parameter

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver already initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_get\_counter\_value** (*pcnt\_unit\_t* pcnt\_unit, int16\_t \*count)

Get pulse counter value.

**参数**

- *pcnt\_unit* –Pulse Counter unit number
- *count* –Pointer to accept counter value

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_counter\_pause** (*pcnt\_unit\_t* pcnt\_unit)

Pause PCNT counter of PCNT unit.

**参数** *pcnt\_unit* –PCNT unit number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_counter\_resume** (*pcnt\_unit\_t* pcnt\_unit)

Resume counting for PCNT counter.

**参数** *pcnt\_unit* –PCNT unit number, select from *pcnt\_unit\_t*

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_counter\_clear** (*pcnt\_unit\_t* pcnt\_unit)

Clear and reset PCNT counter value to zero.

**参数** *pcnt\_unit* –PCNT unit number, select from *pcnt\_unit\_t*

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_intr\_enable** (*pcnt\_unit\_t* pcnt\_unit)

Enable PCNT interrupt for PCNT unit.

---

**备注:** Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with `pcnt_event_enable()` and `pcnt_event_disable()`

---

**参数** *pcnt\_unit* –PCNT unit number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_intr\_disable** (*pcnt\_unit\_t* pcnt\_unit)

Disable PCNT interrupt for PCNT unit.

**参数** *pcnt\_unit* –PCNT unit number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_event\_enable** (*pcnt\_unit\_t* unit, *pcnt\_evt\_type\_t* evt\_type)

Enable PCNT event of PCNT unit.

**参数**

- **unit** –PCNT unit number
- **evt\_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_event\_disable** (*pcnt\_unit\_t* unit, *pcnt\_evt\_type\_t* evt\_type)

Disable PCNT event of PCNT unit.

**参数**

- **unit** –PCNT unit number
- **evt\_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_set\_event\_value** (*pcnt\_unit\_t* unit, *pcnt\_evt\_type\_t* evt\_type, *int16\_t* value)

Set PCNT event value of PCNT unit.

**参数**

- **unit** –PCNT unit number
- **evt\_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value** –Counter value for PCNT event

**返回**

- ESP\_OK Success

- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t pcnt_get_event_value` (`pcnt_unit_t` unit, `pcnt_evt_type_t` evt\_type, int16\_t \*value)

Get PCNT event value of PCNT unit.

#### 参数

- **unit** –PCNT unit number
- **evt\_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value** –Pointer to accept counter value for PCNT event

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t pcnt_get_event_status` (`pcnt_unit_t` unit, uint32\_t \*status)

Get PCNT event status of PCNT unit.

#### 参数

- **unit** –PCNT unit number
- **status** –Pointer to accept event status word

#### 返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t pcnt_isr_unregister` (`pcnt_isr_handle_t` handle)

Unregister PCNT interrupt handler (registered by `pcnt_isr_register`), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by `pcnt_isr_service_install`, please call `pcnt_isr_service_uninstall` instead.

**参数** **handle** –handle to unregister the ISR service.

#### 返回

- `ESP_OK` Success
- `ESP_ERR_NOT_FOUND` Can not find the interrupt that matches the flags.
- `ESP_ERR_INVALID_ARG` Function pointer error.

`esp_err_t pcnt_isr_register` (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, `pcnt_isr_handle_t` \*handle)

Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

#### 参数

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (`OR`) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `pcnt_isr_unregister` to unregister this ISR service if needed, but only if the handle is not NULL.

#### 返回

- `ESP_OK` Success
- `ESP_ERR_NOT_FOUND` Can not find the interrupt that matches the flags.
- `ESP_ERR_INVALID_ARG` Function pointer error.

`esp_err_t pcnt_set_pin` (`pcnt_unit_t` unit, `pcnt_channel_t` channel, int pulse\_io, int ctrl\_io)

Configure PCNT pulse signal input pin and control input pin.

---

**备注:** Set the signal input to `PCNT_PIN_NOT_USED` if unused.

---

**参数**

- **unit** –PCNT unit number
- **channel** –PCNT channel number
- **pulse\_io** –Pulse signal input GPIO
- **ctrl\_io** –Control signal input GPIO

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_filter\_enable** (*pcnt\_unit\_t* unit)

Enable PCNT input filter.

**参数** **unit** –PCNT unit number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_filter\_disable** (*pcnt\_unit\_t* unit)

Disable PCNT input filter.

**参数** **unit** –PCNT unit number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_set\_filter\_value** (*pcnt\_unit\_t* unit, uint16\_t filter\_val)

Set PCNT filter value.

---

**备注:** filter\_val is a 10-bit value, so the maximum filter\_val should be limited to 1023.

---

**参数**

- **unit** –PCNT unit number
- **filter\_val** –PCNT signal filter value, counter in APB\_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_get\_filter\_value** (*pcnt\_unit\_t* unit, uint16\_t \*filter\_val)

Get PCNT filter value.

**参数**

- **unit** –PCNT unit number
- **filter\_val** –Pointer to accept PCNT filter value.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_set\_mode** (*pcnt\_unit\_t* unit, *pcnt\_channel\_t* channel, *pcnt\_count\_mode\_t* pos\_mode, *pcnt\_count\_mode\_t* neg\_mode, *pcnt\_ctrl\_mode\_t* hctrl\_mode, *pcnt\_ctrl\_mode\_t* lctrl\_mode)

Set PCNT counter mode.

**参数**

- **unit** –PCNT unit number
- **channel** –PCNT channel number
- **pos\_mode** –Counter mode when detecting positive edge
- **neg\_mode** –Counter mode when detecting negative edge
- **hctrl\_mode** –Counter mode when control signal is high level
- **lctrl\_mode** –Counter mode when control signal is low level

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_isr\_handler\_add** (*pcnt\_unit\_t* unit, void (\*isr\_handler)(void\*), void \*args)

Add ISR handler for specified unit.

Call this function after using `pcnt_isr_service_install()` to install the PCNT driver's ISR handler service.

The ISR handlers do not need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `pcnt_isr_service_install()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**参数**

- **unit** –PCNT unit number
- **isr\_handler** –Interrupt handler function.
- **args** –Parameter for handler function

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **pcnt\_isr\_service\_install** (int intr\_alloc\_flags)

Install PCNT ISR service.

---

**备注:** We can manage different interrupt service for each unit. This function will use the default ISR handle service, Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

---

**参数** **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed

void **pcnt\_isr\_service\_uninstall** (void)

Uninstall PCNT ISR service, freeing related resources.

*esp\_err\_t* **pcnt\_isr\_handler\_remove** (*pcnt\_unit\_t* unit)

Delete ISR handler for specified unit.

**参数** **unit** –PCNT unit number

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE pcnt driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **pcnt\_config\_t**

Pulse Counter configuration for a single channel.

### Public Members

int **pulse\_gpio\_num**

Pulse input GPIO number, if you want to use GPIO16, enter pulse\_gpio\_num = 16, a negative value will be ignored

int **ctrl\_gpio\_num**

Control signal input GPIO number, a negative value will be ignored

*pcnt\_ctrl\_mode\_t* **lctrl\_mode**

PCNT low control mode

*pcnt\_ctrl\_mode\_t* **hctrl\_mode**

PCNT high control mode

*pcnt\_count\_mode\_t* **pos\_mode**

PCNT positive edge count mode

*pcnt\_count\_mode\_t* **neg\_mode**

PCNT negative edge count mode

int16\_t **counter\_h\_lim**

Maximum counter value

int16\_t **counter\_l\_lim**

Minimum counter value

*pcnt\_unit\_t* **unit**

PCNT unit number

*pcnt\_channel\_t* **channel**

the PCNT channel

## Macros

**PCNT\_PIN\_NOT\_USED**

When selected for a pin, this pin will not be used

**PCNT\_MODE\_KEEP**

Control mode: won't change counter mode

**PCNT\_MODE\_REVERSE**

Control mode: invert counter mode(increase -> decrease, decrease -> increase)

**PCNT\_MODE\_DISABLE**

Control mode: Inhibit counter(counter value will not change in this condition)

**PCNT\_MODE\_MAX****PCNT\_COUNT\_DIS**

Counter mode: Inhibit counter(counter value will not change in this condition)

**PCNT\_COUNT\_INC**

Counter mode: Increase counter value

**PCNT\_COUNT\_DEC**

Counter mode: Decrease counter value

**PCNT\_COUNT\_MAX****Type Definitions**

```
typedef intr_handle_t pcnt_isr_handle_t
```

```
typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t
```

Selection of available modes that determine the counter's action depending on the state of the control signal's input GPIO.

---

**备注:** Configuration covers two actions, one for high, and one for low level on the control input

---

```
typedef pcnt_channel_edge_action_t pcnt_count_mode_t
```

Selection of available modes that determine the counter's action on the edge of the pulse signal's input GPIO.

---

**备注:** Configuration covers two actions, one for positive, and one for negative edge on the pulse input

---

**Enumerations**

```
enum pcnt_port_t
```

PCNT port number, the max port number is (PCNT\_PORT\_MAX - 1).

*Values:*

```
enumerator PCNT_PORT_0
```

PCNT port 0

```
enumerator PCNT_PORT_MAX
```

PCNT port max

```
enum pcnt_unit_t
```

Selection of all available PCNT units.

*Values:*

enumerator **PCNT\_UNIT\_0**

PCNT unit 0

enumerator **PCNT\_UNIT\_1**

PCNT unit 1

enumerator **PCNT\_UNIT\_2**

PCNT unit 2

enumerator **PCNT\_UNIT\_3**

PCNT unit 3

enumerator **PCNT\_UNIT\_MAX**

enum **pcnt\_channel\_t**

Selection of channels available for a single PCNT unit.

*Values:*

enumerator **PCNT\_CHANNEL\_0**

PCNT channel 0

enumerator **PCNT\_CHANNEL\_1**

PCNT channel 1

enumerator **PCNT\_CHANNEL\_MAX**

enum **pcnt\_evt\_type\_t**

Selection of counter's events that may trigger an interrupt.

*Values:*

enumerator **PCNT\_EVT\_THRES\_1**

PCNT watch point event: threshold1 value event

enumerator **PCNT\_EVT\_THRES\_0**

PCNT watch point event: threshold0 value event

enumerator **PCNT\_EVT\_L\_LIM**

PCNT watch point event: Minimum counter value

enumerator **PCNT\_EVT\_H\_LIM**

PCNT watch point event: Maximum counter value

enumerator **PCNT\_EVT\_ZERO**

PCNT watch point event: counter value zero event

enumerator **PCNT\_EVT\_MAX**

## Header File

- [components/hal/include/hal/pcnt\\_types.h](#)

## Enumerations

enum **pcnt\_channel\_level\_action\_t**

PCNT channel action on control level.

*Values:*

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_KEEP**

Keep current count mode

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_INVERSE**

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_HOLD**

Hold current count value

enum **pcnt\_channel\_edge\_action\_t**

PCNT channel action on signal edge.

*Values:*

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_HOLD**

Hold current count value

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_INCREASE**

Increase count value

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_DECREASE**

Decrease count value

enum **pcnt\_unit\_count\_sign\_t**

PCNT unit counter value's sign.

*Values:*

enumerator **PCNT\_UNIT\_COUNT\_SIGN\_ZERO\_POS**

positive value to zero

enumerator **PCNT\_UNIT\_COUNT\_SIGN\_ZERO\_NEG**

negative value to zero

enumerator **PCNT\_UNIT\_COUNT\_SIGN\_NEG**

counter value negative

enumerator **PCNT\_UNIT\_COUNT\_SIGN\_POS**

counter value positive

### 2.3.13 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT's transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

图 11: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

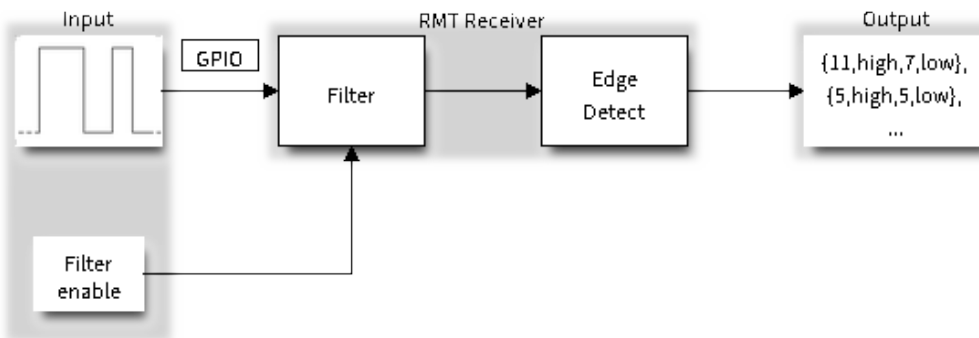

图 12: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. [Configure Driver](#)
2. [Transmit Data](#) or [Receive Data](#)
3. [Change Operation Parameters](#)
4. [Use Interrupts](#)

The RMT has eight channels numbered from zero to seven. The first half (i.e. Channel 0 ~ 3) channels can only be configured for transmitting, and the other half (i.e. Channel 4 ~ 7) channels can only be configured for receiving. They are referred to using indexes defined in structure `rmt_channel_t`.

#### Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

## Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The **RMT operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt\_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio\_num**.
- How many **memory blocks** will be used by the channel, set with **mem\_block\_num**.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
  - When **RMT\_CHANNEL\_FLAGS\_AWARE\_DFS** is set, RMT channel will take REF\_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See [power\\_management](#) for more information.
  - When **RMT\_CHANNEL\_FLAGS\_INVERT\_SIG** is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk\_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when **RMT\_CHANNEL\_FLAGS\_AWARE\_DFS** is set in **flags**, RMT source clock is changed to REF\_TICK or XTAL.

---

**备注:** The period of a square wave after the clock divider is called a ‘tick’ . The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’ .

---

There are also couple of specific parameters that should be set up depending if selected channel is configured in [Transmit Mode](#) or [Receive Mode](#):

**Transmit Mode** When configuring channel in transmit mode, set **tx\_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop\_en**
- Enable the RMT carrier signal - **carrier\_en**
- Frequency of the carrier in Hz - **carrier\_freq\_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier\_duty\_percent**
- Level of the RMT output, when the carrier is applied - **carrier\_level**
- Enable the RMT output if idle - **idle\_output\_en**
- Set the signal level on the RMT output if idle - **idle\_level**
- Specify maximum number of transmissions in a loop - **loop\_count**

**Receive Mode** In receive mode, set **rx\_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter\_en**
- A threshold of the filter, set in the number of ticks - **filter\_ticks\_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle\_threshold**. The receiver will ignore pulses longer than this setting.
- Enable the RMT carrier demodulation - **carrier\_rm**
- Frequency of the carrier in Hz - **carrier\_freq\_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier\_duty\_percent**
- Level of the RMT input, where the carrier is modulated to - **carrier\_level**

**Finalize Configuration** Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is  $> 0$ , then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in [Use Interrupts](#).

Now, depending on how the channel is configured, we are ready to either *Transmit Data* or *Receive Data*. This is described in next two sections.

### Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

图 13: Structure of RMT items (L - signal level)

For a simple example how to define a block of items see [peripherals/rmt/morse\\_code](#).

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

### Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 384 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what's inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in [peripherals/rmt/ir\\_protocols](#).

To stop the receiver, call `rmt_rx_stop()`.

### Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

### Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

### Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`
- Enable or disable loop count feature to automatically transmit items for N iterations, then trigger an ISR callback - `rmt_set_tx_loop_count()`
- Enable automatically stopping when the number of iterations matches the set loop count. Note this is not reliable for target that doesn't support `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP`. - `rmt_enable_tx_loop_autostop()`

### Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

### Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

---

**备注:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

---

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`

- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32s3/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

**警告:** It's not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification when transaction is done, go ahead with `rmt_register_tx_end_callback()`.

## Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

## Application Examples

- Using RMT to send morse code: [peripherals/rmt/morse\\_code](#).
- Using RMT to drive RGB LED strip: [peripherals/rmt/led\\_strip](#).
- NEC remote control TX and RX example: [peripherals/rmt/ir\\_protocols](#).
- Musical buzzer example: [peripherals/rmt/musical\\_buzzer](#).

## API Reference

### Header File

- `components/driver/include/driver/rmt.h`

### Functions

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`

Set RMT clock divider, channel clock is divided from source clock.

#### 参数

- **channel** –RMT channel
- **div\_cnt** –RMT counter clock divider

#### 返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

`esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t *div_cnt)`

Get RMT clock divider, channel clock is divided from source clock.

#### 参数

- **channel** –RMT channel
- **div\_cnt** –pointer to accept RMT counter divider

#### 返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

*esp\_err\_t* **rmt\_set\_rx\_idle\_thresh** (*rmt\_channel\_t* channel, uint16\_t thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thres channel clock cycles, the receive process is finished.

#### 参数

- **channel** –RMT channel
- **thresh** –RMT RX idle threshold

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_rx\_idle\_thresh** (*rmt\_channel\_t* channel, uint16\_t \*thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thres channel clock cycles, the receive process is finished.

#### 参数

- **channel** –RMT channel
- **thresh** –pointer to accept RMT RX idle threshold value

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_set\_mem\_block\_num** (*rmt\_channel\_t* channel, uint8\_t rmt\_mem\_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start\_addr\_CHn to end\_addr\_CHn, which are defined by: Memory block start address is RMT\_CHANNEL\_MEM(n) (in soc/rmt\_reg.h), that is, start\_addr\_chn = RMT base address + 0x800 + 64 \* 4 \* n, and end\_addr\_chn = RMT base address + 0x800 + 64 \* 4 \* n + 64 \* 4 \* RMT\_MEM\_SIZE\_CHn mod 512 \* 4

---

**备注:** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

---

#### 参数

- **channel** –RMT channel
- **rmt\_mem\_num** –RMT RX memory block number, one block has 64 \* 32 bits.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_mem\_block\_num** (*rmt\_channel\_t* channel, uint8\_t \*rmt\_mem\_num)

Get RMT memory block number.

#### 参数

- **channel** –RMT channel
- **rmt\_mem\_num** –Pointer to accept RMT RX memory block number

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_tx_carrier` (`rmt_channel_t` channel, bool carrier\_en, uint16\_t high\_level, uint16\_t low\_level, `rmt_carrier_level_t` carrier\_level)

Configure RMT carrier for TX signal.

Set different values for carrier\_high and carrier\_low to set different frequency of carrier. The unit of carrier\_high/low is the source clock tick, not the divided channel counter clock.

#### 参数

- **channel** –RMT channel
- **carrier\_en** –Whether to enable output carrier.
- **high\_level** –High level duration of carrier
- **low\_level** –Low level duration of carrier.
- **carrier\_level** –Configure the way carrier wave is modulated for channel.
  - 1' b1:transmit on low output level
  - 1' b0:transmit on high output level

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_mem_pd` (`rmt_channel_t` channel, bool pd\_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

#### 参数

- **channel** –RMT channel
- **pd\_en** –RMT memory low power enable.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_get_mem_pd` (`rmt_channel_t` channel, bool \*pd\_en)

Get RMT memory low power mode.

#### 参数

- **channel** –RMT channel
- **pd\_en** –Pointer to accept RMT memory low power mode.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_tx_start` (`rmt_channel_t` channel, bool tx\_idx\_rst)

Set RMT start sending data from memory.

#### 参数

- **channel** –RMT channel
- **tx\_idx\_rst** –Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_tx_stop` (`rmt_channel_t` channel)

Set RMT stop sending.

参数 **channel** –RMT channel

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_rx_start` (`rmt_channel_t` channel, bool rx\_idx\_rst)

Set RMT start receiving data.

**参数**

- **channel** –RMT channel
- **rx\_idx\_rst** –Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_rx\_stop** (*rmt\_channel\_t* channel)

Set RMT stop receiving data.

**参数** **channel** –RMT channel

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_tx\_memory\_reset** (*rmt\_channel\_t* channel)

Reset RMT TX memory.

**参数** **channel** –RMT channel

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_rx\_memory\_reset** (*rmt\_channel\_t* channel)

Reset RMT RX memory.

**参数** **channel** –RMT channel

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_set\_memory\_owner** (*rmt\_channel\_t* channel, *rmt\_mem\_owner\_t* owner)

Set RMT memory owner.

---

**备注:** Setting memroy is only valid for RX channel.

---

**参数**

- **channel** –RMT channel
- **owner** –To set when the transmitter or receiver can process the memory of channel.

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_memory\_owner** (*rmt\_channel\_t* channel, *rmt\_mem\_owner\_t* \*owner)

Get RMT memory owner.

**参数**

- **channel** –RMT channel
- **owner** –Pointer to get memory owner.

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_set\_tx\_loop\_mode** (*rmt\_channel\_t* channel, bool loop\_en)

Set RMT tx loop mode.

**参数**

- **channel** –RMT channel

- **loop\_en** –Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

## 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_tx\_loop\_mode** (*rmt\_channel\_t* channel, bool \*loop\_en)

Get RMT tx loop mode.

## 参数

- **channel** –RMT channel
- **loop\_en** –Pointer to accept RMT transmitter loop sending mode.

## 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_set\_rx\_filter** (*rmt\_channel\_t* channel, bool rx\_filter\_en, uint8\_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

## 参数

- **channel** –RMT channel
- **rx\_filter\_en** –To enable RMT receiver filter.
- **thresh** –Threshold of pulse width for receiver.

## 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_set\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* base\_clk)

Set RMT source clock.

RMT module has two clock sources:

- APB clock which is 80Mhz
- REF tick clock, which would be 1Mhz (not supported in this version).

## 参数

- **channel** –RMT channel
- **base\_clk** –To choose source clock for RMT module.

## 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* \*src\_clk)

Get RMT source clock.

RMT module has two clock sources:

- APB clock which is 80Mhz
- REF tick clock, which would be 1Mhz (not supported in this version).

## 参数

- **channel** –RMT channel
- **src\_clk** –Pointer to accept source clock for RMT module.

## 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_idle_level(rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)`

Set RMT idle output level for transmitter.

#### 参数

- **channel** –RMT channel
- **idle\_out\_en** –To enable idle level output.
- **level** –To set the output signal’ s level for channel in idle state.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)`

Get RMT idle output level for transmitter.

#### 参数

- **channel** –RMT channel
- **idle\_out\_en** –Pointer to accept value of enable idle.
- **level** –Pointer to accept value of output signal’ s level in idle state for specified channel.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_get_status(rmt_channel_t channel, uint32_t *status)`

Get RMT status.

#### 参数

- **channel** –RMT channel
- **status** –Pointer to accept channel status. Please refer to RMT\_CHnSTATUS\_REG(n=0~7) in `rmt_reg.h` for more details of each field.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_rx_intr_en(rmt_channel_t channel, bool en)`

Set RMT RX interrupt enable.

#### 参数

- **channel** –RMT channel
- **en** –enable or disable RX interrupt.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_err_intr_en(rmt_channel_t channel, bool en)`

Set RMT RX error interrupt enable.

#### 参数

- **channel** –RMT channel
- **en** –enable or disable RX err interrupt.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_tx_intr_en(rmt_channel_t channel, bool en)`

Set RMT TX interrupt enable.

#### 参数

- **channel** –RMT channel
- **en** –enable or disable TX interrupt.

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_tx_thr_intr_en(rmt_channel_t channel, bool en, uint16_t evt_thresh)`

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

#### 参数

- **channel** –RMT channel
- **en** –enable or disable TX event interrupt.
- **evt\_thresh** –RMT event interrupt threshold value

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_set_gpio(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num, bool invert_signal)`

Configure the GPIO used by RMT channel.

#### 参数

- **channel** –RMT channel
- **mode** –RMT mode, either RMT\_MODE\_TX or RMT\_MODE\_RX
- **gpio\_num** –GPIO number, which is connected with certain RMT signal
- **invert\_signal** –Invert RMT signal physically by GPIO matrix

#### 返回

- ESP\_ERR\_INVALID\_ARG Configure RMT GPIO failed because of wrong parameter
- ESP\_OK Configure RMT GPIO successfully

`esp_err_t rmt_config(const rmt_config_t *rmt_param)`

Configure RMT parameters.

参数 **rmt\_param** –RMT parameter struct

#### 返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

`esp_err_t rmt_isr_register(void (*fn)(void*), void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)`

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

---

**备注:** If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

---

#### 参数

- **fn** –Interrupt handler function.
- **arg** –Parameter for the handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- **handle** –If non-zero, a handle to later clean up the ISR gets stored here.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.
- ESP\_FAIL System driver installed, can not register ISR handler for RMT

`esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)`

Deregister previously registered RMT interrupt handler.

参数 **handle** –Handle obtained from `rmt_isr_register`

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Handle invalid

*esp\_err\_t* **rmt\_fill\_tx\_items** (*rmt\_channel\_t* channel, const *rmt\_item32\_t* \*item, *uint16\_t* item\_num, *uint16\_t* mem\_offset)

Fill memory data of channel with given RMT items.

**参数**

- **channel** –RMT channel
- **item** –Pointer of items.
- **item\_num** –RMT sending items number.
- **mem\_offset** –Index offset of memory.

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_driver\_install** (*rmt\_channel\_t* channel, *size\_t* rx\_buf\_size, *int* intr\_alloc\_flags)

Initialize RMT driver.

**参数**

- **channel** –RMT channel
- **rx\_buf\_size** –Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- **intr\_alloc\_flags** –Flags for the RMT driver interrupt handler. Pass 0 for default flags. See *esp\_intr\_alloc.h* for details. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling *rmt\_write\_items*.

**返回**

- ESP\_ERR\_INVALID\_STATE Driver is already installed, call *rmt\_driver\_uninstall* first.
- ESP\_ERR\_NO\_MEM Memory allocation failure
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_driver\_uninstall** (*rmt\_channel\_t* channel)

Uninstall RMT driver.

**参数** **channel** –RMT channel

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_channel\_status** (*rmt\_channel\_status\_result\_t* \*channel\_status)

Get the current status of eight channels.

---

**备注:** Do not call this function if it is possible that *rmt\_driver\_uninstall* will be called at the same time.

---

**参数** **channel\_status** –[out] store the current status of each channel

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

*esp\_err\_t* **rmt\_get\_counter\_clock** (*rmt\_channel\_t* channel, *uint32\_t* \*clock\_hz)

Get speed of channel' s internal counter clock.

**参数**

- **channel** –RMT channel
- **clock\_hz** –[out] counter clock speed, in hz

**返回**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

*esp\_err\_t* **rmt\_write\_items** (*rmt\_channel\_t* channel, const *rmt\_item32\_t* \*rmt\_item, *int* item\_num, *bool* wait\_tx\_done)

RMT send waveform from `rmt_item` array.

This API allows user to send waveform with any length.

---

**备注:** This function will not copy data, instead, it will point to the original items, and send the waveform items. If `wait_tx_done` is set to true, this function will block and will not return until all items have been sent out. If `wait_tx_done` is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

---

#### 参数

- **channel** –RMT channel
- **rmt\_item** –head point of RMT items array. If `ESP_INTR_FLAG_IRAM` is used, please do not use the memory allocated from psram when calling `rmt_write_items`.
- **item\_num** –RMT data item number.
- **wait\_tx\_done** –
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

#### 返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

`esp_err_t rmt_wait_tx_done (rmt_channel_t channel, TickType_t wait_time)`

Wait RMT TX finished.

#### 参数

- **channel** –RMT channel
- **wait\_time** –Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with `ESP_ERR_TIMEOUT` if TX is busy (polling).

#### 返回

- `ESP_OK` RMT Tx done successfully
- `ESP_ERR_TIMEOUT` Exceeded the ‘wait\_time’ given
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

`esp_err_t rmt_get_ringbuf_handle (rmt_channel_t channel, RingbufHandle_t *buf_handle)`

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

#### 参数

- **channel** –RMT channel
- **buf\_handle** –Pointer to buffer handle to accept RX ringbuffer handle.

#### 返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

`esp_err_t rmt_translator_init (rmt_channel_t channel, sample_to_rmt_t fn)`

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

#### 参数

- **channel** –RMT channel .
- **fn** –Point to the data conversion function.

#### 返回

- `ESP_FAIL` Init fail.
- `ESP_OK` Init success.

*esp\_err\_t* **rmt\_translator\_set\_context** (*rmt\_channel\_t* channel, void \*context)

Set user context for the translator of specific channel.

**参数**

- **channel** –RMT channel number
- **context** –User context

**返回**

- ESP\_FAIL Set context fail
- ESP\_OK Set context success

*esp\_err\_t* **rmt\_translator\_get\_context** (const size\_t \*item\_num, void \*\*context)

Get the user context set by ‘rmt\_translator\_set\_context’ .

---

**备注:** This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item\_num’ you got in that callback function.

---

**参数**

- **item\_num** –Address of the memory which contains the number of translated items (It’s from driver’s internal memroy)
- **context** –Returned User context

**返回**

- ESP\_FAIL Get context fail
- ESP\_OK Get context success

*esp\_err\_t* **rmt\_write\_sample** (*rmt\_channel\_t* channel, const uint8\_t \*src, size\_t src\_size, bool wait\_tx\_done)

Translate uint8\_t type of data into rmt format and send it out. Requires rmt\_translator\_init to init the translator first.

**参数**

- **channel** –RMT channel .
- **src** –Pointer to the raw data.
- **src\_size** –The size of the raw data.
- **wait\_tx\_done** –Set true to wait all data send done.

**返回**

- ESP\_FAIL Send fail
- ESP\_OK Send success

*rmt\_tx\_end\_callback\_t* **rmt\_register\_tx\_end\_callback** (*rmt\_tx\_end\_fn\_t* function, void \*arg)

Registers a callback that will be called when transmission ends.

Called by rmt\_driver\_isr\_default in interrupt context.

---

**备注:** Requires rmt\_driver\_install to install the default ISR handler.

---

**参数**

- **function** –Function to be called from the default interrupt handler or NULL.
- **arg** –Argument which will be provided to the callback when it is called.

**返回** the previous callback settings (members will be set to NULL if there was none)

*esp\_err\_t* **rmt\_set\_rx\_thr\_intr\_en** (*rmt\_channel\_t* channel, bool en, uint16\_t evt\_thresh)

Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value

**参数**

- **channel** –RMT channel
- **en** –enable or disable RX event interrupt.

- **evt\_thresh** –RMT event interrupt threshold value
- 返回
- ESP\_ERR\_INVALID\_ARG Parameter error
  - ESP\_OK Success

*esp\_err\_t* **rmt\_add\_channel\_to\_group** (*rmt\_channel\_t* channel)

Add channel into a synchronous group (channels in the same group can start transaction simultaneously)

参数 **channel** –RMT channel

返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_remove\_channel\_from\_group** (*rmt\_channel\_t* channel)

Remove channel out of a group.

参数 **channel** –RMT channel

返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_set\_tx\_loop\_count** (*rmt\_channel\_t* channel, *uint32\_t* count)

Set loop count threshold value for RMT TX channel.

When tx loop count reaches this value, an ISR callback will notify user

参数

- **channel** –RMT channel
- **count** –loop count, 1 ~ 1023

返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_enable\_tx\_loop\_autostop** (*rmt\_channel\_t* channel, *bool* en)

Enable or disable the feature that when loop count reaches the threshold, RMT will stop transmitting.

- When the loop auto-stop feature is enabled will halt RMT transmission after the loop count reaches a certain threshold
- When disabled, the RMT transmission continue indefinitely until halted by the users

---

**备注:** The auto-stop feature is implemented in hardware on particular targets (i.e. those with SOC\_RMT\_SUPPORT\_TX\_LOOP\_AUTOSTOP defined). Otherwise, the auto-stop feature is implemented in software via the interrupt.

---

参数

- **channel** –RMT channel
- **en** –enable bit

返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **rmt\_memory\_rw\_rst** (*rmt\_channel\_t* channel)

Reset RMT TX/RX memory index.

参数 **channel** –RMT channel

返回

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

void **rmt\_set\_intr\_enable\_mask** (uint32\_t mask)

Set mask value to RMT interrupt enable register.

**参数 mask** –Bit mask to set to the register

void **rmt\_clr\_intr\_enable\_mask** (uint32\_t mask)

Clear mask value to RMT interrupt enable register.

**参数 mask** –Bit mask to clear the register

*esp\_err\_t* **rmt\_set\_pin** (*rmt\_channel\_t* channel, *rmt\_mode\_t* mode, *gpio\_num\_t* gpio\_num)

Set RMT pin.

**参数**

- **channel** –RMT channel
- **mode** –TX or RX mode for RMT
- **gpio\_num** –GPIO number to transmit or receive the signal.

**返回**

- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_OK** Success

## Structures

struct **rmt\_tx\_config\_t**

Data struct of RMT TX configure parameters.

### Public Members

uint32\_t **carrier\_freq\_hz**

RMT carrier frequency

*rmt\_carrier\_level\_t* **carrier\_level**

Level of the RMT output, when the carrier is applied

*rmt\_idle\_level\_t* **idle\_level**

RMT idle level

uint8\_t **carrier\_duty\_percent**

RMT carrier duty (%)

uint32\_t **loop\_count**

Maximum loop count

bool **carrier\_en**

RMT carrier enable

bool **loop\_en**

Enable sending RMT items in a loop

bool **idle\_output\_en**

RMT idle level output enable

struct **rmt\_rx\_config\_t**

Data struct of RMT RX configure parameters.

**Public Members****uint16\_t idle\_threshold**

RMT RX idle threshold

**uint8\_t filter\_ticks\_thresh**

RMT filter tick number

**bool filter\_en**

RMT receiver filter enable

**bool rm\_carrier**

RMT receiver remove carrier enable

**uint32\_t carrier\_freq\_hz**

RMT carrier frequency

**uint8\_t carrier\_duty\_percent**

RMT carrier duty (%)

*rmt\_carrier\_level\_t* **carrier\_level**

The level to remove the carrier

**struct rmt\_config\_t**

Data struct of RMT configure parameters.

**Public Members***rmt\_mode\_t* **rmt\_mode**

RMT mode: transmitter or receiver

*rmt\_channel\_t* **channel**

RMT channel

*gpio\_num\_t* **gpio\_num**

RMT GPIO number

**uint8\_t clk\_div**

RMT channel counter divider

**uint8\_t mem\_block\_num**

RMT memory block number

**uint32\_t flags**

RMT channel extra configurations, OR'ed with RMT\_CHANNEL\_FLAGS\_[\*]

*rmt\_tx\_config\_t* **tx\_config**

RMT TX parameter

*rmt\_rx\_config\_t* **rx\_config**

RMT RX parameter

struct **rmt\_tx\_end\_callback\_t**

Structure encapsulating a RMT TX end callback.

### Public Members

*rmt\_tx\_end\_fn\_t* **function**

Function which is called on RMT TX end

void \***arg**

Optional argument passed to function

### Macros

**RMT\_CHANNEL\_FLAGS\_AWARE\_DFS**

Channel can work during APB clock scaling

**RMT\_CHANNEL\_FLAGS\_INVERT\_SIG**

Invert RMT signal

**RMT\_MEM\_ITEM\_NUM**

Define memory space of each RMT channel (in words = 4 bytes)

**RMT\_DEFAULT\_CONFIG\_TX** (gpio, channel\_id)

Default configuration for Tx channel.

**RMT\_DEFAULT\_CONFIG\_RX** (gpio, channel\_id)

Default configuration for RX channel.

### Type Definitions

typedef *intr\_handle\_t* **rmt\_isr\_handle\_t**

RMT interrupt handle.

typedef void (\***rmt\_tx\_end\_fn\_t**)(*rmt\_channel\_t* channel, void \*arg)

Type of RMT Tx End callback function.

typedef void (\***sample\_to\_rmt\_t**)(const void \*src, rmt\_item32\_t \*dest, size\_t src\_size, size\_t wanted\_num, size\_t \*translated\_size, size\_t \*item\_num)

User callback function to convert uint8\_t type data to rmt format(*rmt\_item32\_t*).

This function may be called from an ISR, so, the code should be short and efficient.

---

**备注:** In fact, *item\_num* should be a multiple of *translated\_size*, e.g. : When we convert each byte of *uint8\_t* type data to rmt format data, the relation between *item\_num* and *translated\_size* should be  $item\_num = translated\_size * 8$ .

---

**Param src** Pointer to the buffer storing the raw data that needs to be converted to rmt format.

**Param dest [out]** Pointer to the buffer storing the rmt format data.

**Param src\_size** The raw data size.

**Param wanted\_num** The number of rmt format data that wanted to get.

**Param translated\_size [out]** The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.

**Param item\_num [out]** The number of the rmt format data that actually converted to, it can be less than wanted\_num if there is not enough raw data, but cannot exceed wanted\_num. it should return 0 if no data was converted.

### Header File

- [components/hal/include/hal/rmt\\_types.h](#)

### Structures

struct **rmt\_channel\_status\_result\_t**

Data struct of RMT channel status.

### Public Members

*rmt\_channel\_status\_t* **status**[*RMT\_CHANNEL\_MAX*]

Store the current status of each channel

### Enumerations

enum **rmt\_channel\_t**

RMT channel ID.

*Values:*

enumerator **RMT\_CHANNEL\_0**

RMT channel number 0

enumerator **RMT\_CHANNEL\_1**

RMT channel number 1

enumerator **RMT\_CHANNEL\_2**

RMT channel number 2

enumerator **RMT\_CHANNEL\_3**

RMT channel number 3

enumerator **RMT\_CHANNEL\_4**

RMT channel number 4

enumerator **RMT\_CHANNEL\_5**

RMT channel number 5

enumerator **RMT\_CHANNEL\_6**

RMT channel number 6

enumerator **RMT\_CHANNEL\_7**

RMT channel number 7

enumerator **RMT\_CHANNEL\_MAX**

Number of RMT channels

enum **rmt\_mem\_owner\_t**

RMT Internal Memory Owner.

*Values:*

enumerator **RMT\_MEM\_OWNER\_TX**

RMT RX mode, RMT transmitter owns the memory block

enumerator **RMT\_MEM\_OWNER\_RX**

RMT RX mode, RMT receiver owns the memory block

enumerator **RMT\_MEM\_OWNER\_MAX**

enum **rmt\_source\_clk\_t**

Clock Source of RMT Channel.

*Values:*

enumerator **RMT\_BASECLK\_APB**

RMT source clock is APB CLK, 80Mhz by default

enumerator **RMT\_BASECLK\_XTAL**

RMT source clock is XTAL clock, 40Mhz by default

enumerator **RMT\_BASECLK\_MAX**

enum **rmt\_data\_mode\_t**

RMT Data Mode.

---

**备注:** We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

---

*Values:*

enumerator **RMT\_DATA\_MODE\_FIFO**

enumerator **RMT\_DATA\_MODE\_MEM**

enumerator **RMT\_DATA\_MODE\_MAX**

enum **rmt\_mode\_t**

RMT Channel Working Mode (TX or RX)

*Values:*

enumerator **RMT\_MODE\_TX**

RMT TX mode

enumerator **RMT\_MODE\_RX**

RMT RX mode

enumerator **RMT\_MODE\_MAX**

enum **rmt\_idle\_level\_t**

RMT Idle Level.

*Values:*

enumerator **RMT\_IDLE\_LEVEL\_LOW**

RMT TX idle level: low Level

enumerator **RMT\_IDLE\_LEVEL\_HIGH**

RMT TX idle level: high Level

enumerator **RMT\_IDLE\_LEVEL\_MAX**

enum **rmt\_carrier\_level\_t**

RMT Carrier Level.

*Values:*

enumerator **RMT\_CARRIER\_LEVEL\_LOW**

RMT carrier wave is modulated for low Level output

enumerator **RMT\_CARRIER\_LEVEL\_HIGH**

RMT carrier wave is modulated for high Level output

enumerator **RMT\_CARRIER\_LEVEL\_MAX**

enum **rmt\_channel\_status\_t**

RMT Channel Status.

*Values:*

enumerator **RMT\_CHANNEL\_UNINIT**

RMT channel uninitialized

enumerator **RMT\_CHANNEL\_IDLE**

RMT channel status idle

enumerator **RMT\_CHANNEL\_BUSY**

RMT channel status busy

### 2.3.14 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-S3 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

#### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

**Systems on a Chip (SoCs)** ESP32-S3 SDMMC host controller allows using any of GPIOs for any of SD interface signals. However, it is recommended to avoid using strapping GPIOs, GPIOs with internal weak pull-downs and GPIOs commonly used for other purposes to prevent conflicts:

- GPIO0 (strapping pin)
- GPIO45, GPIO46 (strapping pins, internal weak pulldown)
- GPIO26 - GPIO32 (commonly used for SPI Flash and PSRAM)
- GPIO33 - GPIO37 (when using chips and modules with Octal SPI Flash or Octal PSRAM)
- GPIO43, GPIO44 (GPIOs used for UART0 by default)
- GPIO19, GPIO20 (GPIOs used for USB by default)

#### Systems in Packages (SIP)

##### Modules

##### Development Boards

- ESP32-S3-DevKitC-1
  - [No Pull-ups](#)
- ESP32-S3-USB-OTG
  - The board may be used in 1-line and 4-line SD mode or SPI mode.
  - Required pull-ups are provided on GPIOs 33-38.
- ESP32-S3-EYE
  - The board is limited to 1-line SD mode.
  - Required pull-ups are provided on GPIOs 38-40.

##### Solutions

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

## Related Information

### 2.3.15 SDMMC Host Driver

#### Overview

ESP32-S3's SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

Both slots (`SDMMC_HOST_SLOT_0`, `SDMMC_HOST_SLOT_1`) support 1-, 4- and 8-line SD interface. The slots are connected to ESP32-S3 GPIOs using GPIO matrix. This means that any GPIO may be used for each of the SD card signals.

#### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

#### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

#### Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

### Configuring GPIOs

ESP32-S3 SDMMC Host can be configured to use arbitrary GPIOs for each of the signals. Configuration is performed by setting members of `sdmmc_slot_config_t` structure. For example, to use GPIOs 1-6 for CLK, CMD, D0 - D3 signals, respectively:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.clk = GPIO_NUM_1;
slot.cmd = GPIO_NUM_2;
slot.d0 = GPIO_NUM_3;
slot.d1 = GPIO_NUM_4;
slot.d2 = GPIO_NUM_5;
slot.d3 = GPIO_NUM_6;
```

It is also possible to configure Card Detect and Write Protect pins. Similar to other signals, set `cd` and `wp` members of the same structure:

```
slot.cd = GPIO_NUM_7;
slot.wp = GPIO_NUM_8;
```

`SDMMC_SLOT_CONFIG_DEFAULT` sets both to `GPIO_NUM_NC`, meaning that by default the signals are not used.

Once `sdmmc_slot_config_t` structure is initialized this way, you can use it when calling `sdmmc_host_init_slot()` or one of the higher level functions, such as `esp_vfs_fat_sdmmc_mount()`.

### DDR Mode for eMMC chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping `SDMMC_FREQ_HIGHSPEED` frequency, clear `SDMMC_HOST_FLAG_DDR` bit in `flags` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

### See also

See [SD/SDIO/MMC Driver](#) for the higher level driver which implements the protocol layer.

See [SD SPI Host Driver](#) for a similar driver which uses the SPI controller and is limited to SD protocol's SPI mode.

See [SD Pull-up Requirements](#) for pullup support and compatibilities of modules and development kits.

### API Reference

#### Header File

- `components/driver/include/driver/sdmmc_host.h`

**Functions*****esp\_err\_t* sdmmc\_host\_init** (void)

Initialize SDMMC host peripheral.

**备注:** This function is not thread safe**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if sdmmc\_host\_init was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated

***esp\_err\_t* sdmmc\_host\_init\_slot** (int slot, const *sdmmc\_slot\_config\_t* \*slot\_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1\_\* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2\_\* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**备注:** This function is not thread safe**参数**

- **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **slot\_config** –additional configuration for the slot

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if host has not been initialized using sdmmc\_host\_init

***esp\_err\_t* sdmmc\_host\_set\_bus\_width** (int slot, size\_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD\_APP\_SET\_BUS\_WIDTH)

**备注:** This function is not thread safe**参数**

- **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **width** –bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if slot number or width is not valid

**size\_t sdmmc\_host\_get\_slot\_width** (int slot)

Get bus width configured in sdmmc\_host\_init\_slot to be used for data transfer.

**参数** **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)**返回** configured bus width of the specified slot.***esp\_err\_t* sdmmc\_host\_set\_card\_clk** (int slot, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**备注:** This function is not thread safe

---

**参数**

- **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **freq\_khz** –card clock frequency, in kHz

**返回**

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdmmc\_host\_set\_bus\_ddr\_mode** (int slot, bool ddr\_enabled)

Enable or disable DDR mode of SD interface.

**参数**

- **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **ddr\_enabled** –enable or disable DDR mode

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if DDR mode is not supported on this slot

*esp\_err\_t* **sdmmc\_host\_do\_transaction** (int slot, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

---

**备注:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc\_host\_do\_transaction as long as other sdmmc\_host\_\* functions are not called.

---

**参数**

- **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **cmdinfo** –pointer to structure describing command and data to transfer

**返回**

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response
- ESP\_ERR\_INVALID\_SIZE if the size of data transfer is not valid in SD protocol
- ESP\_ERR\_INVALID\_ARG if the data buffer is not in DMA capable memory

*esp\_err\_t* **sdmmc\_host\_io\_int\_enable** (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**参数** **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)

**返回** returns ESP\_OK, other errors possible in the future

*esp\_err\_t* **sdmmc\_host\_io\_int\_wait** (int slot, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**参数**

- **slot** –slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **timeout\_ticks** –number of RTOS ticks to wait for the interrupt

**返回**

- ESP\_OK on success (interrupt received)
- ESP\_ERR\_TIMEOUT if the interrupt did not occur within `timeout_ticks`

`esp_err_t sdmmc_host_deinit` (void)

Disable SDMMC host and release allocated resources.

---

**备注:** This function is not thread safe

---

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdmmc_host_init` function has not been called

`esp_err_t sdmmc_host_pullup_en` (int slot, int width)

Enable the pull-ups of sd pins.

This function is deprecated. Please set `SDMMC_SLOT_FLAG_INTERNAL_PULLUP` flag in `sdmmc_slot_config_t::flags` instead.

---

**备注:** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

---

#### 参数

- **slot** –Slot to use, normally set it to 1.
- **width** –Bit width of your configuration, 1 or 4.

#### 返回

- ESP\_OK: if success
- ESP\_ERR\_INVALID\_ARG: if configured width larger than maximum the slot can support

## Structures

struct `sdmmc_slot_config_t`

Extra configuration for SDMMC peripheral slot

### Public Members

`gpio_num_t clk`

GPIO number of CLK signal.

`gpio_num_t cmd`

GPIO number of CMD signal.

`gpio_num_t d0`

GPIO number of D0 signal.

`gpio_num_t d1`

GPIO number of D1 signal.

`gpio_num_t d2`

GPIO number of D2 signal.

***gpio\_num\_t d3***

GPIO number of D3 signal.

***gpio\_num\_t d4***

GPIO number of D4 signal. Ignored in 1- or 4- line mode.

***gpio\_num\_t d5***

GPIO number of D5 signal. Ignored in 1- or 4- line mode.

***gpio\_num\_t d6***

GPIO number of D6 signal. Ignored in 1- or 4- line mode.

***gpio\_num\_t d7***

GPIO number of D7 signal. Ignored in 1- or 4- line mode.

***gpio\_num\_t gpio\_cd***

GPIO number of card detect signal.

***gpio\_num\_t cd***

GPIO number of card detect signal; shorter name.

***gpio\_num\_t gpio\_wp***

GPIO number of write protect signal.

***gpio\_num\_t wp***

GPIO number of write protect signal; shorter name.

***uint8\_t width***

Bus width used by the slot (might be less than the max width supported)

***uint32\_t flags***

Features used by this slot.

**Macros****SDMMC\_HOST\_SLOT\_0**

SDMMC slot 0.

**SDMMC\_HOST\_SLOT\_1**

SDMMC slot 1.

**SDMMC\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

**SDMMC\_SLOT\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

**SDMMC\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDMMC\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDMMC\_SLOT\_WIDTH\_DEFAULT**

use the maximum possible width for the slot

**SDMMC\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SDMMC host slot

## 2.3.16 SD SPI Host Driver

### Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi\_dev\_handle\_t* spi\_handle returned when attaching the device to an SPI bus by calling *sdspi\_host\_init\_device*. The bus should be already initialized before (by *spi\_bus\_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

### How to Use

Firstly, use the macro *SDSPI\_DEVICE\_CONFIG\_DEFAULT* to initialize a structure *sdmmc\_slot\_config\_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi\_host\_init\_device* to initialize the SD SPI device and attach to its bus.

Then use *SDSPI\_HOST\_DEFAULT* macro to initialize a *sdmmc\_host\_t* structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI device *spi\_handle* just returned from *sdspi\_host\_init\_device*. Call *sdmmc\_card\_init* with the *sdmmc\_host\_t* to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

### Other Details

Only the following driver's API functions are normally used by most applications:

- *sdspi\_host\_init ()*
- *sdspi\_host\_init\_device ()*
- *sdspi\_host\_remove\_device ()*
- *sdspi\_host\_deinit ()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the *sdmmc\_host\_t* structure. For more details, see *the SD/SDIO/MMC Driver*.

---

**备注:** SD over SPI does not support speeds above *SDMMC\_FREQ\_DEFAULT* due to the limitations of the SPI driver.

---

## API Reference

### Header File

- components/driver/include/driver/sdspi\_host.h

### Functions

*esp\_err\_t* **sdspi\_host\_init** (void)

Initialize SD SPI driver.

---

**备注:** This function is not thread safe

---

#### 返回

- ESP\_OK on success
- other error codes may be returned in future versions

*esp\_err\_t* **sdspi\_host\_init\_device** (const *sdspi\_device\_config\_t* \*dev\_config, *sdspi\_dev\_handle\_t* \*out\_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

---

**备注:** This function is not thread safe

---

---

**备注:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

---

---

**备注:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

#### 参数

- **dev\_config** – pointer to device configuration structure
- **out\_handle** – Output of the handle to the sdspi device.

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_host_init_device` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

*esp\_err\_t* **sdspi\_host\_remove\_device** (*sdspi\_dev\_handle\_t* handle)

Remove an SD SPI device.

**参数** **handle** – Handle of the SD SPI device

**返回** Always ESP\_OK

*esp\_err\_t* **sdspi\_host\_do\_transaction** (*sdspi\_dev\_handle\_t* handle, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

---

**备注:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

---

**参数**

- **handle** –Handle of the sdspi device
- **cmdinfo** –pointer to structure describing command and data to transfer

**返回**

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**备注:** This function is not thread safe

---

**参数**

- **host** –Handle of the sdspi device
- **freq\_khz** –card clock frequency, in kHz

**返回**

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using sdspi\_host\_init.

---

**备注:** This function is not thread safe

---

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if sdspi\_host\_init function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**参数** **handle** –Handle of the sdspi device

**返回**

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

**参数**

- **handle** –Handle of the sdspi device
- **timeout\_ticks** –Ticks to wait before timeout.

**返回**

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_init\_slot** (int slot, const *sdspi\_slot\_config\_t* \*slot\_config)

Initialize SD SPI driver for the specific SPI controller.

*Deprecated:*

Use sdspi\_host\_init\_device instead.

---

**备注:** This function is not thread safe

---

---

**备注:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

#### 参数

- **slot** –SPI controller to use (SPI2\_HOST or SPI3\_HOST)
- **slot\_config** –pointer to slot configuration structure

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_init_slot` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

### Structures

struct **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

### Public Members

*spi\_host\_device\_t* **host\_id**

SPI host to use, SPIx\_HOST (see `spi_types.h`).

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

struct **sdspi\_slot\_config\_t**

Extra configuration for SPI host.

*Deprecated:*

Use *sdspi\_device\_config\_t* and corresponding `sdspi_host_init_device()` instead.

### Public Members

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

*gpio\_num\_t* **gpio\_miso**

GPIO number of MISO signal.

*gpio\_num\_t* **gpio\_mosi**

GPIO number of MOSI signal.

*gpio\_num\_t* **gpio\_sck**

GPIO number of SCK signal.

int **dma\_channel**

DMA channel to be used by SPI driver (1 or 2).

## Macros

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_DEFAULT\_DMA**

**SDSPI\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by *sdspi\_host\_init\_device ()*.

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_DEVICE\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SD SPI device.

**SDSPI\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SPI host

## Type Definitions

typedef int **sdspi\_dev\_handle\_t**

Handle representing an SD SPI device.

## 2.3.17 Sigma-delta Modulation

### Introduction

ESP32-S3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

### Functionality Overview

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the 'duty' input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of `sigmadelta_set_duty()`.

### Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

图 14: Sallen-Key Low Pass Filter

## Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

## API Reference

### Header File

- [components/driver/include/driver/sigmadelta.h](#)

### Functions

*esp\_err\_t* **sigmadelta\_config** (const *sigmadelta\_config\_t* \*config)

Configure Sigma-delta channel.

**参数 config** –Pointer of Sigma-delta channel configuration struct

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver already initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **sigmadelta\_set\_duty** (*sigmadelta\_channel\_t* channel, int8\_t duty)

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be  $V_{dc} = VDDIO / 256 * duty + VDDIO/2$ , where VDDIO is the power supply voltage.

**参数**

- **channel** –Sigma-delta channel number
- **duty** –Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **sigmadelta\_set\_prescale** (*sigmadelta\_channel\_t* channel, uint8\_t prescale)

Set Sigma-delta channel's clock pre-scale value. The source clock is APP\_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP\_CLK / pre\_scale.

**参数**

- **channel** –Sigma-delta channel number
- **prescale** –The divider of source clock, ranges from 0 to 255

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **sigmadelta\_set\_pin** (*sigmadelta\_channel\_t* channel, *gpio\_num\_t* gpio\_num)

Set Sigma-delta signal output pin.

**参数**

- **channel** –Sigma-delta channel number
- **gpio\_num** –GPIO number of output pin.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

## Header File

- [components/hal/include/hal/sigmadelta\\_types.h](#)

## Structures

struct **sigmadelta\_config\_t**

Sigma-delta configure struct.

## Public Members

*sigmadelta\_channel\_t* **channel**

Sigma-delta channel number

int8\_t **sigmadelta\_duty**

Sigma-delta duty, duty ranges from -128 to 127.

uint8\_t **sigmadelta\_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

uint8\_t **sigmadelta\_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

## Enumerations

enum **sigmadelta\_port\_t**

SIGMADELTA port number, the max port number is (SIGMADELTA\_NUM\_MAX -1).

*Values:*

enum **sigmadelta\_channel\_t**

Sigma-delta channel list.

*Values:*

## 2.3.18 SPI Master Driver

SPI Master driver is a program that controls ESP32-S3's SPI peripherals while they function as masters.

### Overview of ESP32-S3's SPI peripherals

ESP32-S3 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-S3's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 and SPI3 are general purpose SPI controllers. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. SPI2 has 6 CS lines. SPI3 has 3 CS lines. Each CS line can be used to drive one SPI slave.

## Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral inside ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>De-vice</b>	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
<b>MOSI</b>	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
<b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
<b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
<b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
<b>QUADWP</b>	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
<b>QUADHD</b>	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
<b>DATA4</b>	Data4 signal in Octal/OPI mode.
<b>DATA5</b>	Data5 signal in Octal/OPI mode.
<b>DATA6</b>	Data6 signal in Octal/OPI mode.
<b>DATA7</b>	Data7 signal in Octal/OPI mode.
<b>As- ser- tion</b>	The action of activating a line.
<b>De- asser- tion</b>	The action of returning the line back to inactive (back to idle) status.
<b>Trans- ac- tion</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch- edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch- edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

## Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

**警告:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-S3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Features

### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it' s meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
<b>Com- mand</b>	In this phase, a command (0-16 bit) is written to the bus by the Host.
<b>Ad- dress</b>	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
<b>Write</b>	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
<b>Dummy</b>	This phase is configurable and is used to meet the timing requirements.
<b>Read</b>	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device' s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Transaction Line Mode** Supported line modes for ESP32-S3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOMMON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOMMON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO SPI_TRANS_MULTILINE_ADDR	
Octal Output	1	1	8	SPI_TRANS_MODE_OCT	SPICOMMON_BUSFLAG_OCTAL
OPI	8	8	8	SPI_TRANS_MODE_OCT SPI_TRANS_MULTILINE_ADDR SPI_TRANS_MULTILINE_CMD	

**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member

`spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

---

**备注:** Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

## Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

**Transactions with Integers Other Than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See [Interrupt Transactions](#). For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see [Polling Transactions](#).

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 26  $\mu$ s.
- Interrupt Transaction via CPU: 24  $\mu$ s.
- Polling Transaction via DMA: 11  $\mu$ s.
- Polling Transaction via CPU: 9  $\mu$ s.

**SPI Clock Frequency** Transferring each byte takes eight times the clock period  $8/f_{spi}$ .

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is  $20+8n/f_{spi}[MHz]$  [us] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/f_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#) and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM 安全中断处理程序](#).

### Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi\\_master/hd\\_eeprom](#) directory of ESP-IDF examples.

### API Reference - SPI Common

#### Header File

- [components/hal/include/hal/spi\\_types.h](#)

### Structures

struct **spi\_line\_mode\_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

### Public Members

uint8\_t **cmd\_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8\_t **addr\_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8\_t **data\_lines**

The line width of data phase, e.g. 4-line-data-phase.

### Enumerations

enum **spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

enumerator **SPI1\_HOST**

SPI1.

enumerator **SPI2\_HOST**

SPI2.

enumerator **SPI3\_HOST**

SPI3.

enum **spi\_event\_t**

SPI Events.

*Values:*

enumerator **SPI\_EV\_BUF\_TX**

The buffer has sent data to master.

enumerator **SPI\_EV\_BUF\_RX**

The buffer has received data from master.

enumerator **SPI\_EV\_SEND\_DMA\_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI\_EV\_RECV\_DMA\_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI\_EV\_CMD9**

Received CMD9 from master.

enumerator **SPI\_EV\_CMDA**

Received CMDA from master.

enumerator **SPI\_EV\_TRANS**

A transaction has done.

## Header File

- [components/driver/include/driver/spi\\_common.h](#)

## Functions

*esp\_err\_t* **spi\_bus\_initialize** (*spi\_host\_device\_t* host\_id, const *spi\_bus\_config\_t* \*bus\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus.

**警告:** SPI0/1 is not supported

**警告:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**警告:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

## 参数

- **host\_id** –SPI peripheral that controls this bus
- **bus\_config** –Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **dma\_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting **SPI\_DMA\_DISABLED** limits the size of transactions.
  - Set to **SPI\_DMA\_DISABLED** if only the SPI flash uses this bus.
  - Set to **SPI\_DMA\_CH\_AUTO** to let the driver to allocate the DMA channel.

## 返回

- **ESP\_ERR\_INVALID\_ARG** if configuration is invalid
- **ESP\_ERR\_INVALID\_STATE** if host already is in use
- **ESP\_ERR\_NOT\_FOUND** if there is no available DMA channel
- **ESP\_ERR\_NO\_MEM** if out of memory
- **ESP\_OK** on success

`esp_err_t spi_bus_free (spi_host_device_t host_id)`

Free a SPI bus.

**警告:** In order for this to succeed, all devices have to be removed first.

**参数** `host_id` –SPI peripheral to free

**返回**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

## Structures

struct `spi_bus_config_t`

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

**备注:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

## Public Members

int `mosi_io_num`

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

int `data0_io_num`

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int `miso_io_num`

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

int `data1_io_num`

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int `sclk_io_num`

GPIO pin for SPI Clock signal, or -1 if not used.

int `quadwp_io_num`

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int `data2_io_num`

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int `quadhd_io_num`

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3\_io\_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4\_io\_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5\_io\_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6\_io\_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7\_io\_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max\_transfer\_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32\_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

int **intr\_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

## Macros

**SPI\_MAX\_DMA\_LEN**

**SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

### 参数

- **DATA** –Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

### 参数

- **DATA** –Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_GPIO\_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_IO4\_IO7**

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON\_BUSFLAG\_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```
enum spi_common_dma_t
```

SPI DMA channels.

*Values:*

enumerator **SPI\_DMA\_DISABLED**

Do not enable DMA for SPI.

enumerator **SPI\_DMA\_CH\_AUTO**

Enable DMA, channel is automatically selected by driver.

## API Reference - SPI Master

### Header File

- [components/driver/include/driver/spi\\_master.h](#)

### Functions

*esp\_err\_t* **spi\_bus\_add\_device** (*spi\_host\_device\_t* host\_id, const *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

---

**备注:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

---

#### 参数

- **host\_id** –SPI peripheral to allocate device on
- **dev\_config** –SPI interface protocol config for the device
- **handle** –Pointer to variable to hold the device handle

#### 返回

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_FOUND if host doesn't have any free CS slots
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**参数** **handle** –Device handle to free

#### 返回

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if device already is freed
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

---

**备注:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### 参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute

- **ticks\_to\_wait** –Ticks to wait until there's room in the queue; use portMAX\_DELAY to never time out.

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid. This can happen if SPI\_TRANS\_CS\_KEEP\_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP\_ERR\_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions are not finished
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**参数**

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks\_to\_wait** –Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

---

**备注:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**参数**

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

---

**备注:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

---

**参数**

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute
- **ticks\_to\_wait** –Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

**返回**

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**参数**

- **handle** –Device handle obtained using `spi_host_add_dev`
- **ticks\_to\_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

**返回**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

---

**备注:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**参数**

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute

**返回**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

---

**备注:** The function will wait until all the existing transactions have been sent.

---

**参数**

- **device** –The device to occupy the bus.
- **wait** –Time to wait before the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

**返回**

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**参数** `dev` –The device to release the bus.

int **spi\_cal\_clock** (int fapb, int hz, int duty\_cycle, uint32\_t \*reg\_o)

Calculate the working frequency that is most close to desired frequency, and also the register value.

*Deprecated:*

The app shouldn't care about the register. Call `spi_get_actual_clock` instead.

**参数**

- **fapb** –The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** –Desired working frequency
- **duty\_cycle** –Duty cycle of the spi clock
- **reg\_o** –Output of value to be set in clock register, or NULL if not needed.

**返回** Actual working frequency that most fit.

int **spi\_get\_actual\_clock** (int fapb, int hz, int duty\_cycle)

Calculate the working frequency that is most close to desired frequency.

**参数**

- **fapb** –The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** –Desired working frequency
- **duty\_cycle** –Duty cycle of the spi clock

**返回** Actual working frequency that most fit.

void **spi\_get\_timing** (bool gpio\_is\_used, int input\_delay\_ns, int eff\_clk, int \*dummy\_o, int \*cycles\_remain\_o)

Calculate the timing settings of specified frequency and settings.

---

**备注:** If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

---

**参数**

- **gpio\_is\_used** –True if using GPIO matrix, or False if iomux pins are used.
- **input\_delay\_ns** –Input delay from SCLK launch edge to MISO data valid.
- **eff\_clk** –Effective clock frequency (in Hz) from `spi_cal_clock`.
- **dummy\_o** –Address of dummy bits used output. Set to NULL if not needed.
- **cycles\_remain\_o** –Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool gpio\_is\_used, int input\_delay\_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**参数**

- **gpio\_is\_used** –True if using GPIO matrix, or False if native pins are used.
- **input\_delay\_ns** –Input delay from SCLK launch edge to MISO data valid.

**返回** Frequency limit of current configurations.

## Structures

struct **spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

### Public Members

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

uint8\_t **address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8\_t **dummy\_bits**

Amount of dummy bits to insert between address and data phase.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16\_t **duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16\_t **cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8\_t **cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int **clock\_speed\_hz**

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

int **input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggested to have the right value.

int **spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

uint32\_t **flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

**transaction\_cb\_t pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**transaction\_cb\_t post\_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members****uint32\_t flags**

Bitwise OR of `SPI_TRANS_*` flags.

**uint16\_t cmd**

Command data, of which the length is set in the `command_bits` of `spi_device_interface_config_t`.

**NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**uint64\_t addr**

Address data, of which the length is set in the `address_bits` of `spi_device_interface_config_t`.

**NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

**size\_t length**

Total data length, in bits.

**size\_t rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

const void **\*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8\_t **tx\_data**[4]

If SPI\_TRANS\_USE\_TXDATA is set, data set here is sent directly from this variable.

void **\*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8\_t **rx\_data**[4]

If SPI\_TRANS\_USE\_RXDATA is set, data is received directly to this variable.

struct **spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI\_TRANS\_VARIABLE\_CMD\_ADR to use the bit length here.

### Public Members

struct *spi\_transaction\_t* **base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

uint8\_t **command\_bits**

The command length in this transaction, in bits.

uint8\_t **address\_bits**

The address length in this transaction, in bits.

uint8\_t **dummy\_bits**

The dummy length in this transaction, in bits.

### Macros

**SPI\_MASTER\_FREQ\_8M**

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).  
8MHz

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you' re going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK**

**SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into rx\_data member of *spi\_transaction\_t* instead into memory at rx\_buffer.

**SPI\_TRANS\_USE\_TXDATA**

Transmit tx\_data member of *spi\_transaction\_t* instead of data at tx\_buffer. Do not set tx\_buffer when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by SPI\_MODE\_DIO/SPI\_MODE\_QIO.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the command\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the address\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the dummy\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_CS\_KEEP\_ACTIVE**

Keep CS active after data transfer.

**SPI\_TRANS\_MULTILINE\_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI\_TRANS\_MODE\_OCT**

Transmit/receive data in 8-bit mode.

**SPI\_TRANS\_MULTILINE\_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**Type Definitions**

```
typedef struct spi_transaction_t spi_transaction_t
```

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

**2.3.19 SPI Slave Driver**

SPI Slave driver is a program that controls ESP32-S3's SPI peripherals while they function as slaves.

## Overview of ESP32-S3's SPI peripherals

ESP32-S3 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

SPI2 and SPI3 have independent signal buses with the same respective names.

### Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral external to ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>Device</b>	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• <b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• <b>MOSI</b>	Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.
• <b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• <b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• <b>QUADWP</b>	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• <b>QUADHD</b>	Hold signal. Only used for 4-bit (qio/qout) transactions.
• <b>Assertion</b>	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

## Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

## SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**备注:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

## Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

## Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

## Speed and Timing Considerations

**Transaction Interval** The ESP32-S3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 40 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

## Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

## Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

## API Reference

### Header File

- [components/driver/include/driver/spi\\_slave.h](#)

### Functions

`esp_err_t spi_slave_initialize` (`spi_host_device_t` host, const `spi_bus_config_t` \*bus\_config, const `spi_slave_interface_config_t` \*slave\_config, `spi_dma_chan_t` dma\_chan)

Initialize a SPI bus as a slave interface.

**警告:** SPI0/1 is not supported

**警告:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**警告:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

### 参数

- **host** –SPI peripheral to use as a SPI slave interface

- **bus\_config** –Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **slave\_config** –Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- **dma\_chan** – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**返回**

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_free** (*spi\_host\_device\_t* host)

Free a SPI bus claimed as a SPI slave interface.

**参数** **host** –SPI peripheral to free

**返回**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* host, const *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**参数**

- **host** –SPI peripheral that is acting as a slave
- **trans\_desc** –Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** –Ticks to wait until there's room in the queue; use port-`MAX_DELAY` to never time out.

**返回**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**参数**

- **host** –SPI peripheral to that is acting as a slave
- **trans\_desc** –[out] Pointer to variable able to contain a pointer to the description of the transaction that is executed

- **ticks\_to\_wait** –Ticks to wait until there’s a returned item; use portMAX\_DELAY to never time out.

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Do a SPI transaction.

Essentially does the same as spi\_slave\_queue\_trans followed by spi\_slave\_get\_trans\_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi\_slave\_get\_trans\_result.

**参数**

- **host** –SPI peripheral to that is acting as a slave
- **trans\_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** –Ticks to wait until there’s a returned item; use portMAX\_DELAY to never time out.

**返回**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Structures**

struct **spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members**

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_\* flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi\_slave\_queue\_trans but not yet finished using spi\_slave\_get\_trans\_result) at the same time.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

*slave\_transaction\_cb\_t* **post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

***slave\_transaction\_cb\_t* post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct *spi\_slave\_transaction\_t***

This structure describes one SPI transaction

**Public Members****size\_t length**

Total data length, in bits.

**size\_t trans\_len**

Transaction data length, in bits.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

**Macros****SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**Type Definitions**

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
```

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

### 2.3.20 Temperature Sensor

**Overview**

The ESP32-S3 has a built-in temperature sensor used to measure the chip’s internal temperature, and hard to measure the environmental temperature accurately. Being built-in means that the temperature sensor should work on

any ESP32-S3 regardless of what board the chip is embedded in. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a temperature offset DAC.

The conversion relationship is the first columns of the table below. Among them, offset = 0 is the main measurement option, and other values are extended measurement options.

offset	measure range(Celsius)	measure error(Celsius)
-2	50 ~ 125	< 3
-1	20 ~ 100	< 2
0	-10 ~ 80	< 1
1	-30 ~ 50	< 2
2	-40 ~ 20	< 3

## Driver Usage

1. Initialize the temperature sensor by calling the function `temp_sensor_set_config()` and pass to it a `temp_sensor_config_t` structure. The `temp_sensor_config_t` structure should contain all the required parameters. See the example below.

```
temp_sensor_config_t temp_sensor = {
    .dac_offset = TSENS_DAC_L2,
    .clk_div = 6,
};
temp_sensor_set_config(temp_sensor);
```

2. Start the temp\_sensor by calling :cpp:func:’ temp\_sensor\_start’ . The temperature sensor will now measure the temperature.
3. To get the current temperature, take the example below as a reference, the value you get is in Celsius.

```
float tsens_out;
temp_sensor_read_celsius(&tsens_out);
```

4. To stop the temperature sensor, please call :cpp:func:’ temp\_sensor\_stop’ .

---

**备注:** If you want dynamic reconfiguration, you need to stop the sensor first (`temp_sensor_stop`), set the new configuration (`temp_sensor_set_config`), then start the sensor again (`temp_sensor_start`).

---

## Application Example

Temperature sensor reading example: [peripherals/temp\\_sensor](#).

## API Reference - Normal Temp Sensor

### Header File

- [components/driver/esp32s2/include/driver/temp\\_sensor.h](#)

### Functions

`esp_err_t temp_sensor_set_config(temp_sensor_config_t tsens)`

Set parameter of temperature sensor.

参数 `tsens` –

返回

- ESP\_OK Success

*esp\_err\_t* **temp\_sensor\_get\_config** (*temp\_sensor\_config\_t* \*tsens)

Get parameter of temperature sensor.

参数 **tsens** –

返回

- ESP\_OK Success

*esp\_err\_t* **temp\_sensor\_start** (void)

Start temperature sensor measure.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **temp\_sensor\_stop** (void)

Stop temperature sensor measure.

返回

- ESP\_OK Success

*esp\_err\_t* **temp\_sensor\_read\_raw** (uint32\_t \*tsens\_out)

Read temperature sensor raw data.

参数 **tsens\_out** –Pointer to raw data, Range: 0 ~ 255

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG **tsens\_out** is NULL
- ESP\_ERR\_INVALID\_STATE temperature sensor dont start

*esp\_err\_t* **temp\_sensor\_read\_celsius** (float \*celsius)

Read temperature sensor data that is converted to degrees Celsius.

---

备注: Should not be called from interrupt.

---

参数 **celsius** –The measure output value.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG ARG is NULL.
- ESP\_ERR\_INVALID\_STATE The ambient temperature is out of range.

## Structures

struct **temp\_sensor\_config\_t**

Configuration for temperature sensor reading.

## Public Members

*temp\_sensor\_dac\_offset\_t* **dac\_offset**

The temperature measurement range is configured with a built-in temperature offset DAC.

uint8\_t **clk\_div**

Default: 6

## Macros

**TSENS\_CONFIG\_DEFAULT** ()

temperature sensor default setting.

## Enumerations

enum **temp\_sensor\_dac\_offset\_t**

temperature sensor range option.

*Values:*

enumerator **TSENS\_DAC\_L0**

offset = -2, measure range: 50°C ~ 125°C, error < 3°C.

enumerator **TSENS\_DAC\_L1**

offset = -1, measure range: 20°C ~ 100°C, error < 2°C.

enumerator **TSENS\_DAC\_L2**

offset = 0, measure range: -10°C ~ 80°C, error < 1°C.

enumerator **TSENS\_DAC\_L3**

offset = 1, measure range: -30°C ~ 50°C, error < 2°C.

enumerator **TSENS\_DAC\_L4**

offset = 2, measure range: -40°C ~ 20°C, error < 3°C.

enumerator **TSENS\_DAC\_MAX**

enumerator **TSENS\_DAC\_DEFAULT**

### 2.3.21 触摸传感器

#### 概述

触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成，保护覆盖层位于最上层，绝缘基板上设有电极及走线。用户触摸覆盖层将产生电容变化，根据电容变化判断此次触摸是否为有效触摸行为。

ESP32-S3 最多可支持 14 个电容式触摸传感器通道/GPIO。

触摸传感器可以以矩阵或滑条等方式组合使用，从而覆盖更大触感区域及更多触感点。触摸传感由软件或专用硬件计时器发起，由有限状态机 (FSM) 硬件控制。

如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32-S3 技术参考手册》(PDF) 中“片上传感器与模拟信号处理”章节。

请参考 [触摸传感器应用方案简介](#)，查看触摸传感器设计详情和固件开发指南。

#### 功能介绍

下面将 API 分解成几个函数组进行介绍，帮助用户快速了解以下功能：

- 初始化触摸传感器驱动程序
- 配置触摸传感器 GPIO 管脚
- 触摸状态测量
- 调整测量参数（优化测量）
- 滤波采样
- 触摸监测方式

- 设置中断信号监测触碰动作
- 中断触发，唤醒睡眠模式

请前往[API 参考](#) 章节，查看某一函数的具体描述。[应用示例](#) 章节则介绍了此 API 的具体实现。

**初始化触摸传感器驱动程序** 使用触摸传感器之前，需要先调用 `touch_pad_init()` 函数初始化触摸传感器驱动程序。此函数设置了 [API 参考](#) 项下的 *Macros* 中列出的几项 `.._DEFAULT` 驱动程序参数，同时删除之前设置过的触摸传感器信息（如有），并禁用中断。

如果不再需要该驱动程序，可以调用 `touch_pad_deinit()` 释放已初始化的驱动程序。

**配置触摸传感器 GPIO 管脚** 调用 `touch_pad_config()` 使能某一 GPIO 的触感功能。

使用 `touch_pad_set_fsm_mode()` 选择触摸传感器测量（由 FSM 操作）是由硬件定时器自动启动，还是由软件自动启动。如果选择软件模式，请使用 `touch_pad_sw_start()` 启动 FSM。

**触摸状态测量** 借助以下函数从传感器读取原始数据：

- `touch_pad_read_raw_data()`

该函数也可以用于检查触碰和释放触摸传感器时传感器读数变化范围，然后根据这些信息设定触摸传感器的触摸阈值。

请参考应用示例 [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_read](#)，查看如何使用读取触摸传感器数据。

**优化测量** 触摸传感器设有数个可配置参数，以适应触摸传感器设计特点。例如，如果需要感知较细微的电容变化，则可以缩小触摸传感器充放电的参考电压范围。用户可以使用 `touch_pad_set_voltage()` 函数设置电压参考低值和参考高值。

优化测量除了可以识别细微的电容变化之外，还可以降低应用程序功耗，但可能会增加测量噪声干扰。如果得到的动态读数范围结果比较理想，则可以调用 `touch_pad_set_meas_time()` 函数来减少测量时间，从而进一步降低功耗。

可用的测量参数及相应的‘set’函数总结如下：

- 触摸传感器充放电参数：
  - 电压门限：`touch_pad_set_voltage()`
  - 速率（斜率）`touch_pad_set_cnt_mode()`
- 测量时间：`touch_pad_set_meas_time()`

电压门限（参考低值/参考高值）、速率（斜率）与测量时间的关系如下图所示：

上图中的 *Output* 代表触摸传感器读值，即一个测量周期内测得的脉冲计数值。

所有函数均成对出现，用于设定某一特定参数，并获取当前参数值。例如：`touch_pad_set_voltage()` 和 `touch_pad_get_voltage()`。

**滤波采样** 如果测量中存在噪声，可以使用提供的 API 函数对采样进行滤波。ESP32-S3 的触摸功能提供了两套 API 可实现此功能。

一个是内部触摸通道，它没有连接到任何外部 GPIO。该降噪板的测量值可用于过滤所有通道上的干扰，如来自电源和外部 EMI 的噪声。降噪参数由 `touch_pad_denoise_set_config()` 设置并由 `touch_pad_denoise_enable()` 启动。

另一是可配置的硬件实现 IIR-滤波器（无限脉冲响应滤波器），该滤波器可通过调用 `touch_pad_filter_set_config()` 函数进行配置，调用 `touch_pad_filter_enable()` 函数启用。

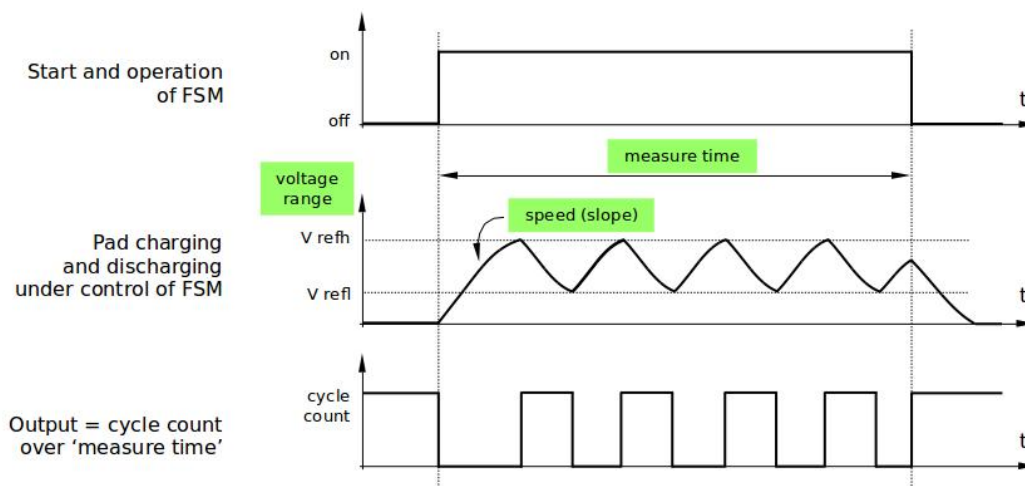

图 15: 触摸传感器 - 测量参数之间的关系

**触摸监测** 触摸监测基于用户配置的阈值和 FSM 执行的原始测量，并由 ESP32 硬件实现。用户可以调用 `touch_pad_get_status()` 查看被触碰的触摸传感器，或调用 `touch_pad_clear_status()` 清除触摸状态信息。

用户也可以将硬件触摸监测连接至中断，详细介绍见下一章节。

如果测量中存在噪声，且电容变化幅度较小，硬件触摸监测结果可能就不太理想。如需解决这一问题，不建议使用硬件监测或中断信号，建议用户在自己的应用程序中进行采样滤波，并执行触摸监测。请参考 [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_interrupt](#)，查看以上两种触摸监测的实现方式。

**中断触发** 在对触摸监测启用中断之前，请先设置一个触摸监测阈值。然后使用 [触摸状态测量](#) 中所述的函数读取并显示触摸和释放触摸传感器时测得的结果。如果测量中存在噪声且相对电容变化较小，请使用滤波器。用户也可以根据应用程序和环境条件，测试温度和电源电压变化对测量值的影响。

确定监测阈值后就可以在初始化时调用 `touch_pad_config()` 设置此阈值，或在运行时调用 `touch_pad_set_thresh()` 设置此阈值。

最后用户可以使用以下函数配置和管理中断调用：

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

中断配置完成后，用户可以调用 `touch_pad_get_status()` 查看中断信号来自哪个触摸传感器，也可以调用 `touch_pad_clear_status()` 清除触摸传感器状态信息。

### 应用示例

- 触摸传感器读值示例：[peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_read](#)
- 触摸传感器中断示例：[peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_interrupt](#)

### API 参考

#### Header File

- `components/driver/esp32s3/include/driver/touch_sensor.h`

**Functions****esp\_err\_t touch\_pad\_fsm\_start** (void)

Set touch sensor FSM start.

---

**备注:** Start FSM after the touch sensor FSM mode is set.

---

---

**备注:** Call this function will reset benchmark of all touch channels.

---

**返回**

- ESP\_OK on success

**esp\_err\_t touch\_pad\_fsm\_stop** (void)

Stop touch sensor FSM.

**返回**

- ESP\_OK on success

**esp\_err\_t touch\_pad\_sw\_start** (void)

Trigger a touch sensor measurement, only support in SW mode of FSM.

**返回**

- ESP\_OK on success

**esp\_err\_t touch\_pad\_set\_meas\_time** (uint16\_t sleep\_cycle, uint16\_t meas\_times)

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**备注:** The greater the duty cycle of the measurement time, the more system power is consumed.

---

**参数**

- **sleep\_cycle** –The touch sensor will sleep after each measurement. sleep\_cycle decide the interval between each measurement.  $t_{sleep} = sleep\_cycle / (RTC\_SLOW\_CLK \text{ frequency})$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using rtc\_clk\_slow\_freq\_get\_hz function.
- **meas\_times** –The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

**返回**

- ESP\_OK on success

**esp\_err\_t touch\_pad\_get\_meas\_time** (uint16\_t \*sleep\_cycle, uint16\_t \*meas\_times)

Get touch sensor times of charge and discharge and sleep time.

**参数**

- **sleep\_cycle** –Pointer to accept sleep cycle number
- **meas\_times** –Pointer to accept measurement times count.

**返回**

- ESP\_OK on success

**esp\_err\_t touch\_pad\_set\_idle\_channel\_connect** (*touch\_pad\_conn\_type\_t* type)

Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The CONN\_HIGHZ(high resistance) setting increases the sensitivity of touch channels. The CONN\_GND(grounding) setting increases the stability of touch channels.

参数 **type** –Select idle channel connect to high resistance state or ground.

返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_idle\_channel\_connect** (*touch\_pad\_conn\_type\_t* \*type)

Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ`(high resistance) setting increases the sensitivity of touch channels. The `CONN_GND`(grounding) setting increases the stability of touch channels.

参数 **type** –Pointer to connection type.

返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_thresh** (*touch\_pad\_t* touch\_num, uint32\_t threshold)

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

---

备注: If set “TOUCH\_PAD\_THRESHOLD\_MAX” , the touch is never be triggered.

---

参数

- **touch\_num** –touch pad index
- **threshold** –threshold of touch sensor. Should be less than the max change value of touch.

返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_thresh** (*touch\_pad\_t* touch\_num, uint32\_t \*threshold)

Get touch sensor trigger threshold.

参数

- **touch\_num** –touch pad index
- **threshold** –pointer to accept threshold

返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_set\_channel\_mask** (uint16\_t enable\_mask)

Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

---

备注: If set this mask, the FSM timer should be stop firstly.

---

---

备注: The touch sensor that in scan map, should be deinit GPIO function firstly by `touch_pad_io_init`.

---

参数 **enable\_mask** –bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14 -> BIT(14)

返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_channel\_mask** (uint16\_t \*enable\_mask)

Get the touch sensor scan group bit mask.

参数 **enable\_mask** –Pointer to bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14 -> BIT(14)

## 返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_clear\_channel\_mask** (uint16\_t enable\_mask)

Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

---

**备注:** If clear all mask, the FSM timer should be stop firstly.

---

参数 **enable\_mask** –bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14 -> BIT(14)

## 返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_config** (*touch\_pad\_t* touch\_num)

Configure parameter for each touch channel.

---

**备注:** Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function

---

参数 **touch\_num** –touch pad index

## 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG if argument wrong
- ESP\_FAIL if touch pad not initialized

*esp\_err\_t* **touch\_pad\_reset** (void)

Reset the FSM of touch module.

---

**备注:** Call this function after `touch_pad_fsm_stop`.

---

## 返回

- ESP\_OK Success

*touch\_pad\_t* **touch\_pad\_get\_current\_meas\_channel** (void)

Get the current measure channel.

---

**备注:** Should be called when touch sensor measurement is in cyclic scan mode.

---

## 返回

- touch channel number

uint32\_t **touch\_pad\_read\_intr\_status\_mask** (void)

Get the touch sensor interrupt status mask.

## 返回

- touch interrupt bit

*esp\_err\_t* **touch\_pad\_intr\_enable** (*touch\_pad\_intr\_mask\_t* int\_mask)

Enable touch sensor interrupt by bitmask.

---

**备注:** This API can be called in ISR handler.

---

参数 **int\_mask** –Pad mask to enable interrupts  
返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_disable** (*touch\_pad\_intr\_mask\_t* int\_mask)

Disable touch sensor interrupt by bitmask.

---

备注: This API can be called in ISR handler.

---

参数 **int\_mask** –Pad mask to disable interrupts  
返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_clear** (*touch\_pad\_intr\_mask\_t* int\_mask)

Clear touch sensor interrupt by bitmask.

参数 **int\_mask** –Pad mask to clear interrupts  
返回

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_isr\_register** (*intr\_handler\_t* fn, void \*arg, *touch\_pad\_intr\_mask\_t* intr\_mask)

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

参数

- **fn** –Pointer to ISR handler
- **arg** –Parameter for ISR
- **intr\_mask** –Enable touch sensor interrupt handler by bitmask.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Arguments error
- ESP\_ERR\_NO\_MEM No memory

*esp\_err\_t* **touch\_pad\_timeout\_set** (bool enable, uint32\_t threshold)

Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

---

备注: The threshold compared with touch readings.

---

---

备注: In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

---

参数

- **enable** –true(default): Enable the timeout check; false: Disable the timeout check.
- **threshold** –For all channels, the maximum value that will not be exceeded during normal operation.

返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_timeout\_resume** (void)

Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

---

**备注:** Call this API after finishes the exception handling by user.

---

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_read\_raw\_data** (*touch\_pad\_t* touch\_num, uint32\_t \*raw\_data)

get raw data of touch sensor.

---

**备注:** After the initialization is complete, the “raw\_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.

---

**参数**

- **touch\_num** –touch pad index
- **raw\_data** –pointer to accept touch sensor value

**返回**

- ESP\_OK Success
- ESP\_FAIL Touch channel 0 haven't this parameter.

*esp\_err\_t* **touch\_pad\_read\_benchmark** (*touch\_pad\_t* touch\_num, uint32\_t \*benchmark)

get benchmark of touch sensor.

---

**备注:** After initialization, the benchmark value is the maximum during the first measurement period.

---

**参数**

- **touch\_num** –touch pad index
- **benchmark** –pointer to accept touch sensor benchmark value

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Touch channel 0 haven't this parameter.

*esp\_err\_t* **touch\_pad\_filter\_read\_smooth** (*touch\_pad\_t* touch\_num, uint32\_t \*smooth)

Get smoothed data that obtained by filtering the raw data.

**参数**

- **touch\_num** –touch pad index
- **smooth** –pointer to smoothed data

*esp\_err\_t* **touch\_pad\_reset\_benchmark** (*touch\_pad\_t* touch\_num)

Force reset benchmark to raw data of touch sensor.

**参数** **touch\_num** –touch pad index

- TOUCH\_PAD\_MAX Reset baseline of all channels

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_set\_config** (const *touch\_filter\_config\_t* \*filter\_info)

set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**参数** **filter\_info** –select filter type and threshold of detection algorithm**返回**

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_filter\_get\_config** (*touch\_filter\_config\_t* \*filter\_info)

get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

参数 **filter\_info** –select filter type and threshold of detection algorithm

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_filter\_enable** (void)

enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_filter\_disable** (void)

disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_denoise\_set\_config** (const *touch\_pad\_denoise\_t* \*denoise)

set parameter of denoise pad (TOUCH\_PAD\_NUM0). T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

参数 **denoise** –parameter of denoise

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_denoise\_get\_config** (*touch\_pad\_denoise\_t* \*denoise)

get parameter of denoise pad (TOUCH\_PAD\_NUM0).

参数 **denoise** –Pointer to parameter of denoise

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_denoise\_enable** (void)

enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_denoise\_disable** (void)

disable denoise function.

返回

- ESP\_OK Success

***esp\_err\_t* touch\_pad\_denoise\_read\_data** (uint32\_t \*data)

Get denoise measure value (TOUCH\_PAD\_NUM0).

参数 **data** –Pointer to receive denoise value

返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_set\_config** (const *touch\_pad\_waterproof\_t* \*waterproof)

set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH\_PAD\_NUM14) and a guard channel. Guard pad is used to detect the large area of water covering the touch panel. Shield pad is used to shield the influence of water droplets covering the touch panel. It is generally designed as a grid and is placed around the touch buttons.

参数 **waterproof** –parameter of waterproof  
返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_get\_config** (*touch\_pad\_waterproof\_t* \*waterproof)

get parameter of waterproof function.

参数 **waterproof** –parameter of waterproof  
返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_enable** (void)

Enable parameter of waterproof function. Should be called after function `touch_pad_waterproof_set_config`.

返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_disable** (void)

Disable parameter of waterproof function.

返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_proximity\_enable** (*touch\_pad\_t* touch\_num, bool enabled)

Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

---

备注: Supports up to three touch channels configured as proximity sensors.

---

参数

- **touch\_num** –touch pad index
- **enabled** –true: enable the proximity function; false: disable the proximity function

返回

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.
- ESP\_ERR\_NOT\_SUPPORTED: Don't support configured.

*esp\_err\_t* **touch\_pad\_proximity\_set\_count** (*touch\_pad\_t* touch\_num, uint32\_t count)

Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

---

备注: All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

---

参数

- **touch\_num** –Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- **count** –The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

返回

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.

*esp\_err\_t* **touch\_pad\_proximity\_get\_count** (*touch\_pad\_t* touch\_num, uint32\_t \*count)

Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**备注:** All proximity channels use the same count value. So please pass the parameter TOUCH\_PAD\_MAX.

---

**参数**

- **touch\_num** –Touch pad index. In this version, pass the parameter TOUCH\_PAD\_MAX.
- **count** –The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**返回**

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.

*esp\_err\_t* **touch\_pad\_proximity\_get\_data** (*touch\_pad\_t* touch\_num, uint32\_t \*measure\_out)

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

**参数**

- **touch\_num** –touch pad index
- **measure\_out** –If the accumulation process does not end, the measure\_out is the process value.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Touch num is not proximity

*esp\_err\_t* **touch\_pad\_sleep\_channel\_get\_info** (*touch\_pad\_sleep\_channel\_t* \*slp\_config)

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

---

**备注:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses touch\_pad\_sleep\_channel\_read\_data instead of touch\_pad\_read\_raw\_data to obtain the sleep channel reading.

---

**参数** **slp\_config** –touch sleep pad config.

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_enable** (*touch\_pad\_t* pad\_num, bool enable)

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

---

**备注:** ESP32S2 only support one sleep channel.

---

---

**备注:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses touch\_pad\_sleep\_channel\_read\_data instead of touch\_pad\_read\_raw\_data to obtain the sleep channel reading.

---

**参数**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **enable** –true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_enable\_proximity** (*touch\_pad\_t* pad\_num, bool enable)

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

---

**备注:** ESP32S2 only support one sleep channel.

---

**参数**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **enable** –true: enable proximity for sleep channel; false: disable proximity for sleep channel;

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_set\_threshold** (*touch\_pad\_t* pad\_num, uint32\_t touch\_thres)

Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

---

**备注:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

---

**参数**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch\_thres** –touch sleep pad threshold

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_get\_threshold** (*touch\_pad\_t* pad\_num, uint32\_t \*touch\_thres)

Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

---

**备注:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

---

**参数**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch\_thres** –touch sleep pad threshold

**返回**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_benchmark** (*touch\_pad\_t* pad\_num, uint32\_t \*benchmark)

Read benchmark of touch sensor sleep channel.

**参数**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **benchmark** –pointer to accept touch sensor benchmark value

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_smooth** (*touch\_pad\_t* pad\_num, uint32\_t \*smooth\_data)

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

#### 参数

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **smooth\_data** –pointer to accept touch sensor smoothed data

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_data** (*touch\_pad\_t* pad\_num, uint32\_t \*raw\_data)

Read raw data of touch sensor sleep channel.

#### 参数

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **raw\_data** –pointer to accept touch sensor raw data

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_reset\_benchmark** (void)

Reset benchmark of touch sensor sleep channel.

#### 返回

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_proximity\_cnt** (*touch\_pad\_t* pad\_num, uint32\_t \*proximity\_cnt)

Read proximity count of touch sensor sleep channel.

#### 参数

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **proximity\_cnt** –pointer to accept touch sensor proximity count value

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_set\_work\_time** (uint16\_t sleep\_cycle, uint16\_t meas\_times)

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

#### 参数

- **sleep\_cycle** –The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency)`. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.
- **meas\_times** –The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

#### 返回

- ESP\_OK Success

### Header File

- `components/driver/include/driver/touch_sensor_common.h`

**Functions*****esp\_err\_t touch\_pad\_init*** (void)

Initialize touch module.

---

**备注:** If default parameter don't match the usage scenario, it can be changed after this function.

---

**返回**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Touch pad init error
- ESP\_ERR\_NOT\_SUPPORTED Touch pad is providing current to external XTAL

***esp\_err\_t touch\_pad\_deinit*** (void)

Un-install touch pad driver.

---

**备注:** After this function is called, other touch functions are prohibited from being called.

---

**返回**

- ESP\_OK Success
- ESP\_FAIL Touch pad driver not initialized

***esp\_err\_t touch\_pad\_io\_init*** (*touch\_pad\_t* touch\_num)

Initialize touch pad GPIO.

**参数** *touch\_num* –touch pad index**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

***esp\_err\_t touch\_pad\_set\_voltage*** (*touch\_high\_volt\_t* refh, *touch\_low\_volt\_t* refl, *touch\_volt\_atten\_t* atten)

Set touch sensor high voltage threshold of charge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**参数**

- **refh** –the value of DREFH
- **refl** –the value of DREFL
- **atten** –the attenuation on DREFH

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

***esp\_err\_t touch\_pad\_get\_voltage*** (*touch\_high\_volt\_t* \*refh, *touch\_low\_volt\_t* \*refl, *touch\_volt\_atten\_t* \*atten)

Get touch sensor reference voltage,.

**参数**

- **refh** –pointer to accept DREFH value
- **refl** –pointer to accept DREFL value
- **atten** –pointer to accept the attenuation on DREFH

**返回**

- ESP\_OK on success

***esp\_err\_t touch\_pad\_set\_cnt\_mode*** (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* slope, *touch\_tie\_opt\_t* opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

---

**备注:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

---

**参数**

- **touch\_num** –touch pad index
- **slope** –touch pad charge/discharge speed
- **opt** –the initial voltage

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_cnt\_mode** (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* \*slope, *touch\_tie\_opt\_t* \*opt)

Get touch sensor charge/discharge speed for each pad.

**参数**

- **touch\_num** –touch pad index
- **slope** –pointer to accept touch pad charge/discharge slope
- **opt** –pointer to accept the initial voltage

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_isr\_deregister** (void (\*fn)(void\*), void \*arg)

Deregister the handler previously registered using touch\_pad\_isr\_handler\_register.

**参数**

- **fn** –handler function to call (as passed to touch\_pad\_isr\_handler\_register)
- **arg** –argument of the handler (as passed to touch\_pad\_isr\_handler\_register)

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if a handler matching both fn and arg isn't registered

*esp\_err\_t* **touch\_pad\_get\_wakeup\_status** (*touch\_pad\_t* \*pad\_num)

Get the touch pad which caused wakeup from deep sleep.

**参数** **pad\_num** –pointer to touch pad which caused wakeup

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_fsm\_mode** (*touch\_fsm\_mode\_t* mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**参数** **mode** –FSM mode

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_fsm\_mode** (*touch\_fsm\_mode\_t* \*mode)

Get touch sensor FSM mode.

**参数** **mode** –pointer to accept FSM mode

**返回**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_clear\_status** (void)

To clear the touch sensor channel active status.

---

**备注:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

---

**返回**

- ESP\_OK on success

uint32\_t **touch\_pad\_get\_status** (void)

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**返回**

- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

bool **touch\_pad\_meas\_is\_done** (void)

Check touch sensor measurement status.

**返回**

- True measurement is under way
- False measurement done

**GPIO 宏查找表** 用户可以使用宏定义某一触摸传感器通道的 GPIO, 或定义某一 GPIO 的通道。例如:

1. TOUCH\_PAD\_NUM5\_GPIO\_NUM 定义了通道 5 的 GPIO (即 GPIO 12);
2. TOUCH\_PAD\_GPIO4\_CHANNEL 定义了 GPIO 4 的通道 (即通道 0)。

### Structures

struct **touch\_pad\_denoise**

Touch sensor denoise configuration

## Public Members

### *touch\_pad\_denoise\_grade\_t* **grade**

Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

### *touch\_pad\_denoise\_cap\_t* **cap\_level**

Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use `touch_pad_denoise_read_data` to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct **touch\_pad\_waterproof**

Touch sensor waterproof configuration

## Public Members

### *touch\_pad\_t* **guard\_ring\_pad**

Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

### *touch\_pad\_shield\_driver\_t* **shield\_driver**

Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel(Touch0).

struct **touch\_filter\_config**

Touch sensor filter configuration

## Public Members

### *touch\_filter\_mode\_t* **mode**

Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

uint32\_t **debounce\_cnt**

Set debounce count, such as  $n$ . If the measured values continue to exceed the threshold for  $n+1$  times, the touch sensor state changes. Range: 0 ~ 7

uint32\_t **noise\_thr**

Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient \* touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;

uint32\_t **jitter\_step**

Set jitter filter step size. Range: 0 ~ 15

### *touch\_smooth\_mode\_t* **smh\_lvl**

Level of filter applied on the original data against large noise interference.

struct **touch\_pad\_sleep\_channel\_t**  
Touch sensor channel sleep configuration

### Public Members

*touch\_pad\_t* **touch\_num**

Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode. If clear the sleep channel, point this pad to TOUCH\_PAD\_NUM0

bool **en\_proximity**  
enable proximity function for sleep pad

### Macros

**TOUCH\_PAD\_BIT\_MASK\_ALL**

**TOUCH\_PAD\_SLOPE\_DEFAULT**

**TOUCH\_PAD\_TIE\_OPT\_DEFAULT**

**TOUCH\_PAD\_BIT\_MASK\_MAX**

**TOUCH\_PAD\_HIGH\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_LOW\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_ATTEN\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_IDLE\_CH\_CONNECT\_DEFAULT**

**TOUCH\_PAD\_THRESHOLD\_MAX**

If set touch threshold max value, The touch sensor can't be in touched status

**TOUCH\_PAD\_SLEEP\_CYCLE\_DEFAULT**

Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**备注:** The greater the duty cycle of the measurement time, the more system power is consumed. The number of sleep cycle in each measure process of touch channels. The timer frequency is RTC\_SLOW\_CLK (can be 150k or 32k depending on the options). Range: 0 ~ 0xffff

---

**TOUCH\_PAD\_MEASURE\_CYCLE\_DEFAULT**

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

**TOUCH\_PAD\_INTR\_MASK\_ALL**

All touch interrupt type enable.

**TOUCH\_PROXIMITY\_MEAS\_NUM\_MAX**

Touch sensor proximity detection configuration

**TOUCH\_DEBOUNCE\_CNT\_MAX****TOUCH\_NOISE\_THR\_MAX****TOUCH\_JITTER\_STEP\_MAX****Type Definitions**typedef struct *touch\_pad\_denoise* **touch\_pad\_denoise\_t**

Touch sensor denoise configuration

typedef struct *touch\_pad\_waterproof* **touch\_pad\_waterproof\_t**

Touch sensor waterproof configuration

typedef struct *touch\_filter\_config* **touch\_filter\_config\_t**

Touch sensor filter configuration

**Enumerations**enum **touch\_pad\_t**

Touch pad channel

*Values:*enumerator **TOUCH\_PAD\_NUM0**

Touch pad channel 0 is GPIO4(ESP32)

enumerator **TOUCH\_PAD\_NUM1**

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM2**

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM3**

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM4**

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM5**

Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM6**

Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM7**

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM8**

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM9**

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM10**

Touch channel 10 is GPIO10(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM11**

Touch channel 11 is GPIO11(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM12**

Touch channel 12 is GPIO12(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM13**

Touch channel 13 is GPIO13(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM14**

Touch channel 14 is GPIO14(ESP32-S2)

enumerator **TOUCH\_PAD\_MAX**

enum **touch\_high\_volt\_t**

Touch sensor high reference voltage

*Values:*

enumerator **TOUCH\_HVOLT\_KEEP**

Touch sensor high reference voltage, no change

enumerator **TOUCH\_HVOLT\_2V4**

Touch sensor high reference voltage, 2.4V

enumerator **TOUCH\_HVOLT\_2V5**

Touch sensor high reference voltage, 2.5V

enumerator **TOUCH\_HVOLT\_2V6**

Touch sensor high reference voltage, 2.6V

enumerator **TOUCH\_HVOLT\_2V7**

Touch sensor high reference voltage, 2.7V

enumerator **TOUCH\_HVOLT\_MAX**

enum **touch\_low\_volt\_t**

Touch sensor low reference voltage

*Values:*

enumerator **TOUCH\_LVOLT\_KEEP**  
Touch sensor low reference voltage, no change

enumerator **TOUCH\_LVOLT\_0V5**  
Touch sensor low reference voltage, 0.5V

enumerator **TOUCH\_LVOLT\_0V6**  
Touch sensor low reference voltage, 0.6V

enumerator **TOUCH\_LVOLT\_0V7**  
Touch sensor low reference voltage, 0.7V

enumerator **TOUCH\_LVOLT\_0V8**  
Touch sensor low reference voltage, 0.8V

enumerator **TOUCH\_LVOLT\_MAX**

enum **touch\_volt\_atten\_t**  
Touch sensor high reference voltage attenuation

*Values:*

enumerator **TOUCH\_HVOLT\_ATTEN\_KEEP**  
Touch sensor high reference voltage attenuation, no change

enumerator **TOUCH\_HVOLT\_ATTEN\_1V5**  
Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_1V**  
Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V5**  
Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V**  
Touch sensor high reference voltage attenuation, 0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_MAX**

enum **touch\_cnt\_slope\_t**  
Touch sensor charge/discharge speed

*Values:*

enumerator **TOUCH\_PAD\_SLOPE\_0**  
Touch sensor charge / discharge speed, always zero

enumerator **TOUCH\_PAD\_SLOPE\_1**  
Touch sensor charge / discharge speed, slowest

enumerator **TOUCH\_PAD\_SLOPE\_2**  
Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_3**  
Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_4**  
Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_5**  
Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_6**  
Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_7**  
Touch sensor charge / discharge speed, fast

enumerator **TOUCH\_PAD\_SLOPE\_MAX**

enum **touch\_tie\_opt\_t**  
Touch sensor initial charge level

*Values:*

enumerator **TOUCH\_PAD\_TIE\_OPT\_LOW**  
Initial level of charging voltage, low level

enumerator **TOUCH\_PAD\_TIE\_OPT\_HIGH**  
Initial level of charging voltage, high level

enumerator **TOUCH\_PAD\_TIE\_OPT\_MAX**

enum **touch\_fsm\_mode\_t**  
Touch sensor FSM mode

*Values:*

enumerator **TOUCH\_FSM\_MODE\_TIMER**  
To start touch FSM by timer

enumerator **TOUCH\_FSM\_MODE\_SW**  
To start touch FSM by software trigger

enumerator **TOUCH\_FSM\_MODE\_MAX**

enum **touch\_trigger\_mode\_t**  
*Values:*

enumerator **TOUCH\_TRIGGER\_BELOW**

Touch interrupt will happen if counter value is less than threshold.

enumerator **TOUCH\_TRIGGER\_ABOVE**

Touch interrupt will happen if counter value is larger than threshold.

enumerator **TOUCH\_TRIGGER\_MAX**

enum **touch\_trigger\_src\_t**

*Values:*

enumerator **TOUCH\_TRIGGER\_SOURCE\_BOTH**

wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator **TOUCH\_TRIGGER\_SOURCE\_SET1**

wakeup interrupt is generated if SET1 is “touched”

enumerator **TOUCH\_TRIGGER\_SOURCE\_MAX**

enum **touch\_pad\_intr\_mask\_t**

*Values:*

enumerator **TOUCH\_PAD\_INTR\_MASK\_DONE**

Measurement done for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_ACTIVE**

Active for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_INACTIVE**

Inactive for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_SCAN\_DONE**

Measurement done for all the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_TIMEOUT**

Timeout for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_PROXI\_MEAS\_DONE**

For proximity sensor, when the number of measurements reaches the set count of measurements, an interrupt will be generated.

enum **touch\_pad\_denoise\_grade\_t**

*Values:*

enumerator **TOUCH\_PAD\_DENOISE\_BIT12**

Denoise range is 12bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT10**

Denoise range is 10bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT8**

Denoise range is 8bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT4**

Denoise range is 4bit

enumerator **TOUCH\_PAD\_DENOISE\_MAX**

enum **touch\_pad\_denoise\_cap\_t**

*Values:*

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L0**

Denoise channel internal reference capacitance is 5pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L1**

Denoise channel internal reference capacitance is 6.4pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L2**

Denoise channel internal reference capacitance is 7.8pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L3**

Denoise channel internal reference capacitance is 9.2pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L4**

Denoise channel internal reference capacitance is 10.6pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L5**

Denoise channel internal reference capacitance is 12.0pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L6**

Denoise channel internal reference capacitance is 13.4pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L7**

Denoise channel internal reference capacitance is 14.8pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_MAX**

enum **touch\_pad\_shield\_driver\_t**

Touch sensor shield channel drive capability level

*Values:*

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L0**

The max equivalent capacitance in shield channel is 40pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L1**

The max equivalent capacitance in shield channel is 80pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L2**

The max equivalent capacitance in shield channel is 120pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L3**

The max equivalent capacitance in shield channel is 160pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L4**

The max equivalent capacitance in shield channel is 200pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L5**

The max equivalent capacitance in shield channel is 240pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L6**

The max equivalent capacitance in shield channel is 280pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L7**

The max equivalent capacitance in shield channel is 320pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_MAX**

enum **touch\_pad\_conn\_type\_t**

Touch channel idle state configuration

*Values:*

enumerator **TOUCH\_PAD\_CONN\_HIGHZ**

Idle status of touch channel is high resistance state

enumerator **TOUCH\_PAD\_CONN\_GND**

Idle status of touch channel is ground connection

enumerator **TOUCH\_PAD\_CONN\_MAX**

enum **touch\_filter\_mode\_t**

Touch channel IIR filter coefficient configuration.

---

**备注:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_16`.

---

*Values:*

enumerator **TOUCH\_PAD\_FILTER\_IIR\_4**

The filter mode is first-order IIR filter. The coefficient is 4.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_8**

The filter mode is first-order IIR filter. The coefficient is 8.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_16**

The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

enumerator **TOUCH\_PAD\_FILTER\_IIR\_32**

The filter mode is first-order IIR filter. The coefficient is 32.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_64**

The filter mode is first-order IIR filter. The coefficient is 64.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_128**

The filter mode is first-order IIR filter. The coefficient is 128.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_256**

The filter mode is first-order IIR filter. The coefficient is 256.

enumerator **TOUCH\_PAD\_FILTER\_JITTER**

The filter mode is jitter filter

enumerator **TOUCH\_PAD\_FILTER\_MAX**

enum **touch\_smooth\_mode\_t**

Level of filter applied on the original data against large noise interference.

---

**备注:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_2`.

---

*Values:*

enumerator **TOUCH\_PAD\_SMOOTH\_OFF**

No filtering of raw data.

enumerator **TOUCH\_PAD\_SMOOTH\_IIR\_2**

Filter the raw data. The coefficient is 2 (Typical value).

enumerator **TOUCH\_PAD\_SMOOTH\_IIR\_4**

Filter the raw data. The coefficient is 4.

enumerator **TOUCH\_PAD\_SMOOTH\_IIR\_8**

Filter the raw data. The coefficient is 8.

enumerator **TOUCH\_PAD\_SMOOTH\_MAX**

### 2.3.22 Two-Wire Automotive Interface (TWAI)

#### Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format

(11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S3's peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

**警告:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. [TWAI Protocol Summary](#)
2. [Signals Lines and Transceiver](#)
3. [Driver Configuration](#)
4. [Driver Operation](#)
5. [Examples](#)

## TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

### Signals Lines and Transceiver

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-S3's GPIO pads.

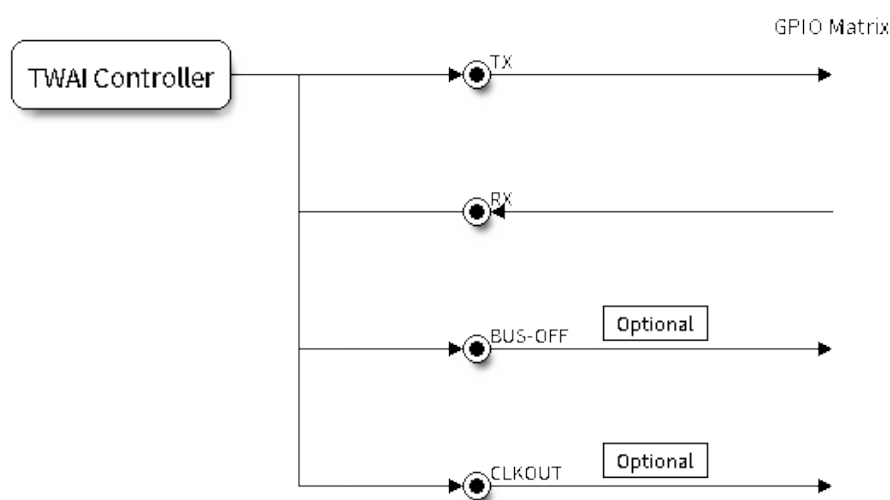

图 16: Signal lines of the TWAI controller

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock (APB Clock).

**备注:** An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

### Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

表 4: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

**备注:** The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI\_ALERT\_ABOVE\_ERR\_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI\_ALERT\_BELOW\_ERR\_WARN is raised when both TEC and REC return back to values below **96**.

**备注:** When enabling alerts, the TWAI\_ALERT\_AND\_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI\_ALERT\_AND\_LOG if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

**备注:** The TWAI\_ALERT\_ALL and TWAI\_ALERT\_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined

by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32-S3, the `brp` can be **any even number from 2 to 128**.

图 17: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

---

**备注:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

---

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`
- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`
- `TWAI_TIMING_CONFIG_10KBITS()`
- `TWAI_TIMING_CONFIG_5KBITS()`
- `TWAI_TIMING_CONFIG_1KBITS()`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which

bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 18: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 19: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**备注:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

## Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

图 20: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

**Driver States** **Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```
#include "driver/twai.h"

...
```

(下页继续)

(续上页)

```

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

```

(下页继续)

```

}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

**Application Examples** **Network Example:** The TWAI Network example demonstrates communication between two ESP32-S3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai\\_self\\_test](#).

## API Reference

### Header File

- [components/hal/include/hal/twai\\_types.h](#)

### Structures

struct **twai\_message\_t**

Structure to store a TWAI message.

---

备注: The flags member is deprecated

---

### Public Members

uint32\_t **extd**

Extended Frame Format (29bit ID)

uint32\_t **rtr**

Message is a Remote Frame

uint32\_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32\_t **reserved**

Reserved bits

uint32\_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32\_t **identifier**

11 or 29 bit identifier

uint8\_t **data\_length\_code**

Data length code

uint8\_t **data**[8]

Data bytes (not relevant in RTR frame)

struct **twai\_timing\_config\_t**

Structure for bit timing configuration of the TWAI driver.

---

备注: Macro initializers are available for this structure

---

### Public Members

uint32\_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8\_t **tseg\_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8\_t **tseg\_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8\_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple\_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai\_filter\_config\_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

备注: Macro initializers are available for this structure

---

### Public Members

uint32\_t **acceptance\_code**

32-bit acceptance code

uint32\_t **acceptance\_mask**

32-bit acceptance mask

bool **single\_filter**

Use Single Filter Mode (see documentation)

### Macros

**TWAI\_EXTD\_ID\_MASK**

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI\_STD\_ID\_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI\_FRAME\_MAX\_DLC**

Max data bytes allowed in TWAI

**TWAI\_FRAME\_EXTD\_ID\_LEN\_BYTES**

EFF ID requires 4 bytes (29bit)

**TWAI\_FRAME\_STD\_ID\_LEN\_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI\_ERR\_PASS\_THRESH**

Error counter threshold for error passive

**Enumerations**enum **twai\_mode\_t**

TWAI Controller operating modes.

*Values:*

enumerator **TWAI\_MODE\_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI\_MODE\_NO\_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI\_MODE\_LISTEN\_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**Header File**

- [components/driver/include/driver/twai.h](#)

**Functions**

*esp\_err\_t* **twai\_driver\_install** (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

---

**备注:** Macro initializers are available for the configuration structures (see documentation)

---

---

**备注:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

---

**参数**

- **g\_config** –[in] General configuration structure
- **t\_config** –[in] Timing configuration structure
- **f\_config** –[in] Filter configuration structure

**返回**

- ESP\_OK: Successfully installed TWAI driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

***esp\_err\_t twai\_driver\_uninstall*** (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**警告:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**返回**

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

***esp\_err\_t twai\_start*** (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**返回**

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

***esp\_err\_t twai\_stop*** (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**警告:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**返回**

- ESP\_OK: TWAI driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

***esp\_err\_t twai\_transmit*** (const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

---

**备注:** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

---

---

**备注:** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

---

**参数**

- **message** –[in] Message to transmit
- **ticks\_to\_wait** –[in] Number of FreeRTOS ticks to block on the TX queue

**返回**

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_receive* (*twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**警告:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**参数**

- **message** –[out] Received message
- **ticks\_to\_wait** –[in] Number of FreeRTOS ticks to block on RX queue

**返回**

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts* (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

---

**备注:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

---

**参数**

- **alerts** –[out] Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** –[in] Number of FreeRTOS ticks to block for alert

**返回**

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts* (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**参数**

- **alerts\_enabled** –[in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** –[out] Bit field of currently raised alerts. Set to NULL if unused

**返回**

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* **twai\_initiate\_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

---

**备注:** The BUS\_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

---

**返回**

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_get\_status\_info** (*twai\_status\_info\_t* \*status\_info)

Get current status information of the TWAI driver.

**参数** *status\_info* –[out] Status information

**返回**

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* **twai\_clear\_transmit\_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

---

**备注:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

---

**返回**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t* **twai\_clear\_receive\_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

---

**备注:** The receive queue is automatically cleared when `twai_start()` is called.

---

**返回**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

## Structures

struct **twai\_general\_config\_t**

Structure for general configuration of the TWAI driver.

---

备注: Macro initializers are available for this structure

---

### Public Members

#### *twai\_mode\_t* mode

Mode of TWAI controller

#### *gpio\_num\_t* tx\_io

Transmit GPIO number

#### *gpio\_num\_t* rx\_io

Receive GPIO number

#### *gpio\_num\_t* clkout\_io

CLKOUT GPIO number (optional, set to -1 if unused)

#### *gpio\_num\_t* bus\_off\_io

Bus off indicator GPIO number (optional, set to -1 if unused)

#### uint32\_t tx\_queue\_len

Number of messages TX queue can hold (set to 0 to disable TX Queue)

#### uint32\_t rx\_queue\_len

Number of messages RX queue can hold

#### uint32\_t alerts\_enabled

Bit field of alerts to enable (see documentation)

#### uint32\_t clkout\_divider

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

#### int intr\_flags

Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP\_INTR\_FLAG\_IRAM, the CONFIG\_TWAI\_ISR\_IN\_IRAM option should be enabled first.

#### struct twai\_status\_info\_t

Structure to store status information of TWAI driver.

### Public Members

#### *twai\_state\_t* state

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

#### uint32\_t msgs\_to\_tx

Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**

Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**

Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**

Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**

Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t **rx\_overrun\_count**

Number of messages that were lost due to a RX FIFO overrun

uint32\_t **arb\_lost\_count**

Number of instances arbitration was lost

uint32\_t **bus\_error\_count**

Number of instances a bus error has occurred

## Macros

**TWAI\_IO\_UNUSED**

Marks GPIO as unused in TWAI configuration

## Enumerations

enum **twai\_state\_t**

TWAI driver states.

*Values:*

enumerator **TWAI\_STATE\_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI\_STATE\_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI\_STATE\_BUS\_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI\_STATE\_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

### 2.3.23 Universal Asynchronous Receiver/Transmitter (UART)

#### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-S3 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

#### Functional Overview

The following overview describes how to establish communication between an ESP32-S3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32-S3's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart\\_echo](#).

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

表 5: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-S3 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling

`uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the 'pattern') added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

## Overview of RS485 specific communication options

---

**备注:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-S3 Technical Reference Manual > UART Controller (UART) > Register Summary* [PDF]. Use the register name to navigate to the register description and then find the field/bit.

---

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S3's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted

datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-S3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32-S3's RS485 interface connection.

#### 备注:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

#### Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

#### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

(下页继续)

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32-S3 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## API Reference

### Header File

- [components/driver/include/driver/uart.h](#)

### Functions

*esp\_err\_t* **uart\_driver\_install** (*uart\_port\_t* uart\_num, int rx\_buffer\_size, int tx\_buffer\_size, int queue\_size, *QueueHandle\_t* \*uart\_queue, int intr\_alloc\_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**备注:** Rx\_buffer\_size should be greater than UART\_FIFO\_LEN. Tx\_buffer\_size should be either zero or greater than UART\_FIFO\_LEN.

---

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **rx\_buffer\_size** –UART RX ring buffer size.
- **tx\_buffer\_size** –UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue\_size** –UART event queue size/depth.
- **uart\_queue** –UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

`bool uart_is_driver_installed (uart_port_t uart_num)`

Checks whether the driver is installed or not.

**参数** `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- true driver is installed
- false driver is not installed

`esp_err_t uart_set_word_length (uart_port_t uart_num, uart_word_length_t data_bit)`

Set UART data bits.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit` –UART data bits

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

`esp_err_t uart_get_word_length (uart_port_t uart_num, uart_word_length_t *data_bit)`

Get the UART data bit configuration.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit` –Pointer to accept value of UART data bits.

**返回**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

`esp_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)`

Set UART stop bits.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits` –UART stop bits

**返回**

- ESP\_OK Success
- ESP\_FAIL Fail

`esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)`

Get the UART stop bit configuration.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits` –Pointer to accept value of UART stop bits.

**返回**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

`esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)`

Set UART parity mode.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `parity_mode` –the enum of uart parity configuration

**返回**

- ESP\_FAIL Parameter error
- ESP\_OK Success

`esp_err_t uart_get_parity (uart_port_t uart_num, uart_parity_t *parity_mode)`

Get the UART parity mode configuration.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).

- **parity\_mode** –Pointer to accept value of UART parity mode.
- 返回

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** –UART baud rate.

返回

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** –Pointer to accept value of UART baud rate

返回

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*baudrate)

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **inverse\_mask** –Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** –Hardware flow control mode
- **rx\_thresh** –Threshold of Hardware RX flow control (0 ~ UART\_FIFO\_LEN). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the rx\_thresh value be set.

返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

参数

- **uart\_num** –UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **enable** –switch on or off
- **rx\_thresh\_xon** –low water mark
- **rx\_thresh\_xoff** –high water mark

返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** –Option for different flow control mode.

**返回**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** –Bit mask of the interrupt status to be cleared.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** –Bit mask of the enable bits.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **disable\_mask** –Bit mask of the disable bits.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TXFIFO\_EMPTY INTERRUPT)

**参数** **uart\_num** –UART port number

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TXFIFO\_EMPTY INTERRUPT)

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** –1: enable; 0: disable
- **thresh** –Threshold of TX interrupt, 0 ~ UART\_FIFO\_LEN

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_isr\_register** (*uart\_port\_t* uart\_num, void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *uart\_isr\_handle\_t* \*handle)

Register UART interrupt handler (ISR).

---

**备注:** UART ISR handler will be attached to the same CPU core that this function is running on.

---

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **fn** –Interrupt handler function.
- **arg** –parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_isr\_free** (*uart\_port\_t* uart\_num)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**备注:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0' s default TX pin and GPIO3 is UART0' s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

---

**备注:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

---

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

- **tx\_io\_num** –UART TX pin GPIO number.
- **rx\_io\_num** –UART RX pin GPIO number.
- **rts\_io\_num** –UART RTS pin GPIO number.
- **cts\_io\_num** –UART CTS pin GPIO number.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**备注:** UART must be configured with hardware flow control disabled.

---

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** –1: RTS output low (active); 0: RTS output high (block)

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** –1: DTR output low; 0: DTR output high

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_tx\_idle\_num** (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **idle\_num** –idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** –UART parameter settings

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** –UART interrupt settings

**返回**

- ESP\_OK Success

- ESP\_FAIL Parameter error

`esp_err_t uart_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)`

Wait until UART TX FIFO is empty.

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** –Timeout, count in RTOS ticks

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int `uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)`

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

**备注:** This function should only be used when UART TX buffer is not enabled.

---

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** –data buffer address
- **len** –data length to send

#### 返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int `uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)`

Send data to the UART port from a given buffer and length,.

If the UART driver' s parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** –data buffer address
- **size** –data length to send

#### 返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int `uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)`

Send data to the UART port from a given buffer and length,.

If the UART driver' s parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

#### 参数

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** –data buffer address
- **size** –data length to send
- **brk\_len** –break signal duration(unit: the time it takes to send one bit at current baudrate)

**返回**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** –pointer to the buffer.
- **length** –data length
- **ticks\_to\_wait** –sTimeout, count in RTOS ticks

**返回**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**备注:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**备注:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get RX ring buffer cached data length.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** –Pointer of `size_t` to accept cached data length

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get TX ring buffer free space size.

**参数**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** –Pointer of `size_t` to accept the free space size

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, char pattern\_chr, uint8\_t chr\_num, int chr\_tout, int post\_idle, int pre\_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**参数**

- **uart\_num** –UART port number.
- **pattern\_chr** –character of the pattern.
- **chr\_num** –number of the character, 8bit value.
- **chr\_tout** –timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at\_cmd char.
- **post\_idle** –idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at\_cmd char
- **pre\_idle** –idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**备注:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**参数** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart\_pattern\_get\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**备注:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**参数** `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

*esp\_err\_t* `uart_pattern_queue_reset` (*uart\_port\_t* uart\_num, int queue\_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**参数**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `queue_length` –Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**返回**

- ESP\_ERR\_NO\_MEM No enough memory
- ESP\_ERR\_INVALID\_STATE Driver not installed
- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* `uart_set_mode` (*uart\_port\_t* uart\_num, *uart\_mode\_t* mode)

UART set communication mode.

---

**备注:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

**参数**

- `uart_num` –Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `mode` –UART UART mode to set

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* `uart_set_rx_full_threshold` (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold value for RX fifo full.

---

**备注:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

**参数**

- `uart_num` –UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- `threshold` –Threshold value above which RX fifo full interrupt is generated

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* `uart_set_tx_empty_threshold` (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold values for TX fifo empty.

**参数**

- `uart_num` –UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2

- **threshold** –Threshold value below which TX fifo empty interrupt is generated
- 返回
- ESP\_OK Success
  - ESP\_ERR\_INVALID\_ARG Parameter error
  - ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* uart\_num, const uint8\_t tout\_thresh)

UART set threshold timeout for TOUT feature.

#### 参数

- **uart\_num** –Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** –This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout\_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If tout\_thresh == 0, the TOUT feature is disabled.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* uart\_num, bool \*collision\_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision\_flag. \*collision\_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

#### 参数

- **uart\_num** –Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** –Pointer to variable of type bool to return collision flag.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int wakeup\_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup\_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF\_TICK as UART clock source, by setting use\_ref\_tick field in *uart\_config\_t* to true.

---

**备注:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as function\_1 to wake up UART0, GPIO9 should be configured as function\_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

---

#### 参数

- **uart\_num** –UART number, the max port number is (UART\_NUM\_MAX -1).
- **wakeup\_threshold** –number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

#### 返回

- ESP\_OK on success

- `ESP_ERR_INVALID_ARG` if `uart_num` is incorrect or `wakeup_threshold` is outside of `[3, 0x3ff]` range.

*esp\_err\_t* `uart_get_wakeup_threshold` (*uart\_port\_t* `uart_num`, int \*`out_wakeup_threshold`)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

#### 参数

- `uart_num` –UART number, the max port number is `(UART_NUM_MAX -1)`.
- `out_wakeup_threshold` –[out] output, set to the current value of wakeup threshold for the given UART.

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `out_wakeup_threshold` is `NULL`

*esp\_err\_t* `uart_wait_tx_idle_polling` (*uart\_port\_t* `uart_num`)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

参数 `uart_num` –UART number

*esp\_err\_t* `uart_set_loop_back` (*uart\_port\_t* `uart_num`, bool `loop_back_en`)

Configure TX signal loop back to RX module, just for the test usage.

•

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

#### 参数

- `uart_num` –UART number
- `loop_back_en` –Set ture to enable the loop back function, else set it false.

void `uart_set_always_rx_timeout` (*uart\_port\_t* `uart_num`, bool `always_rx_timeout_en`)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

#### 参数

- `uart_num` –UART number
- `always_rx_timeout_en` –Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

## Structures

struct `uart_intr_config_t`

UART interrupt configuration parameters for `uart_intr_config` function.

### Public Members

`uint32_t intr_enable_mask`

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

`uint8_t rxfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.

### Public Members

`uart_event_type_t` type

UART event type

`size_t` size

UART data size for `UART_DATA` event

bool `timeout_flag`

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

### Macros

`UART_NUM_0`

UART port 0

`UART_NUM_1`

UART port 1

`UART_NUM_2`

UART port 2

`UART_NUM_MAX`

UART port max

`UART_PIN_NO_CHANGE`

`UART_FIFO_LEN`

Length of the UART HW FIFO.

**UART\_BITRATE\_MAX**

Maximum configurable bitrate.

**Type Definitions**

```
typedef intr_handle_t uart_isr_handle_t
```

**Enumerations**

```
enum uart_event_type_t
```

UART event types used in the ring buffer.

*Values:*

```
enumerator UART_DATA
```

UART data event

```
enumerator UART_BREAK
```

UART break event

```
enumerator UART_BUFFER_FULL
```

UART RX buffer full event

```
enumerator UART_FIFO_OVF
```

UART FIFO overflow event

```
enumerator UART_FRAME_ERR
```

UART RX frame error event

```
enumerator UART_PARITY_ERR
```

UART RX parity event

```
enumerator UART_DATA_BREAK
```

UART TX data and break event

```
enumerator UART_PATTERN_DET
```

UART pattern detected

```
enumerator UART_EVENT_MAX
```

UART event max index

**Header File**

- [components/hal/include/hal/uart\\_types.h](#)

**Structures**

```
struct uart_at_cmd_t
```

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

**Public Members****uint8\_t cmd\_char**

UART AT cmd char

**uint8\_t char\_num**

AT cmd char repeat number

**uint32\_t gap\_tout**

gap time(in baud-rate) between AT cmd char

**uint32\_t pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

**uint32\_t post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

**Public Members****uint8\_t xon\_char**

Xon flow control char

**uint8\_t xoff\_char**

Xoff flow control char

**uint8\_t xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

**uint8\_t xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

struct **uart\_config\_t**

UART configuration parameters for uart\_param\_config function.

**Public Members****int baud\_rate**

UART baud rate

***uart\_word\_length\_t* data\_bits**

UART byte size

*uart\_parity\_t* **parity**

UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

bool **use\_ref\_tick**

Deprecated method to select ref tick clock source, set `source_clk` field instead

### Type Definitions

typedef int **uart\_port\_t**

UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX - 1)`.

### Enumerations

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**  
enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**  
enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**  
enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**  
Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**  
inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**  
inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**  
inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**  
inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**  
inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**  
inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**  
inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**  
inverse the UART dtr signal

enum **uart\_sclk\_t**

UART source clock.

*Values:*

enumerator **UART\_SCLK\_APB**  
UART source clock from APB

enumerator **UART\_SCLK\_RTC**

UART source clock from RTC

enumerator **UART\_SCLK\_XTAL**

UART source clock from XTAL

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

---

**备注:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is `UART_NUM_0`). Similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### 2.3.24 USB Device Driver

#### Overview

The driver allows users to use ESP32-S3 chips to develop USB devices on top the TinyUSB stack. TinyUSB is integrating with ESP-IDF to provide USB features of the framework. Using this driver the chip works as a composite device supporting to represent several USB devices simultaneously. Currently, only the communications device class (CDC) type of the device with the ACM (Abstract Control Model) subclass is supported.

#### Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output through USB Serial Device

## Hardware USB Connection

- Any board with the ESP32-S3 chip with USB connectors or with exposed USB's D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g. with do-it-yourself cable from any USB connection cable).

On ESP32-S3, connect GPIO 20 and 19 to D+/D- respectively:

## Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Encapsulated driver's task servicing the TinyUSB

## Configuration

Via Menuconfig options you can specify:

- Several of descriptor's parameters (see: Descriptors Configuration below)
- USB Serial low-level Configuration
- The verbosity of the TinyUSB's log
- Disable the TinyUSB main task (for the custom implementation)

**Descriptors Configuration** The driver's descriptors are provided by the `tinyusb_config_t` structure's `descriptor` and `string_descriptor` members. Therefore, users should initialize `tinyusb_config_t` to their desired descriptor before calling `tinyusb_driver_install()` to install driver.

However, the driver also provides a default descriptor. The driver can be installed with the default descriptor by setting the `descriptor` and `string_descriptor` members of `tinyusb_config_t` to `NULL` before calling `tinyusb_driver_install()`. The driver's default descriptor is specified using Menuconfig, where the following fields should be configured:

- PID
- VID
- bcdDevice
- Manufacturer
- Product name

- Name of CDC device if it is On
- Serial number

If you want to use own descriptors with extended modification, you can define them during the driver installation process

### Install Driver

To initialize the driver, users should call `tinyusb_driver_install()`. The driver's configuration is specified in a `tinyusb_config_t` structure that is passed as an argument to `tinyusb_driver_install()`.

Note that the `tinyusb_config_t` structure can be zero initialized (e.g. `tinyusb_config_t tusb_cfg = { 0 }`) or partially (as shown below). For any member that is initialized to 0 or `NULL`, the driver will use its default configuration values for that member (see example below)

```
tinyusb_config_t partial_init = {
    .descriptor = NULL;           //Uses default descriptor specified in Menuconfig
    .string_descriptor = NULL;   //Uses default string specified in Menuconfig
    .external_phy = false;
}
```

### USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device could be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).

```
tinyusb_config_cdcacm_t amc_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&amc_cfg);
```

To specify callbacks you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

**USB Serial Console** The driver allows to redirect all standard application strings (stdin/out/err) to the USB Serial Device and return them to UART using `esp_tusb_init_console()/esp_tusb_deinit_console()` functions.

### Application Examples

The table below describes the code examples available in the directory `peripherals/usb/`.

Code Example	Description
<a href="#">peripherals/usb/tusb_console</a>	How to set up ESP32-S3 chip to get log output via Serial Device connection
<a href="#">peripherals/usb/tusb_sample_descriptor</a>	How to set up ESP32-S3 chip to work as a Generic USB Device with a user-defined descriptor
<a href="#">peripherals/usb/tusb_serial_device</a>	How to set up ESP32-S3 chip to work as a USB Serial Device

## API Reference

### Header File

- `components/tinyusb/additions/include/tinyusb.h`

### Functions

`esp_err_t tinyusb_driver_install` (const `tinyusb_config_t` \*config)

This is an all-in-one helper function, including:

- USB device driver initialization
- Descriptors preparation
- TinyUSB stack initialization
- Creates and start a task to handle usb events

---

**备注:** Don't change Custom descriptor, but if it has to be done, Suggest to define as follows in order to match the Interface Association Descriptor (IAD): `bDeviceClass = TUSB_CLASS_MISC`, `bDeviceSubClass = MISC_SUBCLASS_COMMON`,

---

**参数** `config` –tinyusb stack specific configuration

**返回值**

- **ESP\_ERR\_INVALID\_ARG** –Install driver and tinyusb stack failed because of invalid argument
- **ESP\_FAIL** –Install driver and tinyusb stack failed because of internal error
- **ESP\_OK** –Install driver and tinyusb stack successfully

### Structures

struct `tinyusb_config_t`

Configuration structure of the tinyUSB core.

#### Public Members

`tusb_desc_device_t` \***descriptor**

Pointer to a device descriptor

const char \*\***string\_descriptor**

Pointer to an array of string descriptors

bool **external\_phy**

Should USB use an external PHY

### Header File

- `components/tinyusb/additions/include/tinyusb_types.h`

### Macros

**USB\_ESPRESSIF\_VID**

**USB\_STRING\_DESCRIPTOR\_ARRAY\_SIZE**

## Type Definitions

```
typedef const char *tusb_desc_strarray_device_t[7]
```

## Enumerations

```
enum tinyusb_usbdev_t
```

Values:

```
enumerator TINYUSB_USBDEV_0
```

## Header File

- `components/tinyusb/additions/include/tusb_cdc_acm.h`

## Functions

```
esp_err_t tusb_cdc_acm_init (const tinyusb_config_cdcacm_t *cfg)
```

Initialize CDC ACM. Initialization will be finished with the `tud_cdc_line_state_cb` callback.

参数 **cfg** -- init configuration structure

返回 *esp\_err\_t*

```
esp_err_t tinyusb_cdcacm_register_callback (tinyusb_cdcacm_itf_t itf, cdcacm_event_type_t event_type, tusb_cdcacm_callback_t callback)
```

Register a callback invoking on CDC event. If the callback had been already registered, it will be overwritten.

参数

- **itf** -- number of a CDC object
- **event\_type** -- type of registered event for a callback
- **callback** -- callback function

返回 *esp\_err\_t* - ESP\_OK or ESP\_ERR\_INVALID\_ARG

```
esp_err_t tinyusb_cdcacm_unregister_callback (tinyusb_cdcacm_itf_t itf, cdcacm_event_type_t event_type)
```

Unregister a callback invoking on CDC event.

参数

- **itf** -- number of a CDC object
- **event\_type** -- type of registered event for a callback

返回 *esp\_err\_t* - ESP\_OK or ESP\_ERR\_INVALID\_ARG

```
size_t tinyusb_cdcacm_write_queue_char (tinyusb_cdcacm_itf_t itf, char ch)
```

Sent one character to a write buffer.

参数

- **itf** -- number of a CDC object
- **ch** -- character to send

返回 *size\_t* - amount of queued bytes

```
size_t tinyusb_cdcacm_write_queue (tinyusb_cdcacm_itf_t itf, const uint8_t *in_buf, size_t in_size)
```

Write data to write buffer from a byte array.

参数

- **itf** -- number of a CDC object
- **in\_buf** -- a source array
- **in\_size** -- size to write from arr\_src

返回 *size\_t* - amount of queued bytes

`esp_err_t tinyusb_cdcacm_write_flush(tinyusb_cdcacm_itf_t itf, uint32_t timeout_ticks)`

Send all data from a write buffer. Use `tinyusb_cdcacm_write_queue` to add data to the buffer.

WARNING! TinyUSB can block output Endpoint for several RX callbacks, after will do additional flush after the each transfer. That can leads to the situation when you requested a flush, but it will fail until out of the next callbacks ends. SO USING OF THE FLUSH WITH TIMEOUTS IN CALLBACKS IS NOT RECOMMENDED - YOU CAN GET A LOCK FOR THE TIMEOUT

#### 参数

- `itf` -- number of a CDC object
- `timeout_ticks` -- waiting until flush will be considered as failed

返回 `esp_err_t` - `ESP_OK` if (`timeout_ticks > 0`) and flush was successful, `ESP_ERR_TIMEOUT` if timeout occurred or flush was successful with (`timeout_ticks == 0`) `ESP_FAIL` if flush was unsuccessful

`esp_err_t tinyusb_cdcacm_read(tinyusb_cdcacm_itf_t itf, uint8_t *out_buf, size_t out_buf_sz, size_t *rx_data_size)`

Read a content to the array, and defines it's size to the `sz_store`.

#### 参数

- `itf` -- number of a CDC object
- `out_buf` -- to this array will be stored the object from a CDC buffer
- `out_buf_sz` -- size of buffer for results
- `rx_data_size` -- to this address will be stored the object's size

返回 `esp_err_t` `ESP_OK`, `ESP_FAIL` or `ESP_ERR_INVALID_STATE`

`bool tusb_cdc_acm_initialized(tinyusb_cdcacm_itf_t itf)`

Check if the ACM initialized.

参数 `itf` -- number of a CDC object

返回 true or false

## Structures

struct `cdcacm_event_rx_wanted_char_data_t`

Data provided to the input of the `callback_rx_wanted_char` callback.

### Public Members

char `wanted_char`

Wanted character

struct `cdcacm_event_line_state_changed_data_t`

Data provided to the input of the `callback_line_state_changed` callback.

### Public Members

bool `dtr`

Data Terminal Ready (DTR) line state

bool `rts`

Request To Send (RTS) line state

struct `cdcacm_event_line_coding_changed_data_t`

Data provided to the input of the `line_coding_changed` callback.

### Public Members

`cdc_line_coding_t` const \***p\_line\_coding**

New line coding value

struct **cdcacm\_event\_t**

Describes an event passing to the input of a callbacks.

### Public Members

*cdcacm\_event\_type\_t* **type**

Event type

*cdcacm\_event\_rx\_wanted\_char\_data\_t* **rx\_wanted\_char\_data**

Data input of the `callback_rx_wanted_char` callback

*cdcacm\_event\_line\_state\_changed\_data\_t* **line\_state\_changed\_data**

Data input of the `callback_line_state_changed` callback

*cdcacm\_event\_line\_coding\_changed\_data\_t* **line\_coding\_changed\_data**

Data input of the `line_coding_changed` callback

struct **tinyusb\_config\_cdcacm\_t**

Configuration structure for CDC-ACM.

### Public Members

*tinyusb\_usbdev\_t* **usb\_dev**

Usb device to set up

*tinyusb\_cdcacm\_itf\_t* **cdc\_port**

CDC port

size\_t **rx\_unread\_buf\_sz**

Amount of data that can be passed to the AMC at once

*tusb\_cdcacm\_callback\_t* **callback\_rx**

Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

*tusb\_cdcacm\_callback\_t* **callback\_rx\_wanted\_char**

Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

*tusb\_cdcacm\_callback\_t* **callback\_line\_state\_changed**

Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

*tusb\_cdcacm\_callback\_t* **callback\_line\_coding\_changed**

Pointer to the function with the `tusb_cdcacm_callback_t` type that will be handled as a callback

## Type Definitions

typedef void (\***tusb\_cdcacm\_callback\_t**)(int itf, *cdcacm\_event\_t* \*event)  
CDC-ACM callback type.

## Enumerations

enum **tinyusb\_cdcacm\_itf\_t**  
CDC ports available to setup.

*Values:*

enumerator **TINYUSB\_CDC\_ACM\_0**

enum **cdcacm\_event\_type\_t**  
Types of CDC ACM events.

*Values:*

enumerator **CDC\_EVENT\_RX**

enumerator **CDC\_EVENT\_RX\_WANTED\_CHAR**

enumerator **CDC\_EVENT\_LINE\_STATE\_CHANGED**

enumerator **CDC\_EVENT\_LINE\_CODING\_CHANGED**

## Header File

- [components/tinyusb/additions/include/tusb\\_console.h](#)

## Functions

*esp\_err\_t* **esp\_tusb\_init\_console** (int cdc\_intf)

Redirect output to the USB serial.

*参数* **cdc\_intf** -- interface number of TinyUSB' s CDC

*返回* *esp\_err\_t* - ESP\_OK, ESP\_FAIL or an error code

*esp\_err\_t* **esp\_tusb\_deinit\_console** (int cdc\_intf)

Switch log to the default output.

*参数* **cdc\_intf** -- interface number of TinyUSB' s CDC

*返回* *esp\_err\_t*

## Header File

- [components/tinyusb/additions/include/tusb\\_tasks.h](#)

## Functions

*esp\_err\_t* **tusb\_run\_task** (void)

This helper function creates and starts a task which wraps `tud_task()`.

The wrapper function basically wraps `tud_task` and some log. Default parameters: stack size and priority as configured, argument = NULL, not pinned to any core. If you have more requirements for this task, you can create your own task which calls `tud_task` as the last step.

**返回值**

- **ESP\_OK** –run tinyusb main task successfully
- **ESP\_FAIL** –run tinyusb main task failed of internal error
- **ESP\_ERR\_INVALID\_STATE** –tinyusb main task has been created before

*esp\_err\_t* **tusb\_stop\_task** (void)

This helper function stops and destroys the task created by `tusb_run_task()`

**返回值**

- **ESP\_OK** –stop and destory tinyusb main task successfully
- **ESP\_ERR\_INVALID\_STATE** –tinyusb main task hasn' t been created yet

**Header File**

- [components/tinyusb/additions/include/vfs\\_tinyusb.h](#)

**Functions**

*esp\_err\_t* **esp\_vfs\_tusb\_cdc\_register** (int cdc\_intf, char const \*path)

Register TinyUSB CDC at VFS with path.

**参数**

- **cdc\_intf** -- interface number of TinyUSB' s CDC
- **path** -- path where the CDC will be registered, `/dev/tusb_cdc` will be used if left NULL.

返回 *esp\_err\_t* ESP\_OK or ESP\_FAIL

*esp\_err\_t* **esp\_vfs\_tusb\_cdc\_unregister** (char const \*path)

Unregister TinyUSB CDC from VFS.

**参数 path** -- path where the CDC will be unregistered if NULL will be used `/dev/tusb_cdc`

返回 *esp\_err\_t* ESP\_OK or ESP\_FAIL

**2.3.25 USB Host**

**警告:** The USB Host Library API is a beta version thus is subject to change.

The document provides information regarding the USB Host Library. This document is split into the following sections:

**Sections**

- *USB Host*
  - *Overview*
  - *Architecture*
  - *Usage*
  - *Examples*
  - *API Reference*

**Overview**

The USB Host Library (hereinafter referred to as the Host Library) is the lowest public facing API layer of the ESP-IDF USB Host Stack. In most cases, applications that require USB Host functionality will not need to interface with the Host Library directly. Instead, most applications will use the API provided by a host class driver that is implemented on top of the Host Library.

However, users may want to use the Host Library directly for some of (but not limited to) the following reasons:

- The user needs to implement a custom host class driver such as a vendor specific class driver
- The user has a requirement for a lower level of abstraction due to resource/latency requirements

**Features & Limitations** The Host Library has the following features:

- Supports Full Speed (FS) and Low Speed (LS) Devices
- Supports all four transfer types (Control, Bulk, Interrupt, and Isochronous)
- Allows multiple class drivers to run simultaneously (i.e., multiple clients of the Host Library)
- A single device can be used by multiple clients simultaneously (e.g., composite devices)
- The Host Library itself (and the underlying Host Stack) does not internally instantiate any OS tasks. The number of tasks are entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is (the number of host class drivers running + 1).

Currently, the Host Library (and the underlying Host Stack) has the following limitations:

- Only supports a single device, but the Host Library's API is designed for multiple device support.
- Only supports Asynchronous transfers
- Transfer timeouts are not supported yet

### Architecture

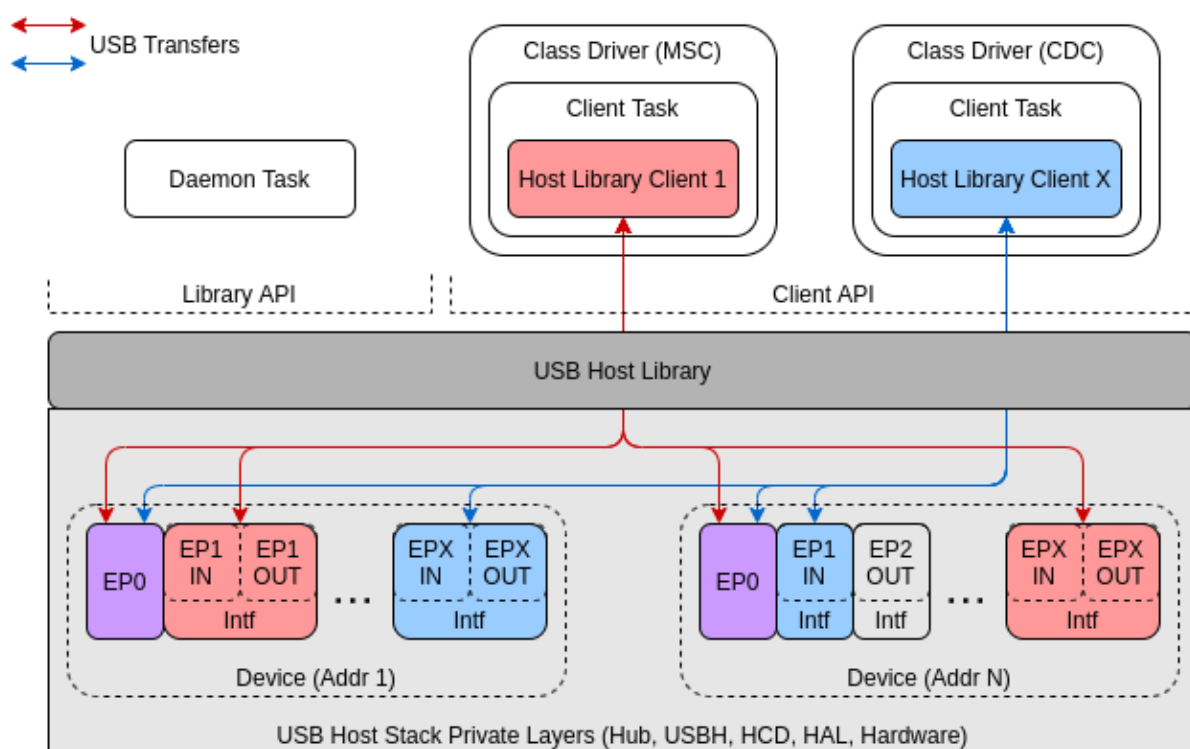

图 21: Diagram of the key entities involved in USB Host functionality

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

- The **Host Library**
- **Clients** of the Host Library
- **Devices**
- Host Library **Daemon Task**

**Host Library** The Host Library is the a lowest public facing layer of the USB Host Stack. Any other IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library's API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client (e.g., device enumeration). Usually, the library API is called by a Host Library Daemon Task.

**Clients** A client of the Host Library is a software component (such as a host class driver or user component) that uses the Host Library to communicate with a USB device. Generally each client has a one-to-one relation with a task, meaning that for a particular client, all of its Client API calls should be done from the context of the same task.

By organizing the software components that use the Host Library's into clients, the Host Library can delegate the handling of all client events (i.e., the events specific to that client) to the client's task. In other words, each client task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.

**Daemon Task** Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events (i.e., events that are not specific to a client) that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients
- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task (usually the Host Library Daemon Task) to handle all of the library events.

**Devices** The Host Library hides the details of device handling (such as connection, memory allocation, and enumeration) from the clients. The clients are provided only with a list of already connected and enumerated devices to choose from. During enumeration, each device is configured to use configuration 1.

It is possible for a two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device's default endpoint (EPO), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device's address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints in the claimed interface. The client's task is responsible for handling its own processing and events.

## Usage

The Host Library (and the underlying Host Stack) will not create any tasks. All tasks (i.e., the client tasks and the Daemon Task) will need to be created by the class drivers or the user. Instead, the Host Library provides two event handler functions that will handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be the largely centered around the invocation of these event handler functions.

## Host Library & Daemon Task

**Basic Usage** The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the daemon task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
            ...
        }
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
            ...
        }
        ...
    }
    ...
}
```

**备注:** See the [peripherals/usb/host/usb\\_host\\_lib](#) example for a full implementation of the Daemon Task

图 22: Graph of Typical USB Host Library Lifecycle

**Lifecycle** The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves...

- two registered clients (Client 1 and Client 2)
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference the graph above, the typical lifecycle involves the following key stages.

1. The Host Library is installed by calling `usb_host_install()`.

- Installation must be done before any other Host Library API is called.
  - Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) will depend on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.
2. **Once the Host Library is installed, the clients can be registered by calling `usb_host_client_register()`.**
    - This is typically called from the client task (where the client task waits for a signal from the Daemon Task).
    - This can be called elsewhere if necessary as long as it is called after `usb_host_install()`.
  3. **Device 1 connects and is then enumerated.**
    - Each registered client (in this case Client 1 and Client 2) are notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
    - Client 1 opens Device 1 and begins communication with it.
  4. **Similarly Device 2 connects and is enumerated.**
    - Client 1 and 2 are notified of a new device (via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event).
    - Client 2 opens Device 2 and begins communication with it.
  5. **Device 1 suddenly disconnects.**
    - Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
    - Client 2 is not notified as it has not opened Device 1.
  6. **Client 1 completes its clean up and deregisters by calling `usb_host_client_deregister()`.**
    - This is typically called from the client task before the task exits.
    - This can be called elsewhere if necessary as long as Client 1 has already completed its clean up.
  7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself.**
    - The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
    - Device 2 is still allocated (i.e., not freed) as it is still connected albeit not currently opened by any client.
  8. **The Daemon Task decides to cleanup as there are no more clients.**
    - The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
    - If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
    - If `usb_host_device_free_all()` was unable to free all devices (e.g., because the device is still opened by a client), the function will return `ESP_ERR_NOT_FINISHED`.
    - The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.
  9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

## Clients & Class Driver

**Basic Usage** The Host Library API provides `usb_host_client_handle_events()` to handle a particular client' s events. This function should be called repeatedly, typically from the client' s task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling
- The function' s primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` which delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` which indicates that a particular USB transfer previously submitted by the client has completed.

---

**备注:** Given that the callbacks are called from within `usb_host_client_handle_events()`, users should

avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

```
#include <string.h>
#include "usb/usb_host.h"

        usb_host_interface_release(class_driver_obj.client_hdl, class_driver_
↪obj.dev_hdl, 1);
        usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.
↪dev_hdl);
        exit = true;
    }
    ... //Handle any other actions required by the class driver
}

//Cleanup class driver
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.client_hdl);
... //Delete the task and any other signal Daemon Task if required
}

```

**备注:** An actual host class driver will likely supported many more features, thus will have a much more complex state machine. A host class driver will likely also need to:

- Be able to open multiple devices
- Parse an opened device's descriptors to identify if the device is of the target class
- Communicate with multiple endpoints of an interface in a particular order
- Claim multiple interfaces of a device

- Handle various errors
- 

**Lifecycle** The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources (e.g., allocating transfers using `usb_host_transfer_alloc()`).
3. For each new device that the class driver needs to communicate with:
  - a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
  - b. If the device is not already connected, wait for a `USB_HOST_CLIENT_EVENT_NEW_DEV` event from the client event callback.
  - c. Open the device via `usb_host_device_open()`.
  - d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and `usb_host_get_active_config_descriptor()` respectively.
  - e. Claim the necessary interfaces of the device via `usb_host_interface_claim()`.
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
5. Once an opened device is no longer needed by the class driver, or has disconnected (as indicated by a `USB_HOST_CLIENT_EVENT_DEV_GONE` event):
  - a. Stop any previously submitted transfers to the device's endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
  - b. Release all previously claimed interfaces via `usb_host_interface_release()`.
  - c. Close the device via `usb_host_device_close()`.
6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
7. Delete the client task. Signal the Daemon Task if necessary.

## Examples

**Host Library Examples** The [peripherals/usb/host/usb\\_host\\_lib](#) demonstrates basic usage of the USB Host Library's API to implement a pseudo class driver.

**Class Driver Examples** The USB Host Stack provides a number examples that implement host class drivers using the Host Library's API.

## CDC-ACM

- A host class driver for the Communication Device Class (Abstract Control Model) is currently implemented as an example component (found via [peripherals/usb/host/cdc/common/cdc\\_acm\\_host](#)).
- The [peripherals/usb/host/cdc/cdc\\_acm\\_host](#) example uses the CDC-ACM host driver component to communicate with CDC-ACM devices
- The [peripherals/usb/host/cdc/cdc\\_acm\\_bg96](#) example uses the CDC-ACM host driver component to communicate with non-compliant CDC-ACM devices (i.e., vendor-specific classes that support a subset of CDC-ACM features) such as the Quectel BG96 modem.

## MSC

- A host class driver for the Mass Storage Class (Bulk-Only Transport) is current implemented as an example found via [peripherals/usb/host/msc](#).

## API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only `#include "usb/usb_host.h"` and all of USB Host Library headers will also be included.

- [usb/include/usb/usb\\_host.h](#) contains the functions and types of the USB Host Library

- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification (i.e., descriptors and standard requests).

### Header File

- `components/usb/include/usb/usb_host.h`

### Functions

`esp_err_t usb_host_install` (const `usb_host_config_t` \*config)

Install the USB Host Library.

- This function should only be called once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

---

**备注:** If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

---

**参数** `config` –[in] USB Host Library configuration

**返回** `esp_err_t`

`esp_err_t usb_host_uninstall` (void)

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag

---

**备注:** If `skip_phy_setup` was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

---

**返回** `esp_err_t`

`esp_err_t usb_host_lib_handle_events` (TickType\_t timeout\_ticks, uint32\_t \*event\_flags\_ret)

Handle USB Host Library events.

- This function handles all of the USB Host Library's processing and should be called repeatedly in a loop
- Check `event_flags_ret` to see if any flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

---

**备注:** This function can block

---

**参数**

- `timeout_ticks` –[in] Timeout in ticks to wait for an event to occur

- **event\_flags\_ret** **–[out]** Event flags that indicate what USB Host Library event occurred.
- 返回 `esp_err_t`

`esp_err_t` **usb\_host\_lib\_unblock** (void)

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (`usb_host_lib_handle_events()`)

返回 `esp_err_t`

`esp_err_t` **usb\_host\_lib\_info** (`usb_host_lib_info_t` \*info\_ret)

Get current information about the USB Host Library.

参数 **info\_ret** **–[out]** USB Host Library Information

返回 `esp_err_t`

`esp_err_t` **usb\_host\_client\_register** (const `usb_host_client_config_t` \*client\_config, `usb_host_client_handle_t` \*client\_hdl\_ret)

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function `usb_host_client_handle_events()` should be called repeatedly

参数

- **client\_config** **–[in]** Client configuration
- **client\_hdl\_ret** **–[out]** Client handle

返回 `esp_err_t`

`esp_err_t` **usb\_host\_client\_deregister** (`usb_host_client_handle_t` client\_hdl)

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library
- The client must have closed all previously opened devices before attempting to deregister

参数 **client\_hdl** **–[in]** Client handle

返回 `esp_err_t`

`esp_err_t` **usb\_host\_client\_handle\_events** (`usb_host_client_handle_t` client\_hdl, `TickType_t` timeout\_ticks)

USB Host Library client processing function.

- This function handles all of a client's processing and should be called repeatedly in a loop
- For a particular client, this function should never be called by multiple threads simultaneously

---

备注: This function can block

---

参数

- **client\_hdl** **–[in]** Client handle
- **timeout\_ticks** **–[in]** Timeout in ticks to wait for an event to occur

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_client\_unblock** (*usb\_host\_client\_handle\_t* client\_hdl)

Unblock a client.

- This function simply unblocks a client if it is blocked on the `usb_host_client_handle_events()` function.
- This function is useful when need to unblock a client in order to deregister it.

参数 **client\_hdl** –[in] Client handle

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_device\_open** (*usb\_host\_client\_handle\_t* client\_hdl, *uint8\_t* dev\_addr,  
*usb\_device\_handle\_t* \*dev\_hdl\_ret)

Open a device.

- This function allows a client to open a device
- A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

参数

- **client\_hdl** –[in] Client handle
- **dev\_addr** –[in] Device' s address
- **dev\_hdl\_ret** –[out] Device' s handle

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_device\_close** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl)

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before deregistering

---

备注: This function can block

---

参数

- **client\_hdl** –[in] Client handle
- **dev\_hdl** –[in] Device handle

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_device\_free\_all** (void)

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
- If a device is not opened by any clients, it will be freed immediately
- If a device is opened by at least one client, the device will be free when the last client closes that device.
- Wait for the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` flag to be set by `usb_host_lib_handle_events()` in order to know when all devices have been freed
- This function is useful when cleaning up devices before uninstalling the USB Host Library

返回

- `ESP_ERR_NOT_FINISHED`: There are one or more devices that still need to be freed. Wait for `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event
- `ESP_OK`: All devices already freed (i.e., there were no devices)

- Other: Error

*esp\_err\_t* **usb\_host\_device\_addr\_list\_fill** (int list\_len, uint8\_t \*dev\_addr\_list, int \*num\_dev\_ret)

Fill a list of device address.

- This function fills an empty list with the address of connected devices
- The Device addresses can then used in `usb_host_device_open()`
- If there are more devices than the list\_len, this function will only fill up to list\_len number of devices.

#### 参数

- **list\_len** –[in] Length of the empty list
- **dev\_addr\_list** –[inout] Empty list to be filled
- **num\_dev\_ret** –[out] Number of devices

返回 `esp_err_t`

*esp\_err\_t* **usb\_host\_device\_info** (*usb\_device\_handle\_t* dev\_hdl, *usb\_device\_info\_t* \*dev\_info)

Get device' s information.

- This function gets some basic information of a device
- The device must be opened first before attempting to get its information

---

备注: This function can block

---

#### 参数

- **dev\_hdl** –[in] Device handle
- **dev\_info** –[out] Device information

返回 `esp_err_t`

*esp\_err\_t* **usb\_host\_get\_device\_descriptor** (*usb\_device\_handle\_t* dev\_hdl, const *usb\_device\_desc\_t* \*\*device\_desc)

Get device' s device descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device' s descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

---

备注: No control transfer is sent. The device' s descriptor is cached on enumeration

---

#### 参数

- **dev\_hdl** –[in] Device handle
- **device\_desc** –[out] Device descriptor

返回 `esp_err_t`

*esp\_err\_t* **usb\_host\_get\_active\_config\_descriptor** (*usb\_device\_handle\_t* dev\_hdl, const *usb\_config\_desc\_t* \*\*config\_desc)

Get device' s active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device' s active configuration descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

---

备注: This function can block

---

---

备注: No control transfer is sent. A device' s active configuration descriptor is cached on enumeration

---

#### 参数

- **dev\_hdl** –[in] Device handle
- **config\_desc** –[out] Configuration descriptor

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_interface\_claim** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bInterfaceNumber, uint8\_t bAlternateSetting)

Function for a client to claim a device' s interface.

- A client must claim a device' s interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

---

备注: This function can block

---

#### 参数

- **client\_hdl** –[in] Client handle
- **dev\_hdl** –[in] Device handle
- **bInterfaceNumber** –[in] Interface number
- **bAlternateSetting** –[in] Interface alternate setting number

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_interface\_release** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bInterfaceNumber)

Function for a client to release a previously claimed interface.

- A client should release a device' s interface after it no longer needs to communicate with the interface
- A client must release all of its interfaces of a device it has claimed before being able to close the device

---

备注: This function can block

---

#### 参数

- **client\_hdl** –[in] Client handle
- **dev\_hdl** –[in] Device handle
- **bInterfaceNumber** –[in] Interface number

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_endpoint\_halt** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

---

备注: This function can block

---

参数

- **dev\_hdl** –Device handle
- **bEndpointAddress** –Endpoint address

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_endpoint\_flush** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- Flushing an endpoint will caused an queued up transfers to be canceled

---

备注: This function can block

---

参数

- **dev\_hdl** –Device handle
- **bEndpointAddress** –Endpoint address

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_endpoint\_clear** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

---

备注: This function can block

---

参数

- **dev\_hdl** –Device handle
- **bEndpointAddress** –Endpoint address

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_transfer\_alloc** (size\_t data\_buffer\_size, int num\_isoc\_packets, *usb\_transfer\_t* \*\*transfer)

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

参数

- **data\_buffer\_size** –[in] Size of the transfer' s data buffer

- **num\_isoc\_packets** –[in] Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
  - **transfer** –[out] Transfer object
- 返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_transfer\_free** (*usb\_transfer\_t* \*transfer)

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return ESP\_OK

参数 **transfer** –[in] Transfer object

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_transfer\_submit** (*usb\_transfer\_t* \*transfer)

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

参数 **transfer** –[in] Initialized transfer object

返回 esp\_err\_t

*esp\_err\_t* **usb\_host\_transfer\_submit\_control** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_transfer\_t* \*transfer)

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer's data buffer should contain the control transfer setup packet
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

参数

- **client\_hdl** –[in] Client handle
- **transfer** –[in] Initialized transfer object

返回 esp\_err\_t

## Structures

struct **usb\_host\_client\_event\_msg\_t**

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

---

**备注:** The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

---

### Public Members

*usb\_host\_client\_event\_t* **event**

Type of event

uint8\_t **address**

New device's address

struct *usb\_host\_client\_event\_msg\_t*::[anonymous]::[anonymous] **new\_dev**

New device info

*usb\_device\_handle\_t* **dev\_hdl**

The handle of the device that was gone

struct *usb\_host\_client\_event\_msg\_t*::[anonymous]::[anonymous] **dev\_gone**

Gone device info

struct **usb\_host\_lib\_info\_t**

Current information about the USB Host Library obtained via `usb_host_lib_info()`

### Public Members

int **num\_devices**

Current number of connected (and enumerated) devices

int **num\_clients**

Current number of registered clients

struct **usb\_host\_config\_t**

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

### Public Members

bool **skip\_phy\_setup**

If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling `usb_host_install()`. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY

int **intr\_flags**

Interrupt flags for the underlying ISR used by the USB Host stack

struct **usb\_host\_client\_config\_t**

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

### Public Members

bool **is\_synchronous**

Whether the client is asynchronous or synchronous or not. Set to false for now.

int **max\_num\_event\_msg**

Maximum number of event messages that can be stored (e.g., 3)

*usb\_host\_client\_event\_cb\_t* **client\_event\_callback**

Client's event callback function

void \***callback\_arg**

Event callback function argument

struct *usb\_host\_client\_config\_t*::[anonymous]::[anonymous] **async**

Async callback config

### Macros

**USB\_HOST\_LIB\_EVENT\_FLAGS\_NO\_CLIENTS**

All clients have been deregistered from the USB Host Library

**USB\_HOST\_LIB\_EVENT\_FLAGS\_ALL\_FREE**

The USB Host Library has freed all devices

### Type Definitions

typedef struct *usb\_host\_client\_handle\_s* \***usb\_host\_client\_handle\_t**

Handle to a USB Host Library asynchronous client.

An asynchronous client can be registered using `usb_host_client_register()`

---

**备注:** Asynchronous API

---

typedef void (\***usb\_host\_client\_event\_cb\_t**)(const *usb\_host\_client\_event\_msg\_t* \*event\_msg, void \*arg)

Client event callback.

- Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
- The client event callback is run from the context of the clients `usb_host_client_handle_events()` function

## Enumerations

enum **usb\_host\_client\_event\_t**

The type event in a client event message.

Values:

enumerator **USB\_HOST\_CLIENT\_EVENT\_NEW\_DEV**

A new device has been enumerated and added to the USB Host Library

enumerator **USB\_HOST\_CLIENT\_EVENT\_DEV\_GONE**

A device opened by the client is now gone

## Header File

- [components/usb/include/usb/usb\\_helpers.h](#)

## Functions

const *usb\_standard\_desc\_t* \***usb\_parse\_next\_descriptor** (const *usb\_standard\_desc\_t* \*cur\_desc, uint16\_t wTotalLength, int \*offset)

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

### 参数

- **cur\_desc** –[in] Current descriptor
- **wTotalLength** –[in] Total length of the configuration descriptor
- **offset** –[inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

返回 *usb\_standard\_desc\_t*\* Next descriptor, NULL if end of configuration descriptor reached

const *usb\_standard\_desc\_t* \***usb\_parse\_next\_descriptor\_of\_type** (const *usb\_standard\_desc\_t* \*cur\_desc, uint16\_t wTotalLength, uint8\_t bDescriptorType, int \*offset)

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the bDescriptorType value) within the configuration descriptor.

### 参数

- **cur\_desc** –[in] Current descriptor
- **wTotalLength** –[in] Total length of the configuration descriptor
- **bDescriptorType** –[in] Type of the next descriptor to get
- **offset** –[inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

返回 *usb\_standard\_desc\_t*\* Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

int **usb\_parse\_interface\_number\_of\_alternate** (const *usb\_config\_desc\_t* \*config\_desc, uint8\_t bInterfaceNumber)

Get the number of alternate settings for a bInterfaceNumber.

Given a particular configuration descriptor, for a particular bInterfaceNumber, get the number of alternate settings available for that interface (i.e., the max possible value of bAlternateSetting for that bInterfaceNumber).

**参数**

- **config\_desc** –[in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** –[in] Interface number

**返回** int The number of alternate settings that the interface has, -1 if bInterfaceNumber not found

```
const usb_intf_desc_t *usb_parse_interface_descriptor (const usb_config_desc_t *config_desc,
                                                    uint8_t bInterfaceNumber, uint8_t
                                                    bAlternateSetting, int *offset)
```

Get a particular interface descriptor (using bInterfaceNumber and bAlternateSetting)

Given a full configuration descriptor, get a particular interface descriptor.

---

**备注:** To get the number of alternate settings for a particular bInterfaceNumber, call `usb_parse_interface_number_of_alternate()`

---

**参数**

- **config\_desc** –[in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** –[in] Interface number
- **bAlternateSetting** –[in] Alternate setting number
- **offset** –[out] Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

**返回** const *usb\_intf\_desc\_t*\* Pointer to interface descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index (const usb_intf_desc_t *intf_desc,
                                                           int index, uint16_t wTotalLength,
                                                           int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

---

**备注:** If bNumEndpoints is 0, it means the interface uses the default endpoint only

---

**参数**

- **intf\_desc** –[in] Pointer to the start of an interface descriptor
- **index** –[in] Endpoint index
- **wTotalLength** –[in] Total length of the containing configuration descriptor
- **offset** –[inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

**返回** const *usb\_ep\_desc\_t*\* Pointer to endpoint descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address (const usb_config_desc_t
                                                             *config_desc, uint8_t
                                                             bInterfaceNumber, uint8_t
                                                             bAlternateSetting, uint8_t
                                                             bEndpointAddress, int
                                                             *offset)
```

Get an endpoint descriptor based on an endpoint's address.

Given a configuration descriptor, get an endpoint descriptor based on its bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

**参数**

- **config\_desc** –[in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** –[in] Interface number
- **bAlternateSetting** –[in] Alternate setting number

- **bEndpointAddress** –[in] Endpoint address
- **offset** –[out] Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

返回 const usb\_ep\_desc\_t\* Pointer to endpoint descriptor, NULL if not found.

void **usb\_print\_device\_descriptor** (const *usb\_device\_desc\_t* \*devc\_desc)

Print device descriptor.

参数 **devc\_desc** –Device descriptor

void **usb\_print\_config\_descriptor** (const *usb\_config\_desc\_t* \*cfg\_desc, *print\_class\_descriptor\_cb* class\_specific\_cb)

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the class\_specific\_cb if it is provided

参数

- **cfg\_desc** –Configuration descriptor
- **class\_specific\_cb** –Class specific descriptor callback. Can be NULL

void **usb\_print\_string\_descriptor** (const *usb\_str\_desc\_t* \*str\_desc)

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

参数 **str\_desc** –String descriptor

static inline int **usb\_round\_up\_to\_mps** (int num\_bytes, int mps)

Round up to an integer multiple of endpoint's MPS.

This is a convenience function to round up a size/length to an endpoint's MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

- If MPS <= 0, this function will return 0
- If num\_bytes <= 0, this function will return 0

参数

- **num\_bytes** –[in] Number of bytes
- **mps** –[in] MPS

返回 int Round up integer multiple of MPS

## Type Definitions

typedef void (\***print\_class\_descriptor\_cb**)(const *usb\_standard\_desc\_t*\*)

Print class specific descriptor callback.

Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

## Header File

- [components/usb/include/usb/usb\\_types\\_stack.h](#)

## Structures

struct **usb\_device\_info\_t**

Basic information of an enumerated device.

### Public Members

*usb\_speed\_t* **speed**

Device's speed

uint8\_t **dev\_addr**

Device's address

uint8\_t **bMaxPacketSize0**

The maximum packet size of the device's default endpoint

uint8\_t **bConfigurationValue**

Device's current configuration number

const *usb\_str\_desc\_t* \***str\_desc\_manufacturer**

Pointer to Manufacturer string descriptor (can be NULL)

const *usb\_str\_desc\_t* \***str\_desc\_product**

Pointer to Product string descriptor (can be NULL)

const *usb\_str\_desc\_t* \***str\_desc\_serial\_num**

Pointer to Serial Number string descriptor (can be NULL)

struct **usb\_isoc\_packet\_desc\_t**

Isochronous packet descriptor.

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint's specified interval, the transfer is split into multiple packets transmitted at the endpoint's specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

### Public Members

int **num\_bytes**

Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int **actual\_num\_bytes**

Actual number of bytes transmitted/received in the packet

*usb\_transfer\_status\_t* **status**

Status of the packet

struct **usb\_transfer\_s**

USB transfer structure.

## Public Members

`uint8_t *const data_buffer`

Pointer to data buffer

`const size_t data_buffer_size`

Size of the data buffer in bytes

`int num_bytes`

Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, `num_bytes` should be an integer multiple of MPS.

`int actual_num_bytes`

Actual number of bytes transferred

`uint32_t flags`

Transfer flags

`usb_device_handle_t device_handle`

Device handle

`uint8_t bEndpointAddress`

Endpoint Address

`usb_transfer_status_t status`

Status of the transfer

`uint32_t timeout_ms`

Timeout (in milliseconds) of the packet (currently not supported yet)

`usb_transfer_cb_t callback`

Transfer callback

`void *context`

Context variable for transfer to associate transfer with something

`const int num_isoc_packets`

Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

`usb_isoc_packet_desc_t isoc_packet_desc[]`

Descriptors for each Isochronous packet

## Macros

`USB_TRANSFER_FLAG_ZERO_PACK`

Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer's length (i.e., `transfer.num_bytes`) is a multiple of the endpoint's MPS

Otherwise, this flag has no effect.

Users should check whether their target device's class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

---

**备注:** See USB2.0 specification 5.7.3 and 5.8.3 for more details

---

---

**备注:** IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host(For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

---

## Type Definitions

```
typedef struct usb_device_handle_s *usb_device_handle_t
```

Handle of a USB Device connected to a USB Host.

```
typedef struct usb_transfer_s usb_transfer_t
```

USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- Bulk: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint's MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- Control: This structure represents a single control transfer. This first 8 bytes of the `data_buffer` must be filled with the setup packet (see [usb\\_setup\\_packet\\_t](#)). The `num_bytes` field should be the total size of the transfer (i.e., size of setup packet + `wLength`).
- Interrupt: Represents an interrupt transfer. If `num_bytes` exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint's specified interval.
- Isochronous: Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each `isoc_packet_desc`. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB's overall status and the status of each packet descriptor will be updated, and the `actual_num_bytes` reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.

---

**备注:** For Bulk/Control/Interrupt IN transfers, the `num_bytes` must be an integer multiple of the endpoint's MPS

---

---

**备注:** This structure should be allocated via `usb_host_transfer_alloc()`

---

---

**备注:** Once the transfer has been submitted, users should not modify the structure until the transfer has completed

---

typedef void (\***usb\_transfer\_cb\_t**)(*usb\_transfer\_t* \*transfer)

USB transfer completion callback.

### Enumerations

enum **usb\_speed\_t**

USB Standard Speeds.

*Values:*

enumerator **USB\_SPEED\_LOW**

USB Low Speed (1.5 Mbit/s)

enumerator **USB\_SPEED\_FULL**

USB Full Speed (12 Mbit/s)

enum **usb\_transfer\_type\_t**

The type of USB transfer.

---

**备注:** The enum values need to match the `bmAttributes` field of an EP descriptor

---

*Values:*

enumerator **USB\_TRANSFER\_TYPE\_CTRL**

enumerator **USB\_TRANSFER\_TYPE\_ISOCHRONOUS**

enumerator **USB\_TRANSFER\_TYPE\_BULK**

enumerator **USB\_TRANSFER\_TYPE\_INTR**

enum **usb\_transfer\_status\_t**

The status of a particular transfer.

*Values:*

enumerator **USB\_TRANSFER\_STATUS\_COMPLETED**

The transfer was successful (but may be short)

enumerator **USB\_TRANSFER\_STATUS\_ERROR**

The transfer failed because due to excessive errors (e.g. no response or CRC error)

enumerator **USB\_TRANSFER\_STATUS\_TIMED\_OUT**

The transfer failed due to a time out

enumerator **USB\_TRANSFER\_STATUS\_CANCELED**

The transfer was canceled

enumerator **USB\_TRANSFER\_STATUS\_STALL**

The transfer was stalled

enumerator **USB\_TRANSFER\_STATUS\_OVERFLOW**

The transfer as more data was sent than was requested

enumerator **USB\_TRANSFER\_STATUS\_SKIPPED**

ISOC packets only. The packet was skipped due to system latency or bus overload

enumerator **USB\_TRANSFER\_STATUS\_NO\_DEVICE**

The transfer failed because the target device is gone

### Header File

- [components/usb/include/usb/usb\\_types\\_ch9.h](#)

### Unions

union **usb\_setup\_packet\_t**

*#include* <usb\_types\_ch9.h> Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

### Public Members

uint8\_t **bmRequestType**

Characteristics of request

uint8\_t **bRequest**

Specific request

uint16\_t **wValue**

Word-sized field that varies according to request

uint16\_t **wIndex**

Word-sized field that varies according to request; typically used to pass an index or offset

uint16\_t **wLength**

Number of bytes to transfer if there is a data stage

struct *usb\_setup\_packet\_t*::[anonymous] [**anonymous**]

uint8\_t **val**[8]

Descriptor value

union **usb\_standard\_desc\_t**

*#include <usb\_types\_ch9.h>* USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

Descriptor Type

struct *usb\_standard\_desc\_t*::[anonymous] [**anonymous**]

USB descriptor attributes

uint8\_t **val**[2]

Descriptor value

union **usb\_device\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

DEVICE Descriptor Type

uint16\_t **bcdUSB**

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

uint8\_t **bDeviceClass**

Class code (assigned by the USB-IF)

uint8\_t **bDeviceSubClass**

Subclass code (assigned by the USB-IF)

uint8\_t **bDeviceProtocol**

Protocol code (assigned by the USB-IF)

`uint8_t bMaxPacketSize0`

Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

`uint16_t idVendor`

Vendor ID (assigned by the USB-IF)

`uint16_t idProduct`

Product ID (assigned by the manufacturer)

`uint16_t bcdDevice`

Device release number in binary-coded decimal

`uint8_t iManufacturer`

Index of string descriptor describing manufacturer

`uint8_t iProduct`

Index of string descriptor describing product

`uint8_t iSerialNumber`

Index of string descriptor describing the device's serial number

`uint8_t bNumConfigurations`

Number of possible configurations

struct `usb_device_desc_t`::[anonymous] [**anonymous**]

USB descriptor attributes

`uint8_t val[18]`

Descriptor value

union `usb_config_desc_t`

`#include <usb_types_ch9.h>` Structure representing a short USB configuration descriptor.

See Table 9-10 of USB2.0 specification for more details

---

**备注:** The full USB configuration includes all the interface and endpoint descriptors of that configuration.

---

## Public Members

`uint8_t bLength`

Size of the descriptor in bytes

`uint8_t bDescriptorType`

CONFIGURATION Descriptor Type

`uint16_t wTotalLength`

Total length of data returned for this configuration

**uint8\_t bNumInterfaces**

Number of interfaces supported by this configuration

**uint8\_t bConfigurationValue**

Value to use as an argument to the SetConfiguration() request to select this configuration

**uint8\_t iConfiguration**

Index of string descriptor describing this configuration

**uint8\_t bmAttributes**

Configuration characteristics

**uint8\_t bMaxPower**

Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.

struct *usb\_config\_desc\_t*::[anonymous] [**anonymous**]

USB descriptor attributes

**uint8\_t val**[9]

Descriptor value

union **usb\_iad\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB interface association descriptor.

### Public Members

**uint8\_t bLength**

Size of the descriptor in bytes

**uint8\_t bDescriptorType**

INTERFACE ASSOCIATION Descriptor Type

**uint8\_t bFirstInterface**

Interface number of the first interface that is associated with this function

**uint8\_t bInterfaceCount**

Number of contiguous interfaces that are associated with this function

**uint8\_t bFunctionClass**

Class code (assigned by USB-IF)

**uint8\_t bFunctionSubClass**

Subclass code (assigned by USB-IF)

**uint8\_t bFunctionProtocol**

Protocol code (assigned by USB-IF)

**uint8\_t iFunction**

Index of string descriptor describing this function

struct *usb\_iad\_desc\_t*::[anonymous] [**anonymous**]

USB descriptor attributes

**uint8\_t val**[9]

Descriptor value

union **usb\_intf\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB interface descriptor.

See Table 9-12 of USB2.0 specification for more details

### Public Members

**uint8\_t bLength**

Size of the descriptor in bytes

**uint8\_t bDescriptorType**

INTERFACE Descriptor Type

**uint8\_t bInterfaceNumber**

Number of this interface.

**uint8\_t bAlternateSetting**

Value used to select this alternate setting for the interface identified in the prior field

**uint8\_t bNumEndpoints**

Number of endpoints used by this interface (excluding endpoint zero).

**uint8\_t bInterfaceClass**

Class code (assigned by the USB-IF)

**uint8\_t bInterfaceSubClass**

Subclass code (assigned by the USB-IF)

**uint8\_t bInterfaceProtocol**

Protocol code (assigned by the USB)

**uint8\_t iInterface**

Index of string descriptor describing this interface

struct *usb\_intf\_desc\_t*::[anonymous] [**anonymous**]

USB descriptor attributes

**uint8\_t val**[9]

Descriptor value

union **usb\_ep\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB endpoint descriptor.

See Table 9-13 of USB2.0 specification for more details

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

ENDPOINT Descriptor Type

uint8\_t **bEndpointAddress**

The address of the endpoint on the USB device described by this descriptor

uint8\_t **bmAttributes**

This field describes the endpoint's attributes when it is configured using the bConfigurationValue.

uint16\_t **wMaxPacketSize**

Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

uint8\_t **bInterval**

Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

struct *usb\_ep\_desc\_t*::[anonymous] [**anonymous**]

USB descriptor attributes

uint8\_t **val**[7]

Descriptor value

union **usb\_str\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB string descriptor.

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

STRING Descriptor Type

uint16\_t **wData**[]

UTF-16LE encoded

```
struct usb_str_desc_t::[anonymous] [anonymous]  
    USB descriptor attributes  
  
    uint8_t val[2]  
        Descriptor value
```

## Macros

**USB\_DESC\_ATTR**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE**

Descriptor types from USB2.0 specification table 9.5.

**USB\_B\_DESCRIPTOR\_TYPE\_CONFIGURATION**

**USB\_B\_DESCRIPTOR\_TYPE\_STRING**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE**

**USB\_B\_DESCRIPTOR\_TYPE\_ENDPOINT**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE\_QUALIFIER**

**USB\_B\_DESCRIPTOR\_TYPE\_OTHER\_SPEED\_CONFIGURATION**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE\_POWER**

**USB\_B\_DESCRIPTOR\_TYPE\_OTG**

Descriptor types from USB 2.0 ECN.

**USB\_B\_DESCRIPTOR\_TYPE\_DEBUG**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE\_ASSOCIATION**

**USB\_B\_DESCRIPTOR\_TYPE\_SECURITY**

Descriptor types from Wireless USB spec.

**USB\_B\_DESCRIPTOR\_TYPE\_KEY**

**USB\_B\_DESCRIPTOR\_TYPE\_ENCRYPTION\_TYPE**

**USB\_B\_DESCRIPTOR\_TYPE\_BOS**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE\_CAPABILITY**

**USB\_B\_DESCRIPTOR\_TYPE\_WIRELESS\_ENDPOINT\_COMP**

**USB\_B\_DESCRIPTOR\_TYPE\_WIRE\_ADAPTER**

**USB\_B\_DESCRIPTOR\_TYPE\_RPIPE**

**USB\_B\_DESCRIPTOR\_TYPE\_CS\_RADIO\_CONTROL**

**USB\_B\_DESCRIPTOR\_TYPE\_PIPE\_USAGE**

Descriptor types from UAS specification.

**USB\_SETUP\_PACKET\_SIZE**

Size of a USB control transfer setup packet in bytes.

**USB\_BM\_REQUEST\_TYPE\_DIR\_OUT**

Bit masks belonging to the bmRequestType field of a setup packet.

**USB\_BM\_REQUEST\_TYPE\_DIR\_IN**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_STANDARD**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_CLASS**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_VENDOR**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_RESERVED**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_MASK**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_DEVICE**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_INTERFACE**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_ENDPOINT**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_OTHER**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_MASK**

**USB\_B\_REQUEST\_GET\_STATUS**

Bit masks belonging to the bRequest field of a setup packet.

**USB\_B\_REQUEST\_CLEAR\_FEATURE**

**USB\_B\_REQUEST\_SET\_FEATURE**

**USB\_B\_REQUEST\_SET\_ADDRESS**

**USB\_B\_REQUEST\_GET\_DESCRIPTOR**

**USB\_B\_REQUEST\_SET\_DESCRIPTOR**

**USB\_B\_REQUEST\_GET\_CONFIGURATION**

**USB\_B\_REQUEST\_SET\_CONFIGURATION**

**USB\_B\_REQUEST\_GET\_INTERFACE**

**USB\_B\_REQUEST\_SET\_INTERFACE**

**USB\_B\_REQUEST\_SYNCH\_FRAME**

**USB\_W\_VALUE\_DT\_DEVICE**

Bit masks belonging to the wValue field of a setup packet.

**USB\_W\_VALUE\_DT\_CONFIG**

**USB\_W\_VALUE\_DT\_STRING**

**USB\_W\_VALUE\_DT\_INTERFACE**

**USB\_W\_VALUE\_DT\_ENDPOINT**

**USB\_W\_VALUE\_DT\_DEVICE\_QUALIFIER**

**USB\_W\_VALUE\_DT\_OTHER\_SPEED\_CONFIG**

**USB\_W\_VALUE\_DT\_INTERFACE\_POWER**

**USB\_SETUP\_PACKET\_INIT\_SET\_ADDR** (setup\_pkt\_ptr, addr)

Initializer for a SET\_ADDRESS request.

Sets the address of a connected device

**USB\_SETUP\_PACKET\_INIT\_GET\_DEVICE\_DESC** (setup\_pkt\_ptr)

Initializer for a request to get a device's device descriptor.

**USB\_SETUP\_PACKET\_INIT\_GET\_CONFIG** (setup\_pkt\_ptr)

Initializer for a request to get a device's current configuration number.

**USB\_SETUP\_PACKET\_INIT\_GET\_CONFIG\_DESC** (setup\_pkt\_ptr, desc\_index, desc\_len)

Initializer for a request to get one of the device's current configuration descriptor.

- desc\_index indicates the configuration's index number
- Number of bytes of the configuration descriptor to get

**USB\_SETUP\_PACKET\_INIT\_SET\_CONFIG** (setup\_pkt\_ptr, config\_num)

Initializer for a request to set a device's current configuration number.

**USB\_SETUP\_PACKET\_INIT\_SET\_INTERFACE** (setup\_pkt\_ptr, intf\_num, alt\_setting\_num)

Initializer for a request to set an interface's alternate setting.

**USB\_SETUP\_PACKET\_INIT\_GET\_STR\_DESC** (setup\_pkt\_ptr, string\_index, lang\_id, desc\_len)

Initializer for a request to get a string descriptor.

**USB\_STANDARD\_DESC\_SIZE**

Size of dummy USB standard descriptor.

**USB\_DEVICE\_DESC\_SIZE**

Size of a USB device descriptor in bytes.

**USB\_CLASS\_PER\_INTERFACE**

Possible base class values of the bDeviceClass field of a USB device descriptor.

**USB\_CLASS\_AUDIO**

**USB\_CLASS\_COMM**

**USB\_CLASS\_HID**

**USB\_CLASS\_PHYSICAL**

**USB\_CLASS\_STILL\_IMAGE**

**USB\_CLASS\_PRINTER**

**USB\_CLASS\_MASS\_STORAGE**

**USB\_CLASS\_HUB**

**USB\_CLASS\_CDC\_DATA**

**USB\_CLASS\_CSCID**

**USB\_CLASS\_CONTENT\_SEC**

**USB\_CLASS\_VIDEO**

**USB\_CLASS\_WIRELESS\_CONTROLLER**

**USB\_CLASS\_PERSONAL\_HEALTHCARE**

**USB\_CLASS\_AUDIO\_VIDEO**

**USB\_CLASS\_BILLBOARD**

**USB\_CLASS\_USB\_TYPE\_C\_BRIDGE**

**USB\_CLASS\_MISC**

**USB\_CLASS\_APP\_SPEC**

**USB\_CLASS\_VENDOR\_SPEC**

**USB\_SUBCLASS\_VENDOR\_SPEC**

Vendor specific subclass code.

**USB\_CONFIG\_DESC\_SIZE**

Size of a short USB configuration descriptor in bytes.

---

**备注:** The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

---

**USB\_BM\_ATTRIBUTES\_ONE**

Bit masks belonging to the bmAttributes field of a configuration descriptor.

**USB\_BM\_ATTRIBUTES\_SELFPOWER**

**USB\_BM\_ATTRIBUTES\_WAKEUP**

**USB\_BM\_ATTRIBUTES\_BATTERY**

**USB\_IAD\_DESC\_SIZE**

Size of a USB interface association descriptor in bytes.

**USB\_INTF\_DESC\_SIZE**

Size of a USB interface descriptor in bytes.

**USB\_EP\_DESC\_SIZE**

Size of a USB endpoint descriptor in bytes.

**USB\_B\_ENDPOINT\_ADDRESS\_EP\_NUM\_MASK**

Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

**USB\_B\_ENDPOINT\_ADDRESS\_EP\_DIR\_MASK**

**USB\_BM\_ATTRIBUTES\_XFERTYPE\_MASK**

Bit masks belonging to the bmAttributes field of an endpoint descriptor.

**USB\_BM\_ATTRIBUTES\_XFER\_CONTROL**

**USB\_BM\_ATTRIBUTES\_XFER\_ISOC**

**USB\_BM\_ATTRIBUTES\_XFER\_BULK**

**USB\_BM\_ATTRIBUTES\_XFER\_INT**

**USB\_BM\_ATTRIBUTES\_SYNC\_MASK**

**USB\_BM\_ATTRIBUTES\_SYNC\_NONE**

**USB\_BM\_ATTRIBUTES\_SYNC\_ASYNC**

**USB\_BM\_ATTRIBUTES\_SYNC\_ADAPTIVE**

**USB\_BM\_ATTRIBUTES\_SYNC\_SYNC**

**USB\_BM\_ATTRIBUTES\_USAGETYPE\_MASK**

**USB\_BM\_ATTRIBUTES\_USAGE\_DATA**

**USB\_BM\_ATTRIBUTES\_USAGE\_FEEDBACK**

**USB\_BM\_ATTRIBUTES\_USAGE\_IMPLICIT\_FB**

**USB\_EP\_DESC\_GET\_XFERTYPE** (desc\_ptr)

Macro helpers to get information about an endpoint from its descriptor.

**USB\_EP\_DESC\_GET\_EP\_NUM** (desc\_ptr)

**USB\_EP\_DESC\_GET\_EP\_DIR** (desc\_ptr)

**USB\_EP\_DESC\_GET\_MPS** (desc\_ptr)

**USB\_STR\_DESC\_SIZE**

Size of a short USB string descriptor in bytes.

## Enumerations

enum **usb\_device\_state\_t**

USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

---

**备注:** The **USB\_DEVICE\_STATE\_NOT\_ATTACHED** is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

---

*Values:*

enumerator **USB\_DEVICE\_STATE\_NOT\_ATTACHED**

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

**enumerator USB\_DEVICE\_STATE\_ATTACHED**

Device is attached to the USB, but is not powered.

**enumerator USB\_DEVICE\_STATE\_POWERED**

Device is attached to the USB and powered, but has not been reset.

**enumerator USB\_DEVICE\_STATE\_DEFAULT**

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

**enumerator USB\_DEVICE\_STATE\_ADDRESS**

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

**enumerator USB\_DEVICE\_STATE\_CONFIGURED**

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

**enumerator USB\_DEVICE\_STATE\_SUSPENDED**

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device's function.

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 [peripherals](#) 目录下。

## 2.4 应用层协议

### 2.4.1 mDNS 服务

#### 概述

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

绝大多数的操作系统默认都会安装 mDNS 服务，或者提供单独的安装包。Mac OS 默认会安装名为 Bonjour 的服务（该服务基于 mDNS），此外 Apple 还发布了适用于 Windows 系统的安装程序，可以在 [官方支持](#) 找到。在 Linux 上，mDNS 服务由 [avahi](#) 提供，通常也会被默认安装。

#### mDNS 属性

- `hostname`: 设备会去响应的主机名，如果没有设置，会根据设备的网络接口名定义 `hostname`。例如，`my-esp32s3` 会被解析为 `my-esp32s3.local`。
- `default_instance`: 默认实例名（即易记的设备名），例如 `Jhon's ESP32-S3 Thing`。如果没有设置，将会使用 `hostname`。

以下为 STA 接口启动 mDNS 服务并设置 `hostname` 和 `default_instance` 的示例方法：

```

void start_mdns_service()
{
    // 初始化 mDNS 服务
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    // 设置 hostname
    mdns_hostname_set("my-esp32s3");
    // 设置默认实例
    mdns_instance_name_set("Jhon's ESP32-S3 Thing");
}

```

**mDNS 服务** mDNS 可以广播设备能够提供的网络服务的相关信息，每个服务会由以下属性构成。

- `instance_name`: 实例名 (即易记的服务名)，例如 Jhon's ESP32-S3 Web Server。如果没有定义，会使用 `default_instance`。
- `service_type`: (必需) 服务类型，以下划线为前缀，[这里](#) 列出了常见的类型。
- `proto`: (必需) 服务运行所依赖的协议，以下划线为前缀，例如 `_tcp` 或者 `_udp`。
- `port`: (必需) 服务运行所用的端口号。
- `txt`: 形如 `{var, val}` 的字符串数组，用于定义服务的属性。

添加一些服务和不同属性的示例方法:

```

void add_mdns_services()
{
    // 添加服务
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    // 注意: 必须先添加服务, 然后才能设置其属性
    // web 服务器使用自定义的实例名
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32-S3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32s3"},
        {"u", "user"},
        {"p", "password"}
    };
    // 设置服务的文本数据 (会释放并替换当前数据)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    // 修改服务端口号
    mdns_service_port_set("_myservice", "_udp", 4321);
}

```

**mDNS 查询** mDNS 提供查询服务和解析主机 IP/IPv6 地址的方法。

服务查询的结果会作为 `mdns_result_t` 类型对象的链表返回。

解析主机 IP 地址的示例方法:

```

void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;

```

(下页继续)

```

addr.addr = 0;

esp_err_t err = mdns_query_a(host_name, 2000, &addr);
if(err){
    if(err == ESP_ERR_NOT_FOUND){
        printf("Host was not found!");
        return;
    }
    printf("Query Failed");
    return;
}

printf(IPSTR, IP2STR(&addr));
}

```

解析本地服务的示例方法:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
↪protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){

```

(下页继续)

```

    ESP_LOGE(TAG, "Query Failed");
    return;
}
if(!results){
    ESP_LOGW(TAG, "No results found!");
    return;
}

mdns_print_results(results);
mdns_query_results_free(results);
}

```

使用上述方法的示例:

```

void my_app_some_method(){
    // 搜索 esp32s3-mdns.local
    resolve_mdns_host("esp32s3-mdns");

    // 搜索 HTTP 服务器
    find_mdns_service("_http", "_tcp");
    // 或者搜索文件服务器
    find_mdns_service("_smb", "_tcp"); // Windows 系统的共享服务
    find_mdns_service("_afpovertcp", "_tcp"); // Apple AFP 文件共享服务
    find_mdns_service("_nfs", "_tcp"); // NFS 服务器
    find_mdns_service("_ftp", "_tcp"); // FTP 服务器
    // 或者网络打印机
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}

```

## 应用示例

有关 mDNS 服务器和查询器的应用示例请参考 [protocols/mdns](#)。

## API 参考

### Header File

- [components/mdns/include/mdns.h](#)

### Functions

*esp\_err\_t* **mdns\_init** (void)

Initialize mDNS on given interface.

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE when failed to register event handler
- ESP\_ERR\_NO\_MEM on memory error
- ESP\_FAIL when failed to start mdns task

void **mdns\_free** (void)

Stop and free mDNS server.

*esp\_err\_t* **mdns\_hostname\_set** (const char \*hostname)

Set the hostname for mDNS server required if you want to advertise services.

参数 **hostname** –Hostname to set

#### 返回

- ESP\_OK success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error

`esp_err_t mdns_delegate_hostname_add` (const char \*hostname, const `mdns_ip_addr_t` \*address\_list)

Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

#### 参数

- **hostname** –Hostname to add
- **address\_list** –The IP address list of the host

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error

`esp_err_t mdns_delegate_hostname_remove` (const char \*hostname)

Remove a delegated hostname All the services added to this host will also be removed.

参数 **hostname** –Hostname to remove

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error

bool `mdns_hostname_exists` (const char \*hostname)

Query whether a hostname has been added.

参数 **hostname** –Hostname to query

#### 返回

- true The hostname has been added.
- false The hostname has not been added.

`esp_err_t mdns_instance_name_set` (const char \*instance\_name)

Set the default instance name for mDNS server.

参数 **instance\_name** –Instance name to set

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error

`esp_err_t mdns_service_add` (const char \*instance\_name, const char \*service\_type, const char \*proto, uint16\_t port, `mdns_txt_item_t` txt[], size\_t num\_items)

Add service to mDNS server.

---

备注: The value length of txt items will be automatically decided by strlen

---

#### 参数

- **instance\_name** –instance name to set. If NULL, global instance name or hostname will be used. Note that `MDNS_MULTIPLE_INSTANCE` config option needs to be enabled for adding multiple instances with the same instance type.
- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **port** –service port
- **txt** –string array of TXT data (eg. {{ “var” ,” val” }, { “other” ,” 2” }})
- **num\_items** –number of items in TXT data

#### 返回

- `ESP_OK` success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error
- `ESP_FAIL` failed to add service

*esp\_err\_t* **mdns\_service\_add\_for\_host** (const char \*instance\_name, const char \*service\_type, const char \*proto, const char \*hostname, uint16\_t port, *mdns\_txt\_item\_t* txt[], size\_t num\_items)

Add service to mDNS server with a delegated hostname.

---

**备注:** The value length of txt items will be automatically decided by strlen

---

#### 参数

- **instance\_name** –instance name to set. If NULL, global instance name or hostname will be used Note that MDNS\_MULTIPLE\_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **port** –service port
- **txt** –string array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num\_items** –number of items in TXT data

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error
- `ESP_FAIL` failed to add service

bool **mdns\_service\_exists** (const char \*service\_type, const char \*proto, const char \*hostname)

Check whether a service has been added.

#### 参数

- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, checks for the local hostname.

#### 返回

- true Correspondding service has been added.
- false Service not found.

bool **mdns\_service\_exists\_with\_instance** (const char \*instance, const char \*service\_type, const char \*proto, const char \*hostname)

Check whether a service has been added.

#### 参数

- **instance** –instance name
- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, checks for the local hostname.

#### 返回

- true Correspondding service has been added.
- false Service not found.

*esp\_err\_t* **mdns\_service\_remove** (const char \*service\_type, const char \*proto)

Remove service from mDNS server.

#### 参数

- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_remove\_for\_host** (const char \*service\_type, const char \*proto, const char \*hostname)

Remove service from mDNS server with hostname.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **hostname** –service hostname. If NULL, local hostname will be used.

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_instance\_name\_set** (const char \*service\_type, const char \*proto, const char \*instance\_name)

Set instance name for service.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **instance\_name** –instance name to set

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_instance\_name\_set\_for\_host** (const char \*service\_type, const char \*proto, const char \*hostname, const char \*instance\_name)

Set instance name for service with hostname.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **instance\_name** –instance name to set

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_port\_set** (const char \*service\_type, const char \*proto, uint16\_t port)

Set service port.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **port** –service port

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_port\_set\_for\_host** (const char \*service\_type, const char \*proto, const char \*hostname, uint16\_t port)

Set service port with hostname.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **port** –service port

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_txt\_set** (const char \*service\_type, const char \*proto, *mdns\_txt\_item\_t* txt[], uint8\_t num\_items)

Replace all TXT items for service.

---

**备注:** The value length of txt items will be automatically decided by strlen

---

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **txt** –array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num\_items** –number of items in TXT data

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_txt\_set\_for\_host** (const char \*service\_type, const char \*proto, const char \*hostname, *mdns\_txt\_item\_t* txt[], uint8\_t num\_items)

Replace all TXT items for service with hostname.

---

**备注:** The value length of txt items will be automatically decided by strlen

---

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **txt** –array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num\_items** –number of items in TXT data

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_txt\_item\_set** (const char \*service\_type, const char \*proto, const char \*key, const char \*value)

Set/Add TXT item for service TXT record.

---

备注: The value length will be automatically decided by strlen

---

**参数**

- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **key** –the key that you want to add/update
- **value** –the new value of the key

**返回**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

*esp\_err\_t* `mdns_service_txt_item_set_with_explicit_value_len` (const char \*service\_type, const char \*proto, const char \*key, const char \*value, uint8\_t value\_len)

Set/Add TXT item for service TXT record.

**参数**

- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **key** –the key that you want to add/update
- **value** –the new value of the key
- **value\_len** –the length of the value

**返回**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

*esp\_err\_t* `mdns_service_txt_item_set_for_host` (const char \*service\_type, const char \*proto, const char \*hostname, const char \*key, const char \*value)

Set/Add TXT item for service TXT record with hostname.

---

备注: The value length will be automatically decided by strlen

---

**参数**

- **service\_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to add/update
- **value** –the new value of the key

**返回**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

*esp\_err\_t* **mdns\_service\_txt\_item\_set\_for\_host\_with\_explicit\_value\_len** (const char \*service\_type, const char \*proto, const char \*hostname, const char \*key, const char \*value, uint8\_t value\_len)

Set/Add TXT item for service TXT record with hostname and txt value length.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to add/update
- **value** –the new value of the key
- **value\_len** –the length of the value

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_txt\_item\_remove** (const char \*service\_type, const char \*proto, const char \*key)

Remove TXT item for service TXT record.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **key** –the key that you want to remove

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_txt\_item\_remove\_for\_host** (const char \*service\_type, const char \*proto, const char \*hostname, const char \*key)

Remove TXT item for service TXT record with hostname.

#### 参数

- **service\_type** –service type (\_http, \_ftp, etc)
- **proto** –service protocol (\_tcp, \_udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to remove

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

*esp\_err\_t* **mdns\_service\_remove\_all** (void)

Remove and free all services from mDNS server.

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mdns\_query\_async\_delete** (*mdns\_search\_once\_t* \*search)

Deletes the finished query. Call this only after the search has ended!

**参数** **search** –pointer to search object

**返回**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE search has not finished
- ESP\_ERR\_INVALID\_ARG pointer to search object is NULL

bool **mdns\_query\_async\_get\_results** (*mdns\_search\_once\_t* \*search, uint32\_t timeout, *mdns\_result\_t* \*\*results)

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

**参数**

- **search** –pointer to search object
- **timeout** –time in milliseconds to wait for answers
- **results** –pointer to the results of the query

**返回** True if search has finished before or at timeout False if search timeout is over

*mdns\_search\_once\_t* \***mdns\_query\_async\_new** (const char \*name, const char \*service\_type, const char \*proto, uint16\_t type, uint32\_t timeout, size\_t max\_results, *mdns\_query\_notify\_t* notifier)

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

**参数**

- **name** –service instance or host name (NULL for PTR queries)
- **service\_type** –service type (\_http, \_arduino, \_ftp etc.) (NULL for host queries)
- **proto** –service protocol (\_tcp, \_udp, etc.) (NULL for host queries)
- **type** –type of query (MDNS\_TYPE\_\*)
- **timeout** –time in milliseconds during which mDNS query is active
- **max\_results** –maximum results to be collected
- **notifier** –Notification function to be called when the result is ready, can be NULL

**返回** `mdns_search_once_s` pointer to new search object if query initiated successfully. NULL otherwise.

*esp\_err\_t* **mdns\_query** (const char \*name, const char \*service\_type, const char \*proto, uint16\_t type, uint32\_t timeout, size\_t max\_results, *mdns\_result\_t* \*\*results)

Query mDNS for host or service All following query methods are derived from this one.

**参数**

- **name** –service instance or host name (NULL for PTR queries)
- **service\_type** –service type (\_http, \_arduino, \_ftp etc.) (NULL for host queries)
- **proto** –service protocol (\_tcp, \_udp, etc.) (NULL for host queries)
- **type** –type of query (MDNS\_TYPE\_\*)
- **timeout** –time in milliseconds to wait for answers.
- **max\_results** –maximum results to be collected
- **results** –pointer to the results of the query results must be freed using `mdns_query_results_free` below

**返回**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG timeout was not given

void **mdns\_query\_results\_free** (*mdns\_result\_t* \*results)

Free query results.

**参数** **results** –linked list of results to be freed

`esp_err_t mdns_query_ptr` (const char \*service\_type, const char \*proto, uint32\_t timeout, size\_t max\_results, `mdns_result_t` \*\*results)

Query mDNS for service.

#### 参数

- **service\_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **max\_results** –maximum results to be collected
- **results** –pointer to the results of the query

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_query_srv` (const char \*instance\_name, const char \*service\_type, const char \*proto, uint32\_t timeout, `mdns_result_t` \*\*result)

Query mDNS for SRV record.

#### 参数

- **instance\_name** –service instance name
- **service\_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **result** –pointer to the result of the query

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_query_txt` (const char \*instance\_name, const char \*service\_type, const char \*proto, uint32\_t timeout, `mdns_result_t` \*\*result)

Query mDNS for TXT record.

#### 参数

- **instance\_name** –service instance name
- **service\_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **result** –pointer to the result of the query

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_query_a` (const char \*host\_name, uint32\_t timeout, `esp_ip4_addr_t` \*addr)

Query mDNS for A record.

#### 参数

- **host\_name** –host name to look for
- **timeout** –time in milliseconds to wait for answer.
- **addr** –pointer to the resulting IP4 address

#### 返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

*esp\_err\_t* **mdns\_query\_aaaa** (const char \*host\_name, uint32\_t timeout, esp\_ip6\_addr\_t \*addr)

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

#### 参数

- **host\_name** –host name to look for
- **timeout** –time in milliseconds to wait for answer. If 0, max\_results needs to be defined
- **addr** –pointer to the resulting IP6 address

#### 返回

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

*esp\_err\_t* **mdns\_handle\_system\_event** (void \*ctx, *system\_event\_t* \*event)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

#### 参数

- **ctx** –The system event context
- **event** –The system event

## Structures

struct **mdns\_txt\_item\_t**

mDNS basic text item structure Used in mdns\_service\_add()

### Public Members

const char \***key**

item key name

const char \***value**

item value string

struct **mdns\_ip\_addr\_s**

mDNS query linked list IP item

### Public Members

esp\_ip\_addr\_t **addr**

IP address

struct *mdns\_ip\_addr\_s* \***next**

next IP, or NULL for the last IP in the list

struct **mdns\_result\_s**

mDNS query result structure

## Public Members

struct *mdns\_result\_s* \***next**  
next result, or NULL for the last result in the list

*mdns\_if\_t* **tcpip\_if**  
interface index

uint32\_t **ttl**  
time to live

*mdns\_ip\_protocol\_t* **ip\_protocol**  
ip\_protocol type of the interface (v4/v6)

char \***instance\_name**  
instance name

char \***service\_type**  
service type

char \***proto**  
service protocol

char \***hostname**  
hostname

uint16\_t **port**  
service port

*mdns\_txt\_item\_t* \***txt**  
txt record

uint8\_t \***txt\_value\_len**  
array of txt value len of each record

size\_t **txt\_count**  
number of txt items

*mdns\_ip\_addr\_t* \***addr**  
linked list of IP addresses found

## Macros

**MDNS\_TYPE\_A**

**MDNS\_TYPE\_PTR**

**MDNS\_TYPE\_TXT**

**MDNS\_TYPE\_AAAA**

**MDNS\_TYPE\_SRV**

**MDNS\_TYPE\_OPT**

**MDNS\_TYPE\_NSEC**

**MDNS\_TYPE\_ANY**

### Type Definitions

typedef struct mdns\_search\_once\_s **mdns\_search\_once\_t**

Asynchronous query handle.

typedef struct *mdns\_ip\_addr\_s* **mdns\_ip\_addr\_t**

mDNS query linked list IP item

typedef enum *mdns\_if\_internal* **mdns\_if\_t**

typedef struct *mdns\_result\_s* **mdns\_result\_t**

mDNS query result structure

typedef void (\***mdns\_query\_notify\_t**)(*mdns\_search\_once\_t* \*search)

### Enumerations

enum **mdns\_ip\_protocol\_t**

mDNS enum to specify the ip\_protocol type

*Values:*

enumerator **MDNS\_IP\_PROTOCOL\_V4**

enumerator **MDNS\_IP\_PROTOCOL\_V6**

enumerator **MDNS\_IP\_PROTOCOL\_MAX**

enum **mdns\_if\_internal**

*Values:*

enumerator **MDNS\_IF\_STA**

enumerator **MDNS\_IF\_AP**

enumerator **MDNS\_IF\_ETH**

enumerator **MDNS\_IF\_MAX**

## 2.4.2 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
├── private_include
│   ├── esp_tls_mbedtls.h
│   └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **ca\_cert\_buf** and **ca\_cert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `ca_cert_buf` - pointer to the buffer which contains the CA cert.
  - `ca_cert_bytes` - size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk\_hint\_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

- **skip server verification:** This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca\_store etc.*

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**备注:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls `IN_CONTENT` length and `OUT_CONTENT` length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

---

**备注:** *These values are subject to change with change in configuration options and version of respective libraries.*

---

## Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in [Digital Signature](#).

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

---

**备注:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert\_buf*) and the DS params (*ds\_data*) are required and the client key (*clientkey\_buf*) can be set to NULL.

---

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

## API Reference

### Header File

- [components/esp-tls/esp\\_tls.h](#)

### Functions

***esp\_tls\_t*\*esp\_tls\_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**返回** *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

***esp\_tls\_t*\*esp\_tls\_conn\_new** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_new\_async*)

**参数**

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.

返回 pointer to `esp_tls_t`, or NULL if connection couldn't be opened.

int `esp_tls_conn_new_sync` (const char \*hostname, int hostlen, int port, const `esp_tls_cfg_t` \*cfg, `esp_tls_t` \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

#### 参数

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

#### 返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

`esp_tls_t` \*`esp_tls_conn_http_new` (const char \*url, const `esp_tls_cfg_t` \*cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host's url.

#### 参数

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘`esp_tls_cfg_t`’. At a minimum, this structure should be zero-initialized.

返回 pointer to `esp_tls_t`, or NULL if connection couldn't be opened.

int `esp_tls_conn_new_async` (const char \*hostname, int hostlen, int port, const `esp_tls_cfg_t` \*cfg, `esp_tls_t` \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

#### 参数

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

#### 返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int `esp_tls_conn_http_new_async` (const char \*url, const `esp_tls_cfg_t` \*cfg, `esp_tls_t` \*tls)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host's url.

**参数**

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`.
- **tls** –[in] pointer to esp-tls as `esp-tls` handle.

**返回**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

static inline ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \*tls, const void \*data, size\_t datalen)

Write from buffer ‘data’ into specified tls connection.

**参数**

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer from which data will be written.
- **datalen** –[in] Length of data buffer.

**返回**

- $\geq 0$  if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- $< 0$  if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

static inline ssize\_t **esp\_tls\_conn\_read** (*esp\_tls\_t* \*tls, void \*data, size\_t datalen)

Read from specified tls connection into the buffer ‘data’ .

**参数**

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer to hold read data.
- **datalen** –[in] Length of data buffer.

**返回**

- $> 0$  if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- $< 0$  if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

void **esp\_tls\_conn\_delete** (*esp\_tls\_t* \*tls)

Compatible version of `esp_tls_conn_destroy()` to close the TLS/SSL connection.

---

**备注:** This API will be removed in IDFv5.0

---

**参数** **tls** –[in] pointer to esp-tls as esp-tls handle.

int **esp\_tls\_conn\_destroy** (*esp\_tls\_t* \*tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new()` or `esp_tls_conn_http_new()` APIs.

**参数** **tls** –[in] pointer to esp-tls as esp-tls handle.

**返回** - 0 on success

- -1 if socket error or an invalid argument

ssize\_t **esp\_tls\_get\_bytes\_avail** (*esp\_tls\_t* \*tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over `mbedtls's mbedtls_ssl_get_bytes_avail()` API.

参数 **tls** –[in] pointer to esp-tls as esp-tls handle.

返回

- -1 in case of invalid arg
- bytes available in the application data record read buffer

*esp\_err\_t* **esp\_tls\_get\_conn\_sockfd** (*esp\_tls\_t* \*tls, int \*sockfd)

Returns the connection socket file descriptor from *esp\_tls* session.

参数

- **tls** –[in] handle to *esp\_tls* context
- **sockfd** –[out] int pointer to sockfd value.

返回 - ESP\_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd == NULL)

*esp\_err\_t* **esp\_tls\_init\_global\_ca\_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

返回

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* **esp\_tls\_set\_global\_ca\_store** (const unsigned char \*cacert\_pem\_buf, const unsigned int cacert\_pem\_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

参数

- **cacert\_pem\_buf** –[in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert\_pem\_bytes** –[in] Length of the buffer.

返回

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_tls\_free\_global\_ca\_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error** (*esp\_tls\_error\_handle\_t* h, int \*esp\_tls\_code, int \*esp\_tls\_flags)

Returns last error in *esp\_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

参数

- **h** –[in] esp-tls error handle.
- **esp\_tls\_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`
- **esp\_tls\_flags** –[out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

返回

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK (0) if no error occurred

- specific error code (based on ESP\_ERR\_ESP\_TLS\_BASE) otherwise

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_error\_type** (*esp\_tls\_error\_handle\_t* h, *esp\_tls\_error\_type\_t* err\_type, int \*error\_code)

Returns the last error captured in *esp\_tls* of a specific type The error information is cleared internally upon return.

#### 参数

- **h** –[in] esp-tls error handle.
- **err\_type** –[in] specific error type
- **error\_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

#### 返回

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK if a valid error returned and was cleared

*mbedtls\_x509\_crt* \***esp\_tls\_get\_global\_ca\_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call *esp\_tls\_set\_global\_ca\_store*(). Then the same CA store could be used by the application for APIs other than *esp\_tls*.

---

**备注:** Modifying the pointer might cause a failure in verifying the certificates.

---

#### 返回

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

*esp\_err\_t* **esp\_tls\_plain\_tcp\_connect** (const char \*host, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_error\_handle\_t* error\_handle, int \*sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

#### 参数

- **host** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] ESP-TLS configuration as *esp\_tls\_cfg\_t*.
- **error\_handle** –[out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** –[out] Socket descriptor if successfully connected on TCP layer

**返回** ESP\_OK on success ESP\_ERR\_INVALID\_ARG if invalid output parameters ESP-TLS based error codes on failure

## Structures

struct **psk\_key\_hint**

ESP-TLS preshared key and hint structure.

## Public Members

const uint8\_t \***key**

key in PSK authentication mode in binary format

const size\_t **key\_size**

length of the key

const char \***hint**

hint in PSK authentication mode in string format

struct **tls\_keep\_alive\_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

### Public Members

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time (second)

int **keep\_alive\_interval**

Keep-alive interval time (second)

int **keep\_alive\_count**

Keep-alive packet retry send count

struct **esp\_tls\_cfg**

ESP-TLS configuration parameters.

---

**备注:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

### Public Members

const char \*\***alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char \***cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char \***cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char \***clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char \***clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

const unsigned char \***clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char \***clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

const unsigned char \***clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**

Enable this option to use secure element or atec608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout\_ms**

Network timeout in milliseconds

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void \***ds\_data**

Pointer for digital signature peripheral context

bool **is\_plain\_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp\_tls\_plain\_tcp\_connect() API

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

struct **esp\_tls**

ESP-TLS Connection Handle.

## Public Members

mbedtls\_ssl\_context **ssl**

TLS/SSL context

mbedtls\_entropy\_context **entropy**

mbedTLS entropy context structure

mbedtls\_ctr\_drbg\_context **ctr\_drbg**

mbedTLS ctr drbg context structure. CTR\_DRBG is deterministic random bit generation based on AES-256

`mbedtls_ssl_config` **conf**

TLS/SSL configuration to be shared between `mbedtls_ssl_context` structures

`mbedtls_net_context` **server\_fd**

mbedTLS wrapper type for sockets

`mbedtls_x509_cert` **cacert**

Container for the X.509 CA certificate

`mbedtls_x509_cert` \***cacert\_ptr**

Pointer to the cacert being used.

`mbedtls_x509_cert` **clientcert**

Container for the X.509 client certificate

`mbedtls_pk_context` **clientkey**

Container for the private key of the client certificate

int **sockfd**

Underlying socket file descriptor.

ssize\_t (\***read**)(struct *esp\_tls* \*tls, char \*data, size\_t datalen)

Callback function for reading data from TLS/SSL connection.

ssize\_t (\***write**)(struct *esp\_tls* \*tls, const char \*data, size\_t datalen)

Callback function for writing data to TLS/SSL connection.

*esp\_tls\_conn\_state\_t* **conn\_state**

ESP-TLS Connection state

fd\_set **rset**

read file descriptors

fd\_set **wset**

write file descriptors

bool **is\_tls**

indicates connection type (TLS or NON-TLS)

*esp\_tls\_role\_t* **role**

esp-tls role

- `ESP_TLS_CLIENT`
- `ESP_TLS_SERVER`

`esp_tls_error_handle_t` **error\_handle**

handle to error descriptor

## Type Definitions

typedef enum *esp\_tls\_conn\_state* **esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

typedef enum *esp\_tls\_role* **esp\_tls\_role\_t**

typedef struct *psk\_key\_hint* **psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls\_keep\_alive\_cfg* **tls\_keep\_alive\_cfg\_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef struct *esp\_tls\_cfg* **esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

---

**备注:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

typedef struct *esp\_tls* **esp\_tls\_t**

ESP-TLS Connection Handle.

## Enumerations

enum **esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

enumerator **ESP\_TLS\_INIT**

enumerator **ESP\_TLS\_CONNECTING**

enumerator **ESP\_TLS\_HANDSHAKE**

enumerator **ESP\_TLS\_FAIL**

enumerator **ESP\_TLS\_DONE**

enum **esp\_tls\_role**

*Values:*

enumerator **ESP\_TLS\_CLIENT**

enumerator **ESP\_TLS\_SERVER**

### 2.4.3 OpenSSL-APIs

---

**备注:** The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp\_tls> instead.

---

The code of this API (located in [openssl](#) directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

#### Chapter Introduction

- Chapter 1. SSL Context Method Create
- Chapter 2. SSL Context Function
- Chapter 3. SSL Function
- Chapter 4. SSL X509 Certification and Private Key Function

#### Chapter 1. SSL Context Method Create

1.1 `const SSL_METHOD* SSLv3_client_method (void)`

Arguments:

none

Return:

SSLV3.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 `const SSL_METHOD* TLSv1_client_method (void)`

Arguments:

none

Return:

```
TLsv1_0 version SSL context client method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = TLsv1_client_method();
    ...
}
```

**1.3 const SSL\_METHOD\* TLsv1\_1\_client\_method (void)****Arguments:**

```
none
```

**Return:**

```
TLsv1.1 version SSL context client method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = TLsv1_1_client_method();
    ...
}
```

**1.4 const SSL\_METHOD\* TLsv1\_2\_client\_method (void)****Arguments:**

```
none
```

**Return:**

```
TLsv1.2 version SSL context client method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = TLsv1_2_client_method();
    ...
}
```

**1.5 const SSL\_METHOD\* TLS\_client\_method (void)**

**Arguments:**

```
none
```

**Return:**

```
TLSV1.2 version SSL context client method point
```

**Description:**

```
create the default SSL context method, it's always to be TLSV1.2
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();

    ...
}
```

**1.6 const SSL\_METHOD\* SSLv3\_server\_method (void)****Arguments:**

```
none
```

**Return:**

```
SSLV3.0 version SSL context server method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();

    ...
}
```

**1.7 const SSL\_METHOD\* TLSv1\_server\_method (void)****Arguments:**

```
none
```

**Return:**

```
TLSV1.0 version SSL context server method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
```

(下页继续)

(续上页)

```
    ...  
}
```

**1.8 const SSL\_METHOD\* TLSv1\_1\_server\_method (void)****Arguments:**

```
none
```

**Return:**

```
TLSV1.1 version SSL context server method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)  
{  
    const SSL_METHOD *method = TLSv1_1_server_method();  
    ...  
}
```

**1.9 const SSL\_METHOD\* TLSv1\_2\_server\_method (void)****Arguments:**

```
none
```

**Return:**

```
TLSV1.2 version SSL context server method point
```

**Description:**

```
create the target SSL context method
```

**Example:**

```
void example(void)  
{  
    const SSL_METHOD *method = TLSv1_2_server_method();  
    ...  
}
```

**1.10 const SSL\_METHOD\* TLS\_server\_method (void)****Arguments:**

```
none
```

**Return:**

```
TLSV1.2 version SSL context server method point
```

**Description:**

```
create the default SSL context method, it's always to be TLSV1.2
```

**Example:**

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

**Chapter 2. SSL Context Function****2.1 SSL\_CTX\* SSL\_CTX\_new (const SSL\_METHOD \* method)****Arguments:**

```
method - the SSL context method point
```

**Return:**

```
context point
```

**Description:**

```
create a SSL context
```

**Example:**

```
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

**2.2 void SSL\_CTX\_free (SSL\_CTX \* ctx)****Arguments:**

```
ctx - the SSL context point
```

**Return:**

```
none
```

**Description:**

```
free a SSL context
```

**Example:**

```
void example(void)
{
    SSL_CTX *ctx;
    ... ..
    SSL_CTX_free(ctx);
}
```

### 2.3 int SSL\_CTX\_set\_ssl\_version (SSL\_CTX \* ctx, const SSL\_METHOD \* meth)

**Arguments:**

```
ctx - SSL context point  
meth - SSL method point
```

**Return:**

```
1 : OK  
0 : failed
```

**Description:**

```
set the SSL context version
```

**Example:**

```
void example(void)  
{  
    SSL_CTX *ctx;  
    const SSL_METHOD *meth;  
  
    ... ..  
  
    SSL_CTX_set_ssl_version(ctx, meth);  
}
```

### 2.4 const SSL\_METHOD\* SSL\_CTX\_get\_ssl\_method (SSL\_CTX \* ctx)

**Arguments:**

```
ctx - SSL context point
```

**Return:**

```
SSL context method
```

**Description:**

```
get the SSL context method
```

**Example:**

```
void example(void)  
{  
    const SSL_METHOD *method;  
    SSL_CTX *ctx;  
  
    ... ..  
  
    method = SSL_CTX_get_ssl_method(ctx);  
}
```

## Chapter 3. SSL Function

### 3.1 SSL\* SSL\_new (SSL\_CTX \* ctx)

**Arguments:**

```
ctx - SSL context point
```

**Return:**

```
SSL method
```

**Description:**

```
create a SSL
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;

    ... ..

    ssl = SSL_new(ctx);
}
```

**3.2 void SSL\_free (SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
none
```

**Description:**

```
free SSL
```

**Example:**

```
void example(void)
{
    SSL *ssl;

    ... ..

    SSL_free(ssl);
}
```

**3.3 int SSL\_do\_handshake (SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

**Description:**

```
perform the SSL handshake
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_do_handshake(ssl);
}
```

### 3.4 int SSL\_connect (SSL \* ssl)

#### Arguments:

```
ssl - SSL point
```

#### Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

#### Description:

```
connect to the remote SSL server
```

#### Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_connect(ssl);
}
```

### 3.5 int SSL\_accept (SSL \* ssl)

#### Arguments:

```
ssl - SSL point
```

#### Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

#### Description:

```
accept the remote connection
```

#### Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..
```

(下页继续)

(续上页)

```
ret = SSL_accept(ssl);  
}
```

### 3.6 int SSL\_shutdown (SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
1 : OK  
0 : failed, connect is close by remote  
-1 : a error catch
```

**Description:**

```
shutdown the connection
```

**Example:**

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_shutdown(ssl);  
}
```

### 3.7 int SSL\_clear (SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
1 : OK  
0 : failed
```

**Description:**

```
shutdown the connection
```

**Example:**

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_clear(ssl);  
}
```

### 3.8 int SSL\_read (SSL \* ssl, void \* buffer, int len)

**Arguments:**

```
ssl    - point
buffer - data buffer point
len    - data length
```

**Return:**

```
> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch
```

**Description:**

```
read data from remote
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ..

    ret = SSL_read(ssl, buf, len);
}
```

**3.9 int SSL\_write (SSL \* ssl, const void \* buffer, int len)****Arguments:**

```
ssl    - SSL point
buffer - data buffer point
len    - data length
```

**Return:**

```
> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch
```

**Description:**

```
send the data to remote
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ..

    ret = SSL_write(ssl, buf, len);
}
```

**3.10 SSL\_CTX \*SSL\_get\_SSL\_CTX (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
SSL context
```

**Description:**

```
get SSL context of the SSL
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;

    ... ..

    ctx = SSL_get_SSL_CTX(ssl);
}
```

**3.11 int SSL\_get\_shutdown (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
shutdown mode
```

**Description:**

```
get SSL shutdown mode
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    int mode;

    ... ..

    mode = SSL_get_SSL_CTX(ssl);
}
```

**3.12 void SSL\_set\_shutdown (SSL \* ssl, int mode)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
shutdown mode
```

**Description:**

```
set SSL shutdown mode
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    int mode = 0;

    ... ..

    SSL_set_shutdown(ssl, mode);
}
```

### 3.13 const SSL\_METHOD\* SSL\_get\_ssl\_method (SSL \* ssl)

#### Arguments:

ssl - SSL point

#### Return:

SSL method

#### Description:

set SSL shutdown mode

#### Example:

```
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;

    ... ..

    method = SSL_get_ssl_method(ssl);
}
```

### 3.14 int SSL\_set\_ssl\_method (SSL \* ssl, const SSL\_METHOD \* method)

#### Arguments:

ssl - SSL point  
meth - SSL method point

#### Return:

1 : OK  
0 : failed

#### Description:

set the SSL method

#### Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;

    ... ..
```

(下页继续)

(续上页)

```
ret = SSL_set_ssl_method(ssl, method);  
}
```

### 3.15 int SSL\_pending (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
data bytes
```

**Description:**

```
get received data bytes
```

**Example:**

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_pending(ssl);  
}
```

### 3.16 int SSL\_has\_pending (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
1 : Yes  
0 : No
```

**Description:**

```
check if data is received
```

**Example:**

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_has_pending(ssl);  
}
```

### 3.17 int SSL\_get\_fd (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
>= 0 : socket id  
< 0 : a error catch
```

**Description:**

```
get the socket of the SSL
```

**Example:**

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_fd(ssl);  
}
```

**3.18 int SSL\_get\_rfd(const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
>= 0 : socket id  
< 0 : a error catch
```

**Description:**

```
get the read only socket of the SSL
```

**Example:**

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_rfd(ssl);  
}
```

**3.19 int SSL\_get\_wfd(const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
>= 0 : socket id  
< 0 : a error catch
```

**Description:**

```
get the write only socket of the SSL
```

**Example:**

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_get_wfd(ssl);
}
```

### 3.20 int SSL\_set\_fd(SSL \* ssl, int fd)

**Arguments:**

```
ssl - SSL point
fd - socket id
```

**Return:**

```
1 : OK
0 : failed
```

**Description:**

```
set socket to SSL
```

**Example:**

```
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;

    ... ..

    ret = SSL_set_fd(ssl, socket);
}
```

### 3.21 int SSL\_set\_rfd(SSL \* ssl, int fd)

**Arguments:**

```
ssl - SSL point
fd - socket id
```

**Return:**

```
1 : OK
0 : failed
```

**Description:**

```
set read only socket to SSL
```

**Example:**

```
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
```

(下页继续)

(续上页)

```
... ..  
ret = SSL_set_rfd(ssl, socket);  
}
```

### 3.22 int SSL\_set\_wfd (SSL \* ssl, int fd)

**Arguments:**

```
ssl - SSL point  
fd - socket id
```

**Return:**

```
1 : OK  
0 : failed
```

**Description:**

```
set write only socket to SSL
```

**Example:**

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    int socket;  
  
    ... ..  
  
    ret = SSL_set_wfd(ssl, socket);  
}
```

### 3.23 int SSL\_version (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
SSL version
```

**Description:**

```
get SSL version
```

**Example:**

```
void example(void)  
{  
    int version;  
    SSL *ssl;  
  
    ... ..  
  
    version = SSL_version(ssl);  
}
```

### 3.24 const char\* SSL\_get\_version (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
SSL version string
```

**Description:**

```
get the SSL current version string
```

**Example:**

```
void example(void)
{
    char *version;
    SSL *ssl;

    ... ..

    version = SSL_get_version(ssl);
}
```

**3.25 OSSL\_HANDSHAKE\_STATE SSL\_get\_state (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
SSL state
```

**Description:**

```
get the SSL state
```

**Example:**

```
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;

    ... ..

    state = SSL_get_state(ssl);
}
```

**3.26 const char\* SSL\_alert\_desc\_string (int value)****Arguments:**

```
value - SSL description
```

**Return:**

```
alert value string
```

**Description:**

```
get alert description string
```

**Example:**

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string(val);
}
```

**3.27 const char\* SSL\_alert\_desc\_string\_long (int value)****Arguments:**

```
value - SSL description
```

**Return:**

```
alert value long string
```

**Description:**

```
get alert description long string
```

**Example:**

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string_long(val);
}
```

**3.28 const char\* SSL\_alert\_type\_string (int value)****Arguments:**

```
value - SSL type description
```

**Return:**

```
alert type string
```

**Description:**

```
get alert type string
```

**Example:**

```
void example(void)
{
    int val;
    char *str;

    ... ..
```

(下页继续)

(续上页)

```
    str = SSL_alert_type_string(val);  
}
```

### 3.29 const char\* SSL\_alert\_type\_string\_long (int value)

**Arguments:**

```
value - SSL type description
```

**Return:**

```
alert type long string
```

**Description:**

```
get alert type long string
```

**Example:**

```
void example(void)  
{  
    int val;  
    char *str;  
  
    ... ..  
  
    str = SSL_alert_type_string_long(val);  
}
```

### 3.30 const char\* SSL\_rstate\_string (SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
state string
```

**Description:**

```
get the state string where SSL is reading
```

**Example:**

```
void example(void)  
{  
    SSL *ssl;  
    char *str;  
  
    ... ..  
  
    str = SSL_rstate_string(ssl);  
}
```

### 3.31 const char\* SSL\_rstate\_string\_long (SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
state long string
```

**Description:**

```
get the state long string where SSL is reading
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_rstate_string_long(ssl);
}
```

**3.32 const char\* SSL\_state\_string (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
state string
```

**Description:**

```
get the state string
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    const char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

**3.33 char\* SSL\_state\_string\_long (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
state long string
```

**Description:**

```
get the state long string
```

**Example:**

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

### 3.34 int SSL\_get\_error (const SSL \* ssl, int ret\_code)

#### Arguments:

```
ssl      - SSL point
ret_code - SSL return code
```

#### Return:

```
SSL error number
```

#### Description:

```
get SSL error code
```

#### Example:

```
void example(void)
{
    SSL *ssl;
    int ret;
    int err;

    ... ..

    err = SSL_get_error(ssl, ret);
}
```

### 3.35 int SSL\_want (const SSL \* ssl)

#### Arguments:

```
ssl - SSL point
```

#### Return:

```
specific statement
```

#### Description:

```
get the SSL specific statement
```

#### Example:

```
void example(void)
{
    SSL *ssl;
    int state;

    ... ..

    state = SSL_want(ssl);
}
```

## 3.36 int SSL\_want\_nothing (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
0 : false  
1 : true
```

**Description:**

```
check if SSL want nothing
```

**Example:**

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_want(ssl);  
}
```

## 3.37 int SSL\_want\_read (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
0 : false  
1 : true
```

**Description:**

```
check if SSL want to read
```

**Example:**

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_want_read(ssl);  
}
```

## 3.38 int SSL\_want\_write (const SSL \* ssl)

**Arguments:**

```
ssl - SSL point
```

**Return:**

```
0 : false  
1 : true
```

## Description:

```
check if SSL want to write
```

## Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want_write(ssl);
}
```

**Chapter 4. SSL X509 Certification and Private Key Function**

## 4.1 X509 \* d2i\_X509 (X509 \*\* cert, const unsigned char \* buffer, long len)

## Arguments:

```
cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes
```

## Return:

```
X509 certification object point
```

## Description:

```
load a character certification context into system context. If '*cert' is
→pointed to the
certification, then load certification into it. Or create a new X509
→certification object
```

## Example:

```
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ... ..

    new = d2i_X509(&cert, buffer, len);
}
```

## 4.2 int SSL\_add\_client\_CA (SSL \* ssl, X509 \* x)

## Arguments:

```
ssl - SSL point
x - CA certification point
```

## Return:

```
1 : OK
0 : failed
```

**Description:**

```
add CA client certification into the SSL
```

**Example:**

```
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;

    ... ..

    ret = SSL_add_client_CA(ssl, new);
}
```

**4.3 int SSL\_CTX\_add\_client\_CA (SSL\_CTX \* ctx, X509 \* x)****Arguments:**

```
ctx - SSL context point
x   - CA certification point
```

**Return:**

```
1 : OK
0 : failed
```

**Description:**

```
add CA client certification into the SSL context
```

**Example:**

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;

    ... ..

    ret = SSL_CTX_add_client_CA(ctx, new);
}
```

**4.4 X509\* SSL\_get\_certificate (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
SSL certification point
```

**Description:**

```
get the SSL certification point
```

**Example:**

```

void example(void)
{
    SSL *ssl;
    X509 *cert;

    ... ..

    cert = SSL_get_certificate(ssl);
}

```

#### 4.5 long SSL\_get\_verify\_result (const SSL \* ssl)

##### Arguments:

ssl - SSL point

##### Return:

the result of verifying

##### Description:

get the verifying result of the SSL certification

##### Example:

```

void example(void)
{
    SSL *ssl;
    long ret;

    ... ..

    ret = SSL_get_verify_result(ssl);
}

```

#### 4.6 int SSL\_CTX\_use\_certificate (SSL\_CTX \* ctx, X509 \* x)

##### Arguments:

ctx - the SSL context point  
pkey - certification object point

##### Return:

1 : OK  
0 : failed

##### Description:

load the certification into the SSL\_CTX or SSL object

##### Example:

```

void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;

    ... ..
}

```

(下页继续)

(续上页)

```
ret = SSL_CTX_use_certificate(ctx, new);  
}
```

#### 4.7 int SSL\_CTX\_use\_certificate\_ASN1 (SSL\_CTX \* ctx, int len, const unsigned char \* d)

##### Arguments:

```
ctx - SSL context point  
len - certification length  
d   - data point
```

##### Return:

```
1 : OK  
0 : failed
```

##### Description:

```
load the ASN1 certification into SSL context
```

##### Example:

```
void example(void)  
{  
    int ret;  
    SSL_CTX *ctx;  
    const unsigned char *buf;  
    int len;  
  
    ... ..  
  
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);  
}
```

#### 4.8 int SSL\_CTX\_use\_PrivateKey (SSL\_CTX \* ctx, EVP\_PKEY \* pkey)

##### Arguments:

```
ctx - SSL context point  
pkey - private key object point
```

##### Return:

```
1 : OK  
0 : failed
```

##### Description:

```
load the private key into the context object
```

##### Example:

```
void example(void)  
{  
    int ret;  
    SSL_CTX *ctx;  
    EVP_PKEY *pkey;  
  
    ... ..  
  
    ret = SSL_CTX_use_PrivateKey(ctx, pkey);  
}
```

## 4.9 int SSL\_CTX\_use\_PrivateKey\_ASN1 (int pk, SSL\_CTX \* ctx, const unsigned char \* d, long len)

**Arguments:**

```
ctx - SSL context point
d   - data point
len - private key length
```

**Return:**

```
1 : OK
0 : failed
```

**Description:**

```
load the ASN1 private key into SSL context
```

**Example:**

```
void example(void)
{
    int ret;
    int pk;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

## 4.10 int SSL\_CTX\_use\_RSAPrivateKey\_ASN1 (SSL\_CTX \* ctx, const unsigned char \* d, long len)

**Arguments:**

```
ctx - SSL context point
d   - data point
len - private key length
```

**Return:**

```
1 : OK
0 : failed
```

**Description:**

```
load the RSA ASN1 private key into SSL context
```

**Example:**

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);
}
```

## 4.11 int SSL\_use\_certificate\_ASN1 (SSL \* ssl, int len, const unsigned char \* d)

**Arguments:**

```
ssl - SSL point  
len - data bytes  
d   - data point
```

**Return:**

```
1 : OK  
0 : failed
```

**Description:**

```
load certification into the SSL
```

**Example:**

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    const unsigned char *buf;  
    long len;  
  
    ... ..  
  
    ret = SSL_use_certificate_ASN1(ssl, len, buf);  
}
```

**4.12 X509\* SSL\_get\_peer\_certificate (const SSL \* ssl)****Arguments:**

```
ssl - SSL point
```

**Return:**

```
peer certification
```

**Description:**

```
get peer certification
```

**Example:**

```
void example(void)  
{  
    SSL *ssl;  
    X509 *peer;  
  
    ... ..  
  
    peer = SSL_get_peer_certificate(ssl);  
}
```

## 2.4.4 ESP HTTP Client

### Overview

esp\_http\_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- `esp_http_client_init()`: To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the `esp_http_client_config_t` configurations. Which configuration values we do not define, the library will use default.
- `esp_http_client_perform()`: The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the `event_handle` (defined by `esp_http_client_config_t`). This function performs its job and blocks the current task until it' s done
- `esp_http_client_cleanup()`: After completing our `esp_http_client`' s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

### Application Example

```

esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.s", evt->data_len, (char*)evt->data);
            }

            break;
        case HTTP_EVENT_ON_FINISH:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
            break;
        case HTTP_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
            break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

## Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with same ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

### Persistent Connections example

```
esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);
```

## HTTPS

The HTTP client supports SSL connections using **mbedtls**, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#) (enabled by default).

---

**备注:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`

---

### HTTPS example

```
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

## HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

**Perform HTTP request as Stream reader** Check the example function `http_perform_as_stream_reader` at [protocols/esp\\_http\\_client](#).

## HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of `config` entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the `UNAUTHORIZED` header. Based on this information, it will know which authentication method to choose, and perform it on the second.

### Config authentication example with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

### Config authentication example with username, password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp\\_http\\_client](#).

## API Reference

### Header File

- `components/esp_http_client/include/esp_http_client.h`

**Functions**

*esp\_http\_client\_handle\_t* **esp\_http\_client\_init** (const *esp\_http\_client\_config\_t* \*config)

Start a HTTP session This function must be the first function to call, and it returns a *esp\_http\_client\_handle\_t* that you must use as input to other functions in the interface. This call MUST have a corresponding call to *esp\_http\_client\_cleanup* when the operation is complete.

**参数 config** –[in] The configurations, see *http\_client\_config\_t*  
**返回**

- *esp\_http\_client\_handle\_t*
- NULL if any errors

*esp\_err\_t* **esp\_http\_client\_perform** (*esp\_http\_client\_handle\_t* client)

Invoke this function after *esp\_http\_client\_init* and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same *esp\_http\_client\_handle\_t* as input as the *esp\_http\_client\_init* call returned. *esp\_http\_client\_perform* performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking *esp\_http\_client\_perform*(), *is\_async* member of *esp\_http\_client\_config\_t* must be set while making a call to *esp\_http\_client\_init*() API. You can do any amount of calls to *esp\_http\_client\_perform* while using the same *esp\_http\_client\_handle\_t*. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. *esp\_http\_client* will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use *esp\_http\_client\_set\_\** between the invokes to set options for the following *esp\_http\_client\_perform*.

---

**备注:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several *esp\_http\_client\_handle\_t*. This function include *esp\_http\_client\_open* -> *esp\_http\_client\_write* -> *esp\_http\_client\_fetch\_headers* -> *esp\_http\_client\_read* (and option) *esp\_http\_client\_close*.

---

**参数 client** –The *esp\_http\_client* handle  
**返回**

- ESP\_OK on successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_http\_client\_set\_url** (*esp\_http\_client\_handle\_t* client, const char \*url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**参数**

- **client** –[in] The *esp\_http\_client* handle
- **url** –[in] The url

**返回**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_set\_post\_field** (*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before *esp\_http\_client\_perform*. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**参数**

- **client** –[in] The *esp\_http\_client* handle
- **data** –[in] post data pointer
- **len** –[in] post length

**返回**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_get\_post\_field** (*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**参数**

- **client** –[in] The client
- **data** –[out] Point to post data pointer

**返回** Size of post data

*esp\_err\_t* **esp\_http\_client\_set\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**参数**

- **client** –[in] The `esp_http_client` handle
- **key** –[in] The header key
- **value** –[in] The header value

**返回**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**参数**

- **client** –[in] The `esp_http_client` handle
- **key** –[in] The header key
- **value** –[out] The header value

**返回**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**参数**

- **client** –[in] The `esp_http_client` handle
- **value** –[out] The username value

**返回**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**参数**

- **client** –[in] The `esp_http_client` handle
- **username** –[in] The username value

**返回**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**参数**

- **client** –[in] The `esp_http_client` handle
- **value** –[out] The password value

## 返回

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, const char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

## 参数

- **client** –[in] The esp\_http\_client handle
- **password** –[in] The password value

## 返回

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request auth\_type.

## 参数

- **client** –[in] The esp\_http\_client handle
- **auth\_type** –[in] The esp\_http\_client auth type

## 返回

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

int **esp\_http\_client\_get\_errno** (*esp\_http\_client\_handle\_t* client)

Get HTTP client session errno.

参数 **client** –[in] The esp\_http\_client handle

## 返回

- (-1) if invalid argument
- errno

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

## 参数

- **client** –[in] The esp\_http\_client handle
- **method** –[in] The method

## 返回

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_timeout\_ms** (*esp\_http\_client\_handle\_t* client, int timeout\_ms)

Set http request timeout.

## 参数

- **client** –[in] The esp\_http\_client handle
- **timeout\_ms** –[in] The timeout value

## 返回

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

## 参数

- **client** –[in] The esp\_http\_client handle
- **key** –[in] The key

## 返回

- ESP\_OK

- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

参数

- **client** –[in] The esp\_http\_client handle
- **write\_len** –[in] HTTP Content length need to write to the server

返回

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* client, const char \*buffer, int len)

This function will write data to the HTTP connection previously opened by esp\_http\_client\_open()

参数

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] This value must not be larger than the write\_len parameter provided to esp\_http\_client\_open()

返回

- (-1) if any errors
- Length of data written

int **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* client)

This function need to call after esp\_http\_client\_open, it will read from http stream, process all receive headers.

参数 **client** –[in] The esp\_http\_client handle

返回

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp\_http\_client\_is\_chunked response)
- (-1: ESP\_FAIL) if any errors
- Download data length defined by content-length header

bool **esp\_http\_client\_is\_chunked\_response** (*esp\_http\_client\_handle\_t* client)

Check response data is chunked.

参数 **client** –[in] The esp\_http\_client handle

返回 true or false

int **esp\_http\_client\_read** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Read data from http stream.

参数

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] The length

返回

- (-1) if any errors
- Length of data was read

int **esp\_http\_client\_get\_status\_code** (*esp\_http\_client\_handle\_t* client)

Get http response status code, the valid value if this function invoke after esp\_http\_client\_perform

参数 **client** –[in] The esp\_http\_client handle

返回 Status code

int **esp\_http\_client\_get\_content\_length** (*esp\_http\_client\_handle\_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp\_http\_client\_perform

参数 **client** –[in] The esp\_http\_client handle

返回

- (-1) Chunked transfer
- Content-Length value as bytes

*esp\_err\_t* **esp\_http\_client\_close** (*esp\_http\_client\_handle\_t* client)

Close http connection, still kept all http request resources.

参数 **client** –[in] The esp\_http\_client handle

返回

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_cleanup** (*esp\_http\_client\_handle\_t* client)

This function must be the last function to call for an session. It is the opposite of the esp\_http\_client\_init function and must be called with the same handle as input that a esp\_http\_client\_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with esp\_http\_client.

参数 **client** –[in] The esp\_http\_client handle

返回

- ESP\_OK
- ESP\_FAIL

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t* client)

Get transport type.

参数 **client** –[in] The esp\_http\_client handle

返回

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

*esp\_err\_t* **esp\_http\_client\_set\_redirection** (*esp\_http\_client\_handle\_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

参数 **client** –[in] The esp\_http\_client handle

返回

- ESP\_OK
- ESP\_FAIL

void **esp\_http\_client\_add\_auth** (*esp\_http\_client\_handle\_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

---

**备注:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

---

参数 **client** –[in] The esp\_http\_client handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t* client)

Checks if entire data in the response has been read without any error.

参数 **client** –[in] The esp\_http\_client handle

返回

- true
- false

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls esp\_http\_client\_read multiple times till the end of data is reached or till the buffer gets full.

**参数**

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] The buffer length

**返回**

- Length of data was read

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* client, int \*len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**参数**

- **client** –[in] The esp\_http\_client handle
- **len** –Length of data discarded

**返回**

- ESP\_OK If successful, len will have discarded length
- ESP\_FAIL If failed to read response
- ESP\_ERR\_INVALID\_ARG If the client is NULL

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* client, char \*url, const int len)

Get URL from client.

**参数**

- **client** –[in] The esp\_http\_client handle
- **url** –[inout] The buffer to store URL
- **len** –[in] The buffer length

**返回**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* client, int \*len)

Get Chunk-Length from client.

**参数**

- **client** –[in] The esp\_http\_client handle
- **len** –[out] Variable to store length

**返回**

- ESP\_OK If successful, len will have length of current chunk
- ESP\_FAIL If the server is not a chunked server
- ESP\_ERR\_INVALID\_ARG If the client or len are NULL

**Structures**

struct **esp\_http\_client\_event**

HTTP Client events data.

**Public Members**

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

esp\_http\_client\_handle\_t context

void **\*data**

data of the event

int **data\_len**

data length of data

void **\*user\_data**

user\_data context, from *esp\_http\_client\_config\_t* user\_data

char **\*header\_key**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header key

char **\*header\_value**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header value

struct **esp\_http\_client\_config\_t**

HTTP configuration.

### Public Members

const char **\*url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char **\*host**

Domain or IP as string

int **port**

Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)

const char **\*username**

Using for Http authentication

const char **\*password**

Using for Http authentication

*esp\_http\_client\_auth\_type\_t* **auth\_type**

Http authentication type, see esp\_http\_client\_auth\_type\_t

const char **\*path**

HTTP Path, if not set, default is /

const char **\*query**

HTTP query

const char **\*cert\_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size\_t **cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

const char \***client\_cert\_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size\_t **client\_cert\_len**

Length of the buffer pointed to by client\_cert\_pem. May be 0 for null-terminated pem

const char \***client\_key\_pem**

SSL client key, PEM format as string, if the server requires to verify client

size\_t **client\_key\_len**

Length of the buffer pointed to by client\_key\_pem. May be 0 for null-terminated pem

const char \***client\_key\_password**

Client key decryption password string

size\_t **client\_key\_password\_len**

String length of the password pointed to by client\_key\_password

const char \***user\_agent**

The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**

HTTP Method

int **timeout\_ms**

Network timeout in milliseconds

bool **disable\_auto\_redirect**

Disable HTTP automatic redirects

int **max\_redirection\_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max\_authorization\_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see esp\_http\_client\_transport\_t

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void **\*user\_data**

HTTP user\_data context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

*esp\_err\_t* (**\*crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to esp\_err\_t

**ESP\_ERR\_HTTP\_CONNECTION\_CLOSED**

Read FIN from peer and the connection closed

**Type Definitions**

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

**Enumerations**

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

*Values:*

enumerator **HTTP\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_EVENT\_ON\_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP\_EVENT\_HEADERS\_SENT**

After sending all the headers to the server

enumerator **HTTP\_EVENT\_HEADER\_SENT**

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

enumerator **HTTP\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP\_EVENT\_ON\_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP\_EVENT\_ON\_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

enum **esp\_http\_client\_transport\_t**

HTTP Client transport.

*Values:*

enumerator **HTTP\_TRANSPORT\_UNKNOWN**

Unknown

enumerator **HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

enum **esp\_http\_client\_method\_t**

HTTP method.

*Values:*

enumerator **HTTP\_METHOD\_GET**

HTTP GET Method

enumerator **HTTP\_METHOD\_POST**

HTTP POST Method

enumerator **HTTP\_METHOD\_PUT**

HTTP PUT Method

enumerator **HTTP\_METHOD\_PATCH**

HTTP PATCH Method

enumerator **HTTP\_METHOD\_DELETE**

HTTP DELETE Method

enumerator **HTTP\_METHOD\_HEAD**

HTTP HEAD Method

enumerator **HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP\_METHOD\_COPY**

HTTP COPY Method

enumerator **HTTP\_METHOD\_MOVE**

HTTP MOVE Method

enumerator **HTTP\_METHOD\_LOCK**

HTTP LOCK Method

enumerator **HTTP\_METHOD\_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP\_METHOD\_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP\_METHOD\_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP\_METHOD\_MKCOL**

HTTP MKCOL Method

enumerator **HTTP\_METHOD\_MAX**

enum **esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

enumerator **HTTP\_AUTH\_TYPE\_NONE**

No authentication

enumerator **HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

enumerator **HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

enum **HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

enumerator **HttpStatus\_Ok**

enumerator **HttpStatus\_MultipleChoices**

enumerator `HttpStatus_MovedPermanently`

enumerator `HttpStatus_Found`

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

## 2.4.5 ESP WebSocket Client

### Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32-S3

### Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

### Configuration

#### URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
  - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
  - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

### TLS Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

**备注:** If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default not requiring verification.

PEM certificate for this example could be extracted from an `openssl s_client` command connecting to `websocket.org`. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `` echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem ``

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol** The subprotocol field in the config struct can be used to request a subprotocol

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

**备注:** The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

### Events

- `WEBSOCKET_EVENT_CONNECTED`: The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- `WEBSOCKET_EVENT_DISCONNECTED`: The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- `WEBSOCKET_EVENT_DATA`: The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- `WEBSOCKET_EVENT_ERROR`: Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

### Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

### Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the [websocket.org](https://websocket.org) server can be found here: [protocols/websocket](https://protocols/websocket).

**Sending Text Data** The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

### API Reference

#### Header File

- `components/esp_websocket_client/include/esp_websocket_client.h`

#### Functions

`esp_websocket_client_handle_t esp_websocket_client_init` (`const esp_websocket_client_config_t *config`)

Start a WebSocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

**参数** `config` **–[in]** The configuration

**返回**

- `esp_websocket_client_handle_t`
- NULL if any errors

`esp_err_t esp_websocket_client_set_uri` (`esp_websocket_client_handle_t client, const char *uri`)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**参数**

- `client` **–[in]** The client
- `uri` **–[in]** The uri

**返回** `esp_err_t`

`esp_err_t esp_websocket_client_start` (`esp_websocket_client_handle_t client`)

Open the WebSocket connection.

**参数** `client` **–[in]** The client

**返回** `esp_err_t`

`esp_err_t esp_websocket_client_stop` (`esp_websocket_client_handle_t client`)

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using `esp_websocket_client_close()`.

Notes:

- Cannot be called from the websocket event handler

参数 **client** –[in] The client

返回 `esp_err_t`

*esp\_err\_t* `esp_websocket_client_destroy` (*esp\_websocket\_client\_handle\_t* client)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

参数 **client** –[in] The client

返回 `esp_err_t`

int `esp_websocket_client_send` (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Generic write data to the WebSocket connection; defaults to binary send.

参数

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

返回

- Number of data was sent
- (-1) if any errors

int `esp_websocket_client_send_bin` (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

参数

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

返回

- Number of data was sent
- (-1) if any errors

int `esp_websocket_client_send_text` (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

参数

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

返回

- Number of data was sent
- (-1) if any errors

*esp\_err\_t* `esp_websocket_client_close` (*esp\_websocket\_client\_handle\_t* client, TickType\_t timeout)

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:

- Client sends CLOSE frame

- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:

- Cannot be called from the websocket event handler

#### 参数

- **client** –[in] The client
- **timeout** –[in] Timeout in RTOS ticks for waiting

返回 `esp_err_t`

`esp_err_t esp_websocket_client_close_with_code` (`esp_websocket_client_handle_t` client, int code, const char \*data, int len, TickType\_t timeout)

Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for `esp_websocket_client_close()`

Notes:

- Cannot be called from the websocket event handler

#### 参数

- **client** –[in] The client
- **code** –[in] Close status code as defined in RFC6455 section-7.4
- **data** –[in] Additional data to closing message
- **len** –[in] The length of the additional data
- **timeout** –[in] Timeout in RTOS ticks for waiting

返回 `esp_err_t`

bool `esp_websocket_client_is_connected` (`esp_websocket_client_handle_t` client)

Check the WebSocket client connection state.

参数 **client** –[in] The client handle

返回

- true
- false

`esp_err_t esp_websocket_register_events` (`esp_websocket_client_handle_t` client, `esp_websocket_event_id_t` event, `esp_event_handler_t` event\_handler, void \*event\_handler\_arg)

Register the Websocket Events.

#### 参数

- **client** –The client handle
- **event** –The event id
- **event\_handler** –The callback function
- **event\_handler\_arg** –User context

返回 `esp_err_t`

## Structures

struct `esp_websocket_event_data_t`

Websocket event data.

## Public Members

const char \***data\_ptr**

Data pointer

int **data\_len**

Data length

uint8\_t **op\_code**

Received opcode

*esp\_websocket\_client\_handle\_t* **client**

*esp\_websocket\_client\_handle\_t* context

void **\*user\_context**

user\_data context, from *esp\_websocket\_client\_config\_t* user\_data

int **payload\_len**

Total payload length, payloads exceeding buffer will be posted through multiple events

int **payload\_offset**

Actual offset for the data associated with this event

struct **esp\_websocket\_client\_config\_t**

Websocket client setup configuration.

### Public Members

const char **\*uri**

Websocket URI, the information on the URI can be overrides the other fields below, if any

const char **\*host**

Domain or IP as string

int **port**

Port to connect, default depend on *esp\_websocket\_transport\_t* (80 or 443)

const char **\*username**

Using for Http authentication - Not supported for now

const char **\*password**

Using for Http authentication - Not supported for now

const char **\*path**

HTTP Path, if not set, default is /

bool **disable\_auto\_reconnect**

Disable the automatic reconnect function when disconnected

void **\*user\_context**

HTTP user data context

int **task\_prio**

Websocket task priority

int **task\_stack**

Websocket task stack

int **buffer\_size**

Websocket buffer size

const char \***cert\_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

size\_t **cert\_len**

Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

const char \***client\_cert**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

size\_t **client\_cert\_len**

Length of the buffer pointed to by `client_cert`. May be 0 for null-terminated pem

const char \***client\_key**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

size\_t **client\_key\_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

*esp\_websocket\_transport\_t* **transport**

Websocket transport type, see 'esp\_websocket\_transport\_t'

const char \***subprotocol**

Websocket subprotocol

const char \***user\_agent**

Websocket user-agent

const char \***headers**

Websocket additional headers

int **pingpong\_timeout\_sec**

Period before connection is aborted due to no PONGs received

bool **disable\_pingpong\_discon**

Disable auto-disconnect due to no PONG received within pingpong\_timeout\_sec

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

size\_t **ping\_interval\_sec**

Websocket ping interval, defaults to 10 seconds if not set

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

### Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

### Enumerations

enum **esp\_websocket\_event\_id\_t**

Websocket Client events id.

*Values:*

enumerator **WEBSOCKET\_EVENT\_ANY**

enumerator **WEBSOCKET\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **WEBSOCKET\_EVENT\_CONNECTED**

Once the Websocket has been connected to the server, no data exchange has been performed

enumerator **WEBSOCKET\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **WEBSOCKET\_EVENT\_DATA**

When receiving data from the server, possibly multiple portions of the packet

enumerator **WEBSOCKET\_EVENT\_CLOSED**

The connection has been closed cleanly

enumerator **WEBSOCKET\_EVENT\_MAX**

enum **esp\_websocket\_transport\_t**

Websocket Client transport.

*Values:*

enumerator **WEBSOCKET\_TRANSPORT\_UNKNOWN**

Transport unknown

enumerator **WEBSOCKET\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **WEBSOCKET\_TRANSPORT\_OVER\_SSL**

Transport over ssl

## 2.4.6 HTTP 服务器

### 概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- `httpd_start()`：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 `httpd_start()` 传递 `httpd_config_t` 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。
- `httpd_stop()`：根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- `httpd_register_uri_handler()`：通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员：`uri` 名字，`method` 类型（比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等），`esp_err_t *handler (httpd_req_t *req)` 类型的函数指针，指向用户上下文数据的 `user_ctx` 指针。

### 应用示例

```
/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char[] resp = "URI GET Response";
```

(下页继续)

```

    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST /uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区
     * httpd_req_recv() 只接收 char*_
    ↪数据，但也可以是任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，content_len_
    ↪会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, rcv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试
             * 简单起见，这里我们直接响应 HTTP_
            ↪408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误，返回 ESP_FAIL 可以确保底层套接字被关闭 */
        return ESP_FAIL;
    }

    /* 发送简单的响应数据包 */
    const char[] resp = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST /uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

```

(续上页)

```

/* 启动 httpd server */
if (httpd_start(&server, &config) == ESP_OK) {
    /* 注册 URI 处理程序 */
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}
/* 如果服务器启动失败，返回的句柄是 NULL */
return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}

```

**简单 HTTP 服务器示例** 请查看位于 [protocols/http\\_server/simple](#) 的 HTTP 服务器示例，该示例演示了如何处理任意内容长度的数据，读取请求头和 URL 查询参数，设置响应头。

## HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定好自定义的回调函数，以便在连接/会话被关闭时释放这部分内存资源。

## 长连接示例

```

/* 自定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 如果会话上下文还不存在则新建一个 */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func; /*!< 释放上下文数据的函数 */
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* 响应 */
    .....
    .....
    .....

    return ESP_OK;
}

```

详情请参考位于 [protocols/http\\_server/persistent\\_sockets](#) 的示例代码。

## API 参考

### Header File

- components/esp\_http\_server/include/esp\_http\_server.h

### Functions

*esp\_err\_t* **httpd\_register\_uri\_handler** (*httpd\_handle\_t* handle, const *httpd\_uri\_t* \*uri\_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

**备注:** URI handlers can be registered in real time as long as the server handle is valid.

### 参数

- **handle** *–[in]* handle to HTTPD server instance
- **uri\_handler** *–[in]* pointer to handler that needs to be registered

### 返回

- ESP\_OK : On successfully registering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_HANDLERS\_FULL : If no slots left for new handler
- ESP\_ERR\_HTTPD\_HANDLER\_EXISTS : If handler with same URI and method is already registered

*esp\_err\_t* **httpd\_unregister\_uri\_handler** (*httpd\_handle\_t* handle, const char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

**参数**

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] URI string
- **method** –[in] HTTP method

**返回**

- ESP\_OK : On successfully deregistering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : Handler with specified URI and method not found

*esp\_err\_t* **httpd\_unregister\_uri** (*httpd\_handle\_t* handle, const char \*uri)

Unregister all URI handlers with the specified uri string.

**参数**

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] uri string specifying all handlers that need to be deregistered

**返回**

- ESP\_OK : On successfully deregistering all such handlers
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : No handler registered with specified uri string

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

---

**备注:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

**参数**

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **recv\_func** –[in] The receive function to be set for this session

**返回**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_send\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

---

**备注:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

**参数**

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **send\_func** –[in] The send function to be set for this session

**返回**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

---

**备注:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

#### 参数

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **pending\_func** –[in] The receive function to be set for this session

#### 返回

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd\_sess\_get\_ctx(), httpd\_sess\_trigger\_close(), httpd\_sess\_update\_lru\_counter().

---

**备注:** This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.

---

**参数** **r** –[in] The request whose socket descriptor should be found

#### 返回

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd\_req\_recv** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content\_len provided in httpd\_req\_t structure to know the length of data to be fetched. If content\_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

---

#### 备注:

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

#### 参数

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that the data will be read into
- **buf\_len** –[in] Length of the buffer

**返回**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

size\_t **httpd\_req\_get\_hdr\_value\_len** (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it' s value.

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**参数**

- **r** –[in] The request being responded to
- **field** –[in] The header field to be searched in the request

**返回**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

*esp\_err\_t* **httpd\_req\_get\_hdr\_value\_str** (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use *httpd\_req\_get\_hdr\_value\_len()* to know the right buffer length

**参数**

- **r** –[in] The request being responded to
- **field** –[in] The field to be searched in the header
- **val** –[out] Pointer to the buffer into which the value will be copied if the field is found
- **val\_size** –[in] Size of the user buffer “val”

**返回**

- ESP\_OK : Field found in the request header and value string copied
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

size\_t **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

**备注:** This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid

**参数** **r** –[in] The request being responded to  
**返回**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**备注:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
  - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
  - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
- 

**参数**

- **r** –[in] The request being responded to
- **buf** –[out] Pointer to the buffer into which the query string will be copied (if found)
- **buf\_len** –[in] Length of output buffer

**返回**

- ESP\_OK : Query is found in the request URL and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Query not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Query string truncated

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**备注:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
  - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
- 

**参数**

- **qry** –[in] Pointer to query string
- **key** –[in] The key to be searched in the query string
- **val** –[out] Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** –[in] Size of the user buffer “val”

**返回**

- ESP\_OK : Key is found in the URL query string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

#### 参数

- **req** –[in] Pointer to the HTTP request
- **cookie\_name** –[in] The cookie name to be searched in the request
- **val** –[out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val\_size** –[inout] Pointer to size of the user buffer “val” . This variable will contain cookie length if ESP\_OK is returned and required buffer length incase ESP\_ERR\_HTTPD\_RESULT\_TRUNC is returned.

#### 返回

- ESP\_OK : Key is found in the cookie string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated
- ESP\_ERR\_NO\_MEM : Memory allocation failure

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “\*” for a wildcard match, and “?\*” to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “\*” anywhere else in the template will be taken literally.

#### 参数

- **uri\_template** –[in] URI template (pattern)
- **uri\_to\_match** –[in] URI to be matched
- **match\_upto** –[in] how many characters of the URI buffer to test (there may be trailing query string etc.)

返回 true if a match was found

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

#### 备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**参数**

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the content is to be fetched
- **buf\_len** –[in] Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**返回**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**备注:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**参数**

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that stores the data
- **buf\_len** –[in] Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**返回**

- ESP\_OK : On successfully sending the response packet chunk
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_sendstr** (*httpd\_req\_t* \*r, const char \*str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**参数**

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body

**返回**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

static inline *esp\_err\_t* **httpd\_resp\_sendstr\_chunk** (*httpd\_req\_t* \*r, const char \*str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

#### 参数

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body (NULL to finish response packet)

#### 返回

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* **httpd\_resp\_set\_status** (*httpd\_req\_t* \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

---

#### 备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the status string is valid till send function is called.
- 

#### 参数

- **r** –[in] The request being responded to
- **status** –[in] The HTTP status code of this response

#### 返回

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_type** (*httpd\_req\_t* \*r, const char \*type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’ .

---

#### 备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the type string is valid till send function is called.
- 

#### 参数

- **r** –[in] The request being responded to
- **type** –[in] The Content Type of the response

#### 返回

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_hdr** (*httpd\_req\_t* \*r, const char \*field, const char \*value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - The header isn't sent out until any of the send APIs is executed.
  - The maximum allowed number of additional headers is limited to value of *max\_resp\_headers* in config structure.
  - Make sure that the lifetime of the field value strings are valid till send function is called.
- 

**参数**

- **r** –[in] The request being responded to
- **field** –[in] The field name of the HTTP header
- **value** –[in] The value of this HTTP header

**返回**

- *ESP\_OK* : On successfully appending new header
- *ESP\_ERR\_INVALID\_ARG* : Null arguments
- *ESP\_ERR\_HTTPD\_RESP\_HDR* : Total additional headers exceed max allowed
- *ESP\_ERR\_HTTPD\_INVALID\_REQ* : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_err** (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error, const char \*msg)

For sending out error code in response to HTTP request.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**参数**

- **req** –[in] Pointer to the HTTP request for which the response needs to be sent
- **error** –[in] Error type to send
- **msg** –[in] Error message string (pass NULL for default message)

**返回**

- *ESP\_OK* : On successfully sending the response packet
- *ESP\_ERR\_INVALID\_ARG* : Null arguments
- *ESP\_ERR\_HTTPD\_RESP\_SEND* : Error in raw send
- *ESP\_ERR\_HTTPD\_INVALID\_REQ* : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_send\_404** (*httpd\_req\_t* \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**参数** **r** –[in] The request being responded to  
**返回**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_send\_408** (*httpd\_req\_t* \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**参数** **r** –[in] The request being responded to  
**返回**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_send\_500** (*httpd\_req\_t* \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**参数** **r** –[in] The request being responded to  
**返回**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

int **httpd\_send** (*httpd\_req\_t* \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

**备注:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
- 

**参数**

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the fully constructed packet is to be read
- **buf\_len** –[in] Length of the buffer

**返回**

- Bytes : Number of bytes that were sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

int **httpd\_socket\_send** (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

---

**备注:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

---

**参数**

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf\_len** –[in] data size
- **flags** –[in] flags for the send() function

**返回**

- Bytes : The number of bytes sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

int **httpd\_socket\_recv** (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

---

**备注:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

---

**参数**

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf\_len** –[in] data size
- **flags** –[in] flags for the send() function

**返回**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

*esp\_err\_t* **httpd\_register\_err\_handler** (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd\_err\_code\_t*. See prototype *httpd\_err\_handler\_func\_t* above for details.

**参数**

- **handle** –[in] HTTP server handle
- **error** –[in] Error type
- **handler\_fn** –[in] User implemented handler function (Pass NULL to unset any previously set handler)

**返回**

- ESP\_OK : handler registered successfully
- ESP\_ERR\_INVALID\_ARG : invalid error code or server handle

*esp\_err\_t* **httpd\_start** (*httpd\_handle\_t* \*handle, const *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**参数**

- **config** –[in] Configuration for new instance of the server
- **handle** –[out] Handle to newly created instance of the server. NULL on error

**返回**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)

- ESP\_ERR\_HTTPD\_ALLOC\_MEM : Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK : Failed to launch server task

*esp\_err\_t* **httpd\_stop** (*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**参数 handle** **–[in]** Handle to server returned by `httpd_start`

**返回**

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

*esp\_err\_t* **httpd\_queue\_work** (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

---

**备注:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

---

**参数**

- **handle** **–[in]** Handle to server returned by `httpd_start`
- **work** **–[in]** Pointer to the function to be executed in the HTTPD' s context
- **arg** **–[in]** Pointer to the arguments that should be passed to this function

**返回**

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

void \***httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**参数**

- **handle** **–[in]** Handle to server returned by `httpd_start`
- **sockfd** **–[in]** The socket descriptor for which the context should be extracted.

**返回**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

#### 参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Context object to assign to the session
- **free\_fn** –[in] Function that should be called to free the context

void \***httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

#### 参见:

`httpd_sess_get_ctx()`

#### 参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

#### 返回

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session ‘transport’ context by socket descriptor.

#### 参见:

`httpd_sess_set_ctx()`

#### 参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Transport context object to assign to the session
- **free\_fn** –[in] Function that should be called to free the transport context

void \***httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global user context (it was set in the server config struct)

参数 **handle** –[in] Handle to server returned by `httpd_start`

返回 global user context

void \***httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

参数 **handle** –[in] Handle to server returned by `httpd_start`

返回 global transport context

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)

Trigger an httpd session close externally.

---

**备注:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

---

#### 参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session to be closed

**返回**

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**备注:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

**参数**

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session for which LRU counter is to be updated

**返回**

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

---

**备注:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

---

**参数**

- **handle** –[in] Handle to server returned by `httpd_start`
- **fds** –[inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client\_fds** –[out] Array of client fds

**返回**

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

## Structures

struct **httpd\_config**

HTTP Server Configuration Structure.

---

**备注:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

## Public Members

unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge “Least Recently Used” connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

uint16\_t **send\_wait\_timeout**

Timeout for send function (in seconds)

void \***global\_user\_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_user\_ctx\_free\_fn**

Free function for global user context

void **\*global\_transport\_ctx**

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

*httpd\_free\_ctx\_fn\_t* **global\_transport\_ctx\_free\_fn**

Free function for global transport context

*httpd\_open\_func\_t* **open\_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

*httpd\_close\_func\_t* **close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

*httpd\_uri\_match\_func\_t* **uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd\_req**

HTTP Request Data Structure.

### Public Members

*httpd\_handle\_t* **handle**

Handle to server instance

int **method**

The type of HTTP request, -1 if unsupported method

const char **uri**[512 + 1]

The URI of this request (1 byte extra for null termination)

size\_t **content\_len**

Length of the request body

void \***aux**

Internally used members

void \***user\_ctx**

User context pointer passed during URI registration.

void \***sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free\_ctx function is set.

[httpd\\_free\\_ctx\\_fn\\_t](#) **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess\_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the sess\_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess\_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free\_ctx or free()) only if the socket gets closed.

struct **httpd\_uri**

Structure for URI handler.

### Public Members

const char \***uri**

The URI to handle

[httpd\\_method\\_t](#) **method**

Method supported by the URI

*esp\_err\_t* (\***handler**)(*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return ESP\_OK, or else the underlying socket will be closed.

void \***user\_ctx**

Pointer to user context data which will be available to handler

## Macros

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD SOCK\_ERR\_FAIL**

**HTTPD SOCK\_ERR\_INVALID**

**HTTPD SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**HTTPD\_DEFAULT\_CONFIG()**

**ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN**

### Type Definitions

typedef struct *httpd\_req* **httpd\_req\_t**

HTTP Request Data Structure.

typedef struct *httpd\_uri* **httpd\_uri\_t**

Structure for URI handler.

typedef int (**\*httpd\_send\_func\_t**)(*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

Prototype for HTTPDs low-level send function.

---

**备注:** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD SOCK_ERR_codes`, which will eventually be conveyed as return value of `httpd_send()` function

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Param buf [in]** buffer with bytes to send

**Param buf\_len [in]** data size

**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level recv function.

---

**备注:** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Param buf [in]** buffer with bytes to send

**Param buf\_len [in]** data size

**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

---

**备注:** User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- Bytes : The number of bytes waiting to be received
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**备注:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.

- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
  - The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

typedef void **\*httpd\_handle\_t**

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http\_method **httpd\_method\_t**

HTTP Method Type wrapper over “enum http\_method” available in “http\_parser” library.

typedef void (**\*httpd\_free\_ctx\_fn\_t**)(void \*ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

typedef *esp\_err\_t* (**\*httpd\_open\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

typedef void (**\*httpd\_close\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for closing a session.

---

**备注:** It's possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

typedef bool (**\*httpd\_uri\_match\_func\_t**)(const char \*reference\_uri, const char \*uri\_to\_match, size\_t match\_upto)

Function prototype for URI matching.

**Param reference\_uri [in]** URI/template with respect to which the other URI is matched

**Param uri\_to\_match [in]** URI/template being matched to the reference URI/template

**Param match\_upto [in]** For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**Return** true on match

typedef struct *httpd\_config* **httpd\_config\_t**

HTTP Server Configuration Structure.

---

**备注:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

typedef void (\***httpd\_work\_fn\_t**)(void \*arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

**Param arg [in]** The arguments for this work function

### Enumerations

enum **httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator **HTTPD\_500\_INTERNAL\_SERVER\_ERROR**

enumerator **HTTPD\_501\_METHOD\_NOT\_IMPLEMENTED**

enumerator **HTTPD\_505\_VERSION\_NOT\_SUPPORTED**

enumerator **HTTPD\_400\_BAD\_REQUEST**

enumerator **HTTPD\_401\_UNAUTHORIZED**

enumerator **HTTPD\_403\_FORBIDDEN**

enumerator **HTTPD\_404\_NOT\_FOUND**

enumerator **HTTPD\_405\_METHOD\_NOT\_ALLOWED**

enumerator **HTTPD\_408\_REQ\_TIMEOUT**

enumerator **HTTPD\_411\_LENGTH\_REQUIRED**

enumerator **HTTPD\_414\_URI\_TOO\_LONG**

enumerator **HTTPD\_431\_REQ\_HDR\_FIELDS\_TOO\_LARGE**

enumerator **HTTPD\_ERR\_CODE\_MAX**

## 2.4.7 HTTPS server

### Overview

This component is built on top of *esp\_http\_server*. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for *esp\_http\_server* applies also to a server you create this way.

### Used APIs

The following API of *esp\_http\_server* should not be used with *esp\_https\_server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config_t.global_transport_ctx`
  - `httpd_config_t.global_transport_ctx_free_fn`
  - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

### Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

### Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

### API Reference

#### Header File

- [components/esp\\_https\\_server/include/esp\\_https\\_server.h](#)

#### Functions

`esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

#### 参数

- **config** - [inout] - server config, must not be const. Does not have to stay valid after calling this function.

- **handle** `-[out]` - storage for the server handle, must be a valid pointer

返回 success

void **httpd\_ssl\_stop** (*httpd\_handle\_t* handle)

Stop the server. Blocks until the server is shut down.

参数 **handle** `-[in]`

## Structures

struct **esp\_https\_server\_user\_cb\_arg**

Callback data struct, contains the ESP-TLS connection handle.

## Public Members

const *esp\_tls\_t* \***tls**

ESP-TLS connection handle

struct **httpd\_ssl\_config**

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

## Public Members

*httpd\_config\_t* **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8\_t \***cacert\_pem**

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in `https_server` component as well as example 1)The `cacert` variable should hold the CA which is used to authenticate clients (should inherit current role of `client_verify_cert_pem` var) 2)There should be another variable `servercert` which would hold servers own certificate (should inherit current role of `cacert` var)

size\_t **cacert\_len**

CA certificate byte length

const uint8\_t \***client\_verify\_cert\_pem**

Client verify authority certificate (CA used to sign clients, or client cert itself)

size\_t **client\_verify\_cert\_len**

Client verify authority cert len

const uint8\_t \***prvtkey\_pem**

Private key

size\_t **prvtkey\_len**

Private key byte length

*httpd\_ssl\_transport\_mode\_t* **transport\_mode**

Transport Mode (default secure)

uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

bool **session\_tickets**

Enable tls session tickets

*esp\_https\_server\_user\_cb* \***user\_cb**

User callback for esp\_https\_server

### Macros

**HTTPD\_SSL\_CONFIG\_DEFAULT** ( )

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

### Type Definitions

typedef struct *esp\_https\_server\_user\_cb\_arg* **esp\_https\_server\_user\_cb\_arg\_t**

Callback data struct, contains the ESP-TLS connection handle.

typedef void **esp\_https\_server\_user\_cb** (*esp\_https\_server\_user\_cb\_arg\_t* \*user\_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user\_cb** Callback data struct

typedef struct *httpd\_ssl\_config* **httpd\_ssl\_config\_t**

### Enumerations

enum **httpd\_ssl\_transport\_mode\_t**

Values:

enumerator **HTTPD\_SSL\_TRANSPORT\_SECURE**

enumerator **HTTPD\_SSL\_TRANSPORT\_INSECURE**

## 2.4.8 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\r\n",
        recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\r\n", inet_ntoa(target_addr.u_addr.ip4), ↪
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
↪sizeof(transmitted));
```

(下页继续)

```

    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

### Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

### API Reference

### Header File

- `components/lwip/include/apps/ping/ping_sock.h`

## Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` \*config, const `esp_ping_callbacks_t` \*cbs, `esp_ping_handle_t` \*hdl\_out)

Create a ping session.

### 参数

- **config** –ping configuration
- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl\_out** –handle of ping session

### 返回

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (`esp_ping_handle_t` hdl)

Delete a ping session.

参数 **hdl** –handle of ping session

### 返回

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: delete ping session successfully

`esp_err_t esp_ping_start` (`esp_ping_handle_t` hdl)

Start the ping session.

参数 **hdl** –handle of ping session

### 返回

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: start ping session successfully

`esp_err_t esp_ping_stop` (`esp_ping_handle_t` hdl)

Stop the ping session.

参数 **hdl** –handle of ping session

### 返回

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: stop ping session successfully

`esp_err_t esp_ping_get_profile` (`esp_ping_handle_t` hdl, `esp_ping_profile_t` profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

### 参数

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

### 返回

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_ERR_INVALID_SIZE`: the actual profile data size doesn't match the “size” parameter
- `ESP_OK`: get profile successfully

## Structures

struct `esp_ping_callbacks_t`

Type of “ping” callback functions.

### Public Members

void **\*cb\_args**

arguments for callback functions

void (**\*on\_ping\_success**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (**\*on\_ping\_timeout**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (**\*on\_ping\_end**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

struct **esp\_ping\_config\_t**

Type of “ping” configuration.

### Public Members

uint32\_t **count**

A “ping” session contains count procedures

uint32\_t **interval\_ms**

Milliseconds between each ping procedure

uint32\_t **timeout\_ms**

Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**

Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**

Stack size of internal ping task

uint32\_t **task\_prio**

Priority of internal ping task

uint32\_t **interface**

Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG()**

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

### Type Definitions

typedef void \***esp\_ping\_handle\_t**

Type of “ping” session handle.

### Enumerations

enum **esp\_ping\_profile\_t**

Profile of ping session.

*Values:*

enumerator **ESP\_PING\_PROF\_SEQNO**

Sequence number of a ping procedure

enumerator **ESP\_PING\_PROF\_TOS**

Type of service of a ping procedure

enumerator **ESP\_PING\_PROF\_TTL**

Time to live of a ping procedure

enumerator **ESP\_PING\_PROF\_REQUEST**

Number of request packets sent out

enumerator **ESP\_PING\_PROF\_REPLY**

Number of reply packets received

enumerator **ESP\_PING\_PROF\_IPADDR**

IP address of replied target

enumerator **ESP\_PING\_PROF\_SIZE**

Size of received packet

enumerator **ESP\_PING\_PROF\_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

## 2.4.9 ASIO port

### Overview

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

**Supported features** ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

### Application Example

ESP examples are based on standard asio [protocols/asio](#):

- [protocols/asio/udp\\_echo\\_server](#)
- [protocols/asio/tcp\\_echo\\_server](#)
- [protocols/asio/asio\\_chat](#)
- [protocols/asio/ssl\\_client\\_server](#)

Please refer to the specific example README.md for details

## 2.4.10 ESP-MQTT

### Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

### Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

### Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

## Configuration

### URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
  - mqtt://mqtt.eclipseprojects.io: MQTT over TCP, default port 1883:
  - mqtt://mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884:
  - mqtt://username:password@mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - mqtt://mqtt.eclipseprojects.io: MQTT over SSL, port 8883
  - mqtt://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - ws://mqtt.eclipseprojects.io:80/mqtt
- MQTT over Websocket Secure samples:
  - wss://mqtt.eclipseprojects.io:443/mqtt
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

### SSL

- Get certificate from server, example: mqtt.eclipseprojects.io openssl s\_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt\_eclipse\_org.pem
- Check the sample application: examples/mqtt\_ssl
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then cert\_len should also be set. Other SSL related configuration parameters are:

- use\_global\_ca\_store: use the global certificate store to verify server certificate, see esp-tls.h for more information
- client\_cert\_pem: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client\_cert\_len: length of the buffer pointed to by client\_cert\_pem. May be 0 for null-terminated pem.
- client\_key\_pem: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client\_key\_len: length of the buffer pointed to by client\_key\_pem. May be 0 for null-terminated pem.
- psk\_hint\_key: pointer to PSK struct defined in esp\_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- alpn\_protos: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

### Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

**Change settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

### Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.

- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

### Functions

`esp_err_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` \*config)

Creates mqtt client handle based on the configuration.

参数 `config` –mqtt configuration structure

返回 `mqtt_client_handle_t` if successfully created, NULL on error

`esp_err_t esp_mqtt_client_set_uri` (`esp_mqtt_client_handle_t` client, const char \*uri)

Sets mqtt connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

参数

- `client` –mqtt client handle

- `uri` –

返回 ESP\_FAIL if URI parse error, ESP\_OK on success

`esp_err_t esp_mqtt_client_start` (`esp_mqtt_client_handle_t` client)

Starts mqtt client with already created client handle.

参数 `client` –mqtt client handle

返回 ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL on other error

`esp_err_t esp_mqtt_client_reconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force reconnection upon a specific event.

参数 `client` –mqtt client handle

返回 ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

`esp_err_t esp_mqtt_client_disconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force disconnection from the broker.

参数 `client` –mqtt client handle

返回 ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization

`esp_err_t esp_mqtt_client_stop` (`esp_mqtt_client_handle_t` client)

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

**参数** **client** –mqtt client handle

**返回** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

int **esp\_mqtt\_client\_subscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**参数**

- **client** –mqtt client handle
- **topic** –
- **qos** –

**返回** message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**参数**

- **client** –mqtt client handle
- **topic** –

**返回** message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**参数**

- **client** –mqtt client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –qos of publish message
- **retain** –retain flag

**返回** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure.

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

#### 参数

- **client** –mqtt client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –qos of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

**返回** message\_id if queued successfully, -1 otherwise

*esp\_err\_t* **esp\_mqtt\_client\_destroy** (*esp\_mqtt\_client\_handle\_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

**参数** **client** –mqtt client handle

**返回** ESP\_OK ESP\_ERR\_INVALID\_ARG on wrong initialization

*esp\_err\_t* **esp\_mqtt\_set\_config** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_client\_config\_t* \*config)

Set configuration structure, typically used when updating the config (i.e. on “before\_connect” event.

#### 参数

- **client** –mqtt client handle
- **config** –mqtt configuration structure

**返回** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG if conflicts on transport configuration. ESP\_OK on success

*esp\_err\_t* **esp\_mqtt\_client\_register\_event** (*esp\_mqtt\_client\_handle\_t* client, *esp\_mqtt\_event\_id\_t* event, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Registers mqtt event.

#### 参数

- **client** –mqtt client handle
- **event** –event type
- **event\_handler** –handler callback
- **event\_handler\_arg** –handlers context

**返回** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_OK on success

int **esp\_mqtt\_client\_get\_outbox\_size** (*esp\_mqtt\_client\_handle\_t* client)

Get outbox size.

**参数** **client** –mqtt client handle

**返回** outbox size 0 on wrong initialization

## Structures

struct **esp\_mqtt\_error\_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from `tcp_transport/esp-tls` | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from MQTT broker on connection |

### Public Members

*esp\_err\_t* **esp\_tls\_last\_esp\_err**

last `esp_err` code reported from `esp-tls` component

int **esp\_tls\_stack\_err**

tls specific error code reported from underlying tls stack

int **esp\_tls\_cert\_verify\_flags**

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* **error\_type**

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* **connect\_return\_code**

connection refused error code reported from MQTT broker on connection

int **esp\_transport\_sock\_errno**

errno from the underlying socket

struct **esp\_mqtt\_event\_t**

MQTT event configuration structure

### Public Members

*esp\_mqtt\_event\_id\_t* **event\_id**

MQTT event type

*esp\_mqtt\_client\_handle\_t* **client**

MQTT client handle for this event

void \***user\_context**

User context passed from MQTT client config

char \***data**

Data associated with this event

int **data\_len**

Length of the data for this event

int **total\_data\_len**

Total length of the data (longer data are supplied with multiple events)

int **current\_data\_offset**

Actual offset for the data associated with this event

char \***topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

MQTT messaged id of message

int **session\_present**

MQTT session\_present flag for connection event

[esp\\_mqtt\\_error\\_codes\\_t](#) \***error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

qos of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

struct **esp\_mqtt\_client\_config\_t**

MQTT client configuration structure

### Public Members

[mqtt\\_event\\_callback\\_t](#) **event\_handle**

handle for MQTT events as a callback in legacy mode

[esp\\_event\\_loop\\_handle\\_t](#) **event\_loop\_handle**

handle for MQTT event loop library

const char \***host**

MQTT server domain (ipv4 as string)

const char \***uri**

Complete MQTT broker URI

uint32\_t **port**

MQTT server port

bool **set\_null\_client\_id**

Selects a NULL client id

const char \***client\_id**

Set client id. Ignored if set\_null\_client\_id == true If NULL set the default client id. Default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char \***username**

MQTT username

const char \***password**

MQTT password

const char \***lwt\_topic**

LWT (Last Will and Testament) message topic (NULL by default)

const char \***lwt\_msg**

LWT message (NULL by default)

int **lwt\_qos**

LWT message qos

int **lwt\_retain**

LWT retained message flag

int **lwt\_msg\_len**

LWT message length

int **disable\_clean\_session**

mqtt clean session, default clean\_session is true

int **keepalive**

mqtt keepalive, default is 120 seconds

bool **disable\_auto\_reconnect**

this mqtt client will reconnect to server (when errors/disconnect). Set disable\_auto\_reconnect=true to disable

void \***user\_context**

pass user context to this option, then can receive that context in event->user\_context

int **task\_prio**

MQTT task priority, default is 5, can be changed in make menuconfig

int **task\_stack**

MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int **buffer\_size**

size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out\_buffer\_size defined)

const char \***cert\_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

size\_t **cert\_len**

Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

const char \***client\_cert\_pem**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

size\_t **client\_cert\_len**

Length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem

const char \***client\_key\_pem**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

size\_t **client\_key\_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

*esp\_mqtt\_transport\_t* **transport**

overrides URI transport

int **refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

const struct *psk\_key\_hint* \***psk\_hint\_key**

Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool **use\_global\_ca\_store**

Use a global `ca_store` for all the connections in which this bool is set.

*esp\_err\_t* (\***cert\_bundle\_attach**)(void \*conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int **reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

const char \*\***alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN

const char \***clientkey\_password**

Client key decryption password string

int **clientkey\_password\_len**

String length of the password pointed to by `clientkey_password`

*esp\_mqtt\_protocol\_ver\_1* **protocol\_ver**

MQTT protocol version used for connection, defaults to value from `menuconfig`

int **out\_buffer\_size**

size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool **use\_secure\_element**

enable secure element for enabling SSL connection

void **\*ds\_data**

carrier of handle for digital signature parameters

int **network\_timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool **disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

const char **\*path**

Path in the URI

int **message\_retransmit\_timeout**

timeout for retransmit of failed packet

## Macros

### **MQTT\_ERROR\_TYPE\_ESP\_TLS**

`MQTT_ERROR_TYPE_TCP_TRANSPORT` error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from `MQTT_ERROR_TYPE_ESP_TLS` layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

## Type Definitions

typedef struct `esp_mqtt_client` **\*esp\_mqtt\_client\_handle\_t**

typedef struct *esp\_mqtt\_error\_codes* **esp\_mqtt\_error\_codes\_t**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	<code>connect_return_code</code>	Internal error reported from MQTT broker on connection

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

## Enumerations

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- `user_context` - user data from *esp\_mqtt\_client\_config\_t*
- `client` - mqtt client handle
- various other data depending on event type

Values:

```
enumerator MQTT_EVENT_ANY
```

```
enumerator MQTT_EVENT_ERROR
```

on error event, additional context: connection return code, error handle from *esp\_tls* (if supported)

```
enumerator MQTT_EVENT_CONNECTED
```

connected event, additional context: `session_present` flag

```
enumerator MQTT_EVENT_DISCONNECTED
```

disconnected event

```
enumerator MQTT_EVENT_SUBSCRIBED
```

subscribed event, additional context:

- `msg_id` message id
- data pointer to the received data
- `data_len` length of the data for this event

```
enumerator MQTT_EVENT_UNSUBSCRIBED
```

unsubscribed event

```
enumerator MQTT_EVENT_PUBLISHED
```

published event, additional context: `msg_id`

```
enumerator MQTT_EVENT_DATA
```

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic

- data pointer to the received data
- data\_len length of the data for this event
- current\_data\_offset offset of the current data for this event
- total\_data\_len total length of the data received
- retain retain flag of the message
- qos qos level of the message
- dup dup flag of the message Note: Multiple MQTT\_EVENT\_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

enumerator **MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enum **esp\_mqtt\_connect\_return\_code\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_CONNECTION\_ACCEPTED**

Connection accepted

enumerator **MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

MQTT connection refused reason: Wrong protocol

enumerator **MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

MQTT connection refused reason: ID rejected

enumerator **MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

enumerator **MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

MQTT connection refused reason: Wrong user

enumerator **MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

enum **esp\_mqtt\_error\_type\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_ERROR\_TYPE\_NONE**

enumerator **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

enumerator **MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

enum **esp\_mqtt\_transport\_t**

*Values:*

enumerator **MQTT\_TRANSPORT\_UNKNOWN**

enumerator **MQTT\_TRANSPORT\_OVER\_TCP**

MQTT over TCP, using scheme: `mqtt`

enumerator **MQTT\_TRANSPORT\_OVER\_SSL**

MQTT over SSL, using scheme: `mqttssl`

enumerator **MQTT\_TRANSPORT\_OVER\_WS**

MQTT over Websocket, using scheme: `ws`

enumerator **MQTT\_TRANSPORT\_OVER\_WSS**

MQTT over Websocket Secure, using scheme: `wss`

enum **esp\_mqtt\_protocol\_ver\_t**

MQTT protocol version used for connection

*Values:*

enumerator **MQTT\_PROTOCOL\_UNDEFINED**

enumerator **MQTT\_PROTOCOL\_V\_3\_1**

enumerator **MQTT\_PROTOCOL\_V\_3\_1\_1**

## 2.4.11 ESP-Modbus

### Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
- **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon ( “:” ) and trailing newline (CR/LF).

- Modbus TCP/IP or Modbus TCP —This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization's with protocol specifications for specifics.

### Messaging Model And Data Mapping

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP). The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

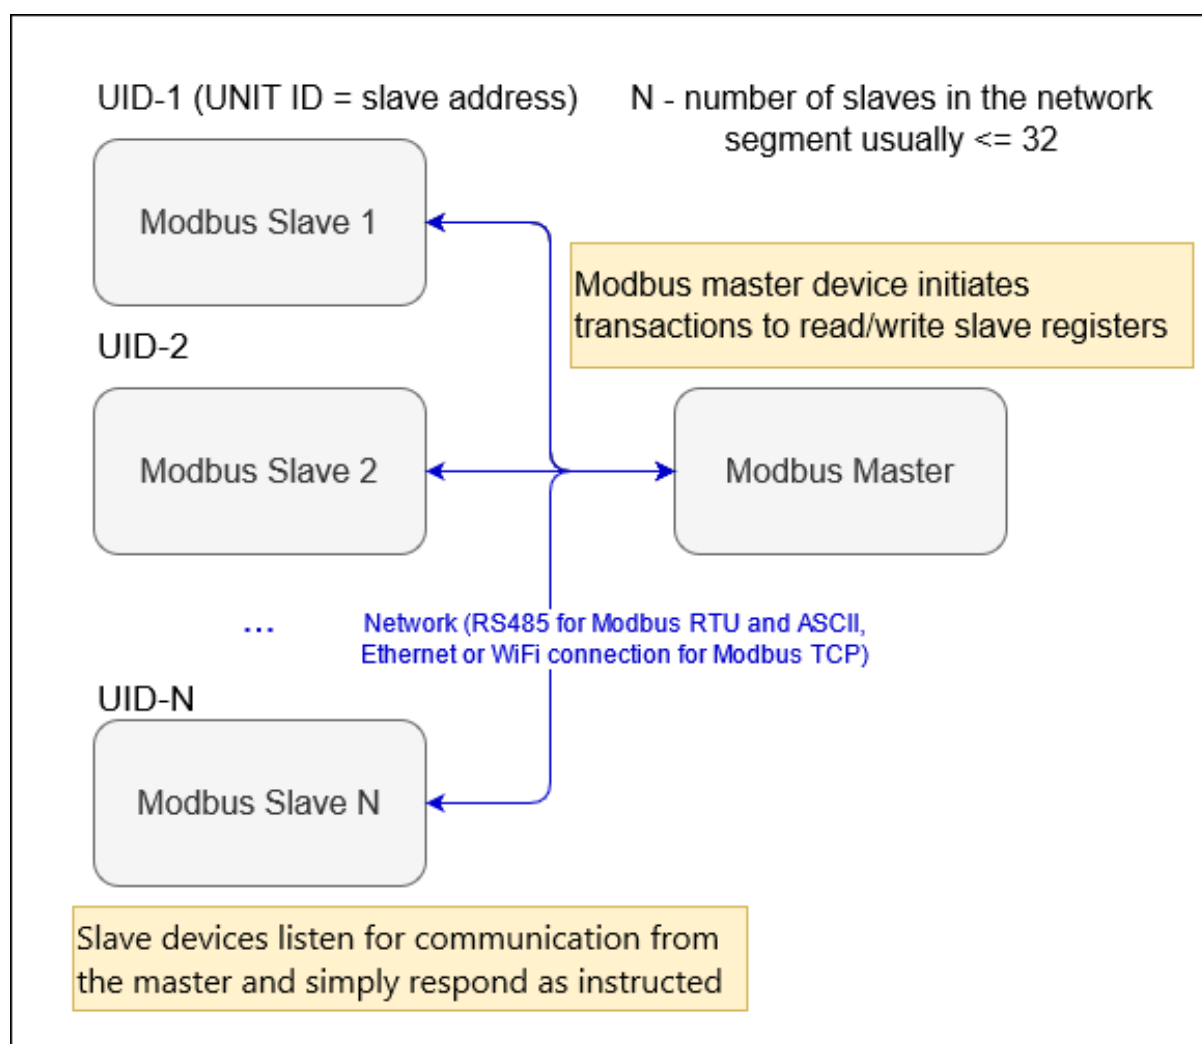

图 23: Modbus segment diagram

**备注:** It is assumed that the number of slaves and their register maps are known by the Modbus master before the start of stack.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device's network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device's data to the four types of registers.

图 24: Modbus data mapping

The following sections give an overview of how to use the ESP\_Modbus component found under *components/freemodbus*. The sections cover initialization of a Modbus port, and the setup a master or slave device accordingly:

- [Modbus Port Initialization](#)
- [Modbus Slave API Overview](#)
- [Modbus Master API Overview](#)

**Modbus Port Initialization** The ESP\_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`
- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER`, `MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER`, `MB_PORT_TCP_SLAVE` are reserved for internal usage.

```
void* master_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus master for serial port
esp_err_t err = mbc_master_init(MB_PORT_SERIAL_MASTER, &master_handler);
if (master_handler == NULL || err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

This example code to initialize slave port:

```
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
```

(下页继续)

```
if (slave_handler == NULL || err != ESP_OK) {  
    // Error handling is performed here  
    ESP_LOGE(TAG, "mb controller initialization fail.");  
}
```

## Modbus Master API Overview

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Modbus Port Initialization* - Initialization of Modbus controller interface for the selected port.
2. *Configuring Master Data Access* - Configure data descriptors to access slave parameters.
3. *Master Communication Options* - Allows to setup communication options for selected port.
4. *Master Communication* - Start stack and sending / receiving data.
5. *Modbus Master Teardown* - Destroy Modbus controller and its resources.

**Configuring Master Data Access** The architectural approach of ESP\_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type *mb\_parameter\_descriptor\_t* and represents the description of one physical characteristic:

表 6: Table 1 Modbus master Data Dictionary description

Field	Description	Detailed information
cid	Characteristic ID	The identifier of characteristic (must be unique).
param	Characteristic Name	String description of the characteristic.
param	Characteristic Units	Physical Units of the characteristic.
mb_slave	Modbus Slave Address	The short address of the device with correspond parameter UID.
mb_param	Modbus Register Type	Type of Modbus register area. <a href="#">MB_PARAM_INPUT</a> , <a href="#">MB_PARAM_HOLDING</a> , <a href="#">MB_PARAM_COIL</a> , <a href="#">MB_PARAM_DISCRETE</a> - represents Input , Holding, Coil and Discrete input register area accordingly;
mb_reg	Modbus Register Start	Relative register address of the characteristic in the register area.
mb_size	Modbus Register Size	Length of characteristic in registers.
param	Instance Offset	Offset to instance of the characteristic in bytes. It is used to calculate the absolute address to the characteristic in the storage structure. It is optional field and can be set to zero if the parameter is not used in the application.
param	Data Type	Specifies type of the characteristic. <a href="#">PARAM_TYPE_U8</a> , <a href="#">PARAM_TYPE_U16</a> , <a href="#">PARAM_TYPE_U32</a> - Unsigned integer 8/16/32 bit type; <a href="#">PARAM_TYPE_FLOAT</a> - IEEE754 floating point format; <a href="#">PARAM_TYPE_ASCII</a> - ASCII string or binary data;
param	Data Size	The storage size of the characteristic (bytes).
param	Parameter Options	Limits, options of characteristic used during processing of alarm in user application (optional)
access	Parameter access type	Can be used in user application to define the behavior of the characteristic during processing of data in user application; <a href="#">PAR_PERMS_READ_WRITE_TRIGGER</a> , <a href="#">PAR_PERMS_READ</a> , <a href="#">PAR_PERMS_READ_WRITE_TRIGGER</a> ;

**备注:** The cid and param\_key have to be unique. Please use the prefix to the parameter key if you have several similar parameters in your register map table.

表 7: Table 2 Example Register mapping table of Modbus slave

CID	Register	Range	Type	Units	Description
0	30004	MAX_UINT	U32	Not defined	Serial number of device (4 bytes) read-only
1	30002	MAX_UINT	U16	Not defined	Software version (4 bytes) read-only
2	40004	-20..40	Float	DegC	Room temperature in DegC. Writing a temperature value to this register for single point calibration.

```
// Enumeration of modbus slave addresses accessed by master device
enum {
    MB_DEVICE_ADDR1 = 1,
    MB_DEVICE_ADDR2,
    MB_SLAVE_COUNT
};

// Enumeration of all supported CIDs for device
enum {
    CID_SER_NUM1 = 0,
    CID_SW_VER1,
    CID_TEMP_DATA_1,
    CID_SER_NUM2,
    CID_SW_VER2,
    CID_TEMP_DATA_2
};

// Example Data Dictionary for Modbus parameters in 2 slaves in the segment
mb_parameter_descriptor_t device_parameters[] = {
    // CID, Name, Units, Modbus addr, register type, Modbus Reg Start Addr, Modbus_
    ↪Reg read length,
    // Instance offset (NA), Instance type, Instance length (bytes), Options (NA),_
    ↪Permissions
    { CID_SER_NUM1, STR("Serial_number_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_
    ↪INPUT, 0, 2,
        0, PARAM_TYPE_U32, 4, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_SW_VER1, STR("Software_version_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_
    ↪INPUT, 2, 1,
        0, PARAM_TYPE_U16, 2, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_TEMP_DATA_1, STR("Temperature_1"), STR("C"), MB_DEVICE_ADDR1, MB_PARAM_
    ↪HOLDING, 0, 2,
        0, PARAM_TYPE_FLOAT, 4, OPTS( 16, 30, 1 ), PAR_PERMS_READ_
    ↪WRITE_TRIGGER },
    { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_
    ↪INPUT, 0, 2,
        0, PARAM_TYPE_U32, 4, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_SW_VER2, STR("Software_version_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_
    ↪INPUT, 2, 1,
        0, PARAM_TYPE_U16, 2, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    ↪TRIGGER },
    { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MB_DEVICE_ADDR2, MB_PARAM_
    ↪HOLDING, 0, 2,
        0, PARAM_TYPE_FLOAT, 4, OPTS( 20, 30, 1 ), PAR_PERMS_READ_
    ↪WRITE_TRIGGER },
};
```

(下页继续)

```
};
// Calculate number of parameters in the table
uint16_t num_device_parameters = (sizeof(device_parameters) / sizeof(device_
↳parameters[0]));
```

During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as the parameter of the function below.

`mbc_master_set_descriptor()`: Initialization of master descriptor.

```
ESP_ERROR_CHECK(mbc_master_set_descriptor(&device_parameters[0], num_device_
↳parameters));
```

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initialization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included in descriptor table using its CID.

**Master Communication Options** Calling the setup function allows for specific communication options to be defined for port.

`mbc_master_setup()`

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```
mb_communication_info_t comm_info = {
    .port = MB_PORT_NUM,           // Serial port number
    .mode = MB_MODE_RTU,          // Modbus mode of communication (MB_MODE_RTU or MB_
↳MODE_ASCII)
    .baudrate = 9600,             // Modbus communication baud rate
    .parity = MB_PARITY_NONE      // parity option for serial port
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

The order of IP address string corresponds to short slave address in the Data Dictionary.

```
#define MB_SLAVE_COUNT 2 // Number of slaves in the segment being accessed (as_
↳defined in Data Dictionary)

char* slave_ip_address_table[MB_SLAVE_COUNT] = {
    "192.168.1.2",               // Address corresponds to UID1 and set to predefined value_
↳by user
    "192.168.1.3",               // corresponds to UID2 in the segment
    NULL                          // end of table
};

mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,      // Modbus TCP port number (default_
↳= 502)
    .ip_addr_type = MB_IPV4,     // version of IP protocol
    .ip_mode = MB_MODE_TCP,      // Port communication mode
    .ip_addr = (void*)slave_ip_address_table, // assign table of IP addresses
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the_
↳corresponding network interface
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

备注: Refer to [esp\\_netif component](#) for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to [protocols/modbus/tcp/mb\\_tcp\\_master](#) for more information.

备注: RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to [Running UART Communication](#) section of UART documentation.

**Master Communication** The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

`mbc_master_start()`

```
esp_err_t err = mbc_master_start();
if (err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller start fail, err=%x.", err);
}
```

The list of functions below are used by the Modbus master stack from a user's application:

`mbc_master_send_request()`: This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure `mb_param_request_t`) and then blocks until a response from corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

`mbc_master_get_cid_info()`: The function gets information about each characteristic supported in the data dictionary and returns the characteristic's description in the form of the `mb_parameter_descriptor_t` structure. Each characteristic is accessed using its CID.

`mbc_master_get_parameter()`: The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for request is taken from parameter description table.

Example:

```
const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;
....

// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->
    ↪ param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic #d %s (%s) value = (0x%08x) read successful.
    ↪ ",
                param_descriptor->cid,
                (char*)param_descriptor->param_key,
                (char*)param_descriptor->param_units,
                *(uint32_t*)temp_data);
    } else {
        ESP_LOGE(TAG, "Characteristic #d (%s) read fail, err = 0x%x (%s).",
                param_descriptor->cid,
                (char*)param_descriptor->param_key,
                (int)err,
                (char*)esp_err_to_name(err));
    }
} else {
```

(下页继续)

(续上页)

```
ESP_LOGE(TAG, "Could not get information for characteristic %d.", cid);
}
```

*mbc\_master\_set\_parameter()*

The function writes characteristic's value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

```
uint8_t type = 0; // Type of parameter
uint8_t temp_data[4] = {0}; // temporary buffer

esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.");
} else {
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s).", (int)err, (char*)esp_err_to_name(err));
}
```

**Modbus Master Teardown** This function stops Modbus communication stack and destroys controller interface and free all used active objects.

*mbc\_master\_destroy()*

```
ESP_ERROR_CHECK(mbc_master_destroy());
```

## Modbus Slave API Overview

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. *Modbus Port Initialization* - Initialization of Modbus controller interface for the selected port.
2. *Configuring Slave Data Access* - Configure data descriptors to access slave parameters.
3. *Slave Communication Options* - Allows to setup communication options for selected port.
4. *Slave Communication* - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. *Modbus Slave Teardown* - Destroy Modbus controller and its resources.

**Configuring Slave Data Access** The following functions must be called when the Modbus controller slave port is already initialized. Refer to *Modbus Port Initialization*.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using *mbc\_slave\_set\_descriptor()* API call before the start of communication. The slave task can call the *mbc\_slave\_check\_event()* function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

---

**备注:** One slave can define several area descriptors per each type of Modbus register area with different start\_offset.

---

Register area is defined by using the *mb\_register\_area\_descriptor\_t* structure.

表 8: Table 3 Modbus register area descriptor

Field	Description
start_offset	Zero-based register relative offset for defined register area. Example: register address = 40002 ( 4x register area - Function 3 - holding register ), start_offset = 2
type	Type of the Modbus register area. Refer to <i>mb_param_type_t</i> for more information.
address	A pointer to the memory area which is used to store the register data for this area descriptor.
size	The size of the memory area in bytes which is used to store register data.

*mbc\_slave\_set\_descriptor()*

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the *mbc\_slave\_start()* API is called the Modbus stack can access the data in user data structures by request from master.

```
#define MB_REG_INPUT_START_AREA0    (0)
#define MB_REG_HOLDING_START_AREA0 (0)
#define MB_REG_HOLD_CNT            (100)
#define MB_REG_INPUT_CNT           (100)

mb_register_area_descriptor_t reg_area; // Modbus register area descriptor
↳structure
unit16_t holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding
↳registers
unit16_t input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input
↳registers

reg_area.type = MB_PARAM_HOLDING; // Set type of
↳register area
reg_area.start_offset = MB_REG_HOLDING_START_AREA0; // Offset of
↳register area in Modbus protocol
reg_area.address = (void*)&holding_reg_area[0]; // Set pointer to
↳storage instance
reg_area.size = sizeof(holding_reg_area) << 1; // Set the size of
↳register storage area in bytes
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

reg_area.type = MB_PARAM_INPUT;
reg_area.start_offset = MB_REG_INPUT_START_AREA0;
reg_area.address = (void*)&input_reg_area[0];
reg_area.size = sizeof(input_reg_area) << 1;
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));
```

At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

```
portENTER_CRITICAL(&param_lock);
holding_reg_area[2] += 10;
portEXIT_CRITICAL(&param_lock);
```

**Slave Communication Options** The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

*mbc\_slave\_setup()*

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:

```

esp_netif_init();
...

mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,           // Modbus TCP port number (default_
    ↪= 502)
    .ip_addr_type = MB_IPV4,         // version of IP protocol
    .ip_mode = MB_MODE_TCP,         // Port communication mode
    .ip_addr = NULL,                // This field keeps the client IP_
    ↪address to bind, NULL - bind to any client
    .ip_netif_ptr = esp_netif_ptr   // esp_netif_ptr - pointer to the_
    ↪corresponding network interface
};

// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_setup((void*)&comm_info));

```

Example initialization of Modbus serial communication:

```

#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...

// Setup communication parameters and start stack
mb_communication_info_t comm_info = {
    .mode = MB_MODE_RTU,             // Communication type
    .slave_addr = MB_SLAVE_ADDR,     // Short address of the slave
    .port = MB_SLAVE_PORT_NUM,      // UART physical port number
    .baudrate = MB_SLAVE_DEV_SPEED, // Baud rate for communication
    .parity = MB_PARITY_NONE        // Parity option
};

ESP_ERROR_CHECK(mbc_slave_setup((void*)&comm_info));

```

**Slave Communication** The function below is used to start Modbus controller interface and allows communication.

`mbc_slave_start()`

```
ESP_ERROR_CHECK(mbc_slave_start());
```

`mbc_slave_check_event()`

The blocking call to function waits for an event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event `mb_event_group_t` which describes the type of register access being done.

`mbc_slave_get_param_info()`

The function gets information about accessed parameters from the Modbus controller event queue. The KConfig `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE` key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The `mb_param_info_t` structure contains information about accessed parameter.

表 9: Table 4 Description of the register info structure:  
mb\_param\_info\_t

Field	Description
time_stamp	the time stamp of the event when defined parameter is accessed
mb_offset	start Modbus register accessed by master
type	type of the Modbus register area being accessed (See the <i>mb_event_group_t</i> for more information)
address	memory address that corresponds to accessed register in defined area descriptor
size	number of registers being accessed by master

Example to get event when holding or input registers accessed in the slave:

```
#define MB_READ_MASK          (MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD)
#define MB_WRITE_MASK        (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK   (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10 / portTICK_RATE_MS)
....

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(&reg_info, MB_PAR_INFO_GET_TOUT));
const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG_WR | MB_EVENT_HOLDING_REG_RD)) {
    ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u
↵",
             rw_str,
             (uint32_t)reg_info.time_stamp,
             (uint32_t)reg_info.mb_offset,
             (uint32_t)reg_info.type,
             (uint32_t)reg_info.address,
             (uint32_t)reg_info.size);
} else if (event & (MB_EVENT_INPUT_REG_RD)) {
    ESP_LOGI(TAG, "INPUT %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
             rw_str,
             (uint32_t)reg_info.time_stamp,
             (uint32_t)reg_info.mb_offset,
             (uint32_t)reg_info.type,
             (uint32_t)reg_info.address,
             (uint32_t)reg_info.size);
}
}
```

**Modbus Slave Teardown** This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

*mbc\_slave\_destroy()*

```
ESP_ERROR_CHECK(mbc_slave_destroy());
```

### Possible Communication Issues And Solutions

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:

```
E (1692332) MB_CONTROLLER_MASTER: mbc_master_get_parameter(111): SERIAL master get_
↳parameter failure error=(0x107) (ESP_ERR_TIMEOUT).
```

表 10: Table 5 Modbus error codes and troubleshooting

Er- ror	Description	Possible solution
0x106	ESP_ERR_NOT_SUPPORTED - Invalid register request - slave returned an exception because the requested register is not supported.	Refer to slave register map. Check the master data dictionary for correctness.
0x107	ESP_ERR_TIMEOUT - Slave response timeout - Modbus slave did not send response during configured slave response timeout.	Measure and increase the maximum slave response timeout <i>idf.py menu-config</i> , option <code>CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND</code> . Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than <code>CONFIG_FMB_PORT_TASK_PRIO</code> it is recommended to place Modbus tasks on the other core using an option <code>CONFIG_FMB_PORT_TASK_AFFINITY</code> . Configure the Modbus task's priority <code>CONFIG_FMB_PORT_TASK_PRIO</code> to ensure that the task gets sufficient processing time to handle Modbus stack events.
0x108	ESP_ERR_INVALID_RESPONSE - Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect.	Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.
0x109	ESP_ERR_INVALID_STATE - Critical failure or FSM sequence failure or master FSM is busy processing previous request.	Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.

### Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support ...” for appropriate communication mode and related configuration keys.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the specific example README.md for details.

Interface method start

### Enumerations

enum **mb\_port\_type\_t**  
Types of actual Modbus implementation.

*Values:*

enumerator **MB\_PORT\_SERIAL\_MASTER**  
Modbus port type serial master.

enumerator **MB\_PORT\_SERIAL\_SLAVE**  
Modbus port type serial slave.

enumerator **MB\_PORT\_TCP\_MASTER**  
Modbus port type TCP master.

enumerator **MB\_PORT\_TCP\_SLAVE**

Modbus port type TCP slave.

enumerator **MB\_PORT\_COUNT**

Modbus port count.

enumerator **MB\_PORT\_INACTIVE**

enum **mb\_event\_group\_t**

Event group for parameters notification.

*Values:*

enumerator **MB\_EVENT\_NO\_EVENTS**

enumerator **MB\_EVENT\_HOLDING\_REG\_WR**

Modbus Event Write Holding registers.

enumerator **MB\_EVENT\_HOLDING\_REG\_RD**

Modbus Event Read Holding registers.

enumerator **MB\_EVENT\_INPUT\_REG\_RD**

Modbus Event Read Input registers.

enumerator **MB\_EVENT\_COILS\_WR**

Modbus Event Write Coils.

enumerator **MB\_EVENT\_COILS\_RD**

Modbus Event Read Coils.

enumerator **MB\_EVENT\_DISCRETE\_RD**

Modbus Event Read Discrete bits.

enumerator **MB\_EVENT\_STACK\_STARTED**

Modbus Event Stack started

enum **mb\_param\_type\_t**

Type of Modbus parameter.

*Values:*

enumerator **MB\_PARAM\_HOLDING**

Modbus Holding register.

enumerator **MB\_PARAM\_INPUT**

Modbus Input register.

enumerator **MB\_PARAM\_COIL**

Modbus Coils.

enumerator **MB\_PARAM\_DISCRETE**

Modbus Discrete bits.

enumerator **MB\_PARAM\_COUNT**

enumerator **MB\_PARAM\_UNKNOWN**

enum **mb\_mode\_type\_t**

Modbus serial transmission modes (RTU/ASCII).

*Values:*

enumerator **MB\_MODE\_RTU**

RTU transmission mode.

enumerator **MB\_MODE\_ASCII**

ASCII transmission mode.

enumerator **MB\_MODE\_TCP**

TCP communication mode.

enumerator **MB\_MODE\_UDP**

UDP communication mode.

enum **mb\_tcp\_addr\_type\_t**

Modbus TCP type of address.

*Values:*

enumerator **MB\_IPV4**

TCP IPV4 addressing

enumerator **MB\_IPV6**

TCP IPV6 addressing

## Header File

- [components/freemodbus/common/include/esp\\_modbus\\_master.h](#)

## Functions

*esp\_err\_t* **mbc\_master\_init\_tcp**(void \*\*handler)

Initialize Modbus controller and stack for TCP port.

**参数 handler** –[out] handler(pointer) to master data structure

**返回**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error
- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

*esp\_err\_t* **mbc\_master\_init** (*mb\_port\_type\_t* port\_type, void \*\*handler)

Initialize Modbus Master controller and stack for Serial port.

**参数**

- **handler** –[out] handler(pointer) to master data structure
- **port\_type** –[in] type of stack

**返回**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error
- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

void **mbc\_master\_init\_iface** (void \*handler)

Initialize Modbus Master controller interface handle.

**参数 handler** –[in] - pointer to master data structure

*esp\_err\_t* **mbc\_master\_destroy** (void)

Destroy Modbus controller and stack.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

*esp\_err\_t* **mbc\_master\_start** (void)

Start Modbus communication stack.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

*esp\_err\_t* **mbc\_master\_setup** (void \*comm\_info)

Set Modbus communication parameters for the controller.

**参数 comm\_info** –Communication parameters structure.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Incorrect parameter data

*esp\_err\_t* **mbc\_master\_set\_descriptor** (const *mb\_parameter\_descriptor\_t* \*descriptor, const uint16\_t num\_elements)

Assign parameter description table for Modbus controller interface.

**参数**

- **descriptor** –[in] pointer to parameter description table
- **num\_elements** –number of elements in the table

**返回**

- *esp\_err\_t* ESP\_OK - set descriptor successfully
- *esp\_err\_t* ESP\_ERR\_INVALID\_ARG - invalid argument in function call

*esp\_err\_t* **mbc\_master\_send\_request** (*mb\_param\_request\_t* \*request, void \*data\_ptr)

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

**参数**

- **request** –[in] pointer to request structure of type *mb\_param\_request\_t*
- **data\_ptr** –[in] pointer to data buffer to send or received data (dependent of command field in request)

**返回**

- *esp\_err\_t* ESP\_OK - request was successful
- *esp\_err\_t* ESP\_ERR\_INVALID\_ARG - invalid argument of function
- *esp\_err\_t* ESP\_ERR\_INVALID\_RESPONSE - an invalid response from slave
- *esp\_err\_t* ESP\_ERR\_TIMEOUT - operation timeout or no response from slave

- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

`esp_err_t mbc_master_get_cid_info` (uint16\_t cid, const `mb_parameter_descriptor_t` \*\*param\_info)

Get information about supported characteristic defined as cid. Uses parameter description table to get this information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param\_info. Returns `ESP_ERR_NOT_FOUND` if characteristic is not supported.

#### 参数

- **cid** –[in] characteristic id
- **param\_info** –pointer to pointer of characteristic data.

#### 返回

- `esp_err_t ESP_OK` - request was successful and buffer contains the supported characteristic name
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_NOT_FOUND` - the characteristic (cid) not found
- `esp_err_t ESP_FAIL` - unknown error during lookup table processing

`esp_err_t mbc_master_get_parameter` (uint16\_t cid, char \*name, uint8\_t \*value, uint8\_t \*type)

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

#### 参数

- **cid** –[in] id of the characteristic for parameter
- **name** –[in] pointer into string name (key) of parameter (null terminated)
- **value** –[out] pointer to data buffer of parameter
- **type** –[out] parameter type associated with the name returned from parameter description table.

#### 返回

- `esp_err_t ESP_OK` - request was successful and value buffer contains representation of actual parameter data from slave
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function or parameter descriptor
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_ERR_NOT_FOUND` - the parameter is not found in the parameter description table
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

`esp_err_t mbc_master_set_parameter` (uint16\_t cid, char \*name, uint8\_t \*value, uint8\_t \*type)

Set characteristic's value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

#### 参数

- **cid** –[in] id of the characteristic for parameter
- **name** –[in] pointer into string name (key) of parameter (null terminated)
- **value** –[out] pointer to data buffer of parameter (actual representation of json value field in binary form)
- **type** –[out] pointer to parameter type associated with the name returned from parameter lookup table.

#### 返回

- `esp_err_t ESP_OK` - request was successful and value was saved in the slave device registers
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function or parameter descriptor

- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave during processing of parameter
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

## Unions

union `mb_parameter_opt_t`

*#include <esp\_modbus\_master.h>* Modbus parameter options for description table.

### Public Members

int `opt1`

Parameter option1

int `opt2`

Parameter option2

int `opt3`

Parameter option3

struct `mb_parameter_opt_t::[anonymous]` [**anonymous**]

int `min`

Parameter minimum value

int `max`

Parameter maximum value

int `step`

Step of parameter change tracking

struct `mb_parameter_opt_t::[anonymous]` [**anonymous**]

## Structures

struct `mb_parameter_descriptor_t`

Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

### Public Members

uint16\_t `cid`

Characteristic cid

const char \***param\_key**

The key (name) of the parameter

const char \***param\_units**

The physical units of the parameter

uint8\_t **mb\_slave\_addr**

Slave address of device in the Modbus segment

*mb\_param\_type\_t* **mb\_param\_type**

Type of modbus parameter

uint16\_t **mb\_reg\_start**

This is the Modbus register address. This is the 0 based value.

uint16\_t **mb\_size**

Size of mb parameter in registers

uint16\_t **param\_offset**

Parameter name (OFFSET in the parameter structure)

*mb\_descr\_type\_t* **param\_type**

Float, U8, U16, U32, ASCII, etc.

*mb\_descr\_size\_t* **param\_size**

Number of bytes in the parameter.

*mb\_parameter\_opt\_t* **param\_opts**

Parameter options used to check limits and etc.

*mb\_param\_perms\_t* **access**

Access permissions based on mode

struct **mb\_param\_request\_t**

Modbus register request type structure.

### Public Members

uint8\_t **slave\_addr**

Modbus slave address

uint8\_t **command**

Modbus command to send

uint16\_t **reg\_start**

Modbus start register

uint16\_t **reg\_size**

Modbus number of registers

### Macros

**MB\_MASTER\_CHECK** (a, err\_code, format, ...)

**MB\_MASTER\_ASSERT** (con)

### Enumerations

enum **mb\_descr\_type\_t**

Modbus descriptor table parameter type defines.

*Values:*

enumerator **PARAM\_TYPE\_U8**

Unsigned 8

enumerator **PARAM\_TYPE\_U16**

Unsigned 16

enumerator **PARAM\_TYPE\_U32**

Unsigned 32

enumerator **PARAM\_TYPE\_FLOAT**

Float type

enumerator **PARAM\_TYPE\_ASCII**

ASCII type

enum **mb\_descr\_size\_t**

Modbus descriptor table parameter size in bytes.

*Values:*

enumerator **PARAM\_SIZE\_U8**

Unsigned 8

enumerator **PARAM\_SIZE\_U16**

Unsigned 16

enumerator **PARAM\_SIZE\_U32**

Unsigned 32

enumerator **PARAM\_SIZE\_FLOAT**

Float size

enumerator **PARAM\_SIZE\_ASCII**

ASCII size

enumerator **PARAM\_SIZE\_ASCII24**

ASCII24 size

enumerator **PARAM\_MAX\_SIZE**

enum **mb\_param\_perms\_t**

Permissions for the characteristics.

*Values:*

enumerator **PAR\_PERMS\_READ**

the characteristic of the device are readable

enumerator **PAR\_PERMS\_WRITE**

the characteristic of the device are writable

enumerator **PAR\_PERMS\_TRIGGER**

the characteristic of the device are triggerable

enumerator **PAR\_PERMS\_READ\_WRITE**

the characteristic of the device are readable & writable

enumerator **PAR\_PERMS\_READ\_TRIGGER**

the characteristic of the device are readable & triggerable

enumerator **PAR\_PERMS\_WRITE\_TRIGGER**

the characteristic of the device are writable & triggerable

enumerator **PAR\_PERMS\_READ\_WRITE\_TRIGGER**

the characteristic of the device are readable & writable & triggerable

## Header File

## Functions

*esp\_err\_t* **mbc\_slave\_init\_tcp**(void \*\*handler)

Initialize Modbus Slave controller and stack for TCP port.

**参数 handler** **–[out]** handler(pointer) to master data structure

**返回**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error
- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

*esp\_err\_t* **mbc\_slave\_init**(*mb\_port\_type\_t* port\_type, void \*\*handler)

Initialize Modbus Slave controller and stack for Serial port.

**参数**

- **handler** **–[out]** handler(pointer) to master data structure
- **port\_type** **–[in]** the type of port

**返回**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error
- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

void **mbc\_slave\_init\_iface** (void \*handler)

Initialize Modbus Slave controller interface handle.

参数 **handler** –[in] - pointer to slave interface data structure

*esp\_err\_t* **mbc\_slave\_destroy** (void)

Destroy Modbus controller and stack.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

*esp\_err\_t* **mbc\_slave\_start** (void)

Start Modbus communication stack.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

*esp\_err\_t* **mbc\_slave\_setup** (void \*comm\_info)

Set Modbus communication parameters for the controller.

参数 **comm\_info** –Communication parameters structure.

返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Incorrect parameter data

*mb\_event\_group\_t* **mbc\_slave\_check\_event** (*mb\_event\_group\_t* group)

Wait for specific event on parameter change.

参数 **group** –Group event bit mask to wait for change

返回

- *mb\_event\_group\_t* event bits triggered

*esp\_err\_t* **mbc\_slave\_get\_param\_info** (*mb\_param\_info\_t* \*reg\_info, uint32\_t timeout)

Get parameter information.

参数

- **reg\_info** –[out] parameter info structure
- **timeout** –Timeout in milliseconds to read information from parameter queue

返回

- ESP\_OK Success
- ESP\_ERR\_TIMEOUT Can not get data from parameter queue or queue overflow

*esp\_err\_t* **mbc\_slave\_set\_descriptor** (*mb\_register\_area\_descriptor\_t* descr\_data)

Set Modbus area descriptor.

参数 **descr\_data** –Modbus registers area descriptor structure

返回

- ESP\_OK: The appropriate descriptor is set
- ESP\_ERR\_INVALID\_ARG: The argument is incorrect

## Structures

struct **mb\_param\_info\_t**

Parameter access event information type.

## Public Members

`uint32_t time_stamp`  
Timestamp of Modbus Event (uS)

`uint16_t mb_offset`  
Modbus register offset

*`mb_event_group_t`* **type**  
Modbus event type

`uint8_t *address`  
Modbus data storage address

`size_t size`  
Modbus event register size (number of registers)

struct `mb_register_area_descriptor_t`  
Parameter storage area descriptor.

### Public Members

`uint16_t start_offset`  
Modbus start address for area descriptor

*`mb_param_type_t`* **type**  
Type of storage area descriptor

`void *address`  
Instance address for storage area descriptor

`size_t size`  
Instance size for area descriptor (bytes)

### Macros

`MB_SLAVE_CHECK` (a, err\_code, format, ...)

`MB_SLAVE_ASSERT` (con)

## 2.4.12 ESP Local Control

### Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
```

(下页继续)

(续上页)

```

        .device_name = SERVICE_NAME,
        .service_uuid = {
            /* LSB <-----
            * -----> MSB */
            0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
            0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx          = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[]   asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */

```

(下页继续)

(续上页)

```

        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTOCOLCOM\_SEC1*: specifies that end to end encryption is used.
2. *PROTOCOLCOM\_SEC0*: specifies that data will be exchanged as a plain text.
3. *PROTOCOLCOM\_SEC\_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom\_handle* of type *protocomm\_security\_t* \* in this context.

### Creating a property

Now that we know how to start the **esp\_local\_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp\_local\_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE\_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name         = "timestamp",
    .type         = TYPE_TIMESTAMP,
    .size         = sizeof(int32_t),
    .flags        = READONLY,
    .ctx          = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a *ctx* field, which is set to point to some custom *func\_get\_time()*. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of *get\_prop\_values()* handler, which is used for retrieving the timestamp.

```

static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
    }
}

```

(下页继续)

```

    if (props[i].type == TYPE_TIMESTAMP) {
        /* Obtain the timer function from ctx */
        int32_t (*func_get_time)(void) = props[i].ctx;

        /* Use static variable for saving the value.
         * This is essential because the value has to be
         * valid even after this function returns.
         * Alternative is to use dynamic allocation
         * and set the free_fn field */
        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t
↪ *prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↪ props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

## Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created

mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

表 11: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl_version	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl_control	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- components/esp\_local\_ctrl/include/esp\_local\_ctrl.h

### Functions

const *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_ble** (void)

Function for obtaining BLE transport mode.

const *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_httpd** (void)

Function for obtaining HTTPD transport mode.

*esp\_err\_t* **esp\_local\_ctrl\_start** (const *esp\_local\_ctrl\_config\_t* \*config)

Start local control service.

**参数 config** –[in] Pointer to configuration structure

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_stop** (void)

Stop local control service.

*esp\_err\_t* **esp\_local\_ctrl\_add\_property** (const *esp\_local\_ctrl\_prop\_t* \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

**参数 prop** –[in] Property description structure

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**参数 name** –[in] Name of the property to remove

**返回**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

const *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure *esp\_local\_ctrl\_prop\_t* when its name is known

**参数** **name** **–[in]** Name of the property to find

**返回**

- Pointer to property
- NULL if not found

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

---

**备注:** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the *protocomm\_ble\_config\_t* structure set in *esp\_local\_ctrl\_config\_t*, and passed to *esp\_local\_ctrl\_start()*.

---

**参数**

- **ep\_name** **–[in]** Name of the endpoint
- **handler** **–[in]** Endpoint handler function
- **user\_ctx** **–[in]** User data

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

## Unions

union **esp\_local\_ctrl\_transport\_config\_t**

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

## Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \***ble**

This is same as *protocomm\_ble\_config\_t*. See *protocomm\_ble.h* for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \***httpd**

This is same as *httpd\_ssl\_config\_t*. See *esp\_https\_server.h* for available configuration parameters.

## Structures

struct **esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the *esp\_local\_ctrl\_add\_property()* function.

Once a property is added, its structure is available for read-only access inside *get\_prop\_values()* and *set\_prop\_values()* handlers.

### Public Members

char \***name**

Unique name of property

uint32\_t **type**

Type of property. This may be set to application defined enums

size\_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32\_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void \***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (\***ctx\_free\_fn**)(void \*ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

### Public Members

void \***data**

Pointer to memory holding property value

size\_t **size**

Size of property value

void (\***free\_fn**)(void \*data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct **esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

*esp\_err\_t* (\***get\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for retrieving current values of properties.

---

**备注:** If any of the properties have fixed sizes, the size field of corresponding element in *prop\_values* need to be set

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the current values for which have been requested by the client

**Param prop\_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the *usr\_ctx* field of *esp\_local\_ctrl\_handlers\_t* structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

*esp\_err\_t* (\***set\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], const *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for changing values of properties.

---

**备注:** If any of the properties have variable sizes, the size field of the corresponding element in *prop\_values* must be checked explicitly before making any assumptions on the size.

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop\_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the *usr\_ctx* field of *esp\_local\_ctrl\_handlers\_t* structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

void \***usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the *esp\_local\_ctrl* service, and freed only when the service is stopped.

void (\***usr\_ctx\_free\_fn**)(void \*usr\_ctx)

Pointer to function which will be internally invoked on *usr\_ctx* for freeing the context resources when *esp\_local\_ctrl\_stop()* is called.

struct **esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

### Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below.

void \***custom\_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature.

void \***pop**

Proof of possession to be used for local control. Could be NULL.

struct **esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

const *esp\_local\_ctrl\_transport\_t* \***ttransport**

Transport layer over which service will be provided.

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided.

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP.

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties.

size\_t **max\_properties**

This limits the number of properties that are available at a time.

### Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

### Type Definitions

typedef struct *esp\_local\_ctrl\_prop* **esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp\_local\_ctrl\_prop\_val* **esp\_local\_ctrl\_prop\_val\_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp\_local\_ctrl\_handlers* **esp\_local\_ctrl\_handlers\_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp\_local\_ctrl\_transport* **esp\_local\_ctrl\_transport\_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm\_ble\_config* **esp\_local\_ctrl\_transport\_config\_ble\_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd\_ssl\_config* **esp\_local\_ctrl\_transport\_config\_httpd\_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`

typedef enum *esp\_local\_ctrl\_proto\_sec* **esp\_local\_ctrl\_proto\_sec\_t**

Security types for `esp_local_control`.

typedef struct *esp\_local\_ctrl\_proto\_sec\_cfg* **esp\_local\_ctrl\_proto\_sec\_cfg\_t**

Protocom security configs

typedef struct *esp\_local\_ctrl\_config* **esp\_local\_ctrl\_config\_t**

Configuration structure to pass to `esp_local_ctrl_start()`

## Enumerations

enum **esp\_local\_ctrl\_proto\_sec**

Security types for `esp_local_control`.

*Values:*

enumerator **PROTOCOL\_SEC0**

enumerator **PROTOCOL\_SEC1**

enumerator **PROTOCOL\_SEC\_CUSTOM**

## 2.4.13 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

## Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

### ESP SPI Slave HD (Half Duplex) Mode Protocol

#### SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave  
This phase determines the rest phases of the transactions. See [Supported Commands](#).
- **Address:** 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional  
This phase is the turn around time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to master.
- **Data:** variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

**Data IO Modes** In some IO modes, more data wires can be use to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here' s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined is determined by the command sent by the master (See [Supported Commands](#)), except from the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit from the QPI mode, master can send EXQPI command.

### Supported Commands

**备注:** The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments.

This way the master doesn't have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see [:doc:' Document of SDMMC driver </api-reference/storage/sdmmc>' structure](#)).
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

---

### ESP SPI Slave

**备注:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the [SDIO interface](#) instead.

---

Hasn't been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.

#### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

## Application Example

The example below shows how ESP32-S3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- [components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl.h](#)

### Functions

*esp\_err\_t* **essl\_init** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Initialize the slave.

#### 参数

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### 返回

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

*esp\_err\_t* **essl\_wait\_for\_ready** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Wait for interrupt of an ESSL slave device.

#### 参数

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### 返回

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_tx\_buffer\_num** (*essl\_handle\_t* handle, uint32\_t \*out\_tx\_num, uint32\_t wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### 参数

- **handle** –Handle of a ESSL device.
- **out\_tx\_num** –Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_get\_rx\_data\_size** (*essl\_handle\_t* handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### 参数

- **handle** –Handle of an ESSL device.
- **out\_rx\_size** –Output of data size to read from slave, in bytes
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_reset\_cnt** (*essl\_handle\_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**参数 handle** –Handle of an ESSL device.

**返回**

- **ESP\_OK**: Success
- **ESP\_ERR\_NOT\_SUPPORTED**: This API is not supported in this mode
- **ESP\_ERR\_INVALID\_ARG**: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

**参数**

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG**: Invalid argument, handle is not init or other argument is not valid.
- **ESP\_ERR\_TIMEOUT**: No buffer to use, or error from SDMMC host controller.
- **ESP\_ERR\_NOT\_FOUND**: Slave is not ready for receiving.
- **ESP\_ERR\_NOT\_SUPPORTED**: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

**参数**

- **handle** –Handle of an ESSL device.
- **out\_data** –[out] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns **ESP\_ERR\_NOT\_FINISHED**
- **out\_length** –[out] Output of length the data actually received from slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- **ESP\_OK** Success: All the data has been read from the slave.
- **ESP\_ERR\_INVALID\_ARG**: Invalid argument, The handle is not initialized or the other arguments are invalid.
- **ESP\_ERR\_NOT\_FINISHED**: Read was successful, but there is still data remaining.
- **ESP\_ERR\_NOT\_FOUND**: Slave is not ready to send data.
- **ESP\_ERR\_NOT\_SUPPORTED**: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**备注:** sdio 28-31 are reserved, the lower API helps to skip.

---

**参数**

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.

- **value\_o** –Output of the returned written value.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t add, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

**参数**

- **handle** –Handle of a *essl* device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see *essl\_spi.h*
- **value\_o** –Output value read from the register.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_wait\_intr** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

wait for an interrupt of the slave

**参数**

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK: If interrupt is triggered.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- ESP\_ERR\_TIMEOUT: No interrupts before timeout.

*esp\_err\_t* **essl\_clear\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**参数**

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to clear.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr** (*essl\_handle\_t* handle, uint32\_t \*intr\_raw, uint32\_t \*intr\_st, uint32\_t wait\_ms)

Get interrupt bits of ESSL slave.

**参数**

- **handle** –Handle of an ESSL device.
- **intr\_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr\_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK: Success
- ESP\_INVALID\_ARG: If both *intr\_raw* and *intr\_st* are NULL.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_set\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t ena\_mask, uint32\_t wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**参数**

- **handle** –Handle of an ESSL device.
- **ena\_mask** –Mask of the interrupt bits to enable.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

**参数**

- **handle** –Handle of an ESSL device.
- **ena\_mask\_o** –Output of interrupt bit enable mask.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

**参数**

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to send to slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**返回**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- [components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

**Functions**

*esp\_err\_t* **essl\_sdio\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_sdio\_config\_t* \*config)

Initialize the ESSL SDIO device and get its handle.

**参数**

- **out\_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

**返回**

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**参数** **handle** –Handle of the ESSL SDIO device to deinit.

**返回**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

struct **essl\_sdio\_config\_t**

Configuration for the ESSL SDIO device.

## Public Members

*sdmmc\_card\_t* \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- `components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h`

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

### 参数

- **out\_handle** –[out] Output of the handle
- **init\_config** –Configuration for the ESSL SPI device

### 返回

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

参数 **handle** –Handle of the ESSL SPI device

### 返回

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**备注:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

---

### 参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE, registers for M/S sync are reserved, see note1).
- **out\_value** –[out] Read buffer for the shared registers.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

### 返回

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI has not been initialized.

- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_get_packet` (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

#### 参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** –[out] Output data address
- **size** –The size of the output data.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

#### 返回

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

*esp\_err\_t* `essl_spi_write_reg` (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**备注:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**备注:** Feature of checking the actual written value (`out_value`) is not supported.

---

#### 参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out\_value** –[out] Not supported, should be set to NULL.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

#### 返回

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to NULL. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_send_packet` (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

#### 参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

#### 返回

- `ESP_OK`: On success

- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void `essl_spi_reset_cnt` (void \*arg)

Reset the counter in Master context.

---

**备注:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**参数** `arg` –Context of the component. (Member `arg` from `essl_handle_t`)

*esp\_err\_t* `essl_spi_rdbuf` (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**备注:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**备注:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_rdbuf_polling` (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

---

**备注:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**备注:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf\_polling** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**备注:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

*esp\_err\_t* **essl\_spi\_rddma** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

**备注:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** –Total length of data to receive.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_seg** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**备注:** To read long buffer, call :cpp:func:essl\_spi\_rddma instead.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_rddma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the rddma\_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**备注:** This is required only when the slave is working in segment mode.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**备注:** This function combines several :cpp:func:essl\_spi\_wrdma\_seg and one :cpp:func:essl\_spi\_wrdma\_done at the end. Used when the slave is working in segment mode.

---

#### 参数

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma\_done will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### 返回

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**备注:** To send long buffer, call :cpp:func:essl\_spi\_wrdma instead.

---

**参数**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**返回**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the wrdma\_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**备注:** This is required only when the slave is working in segment mode.

---

**参数**

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**返回**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t **tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t **rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.4.14 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**备注:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-S3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Apr 26 03:12:05 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**备注:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `ca.crt_all.pem`.

---

## Configuration

Most configuration is done through `menuconfig`. `Make` and `CMake` will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

## Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

## Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in [Updating the Certificate Bundle](#).

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

## API Reference

### Header File

- [components/mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)

### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**参数** **conf** –[in] The config struct for the SSL connection.

**返回**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**参数** **conf** –[in] The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set** (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**参数**

- **x509\_bundle** –[in] A pointer to the certificate bundle.
- **bundle\_size** –[in] Size of the certificate bundle in bytes.

**返回**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

此 API 部分的示例代码在 ESP-IDF 示例工程的 [protocols](#) 目录下提供。

## 2.4.15 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档位于[连网 API](#)。

## 2.5 配网 API

### 2.5.1 Unified Provisioning

#### Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

#### Typical Provisioning Process

#### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to "System Settings" to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

图 25: Typical Provisioning Process

## Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*security1*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

## Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

## Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

## Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

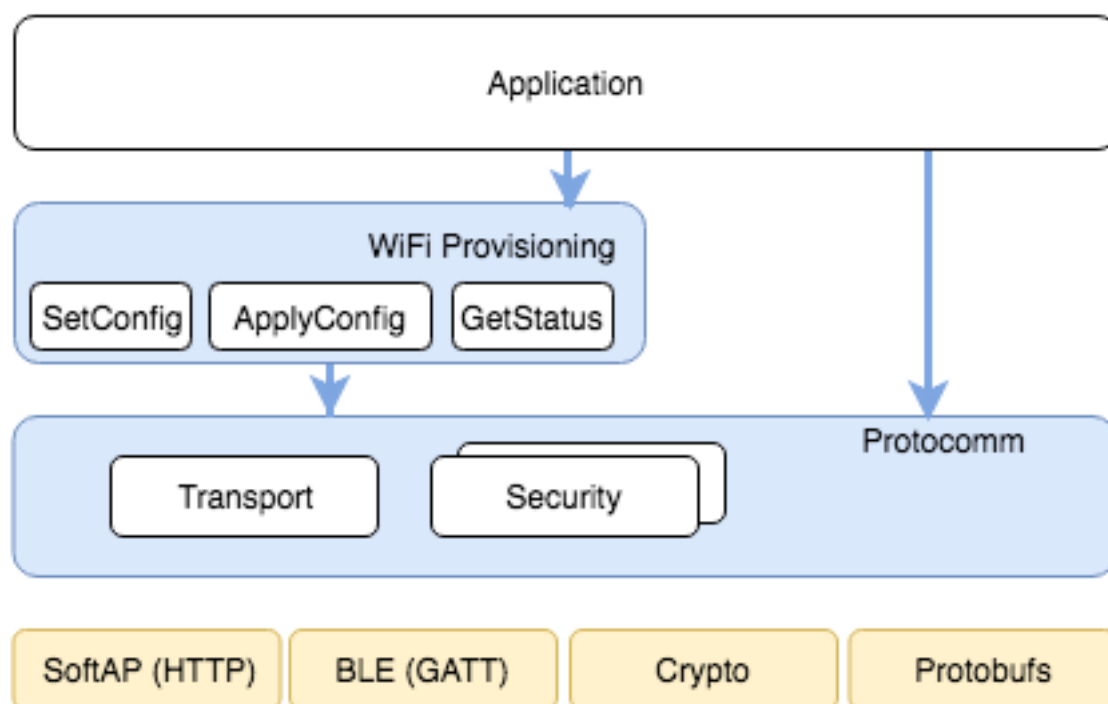

图 26: Unified Provisioning Architecture

### Sample Code

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage. Application implementation can be found as an example under [provisioning](#).

### Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [BLE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [BLE Provisioning app on app store](#).
  - [SoftAP Provisioning app on app Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## 2.5.2 Protocol Communication

### Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

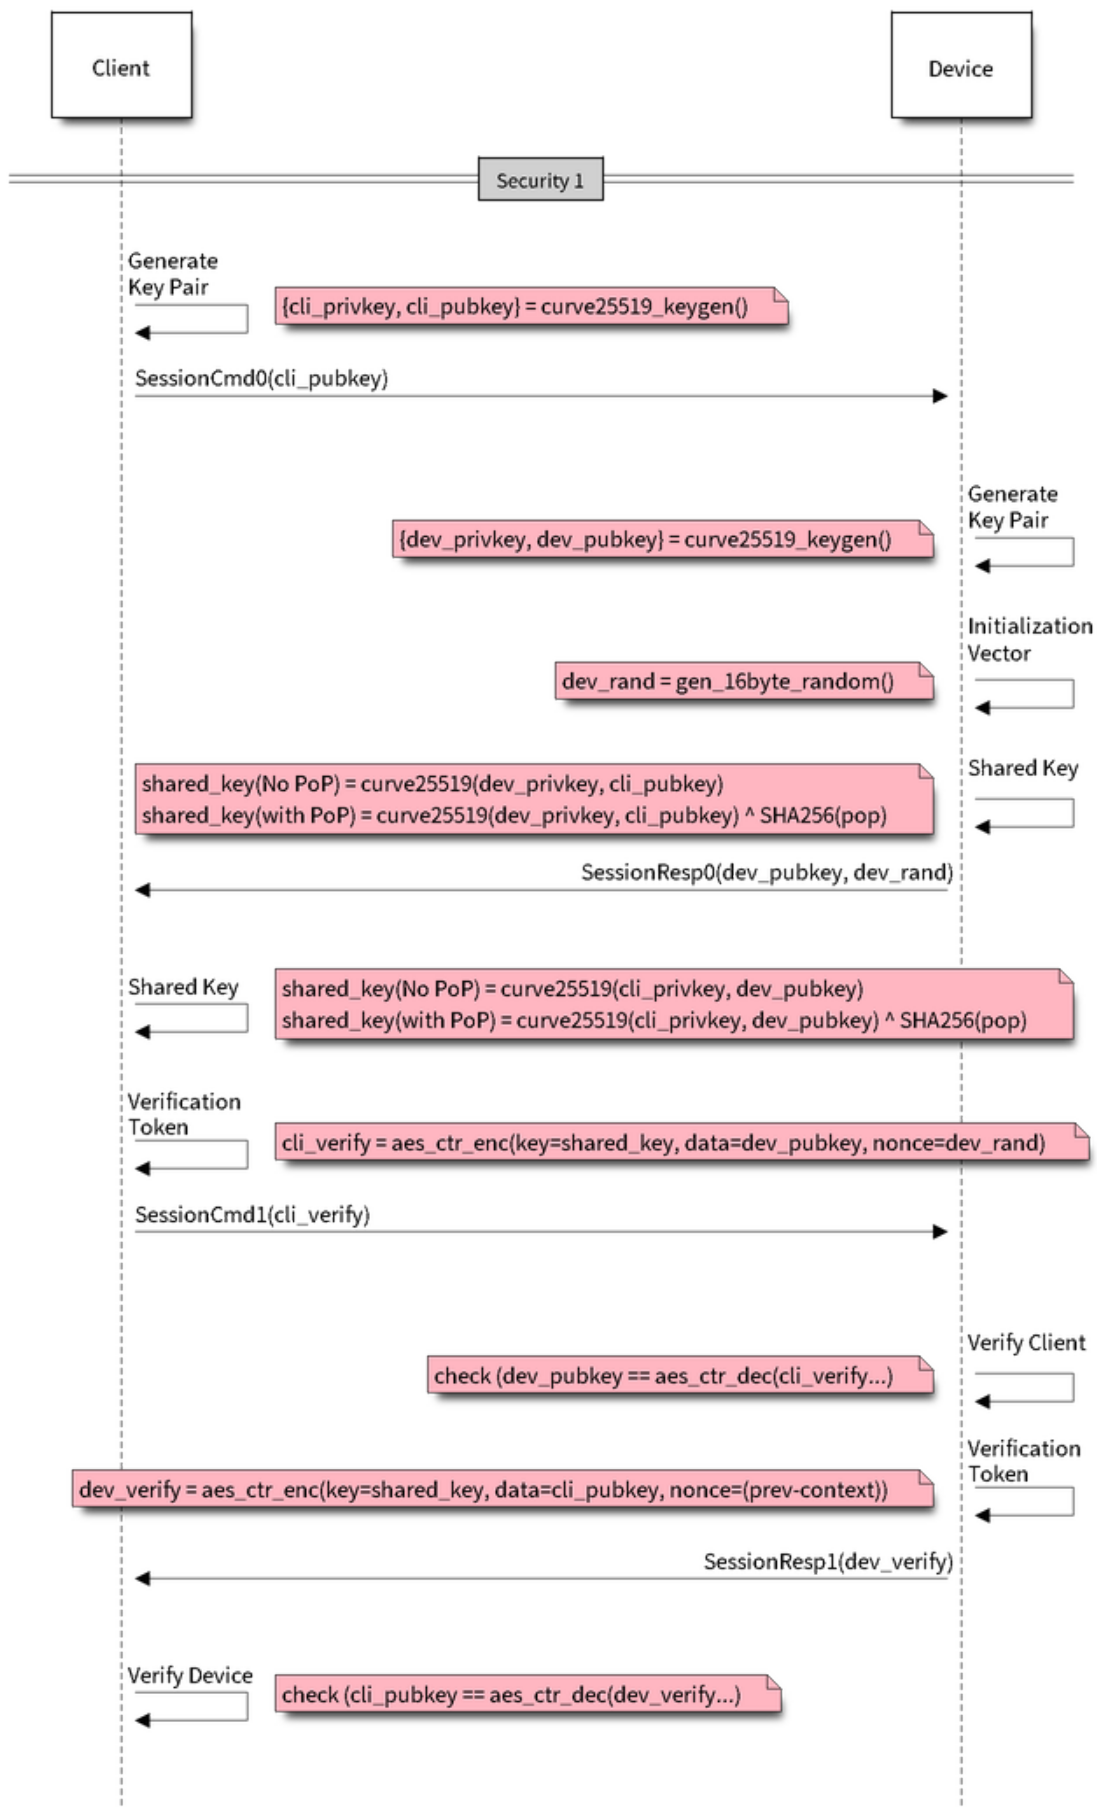

图 27: Security1

**Following features are available for provisioning :**

- **Communication security at application level -**
  - protocomm\_security0 (no security)
  - protocomm\_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm\_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm\_security1) by performing the two way handshake. See [Unified Provisioning](#) for more details about the secure handshake logic.

**Transport Example (SoftAP + HTTP) with Security 1**

For complete example see [provisioning/legacy/softap\\_prov](#)

```

/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
     * throughout the scope of protocomm endpoint. This need not be
     * static,
    ↪static,

```

(下页继续)

```

    * ie. could be dynamically allocated and freed at the time of
    ↪endpoint
    * removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for
    * request handlers, setting security creates an endpoint and
    ↪registers
    * the handler provided by protocomm_security1. One can similarly use
    * protocomm_security0. Only one type of security can be set for a
    * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
    ↪&pop_obj);

    /* Private data passed to the endpoint must be valid throughout the
    ↪scope
    * of protocomm endpoint. This need not be static, ie. could be
    ↪dynamically
    * allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

    /* Add a new endpoint for the protocomm instance, identified by a
    ↪unique name
    * and register a handler function along with private data to be
    ↪passed at the
    * time of handler execution. Multiple endpoints can be added as long
    ↪as they
    * are identified by unique names */
    protocomm_add_endpoint(pc, "echo_req_endpoint",
        echo_req_handler, (void *) &priv_data);

    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

```

### Transport Example (BLE) with Security 0

For complete example see [provisioning/legacy/ble\\_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();
}

```

(下页继续)

```

/* Endpoint UUIDs */
protocomm_ble_name_uuid_t nu_lookup_table[] = {
    {"security_endpoint", 0xFF51},
    {"echo_req_endpoint", 0xFF52}
};

/* Config for protocomm_ble_start() */
protocomm_ble_config_t config = {
    .service_uuid = {
        /* LSB <-----
        * -----> MSB */
        0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
        0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
    },
    .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
↪table[0]),
    .nu_lookup = nu_lookup_table
};

/* Start protocomm layer on top of BLE */
protocomm_ble_start(pc, &config);

/* For protocomm_security0, Proof of Possession is not used, and can
↪be kept NULL */
protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
↪NULL);
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
↪NULL);
return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

## API Reference

### Header File

- components/protocomm/include/common/protocomm.h

### Functions

*protocomm\_t*\***protocomm\_new**(void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm\_t structure initialized to NULL.

#### 返回

- protocomm\_t\* : On success
- NULL : No memory for allocating new instance

void **protocomm\_delete** (*protocomm\_t* \*pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

**参数** **pc** –[in] Pointer to the protocomm instance to be deleted

*esp\_err\_t* **protocomm\_add\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name, *protocomm\_req\_handler\_t* h, void \*priv\_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

---

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.
- 

**参数**

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **h** –[in] Endpoint handler function
- **priv\_data** –[in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

**返回**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_remove\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

---

**备注:**

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.
- 

**参数**

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string

**返回**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

*esp\_err\_t* **protocomm\_open\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Allocates internal resources for new transport session.

---

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
-

**参数**

- **pc** –[in] Pointer to the protocomm instance
- **session\_id** –[in] Unique ID for a communication session

**返回**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_close\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Frees internal resources used by a transport session.

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**参数**

- **pc** –[in] Pointer to the protocomm instance
- **session\_id** –[in] Unique ID for a communication session

**返回**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_req\_handle** (*protocomm\_t* \*pc, const char \*ep\_name, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**参数**

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **session\_id** –[in] Unique ID for a communication session
- **inbuf** –[in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** –[in] Length of the input buffer
- **outbuf** –[out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** –[out] Buffer length of the allocated output buffer

**返回**

- ESP\_OK : Request handled successfully
- ESP\_FAIL : Internal error in execution of registered handler
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_set\_security** (*protocomm\_t* \*pc, const char \*ep\_name, const *protocomm\_security\_t* \*sec, const *protocomm\_security\_pop\_t* \*pop)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**备注:**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**参数**

- **pc** –[in] Pointer to the `protocomm` instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **sec** –[in] Pointer to endpoint security instance
- **pop** –[in] Pointer to proof of possession for authenticating a client

**返回**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

`esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name)`

Remove endpoint security for a `protocomm` instance.

This API will remove a registered security endpoint identified by an endpoint name.

**参数**

- **pc** –[in] Pointer to the `protocomm` instance
- **ep\_name** –[in] Endpoint identifier(name) string

**返回**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

`esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)`

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**备注:**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

**参数**

- **pc** –[in] Pointer to the `protocomm` instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **version** –[in] Version identifier(name) string

**返回**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Version endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

`esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name)`

Remove version verification endpoint from a `protocomm` instance.

This API will remove a registered version endpoint identified by an endpoint name.

**参数**

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string

**返回**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Type Definitions**

```
typedef esp_err_t (protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

---

**备注:** Structure of the protocomm object is kept private

---

**Header File**

- [components/protocomm/include/security/protocomm\\_security.h](#)

**Structures**

```
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

**Public Members**

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```
uint16_t len
```

Length (in bytes) of the proof of possession data

```
struct protocomm_security
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**备注:** This structure should not have any dynamic members to allow re-entrancy

---

**Public Members**

```
int ver
```

Unique version number of security implementation

*esp\_err\_t* (\***init**)(*protocomm\_security\_handle\_t* \*handle)

Function for initializing/allocating security infrastructure

*esp\_err\_t* (\***cleanup**)(*protocomm\_security\_handle\_t* handle)

Function for deallocating security infrastructure

*esp\_err\_t* (\***new\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Starts new secure transport session with specified ID

*esp\_err\_t* (\***close\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Closes a secure transport session with specified ID

*esp\_err\_t* (\***security\_req\_handler**)(*protocomm\_security\_handle\_t* handle, const *protocomm\_security\_pop\_t* \*pop, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler function for authenticating connection request and establishing secure session

*esp\_err\_t* (\***encrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*outbuf, ssize\_t \*outlen)

Function which implements the encryption algorithm

*esp\_err\_t* (\***decrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*outbuf, ssize\_t \*outlen)

Function which implements the decryption algorithm

## Type Definitions

typedef struct *protocomm\_security\_pop* **protocomm\_security\_pop\_t**

Proof Of Possession for authenticating a secure session.

typedef void \***protocomm\_security\_handle\_t**

typedef struct *protocomm\_security* **protocomm\_security\_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**备注:** This structure should not have any dynamic members to allow re-entrancy

## Header File

- components/protocomm/include/security/protocomm\_security0.h

## Header File

- components/protocomm/include/security/protocomm\_security1.h

## Header File

- components/protocomm/include/transport/protocomm\_http.h

## Functions

`esp_err_t protocomm_httpd_start` (`protocomm_t` \*pc, const `protocomm_httpd_config_t` \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

---

**备注:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

---

### 参数

- **pc** –[in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** –[in] Pointer to config structure for initializing HTTP server

### 返回

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_SUPPORTED` : Transport layer bound to another protocomm instance
- `ESP_ERR_INVALID_STATE` : Transport layer already bound to this protocomm instance
- `ESP_ERR_NO_MEM` : Memory allocation for server resource failed
- `ESP_ERR_HTTPD_*` : HTTP server error on start

`esp_err_t protocomm_httpd_stop` (`protocomm_t` \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**参数** **pc** –[in] Same protocomm instance that was passed to `protocomm_httpd_start()`

### 返回

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance pointer

## Unions

union `protocomm_httpd_config_data_t`

`#include <protocomm_httpd.h>` Protocomm HTTPD Configuration Data

### Public Members

void \***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

`protocomm_http_server_config_t` **config**

HTTP Server Configuration, if a server is not already active

## Structures

struct `protocomm_http_server_config_t`

Config parameters for protocomm HTTP server.

### Public Members

uint16\_t **port**

Port on which the HTTP server will listen

size\_t **stack\_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task\_priority**

Priority of server task

struct **protocomm\_httpd\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

bool **ext\_handle\_provided**

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

*protocomm\_httpd\_config\_data\_t* **data**

Protocomm HTTPD Configuration Data

### Macros

**PROTocomm\_HTTPD\_DEFAULT\_CONFIG** ()

### Header File

- [components/protocomm/include/transport/protocomm\\_ble.h](#)

### Functions

*esp\_err\_t* **protocomm\_ble\_start** (*protocomm\_t* \*pc, const *protocomm\_ble\_config\_t* \*config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

#### 参数

- **pc** –[in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** –[in] Pointer to config structure for initializing BLE

#### 返回

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE start error
- `ESP_ERR_NO_MEM` : Error allocating memory for internal resources
- `ESP_ERR_INVALID_STATE` : Error in ble config
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **protocomm\_ble\_stop** (*protocomm\_t* \*pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

---

**备注:** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

---

**参数** `pc` **–[in]** Same protocomm instance that was passed to `protocomm_ble_start()`  
**返回**

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

## Structures

struct **name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

### Public Members

const char \***name**

Name of the handler, which is passed to protocomm layer

uint16\_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm\_ble\_config**

Config parameters for protocomm BLE service.

### Public Members

char **device\_name**[29]

BLE device name being broadcast at the time of provisioning

uint8\_t **service\_uuid**[16]

128 bit UUID of the provisioning service

uint8\_t \***manufacturer\_data**

BLE device manufacturer data pointer in advertisement

ssize\_t **manufacturer\_data\_len**

BLE device manufacturer data length in advertisement

ssize\_t **nu\_lookup\_count**

Number of entries in the Name-UUID lookup table

*protocomm\_ble\_name\_uuid\_t* \***nu\_lookup**

Pointer to the Name-UUID lookup table

unsigned **ble\_bonding**

BLE bonding

unsigned **ble\_sm\_sc**

BLE security flag

## Macros

### MAX\_BLE\_DEVNAME\_LEN

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

### BLE\_UUID128\_VAL\_LENGTH

### MAX\_BLE\_MANUFACTURER\_DATA\_LEN

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

## Type Definitions

```
typedef struct name_uuid protocomm_ble_name_uuid_t
```

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

```
typedef struct protocomm_ble_config protocomm_ble_config_t
```

Config parameters for protocomm BLE service.

## 2.5.3 Wi-Fi Provisioning

### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure *Protocol Communication (protocomm)* sessions. The set of *wifi\_prov\_mgr\_* APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization** *wifi\_prov\_mgr\_init()* is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other *wifi\_prov\_mgr\_* APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to *wifi\_prov\_mgr\_deinit()*.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure *wifi\_prov\_mgr\_config\_t* has a few fields to specify the behavior desired of the manager :

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options :
  - *wifi\_prov\_scheme\_ble* : BLE transport and GATT Server for handling provisioning commands
  - *wifi\_prov\_scheme\_softap* : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - *wifi\_prov\_scheme\_console* : Serial transport and console for handling provisioning commands

- *scheme\_event\_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app\_event\_handler* (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT`s` that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↳*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                    "\n\tSSID      : %s\n\tPassword : %s",
                    (const char *) wifi_sta_cfg->ssid,
                    (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↳reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                    "\n\tPlease reset to factory and retry_
↳provisioning",
                    (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                    "Wi-Fi station authentication failed" : "Wi-Fi_
↳access-point not found");
                break;
            }
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
        }
    }
}
```

(下页继续)

```

        break;
    default:
        break;
    }
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses *protocomm*, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```

const char *service_name = "my_device";
const char *service_key  = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**备注:** If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become

available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning( security, pop, service_
↳ name, service_key ) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`'s and call `cpp:func:`wifi_prov_mgr_deinit()`` when event ID is `WIFI_PROV_END`:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

表 12: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<a href="http://&lt;mdns-hostname&gt;.local/prov-session">http://&lt;mdns-hostname&gt;.local/prov-session</a>	Security endpoint used for session establishment
prov-scan	<a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a>	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<a href="http://&lt;mdns-hostname&gt;.local/prov-config">http://&lt;mdns-hostname&gt;.local/prov-config</a>	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://&lt;mdns-hostname&gt;.local/proto-ver">http://&lt;mdns-hostname&gt;.local/proto-ver</a>	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the *proto-ver* endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, . . . .` Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no\_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my\_app* in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the *.proto* files found under `protocomm/proto`, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi\_config* commands, serialized as Protobuf messages (the corresponding *.proto* files can be found under `wifi_provisioning/proto`):

- *get\_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set\_config* - For setting the Wi-Fi connection credentials
- *apply\_config* - For applying the credentials saved during *set\_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi\_config* commands described above. The *wifi\_scan* endpoint supports the following protobuf commands :

- *scan\_start* - For starting Wi-Fi scan with various options :
  - *blocking* (input) - If true, the command returns only when the scanning is finished
  - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - *group\_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting *group\_channels* to 4, will create 5 groups, with each group having 3 channels, except the last one which will have  $14 \% 3 = 2$  channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been

scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- *period\_ms* (input) - Scan parameter specifying how long to wait on each channel
- *scan\_status* - Gives the status of scanning process :
  - *scan\_finished* (output) - When scan has finished this returns true
  - *result\_count* (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- *scan\_result* - For fetching scan results. This can be called even if scan is still on going
  - *start\_index* (input) - Starting index from where to fetch the entries from the results list
  - *count* (input) - Number of entries to fetch from the starting index
  - *entries* (output) - List of entries returned. Each entry consists of *ssid*, *channel* and *rss* information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call [wifi\\_prov\\_mgr\\_endpoint\\_unregister\(\)](#) to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the [apply\\_config](#) command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next [get\\_status](#) command. If [get\\_status](#) command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and [get\\_status](#) will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling [wifi\\_prov\\_mgr\\_disable\\_auto\\_stop\(\)](#). Now the provisioning service will only be stopped after an explicit call to [wifi\\_prov\\_mgr\\_stop\\_provisioning\(\)](#), which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI\_PROV\_END event gets emitted. This delay is specified by the argument to [wifi\\_prov\\_mgr\\_disable\\_auto\\_stop\(\)](#).

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling [wifi\\_prov\\_mgr\\_stop\\_provisioning\(\)](#) inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

## Application Examples

For complete example implementation see [provisioning/wifi\\_prov\\_mgr](#)

## Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [BLE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [BLE Provisioning app on app store](#).
  - [SoftAP Provisioning app on app Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## API Reference

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)

### Functions

*esp\_err\_t* **wifi\_prov\_mgr\_init** (*wifi\_prov\_mgr\_config\_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

**参数 config** **–[in]** Configuration structure

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Fail

void **wifi\_prov\_mgr\_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI\_PROV\_END, and then performs the de-initialization

*esp\_err\_t* **wifi\_prov\_mgr\_is\_provisioned** (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp\_wifi component

If one were to call esp\_wifi\_set\_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

---

**备注:** Calling wifi\_prov\_mgr\_start\_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

---

**参数 provisioned** **–[out]** True if provisioned, else false

**返回**

- ESP\_OK : Retrieved provision state successfully

- ESP\_FAIL : Wi-Fi not initialized
- ESP\_ERR\_INVALID\_ARG : Null argument supplied
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

`esp_err_t wifi_prov_mgr_start_provisioning` (`wifi_prov_security_t` security, const char \*pop, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- `wifi_prov_scheme_ble` : This starts `protocomm_ble`, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap` : This activates SoftAP mode of Wi-Fi and starts `protocomm_httpd`, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type `_esp_wifi_prov_tcp`)

Event `WIFI_PROV_START` is emitted right after provisioning starts without failure

---

**备注:** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

---

#### 参数

- **security** `–[in]` Specify which `protocomm` security scheme to use :
  - `WIFI_PROV_SECURITY_0` : For no security
  - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- **pop** `–[in]` Pointer to proof of possession string (NULL if not needed). This is relevant only for `protocomm` security 1, in which case it is used for authenticating secure session
- **service\_name** `–[in]` Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service\_key** `–[in]` Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

#### 返回

- ESP\_OK : Provisioning started successfully
- ESP\_FAIL : Failed to start provisioning service
- ESP\_ERR\_INVALID\_STATE : Provisioning manager not initialized or already started

void `wifi_prov_mgr_stop_provisioning` (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some `protocomm` command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying `protocomm` service is stopped.

`cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the

client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (uint32\_t cleanup\_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

---

**备注:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**参数 cleanup\_delay** **–[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

**返回**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

*esp\_err\_t* **wifi\_prov\_mgr\_set\_app\_info** (const char \*label, const char \*version, const char \*\*capabilities, size\_t total\_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov” , containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

---

**备注:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**参数**

- **label** **–[in]** String indicating the application name.
- **version** **–[in]** String indicating the application version. There is no constraint on format.
- **capabilities** **–[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total\_capabilities** **–[in]** Size of capabilities array

**返回**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_create** (const char \*ep\_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

---

**备注:** This API can only be called BEFORE provisioning is started

---

---

**备注:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**备注:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**参数** **ep\_name** –[in] unique name of the endpoint

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_register** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

---

**备注:** This API can only be called AFTER provisioning has started

---

---

**备注:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**备注:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**参数**

- **ep\_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user\_ctx** –[in] User data

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

void **wifi\_prov\_mgr\_endpoint\_unregister** (const char \*ep\_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**参数** `ep_name` –[in] Name of the endpoint

`esp_err_t` `wifi_prov_mgr_event_handler` (void \*ctx, `system_event_t` \*event)

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

---

**备注:** : This function is DEPRECATED, because events are now handled internally using the event loop library, `esp_event`. Calling this will do nothing and simply return `ESP_OK`.

---

**参数**

- `ctx` –[in] Event context data
- `event` –[in] Event info

**返回**

- `ESP_OK` : Event handled successfully

`esp_err_t` `wifi_prov_mgr_get_wifi_state` (`wifi_prov_sta_state_t` \*state)

Get state of Wi-Fi Station during provisioning.

**参数** `state` –[out] Pointer to `wifi_prov_sta_state_t` variable to be filled

**返回**

- `ESP_OK` : Successfully retrieved Wi-Fi state
- `ESP_FAIL` : Provisioning app not running

`esp_err_t` `wifi_prov_mgr_get_wifi_disconnect_reason` (`wifi_prov_sta_fail_reason_t` \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

**参数** `reason` –[out] Pointer to `wifi_prov_sta_fail_reason_t` variable to be filled

**返回**

- `ESP_OK` : Successfully retrieved Wi-Fi disconnect reason
- `ESP_FAIL` : Provisioning app not running

`esp_err_t` `wifi_prov_mgr_configure_sta` (`wifi_config_t` \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event `WIFI_PROV_CRED_RECV` is emitted after credentials have been applied and Wi-Fi station started

**参数** `wifi_cfg` –[in] Pointer to Wi-Fi configuration structure

**返回**

- `ESP_OK` : Wi-Fi configured and started successfully
- `ESP_FAIL` : Failed to set configuration

`esp_err_t` `wifi_prov_mgr_reset_provisioning` (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**返回**

- `ESP_OK` : Reset provisioning config successfully

- ESP\_FAIL : Failed to reset provisioning config

*esp\_err\_t* **wifi\_prov\_mgr\_reset\_sm\_state\_on\_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

#### 返回

- ESP\_OK : Reset provisioning state machine successfully
